- **1**: This function is enabled. After this function is enabled, CM Server automatically isolates faulty instances.

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

barrier_restart_threshold

Parameter description: Specifies the interval of waiting for restarting the barrier of the standby cluster for DR. When the barrier of the standby cluster for DR is suspended for a period longer than the value of this parameter, the barrier is restarted.

Parameter type: integer.

Unit: seconds

Value range: 0 to 2592000. **0** indicates that barrier restart is disabled.

Default value: **30**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may cause inaccurate fault detection and delayed fault rectification.

enable_topology_network_arbitrate

Parameter description: Specifies whether to perform network topology arbitration. If this parameter is enabled, GaussDB performs arbitration based on the network topology. This parameter can be used only in quorum mode.

Parameter type: integer.

Unit: none

Value range:

- **0**: disabled.
- **1**: enabled. Once enabled, CM Server automatically performs arbitration based on the network topology.

Default value: **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

topology_network_arbitrate_wait_time

Parameter description: Specifies the waiting time for network topology data to become stable during network topology arbitration. If the network topology data changes within the period specified by this parameter, network topology arbitration is not performed. This parameter can be used only in quorum mode.

Parameter type: integer.

Unit: seconds

Value range: 5 to 600

Default value: **10**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

topology_network_collecting_failed_times

Parameter description: Specifies the number of consecutive network disconnections on the data plane. If the number of disconnections exceeds the value of this parameter, the data plane network topology is abnormal. The value must be the same as that of **topology_network_collecting_failed_times** set for the CM Agent. This parameter can be used only in quorum mode.

Parameter type: integer.

Unit: none

Value range: 3 to 50

Default value: **5**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

topology_network_stable_cn_percent

Parameter description: Specifies the percentage of remaining CNs that can be loaded on the data plane network topology. The network arbitration module

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

calculates the minimum number of reserved CNs based on this parameter. The minimum number of retained CNs is the number of all CNs multiplied by the value of this parameter. If the calculated number is less than 1, the value **1** is used. This parameter can be used only in quorum mode.

Parameter type: integer.

Unit: none

Value range: 0 to 100

Default value: **50**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

topology_network_check_max_cn_count

Parameter description: Specifies the maximum number of CNs in a cluster supported by data plane network topology detection. If the number of CNs exceeds the value of this parameter, data plane network topology arbitration is not performed. If this parameter is set to **0**, network topology arbitration is disabled. This parameter can be used only in quorum mode.

Parameter type: integer.

Unit: none

Value range: 0 to 256

Default value: **16**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

hardware_max_cn_delete_threshold

Parameter description: Specifies the maximum threshold for removing CNs due to hardware faults. The value is rounded down.

Parameter type: integer.

Unit: %

Value range: 0 to 99

- **0**: CNs are not removed.
- 1–99: indicates the percentage of CNs to be removed. At least one available CN must be retained.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **50**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cluster_starting_aribt_delay

Parameter description: Specifies the time that CM Server waits for the static primary DN to be promoted to primary during cluster startup.

Parameter type: integer.

Unit: seconds

Value range: 1 to 2592000

Default value: **180**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 6-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cluster_unavailable_alarm_timeout

Parameter description: Specifies the timeout period for a cluster in the unavailable state. After the timeout, the cluster reports the ALM_AI_ClusterUnavailable alarm.

Parameter type: integer.

Unit: seconds

Value range: 0 to 1000

- **0**: This alarm is not reported.
- 1–1000: indicates the time when the cluster is in an unavailable state.

Default value: **40**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: none

cluster_degrade_alarm_timeout

Parameter description: Specifies the timeout period for a cluster to be in the **Degrade** state. After the timeout, the cluster reports the ALM_AI_ClusterDegrade alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: seconds

Value range: 0 to 1000

- **0**: This alarm is not reported.
- 1–1000: indicates the time when the cluster is in the **Degrade** state.

Default value: **40**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: none

max_frequency_heal_timeout

Parameter description: The ALM_AI_ClusterHealFrequent alarm is triggered if the cluster is healed for 10 times or more within this period.

Parameter type: integer.

Unit: seconds

Value range: 0 to 1000

- **0**: This alarm is not reported.
- 1 to 1000: indicates the time range for continuously triggering the healing process.

Default value: **300**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: none

cn_auto_repair_max_concurrency

Parameter description: Specifies the maximum number of CNs that can be concurrently added back.

Parameter type: integer.

Unit: none

Value range: 0 to 256. **0** indicates that the number of CNs concurrently added back is the same as the number of normal CNs in the cluster but cannot be greater than 10.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cn_auto_repair_timeout

Parameter description: Specifies the timeout period for adding CNs back. If a CN fails to be added back repeatedly in a period longer than this threshold and the number of attempt failures exceeds this retry threshold, it will be abandoned from automatic re-addition.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **1800**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cn_auto_repair_retry_times

Parameter description: Specifies the number of CN re-addition retries. If a CN fails to be added back repeatedly in a period longer than the timeout threshold and the number of attempt failures exceeds this retry threshold, it will be abandoned from automatic re-addition. Though it is abandoned, if you adjust the value of this threshold, automatic re-addition of the faulty CN will start again.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **3**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cn_dn_disconnect_to_delete_time

Parameter description: Specifies the number of times that a CN fails to check SQL statements on all primary DNs. When the number of failures exceeds the value of this parameter, the CN is removed.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1 to 600

Default value: **20**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

majority_standby_lock_timeout

Parameter description: Specifies the timeout interval for locking the majority of standby nodes. The cluster enters the leader election (arbitration) process and locks the majority of standby nodes. When the primary node is faulty, the arbitration process is blocked until this timeout period expires. After the timeout period expires, the original primary node is stopped and the arbitration process is resumed.

Parameter type: integer.

Unit: seconds

Value range: 0 to 2147483647. The value **0** indicates that the function is disabled.

Default value: **120**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

replica_reduce_delay_time

Parameter description: Specifies the delay time for reducing copies. If the majority of DNs are in the **unknown** state, the copy reduction operation is triggered only after the detected state persists for a period of time specified by this parameter. If the majority of DNs are in the **building**, **need_repair**, or **starting** state, the copy reduction operation is triggered only after the detected state persists for a period of time five times the specified delay.

Parameter type: integer.

Unit: seconds

Value range: 0 to 2147483647

Default value: **12**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the probability of incorrect copy reduction increases in a short period of time due

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

to faults such as network disconnection. If this parameter is set to a large value, the cluster is unavailable for a long time when the majority of nodes are faulty. Before modifying this parameter, make sure you understand its meaning and fully verify the change in a test environment.

replica_increase_delay_time

Parameter description: Specifies the delay time for adding copies. When a copy is recovered and can be added back (that is, the copy status is **normal** and the log synchronization rate is greater than or equal to 99%), the automatic copy addition is triggered only after a delay specified by this parameter. This parameter is used to prevent resource flapping caused by immediate copy addback after copy reduction.

Parameter type: integer.

Unit: seconds

Value range: 0 to 2147483647

Default value: **60**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, resource flapping caused by immediate copy addition after copy reduction may occur. If this parameter is set to a large value, the time for adding copies back after they are recovered is prolonged. Before modifying this parameter, make sure you understand its meaning and fully verify the change in a test environment.

dr_dest_name

Parameter description: Specifies the target clusters to which logs can be synchronized from the current cluster. This parameter is valid only when the cluster is deployed in a single-node system. In addition, you do not need to reload the parameter after setting this parameter.

Parameter type: string

Unit: none

Value range: a valid target cluster instance ID.

Default value: **""**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**. After this parameter is set, you do not need to reload the parameter.

Setting suggestion: This parameter is internally called. You are advised not to modify it.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hadr_replconninfo_config_mode

Parameter description: Specifies the DR type of the current database instance.

Parameter type: string

Unit: none

Value range: **"local_file"** or **"cluster_manager"**

Default value: **"local_file"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 2 in **Table 6-3**.

Setting suggestion: This parameter is internally called. You are advised not to modify it.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

7 System Catalogs and System Views

7.1 Overview of System Catalogs and System Views

System catalogs store the structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query system catalogs and internal database status.

System catalogs and system views are visible to either system administrators or all users. Some of the following system catalogs and views have marked the need of administrator permissions. They are accessible only to administrators.

You can delete and rebuild the catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
- Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
- System catalogs and views do not support foreign key-related columns.
- For details about column types in system catalogs and system views, see **Data Types**.
- For ADM views, the accessed objects are all objects of this type in the database. Therefore, unified permission management is required for ADM views. By default, only system administrators have the permission to access ADM views. Some ADM view data comes from public and non-sensitive columns in base tables. For DB views, the objects that the current user has the permission to access in the database can be queried. Common users can access these views. For MY views, objects to which the current user belongs can be queried. Common users can access these views.

7.2 System Catalogs

7.2.1 Partitioned Table

7.2.1.1 PG_PARTITION

PG_PARTITION records information about all partitioned tables, table partitions, and index partitions in the database, but it does not store information about partitioned indexes. Since partitioned tables do not have actual physical files, PG_PARTITION does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, or **reltoastidxid**.

Table 7-1 PG_PARTITION columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
relname	Name	Name of a partitioned table, a partition, a TOAST table on a partition, or an index partition.
parttype	"Char"	Object type. • **'r'**: partitioned table. • **'p'**: table partition. • **'s'**: table subpartition. • **'x'**: index partition.
parentid	OID	• OID of a partitioned table in PG_CLASS when the object is a partitioned table or partition. • OID of a partitioned index when the object is an index partition.
rangenum	Integer	Reserved column.
intervalnum	Integer	Reserved column.
partstrategy	"Char"	Partitioning policy of the partitioned table. Currently, only the following policies are supported: • **'r'**: range partitioning. • **'l'**: list partitioning. • **'h'**: hash partitioning. • **'n'**: no partitioning because the object is not a table partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relfilenode	OID	Physical storage location of a table partition, an index partition, or a TOAST table on a partition.
reltablespace	OID	OID of the tablespace containing a table partition, an index partition, or a TOAST table on a partition.
relpages	Double precision	Statistics: number of data pages in a table partition or an index partition.
reltuples	Double precision	Statistics: number of tuples in a table partition or an index partition.
relallvisible	Integer	Statistics: number of visible data pages in a table partition or an index partition.
reltoastrelid	OID	OID of the TOAST table corresponding to a table partition.
reltoastidxid	OID	Index OID of the TOAST table corresponding to a table partition.
indextblid	OID	OID of the table partition corresponding to an index partition.
indisusable	Boolean	Specifies whether an index partition is available. • **t** (true): available. • **f** (false): unavailable.
reldeltarelid	OID	Not supported currently.
reldeltaidx	OID	Not supported currently.
relcudescrelid	OID	Not supported currently.
relcudescidx	OID	Not supported currently.
relfrozenxid	XID32	Frozen transaction ID. To ensure compatibility with earlier versions, this column is reserved. The **relfrozenxid64** column is added to record the information.
intspnum	Integer	Number of tablespaces to which an interval partition belongs.
partkey	Int2vector	Column number of the partition key.
intervaltablespace	Oidvector	Tablespace to which an interval partition belongs. Interval partitions fall into tablespaces in a round-robin manner.
interval	Text[]	Interval value of an interval partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
boundaries	Text[]	Upper limit of a range partition or an interval partition.
transit	Text[]	Transit of an interval partition.
reloptions	Text[]	Partition storage attribute used to collect online scale-out information. Same as **pg_class.reloptions**, it is expressed as a string in "keyword=value" format.
relfrozenxid64	XID	Frozen transaction ID.
relminmxid	XID	Frozen multi-transaction ID.
partitionno	Integer	Used to maintain the partition map of a partitioned table. • If the object is a partition, this column indicates the partition ID, which increments from 1. • If the object is a partitioned table, this column indicates the maximum partition ID, which is specially marked with a negative value. This value increases with certain partition-related DDL syntax. • For other object types, this column is null and holds no specific meaning. **partitionno** is a permanent auto-increment column, which can be reset or reclaimed by using the ALTER TABLE t_name RESET PARTITION syntax.
subpartitionno	Integer	Reserved column.
partkeyexpr	pg_node_tree	Not supported currently.

7.2.1.2 GS_SUBPARTITION_TEMPLATE

GS_SUBPARTITION_TEMPLATE records information about subpartition templates.

Table 7-2 GS_SUBPARTITION_TEMPLATE columns

Name	Type	Description
table_oid	OID	OID of the base table to which a template belongs.
position	Integer	Partition number defined in the template, starting from 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spart_name	Name	Partition name defined in the template.
spart_tablespace	OID	Partition tablespace OID defined in the template.
spart_boundaries	Text[]	Partition boundary defined in the template. For range partitioning, it is defined as an upper limit. For list partitioning, it is defined as a value list. For hash partitioning, it is defined as a hash remainder.

7.2.2 Workload Management

7.2.2.1 GS_ABNORMAL_SQL_INFO

GS_ABNORMAL_SQL_INFO provides information about SQL statements that cause abnormal CPU usage of the database.

Table 7-3 GS_ABNORMAL_SQL_INFO columns

Column Name	Type	Description
unique_sql_id	bigint	Unique SQL ID.
abnormal_count	integer	Number of exceptions.
current_controllable	boolean	Specifies whether the CPU usage is controlled.
is_logged_when_controlled	boolean	Specifies whether to print logs when the CPU usage is controlled.
control_expiration_time	timestamp without time zone	Control expiration time.
abnormal_type	name	Exception type.
user_id	oid	OID of the user to which the abnormal SQL statement belongs.

7.2.2.2 GS_ABNORMAL_SQL_WHITE_LIST

GS_ABNORMAL_SQL_WHITE_LIST provides information about the SQL whitelist for abnormal database CPU usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-4 GS_ABNORMAL_SQL_INFO columns

Column Name	Type	Description
unique_sql_id	bigint	Unique SQL ID.
user_id	oid	OID of the user to which the abnormal SQL statement belongs.

7.2.2.3 PG_APP_WORKLOADGROUP_MAPPING

PG_APP_WORKLOADGROUP_MAPPING provides load mapping group information in the database.

Table 7-5 PG_APP_WORKLOADGROUP_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
appname	name	Application name
workload_gpname	name	Mapped workload group name

7.2.3 OLTP Table Compression

7.2.3.1 GS_ILM

GS_ILM provides the main information about the ILM policy, including the policy name, policy owner, policy type, policy ID, and policy status.

Table 7-6 GS_ILM columns

Name	Type	Description
pidx	integer	Policy sequence number, which is globally unique and starts with 1.
creator	oid	Policy owner.
name	name	Policy name. Currently, the policy name cannot be customized. The default name is p +pidx.
ptype	"char"	Policy type: • **m**: data movement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
flag	smallint	Value range: • **0**: The policy is enabled. • **1**: The policy is disabled. • **2**: Database-level policy.

7.2.3.2 GS_ILM_JOBDETAIL

GS_ILM_JOBDETAIL records information including the job type, job status, and job statistics.

Table 7-7 GS_ILM_JOBDETAIL columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
jobtype	"char"	Current job type: compression ('c').
jobstatus	smallint	Current job status: • **1**: JOB CREATED • **2**: COMPLETED SUCCESSFULLY • **3**: FAILED • **4**: STOPPED • **5**: JOB CREATION FAILED
jobname	text	The ADO job name is unique in the table and is joined with **job_name** in the PG_JOB system catalog.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
payload	text	PL/SQL code of the current job.
statistics	text	Statistics of the current job.
comments	text	Description of the current job execution, such as the failure cause.

7.2.3.3 GS_ILM_OBJECT

GS_ILM_OBJECT records the relationships between data objects and policies as well as the scheduling information of policies on the data objects. When a policy is set for a partitioned table, this catalog generates an independent record for each partition or subpartition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-8 GS_ILM_OBJECT columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	OID of a logical data object which has a partitioned table.
dataobjoid	oid	OID of a physical data object, which is the entity that needs to execute the policy and the leaf of the tree-level partition relationship.
objtype	"char"	Current data object type. The options are as follows: • Table ('r') • Partition ('p') • Subpartition ('s') • Ordinary index ('i') • Global index ('I') • Global secondary index ('G') • Index Partition ('x')
origobjoid	oid	OID of the original object that defines the policy.
origobjtype	"char"	Type of the original data object that defines the policy. The options are as follows: • Table ('r') • Partition ('p') • Subpartition ('s') • Ordinary index ('i') • Global index ('I') • Global secondary index ('G')
lastchktime	timestamp with time zone	Time of the last ADO task.
lastexetime	timestamp with time zone	Time of the last ADO job.
roundcnt	smallint	Number of successful rounds.
failcnt	smallint	Number of failures.
lastjobstatus	"char"	Execution status of the last job.
lastroundstarttime	timestamp with time zone	Start time of the full table scan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lastjobblkid	bigint	ID of the block that has been processed by the job last time.
flag	smallint	Value range: • **0**: The object compression policy is enabled. • **1**: The object compression policy is disabled. • **2**: The object compression policy is enabled, and a full table scan is completed during the last compression scheduling.
lasthashbktpos	oidvector	Records the last compression position of the previous compression scheduling by storing two values: **[bucketid, blockid]**.

7.2.3.4 GS_ILM_PARAM

GS_ILM_PARAM is a feature parameter table, which records the parameters related to the ILM feature, such as the control parameters of background scheduling.

Table 7-9 GS_ILM_PARAM columns

Name	Type	Description
idx	smallint	Parameter ID.
name	name	Parameter name.
value	double precision	Parameter value. For details, see the description in **Table 7-10**.

Table 7-10 GS_ILM_PARAM feature parameter range

Parameter ID	Parameter	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter	Description
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Background scheduling status. This parameter cannot be modified using DBE_ILM_ADMIN.CUSTOMIZE_ILM. Use disable_ilm () and enable_ilm () to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Value range: ● **0** (default): The unit is day. ● **1**: The unit is second, which is generally used in test scenarios.
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The default value is **10**. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The default value is **1024**. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer or floating-point number greater than or equal to 0 and less than 1440 (24 hours). The value is rounded down for a floating-point number before taking effect.
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression speed. The default value is **40**. The value ranges from 0 to 10000, in blocks/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the speed is not limited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter	Description
16	ENABLE_META_COMPRESSION	Specifies whether to enable header compression. The default value is **0** (disabled), and the value **1** indicates that header compression is enabled. **NOTE** If this parameter is set to **1**, the compression ratio is improved for tables with short rows (less data in a single row), but the performance of accessing compressed rows greatly deteriorates. If most tables in the database have long rows, you are advised not to enable this parameter.
17	SAMPLE_MIN	Minimum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
18	SAMPLE_MAX	Maximum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
19	CONST_PRIO	Constant encoding priority. The default value is **40**. The value range is [0,100]. The value **100** indicates that constant encoding is disabled. Decimals can be entered and will be automatically rounded down.
20	CONST_THRESHOLD	Constant encoding threshold. The default value is **90**. The value range is [1,100], indicating that constant encoding is performed when the proportion of constant values in a column exceeds the threshold. Decimals can be entered and will be automatically rounded down.
21	EQVALUE_PRIO	Equivalent encoding priority. The default value is **60**. The value range is [0,100]. The value **100** indicates that equivalent encoding is disabled. Decimals can be entered and will be automatically rounded down.
22	EQVALUE_THRESHOLD	Equivalent encoding threshold. The default value is **80**. The value range is [1,100], indicating that equivalent encoding is performed when the ratio of equal values in two columns exceeds the threshold. Decimals can be entered and will be automatically rounded down.
23	ENABLE_DELTA_ENCODE_SWITCH	Specifies whether to enable difference encoding. The default value is **1**. The value **0** indicates that difference encoding is disabled, and the value **1** indicates that difference encoding is enabled. Decimals can be entered and will be automatically rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter	Description
24	LZ4_COMPRESSION_LEVEL	LZ4 compression level. The default value is **0**. The value range is [0,16]. Decimals can be entered and will be automatically rounded down.
25	ENABLE_LZ4_PARTIAL_DECOMPRESSION	Specifies whether to enable partial decompression. The default value is **1**. The value **0** indicates that partial decompression is disabled, and the value **1** indicates that partial decompression is enabled. Decimals can be entered and will be automatically rounded down.
26	INDEXJOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job for index compression. The unit is MB. The default value is **1024**. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
27	ENABLE_INDEX_COMPRESS	Specifies whether to enable index compression. The value can be **0** (disabled) or **1** (enabled). The default value is **0**.

7.2.3.5 GS_ILM_POLICY

GS_ILM_POLICY records policy action types and judgment conditions.

Table 7-11 GS_ILM_POLICY columns

Name	Type	Description
pidx	integer	Policy ID.
action	"char"	Policy action. Only compression ('c') is supported.
ctype	"char"	Compression type. Only advanced row compression ('a') and cross-page transparent compression ('t') are supported.
condition	"char"	Condition type. Only LAST MODIFICATION('m') is supported.
days	smallint	Number of judgment days.
scope	"char"	Policy scope. Only Row ('r') and Unit ('u') are supported.
predicate	pg_node_tree	Policy row-level expression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
csubtype	"char"	Compression level. Advanced compression supports only Medium ('m') and High ('h'). Cross-page transparent compression supports Low ('l'), Medium ('m'), and High ('h').

7.2.3.6 GS_ILM_TASK

GS_ILM_TASK records ADO task information, such as the creation time, start time, end time, and execution status.

Table 7-12 GS_ILM_TASK columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
creator	oid	Creator of an ADO task.
createtime	timestamp with time zone	Creation time.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
executestate	smallint	Value range: • **1**: 'INACTIVE' • **2**: 'ACTIVE' • **3**: 'COMPLETED'
flag	smallint	Reserved column.

7.2.3.7 GS_ILM_TASKDETAIL

GS_ILM_TASKDETAIL records the evaluation result of a specified data object and policy.

Table 7-13 GS_ILM_TASKDETAIL columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	Data OID.
objtype	"char"	Data object type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
taskoid	bigint	OID of an ADO task.
evalresult	smallint	Evaluation result: • **0**: SELECTED FOR EXECUTION. The evaluation is passed. • **1**: PRECONDITION NOT SATISFIED. The condition is not met. • **2**: JOB ALREADY EXISTS. The job already exists.
jobname	text	ADO job name generated after the evaluation is passed is joined with the **jobname** column in the **GS_ILM_JOBDETAIL** system catalog.

7.2.3.8 GS_ILM_TICKER

GS_ILM_TICKER records the mapping between LSNs and time. A maximum of 3650 lines of records can be retained.

Table 7-14 GS_ILM_TICKER columns

Name	Type	Description
ilm_ticker_lsn	bigint	LSN when the dotting operation is triggered.
ilm_ticker_time	timestamp with time zone	Time when the dotting operation is triggered.

7.2.3.9 GS_ILM_TURBO_OBJECT

GS_ILM_TURBO_OBJECT records information about cross-page transparent compression policies.

Table 7-15 GS_ILM_TURBO_OBJECT columns

Name	Type	Description
objoid	oid	OID of the original object that defines the policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
objtype	"char"	Current data object type. The options are as follows: • Table ('r') • Partition ('p') • Subpartition ('s') • Ordinary index ('i') • Global index ('I') • Global secondary index ('G') • Index Partition ('x')
csubtype	"char"	Cross-page transparent compression policy level: • Low ('l') • Medium ('m') • High ('h')
encodetype	tinyint	Encoding type: • Tile ('1') • Fuzzy splitting ('2') • Pattern encoding ('3')
compresstype	tinyint	General compressor type: • lz4 ('1') • zstd ('2')
compressunit	tinyint	Length of the compression unit: • 1 ('1') • 2 ('2') • 4 ('3') • 8 ('4') • 16 ('5') • 32 ('6') • 64 ('7')
lmtinterval	integer	Interval of cold and hot data management, in hours.

7.2.4 Encrypted Equality Query

7.2.4.1 GS_CLIENT_GLOBAL_KEYS

GS_CLIENT_GLOBAL_KEYS records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-16 GS_CLIENT_GLOBAL_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
global_key_name	name	CMK name.
key_namespace	oid	A namespace OID that contains this CMK.
key_owner	oid	CMK owner.
key_acl	aclitem[]	Access permissions that the key should have on creation
create_date	timestamp without time zone	Time when the key is created

7.2.4.2 GS_CLIENT_GLOBAL_KEYS_ARGS

GS_CLIENT_GLOBAL_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 7-17 GS_CLIENT_GLOBAL_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
global_key_id	oid	CMK OID.
function_name	name	The value is **encryption**.
key	name	CMK metadata name.
value	bytea	Value of the CMK metadata name.

7.2.4.3 GS_COLUMN_KEYS

GS_COLUMN_KEYS records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

Table 7-18 GS_COLUMN_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
column_key_name	name	CEK name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK.
global_key_id	oid	Foreign key, which is the CMK OID.
key_namespace	oid	A namespace OID that contains this CEK.
key_owner	oid	CEK owner.
create_date	timestamp without time zone	Time when the CEK is created
key_acl	aclitem[]	Access permissions that the CEK should have on creation

7.2.4.4 GS_COLUMN_KEYS_ARGS

GS_COLUMN_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 7-19 GS_COLUMN_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
column_key_id	oid	CEK OID
function_name	name	The value is **encryption**.
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

7.2.4.5 GS_ENCRYPTED_COLUMNS

GS_ENCRYPTED_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

Table 7-20 GS_ENCRYPTED_COLUMNS columns

Name	Type	Description
rel_id	oid	OID of the table.
column_name	name	Name of an encrypted column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be **2(DETERMINISTIC)** or **1(RANDOMIZED)**.
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the **oid** columns in the **PG_TYPE** system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the **atttypmod** columns in the **PG_ATTRIBUTE** system catalog.
create_date	timestamp without time zone	Time when an encrypted column is created

7.2.4.6 GS_ENCRYPTED_PROC

GS_ENCRYPTED_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

Table 7-21 GS_ENCRYPTED_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
func_id	oid	OID of the function, corresponding to the row identifier (OID) in the **PG_PROC** system catalog.
prorettype_orig	integer	Original data type of the return value
last_change	timestamp without time zone	Last modification time of the encrypted function.
proargcachedcol	oidvector	OID of the encrypted column corresponding to the **INPUT** parameter of the function, corresponding to the row identifier (OID) in the **GS_ENCRYPTED_COLUMNS** system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proallargtypes_orig	oid[]	Original data type of all function parameters

7.2.5 Communications

7.2.5.1 PGXC_NODE

PGXC_NODE records information about cluster nodes.

NOTICE

- PGXC_NODE stores information about database instance nodes. The PGXC_NODE system catalog has specific meanings only on CNs and its data is valid and correct.
- In the result of querying the PGXC_NODE system catalog on a DN, only the **node_id** column is meaningful. Other columns are meaningless and invalid.

Table 7-22 PGXC_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
node_name	name	Node name.
node_type	"char"	Node type. The **R**, **M**, and **O** types are unique to the standby cluster for DR. • **C**: CN. • **D**: DN • **S**: standby node • **R**: read-only CN of the standby cluster. • **M**: static primary DN of the standby cluster. • **O**: other data nodes in the standby cluster.
node_port	integer	Port number of the node.
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	Boolean	Specifies whether a primary/standby switchover occurs on the current node. • **t** (true): yes • **f** (false): no
nodeis_primary	Boolean	Specifies whether the current node is preferred to execute non-query operations in the **replication** table. • **t** (true): yes • **f** (false): no
nodeis_preferred	Boolean	Specifies whether the current node is preferred to execute queries in the **replication** table. • **t** (true): yes • **f** (false): no
node_id	integer	Node identifier. The value is obtained by calculating the value of **node_name** using the hash function.
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel.
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel.
nodeis_central	Boolean	Specifies whether the current node is a central control node. It is used only for CNs and is invalid for DNs. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
nodeis_active	Boolean	Specifies whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs. • **t** (true): yes • **f** (false): no
cluster_name	text	Specifies the cluster name.
slice_order	integer	Sequence number of the shard that a node belongs to.

7.2.6 Ledger Database

7.2.6.1 GS_GLOBAL_CHAIN

GS_GLOBAL_CHAIN records information about modification operations performed by users on the tamper-proof user table. Each record corresponds to a table-level modification operation. Users with the AUDITADMIN permission can query this system catalog, but no user is allowed to modify this system catalog.

Table 7-23 GS_GLOBAL_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger.
dbname	name	Name of the database to which the modified tamper-proof user table belongs.
username	name	Username, which is the name of the user who performs the operation of modifying the user table.
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.
relname	name	User table name, which is the name of the modified tamper-proof user table.
relhash	hash16	Table-level hash change amount generated by operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
globalhash	hash32	Global digest, which is calculated based on the information of the current row and **globalhash** of the previous row. It connects the entire table to verify the integrity of GS_GLOBAL_CHAIN data.
txcommand	text	SQL statement whose operations are recorded.

7.2.7 SPM

7.2.7.1 GS_SPM_SQL

GS_SPM_SQL is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SPM information. Users with the SYSADMIN permission can read the system catalog, but only the initial user can write data to the system catalog.

Table 7-24 GS_SPM_SQL columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
sql_text	text	SQL text string.
param_num	integer	Number of parameters required for SQL execution.
user	oid	OID of the login user.
creation_time	timestamp with time zone	Time when a record is created.

7.2.7.2 GS_SPM_PARAM

GS_SPM_PARAM is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SQL parameters. Each SQL statement stores only one group of parameters. Users with the SYSADMIN permission can read the system catalog, but only the initial user can write data to the system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-25 GS_SPM_PARAM columns

Name	Type	Description
sql_namespace	oid	Schema OID
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Determines whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.
user	oid	User who creates the record.
creation_time	timestamp with time zone	Time when a record is created.
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: • OIDs of the schema on which the user has permissions. • OIDs of the existing schemas. • OIDs of the schemas where the non-local temporary tables are located.

7.2.7.3 GS_SPM_BASELINE

GS_SPM_BASELINE is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store baseline information. Users with the SYSADMIN permission can read the system catalog, but only the initial user can write data to the system catalog.

Table 7-26 GS_SPM_BASELINE columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
cost	double precision	Total plan cost.
user	oid	User who creates the baseline.
status	integer	Baseline status. The options are as follows: ● **0** (UNACC): indicates that the plan is not accepted. ● **1** (ACC): indicates that the plan has been accepted. ● **2** (FIXED): indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
source	text	Baseline source.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the baseline is created.
last_used_time	timestamp with time zone	Last time when a plan was used.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan changes.
invalid	Boolean	Specifies whether the current baseline is invalid.
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: ● OIDs of the schema on which the user has permissions. ● OIDs of the existing schemas. ● OIDs of the schemas where the non-local temporary tables are located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.7.4 GS_SPM_EVOLUTION

GS_SPM_EVOLUTION is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store plan evolution result. Users with the SYSADMIN permission can read the system catalog, but only the initial user can write data to the system catalog.

Table 7-27 GS_SPM_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Plan ID.
better	Boolean	Determines whether it is a positive evolution. ● **t** indicates positive evolution. ● **f** indicates negative evolution.
refer_plan	bigint	Plan hash used as a reference for report generation.
status	integer	Determines whether exceptions occur during the evolution. ● The value **0** indicates that no exception occurs. ● The value **1** indicates that an exception occurs.
reason	text	Content of the evolution report.
user	oid	User who generates the evolution result.
creation_time	timestamp with time zone	Time when the evolution result is created.

7.2.7.5 GS_SPM_ID_HASH_JOIN

GS_SPM_ID_HASH_JOIN is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. The system catalog stores the relationship between unique_sql_id and sql_hash. Users with the SYSADMIN permission can read the system catalog, but only the initial user can write data to the system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-28 GS_SPM_ID_HASH_JOIN columns

Name	Type	Description
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.

7.2.8 AI

7.2.8.1 GS_MODEL_WAREHOUSE

GS_MODEL_WAREHOUSE stores AI engine training models, including the models and detailed description of the training process.

Table 7-29 GS_MODEL_WAREHOUSE columns

Name	Type	Description
oid	OID	Implicit column.
modelname	Name	Model name, which is unique.
modelowner	OID	OID of the model owner.
createtime	Timestamp without time zone	Time when the model was created.
processedtuples	Integer	Number of tuples involved in training.
discardedtuples	Integer	Number of unqualified tuples not used in training.
preprocesstime	Real	Data preprocessing duration.
exectime	Real	Training duration.
iterations	Integer	Number of iterations.
outputtype	OID	OID of the output data type.
modeltype	Text	AI operator type.
query	Text	Query statement executed to create the model.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
modeldata	Bytea	Stored binary model information.
weight	Real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	Text[]	Name of an involved hyperparameter.
hyperparametersvalues	Text[]	Value of the hyperparameter.
hyperparametersoids	OID[]	OID of the data type corresponding to the hyperparameter.
coefnames	Text[]	Name of a model parameter.
coefvalues	Text[]	Value of the model parameter.
coefoids	OID[]	OID of the data type corresponding to the model parameter.
trainingscoresname	Text[]	Name of the method used to measure the model performance.
trainingscoresvalue	Real[]	Value used to measure the model performance.
modeldescribe	Text[]	Model description.

7.2.8.2 GS_OPT_MODEL

GS_OPT_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, system functions, and training history of machine learning models.

NOTE

This system catalog is provided in distributed mode, but AI capabilities remain unavailable.

7.2.8.3 GS_ABO_MODEL_STATISTIC

GS_ABO_MODEL_STATISTIC stores the metadata, names, and operators of the models estimated by ABO based on feedback cardinality.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-30 GS_ABO_MODEL_STATISTIC columns

Name	Type	Description
oid	OID	Implicit column.
modelname	Name	Model name, which is unique.
createtime	Timestamp without time zone	Time when the model was created or updated.
groupkey	OID	Operator hash of the model.
joinkey	OID	Hash of the model's operator connection shape.
fixed_selectivity	Double precision	Fixed selectivity for operators that do not contain numeric conditions.
avg_qerror	Double precision	Average qerror of the model.
max_qerror	Double precision	Maximum qerror of the model.
feedback_num	Integer	Training data volume of the model.
status	Integer	Model status. • **0**: The model is ineffective. • **1**: The model is effective. • **2**: The model is to be updated. • **3**: The model is blacklisted. • **4**: The model will be replaced by the default model when it is used next time.
train_count	Integer	Total number of model training times.
train_failure_count	Integer	Number of model training failures.
prediction_count	Integer	Total number of model prediction times.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
prediction_failure_count	Integer	Number of model prediction failures.
rtable_ids	oidvector	Sequence of including the model conditions into the base table.
attnums	int2vector	Sequence of columns involved in model input conditions.

7.2.8.4 GS_ABO_HISTORY

GS_ABO_HISTORY stores the usage statistics of ABO (cardinality estimation feedback) models.

Table 7-31 GS_ABO_HISTORY columns

Name	Type	Description
sql_id	Bigint	SQL ID.
user_id	OID	User ID.
acm_sql_status	Tinyint	Specifies whether it is blacklisted. • **0**: not blacklisted. • **1**: blacklisted. • **2**: not blacklisted and being executed.
explore_count	Bigint	Number of exploration times for the plan used for the blacklist mechanism.
execution_time	Double precision	Execution time of this query, in milliseconds.
usage_count	Bigint	Number of times that the feedback cardinality is used.
create_time	Timestamp without time zone	Time when this record was created.

7.2.9 Audit

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.9.1 GS_AUDITING_POLICY

GS_AUDITING_POLICY records main information for each unified audit policy. Each record corresponds to an audit policy. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

Table 7-32 GS_AUDITING_POLICY columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
polname	Name	Policy name, which must be unique.
polcomments	Name	Policy description, which is represented by the COMMENTS keyword.
modifydate	Timestamp without time zone	Timestamp when the policy was created or last modified.
polenabled	Boolean	Specifies whether the policy is enabled. • **t** (true): The policy is enabled. • **f** (false): The policy is disabled.

7.2.9.2 GS_AUDITING_POLICY_ACCESS

GS_AUDITING_POLICY_ACCESS records unified audit information for ACCESS database operations. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

Table 7-33 GS_AUDITING_POLICY_ACCESS columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
accesstype	Name	Type related to ACCESS, for example, SELECT, INSERT, or DELETE.
labelname	Name	Resource label name, corresponding to **polname** in the **GS_AUDITING_POLICY** system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policyoid	OID	OID of the audit policy, corresponding to **oid** in the GS_AUDITING_POLICY system catalog.
modifydate	Timestamp without time zone	Timestamp of creation or latest modification.

7.2.9.3 GS_AUDITING_POLICY_FILTERS

GS_AUDITING_POLICY_FILTERS records filter policies for unified audit. Each record corresponds to an audit policy. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

Table 7-34 GS_AUDITING_POLICY_FILTERS columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
filtertype	Name	Filter type. Currently, the value can only be **logical_expr**.
labelname	Name	Name. Currently, the value can only be **logical_expr**.
policyoid	OID	OID of the audit policy, corresponding to **oid** in the GS_AUDITING_POLICY system catalog.
modifydate	Timestamp without time zone	Timestamp of creation or latest modification.
logicaloperator	Text	Logical character string of a filter criterion.

7.2.9.4 GS_AUDITING_POLICY_PRIVILEGES

GS_AUDITING_POLICY_PRIVILEGES records unified audit information for PRIVILEGES database operations. Each record corresponds to an audit policy. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-35 GS_AUDITING_POLICY_PRIVI columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
privilegetype	Name	Type related to PRIVILEGES, for example, CREATE, ALTER, or DROP.
labelname	Name	Resource label name, corresponding to **polname** in the GS_AUDITING_POLICY system catalog.
policyoid	OID	OID of the audit policy, corresponding to **oid** in the GS_AUDITING_POLICY system catalog.
modifydate	Timestamp without time zone	Timestamp of creation or latest modification.

7.2.10 User and Permission Management

7.2.10.1 GS_DB_PRIVILEGE

GS_DB_PRIVILEGE records grant information for ANY permissions, with each entry representing a distinct grant.

Table 7-36 GS_DB_PRIVILEGE columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
roleid	OID	User ID.
privilege_type	Text	ANY permissions of the user. For details about such permissions, see Table 1-402.
admin_option	Boolean	Specifies whether the ANY permissions recorded in the **privilege_type** column can be re-granted. • **t**: yes. • **f**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.10.2 PG_DB_ROLE_SETTING

PG_DB_ROLE_SETTING stores default values for the configuration items bound to each role and data entry during database runtime.

Table 7-37 PG_DB_ROLE_SETTING columns

Name	Type	Description
setdatabase	OID	Database corresponding to the configuration item (**0** if no database is specified).
setrole	OID	Role corresponding to the configuration item (**0** if no role is specified).
setconfig	Text[]	Default value of the configuration item during runtime.

7.2.10.3 PG_DEFAULT_ACL

PG_DEFAULT_ACL stores the initial permissions assigned to newly created objects.

Table 7-38 PG_DEFAULT_ACL columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
defaclrole	OID	ID of a role associated with the permission.
defaclnamespace	OID	Namespace associated with the permission (**0** if no namespace is associated).
defaclobjtype	"Char"	Object type of the permission. • **r**: table or view. • **S**: sequence. • **f**: function. • **T**: type. • **K**: client master key. • **k**: column encryption key.
defaclacl	ACLItem[]	Access permission that this type of object should have on creation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.10.4 PG_RLSPOLICY

PG_RLSPOLICY stores row-level security policies.

Table 7-39 PG_RLSPOLICY columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
polname	Name	Name of a row-level security policy.
polrelid	OID	OID of the table object to which the row-level security policy is applied.
polcmd	"Char"	SQL operations affected by the row-level security policy.
polpermissive	Boolean	Attribute of the row-level security policy. • **t**: expression concatenation using the OR condition. • **f**: expression concatenation using the AND condition.
polroles	OID[]	OIDs of users affected by the row-level security policy (if unspecified, all users are affected).
polqual	pg_node_tree	Expression of the row-level security policy.

7.2.10.5 PG_SECLABEL

PG_SECLABEL stores security labels for database objects.

PG_SHSECLABEL serves a similar purpose, but it stores security labels for database objects shared within the same database cluster.

Table 7-40 PG_SECLABEL columns

Name	Type	Reference	Description
objoid	OID	Any OID	OID of the object to which the security label belongs.
classoid	OID	**PG_CLASS**.oid	OID of the system catalog that contains the current object.
objsubid	Integer	-	SN of a column in this object.
provider	Text	-	Provider associated with the current label.
label	Text	-	Security label applied to the object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.10.6 PG_SHSECLABEL

PG_SHSECLABEL stores security labels for shared database objects. Security labels can be manipulated using the **SECURITY LABEL** command.

PG_SECLABELS provides an easier way to view security labels.

PG_SECLABEL serves a similar purpose, but it stores security labels for objects within a single database.

Unlike most system catalogs, PG_SHSECLABEL is shared across all databases within a cluster: there is only one PG_SHSECLABEL per database cluster, not one per database.

Table 7-41 PG_SHSECLABEL columns

Name	Type	Reference	Description
objoid	OID	Any OID	OID of the object to which the security label belongs.
classoid	OID	**PG_CLASS**.oid	OID of the system catalog that contains the current object.
provider	Text	-	Provider associated with the current label.
label	Text	-	Security label applied to the current object.

7.2.10.7 PG_USER_MAPPING

PG_USER_MAPPING stores the mappings from local users to remote.

This system catalog is accessible only to users with the SYSADMIN permission. Common users can query the **PG_USER_MAPPINGS** view.

Table 7-42 PG_USER_MAPPING columns

Name	Type	Reference	Description
oid	OID	-	Row identifier (implicit attribute, which must be explicitly selected).
umuser	OID	**PG_AUTHID**.oid	OID of the local user being mapped (**0** if the user mapping is public).
umserver	OID	**PG_FOREIGN_SERVER**.oid	OID of the foreign server that contains this mapping.
umoptions	Text[]	-	User mapping options, as "keyword=value" strings.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.10.8 PG_USER_STATUS

PG_USER_STATUS stores the states of users who access databases. This system catalog is accessible only to users with the SYSADMIN permission.

Table 7-43 PG_USER_STATUS columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
roloid	OID	Role ID.
failcount	Integer	Number of failed attempts.
locktime	Timestamp with time zone	Lock time. By default, this parameter displays the creation date of the role. If the role is locked by an administrator or due to exceeding the failed login attempt threshold, this parameter reflects the date when the role was locked.
rolstatus	Smallint	Role state. ● **0**: normal. ● **1**: locked for a specific period of time due to exceeding the failed login attempt threshold. ● **2**: locked by an administrator. ● **3**: not locked, despite exceeding the failed login attempt threshold.
permspace	Bigint	Size of the permanent table storage space used by the role.
tempspace	Bigint	Size of the temporary table storage space used by the role.
password expired	Smallint	Expiration status of its password. ● **0**: not expired. ● **1**: expired.
passwordlifetime	Smallint	Password validity period, in days. When left unset, it defaults to **0**, meaning that the password remains valid permanently.

7.2.11 Connection and Authentication

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.11.1 PG_AUTHID

PG_AUTHID stores information about database authentication identifiers (roles). The concept of "users" is encompassed within the "roles" framework, where a user is essentially a role with the **rolcanlogin** attribute set. Any role, whether its **rolcanlogin** is set or not, can include other roles as members.

There is only one PG_AUTHID within a cluster, not one per database. This system catalog is accessible only to users with the SYSADMIN permission.

Table 7-44 PG_AUTHID columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
rolname	Name	Role name.
rolsuper	Boolean	Specifies whether the role is the initial system administrator with the highest permission. • **t** (true): yes. • **f** (false): no.
rolinherit	Boolean	Specifies whether the role automatically inherits permissions from its owning role. • **t** (true): yes. • **f** (false): no.
rolcreaterole	Boolean	Specifies whether the role can create additional roles. • **t** (true): yes. • **f** (false): no.
rolcreatedb	Boolean	Specifies whether the role can create databases. • **t** (true): yes. • **f** (false): no.
rolcatupdate	Boolean	Specifies whether the role can directly update system catalogs. Only the initial system administrator (**usesysid=10**) has this permission; other roles cannot acquire this permission. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolcanlogin	Boolean	Specifies whether the role can log in, that is, whether it can be assigned a session authorization identifier. • **t** (true): yes. • **f** (false): no.
rolreplication	Boolean	Specifies whether the role has the replication permission. • **t** (true): yes. • **f** (false): no.
rolauditadmin	Boolean	Specifies whether the role has the AUDITADMIN permission. • **t** (true): yes. • **f** (false): no.
rolsystemadmin	Boolean	Specifies whether the role has the SYSADMIN permission. • **t** (true): yes. • **f** (false): no.
rolconnlimit	Integer	Maximum number of concurrent connections that the role can establish (if the role can log in). A value of **-1** indicates no limit.
rolpassword	Text	Password ciphertext (**NULL** if no password is set).
rolvalidbegin	Timestamp with time zone	Start time of the account validity period (**NULL** if no start time is defined).
rolvaliduntil	Timestamp with time zone	End time of the account validity period (**NULL** if no end time is defined).
rolrespool	Name	Resource pool available to the user.
roluseft	Boolean	Specifies whether the role can manipulate foreign tables. • **t** (true): yes. • **f** (false): no.
rolparentid	OID	OID of the group to which the user belongs.
roltabspace	Text	Maximum space allowed for the user's data tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolkind	"Char"	Special user type. • **n**: common user. • **p**: permanent user.
rolnodegroup	OID	OID of the node group associated with a role. If no node group is associated, the value is **0**.
roltempspace	Text	Maximum space allowed for the user's temporary tables, in KB.
rolspillspace	Text	Maximum spill space allowed for job execution by the user, in KB.
rolexcpdata	Text	Query rules that can be configured by the user. (This column remains unused currently.)
rolmonitoradmin	Boolean	Specifies whether the role has the MONADMIN permission. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	Boolean	Specifies whether the role has the OPRADMIN permission. • **t** (true): yes. • **f** (false): no.
rolpolicyadmin	Boolean	Specifies whether the role has the POLADMIN permission. • **t** (true): yes. • **f** (false): no.

7.2.11.2 PG_AUTH_HISTORY

PG_AUTH_HISTORY records the authentication history of roles. This system catalog is accessible only to users with the SYSADMIN permission.

Table 7-45 PG_AUTH_HISTORY columns

Name	Type	Description
oid	OID	Row identifier (implicit attribute, which must be explicitly selected).
roloid	OID	Role ID.
passwordtime	Timestamp with time zone	Time of password creation or modification.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolpassword	Text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter **password_encryption_type**.

7.2.11.3 PG_AUTH_MEMBERS

PG_AUTH_MEMBERS stores and displays membership between roles.

Table 7-46 PG_AUTH_MEMBERS columns

Name	Type	Description
roleid	OID	ID of the parent role that owns a member.
member	OID	Role ID of the member included in the given parent role.
grantor	OID	ID of the role that grants this membership.
admin_option	Boolean	Specifies whether the member can grant the parent role to others.

7.2.12 Dynamic Data Masking

7.2.12.1 GS_MASKING_POLICY

GS_MASKING_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the SYSADMIN or POLADMIN can access this system catalog.

Table 7-47 GS_MASKING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description, which is represented by the COMMENTS keyword.
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
polenabled	boolean	Specifies whether to enable a policy. • **t** (true): enabled. • **f** (false): disabled

7.2.12.2 GS_MASKING_POLICY_ACTIONS

GS_MASKING_POLICY_ACTIONS records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the SYSADMIN or POLADMIN can access this system catalog.

Table 7-48 GS_MASKING_POLICY_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information specified in a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

7.2.12.3 GS_MASKING_POLICY_FILTERS

GS_MASKING_POLICY_FILTERS records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the SYSADMIN or POLADMIN can access this system catalog.

Table 7-49 GS_MASKING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
filtertype	name	Filter type. Currently, the value is **logical_expr**.
filterlabelname	name	Filter range. Currently, the value is **logical_expr**.
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified
logicaloperator	text	Polish notation of a filter criterion

7.2.13 DATABASE LINK

7.2.13.1 GS_DATABASE_LINK

GS_DATABASE_LINK stores database link information, mainly recording detailed information about database links. Only SYSADMIN can read this system catalog.

Table 7-50 GS_DATABASE_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
dlowner	oid	ID of the owner of the current database link. If the owner is **public**, the value is **0**.
dlfdw	oid	OID of the foreign data wrapper of the current database link.
dlcreater	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.14 Materialized Views

7.2.14.1 GS_MATVIEW

GS_MATVIEW provides information about each materialized view in the database.

Table 7-51 GS_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
mapid	oid	OID of a map table joined with a materialized view. Each map table corresponds to one materialized view. If a complete-refresh materialized view does not correspond to a map table, the value of this column is **0**.
ivm	boolean	Type of a materialized view. The value **t** indicates a fast-refresh materialized view, and the value **f** indicates a complete-refresh materialized view.
needrefresh	boolean	Reserved column.
refreshtime	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for fast-refresh materialized views on DNs. In other cases, the value is null.

7.2.14.2 GS_MATVIEW_DEPENDENCY

GS_MATVIEW_DEPENDENCY provides association information about each fast-refresh materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the complete-refresh materialized view. Therefore, no record is written into the Mlog table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-52 GS_MATVIEW_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

7.2.15 Logical Decoding

In the logical decoding independent multi-version dictionary, the logical decoding dictionary catalog used is the system catalog. Logical decoding system catalogs are instance-level system catalogs. Only administrators can view and modify system catalogs.

7.2.15.1 GS_LOGICAL_ATTRDEF

GS_LOGICAL_ATTRDEF records the default values of storage columns required for logical decoding.

Table 7-53 GS_LOGICAL_ATTRDEF columns

Column	Type	Description
adid	oid	Identifier of an attribute descriptor.
adrelid	oid	OID of the table.
adnum	smallint	Attribute number.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
dbnode	oid	Database OID.
adbin	pg_node_tree	Expression of the default value.
adgencol	"char"	Specifies whether a column is a GENERATED column.

7.2.15.2 GS_LOGICAL_ATTRIBUTE

GS_LOGICAL_ATTRIBUTE records information about catalog columns required for logical decoding.

Table 7-54 GS_LOGICAL_ATTRIBUTE columns

Column	Type	Description
attrelid	oid	RELATION OID that contains the attribute.
attname	name	Attribute name.
atttypid	oid	OID of the data type of the attribute.
attlen	smallint	Attribute length.
attnum	smallint	Attribute ID, which uniquely identifies an attribute in a relationship.
atthasdef	boolean	Specifies whether an attribute has a default value.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.
attndims	integer	If the value is of the array type, the value is the declared dimension number. Otherwise, the value is zero.
attcacheoff	integer	Used for the byte offset of the function cache attribute in the heap tuple.
attbyval	boolean	Specifies whether an attribute is passed by value.
attstorage	"char"	Attribute storage mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
attalign	"char"	Alignment mode of an attribute.
attisdropped	boolean	Specifies whether the data is deleted (logically invisible).
attinitdefval	bytea	Default value expression of a storage attribute.
attcollation	oid	Copy of **attcollation** in **PG_ATTRIBUTE** of this column's type.
atttypmod	integer	Copy of **atttypmod** in **PG_ATTRIBUTE** of this column's type.

7.2.15.3 GS_LOGICAL_AUTHID

GS_LOGICAL_AUTHID records user information required for logical decoding.

Table 7-55 GS_LOGICAL_AUTHID columns

Column	Type	Description
rolid	oid	User ID.
rolname	name	Username.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
rolkind	"char"	User type.
pdbid	oid	Tenant ID.

7.2.15.4 GS_LOGICAL_CLASS

GS_LOGICAL_CLASS records information about database objects required for logical decoding and the relationships between the database objects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-56 GS_LOGICAL_CLASS columns

Column	Type	Description
relname	name	Table name.
relnamespace	oid	Namespace OID.
relpersistence	"char"	Catalog durability (for example, **p** indicates a permanent table).
relkind	"char"	Table type (for example, **r** indicates a relationship).
relnatts	smallint	Number of columns in the table.
relhaspkey	bool	Specifies whether the table has (or has ever had) a primary key index.
relcmprs	tinyint	Compression attribute of a row in a table.
relreplident	"char"	Replica identity replication mode.
spacenode	oid	Tablespace OID.
dbnode	oid	Database OID.
relnode	oid	Identifier of the physical storage file corresponding to the table.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
originid	integer	Source identifier of a tuple.
relid	oid	Relationship identifier (table OID).
relowner	oid	Identifier of the table owner.
reltoastrelid	oid	OID of the TOAST table (if any).
relhasoids	boolean	Specifies whether the table has an object identifier (OID) column.
relam	oid	Identifier of the indexing method used by the table.
reloptions	text[]	Additional options for saving the table, stored in text format.
relbucket	oid	Identifier of the hash partitioning bucket to which the table belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
parttype	"char"	Specifies whether the table is a partitioned table. **'p'** indicates that it is a partitioned table, while **'n'** indicates that it is not.

7.2.15.5 GS_LOGICAL_CONSTRAINT

GS_LOGICAL_CONSTRAINT records CHECK, PRIMARY KEY, and UNIQUE constraints on tables required for logical decoding.

Table 7-57 GS_LOGICAL_CONSTRAINT columns

Name	Type	Description
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of a namespace that contains the constraint.
contype	"char"	• **c**: CHECK constraint. • **p**: PRIMARY KEY constraint. • **u**: UNIQUE constraint. • **t**: trigger constraint. • **x**: mutual exclusion constraint. • **f**: FOREIGN KEY constraint. • **s**: clustering constraint. • **i**: invalid constraint.
condeferrable	boolean	Specifies whether the constraint is deferrable. • **true**: yes. • **false**: no.
condeferred	boolean	Specifies whether the constraint can be deferrable by default. • **true**: yes. • **false**: no.
convalidated	boolean	Specifies whether the constraint is valid. Currently, it can be set to **false** only for FOREIGN KEY and CHECK constraints. • **true**: valid. • **false**: invalid.
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint).
conindid	oid	ID of an index joined with the constraint.
confrelid	oid	Referenced table if this is a FOREIGN KEY constraint. Otherwise, the value is **0**.
confupdtype	"char"	Foreign key update action code. ● **a**: no action. ● **r**: restriction. ● **c**: cascading. ● **n**: The parameter is set to **null**. ● **d**: The default value is used.
confdeltype	"char"	Foreign key deletion action code. ● **a**: no action. ● **r**: restriction. ● **c**: cascading. ● **n**: The parameter is set to **null**. ● **d**: The default value is used.
confmatchtype	"char"	Foreign key match type. ● **f**: full match. ● **p**: partial match. ● **u**: unspecified (The **NULL** value can be matched if **f** is specified.)
conislocal	boolean	Specifies whether the constraint is defined locally for the relationship. ● **true**: yes ● **false**: no.
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.
connoinherit	boolean	Specifies whether the constraint can be inherited. ● **true**: yes. ● **false**: no.
consoft	boolean	Specifies whether the column indicates an informational constraint. ● **true**: yes ● **false**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conopt	boolean	Specifies whether you can use the informational constraint to optimize the execution plan. • **true**: yes. • **false**: no.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.
constroid	oid	Row identifier.
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
consrc	text	Readable representation of the expression if this column is a CHECK constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

7.2.15.6 GS_LOGICAL_DATABASE

GS_LOGICAL_DATABASE records information about available databases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-58 GS_LOGICAL_DATABASE columns

Column	Type	Description
datname	name	Database name.
datid	oid	Database OID.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding of the database.
datcollate	name	Character type used by the database.
datctype	name	Sequence used by the database.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode. Currently, five compatibility modes are supported: ORA, MYSQL, TD, M, and PG, indicating compatibility with Oracle Database, MySQL, Teradata, M-compatible databases, and PostgreSQL, respectively.
dattimezone	name	Time zone of the database. The default is PRC.

7.2.15.7 GS_LOGICAL_DICTIONARY

GS_LOGICAL_DICTIONARY records logical decoding data dictionary information.

Table 7-59 GS_LOGICAL_DICTIONARY columns

Column	Type	Description
status	integer	Specifies whether the logical decoding data dictionary is valid.
restart_lsn	bigint	Reserved column.
restart_lsn_time	timestamp with time zone	Baseline completion time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
dictionary_csn_min	bigint	Minimum version number in use.
last_clean_time	timestamp with time zone	Time when the data dictionary table is cleared for the last time.
last_clean_result	boolean	Result of the last cleanup of the data dictionary table.
originid	integer	Source identifier of a tuple.
last_flush_csn	bigint	CSN of the last metadata information modification.
pdbid	oid	ID of the tenant corresponding to the record.

7.2.15.8 GS_LOGICAL_INDEX

GS_LOGICAL_INDEX stores some index information, and GS_LOGICAL_CLASS stores other information.

Table 7-60 GS_LOGICAL_INDEX columns

Column	Type	Description
indexrelid	Oid	OID of the index.
indrelid	Oid	Referenced RELATION OID.
indnatts	smallint	Total number of columns in an index.
indisunique	boolean	Specifies whether the index is a unique index.
indisprimary	boolean	Specifies whether the index is a primary key.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
indimmediate	boolean	Specifies whether to execute the UNIQUE constraint immediately.
indisvalid	boolean	Specifies whether the index can be used for query.
indisready	boolean	Specifies whether this index is ready to accept inserts.
indisusable	boolean	Specifies whether this index can be used for insertion and selection.
indkey	int2vector	Index column number.
indcollation	oidvector	Sorting identifier.
indpred	pg_node_tree	Expression tree of the predicate if it is a partial index; otherwise, the value is **NULL**.
indisreplident	boolean	Specifies whether an index is identified as a replication identifier index.

7.2.15.9 GS_LOGICAL_NAMESPACE

GS_LOGICAL_NAMESPACE records namespace information.

Table 7-61 GS_LOGICAL_NAMESPACE columns

Column	Type	Description
nspid	oid	Namespace OID.
nspname	name	Namespace name.
nspowner	oid	OID of the namespace owner.
nsptimeline	bigint	Timeline identifier of the namespace.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.15.10 GS_LOGICAL_PARTITION

GS_LOGICAL_PARTITION records partitioned table information.

Table 7-62 GS_LOGICAL_PARTITION columns

Column	Type	Description
partitionid	Oid	Partitioned table OID.
relname	name	Name of a partitioned table.
parttype	char	Partitioning type.
parentid	oid	OID of a parent table.
relfilenode	oid	Partitioned table relfilenode.
reltoastrelid	oid	OID of a TOAST table.
reltoastidxid	oid	OID of the TOAST index.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
reltablespace	oid	Tablespace OID.
dbnode	oid	Database OID.

7.2.15.11 GS_LOGICAL_TYPE

GS_LOGICAL_TYPE stores information about data types.

Table 7-63 GS_LOGICAL_TYPE columns

Column	Type	Description
typname	name	Type name.
typnamespace	oid	OID of the namespace that contains this type.
typlen	smallint	Number of bytes used by a value of this type.
typbyval	boolean	Specifies whether the value of this type is passed by value or by reference.
typtype	"char"	Row type of the catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
typisdefined	boolean	Specifies whether a type is completely defined.
typreceive	regproc	Receiving function in binary format.
typsend	regproc	Sending function.
typmodin	regproc	Input function for optional type modifiers.
typmodout	regproc	Output function.
typid	oid	Type OID.
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
typstorage	"char"	Data storage mode of a specified column. The options are as follows: ● **p**: plain storage. Numbers are always stored in a simple way. ● **e**: external storage. Data is stored outside the main table (for example, in the TOAST table). The main table stores references to data form external storage. ● **m**: main storage. Data can be stored compressed inline, which is similar to plain storage. This method is usually used to store types that require customized storage, for example, customized composite types. ● **x**: extended storage. Values may be compressed and/or moved into a level-2 relational table. **x** is usually the storage mode of the TOAST type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
typelem	oid	If **typelem** is not zero, it represents another row in the **gs_logical_type** table that defines the type (such as array) obtained by index. If **typsubscript** is zero, **typelem** should be zero. If the handler does not need **typelem** to determine the index type, **typelem** can also be zero when **typsubscript** is not zero. Note that **typelem** dependencies represent physical limitations on element types in this type; therefore, using DDL to modify a type may be restricted by the existence of this type.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the GS_LOGICAL_CLASS entry that defines the corresponding table. For a composite type, the type of GS_LOGICAL_CLASS is not a table. For non-composite types, the value in this column is **0**.

7.2.15.12 GS_SQLAPPLY_SKIP

GS_SQLAPPLY_SKIP records rules that can be skipped during logical replay. This catalog is reserved in the current version.

Table 7-64 GS_SQLAPPLY_SKIP columns

Column	Type	Description
createtime	timestamp with time zone	Creation timestamp.
originid	integer	Replication source ID.
skiptype	integer	SKIP types: ● **1**: SKIP OBJ ● **2**: SKIP TXN ● **3**: SKIP ERR
dumpcontext	"char"	Dumps transactions to a file. ● **'a'**: The entire transaction is dumped. ● **'n'**: no dumping. ● **'s'**: Only changes skipped by the transaction are dumped.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
param1	text	For details, see the description in **Table 7-65** and **Table 7-66**.
param2	text	For details, see the description in **Table 7-65** and **Table 7-66**.
param3	text	For details, see **Table 7-65**.
param4	text	For details, see **Table 7-65**.
param5	text	Reserved column.

Table 7-65 Columns of param1–4 in SKIP OBJ or SKIP ERR

Column	Type	Description
db_name	text	Database name.
schema_name	text	Schema name.
object_name	text	Object name.
stmt_type	text	SQL statement type.

Table 7-66 Columns of param1–2 in SKIP TXN

Column	Type	Description
csn	text	Transaction SN.
xid	text	Transaction ID.

7.2.15.13 GS_TXN_LSN_TIME

GS_TXN_LSN_TIME records the mapping between logical decoding commit sequence numbers, log sequence numbers, and timestamps. In a distributed environment, it contains data only on DNs.

Table 7-67 GS_TXN_LSN_TIME columns

Column	Type	Description
create_csn	bigint	Commit sequence number.
create_lsn	bigint	Log sequence number.
snp_xmin	bigint	Minimum snapshot ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
create_time	timestamp with time zone	Timestamp when a tuple is inserted.
snp_snapshot	text	Serialized snapshot text.
barrier	text	Barrier information.

NOTE

- **create_lsn** is stored as a number in the system catalog. An LSN can be converted to the common LSN format (for reference only), that is, *XXXXXXXX*/*XXXXXXXX*, using the SQL syntax. The conversion syntax is as follows:

```
SELECT CONCAT(to_hex(({lsn_num}::bigint >> 32) & x'ffffffff'::bigint), '/', to_hex(({lsn_num}::bigint << 32 >> 32) & x'ffffffff'::bigint));
```

  When using the preceding SQL statement, convert **lsn_num** to the required number. The following uses **607906688** as an example:

```
gaussdb=# SELECT CONCAT(to_hex((607906688::bigint >> 32) & x'ffffffff'::bigint), '/',
to_hex((607906688::bigint << 32 >> 32) & x'ffffffff'::bigint));
concat
------------
0/243beb80
(1 row)
```

- An M-compatible database needs to use the following conversion statement:

```
SELECT CONCAT(hex(({lsn_num} >> 32) & 4294967295), '/', hex((({lsn_num}<< 32) >> 32) & 4294967295));
```

  When using the preceding SQL statement, convert **lsn_num** to the required number. The following uses **607906688** as an example:

```
gaussdb_m=# SELECT CONCAT(hex((607906688 >> 32) & 4294967295), '/', hex(((607906688 << 32) >> 32) & 4294967295));
  concat
------------
 0/243BEB80
(1 row)
```

7.2.15.14 GS_LOGICAL_SET

GS_LOGICAL_SET records metadata defined by the SET data type.

Table 7-68 GS_LOGICAL_SET columns

Column	Type	Description
setid	oid	Row identifier.
settypid	oid	OID of the SET data type.
setnum	tinyint	Number of members of the SET data type. A maximum of 64 members are supported.
setsortorder	tinyint	Sorting order of members when the SET data type is defined. The value starts from 0.
setlabel	text	Member name of the SET data type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
numbers	integer	Number of members of the M-compatible SET and ENUM data types. This column is used only in M-compatible databases.
sortorder	integer	Sorting order of members when the M-compatible SET and ENUM data types are defined. This column is used only in M-compatible databases.

7.2.15.15 GS_LOGICAL_ENUM

GS_LOGICAL_ENUM contains entries showing the values and labels for each enumerated type.

Table 7-69 GS_LOGICAL_ENUM columns

Column	Type	Description
enumid	oid	Row identifier.
enumtypid	oid	OID of the **PG_TYPE** entry owning this enumerated value.
enumlabel	name	Textual label for this enumerated value.
enumsortorder	real	Sort position of this enumerated value within its enumerated type.
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.15.16 GS_SQLAPPLY_HISTORY

GS_SQLAPPLY_HISTORY records the decoding position of the start or end time of logical replay.

Table 7-70 GS_SQLAPPLY_HISTORY columns

Column	Parameter Type	Description
occurtime	timestamp with time zone	Start or end time of logical replay.
originid	integer	Decoding metadata ID of logical replay.
opkind	char	Start (**'b'**) or end (**'e'**) information of logical replay.
l_xid	bigint	Start or end transaction ID of logical replay in the local cluster.
l_lsn	bigint	Start or end log position of logical replay in the local cluster.
l_csn	bigint	Start or end transaction commit sequence of logical replay in the local cluster.
r_restartlsn	bigint	Start or end log stream position of logical decoding in the remote cluster.
r_confirmlsn	bigint	Earliest or latest commit log position of the transaction returned by logical decoding in the remote cluster.
r_confirmcsn	bigint	Earliest or latest commit sequence of the transaction returned by logical decoding in the remote cluster.
uuid	text	ID of the logical standby cluster.

7.2.16 DSL Rule Engine

7.2.16.1 GS_DSL_REWRITERULE

GS_DSL_REWRITERULE records DSL rule information. Only the initial user can modify this table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-71 GS_DSL_REWRITERULE columns

Name	Type	Description
rulename	name	Rule name, which is globally unique and is set when the rule is added. The name must start with a letter and can have up to 64 bytes, containing a mix of letters, digits, underscores (_), and hyphens (-). Chinese characters and other special characters are not allowed.
ruledesc	name	Brief description of the rule function. The value can contain a maximum of 64 bytes.
enabled	boolean	Specifies whether to enable this rule.
externalrule	boolean	The external rule is set to **TRUE**, and the built-in rule is set to **FALSE**.
costbased	boolean	Specifies whether to enable the rule based on the cost. This function is not supported currently.
priority	integer	Specifies the priority. The value is globally unique and ranges from 1 to 9999. A larger value indicates a lower priority.
dbcompatibility	tinyint	This column uses bit mapping to store the database compatibility mode of the rule. The bit is converted to a decimal number as follows: ● **01**: The database is ORA-compatible. ● **02**: The database is MySQL-compatible. ● **04**: The database is TD-compatible. ● **08**: The database is PG-compatible. ● **16**: The database is M-compatible. ● **31**: indicates that the database is compatible with all databases.
planmode	tinyint	Plan type supported by the rule. The options are **STREAM**, **REMOTEQUERY**, and **ANY**, with **ANY** being the default value. This column uses bit mapping to store the plan types supported by the rule. The bit IDs are as follows: ● **01**: The STREAM plan is supported. ● **02**: The REMOTEQUERY plan is supported. ● **03**: All plans are supported.
createtime	timestamp with time zone	Time when a rule is created for the first time, which is automatically generated by the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lastupdatetime	timestamp with time zone	Time when the rule content is updated for the last time, which is automatically generated by the system.
rulehash	text	Hash value of the rule text, which is used to check the uniqueness of the text content.
ruletext	text	Rule text, which is used to store the definition of an external DSL rule. For a built-in DSL rule, this column is left blank.
conflictrule	text	Conflict rule. If a conflict rule that has been applied is detected, the rule is skipped. For example, if the value is **(rulea,ruleb,rulec)**, the rule is skipped when **rulea**, **ruleb**, or **rulec** has been rewritten.
rulegroup	name	Rule group, which is globally unique and is specified by the user when the rule is added. The name must start with a letter and can have up to 64 bytes, containing a mix of letters, digits, underscores (_), and hyphens (-). Chinese characters and other special characters are not allowed. This column is used only for built-in rules and is unavailable for external rules.
updateversion	integer	Version number of the updated rule. The system determines whether the rule takes effect based on the version number.

7.2.17 HTAP

7.2.17.1 GS_IMCV

GS_IMCV provides metadata about all IMCV catalogs.

Table 7-72 GS_IMCV columns

Name	Type	Description
reloid	oid	Table ID.
relname	name	Table name.
dbname	name	Database name.
username	name	Owner of the IMCV table.
parentoid	oid	Parent table ID. Specifies a parent table ID for a partition. **0** is displayed for non-partitions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
imcvispart	boolean	Specifies whether the table is a partitioned table.
imcvnattr	smallint	Number of columns to be loaded.
imcvkey	int2vector	Number of loaded columns.
priority	smallint	Loading priority. ● **'1'**: PRIORITY_NONE (no priority). ● **'2'**: PRIORITY_LOW (low priority). ● **'3'**: PRIORITY_HIGH (high priority).
childoids	oidvector_extend	If the table is a partitioned table, IDs of its subpartitions are recorded. Otherwise, it is empty.
dboid	oid	Database ID.
rootoid	oid	For an ordinary table, the value is the ID of the table. For a partitioned table, the value is the ID of the base table of the partitioned table.
schemaname	name	Schema name.

7.2.18 Other System Catalogs

7.2.18.1 GS_ASP

GS_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

Table 7-73 GS_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. ● **t** (true): yes ● **f** (false): no
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Start time of a session.
event	text	Event name. For details about key events in the kernel, see **Table 7-470**, **Table 7-471**, **Table 7-472**, and **Table 7-473**. For details about the impact of each transaction lock on services, see **LOCK**.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Parallel thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	ID of the unique SQL statement.
unique_query_id	bigint	ID of the normalized SQL statement.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	CN from which the unique SQL statement comes. **cn_id** is in the key of the unique query.
unique_query	text	Standardized unique SQL text string.
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lockmode	text	Mode of a lock that the session waits for. • **LW_EXCLUSIVE**: exclusive lock. • **LW_SHARED**: shared lock. • **LW_WAIT_UNTIL_FREE**: waits for **LW_EXCLUSIVE** to be available.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID. The structure is *nodeid*:*sessionid*#*seqid*. • *nodeid*: ID of the delivery node. • *sessionid*: session ID of the delivery node. • *seqid*: sequence number in ascending order. The ID is **0** on the delivery node. The *nodeid* and *sessionid* values of this column are the same for sessions delivered to other nodes in the same session.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Current statement state. The options are as follows: • **active**: The background is executing a query. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	ID of the current transaction.
top_xid	xid	ID of the top-level transaction that is being executed.
instance_name	text	CN or DN to which the record belongs.
parent_unique_sql_id	bigint	Calls the **sql_id** of the parent statement of the current statement.
control_status	text	The value is **under_cpu_throttle** when CPU resources for abnormal SQL statements are controlled. Otherwise, the value is **normal**.
top_unique_query_id	bigint	This column displays the **unique_query_id** of the top-level SQL statement of the stored procedure.
top_unique_query	text	This column displays the **unique_query** of the top-level SQL statement of the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_hash	bigint	Hash value of the current SQL statement, which is **0**.
plan_hash	bigint	Hash value of the execution plan of the current SQL statement, which is **0**.

7.2.18.2 GS_COPY_ERROR_OLD

GS_COPY_ERROR_OLD captures error rows related to the COPY FROM procedure for future reference.

This system catalog is used only for compatibility with earlier versions. That is, it may contain data in the database upgraded from an earlier version. In this version, this system catalog is invalid, and the COPY statement does not record any data in it.

Table 7-74 GS_COPY_ERROR_OLD columns

Name	Type	Description
relname	character varying	Table name, in the form of *Schema name*.*Table name*.
begintime	timestamp with time zone	Time when a data format error was reported.
filename	character varying	Name of the source data file where a data format error occurs.
lineno	bigint	Number of the row where a data format error occurs in a source data file.
rawrecord	text	Raw record of a data format error in the source data file.
detail	text	Error details.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Currently, the pg_catalog.gs_copy_error_old table does not have an automatic clearing mechanism. The administrator needs to manually run the TRUNCATE statement to clear the table.
- The pg_catalog.gs_copy_error_old table does not have row-level security.

7.2.18.3 GS_COPY_SUMMARY_LOG

In a distributed deployment environment, this system catalog does not take effect, that is, no data is recorded.

Table 7-75 GS_COPY_SUMMARY_LOG columns

Name	Type	Description
relname	text	Name of the target table to be imported.
begintime	timestamp with time zone	Start time of an import task.
endtime	timestamp with time zone	End time of an import task.
id	bigint	ID of the import transaction.
pid	bigint	ID of the worker thread for the current import.
readrows	bigint	Total number of data rows read by the import task.
skiprows	bigint	Total number of data rows skipped in the import task.
loadrows	bigint	Number of data rows successfully imported in the current import task.
errorrows	bigint	Number of error data rows in the current import task.
whenrows	bigint	Number of data rows that violate the WHEN filter criterion in the current import task.
allnullrows	bigint	Number of data rows where all columns are empty.
detail	text	Summary of the import task, including the number of successfully imported rows, number of error data rows, number of rows that violate the WHEN condition, and number of blank rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
custom_id	text	Value of **copy_custom_id** in the COPY syntax, which indicates the information about the imported custom identifier.

NOTE

- Currently, the pg_catalog.gs_copy_summary_log table does not have an automatic clearing mechanism. The administrator needs to manually run the TRUNCATE statement to clear the table.
- The pg_catalog.gs_copy_summary_log table does not have row-level security.

7.2.18.4 GS_COPY_ERROR_LOG

GS_COPY_ERROR_LOG captures error rows related to the COPY FROM procedure for future reference.

- If the GUC parameter **enableSeparationOfDuty** is set to **on**, the user can be a common database user or an administrator.
- If the GUC parameter **enableSeparationOfDuty** is set to **off**, the user can be a common database user or an administrator. Common users require permissions granted by an administrator (by setting the **allow_create_sysobject** parameter to **on**.) An administrator can use it directly.

Table 7-76 GS_COPY_ERROR_LOG columns

Name	Type	Description
relname	text	Table name, in the form of *Schema name*.*Table name*.
begintime	timestamp with time zone	Time when a data format error was reported.
filename	text	Name of the source data file where a data format error occurs.
lineno	bigint	Number of the row where a data format error occurs in a source data file.
rawrecord	text	Raw record of a data format error in the source data file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
detail	text	Error details.
custom_id	text	Value of **copy_custom_id** in the COPY syntax, which indicates the information about the imported custom identifier.

NOTE

- Currently, the pg_catalog.gs_copy_error_log table does not have an automatic clearing mechanism. The administrator needs to manually run the TRUNCATE statement to clear the table.
- The pg_catalog.gs_copy_error_log table does not have row-level security.
- After scale-in, the data in the pg_catalog.gs_copy_error_log table on the removed DN will be lost. Before scale-in, check whether the data in the table is required. If the data is required, back up the data in advance.
- In separation-of-duties scenarios, error logs are not recorded in pg_catalog.pgxc_copy_error_log or pg_catalog.gs_copy_error_log. If error information needs to be recorded for the **load_user** user, execute the following statement to create the error log in the schema with the same name as the user:

  ```
  CREATE TABLE load_user.pgxc_copy_error_log (relname varchar, begintime timestamptz, filename varchar, lineno int8, rawrecord text, detail text);
  CREATE INDEX copy_error_log_relname_idx ON load_user.pgxc_copy_error_log(relname);
  ```

  (Optional) Add the **custom_id** column to the table.

  ```
  ALTER TABLE load_user.pgxc_copy_error_log ADD COLUMN custom_id varchar(64);
  ```

7.2.18.5 GS_DEP_SOURCE

GS_DEP_SOURCE records metadata and partial compilation results of objects. Only system administrators can view the information.

Table 7-77 GS_DEP_SOURCE columns

Name	Type	Reference	Description
object_oid	oid	**object_oid** in PG_OBJECT	Object identifier.
object_type	"char"	-	Object type. **v** indicates a view.
source	text	-	Defined meta information.
compile	pg_node_tree	-	Partial compilation result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

For the **source** column, the asterisk (*) in "SELECT *" in the view definition statement is expanded, and the schema used by the created view is appended. The following is an example:

```
gaussdb=# CREATE USER user01 WITH SYSADMIN PASSWORD 'xxxx';
gaussdb=# SET ROLE user01 PASSWORD 'xxxx';
-- Create table t1 under the user01 schema.
gaussdb=# CREATE TABLE t1(c1 INT, c2 INT);
-- Create view v1 under the user01 schema. The table queried by v1 is user01.t1.
gaussdb=# CREATE VIEW v1 AS SELECT * FROM t1;
-- Query the source column.
gaussdb=# SELECT source FROM gs_dep_source WHERE object_oid = xxx;
 source
--------
CREATE OR REPLACE VIEW user01.v1(c1, c2) AS SELECT t1.c1, t1.c2 FROM user01.t1;
(1 row)
```

7.2.18.6 GS_DEPENDENCIES

GS_DEPENDENCIES records object dependency information and has a one-to-many relationship with **GS_DEPENDENCIES_OBJ**.

Table 7-78 GS_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace.
packagename	name	Name of a package.
refobjpos	integer	Position of the referenced object. • **1**: type • **2**: package header • **4**: function header • **8**: function body • **16**: package body • **32**: view
refobjoid	oid	OID of the referenced object.
objectname	text	Name of the dependent object.

7.2.18.7 GS_DEPENDENCIES_OBJ

GS_DEPENDENCIES_OBJ records the detailed information about referenced objects.

Table 7-79 GS_DEPENDENCIES_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
packagename	name	Name of a package.
type	integer	Type of the referenced object. • **1**: unknown type • **2**: variable • **3**: type • **4**: function • **5**: view • **6**: function header
name	text	Name of the referenced object
objnode	pg_node_tree	Detailed information about the referenced object

7.2.18.8 GS_GLOBAL_CONFIG

GS_GLOBAL_CONFIG records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users and status of the cluster (whether it is being scaled, which is specified by **redis_bucket_expansion**). Initial database users can write, modify, and delete parameters in system catalogs by using ALTER and DROP. Only the initial user and users with the SYSADMIN or CREATEROLE permission can access this system catalog. Other users do not have such permission.

Table 7-80 GS_GLOBAL_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, name of parameter for redistribution after scale-out, or parameter required by users during cluster initialization.
value	text	Specifies the preset parameter value, weak password name, parameter for redistribution after scale-out, or parameter value required by users during cluster initialization.

NOTICE

You are advised not to write, modify, or delete the **redis_bucket_expansion** parameter. The parameter name has been used to indicate that the cluster is being scaled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.18.9 GS_JOB_ATTRIBUTE

GS_JOB_ATTRIBUTE records attributes of DBE_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

Table 7-81 GS_JOB_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

7.2.18.10 GS_JOB_ARGUMENT

GS_JOB_ARGUMENT provides the parameter attributes of DBE_SCHEDULER scheduled tasks and programs.

Table 7-82 GS_JOB_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.18.11 GS_PACKAGE

GS_PACKAGE records package information.

Table 7-83 GS_PACKAGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
pkgnamespace	oid	Schema to which a package belongs.
pkgowner	oid	Owner of a package.
pkgname	name	Name of a package.
pkgspecsrc	text	Package specification.
pkgbodydeclsrc	text	Package body.
pkgbodyinitsrc	text	Package initialization source.
pkgacl	aclitem[]	Access permission.
pkgsecdef	boolean	Specifies whether the package has the definer permission.

7.2.18.12 GS_PLAN_TRACE

GS_PLAN_TRACE is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the SYSADMIN permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

Table 7-84 GS_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this column cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the currently requested SQL statement. The value of this column cannot exceed 10 KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plan_trace	text	Details about the process of generating the query plan corresponding to the currently requested SQL statement. The value of this column cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

7.2.18.13 GS_POLICY_LABEL

GS_POLICY_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the SYSADMIN or POLADMIN can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

Table 7-85 GS_POLICY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource label type. Currently, the value is **RESOURCE**.
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view.

7.2.18.14 GS_RECYCLEBIN

GS_RECYCLEBIN describes details about objects in the recycle bin of the flashback feature.

Table 7-86 GS_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column.
rcybaseid	oid	Base table object ID, which references **gs_recyclebin.oid**.
rcydbid	oid	OID of the database to which the current object belongs.
rcyrelid	oid	OID of the current object.
rcyname	name	Name of the object in the recycle bin. The format is BIN*$unique_id$oid$*0. *unique_id* indicates the unique identifier with a maximum of 16 characters, and *oid* indicates the object identifier.
rcyoriginname	name	Original object name.
rcyoperation	char	Operation type. • **d**: drop • **t**: truncate

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rcytype	integer	Object type. ● **0**: table ● **1**: index. ● **2**: TOAST table. ● **3**: TOAST index. ● **4**: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types. ● **5**: partition. ● **6**: global index. ● **7**: materialized view. ● **8**: global secondary index.
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated.
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated.
rcycreatecsn	bigint	CSN when an object is created.
rcychangecsn	bigint	CSN when an object definition is modified.
rcynamespace	oid	OID of the namespace that contains this relationship.
rcyowner	oid	Owner of the relationship.
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or **0** if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rcybucket	oid	Bucket information in 12.2.15.42 PG_HASHBUCKET.

7.2.18.15 GS_SECURITY_LABEL

GS_SECURITY_LABEL is a shared system catalog that records information about security labels. Each record corresponds to a security label.

Table 7-87 GS_SECURITY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
label_name	name	Security label name.
label_content	text	Content of the security label.

7.2.18.16 GS_SQL_PATCH

GS_SQL_PATCH records the status information about SQL_PATCH on the current node.

Table 7-88 GS_SQL_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique ID.
owner	oid	ID of the user who creates the patch.
enable	Boolean	Specifies whether the patch takes effect.
status	"char"	Specifies whether the SQL patch is created based on the unique SQL ID (value: **'d'**) or SQL hash value (value: **'h'**).
abort	Boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the SQL outer statement for which the patch takes effect. The value of this parameter is **0** for statements outside a stored procedure. For statements inside the stored procedure, the value of this parameter is the globally unique ID of the statement that calls the stored procedure.

7.2.18.17 GS_STATISTIC_EXT_HISTORY

GS_STATISTIC_EXT_HISTORY is a multi-column historical statistics management table. It stores historical extended statistics about tables in the database, including multi-column statistics and expression statistics (supported later).

Table 7-89 GS_STATISTIC_EXT_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of the object to which a table belongs. **'c'** indicates an ordinary table, and **'p'** indicates a partitioned table.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. • **d**: The original DUJ1 algorithm is used for estimation. • **c**: The C19 algorithm is used for estimation.
staorigin	"char"	Source of the statistics collection mode. • **a**: The collection is triggered by AUTOANALYZE. • **m**: The collection is triggered by manual ANALYZE. • **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The returned value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The returned value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	"char"	Source of extended statistics: ● **'a'**: indicates that the statistics data is automatically created, which is controlled by the GUC parameter **auto_statistic_ext_columns**. ● **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	"char"	Status of extended statistics: ● **'a'**: active and available. ● **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
staextname	name	Alias of the multi-column group of multi-column statistics.

7.2.18.18 GS_STATISTIC_HISTORY

GS_STATISTIC_HISTORY is a single-column historical statistics management table that stores historical statistics about tables and index columns in a database.

Table 7-90 GS_STATISTIC_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. ● **d**: The original DUJ1 algorithm is used for estimation. ● **c**: The C19 algorithm is used for estimation. ● **u**: The algorithm that calculates the NDV cannot be obtained from the current CN. You can query the same timestamp in history tables of other CNs for the algorithm.
staorigin	"char"	Source of the statistics collection mode. ● **a**: The collection is triggered by AUTOANALYZE. ● **m**: The collection is triggered by manual ANALYZE. ● **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The returned value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The returned value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. Reserved column.

7.2.18.19 GS_SYSTEM_OBJECTS_VERSION

GS_SYSTEM_OBJECTS_VERSION records the version information of system objects. It is used to determine the changed and new system objects during the upgrade, and update the system object definitions or create system objects.

The system object types written into this system catalog include views, functions, tables, indexes, types, rules, and type casting relationships (CAST).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-91 GS_SYSTEM_OBJECTS_VERSION columns

Name	Type	Description
obj_id	oid	Identifier of a system object. For different types of system objects, the relationships are as follows: Unique identifier of a view, table, or index in **PG_CLASS**, and unique identifier of a type, function, rule, or CAST in **PG_TYPE**, **PG_PROC**, **PG_REWRITE**, or **PG_CAST**, respectively.
obj_type	char	Type of a system object. • **v**: view. • **f**: function. • **r**: ordinary table. • **i**: index. • **c**: composite type. • **d**: domain type. • **R**: rule. • **C**: type casting.
obj_version	int8	Version number of a system object. **0**: initial version number. **-1**: version number of a deleted object. Other version numbers are used for subsequent object changes.

7.2.18.20 GS_TABLESTATS_HISTORY

GS_TABLESTATS_HISTORY manages historical statistics at the table, index, and partition levels. It stores historical statistics about tables, indexes, and partitions in a database.

Table 7-92 GS_TABLESTATS_HISTORY columns

Name	Type	Description
relid	oid	Unique ID of a table, index, or partition in a 12.2.15.28 PG_CLASS or 12.2.1.1 PG_PARTITION.
relname	name	Name of a table, index, or partition.
relnamespace	oid	OID of the namespace that contains this object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relkind	"char"	Object type. • **r**: ordinary table. • **I**: table-level index. • **i**: partitioned index. • **p**: partition. • **s**: subpartition.
reltimestamp	timestamp with time zone	Time when the statistics are collected.
relpages	double precision	Size of the table on disk in pages. This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table.

7.2.18.21 GS_TS_DICT_DEFINITION

GS_TS_DICT_DEFINITION stores the contents of user-defined dictionaries, used for creating and using user-defined dictionaries. In the current version, system catalogs can be viewed only.

Table 7-93 GS_TS_DICT_DEFINITION columns

Name	Type	Description
dict_oid	oid	OID of a dictionary to which the dictionary content belongs.
definition_type	"char"	Dictionary content type.
definition	text	Dictionary content definition.

7.2.18.22 GS_TXN_SNAPSHOT

GS_TXN_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-94 GS_TXN_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

7.2.18.23 GS_UID

GS_UID records the unique identification meta information of the **hasuids** attribute table in the database.

Table 7-95 GS_UID columns

Name	Type	Description
relid	oid	OID of a table
uid_backup	bigint	Largest unique identifier that can be assigned to a table

7.2.18.24 GS_WORKLOAD_RULE

GS_WORKLOAD_RULE records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

Table 7-96 GS_WORKLOAD_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be **NULL**.
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to **false**.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, **"resource"**, and **"client"** are supported. Other values are invalid.
option_val	text[]	Parameter values of a concurrency control rule, including the SQL IDs, keyword lists, resource limitations, client IP addresses, and application names. For details, see the **gs_add_workload_rule** API description.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

NOTICE

For the client concurrency control rule, in the **option_val** column, **ApplicationName** retains and displays the original complete content entered by the user. During client concurrency control rule matching, the maximum valid length of **ApplicationName** is 64 bytes (including 63 available bytes and the terminator). If the original input length exceeds 63 bytes, the value is automatically truncated and only the first 63 bytes are used for rule matching.

7.2.18.25 PG_AGGREGATE

PG_AGGREGATE records information about aggregate functions. Each entry in PG_AGGREGATE is an extension of an entry in PG_PROC. The PG_PROC entry

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

Table 7-97 PG_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	**proname** in **PG_PROC**	**proname** of the aggregate function in **PG_PROC**.
aggtransfn	regproc	**proname** in **PG_PROC**	Transition function
aggcollectfn	regproc	**proname** in **PG_PROC**	Collect function
aggfinalfn	regproc	**proname** in **PG_PROC**	Final function (**0** if none)
aggsortop	oid	**oid** in **PG_OPERATOR**	Associated sort operator (**0** if none)
aggtranstype	oid	**oid** in **PG_TYPE**	Data type of the aggregate function's internal transition (state) data The possible values and their meanings are defined by the types in **pg_type.h**. The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: • **n**: normal aggregate • **o**: ordered set aggregate

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
aggnumdirectargs	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is **0**.
agginitfn	regproc	**proname** in PG_PROC	Initialization function.

7.2.18.26 PG_AM

PG_AM records information about index access methods. There is one row for each index access method supported by the system.

Table 7-98 PG_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amname	name	-	Name of the access method.
amstrategies	smallint	-	Number of operator strategies for the access method (**0** if the access method does not have a fixed set of operator strategies).
amsupport	smallint	-	Number of support routines for the access method.
amcanorder	boolean	-	Specifies whether the access method supports ordered scans sorted by the indexed column's value. • **t** (true): supported. • **f** (false): not supported.
amcanorderbyop	boolean	-	Specifies whether the access method supports ordered scans sorted by the result of an operator on the indexed column. • **t** (true): supported. • **f** (false): not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amcanbackward	boolean	-	Specifies whether the access method supports backward scanning. • **t** (true): supported. • **f** (false): not supported.
amcanunique	boolean	-	Specifies whether the access method supports unique indexes. • **t** (true): supported. • **f** (false): not supported.
amcanmulticol	boolean	-	Specifies whether the access method supports composite indexes. • **t** (true): supported. • **f** (false): not supported.
amoptionalkey	boolean	-	Specifies whether the access method supports scanning without any constraint for the first index column. • **t** (true): supported. • **f** (false): not supported.
amsearcharray	boolean	-	Specifies whether the access method supports **ScalarArrayOpExpr** searches. • **t** (true): supported. • **f** (false): not supported.
amsearchnulls	boolean	-	Specifies whether the access method supports **IS NULL/NOT NULL** searches. • **t** (true): supported. • **f** (false): not supported.
amstorage	boolean	-	Specifies whether the index storage data type can differ from the column data type. • **t** (true): allowed. • **f** (false): not allowed.
amclusterable	boolean	-	Specifies whether an index of this type can be clustered on. • **t** (true): allowed. • **f** (false): not allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
ampredlocks	boolean	-	Specifies whether an index of this type manages fine-grained predicate locks. • **t** (true): allowed. • **f (false)**: not allowed.
amkeytype	oid	**oid** in PG_TYPE	Type of data stored in index (**0** if it is not a fixed type).
aminsert	regproc	**proname** in PG_PROC	"Insert this tuple" function.
ambeginscan	regproc	**proname** in PG_PROC	"Prepare for index scan" function.
amgettuple	regproc	**proname** in PG_PROC	"Next valid tuple" function (**0** if none).
amgetbitmap	regproc	**proname** in PG_PROC	"Fetch all valid tuples" function (**0** if none).
amrescan	regproc	**proname** in PG_PROC	"(Re)start index scan" function.
amendscan	regproc	**proname** in PG_PROC	"Clean up after index scan" function.
ammarkpos	regproc	**proname** in PG_PROC	"Mark current scan position" function.
amrestrpos	regproc	**proname** in PG_PROC	"Restore marked scan position" function.
ammerge	regproc	**proname** in PG_PROC	"Merge multiple indexes" function.
ambuild	regproc	**proname** in PG_PROC	"Build new index" function.
ambuildempty	regproc	**proname** in PG_PROC	"Build empty index" function.
ambulkdelete	regproc	**proname** in PG_PROC	Bulk-delete function.
amvacuumcleanup	regproc	**proname** in PG_PROC	Post-VACUUM cleanup function.
amcanreturn	regproc	**proname** in PG_PROC	Function to check whether the index supports index-only scans (**0** if none).
amcostestimate	regproc	**proname** in PG_PROC	Function to estimate cost of an index scan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amoptions	regproc	**proname** in **PG_PROC**	Function to parse and validate **reloptions** for an index.

7.2.18.27 PG_AMOP

PG_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

Table 7-99 PG_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amopfamily	oid	**PG_OPFAMILY**.oid	Operator family of this entry.
amoplefttype	oid	**oid** in **PG_TYPE**	Left-hand input data type of the operator. For details about the values and their descriptions, see **Data Types**.
amoprighttype	oid	**oid** in **PG_TYPE**	Right-hand input data type of the operator. For details about the values and their descriptions, see **Data Types**.
amopstrategy	smallint	-	Number of operator strategies.
amoppurpose	"char"	-	Purpose of the operator. • **s**: search • **o**: order
amopopr	oid	**PG_OPERATOR**.oid	OID of the operator.
amopmethod	oid	**PG_AM**.oid	Operator family of the index access method.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amopsortfamily	oid	PG_OPFAMILY.oid	The B-tree operator family according to which this entry sorts for an ordering operator (**0** for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed_column operator constant**. Such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of the **ORDER BY** are specified by the **amopsortfamily** column, which must reference a btree operator family for the operator's result type.

7.2.18.28 PG_AMPROC

PG_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

Table 7-100 PG_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amprocfamily	oid	PG_OPFAMILY.oid	Operator family of this entry.
amproclefttype	oid	**oid** in PG_TYPE	Left-hand input data type of the associated operator. For details about common data types, see **Data Types**.
amprocrighttype	oid	**oid** in PG_TYPE	Right-hand input data type of the associated operator. For details about common data types, see **Data Types**.
amprocnum	smallint	-	Support procedure number.
amproc	regproc	**proname** in PG_PROC	OID of the procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

7.2.18.29 PG_ATTRDEF

PG_ATTRDEF records default values of columns.

Table 7-101 PG_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
adrelid	oid	Table to which a column belongs.
adnum	smallint	Number of columns.
adbin	pg_node_tree	Internal representation of the default value of the column.
adsrc	text	Internal representation of the readable default value.
adgencol	"char"	Specifies whether a column is a generated column. The value **'s'** indicates that the column is a generated column, and the value **'\0'** indicates that the column is an ordinary column. The default value is **'\0'**.
adbin_on_update	pg_node_tree	Internal representation of the attribute expression **on update current_timestamp** of the column.
adsrc_on_update	text	Internal representation of the readable attribute expression **on update current_timestamp**.
adbin_extend	pg_node_tree	Internal representation of a generated expression. In the scenario where a generated column references another generated column, the generated expression does not contain the generated column reference. The **adbin** column expands the referenced generated column to an equivalent form in the generated expression.

7.2.18.30 PG_ATTRIBUTE

PG_ATTRIBUTE records information about table columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-102 PG_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs.
attname	name	Column name. If this column indicates an index column, changing the column name in the original table does not update this column's information. To get the correct column name, use the pg_get_indexdef function.
atttypid	oid	Column type.
attstattarget	integer	Level of details of statistics collected for this column by ANALYZE. • The value **0** indicates that no statistics should be collected. • A negative value indicates that the system default statistic object is used. • The exact meaning of positive values is data type-dependent. For scalar data types, **attstattarget** is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	A copy of **typlen** in 12.2.15.78 PG_TYPE of this column's type.
attnum	smallint	Number of the column.
attndims	integer	Number of dimensions if the column is an array (**0** in other cases).
attcacheoff	integer	This column is always **-1** on disk. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **-1** for types that do not need ATTTYPMOD.
attbyval	boolean	A copy of **typbyval** in 12.2.15.78 PG_TYPE of this column's type.
attstorage	"char"	A copy of **typstorage** in 12.2.15.78 PG_TYPE of this column's type.
attalign	"char"	A copy of **typalign** in 12.2.15.78 PG_TYPE of this column's type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attnotnull	boolean	A NOT NULL constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	boolean	This column has a default value, in which case there will be a corresponding entry in the 12.2.15.25 PG_ATTRDEF system catalog that actually defines the value.
attisdropped	boolean	Indicates that this column has been dropped and is no longer valid. A dropped column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: • **0**: not compressed (**ATT_CMPR_NOCOMPRESS**) • **1**: DELTA compression algorithm (**ATT_CMPR_DELTA**) • **2**: dictionary compression algorithm (**ATT_CMPR_DICTIONARY**) • **3**: prefix compression algorithm (**ATT_CMPR_PREFIX**) • **4**: digital string compression algorithm (**ATT_CMPR_NUMSTR**)
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: • **n_distinct**: number of **distinct** values of a column (excluding subtables). • **n_distinct_inherited**: number of **distinct** values of a column (including subtables).
attfdwoptions	text[]	Column attribute of a foreign table. Currently, **dist_fdw**, **file_fdw**, and **log_fdw** do not use foreign table column attributes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attinitdefval	bytea	**attinitdefval** stores the default value expression. ADD COLUMN in the row-store table must use this column.
attkvtype	tinyint	Key value type for a column. Value: **0**: default value (**ATT_KV_UNDEFINED**). **1**: dimension (**ATT_KV_TAG**). **2**: indicator (**ATT_KV_FIELD**). **3**: time column (**ATT_KV_TIMETAG**). **4**: hidden distribution key (**ATT_KV_HIDETAG**).
attidentity	"char"	Identity type of a column. Value: **'0'** or **'\0'**: The column is a non-IDENTITY column. **'a'**: The **IDENTITY** column attribute is of the **ALWAYS** type. **'d'**: The **IDENTITY** column attribute is of the **BY DEFAULT** type. **'n'**: The **IDENTITY** column attribute is of the **BY DEFAULT ON NULL** type.

7.2.18.31 PG_CAST

PG_CAST records the conversion relationship between data types.

Table 7-103 PG_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
castsource	oid	OID of the source data type.
casttarget	oid	OID of the target data type.
castfunc	oid	OID of the conversion function. The value **0** indicates that no conversion function is required.
castcontext	"char"	Conversion mode between the source and target data types. ● **'e'**: Only explicit conversion can be performed (using the CAST or :: syntax). ● **'i'**: Implicit conversion can be performed. ● **'a'**: Both implicit and explicit conversion can be performed when values are assigned to target columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
castmethod	"char"	Conversion method. • **'f'**: Conversion is performed using the specified function in the **castfunc** column. • **'b'**: Binary forcible conversion rather than the specified function in the **castfunc** column is performed between data types.

7.2.18.32 PG_CLASS

PG_CLASS records database objects and their relationship.

Table 7-104 PG_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have PG_TYPE records.
reloftype	oid	OID of the composite type (**0** for other types).
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.
relfilenode	oid	Name of the on-disk file of this relationship (**0** if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size **BLCKSZ**). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by VACUUM, ANALYZE, and a few DDL statements such as CREATE INDEX.
reltoastrelid	oid	OID of the TOAST table associated with the table (**0** if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table (**0** for a table other than a TOAST table)
reldeltarelid	oid	Not supported currently.
reldeltaidx	oid	Not supported currently.
relcudescrelid	oid	Not supported currently.
relcudescidx	oid	Not supported currently.
relhasindex	boolean	Its value is **true** if it is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM thread detects that a table has no index, it clears the **relhasindex** field and sets the value to **false**.
relisshared	boolean	Its value is **true** if the table is shared across all databases in the entire cluster. Otherwise, the value is **false**. Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	• **p**: permanent table • **u**: non-log table • **t**: temporary table • **g**: global temporary table
relkind	"char"	• **r**: ordinary table. • **i**: index. • **G**: global secondary index. • **s**: sequence. • **v**: view. • **c**: composite type. • **t**: TOAST table. • **f**: foreign table. • **m**: materialized view. • **e**: STREAM object. • **o**: CONTVIEW object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relnatts	smallint	Number of user columns in the relationship (excluding system columns). 12.2.15.26 PG_ATTRIBUTE has the same number of rows as the user columns.
relchecks	smallint	Number of CHECK constraints in the table. For details, see the system catalog 12.2.15.30 PG_CONSTRAINT.
relhasoids	boolean	Its value is **true** if an OID is generated for each row of the relationship. Otherwise, the value is **false**.
relhaspkey	boolean	Its value is **true** if the table has (or once had) a primary key. Otherwise, the value is **false**.
relhasrules	boolean	Its value is **true** if the table has rules. For details, see the system catalog 12.2.15.63 PG_REWRITE.
relhastriggers	boolean	The value is **true** if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog 12.2.15.72 PG_TRIGGER.
relhassubclass	boolean	Its value is **true** if the table has (or once had) any inheritance child table. Otherwise, the value is **false**.
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. • **0**: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified). • **1**: The compression feature of the table data is NOCOMPRESS or has no specified keyword. • **2**: The compression feature of the table data is COMPRESS.
relhasclusterkey	boolean	Not supported currently.
relrowmovement	boolean	Specifies whether row movement is allowed when the partitioned table is updated. • **true**: Row movement is allowed. • **false**: Row movement is not allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. • **p**: The table or index has the property of a partitioned table. • **n**: The table or index does not have the property of a partitioned table. • **s**: The table is a subpartitioned table.
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. To ensure compatibility with earlier versions, this column is reserved. The **relfrozenxid64** column is added to record the information.
relacl	aclitem[]	Access permissions. For details about the ACLItem type, see **ACLItem Type**. The command output of the query is as follows: *user1*=*privs*/*user2* indicates that the permission granted by user 2 to user 1 is **privs**. =*privs*/*user3* indicates that the permission granted to the **public** role by user 3 is **privs**. In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and **privs** indicates the permissions supported by the database. For details on permission descriptions, see **Table 7-105**.
reloptions	text[]	Method of accessing objects such as tables, indexes, and views, represented as a string in the "keyword=value" format.
relreplident	"char"	Identifier of a decoding column in logical decoding. • **d**: default (primary key, if any). • **n**: none. • **f**: all columns. • **i**: The indisreplident of the index is specified or the default index is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. For a global temporary table, this column is meaningless. You can use the pg_catalog.gs_global_list_gtt_relfrozenxids function to view **relfrozenxid64** of the global temporary table of each session.
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the PG_HASHBUCKET catalog. **NULL** indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition key information. **NULL** indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is **0** (**InvalidTransactionId**) if the relationship is not a table.

Table 7-105 Description of permissions

Parameter	Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

7.2.18.33 PG_COLLATION

PG_COLLATION describes available collations, which are essentially mappings from an SQL name to OS locale categories.

Table 7-106 PG_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
collname	name	-	Collation name (unique per namespace and encoding).
collnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains this collation.
collowner	oid	**oid** in PG_AUTHID	Owner of the collation.
collencoding	integer	-	Encoding in which the collation is applicable, or **–1** if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	**LC_COLLATE** for this collation object.
collctype	name	-	**LC_CTYPE** for this collation object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
collpadattr	text	-	Collation padding attribute. • **NULL**: not applicable. • **NO PAD**: no padding. • **PAD SPACE**: blank spaces padded at the end.
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.
id	integer	-	Not supported in the current version.

7.2.18.34 PG_CONSTRAINT

PG_CONSTRAINT records CHECK, PRIMARY KEY, UNIQUE, and FOREIGN KEY constraints on tables.

Table 7-107 PG_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.
contype	"char"	• **c**: CHECK constraint. • **p**: PRIMARY KEY constraint. • **u**: UNIQUE constraint. • **t**: trigger constraint. • **x**: mutual exclusion constraint. • **f**: FOREIGN KEY constraint. • **s**: clustering constraint. • **i**: invalid constraint.
condeferrable	Boolean	Specifies whether the constraint is deferrable. • **true**: yes. • **false**: no.
condeferred	Boolean	Specifies whether the constraint can be deferrable by default. • **true**: yes. • **false**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
convalidated	Boolean	Specifies whether the constraint is valid. Currently, it can be set to **false** only for FOREIGN KEY and CHECK constraints. • **true**: valid • **false**: invalid.
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint).
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is **0**.
confupdtype	"char"	Foreign key update action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.
confdeltype	"char"	Foreign key deletion action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.
confmatchtype	"char"	Foreign key match type. • **f**: full match. • **p**: partial match. • **u**: unspecified (The NULL value can be matched if **f** is specified.)
conislocal	Boolean	Specifies whether the constraint is defined locally for the relationship. • **true**: yes. • **false**: no.
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
connoinherit	Boolean	Specifies whether the constraint can be inherited. • **true**: yes. • **false**: no.
consoft	Boolean	Specifies whether the column indicates an informational constraint. • **true**: yes. • **false**: no.
conopt	Boolean	Specifies whether you can use the informational constraint to optimize the execution plan. • **true**: yes. • **false**: no.
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a CHECK constraint.
consrc	text	Readable representation of the expression if this column is a CHECK constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use pg_get_constraintdef() to extract the definition of a CHECK constraint.
- The **relchecks** column of **PG_CLASS** must be consistent with the number of CHECK constraints found for the given relationship on the table.

7.2.18.35 PG_CONVERSION

PG_CONVERSION describes encoding conversion information.

Table 7-108 PG_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
conname	name	-	Conversion name (unique within a namespace).
connamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains this conversion.
conowner	oid	**oid** in **PG_AUTHID**	Owner of the conversion.
conforencoding	integer	-	Source encoding ID.
contoencoding	integer	-	Destination encoding ID.
conproc	regproc	**proname** in **PG_PROC**	Conversion procedure.
condefault	boolean	-	If this is the default conversion, the value is **true**. Otherwise, the value is **false**.

7.2.18.36 PG_DATABASE

PG_DATABASE records information about available databases.

Table 7-109 PG_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
datname	name	Database name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding for the database.
datcollate	name	Sequence used by the database.
datctype	name	Character type used by the database.
datistemplate	boolean	Specifies whether the database can be used as a template database. ● **true**: allowed. ● **false**: not allowed.
datallowconn	boolean	This column is used to protect the **template0/templatea** database from being altered. ● **true**: Users can connect to the database. ● **false**: No user can connect to the database.
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value **-1** indicates no limit.
datlastsysoid	oid	Last system OID in the database.
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure compatibility with earlier versions, this column is reserved. The **datfrozenxid64** column is added to record the information.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of **relminmxid** in 12.2.15.28 PG_CLASS of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.
dattype	"char"	Database type. **"D"** indicates an ordinary database.

7.2.18.37 PG_DEPEND

PG_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also **PG_SHDEPEND**, which performs a similar functionality for dependencies involving objects that are shared across a database cluster.

Table 7-110 PG_DEPEND columns

Name	Type	Reference	Description
classid	oid	**oid** in PG_CLASS	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object.
objsubid	integer	-	Column number for a table column (**objid** and **classid** refer to the table itself); **0** for all other object types.
refclassid	oid	**oid** in PG_CLASS	OID of the system catalog where a referenced object resides.
refobjid	oid	Any OID column	OID of the referenced object.
refobjsubid	integer	-	Column number for a table column (**refobjid** and **refclassid** refer to the table itself); **0** for all other object types.
deptype	"char"	-	A code defining the specific semantics of this dependency.
depsrc	text	-	Name of the referenced object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In all cases, a PG_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- DEPENDENCY_NORMAL (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying CASCADE, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- DEPENDENCY_AUTO (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- DEPENDENCY_INTERNAL (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A DROP of the referenced object will be propagated through to drop the dependent object whether CASCADE is specified or not. Example: A trigger created to enforce a FOREIGN KEY constraint is made internally dependent on the constraint's **PG_CONSTRAINT** entry.
- DEPENDENCY_EXTENSION (e): The dependent object is a member of the extension of the referenced object (see **PG_EXTENSION**). The dependent object can be dropped only via DROP EXTENSION on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify GS_DUMP.
- DEPENDENCY_PIN (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be dropped. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.
- DEPENDENCY_COMPILE (c): When the dependent object is a view, this records the dependency relationships with referenced objects during compilation. For example, if a table column is used in the view definition, the compilation dependency of the view on the table is recorded during view creation and recompilation.

7.2.18.38 PG_DESCRIPTION

PG_DESCRIPTION records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of PG_DESCRIPTION.

See also **PG_SHDESCRIPTION**, which provides a similar functionality for descriptions involving objects that are shared within the entire cluster.

Table 7-111 PG_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
classoid	oid	**oid** in PG_CLASS	OID of the system catalog where the object appears.
objsubid	integer	-	Column number for a comment on a table column (**objoid** and **classoid** refer to the table itself); **0** for all other object types.
description	text	-	Arbitrary text that serves as the description of the object.

7.2.18.39 PG_DIRECTORY

PG_DIRECTORY stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable_access_server_directory** is set to **off**, only the initial user can create directory objects. When **enable_access_server_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the permissions of the built-in role gs_role_directory_create can create directory objects. Common users can access this system catalog only after being authorized.

Table 7-112 PG_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
dirname	name	Name of a directory object.
owner	oid	Owner of a directory object.
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

7.2.18.40 PG_ENUM

PG_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG_ENUM.

Table 7-113 PG_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
enumtypid	oid	**oid** in PG_TYPE	OID of the PG_TYPE entry owning this enumerated value.
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type.
enumlabel	name	-	Textual label for this enumerated value.

The OIDs for PG_ENUM rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

7.2.18.41 PG_EXTENSION

PG_EXTENSION records information about the installed extensions. By default, GaussDB has the following extensions: plpgsql, DIST_FDW, FILE_FDW, GC_FDW, DBLINK_FDW, PACKAGES, ROACH_API, STREAMING, TSDB, GSREDISTRIBUTE, SECURITY_PLUGIN, GSSTAT_PLUGIN, NUMERIC_ENHANCE, PKG_DBE_RAW, PKG_DBE_OUTPUT, PKG_DBE_UTILITY, PKG_DBE_XML, PKG_DBE_OBFUSCATION_TOOLKIT, PKG_ILM, PKG_DBE_XMLGEN, PKG_DBE_STATS, PKG_DBE_DESCRIBE, and PKG_DBE_LICENSE.

Table 7-114 PG_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name.
extowner	oid	Owner of the extension.
extnamespace	oid	Namespace containing the extension's exported objects.
extrelocatable	Boolean	Specifies whether the extension can be relocated to another namespace. The value can be **true** (yes) or **false** (no).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
extversion	text	Version number of the extension.
extconfig	oid[]	Configuration information about the extension.
extcondition	text[]	Filter conditions for the extension's configuration information.

7.2.18.42 PG_EXTENSION_DATA_SOURCE

PG_EXTENSION_DATA_SOURCE records information about external data sources. An external data source contains information about an external database, such as its password encoding. It is mainly used with Extension Connector. By default, only system administrators can query this system catalog. Due to specification changes, the current version no longer supports this feature. Do not use it.

Table 7-115 PG_EXTENSION_DATA_SOURCE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
srcname	name	-	Name of an external data source.
srcowner	oid	PG_AUTHID.oid	Owner of a foreign data source.
srctype	text	-	Type of an external data source. It is **NULL** by default.
srcversion	text	-	Version of an external data source. It is **NULL** by default.
srcacl	aclitem[]	-	Access permissions.
srcoptions	text[]	-	Option used for foreign data sources, expressed in a string in the format of *keyword*=*value*.

7.2.18.43 PG_FOREIGN_DATA_WRAPPER

PG_FOREIGN_DATA_WRAPPER records foreign data wrapper definitions. A foreign data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-116 PG_FOREIGN_DATA_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
fdwname	name	-	Name of a foreign data wrapper.
fdwowner	oid	**oid** in **PG_AUTHID**	Owner of a foreign data wrapper.
fdwhandler	oid	**oid** in **PG_PROC**	References a handler function that is responsible for supplying execution routines for a foreign data wrapper. The value is **0** if no handler is provided.
fdwvalidator	oid	**oid** in **PG_PROC**	References a validator function that is responsible for checking the validity of the options given to the foreign data wrapper, as well as options for foreign servers and user mappings using the foreign data wrapper. The value is **0** if no validator is provided.
fdwacl	aclitem[]	-	Access permissions.
fdwoptions	text[]	-	Foreign data wrapper specific option, expressed in a string in the format of keyword=value.

7.2.18.44 PG_FOREIGN_SERVER

PG_FOREIGN_SERVER records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign data wrappers.

Table 7-117 PG_FOREIGN_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
srvname	name	-	Name of a foreign server.
srvowner	oid	**oid** in **PG_AUTHID**	Owner of the foreign server.
srvfdw	oid	**oid** in **PG_FOREIGN_DATA_WRAPPER**	OID of the foreign data wrapper of the foreign server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
srvtype	text	-	Type of the server (optional).
srvversion	text	-	Version of the server (optional).
srvacl	aclitem[]	-	Access permissions.
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value.

7.2.18.45 PG_FOREIGN_TABLE

PG_FOREIGN_TABLE records auxiliary information about foreign tables.

Table 7-118 PG_FOREIGN_TABLE columns

Name	Type	Description
ftrelid	oid	ID of a foreign table.
ftserver	oid	Server where the foreign table is located.
ftwriteonly	boolean	Specifies whether the foreign table is writable. Values are as follows: • **t** (true): yes. • **f** (false): no.
ftoptions	text[]	Options of the foreign table. For details, see the **7.13.8.22 CREATE FOREIGN TABLE** syntax description.

7.2.18.46 PG_HASHBUCKET

PG_HASHBUCKET records hash bucket information.

Table 7-119 PG_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
bucketid	oid	Node group bound to the database where the PG_HASHBUCKET system catalog resides on the CN. This column is empty on the DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketcnt	integer	This parameter is not used on the CN. It indicates the number of buckets owned by the current DN on the DN.
bucketmapsize	integer	This parameter is not used in the current version.
bucketref	integer	Reserved column with **1** as its default value.
bucketvector	oidvector_extend	This parameter is not used on the CN. It indicates the list of buckets owned by the current DN on the DN.
bucketmap	text	Stores the mapping between logical buckets and physical buckets, that is, the mapping between 16384 and 1024.
bucketversion	oidvector_extend	Records the version number of the information that changes during subsequent hash bucket scale-out.
bucketcsn	text	Maximum CSN of each bucket on the source node before hash bucket redistribution, which is used to determine the visibility of the new node.
bucketxid	text	**next_xid** set for bringing a new node online during hash bucket scaling. This parameter is used to check whether the value is within the threshold range.
bucketclogmode	smallint	Clog directory type used by a bucket table. • **Empty**: The **pg_clog/**<*bucketid*> directory is used. • **1**: The **pg_clog/base/**<*dbid*>**/**<*bucketid*> directory is used.
cbibuckets	oidvector_extend	Records the list of buckets that are being rebuilt online by the CBI.

7.2.18.47 PG_INDEX

PG_INDEX records part of index information. The rest is mostly recorded in PG_CLASS.

Table 7-120 PG_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the **12.2.15.28 PG_CLASS** entry for the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indrelid	oid	OID of the 12.2.15.28 PG_CLASS entry for the table that uses the index.
indnatts	smallint	Number of columns in the index.
indisunique	Boolean	Specifies whether the index is unique. • **true**: The index is unique. • **false**: The index is not unique.
indisprimary	Boolean	Specifies whether the index is the primary key of the table. • **true**: The index is the primary key of the table. **indisunique** should always be **true** when the value of this column is **true**. • **false**: The index is not the primary key of the table.
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. • **true**: The index supports exclusive constraints. • **false**: The index does not support exclusive constraints.
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. • **true**: The uniqueness check is performed immediately when data is inserted. • **false**: The uniqueness check is not performed when data is inserted.
indisclustered	Boolean	Specifies whether the table is clustered on the index. • **true**: The table is clustered on the index. • **false**: The table is not clustered on the index.
indisusable	Boolean	Specifies whether the index is available for insert and select operations. • **true**: The index is available for insert and select operations. • **false**: The index is unavailable for insert and select operations.
indisvalid	Boolean	• **true**: The index can be used for query. • **false**: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indcheckxmin	Boolean	• **true**: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their **TransactionXmin**, because the table may contain broken HOT chains with incompatible rows that they can see. • **false**: Indexes can be used for query.
indisready	Boolean	• **true**: The index is available for inserting data. • **false**: The index is ignored when data is inserted or modified.
indkey	int2vector	This is an array of **indnatts** values indicating that this index creates table columns. For example, a value of **1 3** indicates that the first and the third columns make up the index key. The value **0** in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see **PG_COLLATION**.
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. For details, see **12.2.15.53 PG_OPCLASS**.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in **nodeToString()** representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in **nodeToString()** representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. • **true**: The column of this index is a decoded column of logical decoding. • **false**: The column of this index is not a decoded column of logical decoding.
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of **indnatts** are not involved in the index query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indcctmpid	oid	OID of the temporary table when the Ustore builds indexes online.
indisvisible	Boolean	• **true**: The index status is visible, that is, the optimizer can use the index. • **false**: The index is invisible. If the value of **enable_invisible_indexes** is **off**, the optimizer cannot use the index. If the value of **enable_invisible_indexes** is **on**, the optimizer can use the index.

7.2.18.48 PG_INHERITS

PG_INHERITS records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

Table 7-121 PG_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	**oid** in **PG_CLASS**	OID of a child table
inhparent	oid	**oid** in **PG_CLASS**	OID of a parent table.
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

7.2.18.49 PG_JOB

PG_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG_JOB and trigger jobs based on scheduled job execution time, and update job status in PG_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

Table 7-122 PG_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is **-1**, indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	CN on which the job will be executed.
job_status	"char"	Execution status of the current task. The default value is **'s'**. The options are as follows: ● **'r'**: running ● **'s'**: successfully finished ● **'f'**: job failed ● **'d'**: disable If a job fails to be executed for 16 consecutive times, **job_status** is automatically set to **'d'**, and no more attempt will be made on this job. Note: When you disable a scheduled job (by setting **job_queue_processes** to **0**), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled job function is enabled (**job_queue_processes** is not set to **0**), the system updates the value of this column based on the real-time job status.
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond.
next_run_date	timestamp without time zone	Time when a scheduled task is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled task.
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	Enabling status of the DBE_SCHEDULER scheduled job. The options are as follows: • **true**: enabled • **false**: disabled
failure_msg	text	Error information about the latest task execution.

7.2.18.50 PG_JOB_PROC

PG_JOB_PROC records the content of each job in **PG_JOB**, including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

Table 7-123 PG_JOB_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is joined with **job_id** in the system catalog **PG_JOB**.
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_name	text	Name of the DBE_SCHEDULER scheduled job or program.

7.2.18.51 PG_LANGUAGE

PG_LANGUAGE registers programming languages. You can use them and APIs to write functions or stored procedures.

Table 7-124 PG_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Name of the language.
lanowner	oid	**oid** in **PG_AUTHID**	Owner of the language.
lanispl	boolean	-	• **true**: user-defined language. • **false**: internal language, for example, SQL. Currently, gs_dump still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	• **true**: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment. • **false**: The language is untrusted. Only the initial user can create functions in untrusted languages.
lanplcallfoid	oid	**oid** in **PG_PROC**	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	**oid** in **PG_PROC**	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is **0** if inline blocks are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
lanvalidator	oid	**oid** in PG_PROC	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is **0** if no validator is provided.
lanacl	aclitem[]	-	Access permission.

7.2.18.52 PG_NAMESPACE

PG_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

Table 7-125 PG_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
nspname	name	Name of a namespace.
nspowner	oid	Owner of a namespace.
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see **GRANT** and **REVOKE**.
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspblockchain	Boolean	Specifies whether the mode is the tamper-proof mode. • **true**: The mode is the tamper-proof mode. • **false**: The mode is not the tamper-proof mode.
nspcollation	oid	Default collation of the namespace (a value may exist only when **sql_compatibility** is set to **'MYSQL'**).
nspgroupoid	oid	Node group. This is a single-node attribute. When a single-node table is implicitly created in this schema, it is created in the node group specified by this column by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.18.53 PG_OBJECT

PG_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

Table 7-126 PG_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. • **r**: ordinary table • **i**: index • **s**: sequence • **v**: view • **p**: stored procedure and function • **S**: package header • **B**: package body
creator	oid	Object owner.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include **ALTER**, **GRANT**, and **REVOKE**.
createcsn	bigint	CSN when an object is created.
changecsn	bigint	CSN when DDL operations are performed on a table or an index.
valid	Boolean	Validity of an object. **t** indicates valid, and **f** indicates invalid.
relchangecsn	bigint	CSN when the table definition is changed or the TRUNCATE DDL operation is performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changecsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createcsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createcsn** and **changecsn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

7.2.18.54 PG_OPCLASS

PG_OPCLASS defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are data types that accept the left-hand column.

Table 7-127 PG_OPCLASS columns

Name	Type	Reference	Description
OID	OID	-	Row identifier (hidden attribute, which must be specified).
opcmethod	OID	**oid** in **PG_AM**	Index access method operator class served by an operator class.
opcname	name	-	Name of the operator class.
opcnamespace	OID	**oid** in **PG_NAMESPACE**	Namespace of the operator class.
opcowner	OID	**oid** in **PG_AUTHID**	Owner of the operator class.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opcfamily	OID	**oid** in PG_OPFAMILY	Operator family containing the operator class.
opcintype	OID	**oid** in PG_TYPE	Data type that the operator class indexes.
opcdefault	Boolean	-	The value is **t** (true) if the operator class is the default for **opcintype**. Otherwise, the value is **f** (false).
opckeytype	OID	**oid** in PG_TYPE	Type of data stored in an index, or zero if same as **opcintype**.

An operator class's **opcmethod** must match the **opfmethod** of its containing operator family.

7.2.18.55 PG_OPERATOR

PG_OPERATOR records information about operators.

Table 7-128 PG_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
oprname	name	-	Name of an operator.
oprnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the operator.
oprowner	oid	**oid** in PG_AUTHID	Owner of the operator.
oprkind	"char"	-	• **b**: infix (both sides) • **l**: prefix (left side) • **r**: suffix (right side)
oprcanmerge	boolean	-	Specifies whether the operator supports merge joins. • **t (true)**: yes • **f (false)**: no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
oprcanhash	boolean	-	Specifies whether the operator supports hash joins. • **t (true)**: yes • **f (false)**: no
oprleft	oid	**oid** in **PG_TYPE**	Type of the left operand.
oprright	oid	**oid** in **PG_TYPE**	Type of the right operand.
oprresult	oid	**oid** in **PG_TYPE**	Type of the result.
oprcom	oid	**oid** in **PG_OPERATOR**	If it exists, the value is the exchange character of this operator. If it does not exist, the value is **0**.
oprnegate	oid	**oid** in **PG_OPERATOR**	If it exists, the value is the invertor of this operator. If it does not exist, the value is **0**.
oprcode	regproc	**proname** in **PG_PROC**	Function that implements the operator.
oprrest	regproc	**proname** in **PG_PROC**	Restriction selectivity estimation function for the operator.
oprjoin	regproc	**proname** in **PG_PROC**	Join selectivity estimation function for the operator.

7.2.18.56 PG_OPFAMILY

PG_OPFAMILY defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

Table 7-129 PG_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opfmethod	oid	**oid** in PG_AM	Index access method used by an operator family.
opfname	name	-	Name of the operator family.
opfnamespace	oid	**oid** in PG_NAMESPACE	Namespace of the operator family.
opfowner	oid	**oid** in PG_AUTHID	Owner of the operator family.

The majority of the information defining an operator family is not in its PG_OPFAMILY row, but in the associated rows in PG_AMOP, PG_AMPROC, and PG_OPCLASS.

7.2.18.57 PG_PLTEMPLATE

PG_PLTEMPLATE records template information for procedural languages.

Table 7-130 PG_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used.
tmpltrusted	Boolean	The value is **true** if the language is considered trusted. Otherwise, the value is **false**.
tmpldbacreate	Boolean	The value is **true** if the language is created by the owner of the database. Otherwise, the value is **false**.
tmplhandler	text	Name of the call handler function.
tmplinline	text	Name of the anonymous block handler (**NULL** if no name of the block handler exists).
tmplvalidator	text	Name of the verification function (**NULL** if no verification function is available).
tmpllibrary	text	Path of the shared library that implements languages.
tmplacl	aclitem[]	Access permissions for template (not yet used).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.18.58 PG_PROC

PG_PROC stores information about functions or stored procedures.

Table 7-131 PG_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call API of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. ● **t** (true): yes ● **f** (false): no
proiswindow	Boolean	Specifies whether the function is a window function. ● **t** (true): yes ● **f** (false): no
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). ● **t** (true): yes ● **f** (false): no
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. ● **t** (true): There is no side effect. ● **f** (false): There are side effects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proisstrict	Boolean	• **t** (true): When this function is used, the function does not call the function and returns null if the input parameter is null. • **f** (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). • **true**: The return value of the function is a set. • **false**: The return value of the function is not a set.
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. • **i**: immutable functions, which always deliver the same result for the same inputs. • **s**: stable functions, whose results (for fixed inputs) do not change within a scan. • **v**: volatile functions, whose results may change at any time. It is also used for functions with side effects, so that the engine cannot get optimized if volatile functions are called.
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (API) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including **OUT** and **INOUT** parameters); however, if all the parameters are **IN** parameters, this column is null. Note that array indexing is 1-based, whereas for historical reasons, **proargtypes** is indexed from 0.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: • **i** indicates the **IN** parameter. • **o** indicates the **OUT** parameter. • **b** indicates the **INOUT** parameter. • **v** indicates the **VARIADIC** parameter. If all the parameters are **IN** parameters, this column is null. Note that indexes correspond to positions of **proallargtypes**, not **proargtypes**.
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that indexes correspond to positions of **proallargtypes**, not **proargtypes**.
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of **pronargdefaults** elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	Boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. • **true**: fence mode. In this mode, the function is executed in the fork process. • **false**: not fence mode. For built-in functions, **fencedmode** is set to **false**, indicating the not fence mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proshippable	Boolean	Specifies whether the function can be pushed down to DNs for execution. The default value is **false**. ● Functions of the **IMMUTABLE** type can always be pushed down to DNs. ● Functions of the **STABLE** or **VOLATILE** type can be pushed down to DNs only if their attribute is **SHIPPABLE**.
propackage	Boolean	Specifies whether the function supports overloading. The default value is **false**. ● **t** (true): supported. ● **f** (false): not supported.
prokind	"char"	Specifies whether the object is a function or a stored procedure. ● **'f'**: The object is a function. ● **'p'**: The object is a stored procedure.
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with ORA syntax, including parameter comments. The default value is **NULL**.
proisprivate	Boolean	Specifies whether a function is a private function in the package. The default value is **false**.
propackageid	oid	OID of the package to which the function belongs. If the function is not in the package, the value is **0**.
proargtypesext	oidvector_extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (API) of the function.
prodefaultargposext	int2vector_extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and **INOUT** parameters) of the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
allargtypesext	oidvector_extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and **INOUT** parameters).

NOTE

When a function is created, data is inserted into the PG_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one-third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg_proc_proname_all_args_nsp_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

7.2.18.59 PG_RANGE

PG_RANGE records information about range types, except for records of types in **PG_TYPE**.

Table 7-132 PG_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	**oid** in **PG_TYPE**	OID of the range type.
rngsubtype	oid	**oid** in **PG_TYPE**	OID of the element type (subtype) of this range type.
rngcollation	oid	**oid** in **PG_COLLATION**	OID of the collation used for range comparisons (**0** if none).
rngsubopc	oid	**oid** in **PG_OPCLASS**	OID of the subtype's operator class used for range comparisons.
rngcanonical	regproc	**proname** in **PG_PROC**	Name of the function to convert a range value into canonical form (**0** if none).
rngsubdiff	regproc	**proname** in **PG_PROC**	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of **rngsubdiff** is **0**.

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

7.2.18.60 PG_REPLICATION_ORIGIN

PG_REPLICATION_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each cluster has only one copy of PG_REPLICATION_ORIGIN, not one copy per database instance.

Table 7-133 PG_REPLICATION_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

7.2.18.61 PG_RESOURCE_POOL

PG_RESOURCE_POOL provides information about database resource pools.

Table 7-134 PG_RESOURCE_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
respool_name	name	Name of the resource pool.
mem_percent	integer	Percentage of the memory configuration.
cpu_affinity	bigint	Value of cores bound to the CPU.
control_group	name	Name of the Cgroup where the resource pool is located.
active_statements	integer	Reserved column.
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used only for scaling.
memory_limit	name	Maximum memory of the resource pool.
parentid	oid	OID of the parent resource pool.
io_limits	integer	Upper limit of IOPS. The unit is 10 thousand per second.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_priority	name	Specifies the I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
nodegroup	name	Indicates the name of the node group to which the resource pool belongs.
is_foreign	Boolean	Specifies whether the resource pool can be used for users outside the logical database. • **true**: The resource pool controls the resources of common users who do not belong to the current resource pool. • **false**: The resources of common users who do not belong to the current resource pool are not controlled.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.
max_dynamic_memory	name	Maximum dynamic memory that can be used by a resource pool.
max_shared_memory	name	Maximum shared memory that can be used by a resource pool.
max_concurrency	integer	Maximum number of concurrent requests that can be used by a resource pool.

7.2.18.62 PG_REWRITE

PG_REWRITE records rewrite rules defined for tables and views.

Table 7-135 PG_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Rule name.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always **0** to indicate the entire table).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ev_type	"char"	Event type for the rule. • **1**: SELECT • **2**: UPDATE • **3**: INSERT • **4**: DELETE
ev_enabled	"char"	Controls the mode in which the rule is triggered. • **O**: The rule is triggered in origin and local modes. • **D**: The rule is disabled. • **R**: The rule is triggered in replica mode. • **A**: The rule is always triggered.
is_instead	Boolean	The value is **true** if the rule is of the **INSTEAD** type. Otherwise, the value is **false**.
ev_qual	pg_node_tree	Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.
ev_action	pg_node_tree	Query tree (in the form of a nodeToString() representation) for the rule's action.
ev_action_def	text	Saves the original SELECT statement when the view is defined.

7.2.18.63 PG_SET

PG_SET records metadata defined by the SET data type.

Currently, this feature is not supported in the distributed mode.

7.2.18.64 PG_SHDEPEND

PG_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also **PG_DEPEND**, which provides a similar functionality for dependencies involving objects within a single database.

PG_SHDEPEND is shared among all databases of cluster. That is, there is only one PG_SHDEPEND for each cluster, not for each database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-136 PG_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	**oid** in **PG_DATABASE**	OID of the database where a dependent object is (**0** for a shared object).
classid	oid	**oid** in **PG_CLASS**	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object.
objsubid	integer	-	Column number of a table column (the table to which the column points can be determined based on **objid** and **classid**). The value is **0** for all other object types.
refclassid	oid	**oid** in **PG_CLASS**	OID of the system catalog the referenced object is in (must be a shared catalog).
refobjid	oid	Any OID column	OID of the referenced object.
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. The value can be **o**, **a**, **p**, **d**, or **l**.
objfile	text	-	Path of the user-defined C function library file.

In all cases, a PG_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED_DEPENDENCY_OWNER (o)

  The referenced object (which must be a role) is the owner of the dependent object.

- SHARED_DEPENDENCY_ACL (a)

  The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED_DEPENDENCY_ACL does not add a record to the owner of the object because the owner will have a SHARED_DEPENDENCY_OWNER record.

- SHARED_DEPENDENCY_PIN (p)

  This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

- SHARED_DEPENDENCY_ DBPRIV(d)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the **12.2.10.1 GS_DB_PRIVILEGE** system catalog).

- SHARED_DEPENDENCY_ SECLABEL(l)

  The referenced object (must be a security label) is applied to the dependent object.

7.2.18.65 PG_SHDESCRIPTION

PG_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the **\d** command.

See also PG_DESCRIPTION, which provides a similar functionality for descriptions involving objects within a single database.

PG_SHDESCRIPTION is shared among all databases of cluster. That is, there is only one PG_SHDESCRIPTION for each cluster, not for each database.

Table 7-137 PG_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	**oid** in **PG_CLASS**	OID of the system catalog where the object appears.
description	text	-	Description of the object.

7.2.18.66 PG_STATISTIC

PG_STATISTIC stores statistics about tables and index columns in a database. By default, only users with the SYSADMIN permission can access the system catalog. Common users can access this system catalog only after being authorized.

Table 7-138 PG_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	**stakindN** records the type of statistics. N is a code, indicating that the statistics of this type are stored in the *N*th slot of the **pg_statistic** row. Value range of *N* ranges from 1 to 5, for example, stakind1, stakind2, or stakind3. For **stakindN**, the numbers indicate the following information: ● **1**: MCV ● **2**: histogram ● **3**: correlation ● **4**: MCELEM (common element, used for arrays) ● **5**: histogram of the number of different elements (used for arrays)
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. Reserved column.
stastate	"char"	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. • **l**: locked • **u**: unlocked

NOTICE

PG_STATISTIC stores sensitive information about statistical objects, such as MCVs. System administrators and authorized users can access the PG_STATISTIC system catalog to query the sensitive information about the statistical objects.

7.2.18.67 PG_STATISTIC_EXT

PG_STATISTIC_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to system administrators.

Table 7-139 PG_STATISTIC_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of an object. **'c'** indicates a table, and **'p'** indicates a partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. ● **t** (true): yes ● **f** (false): no
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	**stakindN** records the type of statistics. N is a code, indicating that the statistics of this type are stored in the *N*th slot of the **pg_statistic** row. Value range of *N* ranges from 1 to 5, for example, stakind1, stakind2, or stakind3. For **stakindN**, the numbers indicate the following information: ● **1**: MCV ● **6**: MCV with a null value ● **8**: Bayesian network
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so the best practice is to define these columns type as anyarray. The value of *N* ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	char	Source of extended statistics: ● **'a'**: indicates automatic creation. For details, see the GUC parameter **auto_statistic_ext_columns**. ● **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	char	Status of extended statistics: ● **'a'**: active and available. ● **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
stastate	char	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. ● **l**: locked ● **u**: unlocked
staextname	name	Alias of the multi-column group of multi-column statistics.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

PG_STATISTIC_EXT stores sensitive information about statistical objects, such as MCVs. System administrators and authorized users can access the PG_STATISTIC_EXT system catalog to query the sensitive information about the statistical objects.

7.2.18.68 PG_SYNONYM

PG_SYNONYM records the mapping between synonym object names and other database object names.

Table 7-140 PG_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.
synnamespace	oid	OID of the namespace that contains a synonym. The OID of the PUBLIC synonym namespace is 0.
synowner	oid	Owner of a synonym, usually the OID of the user who created it. The owner of the PUBLIC synonym is 0.
synobjschema	name	Schema name specified by an associated object.
synobjname	name	Name of an associated object.
syndblinkname	name	Database link name.

7.2.18.69 PG_TABLESPACE

PG_TABLESPACE records tablespace information.

Table 7-141 PG_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
spcname	name	Tablespace name.
spcowner	oid	Owner of the tablespace, usually the user who created it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spcacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
spcoptions	text[]	Options of the tablespace.
spcmaxsize	text	Maximum size of the available disk space, in bytes.
relative	Boolean	Specifies whether the storage path specified by the tablespace is a relative path. • **t (true)**: yes. • **f (false)**: no.

7.2.18.70 PG_TRIGGER

PG_TRIGGER records trigger information.

Table 7-142 PG_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be called by the trigger.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tgtype	smallint	Trigger type. • **4**: AFTER INSERT FOR EACH STATEMENT. • **5**: AFTER INSERT FOR EACH ROW. • **6**: BEFORE INSERT FOR EACH STATEMENT. • **7**: BEFORE INSERT FOR EACH ROW. • **8**: AFTER DELETE FOR EACH STATEMENT. • **9**: AFTER DELETE FOR EACH ROW. • **10**: BEFORE DELETE FOR EACH STATEMENT. • **11**: BEFORE DELETE FOR EACH ROW. • **16**: AFTER UPDATE FOR EACH STATEMENT. • **17**: AFTER UPDATE FOR EACH ROW. • **18**: BEFORE UPDATE FOR EACH STATEMENT. • **19**: BEFORE UPDATE FOR EACH ROW. • **32**: AFTER TRUNCATE FOR EACH STATEMENT. • **34**: BEFORE TRUNCATE FOR EACH STATEMENT. • **69**: INSTEAD OF INSERT FOR EACH ROW. • **73**: INSTEAD OF DELETE FOR EACH ROW. • **81**: INSTEAD OF UPDATE FOR EACH ROW.
tgenabled	"char"	• **O**: The trigger is triggered in origin and local modes. • **D**: The trigger is disabled. • **R**: The trigger is triggered in replica mode. • **A**: The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is **true**, it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in **PG_CONSTRAINT**.
tgdeferrable	Boolean	Specifies whether the constraint trigger is of the DEFERRABLE type. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. • **t** (true): yes • **f** (false): no
tgnargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter specified in the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger (**null** if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

7.2.18.71 PG_TS_CONFIG

PG_TS_CONFIG contains entries representing text search configurations. Each of these configurations contains a list of specific text search parsers and dictionary mappings.

The parser is shown in the PG_TS_CONFIG entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG_TS_CONFIG_MAP**.

Table 7-143 PG_TS_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
cfgname	name	-	Text search configuration name.
cfgnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the configuration.
cfgowner	oid	**oid** in **PG_AUTHID**	Owner of the configuration.
cfgparser	oid	**oid** in **PG_TS_PARSER**	OID of the text search parser for this configuration.
cfoptions	text[]	-	Configuration options.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.2.18.72 PG_TS_CONFIG_MAP

PG_TS_CONFIG_MAP contains parser symbol mappings for each text search configuration.

Table 7-144 PG_TS_CONFIG_MAP columns

Name	Type	Reference	Description
mapcfg	oid	**oid** in PG_TS_CONFIG	OID of the PG_TS_CONFIG entry owning this map entry.
maptokentype	integer	-	Token type generated by the configuration's parser.
mapseqno	integer	-	Sequence number of a token type when the values of **mapcfg** or **maptokentype** are the same.
mapdict	oid	**oid** in PG_TS_DICT	OID of the text search dictionary to consult.

7.2.18.73 PG_TS_DICT

PG_TS_DICT contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

Table 7-145 PG_TS_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
dictname	name	-	Text search dictionary name
dictnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the dictionary.
dictowner	oid	**oid** in PG_AUTHID	Owner of the dictionary.
dicttemplate	oid	**oid** in PG_TS_TEMPLATE	OID of the text search template for the dictionary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
dictinitoption	text	-	Initialization option string for the template.

7.2.18.74 PG_TS_PARSER

PG_TS_PARSER contains definition of text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Because the parser must be implemented through functions at the C language level, the new parser must be created by a database system administrator.

Table 7-146 PG_TS_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
prsname	name	-	Text search parser name.
prsnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the parser.
prsstart	regproc	**proname** in **PG_PROC**	Name of the parser's startup function.
prstoken	regproc	**proname** in **PG_PROC**	Name of the parser's next-token function.
prsend	regproc	**proname** in **PG_PROC**	Name of the parser's shutdown function.
prsheadline	regproc	**proname** in **PG_PROC**	Name of the parser's headline function.
prslextype	regproc	**proname** in **PG_PROC**	Name of the parser's lextype function.

7.2.18.75 PG_TS_TEMPLATE

PG_TS_TEMPLATE contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-147 PG_TS_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
tmplname	name	-	Text search template name
tmplnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the template
tmplinit	regproc	**proname** in **PG_PROC**	Name of the template's initialization function.
tmpllexize	regproc	**proname** in **PG_PROC**	Name of the template's lexize function.

7.2.18.76 PG_TYPE

PG_TYPE stores information about data types.

Table 7-148 PG_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name.
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typlen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • **-1**: a "varlena" type (one that has a length word). • **-2**: a null-terminated C string.
typbyval	Boolean	• **true**: A value of this type is specified by value internally. • **false**: A value of this type is specified by reference internally. If **typlen** of this type is not **1**, **2**, **4**, or **8**, you are advised to specify a reference value for **typbyval**. You can also specify a value for **typbyval**. Variable-length types are usually passed by reference or by value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typtype	"char"	• **b**: basic type. • **c**: composite type (for example, the row type of a table). • **d**: domain type. • **p**: pseudo type. • **r**: range type. • **e**: enumeration type. • **u**: undefined type. • **o**: set type. For details, see **typrelid** and **typbasetype**.
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	• **true**: Data is converted when it complies with the conversion rule specified by **typcategory**. • **false**: Data is not converted.
typisdefined	Boolean	• **true**: The type has been defined. • **false**: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the **PG_CLASS** entry that defines the corresponding table. For a free-standing composite type, the PG_CLASS entry does not represent a table, but it is required for the type's **PG_ATTRIBUTE** entries to link to. It is **0** for non-composite type.
typelem	oid	If **typelem** is not **0**, it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type **typelem**. A "true" array type has a variable length (**typlen** = **-1**), but some fixed-length types (**typlen** > **0**) also have non-zero **typelem**, for example **name** and **point**. If a fixed-length type has a **typelem**, its internal representation must be a number of values of the **typelem** data type with no other data. Variable-length array types have a header defined by the array subroutines.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typarray	oid	If the value is not **0**, the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); **0** for non-input conversion function.
typsend	regproc	output conversion function (binary format); **0** for non-output conversion function.
typmodin	regproc	Input type modifier function; **0** if none.
typmodout	regproc	Output type modifier function; **0** if none.
typanalyze	regproc	Custom ANALYZE function; **0** if the standard function is used.
typalign	"char"	Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are: ● **c**: char alignment, that is, no alignment required ● **s**: short alignment (2 bytes on most machines) ● **i**: integer alignment (4 bytes on most machines) ● **d**: double alignment (8 bytes on many machines, but by no means all) **NOTICE** For types used in system catalogs, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typstorage	"char"	Data storage mode of a specified column, including the following types: • **p**: plain storage. Values are always stored in plain mode. • **e**: external storage. Data is stored outside the main table (for example, in the TOAST table). The main table stores references to data form external storage. • **m**: main storage. Data can be stored compressed inline, which is similar to plain storage. This method is usually used to store types that require customized storage, for example, customized composite types. • **x**: extended storage. Values may be compressed and/or moved into a level-2 relational table. **x** is usually the storage mode of the TOAST type.
typnotnull	Boolean	Specifies whether the type has a NOT NULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see **typtype**), then **typbasetype** identifies the type that this one is based on. The value is **0** if this type is not a derived type.
typtypmod	integer	Records the **typtypmod** to be applied to domains' base types by domains (the value is **–1** if the base type does not use **typmod**). This is **-1** if this type is not a domain. If the type is array, **typtypmod** indicates the maximum capacity of the array type. If the type is index-by table collection, **typtypmod** indicates the maximum index length of the collection type.
typndims	integer	If a domain is an array, **typndims** is the number of array dimensions. This is **0** for types other than domains over array types.
typcollation	oid	Sorting rule of a specified type. For details about the values, see the **PG_COLLATION** system catalog. (**0** if sequencing is not supported)
typdefaultbin	pg_node_tree	**nodeToString()** representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typdefault	text	The value is **NULL** if a type has no associated default value. If **typdefaultbin** is not set to **NULL**, **typdefault** must contain a default expression represented by **typdefaultbin**. If **typdefaultbin** is **NULL** and **typdefault** is not, then **typdefault** is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission.
typelemmod	integer	• **-1**: **typmod** is not required for the element type corresponding to the set and array types. • Value greater than or equal to 0: **typmod** of the element type corresponding to the set and array types is used. • **NULL**: **typmod** of the element type corresponding to the set and array types is unknown. **typmod** usually refers to the maximum length of a type.

7.2.18.77 PGXC_CLASS

PGXC_CLASS records replicated or distributed information for each table.

Table 7-149 PGXC_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table.
pclocatortype	"char"	Locator type. • **H**: Hash • **G**: Range • **L**: List • **M**: Modulo • **N**: Round Robin • **R**: Replication • **U**: MurmurHash
pchashalgorithm	smallint	Distributed tuple using the hash algorithm. • **1**: default hash algorithm. • **2**: MURMURHASH algorithm.
pchashbuckets	smallint	Value of a harsh container.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pgroup	name	Name of the node.
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are **0** will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key.
nodeoids	oidvector_extend	List of distributed table node OIDs.
options	text	Extension status information. This is a reserved column in the system.
diskey	text[]	Character string of the distribution key expression in the brackets of the DISTRIBUTE BY clause in the SQL table creation statement. Currently, only MURMURHASH distribution is supported.
diskeyexprs	pg_node_tree	Character string information obtained by serializing diskey by using the pack_node_to_string() function.

7.2.18.78 PGXC_GROUP

PGXC_GROUP records information about node groups.

Table 7-150 PGXC_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Name of a node group
in_redistribution	"char"	Specifies whether redistribution is required. Valid value: • **n**: The node group is not redistributed. • **y**: The source node group is in redistribution. • **t**: The destination node group is in redistribution.
group_members	oidvector_extend	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_installation	Boolean	Specifies whether to install a sub-cluster. • **t** (true): yes • **f** (false): no
group_acl	aclitem[]	Access permission.
group_kind	"char"	Node group type. The options are as follows: • **i**: installation node group. • **n**: node group in a common cluster. • **e**: elastic cluster. • **s**: system built-in single-DN cluster.
group_parent	oid	For a child node group, this column indicates the OID of the parent node group. For a parent node group, this column is left blank.
bucket_map	text	Mapping between physical buckets and logical buckets.

7.2.18.79 PGXC_SLICE

PGXC_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

Table 7-151 PGXC_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by **type**.
type	"char"	• **'t'**: **relname** is the table name. • **'s'**: **relname** is the shard name.
strategy	"char"	• **'r'**: range distributed table. • **'l'**: list distributed table. This value will be extended for subsequent interval shards.
relid	oid	OID of the distributed table to which the tuple belongs.
referenceoid	oid	OID of the referenced distributed table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distributed table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval	text[]	Reserved column.
transitboundary	text[]	Reserved column.
transitno	integer	Reserved column.
nodeoid	oid	When **relname** is set to a shard name, **nodeoid** indicates the OID of the DN where the shard data is stored.
boundaries	text[]	When **relname** is set to a shard name, this parameter indicates the boundary value of the shard.
specified	boolean	Specifies whether the DN corresponding to the current shard is explicitly specified in the DDL.
sliceorder	integer	User-defined shard sequence.

7.2.18.80 PLAN_TABLE_DATA

PLAN_TABLE_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN_TABLE view, the system catalog PLAN_TABLE_DATA stores EXPLAIN PLAN information collected by all sessions and users.

Table 7-152 PLAN_TABLE_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a worker thread start timestamp and a worker thread ID. Values are constrained by NOT NULL.
user_id	oid	User who inserts the data. Values are constrained by **NOT NULL**.
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query plan ID. The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan.
operation	character varying(30)	Operation description.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
options	character varying(255)	Operation action.
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.

NOTE

- PLAN_TABLE_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the **PLAN_TABLE** view.
- Data of inactive (exited) sessions is cleaned from PLAN_TABLE_DATA by gs_clean after being stored in this system catalog for a certain period of time (5 minutes by default). You can also run **gs_clean -C** to manually delete data of inactive sessions.
- Data is automatically inserted into PLAN_TABLE_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN_TABLE_DATA. Otherwise, data in PLAN_TABLE_DATA may be disordered. To delete data from the table, you are advised to use the **PLAN_TABLE** view.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

7.2.18.81 STATEMENT_HISTORY

STATEMENT_HISTORY displays information about statements executed on the current node. To query this system catalog, you must have the SYSADMIN permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track_stmt_stat_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

column, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.

- If the values in **track_stmt_stat_level** for controlling full SQL statements and slow SQL statements are not **OFF**, the **is_slow_sql** field is recorded as **true** for an SQL statement that exceeds the **log_min_duration_statement** threshold. Other fields are recorded based on the levels in **track_stmt_stat_level**.

Table 7-153 STATEMENT_HISTORY columns

Name	Type	Description	Lowest Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of **debug_query_id** in the Parse packet, DCL statements, and TCL statements is **0**. Statements in a stored procedure use the same ID.	L0
query	text	Normalized SQL (available only on CNs). When **track_stmt_parameter** is enabled, complete SQL statements are displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. (This is meaningless for non-DML statements.)	L0
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. The parsing of complex data types, for example, smalldatetime, also increases the number of parsing times. (This is meaningless for non-DML statements.)	L0
query_plan	text	Statement execution plan.	L1(Full SQL) L0(Slow SQL)
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
n_tuples_fetched	bigint	Number of rows randomly scanned, that is, number of times that TABLE ACCESS BY INDEX ROWID is performed. The process of TABLE ACCESS BY INDEX ROWID is as follows: When you use indexes to query data, if the columns to be queried are not in the indexes, the database engine needs to access the main table again through the primary key or unique identifier in the indexes to obtain the required complete data rows.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned, that is, the sum of the number of live rows obtained by sequential scans and the number of index entries returned by index scans.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block accesses, indicating the total number of blocks read from the buffer and disk.	L0
n_blocks_hit	bigint	Number of buffer block hits, indicating the number of blocks read from the buffer.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).	L0
cpu_time	bigint	Time consumed on the CPU (unit: μs).	L0
execution_time	bigint	Execution time in the executor (unit: μs).	L0
parse_time	bigint	SQL parsing time (unit: μs). (If an exception occurs during parsing, **parse_time** is not recorded.)	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
plan_time	bigint	SQL plan generation time (unit: μs). (If an exception occurs during plan generation, **plan_time** is not recorded.)	L0
rewrite_time	bigint	SQL rewriting time (unit: μs). (If an exception occurs during rewriting, **rewrite_time** is not recorded.)	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).	L0
data_io_time	bigint	I/O time (unit: μs).	L0
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock wait.	L1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
details	bytea	List of wait times, statement lock events, and GSTrace function running time. When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For details about key events in the kernel, see **Table 7-470**, **Table 7-471**, **Table 7-472**, and **Table 7-473**. You can also view the list of all events in the system in the wait_event_info view. For details about the impact of each transaction lock on services, see **LOCK**. In the GStrace full-link tracing function, the **function** field on the GStrace panel indicates the function name, and the parent-child relationship of the function is expressed in a tree structure. The **duration** field on the GStrace panel indicates the function running time, in microseconds. When the record level is **L2**, the list of statement lock events starts to be recorded in chronological order. The number of recorded lock events is determined by the **track_stmt_details_size** parameter. This column is in binary format and needs to be read using the parsing function pg_catalog.statement_detail_decode. For details, see **Table 1-204**. Events include: • LOCK_START: Start locking. • LOCK_END: Complete locking. • LOCK_WAIT_START: Start lock waiting. • LOCK_WAIT_END: Complete lock waiting. • LOCK_RELEASE: Release the lock. • LWLOCK_WAIT_START: Start lightweight lock waiting.	L0/L2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
		• LWLOCK_WAIT_END: Complete lightweight lock waiting.	
is_slow_sql	Boolean	Specifies whether the SQL statement is a slow SQL statement. • **t** (true): yes. • **f** (false): no.	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. **NOTE** • If the statement is executed in SQLBypass mode (you can run the **explain** command to view the plan), there is no risk of slow SQL statements and the information in this column may be missing. • This column can contain a maximum of 256 characters and the excess part will be truncated. Optimize the SQL statement based on the existing prompt information. • In **advise**, table aliases are displayed as table aliases, and column aliases are displayed as original column names.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is **0**.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
finish_status	text	Statement completion status. • **normal** (default) • **cancelled**: cancellation or termination. • **error**: The operation ends due to other exceptions except **cancelled**. **NOTE** If the statement completion status is not **normal**, the statement execution is abnormal. Other columns have no reference value.	L0
used_memory	integer	Memory usage of a single statement (unit: MB).	L0
lock_max_local_count	bigint	Maximum number of locks that can be held by the locallock mechanism.	L0
lock_max_fastpath_count	bigint	Maximum number of locks that can be held by the fastpath mechanism.	L0
lock_max_global_count	bigint	Maximum number of locks that can be held by the primary lock table.	L0
sql_hash	bigint	Hash value of the current SQL statement.	L0
plan_hash	bigint	Hash value of the current SQL plan.	L0
plan_hash_prev	bigint	For a generic plan, the value is the hash value of the previous plan.	L0
driver_start_time	timestamp with time zone	Time when the JDBC driver starts the execution.	L0
driver_wait_response	timestamp with time zone	Time when the JDBC driver starts to wait for the data returned by the database after sending a packet.	L0
driver_finish_time	timestamp with time zone	Time when the JDBC driver receives the data returned by the database.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
driver_info	json	The default value of L0 is **{}**. Starting from L1, the time when the JDBC driver sends and receives packets is recorded. After the **track_stmt_stat_level** parameter is modified, the modification takes effect only for new sessions.	L1
kernel_info	json	Time when database packets are sent and received.	L0
adaptive_join_states	text	Specifies the chosen connection mode of the adaptive connection operator. The format is **[plan_node_id, use_hashjoin]**. The first digit indicates the corresponding **plan_node_id**, and the second digit specifies whether to use HashJoin. The value **1** indicates yes, and the value **0** indicates no.	L0
aplan_count	bigint	Number of Aplan execution times.	L0
aplan_parse_time	bigint	Aplan parsing time.	L0
aplan_execution_time	bigint	Aplan execution time.	L0
relids	text	pg_class.oid involving tables in the statement. Separate multiple tables with commas (,).	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The record level of the **query_plan** column is L1 for full SQL statements and L0 for slow SQL statements.
- For the **db_time** time model, the time statistics of each dimension in **statement_history** meet the requirement that **db_time** is greater than or equal to **max(cpu_time, parse_time, plan_time, rewrite_time, data_io_time, net_send_info.time, net_recv_info.time, net_stream_send_info.time, net_stream_recv_info.time)**.
- The **query** column in statement_history is obtained from the unique SQL hash table. This process creates the LWLock wait event UniqueSQLMappingLock. By then, **db_time** has already ended, so it does not include this time. Therefore, if **instr_unique_sql_count** is set to a large value, **lwlock_wait_time** may be greater than **db_time**.
- For the **db_time** time model formula, the following dimensions are not included in the statistical range:
  - **execution_time**
  - **pl_execution_time**
  - **pl_compilation_time**
- The maximum nesting depth of wait events is **20**. If the nesting depth exceeds 20, a new wait event overwrites the last wait event.
- Adaptive join does not support distributed mode. Therefore, **adaptive_join_states** does not take effect in distributed mode.
- SQL plan management does not support the distributed mode. Therefore, **sql_hash**, **plan_hash**, and **plan_hash_prev** do not take effect in the distributed mode.
- Statistics about statements in a stored procedure executed on a DN are not aggregated.
- The **CPU_TIME** value of the statement in the stored procedure is **0**.
- Lock-related metrics of sub-statements in a distributed stored procedure are not aggregated to the top-level statements.
- If a query plan fails to be recorded, the cause of the failure is displayed in the **query_plan** column. The following are some examples:
  - In the LightProxy scenario, statements are pushed down, and the plan is recorded on DNs instead of CNs. Message: "The current plan is lightproxy. Please check the query_plan on the DN node."
  - In the Stream scenario, the plan is pushed down and recorded on CNs instead of DNs. Message: "The current plan is streaming. Please check the query_plan on the CN node."
  - For COMMIT statements that are automatically committed by DML statements, related plans are not recorded. Message: "The current record is a transaction commit of a DML statement. Please check the plan of this DML statement."
  - Plans are not recorded for non-DML/DQL statements. Message: "Do not record plans for non-DML/DQL statements." For DDL statements, in a cluster with multiple CNs, query_plan records information about interactions between nodes.
  - Plans are not recorded for substatements that are not adapted or have no plan in a stored procedure, such as simple expressions, OPEN CURSOR, CLOSE, and BYPASS path statements. Plans for substatements executed in a stored procedure are not recorded on DNs. The message "Statement has no plan or is unsupported for plan recording." is displayed.
  - For SQL statements that have entered the PARSE phase, no plan has been generated and therefore the statements are not recorded. Message: "This statement is a PARSE statement and has not yet generated a query plan."
  - When the system checks whether **query_plan** needs to be reported, the SQL statement execution is not slow, but the overall execution of the SQL statements is slow due to subsequent tasks such as cleanup. Message: "Check the reported query_plan time is 2026-01-01 08:05:01.735619+08, at this time the SQL is not slow."

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the statement execution status is abnormal, the plan may fail to be recorded. In this case, check the logs to analyze the cause. Message: "An error occurred during statement execution. Please check the log for analysis."
- For other scenarios where the recording fails, check the logs to analyze the cause. Message: "The query plan failed to be recorded. Please check the log analysis."

7.2.18.82 STREAMING_STREAM

STREAMING_STREAM records the metadata of all STREAM objects.

Table 7-154 STREAMING_STREAM column

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

7.2.18.83 STREAMING_CONT_QUERY

STREAMING_CONT_QUERY records the metadata of all CONTVIEW objects.

Table 7-155 STREAMING_CONT_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. ● **'r'**: CONTVIEW is based on the row-store model.
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.
active	Boolean	Specifies whether the CONTVIEW is in the continuous computing state. ● **t** (true): yes. ● **f** (false): no.
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
step_factor	smallint	CONTVIEW step mode. The main values are **0** (no overlapping window) and **1** (sliding window, with one step).
ttl	integer	Value of **ttl_interval** set by CONTVIEW.
ttl_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

7.3 System Views

7.3.1 Partitioned Tables

7.3.1.1 ADM_IND_PARTITIONS

ADM_IND_PARTITIONS displays partition information about local indexes of partitioned tables in the database. Each local index partition (if any) of a partitioned table in the database has a corresponding row in ADM_IND_PARTITIONS. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-156 ADM_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of an index partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the subpartitioned table. This table does not store subpartition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of subpartitions in a partition. This table does not store subpartition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains a partition.
pct_free	numeric	Minimum percentage of available space in a block.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
pct_direct_access	numeric	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.1.2 ADM_IND_SUBPARTITIONS

ADM_IND_SUBPARTITIONS displays partition information about local indexes (excluding global indexes of partitioned tables) of subpartitioned tables in the database. Each local index partition (if any) of a subpartitioned table in the database has a corresponding row in ADM_IND_SUBPARTITIONS. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-157 ADM_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the partition where an index is located.
subpartition_name	character varying(64)	Name of the subpartition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the subpartition in a partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Compression type used for subpartitions.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a subpartition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Buffer pool of a subpartition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.3 ADM_PART_COL_STATISTICS

ADM_PART_COL_STATISTICS displays column statistics and histogram information about all table partitions in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-158 ADM_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Number of different values in a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on the column, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on the column, the value of this column is **1/ NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	date	Date when the column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
notes	character varying(63)	Not supported. The value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
schema	character varying(64)	Name of the namespace to which a column belongs.

NOTE

In ORA-compatible mode, if the GUC parameter **mapping_date_to_datea** is set to **on** during database initialization, the type of the **last_analyzed** column in the view is changed to datea. If the GUC parameter **mapping_date_to_datea** is set to **off**, the type of the **last_analyzed** column in the view is changed to timestamp(0) without time zone.

7.3.1.4 ADM_PART_INDEXES

ADM_PART_INDEXES displays information about all partitioned table indexes in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-159 ADM_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Owner name of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of a partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Name of the schema to which a partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current subpartitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.

7.3.1.5 ADM_PART_TABLES

ADM_PART_TABLES displays information about all partitioned tables in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-160 ADM_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed.
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.
status	character varying(8)	Not supported. The value is **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. The value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. The value is **NULL**.
def_next_extent	character varying(40)	Not supported. The value is **NULL**.
def_min_extents	character varying(40)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_max_extents	character varying(40)	Not supported. The value is **NULL**.
def_max_size	character varying(40)	Not supported. The value is **NULL**.
def_pct_increase	character varying(40)	Not supported. The value is **NULL**.
def_freelists	numeric	Not supported. The value is **NULL**.
def_freelist_groups	numeric	Not supported. The value is **NULL**.
def_logging	character varying(7)	Not supported. The value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. • NONE • ENABLED • DISABLED
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. The value is **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. The value is **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. The value is **NULL**.
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. The value is **NO**.
interval_subpartition	character varying(1000)	Not supported. The value is **NULL**.
autolist_subpartition	character varying(3)	Not supported. The value is **NO**.
is_nested	character varying(3)	Not supported. The value is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, the value is **YES**.
def_indexing	character varying(3)	Not supported. The value is **ON**.
def_inmemory	character varying(8)	Not supported. The value is **NONE**.
def_inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
def_read_only	character varying(3)	Not supported. The value is **NO**.
def_cellmemory	character varying(24)	Not supported. The value is **NULL**.
def_inmemory_service	character varying(12)	Not supported. The value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.6 ADM_SUBPART_KEY_COLUMNS

ADM_SUBPART_KEY_COLUMNS displays information about the partition key columns of subpartitioned tables or partitioned indexes in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas. The distributed system does not support subpartitioned tables. All columns in this view are set to **NULL**.

Table 7-161 ADM_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a subpartitioned table or index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
name	character varying(128)	Name of a subpartitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a subpartitioned table. • Its value is **index** for a subpartitioned index.
column_name	character varying(4000)	Subpartition key column name of a subpartitioned table.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. The value is **NULL**.

7.3.1.7 ADM_TAB_PARTITIONS

ADM_TAB_PARTITIONS displays information about partitions (including subpartitioned tables) in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-162 ADM_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name
partition_name	character varying(64)	Partition name.
high_value	text	Limit of the partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
composite	character varying(3)	Specifies whether the table is a subpartitioned table.
subpartition_count	bigint	Number of subpartitions.
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to a table are logged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. The value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. The value is **NULL**.
read_only	character varying(4)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.

7.3.1.8 ADM_TAB_SUBPARTITIONS

ADM_TAB_SUBPARTITIONS displays information about all subpartitions in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-163 ADM_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Subpartition name.
high_value	text	Limit of a subpartition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a subpartitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a subpartition.

7.3.1.9 DB_IND_PARTITIONS

DB_IND_PARTITIONS displays partition information about local indexes (excluding global indexes of partitioned tables) of partitioned tables accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-164 DB_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partition_name	character varying(64)	Name of an index partition.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the subpartitioned table. This table does not store subpartition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of subpartitions in a partition. This table does not store subpartition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tablespace_name	name	Name of the tablespace that contains a partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
pct_direct_access	numeric	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. The value is **NULL**.

7.3.1.10 DB_IND_SUBPARTITIONS

DB_IND_SUBPARTITIONS displays partition information about local indexes (excluding global indexes of partitioned tables) of subpartitioned tables accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-165 DB_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the partition where an index is located.
subpartition_name	character varying(64)	Name of the subpartition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition.
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the subpartition in a partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Compression type used for subpartitions.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a subpartition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Buffer pool of a subpartition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.11 DB_PART_COL_STATISTICS

DB_PART_COL_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-166 DB_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on the column, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on the column, the value of this column is **1/ NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	date	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
notes	character varying(63)	Not supported. The value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
schema	character varying(64)	Name of the namespace to which a column belongs.

NOTE

In ORA-compatible mode, if the GUC parameter **mapping_date_to_datea** is set to **on** during database initialization, the type of the **last_analyzed** column in the view is changed to datea. If the GUC parameter **mapping_date_to_datea** is set to **off**, the type of the **last_analyzed** column in the view is changed to timestamp(0) without time zone.

7.3.1.12 DB_PART_INDEXES

DB_PART_INDEXES displays information about partitioned table indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-167 DB_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Owner name of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of a partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Name of the schema to which a partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current subpartitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.

7.3.1.13 DB_PART_KEY_COLUMNS

DB_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-168 DB_PART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. The value is **NULL**.

7.3.1.14 DB_PART_TABLES

DB_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-169 DB_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.
status	character varying(8)	Not supported. The value is **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. The value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. The value is **NULL**.
def_next_extent	character varying(40)	Not supported. The value is **NULL**.
def_min_extents	character varying(40)	Not supported. The value is **NULL**.
def_max_extents	character varying(40)	Not supported. The value is **NULL**.
def_max_size	character varying(40)	Not supported. The value is **NULL**.
def_pct_increase	character varying(40)	Not supported. The value is **NULL**.
def_freelists	numeric	Not supported. The value is **NULL**.
def_freelist_groups	numeric	Not supported. The value is **NULL**.
def_logging	character varying(7)	Not supported. The value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. • NONE - Not specified • ENABLED • DISABLED

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. The value is **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. The value is **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. The value is **NULL**.
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. The value is **NO**.
interval_subpartition	character varying(1000)	Not supported. The value is **NULL**.
autolist_subpartition	character varying(3)	Not supported. The value is **NO**.
is_nested	character varying(3)	Not supported. The value is **NO**.
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, the value is **YES**.
def_indexing	character varying(3)	Not supported. The value is **ON**.
def_inmemory	character varying(8)	Not supported. The value is **NONE**.
def_inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_read_only	character varying(3)	Not supported. The value is **NO**.
def_cellmemory	character varying(24)	Not supported. The value is **NULL**.
def_inmemory_service	character varying(12)	Not supported. The value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.15 DB_SUBPART_KEY_COLUMNS

DB_SUBPART_KEY_COLUMNS displays information about the partition key columns of subpartitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas. The distributed system does not support subpartitioned tables. All columns in this view are set to **NULL**.

Table 7-170 DB_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a subpartitioned table or index.
name	character varying(128)	Name of a subpartitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Subpartition key column name of a subpartitioned table.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. The value is **NULL**.

7.3.1.16 DB_TAB_PARTITIONS

DB_TAB_PARTITIONS displays information about partitions (including subpartitioned tables) accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-171 DB_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of the partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a subpartitioned table.
subpartition_count	bigint	Number of subpartitions.
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. The value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. The value is **NULL**.
read_only	character varying(4)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inmemory_service_name	character varying(100)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.

7.3.1.17 DB_TAB_SUBPARTITIONS

DB_TAB_SUBPARTITIONS displays information about subpartitioned tables accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-172 DB_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Subpartition name.
high_value	text	Limit of a subpartition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a subpartitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a subpartition.
partition_position	numeric	Position of the partition in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
subpartition_position	numeric	Position of the subpartition in a partition.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(3)	Specifies whether the changes made to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. The value is **NULL**.
num_rows	numeric	Number of rows in a subpartition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.
buffer_pool	character varying(7)	Buffer pool of a subpartition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether a segment is created in a subpartitioned table.
indexing	character varying(3)	Not supported. The value is **NULL**.
read_only	character varying(3)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.

Name	Type	Description
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.

7.3.1.18 MY_IND_PARTITIONS

MY_IND_PARTITIONS displays partition information about local indexes (excluding global indexes of partitioned tables) of partitioned tables accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-173 MY_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of an index partition.
def_tablespace_name	name	Tablespace name of an index partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the subpartitioned table. This table does not store subpartition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of subpartitions in a partition. This table does not store subpartition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tablespace_name	name	Name of the tablespace that contains a partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
pct_direct_access	numeric	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. The value is **NULL**.

7.3.1.19 MY_IND_SUBPARTITIONS

MY_IND_SUBPARTITIONS displays partition information about local indexes (excluding global indexes of partitioned tables) of subpartitioned tables owned by the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-174 MY_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the partition where an index is located.
subpartition_name	character varying(64)	Name of the subpartition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_partition_usable	boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the subpartition in a partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to an index are logged.
compression	character varying(13)	Compression type used for subpartitions.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a subpartition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_analyzed	timestamp with time zone	Date when a partition was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Buffer pool of a subpartition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.20 MY_PART_COL_STATISTICS

MY_PART_COL_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-175 MY_PART_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on the column, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on the column, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	date	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
notes	character varying(63)	Not supported. The value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
schema	character varying(64)	Name of the namespace to which a column belongs.

NOTE

In ORA-compatible mode, if the GUC parameter **mapping_date_to_datea** is set to **on** during database initialization, the type of the **last_analyzed** column in the view is changed to datea. If the GUC parameter **mapping_date_to_datea** is set to **off**, the type of the **last_analyzed** column in the view is changed to timestamp(0) without time zone.

7.3.1.21 MY_PART_INDEXES

MY_PART_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-176 MY_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Owner name of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of a partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema	character varying(64)	Schema of a partitioned table index.
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current subpartitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.

7.3.1.22 MY_PART_KEY_COLUMNS

MY_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-177 MY_PART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
collated_column_id	numeric	Not supported. The value is **NULL**.

7.3.1.23 MY_PART_TABLES

MY_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-178 MY_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partitioning policy of a subpartitioned table. For a partitioned table, **NONE** is displayed.
def_subpartition_count	integer	Default number of subpartitions to be created. The value is **1** for a subpartitioned table and **0** for a partitioned table.
subpartitioning_key_count	integer	Number of subpartition keys of a partitioned table.
status	character varying(8)	Not supported. The value is **valid**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. The value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. The value is **NULL**.
def_next_extent	character varying(40)	Not supported. The value is **NULL**.
def_min_extents	character varying(40)	Not supported. The value is **NULL**.
def_max_extents	character varying(40)	Not supported. The value is **NULL**.
def_max_size	character varying(40)	Not supported. The value is **NULL**.
def_pct_increase	character varying(40)	Not supported. The value is **NULL**.
def_freelists	numeric	Not supported. The value is **NULL**.
def_freelist_groups	numeric	Not supported. The value is **NULL**.
def_logging	character varying(7)	Not supported. The value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. • NONE • ENABLED • DISABLED

def_inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.

7.3.1.24 MY_SUBPART_KEY_COLUMNS

MY_SUBPART_KEY_COLUMNS displays information about the partition key columns of subpartitioned tables or partitioned indexes owned by the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas. The distributed system does not support subpartitioned tables. All columns in this view are set to **NULL**.

Table 7-179 MY_SUBPART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a subpartitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Subpartition key column name of a subpartitioned table.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. The value is **NULL**.

7.3.1.25 MY_TAB_PARTITIONS

MY_TAB_PARTITIONS displays information about all partitions (including subpartitioned tables) accessible to the current user. Each partition of a partitioned table accessible to the current user has one record in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

MY_TAB_PARTITIONS. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-180 MY_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of the partition. • For range partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a subpartitioned table.
subpartition_count	bigint	Number of subpartitions.
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. The value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a partition was last analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. The value is **NULL**.
read_only	character varying(4)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.

7.3.1.26 MY_TAB_SUBPARTITIONS

MY_TAB_SUBPARTITIONS displays information about all subpartitioned tables accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-181 MY_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
schema	character varying(64)	Schema name.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Subpartition name.
high_value	text	Boundary value expression in a subpartition.
high_value_length	integer	Length of the boundary value expression in subpartition.
partition_position	numeric	Position of the partition in the table.
subpartition_position	numeric	Position of the subpartition in a partition.
tablespace_name	name	Name of the tablespace that contains a subpartition.
pct_free	numeric	Minimum percentage of available space in a block.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_used	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether the changes made to a table are logged. • YES • NO
compression	character varying(8)	Specifies whether a subpartition is compressed. Value range: **ENABLED** and **DISABLED**.
compress_for	character varying(30)	Not supported. The value is **NULL**.
num_rows	numeric	Not supported. The value is **NULL**.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buffer_pool	character varying(7)	Buffer pool of a subpartition. • DEFAULT • KEEP • RECYCLE • NULL
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether this partition is an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether a subpartition segment has been created. • **YES**: created. • **NO**: not created. • **N/A**: The table does not have subpartitions.
indexing	character varying(3)	Not supported. The value is **NULL**.
read_only	character varying(5)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.

7.3.1.27 GS_STATIO_ALL_PARTITIONS

GS_STATIO_ALL_PARTITIONS contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the gs_statio_get_all_partitions_stats() function.

Table 7-182 GS_STATIO_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of a partition schema.
relname	name	Name of the table where a partition is located.
partition_name	name	Name of the partition to which a partition belongs.
sub_partition_name	name	Name of the subpartition to which a partition belongs. The distributed system does not support subpartitions. Set it to **NULL**.
heap_blks_read	bigint	Number of disk blocks read from the partition.
heap_blks_hit	bigint	Number of cache hits in the partition.
idx_blks_read	bigint	Number of disk blocks read from all indexes on the partition.
idx_blks_hit	bigint	Number of cache hits of all indexes in a partition.
toast_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partition (if any).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_hit	bigint	Number of buffer hits in the partition's TOAST table partition (if any).
tidx_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partitioned index (if any).
tidx_blks_hit	bigint	Specifies the number of buffer hits in the partition's TOAST table partitioned index (if any).

7.3.1.28 GS_STAT_XACT_ALL_PARTITIONS

GS_STAT_XACT_ALL_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the gs_stat_get_xact_all_partitions_stats() function.

Table 7-183 GS_STAT_XACT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of a partition schema.
relname	name	Name of the table where a partition is located.
partition_name	name	Name of the partition to which a partition belongs.
sub_partition_name	name	Name of the subpartition to which a partition belongs. The distributed system does not support subpartitions. Set it to **NULL**.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Specifies the number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Specifies the number of live rows fetched by index scans.
n_tup_ins	bigint	Specifies the number of rows inserted.
n_tup_upd	bigint	Specifies the number of rows updated.
n_tup_del	bigint	Specifies the number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.1.29 GS_STAT_ALL_PARTITIONS

GS_STAT_ALL_PARTITIONS displays information about each partition in all partitioned tables in the current database. Each partition occupies a row, showing statistics about access to the partition. The current version does not support the update of subpartition statistics. The view information is queried by the gs_stat_get_all_partitions_stats() function.

Table 7-184 GS_STAT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of the table to which a partition belongs.
relname	name	Name of the table where a partition is located.
partition_name	name	Name of the partition to which a partition belongs.
sub_partition_name	name	Name of the subpartition to which a partition belongs.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Specifies the number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Specifies the number of live rows fetched by index scans.
n_tup_ins	bigint	Specifies the number of rows inserted.
n_tup_upd	bigint	Specifies the number of rows updated.
n_tup_del	bigint	Specifies the number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of dead row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that a partition is cleared.
autovacuum_count	bigint	Number of times that a partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that a partition is analyzed.
autoanalyze_count	bigint	Number of times that a partition is analyzed by the autovacuum daemon thread.

7.3.2 Workload Management

7.3.2.1 GS_WLM_CGROUP_INFO

GS_WLM_CGROUP_INFO displays information about a Cgroup for a job that is being executed.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 7-185 GS_WLM_CGROUP_INFO columns

Name	Type	Description
cgroup_name	text	Cgroup name.
priority	integer	Priority of the job.
usage_percent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
cpuacct	bigint	Allocated CPU quota.
cpuset	text	Allocated CPU cores.
relpath	text	Relative path of the Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
valid	text	Specifies whether the Cgroup is valid.
node_group	text	Reserved column.

7.3.2.2 GS_WLM_REBUILD_USER_RESOURCE_POOL

Rebuilds a user's resource pool information in memory on the current connection node. It is used as a remedy only when resource pool information is missing or disordered. Only users with the SYSADMIN permission can query this view.

Table 7-186 GS_WLM_REBUILD_USER_RESOURCE_POOL columns

Name	Type	Description
gs_wlm_rebuild_user_resource_pool	Boolean	Rebuilds information about the user resource pool in the memory. **t** indicates success, and **f** indicates failure.

7.3.2.3 GS_WLM_USER_INFO

GS_WLM_USER_INFO displays user statistics. Only users with the SYSADMIN permission can query this view.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 7-187 GS_WLM_USER_INFO columns

Name	Type	Description
userid	oid	OID of a user.
username	name	Username.
sysadmin	Boolean	Specifies whether the user is an administrator. • **t** (true): yes. • **f** (false): no.
rpoid	oid	OID of the associated resource pool.
respool	name	Name of the associated resource pool.
parentid	oid	OID of the user group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
totalspace	bigint	Available space limit of the user.
spacelimit	bigint	User table space limit.
childcount	integer	Number of child users.
childlist	text	Child user list.

7.3.2.4 GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO

Views the real-time concurrency usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN node. You need to log in to the standby node and use the system function **gs_wlm_respool_concurrency_info()** to query the usage of concurrent tasks.

Table 7-188 GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	text	Name of a resource pool.
max_concurrency	integer	Maximum number of concurrent queries allowed by the resource pool.
running_concurrency	integer	Number of concurrent tasks that are being executed in the current resource pool.
waiting_concurrency	integer	Number of concurrent tasks that are waiting in the current resource pool.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_concurrency | running_concurrency | waiting_concurrency
-------------+--------------+-----------------+---------------------+---------------------
 coordinator1 | default_pool |              -1 |                   1 |                   0
 datanode3    | default_pool |              -1 |                   1 |                   0
 datanode1    | default_pool |              -1 |                   1 |                   0
 datanode2    | default_pool |              -1 |                   1 |                   0
(4 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.2.5 GLOBAL_WLM_RESPOOL_CONNECTION_INFO

This view is used to view the real-time connection usage of resource pool on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN node. You need to log in to the standby node and use the system function **gs_wlm_respool_connection_info()** to query the usage of concurrent tasks.

Table 7-189 GLOBAL_WLM_RESPOOL_CONNECTION_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	text	Name of a resource pool.
max_connections	integer	Maximum number of connections to a resource pool.
curr_connections	integer	Number of existing connections in the current resource pool.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_connections | curr_connections
-------------+--------------+-----------------+------------------
 coordinator1 | default_pool |              -1 |                1
 datanode2    | default_pool |              -1 |                2
 datanode3    | default_pool |              -1 |                2
 datanode1    | default_pool |              -1 |                2
(4 rows)
```

7.3.2.6 GLOBAL_WLM_RESPOOL_CPU_INFO

This view is used to view the real-time CPU usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN node. You need to log in to the standby node and use the system function **gs_wlm_respool_cpu_info()** to query the usage of CPU.

Table 7-190 GLOBAL_WLM_RESPOOL_CPU_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	text	Name of a resource pool.
control_group	text	Cgroup name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_affinity	text	Value of cores bound to the CPU.
cpu_usage	integer	CPU usage of a resource pool. **NOTE** If the CN and DN are deployed together, the CN and DN share the same CPU resources. Therefore, the **cpu_usage** values of the CN and DN are the same. If the CN and DN are independently deployed, the **cpu_usage** values of the CN and DN are displayed separately.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name |    control_group    | cpu_affinity | cpu_usage
--------------+--------------+---------------------+--------------+-----------
 coordinator1 | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode1    | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode2    | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode3    | default_pool | DefaultClass:Medium | 0-71         |         0
(4 rows)
```

7.3.2.7 GLOBAL_WLM_RESPOOL_IO_INFO

This view is used to view the real-time I/O usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN node. You need to log in to the standby node and use the system function **gs_wlm_respool_io_info()** to query the usage of I/Os.

Table 7-191 GLOBAL_WLM_RESPOOL_IO_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	text	Name of a resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_limits	integer	Upper limit of IOPS. The value **0** indicates there is no limit. • Row-store: The unit is determined by GUC parameter **io_control_unit**, which is used to count the number of I/Os during I/O control. The value of **io_control_unit** is **1**, which indicates one IOPS.
io_priority	text	I/O priority set for jobs that consume I/O resources. It takes effect when the I/O usage reaches 90%. **None** indicates there is no control.
current_iops	integer	Number of times that the current I/O has been triggered. The current I/O statistics occasionally exceed the upper limit, which is related to the I/O statistics algorithm and is normal.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | io_limits | io_priority | current_iops
--------------+--------------+-----------+-------------+--------------
 coordinator1 | default_pool |         0 | None        |            0
 datanode2    | default_pool |         0 | None        |            0
 datanode3    | default_pool |         0 | None        |            0
 datanode1    | default_pool |         0 | None        |            0
(4 rows)
```

7.3.2.8 GLOBAL_WLM_RESPOOL_MEMORY_INFO

This view is used to view the real-time memory usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN node. You need to log in to the standby node and use the system function **gs_wlm_respool_memory_info()** to query the memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-192 GLOBAL_WLM_RESPOOL_MEMORY_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	text	Name of a resource pool.
max_dynamic_memory	text	Maximum dynamic memory that can be used.
current_dynamic_memory	text	Used dynamic memory.
max_shared_memory	text	Maximum shared memory that can be used.
current_shared_memory	text	Shared memory that has been used.
shared_memory_hits_percent	integer	This function is unavailable and is reserved for future evolution. This column is reserved and the value is **0**.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_dynamic_memory | current_dynamic_memory | max_shared_memory |
current_shared_memory | shared_memory_hits_percent
-------------+--------------+--------------------+------------------------+-------------------+------------------------
+---------------------------
 coordinator1 | default_pool | -1                 | 9415kB                 | -1                | 3856kB
|                          0
 datanode1    | default_pool | -1                 | 10724kB                | -1                | 2808kB
|                          0
 datanode2    | default_pool | -1                 | 10724kB                | -1                | 2808kB
|                          0
 datanode3    | default_pool | -1                 | 10724kB                | -1                | 560kB
|                          0
(4 rows)
```

7.3.2.9 PGXC_WLM_REBUILD_USER_RESPOOL

Rebuilds a user's resource pool information in memory on all nodes. It is used as a remedy only when resource pool information is missing or disordered. Only users with the SYSADMIN permission can query this view.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-193 PGXC_WLM_REBUILD_USER_RESPOOL columns

Name	Type	Description
gs_wlm_rebuild_user_resource_pool	Boolean	Rebuilds information about the user resource pool in the memory. **t** indicates success, and **f** indicates failure.

7.3.3 OLTP Table Compression

7.3.3.1 GS_ADM_ILMDATAMOVEMENTPOLICIES

GS_ADM_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions. Only system administrators can access this system view.

Table 7-194 GS_ADM_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.
node_name	name	Name of a data source node.

7.3.3.2 GS_ADM_ILMOBJECTS

GS_ADM_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status. Only SYSADMINs can access this system view.

Table 7-195 GS_ADM_ILMOBJECTS columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
object_owner	character varying(128)	Owner of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(24)	Data object type. Value range: • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **GLOBAL PARTITIONED INDEX**: global index. • **GLOBAL SECONDARY INDEX**: global secondary index. • **INDEX PARTITION**: index partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. Value range: • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **POLICY NOT INHERITED**: not inherited.
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. In the current version, this parameter is set to **NULL**.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

7.3.3.3 GS_ADM_ILMPOLICIES

GS_ADM_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status. Only users with the SYSADMIN permission can access this system view.

Table 7-196 GS_ADM_ILMPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.
node_name	name	Name of a data source node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.3.4 GS_ADM_ILMEVALUATIONDETAILS

GS_ADM_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name. By default, only SYSADMINs can access the system view.

Table 7-197 GS_ADM_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(24)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **GLOBAL PARTITIONED INDEX**: global index. • **GLOBAL SECONDARY INDEX**: global secondary index. • **INDEX PARTITION**: index partition.
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.3.5 GS_ADM_ILMPARAMETERS

GS_ADM_ILMPARAMETERS displays the environment parameters related to ILM scheduling and execution. The parameters can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM API. By default, only users with the SYSADMIN permission can access the system view.

Table 7-198 GS_ADM_ILMPARAMETERS columns

Name	Type	Description
name	character varying(128)	ADO-related environment parameters, which can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM API.
value	numeric	Parameter value.

7.3.3.6 GS_ADM_ILMRESULTS

GS_ADM_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized.

Table 7-199 GS_ADM_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.3.7 GS_ADM_ILMTASKS

GS_ADM_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized.

Table 7-200 GS_ADM_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task. This column exists only in the ADM view.
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated.
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

7.3.3.8 GS_MY_ILMEVALUATIONDETAILS

GS_MY_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name.

Table 7-201 GS_MY_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(24)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **GLOBAL PARTITIONED INDEX**: global index. • **GLOBAL SECONDARY INDEX**: global secondary index. • **INDEX PARTITION**: index partition.
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

7.3.3.9 GS_MY_ILMRESULTS

GS_MY_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time.

Table 7-202 GS_MY_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

7.3.3.10 GS_MY_ILMTASKS

GS_MY_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time.

Table 7-203 GS_MY_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task.
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated.
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

7.3.3.11 GS_MY_ILMDATAMOVEMENTPOLICIES

GS_MY_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions.

Table 7-204 GS_MY_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.
node_name	name	Name of a data source node.

7.3.3.12 GS_MY_ILMOBJECTS

GS_MY_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status.

Table 7-205 GS_MY_ILMOBJECTS

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(24)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **GLOBAL PARTITIONED INDEX**: global index. • **GLOBAL SECONDARY INDEX**: global secondary index. • **INDEX PARTITION**: index partition.
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. The options are as follows: • **TABLE**: table. • **TABLE PARTITION**: partition. • **TABLE SUBPARTITION**: subpartition. • **INDEX**: ordinary index. • **POLICY NOT INHERITED**: not inherited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. The value is **null** in the current version.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

7.3.3.13 GS_MY_ILMPOLICIES

GS_MY_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status.

Table 7-206 GS_MY_ILMPOLICIES

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.
node_name	name	Name of a data source node.

7.3.4 Communications

7.3.4.1 COMM_CLIENT_INFO

COMM_CLIENT_INFO displays information about active client connections of a single node (You can query this view on a DN to view the information about the connection between the CN and DN). By default, only users with the SYSADMIN permission can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-207 COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Name of the current DN, for example, dn_6001_6002_6003.
app	text	Query a view on a DN. The app displays the client connected to the current DN, such as the coordinator (CN), GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	**socket fd** is displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

7.3.4.2 GLOBAL_COMM_CLIENT_INFO

GLOBAL_COMM_CLIENT_INFO queries information about active client connections of global nodes in a cluster. By default, only users with the SYSADMIN permission can access this system view.

Table 7-208 GLOBAL_COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Current node name.
app	text	Client that connects to the current DN, such as a CN, GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	Displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
logic_id	integer	Displayed if the connection is a logical connection.

7.3.4.3 GS_COMM_LISTEN_ADDRESS_EXT_INFO

GS_COMM_LISTEN_ADDRESS_EXT_INFO queries DFX information, such as threads, sessions, and socket, for connecting the extended IP addresses of the current DN. For details about the application scenarios, see **gs_comm_listen_address_ext_info()**.

Table 7-209 GS_COMM_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.
local_port	text	Local port of the current connection.

7.3.4.4 GS_GET_LISTEN_ADDRESS_EXT_INFO

GS_GET_LISTEN_ADDRESS_EXT_INFO queries the extended IP address configured for the current DN instance. For details about the application scenarios, see **gs_get_listen_address_ext_info()**.

Table 7-210 GS_GET_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	DN name.
host	text	Listening IP address of a DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
port	bigint	Listening port of a DN.
ext_listen_ip	text	Extended IP address configured for a DN.

7.3.4.5 GS_LIBCOMM_FD_INFO

Records information about socket persistent connections of the libcomm communications library. Only the user with the PUBLIC permission can query this view.

Table 7-211 GS_LIBCOMM_FD_INFO columns

Name	Type	Description
node_name	text	DN name.
ip	text	IP address of the DN.
ctrl_port	bigint	Control channel port.
data_port	bigint	Data channel port.
remote_name	text	Instance name of the DN at the peer site.
remote_ip	text	Peer IP address.
remote_port	bigint	Peer port number.
local_ip	text	Local IP address.
local_port	bigint	Local port number.
fd	bigint	Socket connection.
type	text	Type of the TCP connection channel. The options are as follows: • **DATA_SEND_FD**: socket of the sender of the data channel • **DATA_RECV_FD**: socket of the receiver of the data channel. • **CTL_SEND_FD**: socket of the sender of the control channel. • **CTL_RECV_FD**: socket of the receiver of the control channel.

7.3.4.6 GS_LIBCOMM_MEMORY_INFO

Records the basic configuration information used by the internal memory of the current libcomm communications library. Only the user with the PUBLIC permission can query this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-212 GS_LIBCOMM_MEMORY_INFO columns

Name	Type	Description
node_name	text	DN name.
current_used_memory	bigint	Memory used by the libcomm communications library, in bytes.
current_data_item_num	bigint	Number of data blocks in the libcomm lockless queue.
init_mailbox_memory	bigint	Memory used by libcomm to initialize the mailbox, in bytes.
max_datanode	bigint	Maximum number of DNs supported by the libcomm communications library.
max_stream	bigint	Maximum number of data streams supported by a single TCP connection of the libcomm.
max_quota_size	bigint	Total buffer size of the libcomm logical connection, in bytes.
max_usable_memory	bigint	Maximum memory that can be used by the libcomm communications library cache, in bytes.
max_memory_pool	bigint	Total size of the memory resource pool that can be used by the libcomm communications library on each DN. The unit is byte.

7.3.4.7 GS_STATIC_THREADPOOL_CTRL_STATUS

GS_STATIC_THREADPOOL_CTRL_STATUS returns statistics about static threads related to the thread pool of the current instance. When the thread pool is enabled, the CN thread pool can be queried using this view. A blank line is returned when a DN is connected for query or the thread pool is disabled. If **static_thread_pool_num** is set to **0** or less than the number of groups in the thread pool, the default value of the static thread pool is **0**. Only the user with the PUBLIC permission can query this view.

Table 7-213 GS_STATIC_THREADPOOL_CTRL_STATUS columns

Name	Type	Description
node_name	text	Instance name.
group_id	integer	Group ID of the thread pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
worker_info	text	Dynamic statistics about the running thread pool of the current group. The information includes: **default** and **default_s**: number of threads, referring to the default number of threads in the dynamic thread pool and that of the static thread pool, respectively. **expect** and **expect_s**: number of threads, referring to the expected number of threads in the dynamic thread pool and that of the static thread pool, respectively. **actual**: actual number of running threads, including dynamic pool threads and static pool threads. **static threads limit**: indicates the number of static pool threads configured for the current group. **has static threads**: specifies whether a static pool is created for the current group. The default value is **0**, indicating that no user is created. **idle static threads**: number of idle static pool threads. **wait session num**: number of waiting sessions.

7.3.4.8 PG_COMM_DELAY

PG_COMM_DELAY displays the communications library delay status for a single DN.

Table 7-214 PG_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

7.3.4.9 PG_COMM_RECV_STREAM

PG_COMM_RECV_STREAM displays the receiving stream status of all the communications libraries for a single DN.

Table 7-215 PG_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

7.3.4.10 PG_COMM_SEND_STREAM

PG_COMM_SEND_STREAM displays the sending stream status of all the communication libraries for a single DN.

Table 7-216 PG_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current lifecycle of a stream. The unit is ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

7.3.4.11 PG_COMM_STATUS

PG_COMM_STATUS displays the communications library status for a single DN.

Table 7-217 PG_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in KB/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in KB/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

7.3.4.12 PG_GET_INVALID_BACKENDS

PG_GET_INVALID_BACKENDS displays information about current standby DN background threads connected to the CN. Only system administrators and monitor administrators can access this view.

Table 7-218 PG_GET_INVALID_BACKENDS columns

Name	Type	Description
pid	bigint	Thread ID
node_name	text	Node information connected to the background thread.
dbname	name	Name of the connected database.
backend_start	timestamp with time zone	Background thread startup time.
query	text	Query statement executed by the background thread.

7.3.4.13 PG_POOLER_STATUS

PG_POOLER_STATUS queries the cache connection status in the pooler. This view can only query on the CN, and displays the connection cache information about the pooler module.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-219 PG_POOLER_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	• ID of the thread connected to the CN for non-thread pool logic. • Session ID for connecting to the CN for thread pool logic.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	bigint	Port number of the connected instance node.
fdsock	bigint	Peer socket.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	GUC session parameter delivered by the connection.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

7.3.4.14 PGXC_COMM_DELAY

PGXC_COMM_DELAY displays the communications library delay status for all DNs. Only the SYSADMIN and MONADMIN can query this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-220 PGXC_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

7.3.4.15 PGXC_COMM_RECV_STREAM

PGXC_COMM_RECV_STREAM displays the receiving stream status of the communications libraries for all the DNs.

Table 7-221 PGXC_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

7.3.4.16 PGXC_COMM_SEND_STREAM

PGXC_COMM_SEND_STREAM displays the sending stream status of the communications libraries for all the DNs.

Table 7-222 PGXC_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. The options are as follows: • **UNKNOWN**: The connection status is unknown. • **READY**: The connection is ready. • **RUN**: The connection sends packets normally. • **HOLD**: The connection is waiting to send packets. • **CLOSED**: The connection is closed. • **TO_CLOSED**: The connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

7.3.4.17 PGXC_COMM_STATUS

PGXC_COMM_STATUS displays the communications library status for all the DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-223 PGXC_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on a node, in bytes/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the bigint node, in KB/s.
txkbyte_rate	bigint	Sending rate of the communications library on the bigint node, in KB/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the libcomm process, in bytes.
memkbyte_libpq	bigint	Communication memory size of the libpq process in bytes.
used_pm	integer	Real-time usage of the postmaster thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

7.3.5 Segment-Page Storage

7.3.5.1 GLOBAL_GS_SEG_DATAFILES

GLOBAL_GS_SEG_DATAFILES displays information about data files in all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

Table 7-224 GLOBAL_GS_SEG_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name. Example: **base/17467/2_fsm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.
utilization	real	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/**total_blocks**.

7.3.5.2 GLOBAL_GS_SEG_EXTENTS

GLOBAL_GS_SEG_EXTENTS displays the extent information about all tablespaces on all nodes, which can only be executed on the CN. This view displays all extents

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

Table 7-225 GLOBAL_GS_SEG_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	integer	Fork of a segment object. Value range: • **0**: main. • **1**: fsm. • **2**: vm.
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
usage_type	text	Usage type of the extension. Value range: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.5.3 GLOBAL_GS_SEG_SEGMENTS

GLOBAL_GS_SEG_SEGMENTS displays the segment information of all tablespaces on all nodes, including the table, index, TOAST and TOAST INDEX segments, and fsm fork and vm fork segments. It can only be executed on the CN. Only an administrator can query the information.

Table 7-226 GLOBAL_GS_SEG_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Segment object name, which is obtained from pg_class and **relname** in pg_partition.
partition_name	name	Partition name of the segment object; **NULL** if the segment object is not partitioned. Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. The options are as follows: ● **0**: main fork. ● **1**: FSM fork. ● **2**: VM fork.
segment_type	text	Segment object type. Value range: ● **table**: segment-page ordinary table. ● **table partition**: segment-page partitioned table (main table and child table) and segment-page subpartitioned table (partitioned table in it). ● **table subpartition**: segment-page subpartitioned table (top node table and subpartitioned table). ● **index**: index of a segment-page ordinary table. ● **index partition**: index of a segment-page partitioned table or subpartitioned table. ● **global partition index**: global index for segment-page partitioned tables and subpartitioned tables. ● **toast**: segment-page TOAST table. ● **toast index**: index of a segment-page TOAST table.
tablespace_name	name	Tablespace to which a segment object belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

7.3.5.4 GLOBAL_GS_SEG_SPC_EXTENTS

GLOBAL_GS_SEG_SPC_EXTENTS displays the information about used extents of all tablespaces on all nodes, which can only be executed on the CN. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-227 GLOBAL_GS_SEG_SPC_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

7.3.5.5 GLOBAL_GS_SEG_SPC_SEGMENTS

GLOBAL_GS_SEG_SPC_SEGMENTS displays the information about used segments of all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

Table 7-228 GLOBAL_GS_SEG_SPC_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

7.3.5.6 GS_SEG_DATAFILES

GS_SEG_DATAFILES displays information about data files in all tablespaces. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-229 GS_SEG_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name, for example, **base/17467/2_fsm**.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Segment fork type. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
utilization	real	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/**total_blocks**.

7.3.5.7 GS_SEG_DATAFILE_LAYOUT

GS_SEG_DATAFILE_LAYOUT displays the static layout of data files 1 to 5 in segment-page mode. Only an administrator can query the information.

Table 7-230 GS_SEG_DATAFILE_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
seg_storage_type	text	• **segment** indicates common segment-page data. • **hashbucket** indicates hash bucket data.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
section_id	integer	Data section ID of a data file.
section_type	text	Type of the data file section. Value range: • **file_header** indicates the file header. • **spc_header** indicates the space header. • **map_header** indicates the mapping header. • **map_pages** indicates the mapping page. • **ip_pages(inverse pointer pages)** indicates the inverse pointer page. • **data_pages** indicates the data page.
page_start	bigint	Start page number of the data section.
page_end	bigint	End page number of the data section.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
page_count	bigint	Number of pages in the data section.
total_size	bigint	Size of the data section. The unit is byte.

7.3.5.8 GS_SEG_EXTENTS

GS_SEG_EXTENTS displays extent information about all tablespaces. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

Table 7-231 GS_SEG_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
usage_type	text	Usage type of the extension. Value range: ● **segment head**: segment header. ● **fork head**: fork header. ● **level1 page**: level-1 page. ● **data extent**: data extents.

7.3.5.9 GS_SEG_SEGMENTS

GS_SEG_SEGMENTS displays information about segments in all tablespaces, including tables, indexes, TOAST, TOAST INDEX segments, and fsm fork and vm fork segments. Only an administrator can query the information.

Table 7-232 GS_SEG_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Part object name, which is obtained from pg_class and **relname** in pg_partition.
partition_name	name	Partition name of the segment object (**NULL** if the segment object is not partitioned). Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. Value range: ● **0**: main fork. ● **1**: FSM fork. ● **2**: VM fork.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_type	text	Segment object type. Value range: • **table**: segment-page ordinary table. • **table partition**: segment-page partitioned table (main table and child table) and segment-page subpartitioned table (partitioned table in it). • **table subpartition**: segment-page subpartitioned table (top node table and subpartitioned table). • **index**: index of a segment-page ordinary table. • **index partition**: index of a segment-page partitioned table or subpartitioned table. • **global partition index**: global index for segment-page partitioned tables and subpartitioned tables. • **toast**: segment-page TOAST table. • **toast index**: index of a segment-page TOAST table.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

7.3.5.10 GS_SEG_SEGMENT_LAYOUT

GS_SEG_SEGMENT_LAYOUT displays the static layout of segment-page files. Only an administrator can query the information.

Table 7-233 GS_SEG_SEGMENT_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
section_id	integer	ID of the data section divided by a segment.
section_type	text	Extent type of the segment data section. Value range: • **meta**: segment header. • **data**: data.
extent_size	integer	Extent size. The unit is byte.
extent_page_count	integer	Number of extent pages.
extent_count_start	bigint	Start extent number.
extent_count_end	bigint	End extent number.
total_size	bigint	Size of the segment data section. The unit is byte.

7.3.5.11 GS_SEG_SPC_EXTENTS

GS_SEG_SPC_EXTENTS displays information about the used extents of all tablespaces. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-234 GS_SEG_SPC_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

7.3.5.12 GS_SEG_SPC_SEGMENTS

GS_SEG_SPC_SEGMENTS displays information about used segments in all tablespaces. Only an administrator can query the information.

Table 7-235 GS_SEG_SPC_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

7.3.5.13 GS_SEG_SPC_REMAIN_EXTENTS

GS_SEG_SPC_REMAIN_EXTENTS displays the residual isolated extent information of the index tablespace. The extent information is not included in the residual segment and can be used as an independent clearing unit. Only an administrator can query the information.

Table 7-236 GS_SEG_SPC_REMAIN_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.

Name	Type	Description
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

7.3.5.14 GS_SEG_SPC_REMAIN_SEGMENTS

GS_SEG_SPC_REMAIN_SEGMENTS displays the residual segment information of the index tablespace, including the main fork, fsm fork, and vm fork segments. Only an administrator can query the information.

Table 7-237 GS_SEG_SPC_REMAIN_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contents	text	Storage content of a data file. Value range: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the inverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended inverse pointer. The format is (*block_id*, *offset*).

NOTE

Due to the mechanism for determining transaction visibility, when transaction A creates a segment-page object and the transaction is not committed, other sessions can query the segment generated by transaction A when executing **GS_SEG_SPC_REMAIN_SEGMENTS**. Actually, this segment is not residual and will not be cleared even if the residual clearing function is automatically or manually executed. After transaction A ends, you can determine whether the segment is residual.

7.3.6 SPM

7.3.6.1 GS_SPM_SQL_BASELINE

GS_SPM_SQL_BASELINE is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

baseline information of the current user. Users with permissions higher than common users can access this view.

Table 7-238 GS_SPM_SQL_BASELINE columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	text	Status of a plan. Value range: • **UNACC**: indicates that the plan is not accepted. • **ACC**: indicates that the plan has been accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan changes.
invalid	Boolean	Specifies whether the current baseline is invalid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: • OIDs of the schema on which the user has permissions. • OIDs of the existing schemas. • OIDs of the schemas where the non-local temporary tables are located.

7.3.6.2 GS_SPM_SQL_PARAM

GS_SPM_SQL_PARAM is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the SQL parameter information of the current user. Users with permissions higher than common users can access this view.

Table 7-239 GS_SPM_SQL_PARAM columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
sql_text	text	SQL text string.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Specifies whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.
creation_time	timestamp with time zone	Time when a record is created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: • OIDs of the schema on which the user has permissions. • OIDs of the existing schemas. • OIDs of the schemas where the non-local temporary tables are located.

7.3.6.3 GS_SPM_SQL_EVOLUTION

GS_SPM_SQL_EVOLUTION is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the planned evolution result of the current user. Users with permissions higher than common users can access this view.

Table 7-240 GS_SPM_SQL_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
better	Boolean	Determines whether it is a positive evolution.
status	text	Specifies whether exceptions occur during the evolution. Value range: • **SUCCESS**: The evolution is successful. • **FAILED**: The evolution fails.
refer_plan	bigint	Plan hash used as a reference for report generation.
sql_text	text	SQL text string.
outline	text	Hint string list of the current plan.
reason	text	Content of the evolution report.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the evolution result is created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: • OIDs of the schema on which the user has permissions. • OIDs of the existing schemas. • OIDs of the schemas where the non-local temporary tables are located.

7.3.6.4 GS_SPM_SYS_BASELINE

GS_SPM_SYS_BASELINE is a system view of the SPM feature. This feature is not supported in the distributed system. This view is used to view baseline information in the database. The user with the SYSADMIN permission and initial user can access this view.

Table 7-241 GS_SPM_SYS_BASELINE columns

Name	Type	Description
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	integer	Status of a plan. Value range: • **0** (UNACC): plan that is not accepted. • **1** (ACC): plan that has been accepted. • **2** (FIXED): a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan changes.
invalid	Boolean	Specifies whether the current baseline is invalid.
namespace_oids	text	OID list in the current **search_path**. The OIDs must meet the following requirements: • OIDs of the schema on which the user has permissions. • OIDs of the existing schemas. • OIDs of the schemas where the non-local temporary tables are located.

7.3.7 Audit

7.3.7.1 ADM_AUDIT_OBJECT

ADM_AUDIT_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on ADM_AUDIT_OBJECT can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

Table 7-242 ADM_AUDIT_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session). **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database. **NOTE** During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of this column is changed to **datea**.
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in DBA_AUDIT_TRAIL **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. The value is **NULL**.
new_name	character varying(128)	Not supported. The value is **NULL**.
ses_actions	character varying(19)	Not supported. The value is **NULL**.
comment_text	character varying(4000)	Not supported. The value is **NULL**.
sessionid	numeric	Not supported. The value is **NULL**.
entryid	numeric	Not supported. The value is **NULL**.
statementid	numeric	Not supported. The value is **NULL**.
returncode	numeric	Not supported. The value is **NULL**.
priv_used	character varying(40)	Not supported. The value is **NULL**.
client_id	character varying(128)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
econtext_id	character varying(64)	Not supported. The value is **NULL**.
session_cpu	numeric	Not supported. The value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. The value is **NULL**.
global_uid	character varying(32)	Not supported. The value is **NULL**.
instance_number	numeric	Not supported. The value is **NULL**.
os_process	character varying(16)	Not supported. The value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. The value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. The value is **NULL**.
sql_text	character varying	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. The value is **NULL**.

7.3.7.2 ADM_AUDIT_SESSION

ADM_AUDIT_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on ADM_AUDIT_SESSION can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-243 ADM_AUDIT_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created (user login date and time of the entry created by AUDIT SESSION). **NOTE** During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of this column is changed to **datea**.
action_name	character varying(28)	Action name corresponding to the numeric code in the action column in DBA_AUDIT_TRAIL. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
logoff_time	date	Not supported. The value is **NULL**.
logoff_lread	numeric	Not supported. The value is **NULL**.
logoff_pread	numeric	Not supported. The value is **NULL**.
logoff_lwrite	numeric	Not supported. The value is **NULL**.
logoff_dlock	numeric	Not supported. The value is **NULL**.
sessionid	numeric	Not supported. The value is **NULL**.
returncode	numeric	Not supported. The value is **NULL**.
client_id	character varying(128)	Not supported. The value is **NULL**.
session_cpu	numeric	Not supported. The value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_uid	character varying(32)	Not supported. The value is **NULL**.
instance_number	numeric	Not supported. The value is **NULL**.
os_process	character varying(16)	Not supported. The value is **NULL**.

7.3.7.3 ADM_AUDIT_STATEMENT

ADM_AUDIT_STATEMENT displays all grant and revoke audit trail entries. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on ADM_AUDIT_STATEMENT can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

Table 7-244 ADM_AUDIT_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session). **NOTE** During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of this column is changed to **datea**.
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_name	character varying(28)	Action type corresponding to the code in the action column. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_name	character varying(128)	Not supported. The value is **NULL**.
obj_privilege	character varying(32)	Not supported. The value is **NULL**.
sys_privilege	character varying(40)	Not supported. The value is **NULL**.
admin_option	character varying(1)	Not supported. The value is **NULL**.
grantee	character varying(128)	Not supported. The value is **NULL**.
audit_option	character varying(40)	Not supported. The value is **NULL**.
ses_actions	character varying(19)	Not supported. The value is **NULL**.
comment_text	character varying(4000)	Not supported. The value is **NULL**.
sessionid	numeric	Not supported. The value is **NULL**.
entryid	numeric	Not supported. The value is **NULL**.
statementid	numeric	Not supported. The value is **NULL**.
returncode	numeric	Not supported. The value is **NULL**.
priv_used	character varying(40)	Not supported. The value is **NULL**.
client_id	character varying(128)	Not supported. The value is **NULL**.
econtext_id	character varying(64)	Not supported. The value is **NULL**.
session_cpu	numeric	Not supported. The value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_uid	character varying(32)	Not supported. The value is **NULL**.
instance_number	numeric	Not supported. The value is **NULL**.
os_process	character varying(16)	Not supported. The value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. The value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. The value is **NULL**.
sql_text	character varying(2000)	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. The value is **NULL**.

7.3.7.4 ADM_AUDIT_TRAIL

ADM_AUDIT_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on ADM_AUDIT_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

CAUTION

In a distributed system, the gs_query_audit function can only be used to query the audit information of the current node.

Table 7-245 ADM_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session). **NOTE** During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of this column is changed to **datea**.
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. The value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the action column. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. The value is **NULL**.
new_name	character varying(128)	Not supported. The value is **NULL**.

current_user	character varying(128)	Not supported. The value is **NULL**.

7.3.7.5 GS_AUDITING

GS_AUDITING displays all audit information about database-related operations. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

Table 7-246 GS_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value can be **'access'** or **'privilege'**. • **access**: DML operations are audited. • **privilege**: DDL operations are audited.
polenabled	boolean	Specifies whether the policy is enabled. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DML database operation types, such as SELECT, INSERT, and DELETE, or DDL database operation types, such as CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
priv_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

7.3.7.6 GS_AUDITING_ACCESS

GS_AUDITING_ACCESS displays all audit information about database ACCESS-related operations. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-247 GS_AUDITING_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value is **'access'**, indicating that DML operations are audited.
polenabled	boolean	Specifies whether the policy is enabled. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	ACCESS database operation type. Example: SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
access_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

7.3.7.7 GS_AUDITING_PRIVILEGE

GS_AUDITING_PRIVILEGE displays all audit information about database PRIVILEGE-related operations. By default, only users with the SYSADMIN or POLADMIN permission can access it. Common users can access it only after being authorized.

Table 7-248 GS_AUDITING_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value is **'privilege'**, indicating that DDL operations are audited.
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	PRIVILEGE database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8 User and Permission Management

7.3.8.1 ADM_COL_PRIVS

ADM_COL_PRIVS displays permission granting information about all columns. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-249 ADM_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which a permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.2 ADM_ROLE_PRIVS

ADM_ROLE_PRIVS displays information about roles granted to all users and roles. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-250 ADM_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which a permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. The value is **NULL**.
default_role	character varying(3)	Not supported. The value is **NULL**.
os_granted	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.3 ADM_ROLES

ADM_ROLES displays information about database roles. This view exists in both PG_CATALOG and SYS schemas. By default, only users with the SYSADMIN permission can access this view.

Table 7-251 ADM_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID.
authentication_type	text	Authentication mechanism of the role. • **password**: Password authentication is required. • **null**: Authentication is not required.
common	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
oracle_maintained	character varying(1)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.
implicit	character varying(3)	Not supported. The value is **NULL**.
external_name	character varying(4000)	Not supported. The value is **NULL**.

7.3.8.4 ADM_SYS_PRIVS

ADM_SYS_PRIVS displays information about system permissions granted to users and roles. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-252 ADM_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which a permission is granted.
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see **Table 1-402**.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.5 ADM_TAB_PRIVS

ADM_TAB_PRIVS displays authorization information about all objects in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-253 ADM_TAB_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which a permission is granted.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name.
grantor	character varying(128)	Name of the user who grants the permission.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
type	character varying(24)	Object type. Its value can be NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE or TABLESPACE.
hierarchy	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.6 ADM_USERS

ADM_USERS displays information about all database users. This view is accessible only to users with the SYSADMIN permission. It exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-254 ADM_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.
account_status	character varying(32)	Account status. • **NULL**: The account is the initial system administrator with the highest permission. • **0**: normal. • **1**: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold. • **2**: The account is locked by the administrator.
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is **NULL** for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is **NULL**.
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is **NULL**.
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
external_name	character varying(4000)	Not supported. The default value is **NULL**.
password_versions	character varying(12)	Encryption mode of the account password. The value can be **MD5**, **SHA256**, or **SM3**.
editions_enabled	character varying(1)	Not supported. The default value is **NULL**.
authentication_type	text	Authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is **NULL**.
common	character varying(3)	Not supported. The default value is **NULL**.
last_login	timestamp with time zone	Last login.
oracle_maintained	character varying(1)	Not supported. The default value is **NULL**.
inherited	character varying(3)	Not supported. The default value is **NULL**.
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is **NULL**.
all_shard	character varying(3)	Not supported. The default value is **NULL**.
password_change_date	timestamp with time zone	Date when a password was last set.

7.3.8.7 DB_COL_PRIVS

DB_COL_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-255 DB_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which a permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.8 DB_DIRECTORIES

DB_DIRECTORIES is used to view all directories on which the current user has the operation permission. Administrators can query all directories, and common users can query only directories on which the current user has the operation permission. This view exists in both PG_CATALOG and SYS schemas.

Table 7-256 DB_DIRECTORIES columns

Name	Type	Description
owner	oid	OID of the owner of a directory object.
directory_name	name	Name of a directory object.
directory_path	text	Directory path represented by a directory object.
origin_con_id	character varying(256)	ID of the container where a directory object is created. Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.9 DB_TAB_PRIVS

DB_TAB_PRIVS displays authorization information about all objects accessible to the current user. This view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-257 DB_TAB_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
grantee	character varying(128)	Name of the user or role to which a permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
type	character varying(24)	Object type. Its value can be NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, or TABLESPACE.
hierarchy	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.10 DB_USERS

DB_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only users with the SYSADMIN permission can access this view. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-258 DB_USERS columns

Name	Type	Description
user_id	oid	User OID.
username	name	Username.

7.3.8.11 GS_DB_PRIVILEGES

GS_DB_PRIVILEGES displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 7-259 GS_DB_PRIVILEGES columns

Name	Type	Description
rolename	name	Username.
privilege_type	text	ANY permission of a user. For details about the value, see **Table 1-402**.
admin_option	text	Specifies whether the ANY permission recorded in the **privilege_type** column can be re-granted. • **yes** • **no**

7.3.8.12 GS_LABELS

GS_LABELS displays all configured resource labels. Only users with the SYSADMIN or POLADMIN permission can access this view.

Table 7-260 GS_LABELS columns

Name	Type	Description
labelname	name	Resource label name.
labeltype	name	Resource label type. This parameter corresponds to the **labeltype** column in the **GS_POLICY_LABEL** system catalog.
fqdntype	name	Database resource type. For example, table, schema, or index.
schemaname	name	Name of the schema to which a database resource belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fqdnname	name	Database resource name.
columnname	name	Database resource column name. It is empty if the labeled database resource is not a table column.

7.3.8.13 MY_COL_PRIVS

MY_COL_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-261 MY_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which a permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.14 MY_ROLE_PRIVS

MY_ROLE_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-262 MY_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which a permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. The value is **NULL**.
default_role	character varying(3)	Not supported. The value is **NULL**.
os_granted	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.15 MY_SYS_PRIVS

MY_SYS_PRIVS displays information about system permissions granted to the current user. By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-263 MY_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which a permission is granted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 1-402.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.16 PG_RLSPOLICIES

PG_RLSPOLICIES displays information about row-level security policies. The initial user and users with the SYSADMIN attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 7-264 PG_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which a row-level security policy is applied.
policyname	name	Name of a row-level security policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: • **PERMISSIVE**: permissive policy, which is concatenated using the OR expression. • **RESTRICTIVE**: restrictive policy, which is concatenated using the AND expression.
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

7.3.8.17 GS_RLSPOLICIES

GS_RLSPOLICIES displays information about row-level security policies. The initial user and users with the SYSADMIN attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 7-265 GS_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which a row-level security policy is applied.
policyname	name	Name of a row-level security policy.
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: • **PERMISSIVE**: permissive policy, which is concatenated using the OR expression. • **RESTRICTIVE**: restrictive policy, which is concatenated using the AND expression.
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.18 PG_ROLES

PG_ROLES displays information about database roles. The initial user and users with the SYSADMIN or CREATEROLE attribute can view information about all roles. Other users can view only their own information.

Table 7-266 PG_ROLES columns

Name	Type	Reference	Description
rolname	name	-	Role name.
rolsuper	boolean	-	Specifies whether a role is the initial SYSADMIN with the highest permissions. ● **t** (true): yes. ● **f** (false): no.
rolinherit	boolean	-	Specifies whether a role inherits the permissions for this type of roles. ● **t** (true): yes. ● **f** (false): no.
rolcreaterole	boolean	-	Specifies whether a role has the permissions to create other roles. ● **t** (true): yes. ● **f** (false): no.
rolcreatedb	boolean	-	Specifies whether a role has the permissions to create databases. ● **t** (true): yes. ● **f** (false): no.
rolcatupdate	boolean	-	Specifies whether a role has the permissions to directly update system catalogs. Only the initial SYSADMIN whose **usesysid** is set to **10** has this permission. This permission is unavailable for other users. ● **t** (true): yes. ● **f** (false): no.
rolcanlogin	boolean	-	Specifies whether a role has the permissions to log in to the database. ● **t** (true): yes. ● **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolreplication	boolean	-	Specifies whether a role has the permissions to be replicated. • **t** (true): yes. • **f** (false): no.
rolauditadmin	boolean	-	Specifies whether a role is AUDITADMIN. • **t** (true): yes. • **f** (false): no.
rolsystemadmin	boolean	-	Specifies whether a role is SYSADMIN. • **t** (true): yes. • **f** (false): no.
rolconnlimit	integer	-	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value **-1** indicates no limit.
rolpassword	text	-	Encrypted user password. The value is displayed as ********.
rolvalidbegin	timestamp with time zone	-	Account validity start time. If this column is not set, the value is **NULL**.
rolvaliduntil	timestamp with time zone	-	Account validity end time. If this column is not set, the value is **NULL**.
rolrespool	name	-	Resource pool that a user can use.
rolparentid	oid	**PG_AUTHID**.rolparentid	OID of the group user to which a user belongs.
roltabspace	text	-	Storage space of the user permanent table, in KB.
rolconfig	text[]	**PG_DB_ROLE_SETTING**.setconfig	Default value of runtime configuration items.
oid	oid	**PG_AUTHID**.oid	Role ID.
roluseft	boolean	**PG_AUTHID**.roluseft	Specifies whether a role has the permissions to perform operations on foreign tables. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolkind	"char"	-	Role type. • **n**: common user, that is, non-permanent user. • **p**: permanent user.
nodegroup	name	-	Name of the node group associated with a role. If no node group is associated, leave it blank.
roltempspace	text	-	Storage space of the user temporary table, in KB.
rolspillspace	text	-	Operator disk spill space of the user, in KB.
rolmonitoradmin	boolean	-	Specifies whether a role is MONADMIN. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	boolean	-	Specifies whether a role is OPRADMIN. • **t** (true): yes. • **f** (false): no.
rolpolicyadmin	boolean	-	Specifies whether a role is POLADMIN. • **t** (true): yes. • **f** (false): no.

7.3.8.19 GS_ROLES

GS_ROLES displays information about database roles. The initial user and users with the SYSADMIN or CREATEROLE attribute can view information about all roles. Other users can view only their own information.

Table 7-267 GS_ROLES columns

Name	Type	Reference	Description
rolname	name	-	Role name.
rolsuper	boolean	-	Specifies whether a role is the initial SYSADMIN with the highest permissions. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolinherit	boolean	-	Specifies whether a role inherits the permissions for this type of roles. ● **t** (true): yes. ● **f** (false): no.
rolcreaterole	boolean	-	Specifies whether a role has the permissions to create other roles. ● **t** (true): yes. ● **f** (false): no.
rolcreatedb	boolean	-	Specifies whether a role has the permissions to create databases. ● **t** (true): yes. ● **f** (false): no.
rolcatupdate	boolean	-	Specifies whether a role has the permissions to directly update system catalogs. Only the initial SYSADMIN whose **usesysid** is set to **10** has this permission. This permission is unavailable for other users. ● **t** (true): yes. ● **f** (false): no.
rolcanlogin	boolean	-	Specifies whether a role has the permissions to log in to the database. ● **t** (true): yes. ● **f** (false): no.
rolreplication	boolean	-	Specifies whether a role has the permissions to be replicated. ● **t** (true): yes. ● **f** (false): no.
rolauditadmin	boolean	-	Specifies whether a role is AUDITADMIN. ● **t** (true): yes. ● **f** (false): no.
rolsystemadmin	boolean	-	Specifies whether a role is SYSADMIN. ● **t** (true): yes. ● **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolconnlimit	integer	-	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value **-1** indicates no limit.
rolpassword	text	-	Encrypted user password. The value is displayed as ********.
rolvalidbegin	timestamp with time zone	-	Account validity start time. If this column is not set, the value is **NULL**.
rolvaliduntil	timestamp with time zone	-	Account validity end time. If this column is not set, the value is **NULL**.
rolrespool	name	-	Resource pool that a user can use.
rolparentid	oid	**PG_AUTHID**.rolparentid	OID of the group user to which a user belongs.
roltabspace	text	-	Storage space of the user permanent table, in KB.
rolconfig	text[]	**PG_DB_ROLE_SETTING**.setconfig	Default value of runtime configuration items.
oid	oid	**PG_AUTHID**.oid	Role ID.
roluseft	boolean	**PG_AUTHID**.roluseft	Specifies whether a role has the permissions to perform operations on foreign tables. • **t** (true): yes. • **f** (false): no.
rolkind	"char"	-	Role type. • **n**: common user, that is, non-permanent user. • **p**: permanent user.
nodegroup	name	-	Name of the node group associated with a role. If no node group is associated, it is left blank.
roltempspace	text	-	Storage space of the user temporary table, in KB.
rolspillspace	text	-	Operator disk spill space of the user, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolmonitoradmin	boolean	-	Specifies whether a role is MONADMIN. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	boolean	-	Specifies whether a role is OPRADMIN. • **t** (true): yes. • **f** (false): no.
rolpolicyadmin	boolean	-	Specifies whether a role is POLADMIN. • **t** (true): yes. • **f** (false): no.

7.3.8.20 PG_SECLABELS

PG_SECLABELS provides information about security labels.

Table 7-268 PG_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object to which a security label belongs.
classoid	oid	PG_CLASS.oid	OID of the system catalog that contains the object to which a security label belongs.
objsubid	integer	-	• Column number for the security label on a table column (by referring to **objoid** and **classoid** in the table). • For all other object types, this column is **0**.
objtype	text	-	Type of the object to which a security label belongs, in text format. Example: • **table**: table type. • **column**: column type.
objnamespace	oid	PG_NAMESPACE.oid	OID of the namespace for the object, if applicable; otherwise, **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objname	text	-	Name of the object to which a security label belongs, in text format.
provider	text	PG_SECLABEL.provider	Security label provider.
label	text	PG_SECLABEL.label	Security label name.

7.3.8.21 GS_SECLABELS

GS_SECLABELS provides information about security labels.

Table 7-269 GS_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object to which a security label belongs.
classoid	oid	PG_CLASS.oid	OID of the system catalog that contains the object to which a security label belongs.
objsubid	integer	-	• Column number for the security label on a table column (by referring to **objoid** and **classoid** in the table). • For all other object types, this column is **0**.
objtype	text	-	Type of the object to which a security label belongs, in text format. • **table**: table type. • **column**: column type.
objnamespace	oid	PG_NAMESPACE.oid	OID of the namespace for the object, if applicable; otherwise, **NULL**.
objname	text	-	Name of the object to which a security label belongs, in text format.
provider	text	PG_SECLABEL.provider	Security label provider.
label	text	PG_SECLABEL.label	Security label name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.22 PG_SHADOW

PG_SHADOW displays the attributes of all roles marked with rolcanlogin in **PG_AUTHID**. Only the users with the SYSADMIN permission can access this system view.

The information in this view is basically the same as that of the view in **PG_USER**. The difference is that passwords are sensitive and displayed as ******** in the latter.

Table 7-270 PG_SHADOW columns

Name	Type	Reference	Description
usename	name	**PG_AUTHID**.rolname	Username.
usesysid	oid	**PG_AUTHID**.oid	User ID.
usecreatedb	boolean	-	Specifies whether a user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.
usesuper	boolean	-	Specifies whether a user is SYSADMIN. • **t** (true): yes. • **f** (false): no.
usecatupd	boolean	-	Specifies whether a user has the permissions to update views. Even users with the SYSADMIN permission cannot update the view unless this column is **t**. • **t** (true): yes. • **f** (false): no.
userepl	boolean	-	Specifies whether a user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	**PG_AUTHID**.rolpassword	Password ciphertext. If there is no password, the value is **NULL**.
valbegin	timestamp with time zone	-	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	-	Account validity end time. If this column is not set, the value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
respool	name	-	Resource pool where the user is located.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.
useconfig	text[]	PG_DB_ROLE_SETTING.setconfig	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk flushing space, in KB.
usemonitoradmin	boolean	-	Specifies whether a user is MONADMIN. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	boolean	-	Specifies whether a user is OPRADMIN. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	boolean	-	Specifies whether a user is POLADMIN. • **t** (true): yes. • **f** (false): no.

7.3.8.23 GS_SHADOW

GS_SHADOW displays the attributes of all roles marked with rolcanlogin in PG_AUTHID. Only the users with the SYSADMIN permission can access this system view.

The information in this view is basically the same as that of the view in GS_USER. The difference is that passwords are sensitive and displayed as ******** in the latter.

Table 7-271 GS_SHADOW columns

Name	Type	Reference	Description
usename	name	PG_AUTHID.rolname	Username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
usesysid	oid	PG_AUTHID.oid	User ID.
usecreatedb	boolean	-	Specifies whether a user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.
usesuper	boolean	-	Specifies whether a user is SYSADMIN. • **t** (true): yes. • **f** (false): no.
usecatupd	boolean	-	Specifies whether a user has the permissions to update views. Even users with the SYSADMIN permission cannot update the view unless this column is **t**. • **t** (true): yes. • **f** (false): no.
userepl	boolean	-	Specifies whether a user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	PG_AUTHID.rolpassword	Password ciphertext. If there is no password, the value is **NULL**.
valbegin	timestamp with time zone	-	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	-	Account validity end time. If this column is not set, the value is **NULL**.
respool	name	-	Resource pool where the user is located.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.
useconfig	text[]	PG_DB_ROLE_SETTING.setconfig	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
spillspacelimit	text	-	Operator disk flushing space, in KB.
usemonitoradmin	boolean	-	Specifies whether a user is MONADMIN. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	boolean	-	Specifies whether a user is OPRADMIN. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	boolean	-	Specifies whether a user is POLADMIN. • **t** (true): yes. • **f** (false): no.

7.3.8.24 PG_USER

PG_USER displays information about database users. By default, only the initial user and users with the SYSADMIN attribute can view the information. Other users can view the information only after being granted permissions.

Table 7-272 PG_USER columns

Name	Type	Description
usename	name	Username.
usesysid	oid	User ID.
usecreatedb	boolean	Specifies whether a user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.
usesuper	boolean	Specifies whether a user is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usecatupd	boolean	Specifies whether a user has the permissions to directly update system catalogs. Only the initial SYSADMIN whose **usesysid** is set to **10** has this permission. This permission is unavailable for other users. • **t** (true): yes. • **f** (false): no.
userepl	boolean	Specifies whether a user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	Account validity end time. If this column is not set, the value is **NULL**.
respool	name	Resource pool where the user is located.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items. For details, see **setconfig** in **PG_DB_ROLE_SETTING**.
nodegroup	name	Name of the node group associated with a user. If the user is not associated with any node groups, it is left blank.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk flushing space, in KB.
usemonitoradmin	boolean	Specifies whether a user is MONADMIN. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
useoperatoradmin	boolean	Specifies whether a user is OPRADMIN. ● **t** (true): yes. ● **f** (false): no.
usepolicyadmin	boolean	Specifies whether this user is POLADMIN. ● **t** (true): yes. ● **f** (false): no.

7.3.8.25 GS_USER

GS_USER displays information about database users. By default, only the initial user and users with the SYSADMIN attribute can view the information. Other users can view the information only after being granted permissions.

Table 7-273 GS_USER columns

Name	Type	Description
usename	name	Username.
usesysid	oid	User ID.
usecreatedb	boolean	Specifies whether a user has the permissions to create databases. ● **t** (true): yes. ● **f** (false): no.
usesuper	boolean	Specifies whether a user is the initial system administrator with the highest permissions. ● **t** (true): yes. ● **f** (false): no.
usecatupd	boolean	Specifies whether a user has the permissions to directly update system catalogs. Only the initial SYSADMIN whose **usesysid** is set to **10** has this permission. This permission is unavailable for other users. ● **t** (true): yes. ● **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
userepl	boolean	Specifies whether a user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	Account validity end time. If this column is not set, the value is **NULL**.
respool	name	Resource pool where the user is located.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items. For details, see **setconfig** in **PG_DB_ROLE_SETTING**.
nodegroup	name	Name of the node group associated with a user. If the user is not associated with any node groups, it is left blank.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk flushing space, in KB.
usemonitoradmin	boolean	Specifies whether a user is MONADMIN. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	boolean	Specifies whether a user is OPRADMIN. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	boolean	Specifies whether a user is POLADMIN. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.26 PG_USER_MAPPINGS

PG_USER_MAPPINGS displays user mapping information. All users can view the report.

Table 7-274 PG_USER_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	PG_USER_MAPPING.oid	OID of the user mapping.
srvid	oid	PG_FOREIGN_SERVER.oid	OID of the foreign server that contains the mapping.
srvname	name	PG_FOREIGN_SERVER.srvname	Name of the foreign server.
umuser	oid	PG_AUTHID.oid	OID of the local role being mapped (**0** if the user mapping is public).
usename	name	-	Name of the local user to be mapped.
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, it is a string in the format of "keyword=value". Otherwise, it is **NULL**.

7.3.8.27 ROLE_ROLE_PRIVS

ROLE_ROLE_PRIVS displays roles granted to other roles and provides only information about the roles accessible to the user. By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-275 ROLE_ROLE_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.8.28 ROLE_SYS_PRIVS

ROLE_SYS_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-276 ROLE_SYS_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see **Table 1-402**.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.8.29 ROLE_TAB_PRIVS

ROLE_TAB_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). By default, this view is accessible to all users. It exists in both PG_CATALOG and SYS schemas.

Table 7-277 ROLE_TAB_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. The value is **NULL**.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

7.3.9 Dynamic Data Masking

7.3.9.1 GS_MASKING

GS_MASKING displays all configured dynamic masking policies. Only the users with the SYSADMIN or POLADMIN permission can access this view.

Table 7-278 GS_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabled	Boolean	Specifies whether to enable the masking policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

7.3.10 Transparent Data Encryption (TDE)

7.3.10.1 PG_TDE_INFO

PG_TDE_INFO displays encryption information of the entire cluster.

Table 7-279 PG_TDE_INFO columns

Name	Type	Description
is_encrypt	Boolean	Specifies whether the cluster is an encrypted cluster. • **f**: Non-encrypted cluster. • **t**: Encrypted cluster.
g_tde_algo	text	Encryption algorithm. • **SM4-CTR-128** • **AES-CTR-128**
remain	text	Reserved column.

7.3.11 DATABASE LINK

7.3.11.1 GS_DB_LINKS

GS_DB_LINKS displays information about database links. You can view information about your own database links and database links at the PUBLIC level.

Table 7-280 GS_DB_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current database link.
dlname	name	Name of the current DATABASE LINK object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dlowner	oid	Owner ID of the current database link. If the object owner is **public**, the value is **0**.
dlownername	name	Name of the owner of the current database link.
options	text[]	Connection information of the current database link. The value is a character string in the "keyword=value" format.
useroptions	text	Information of the remote user to which the current database link connects.
heterogeneous	text	Not supported yet. Its value is **NULL**.
protocol	text	Not supported yet. Its value is **NULL**.
opencursors	text	Not supported yet. Its value is **NULL**.
intransaction	Boolean	Specifies whether the current database link exists in a transaction.
updatasent	Boolean	Specifies whether the current database link uses statements for updating data in a transaction and is in the uncommitted phase.

7.3.11.2 V$DBLINK

V$DBLINK displays information about database links. You can view information about your own database links and database links at the PUBLIC level. By default, only administrators can view this view.

NOTE

The data in this view is obtained from **GS_DB_LINKS**, but this view only records the information about database links that have been used or are being used in the current session. For details about how to use database links, see "Feature Usage Guidelines > Database Links" in *Developer Guide*.

Table 7-281 V$DBLINK columns

Name	Type	Description
db_link	character varying(128)	Name of the current database link.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
owner_id	numeric	Owner ID of the current database link. If the owner of the database link is **PUBLIC**, the value of **owner_id** is **0**.
logged_on	character varying(3)	Not supported yet. Its value is **NULL**.
heterogeneous	character varying(3)	Not supported yet. Its value is **NULL**.
protocol	character varying(6)	Not supported yet. Its value is **NULL**.
open_cursors	numeric	Not supported yet. Its value is **NULL**.
in_transaction	character varying(3)	Determines whether the current database link exists in a transaction. ● **YES**: in a transaction. ● **NO**: not in a transaction.
update_sent	character varying(3)	Determines whether the current database link uses statements for updating data. ● **YES**: Statements for updating data are used. ● **NO**: Statements for updating data are not used.
commit_point_strength	numeric	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.

7.3.12 Materialized Views

7.3.12.1 GS_MATVIEWS

GS_MATVIEWS displays information about each materialized view in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-282 GS_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	**nspname** in PG_NAMESPACE	Name of the schema of a materialized view.
matviewname	name	**relname** in PG_CLASS	Name of a materialized view.
matviewowner	name	**rolname** in PG_AUTHID	Owner of a materialized view.
tablespace	name	**spcname** in PG_TABLESPACE	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	Boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query)

7.3.13 Other System Views

NOTE

Accessing a view in the SYS schema requires access permissions. Common users can be granted access permissions after the administrator run the **GRANT USAGE ON SCHEMA SYS TO** *username*; command.

7.3.13.1 ADM_ARGUMENTS

ADM_ARGUMENTS displays parameter information of all stored procedures and functions. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-283 ADM_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	The *n*th overloaded function of the same name.
subprogram_id	numeric	Not supported yet. Its value is **NULL**.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of a parameter in the parameter list. The value is **0** for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value of this column is always **0** because only one row is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: • **y**: yes. • **n**: no.
default_value	text	Not supported yet. Its value is **NULL**.
default_length	numeric	Not supported yet. Its value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: • **in**: input parameter. • **out**: output parameter. • **in/out**: input and output parameters. • **variadic**: VARIADIC parameter.
data_length	numeric	Not supported yet. Its value is **NULL**.
data_precision	numeric	Not supported yet. Its value is **NULL**.
data_scale	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
radix	numeric	Radix of a number, which is **10** when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to **NULL**.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name. Only the user-defined type is displayed.
type_subname	character varying(128)	Not supported yet. Its value is **NULL**.
type_link	character varying(128)	Not supported yet. Its value is **NULL**.
type_object_type	character varying(7)	The parameter type of the data type described by the **type_owner**, **type_name**, and **type_subname** columns: • **table**: The parameter is of the table type. • **view**: The parameter is of the view type. • For other data types, the value is **NULL**.
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported yet. Its value is **NULL**.
char_used	character varying(1)	Not supported. • **b**: varchar, nvarchar2, bpchar, or char. • **NULL**: other types.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.2 ADM_COL_COMMENTS

ADM_COL_COMMENTS displays information about table column comments in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-284 ADM_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. The value is **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

7.3.13.3 ADM_COLL_TYPES

ADM_COLL_TYPES displays information about all collection types. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-285 ADM_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported yet. Its value is **NULL**.
elem_type_mod	character varying(7)	Not supported yet. Its value is **NULL**.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported yet. Its value is **NULL**.
precision	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
scale	numeric	Not supported yet. Its value is **NULL**.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
elem_storage	character varying(7)	Not supported yet. Its value is **NULL**.
nulls_stored	character varying(3)	Not supported yet. Its value is **NULL**.
char_used	character varying(1)	Not supported yet. Its value is **NULL**.

7.3.13.4 ADM_CONS_COLUMNS

ADM_CONS_COLUMNS displays information about constraint columns in database tables. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-286 ADM_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

7.3.13.5 ADM_CONSTRAINTS

ADM_CONSTRAINTS displays information about table constraints in database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-287 ADM_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: CHECK constraint. • **f**: FOREIGN KEY constraint. • **p**: PRIMARY KEY constraint. • **u**: UNIQUE constraint.
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
owner	character varying(64)	Constraint creator.
status	character varying(8)	Constraint status.
generated	character varying(14)	Not supported yet. Its value is **NULL**.
search_condition	text	Not supported yet. Its value is **NULL**.
search_condition_vc	character varying(4000)	Not supported yet. Its value is **NULL**.
r_owner	character varying(128)	Not supported yet. Its value is **NULL**.
r_constraint_name	character varying(128)	Not supported yet. Its value is **NULL**.
delete_rule	character varying(9)	Not supported yet. Its value is **NULL**.
con_deferrable	character varying(14)	Not supported yet. Its value is **NULL**.
deferred	character varying(9)	Not supported yet. Its value is **NULL**.
validated	character varying(13)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bad	character varying(3)	Not supported yet. Its value is **NULL**.
rely	character varying(4)	Not supported yet. Its value is **NULL**.
last_change	date	Not supported yet. Its value is **NULL**.
invalid	character varying(7)	Not supported yet. Its value is **NULL**.
view_related	character varying(14)	Not supported yet. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported yet. Its value is **NULL**.

7.3.13.6 ADM_DATA_FILES

ADM_DATA_FILES displays the description of database files. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-288 ADM_DATA_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs
bytes	double precision	Length of a file, in bytes

7.3.13.7 ADM_DEPENDENCIES

ADM_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-289 ADM_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported yet. Its value is **NULL**.
dependency_type	character varying(4)	Not supported yet. Its value is **NULL**.

7.3.13.8 ADM_DIRECTORIES

ADM_DIRECTORIES stores information about all directory objects in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-290 ADM_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner.
directory_name	name	Directory name.
directory_path	text	OS path name of a directory.
origin_con_id	character varying(256)	Not supported yet. Its value is **NULL**.

7.3.13.9 ADM_HIST_SNAPSHOT

ADM_HIST_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. This view can be accessed only when the GUC parameter **enable_wdr_snapshot** is set to **on**. To access the PG_CATALOG.ADM_HIST_SNAPSHOT and SYS.ADM_HIST_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables_snap_timestamp** tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-291 ADM_HIST_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. The value is the same as that of **DBID**.
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.
snap_level	numeric	Not supported yet. Its value is **NULL**.
error_count	numeric	Not supported yet. Its value is **NULL**.
snap_flag	numeric	Not supported yet. Its value is **NULL**.
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot), with the time zone.
con_id	numeric	Not supported. The value is **0**.

7.3.13.10 ADM_HIST_SQL_PLAN

ADM_HIST_SQL_PLAN displays plan information collected by the current user by running the EXPLAIN PLAN statement. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-292 ADM_HIST_SQL_PLAN columns

Name	Type	Description
dbid	text	Database ID
sql_id	character varying(30)	Session that inserts the data. Its value consists of a worker thread start timestamp and a worker thread ID. Values are constrained by **NOT NULL**.
plan_hash_value	bigint	Query ID.
id	integer	Number assigned to each step in the execution plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation action
object_node	character varying(128)	Not supported yet. Its value is **NULL**.
object#	numeric	Not supported yet. Its value is **NULL**.
object_owner	name	Object number of a table or an index
object_name	name	Name of an operated object. It is defined by users.
object_alias	character varying(261)	Not supported yet. Its value is **NULL**.
object_type	character varying(30)	Object type
optimizer	character varying(20)	Not supported yet. Its value is **NULL**.
parent_id	numeric	Not supported yet. Its value is **NULL**.
depth	numeric	Not supported yet. Its value is **NULL**.
position	numeric	Not supported yet. Its value is **NULL**.
search_columns	numeric	Not supported yet. Its value is **NULL**.
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
other_tag	character varying(35)	Not supported yet. Its value is **NULL**.
partition_start	character varying(64)	Not supported yet. Its value is **NULL**.
partition_stop	character varying(64)	Not supported yet. Its value is **NULL**.
partition_id	numeric	Not supported yet. Its value is **NULL**.
other	character varying(4000)	Not supported yet. Its value is **NULL**.
distribution	character varying(20)	Not supported yet. Its value is **NULL**.
cpu_cost	numeric	Not supported yet. Its value is **NULL**.
io_cost	numeric	Not supported yet. Its value is **NULL**.
temp_space	numeric	Not supported yet. Its value is **NULL**.
access_predicates	character varying(4000)	Not supported yet. Its value is **NULL**.
filter_predicates	character varying(4000)	Not supported yet. Its value is **NULL**.
projection	character varying(4000)	Returned column information
time	numeric	Not supported yet. Its value is **NULL**.
qblock_name	character varying(128)	Not supported yet. Its value is **NULL**.
remarks	character varying(4000)	Not supported yet. Its value is **NULL**.
timestamp	date	Not supported yet. Its value is **NULL**.
other_xml	clob	Not supported yet. Its value is **NULL**.
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	numeric	Container ID. Containers are not supported. Its value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.11 ADM_HIST_SQLSTAT

ADM_HIST_SQLSTAT displays information about statements executed on the current node. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 7-293 ADM_HIST_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
plan_hash_value	integer	ID of the normalized SQL statement.
module	integer	Name of the module that is executing when the SQL statement is first parsed.
apwait_delta	integer	Delta value of the application wait time.
sql_id	bigint	Query ID.
snap_id	bigint	Unique snapshot ID.
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time_delta	bigint	CPU time (unit: μs).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: μs).
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
parsing_schema_name	character varying	Not supported yet. Its value is **NULL**.
disk_reads_delta	bigint	Not supported yet. Its value is **NULL**.
buffer_reads_delta	bigint	Not supported yet. Its value is **NULL**.
clwait_delta	bigint	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.12 ADM_HIST_SQLTEXT

ADM_HIST_SQLTEXT displays information about statements executed on the current node. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 7-294 ADM_HIST_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID.
sql_id	bigint	Query ID.
sql_text	clob	Text corresponding to the query.
command_type	integer	Not supported. The value is **0**.
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	integer	Container ID. Containers are not supported. The value is **0**.

7.3.13.13 ADM_IND_COLUMNS

ADM_IND_COLUMNS displays information about index columns in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-295 ADM_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_length	numeric	Column length. For the variable-length type, its value is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Columns sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported yet. Its value is **NULL**.

7.3.13.14 ADM_IND_EXPRESSIONS

ADM_IND_EXPRESSIONS displays information about expression indexes in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-296 ADM_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

7.3.13.15 ADM_INDEXES

ADM_INDEXES displays all indexes in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-297 ADM_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the name of the index is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported yet. Its value is **NULL**.
prefix_length	numeric	Not supported yet. Its value is **NULL**.
ini_trans	numeric	Not supported yet. Its value is **NULL**.
max_trans	numeric	Not supported yet. Its value is **NULL**.
initial_extent	numeric	Not supported yet. Its value is **NULL**.
next_extent	numeric	Not supported yet. Its value is **NULL**.
min_extents	numeric	Not supported yet. Its value is **NULL**.
max_extents	numeric	Not supported yet. Its value is **NULL**.
pct_increase	numeric	Not supported yet. Its value is **NULL**.
pct_threshold	numeric	Not supported yet. Its value is **NULL**.
include_column	numeric	Not supported yet. Its value is **NULL**.
freelists	numeric	Not supported yet. Its value is **NULL**.
freelist_groups	numeric	Not supported yet. Its value is **NULL**.
pct_free	numeric	Not supported yet. Its value is **NULL**.
logging	character varying(3)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blevel	numeric	Not supported yet. Its value is **NULL**.
leaf_blocks	numeric	Not supported yet. Its value is **NULL**.
distinct_keys	numeric	Not supported yet. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported yet. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported yet. Its value is **NULL**.
clustering_factor	numeric	Not supported yet. Its value is **NULL**.
num_rows	numeric	Not supported yet. Its value is **NULL**.
sample_size	numeric	Not supported yet. Its value is **NULL**.
last_analyzed	date	Not supported yet. Its value is **NULL**.
degree	character varying(40)	Not supported yet. Its value is **NULL**.
instances	character varying(40)	Not supported yet. Its value is **NULL**.
temporary	character varying(1)	Not supported yet. Its value is **NULL**.
secondary	character varying(1)	Not supported yet. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported yet. Its value is **NULL**.
flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
duration	character varying(15)	Not supported yet. Its value is **NULL**.
pct_direct_access	numeric	Not supported yet. Its value is **NULL**.

7.3.13.16 ADM_OBJECTS

ADM_OBJECTS displays all database objects in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-298 ADM_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Object type. For example, table, schema, and index.
namespace	oid	Namespace containing the object.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. • **valid**: The object is valid. • **invalid**: The object is invalid.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported yet. Its value is **NULL**.
timestamp	character varying(19)	Not supported yet. Its value is **NULL**.
secondary	character varying(1)	Not supported yet. Its value is **NULL**.
edition_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sharing	character varying(18)	Not supported yet. Its value is **NULL**.
editionable	character varying(1)	Not supported yet. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported yet. Its value is **NULL**.
application	character varying(1)	Not supported yet. Its value is **NULL**.
duplicated	character varying(1)	Not supported yet. Its value is **NULL**.
sharded	character varying(1)	Not supported yet. Its value is **NULL**.
created_appid	numeric	Not supported yet. Its value is **NULL**.
modified_appid	numeric	Not supported yet. Its value is **NULL**.
created_vsnid	numeric	Not supported yet. Its value is **NULL**.
modified_vsnid	numeric	Not supported yet. Its value is **NULL**.

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

7.3.13.17 ADM_PROCEDURES

ADM_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-299 ADM_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if **object_name** is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	*n*th overloaded function of the name.
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **yes** • **no**
pipelined	character varying(3)	Not supported. The value is **no**.
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. The value is **no**.
interface	character varying(3)	Not supported. The value is **no**.
deterministic	character varying(3)	Not supported. The value is **no**.
authid	character varying(12)	Permission type. • **definer**: The creator permission is used. • **current_user**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
result_cache	character varying(3)	Not supported yet. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.
polymorphic	character varying(5)	Not supported yet. Its value is **NULL**.
argument_number	smallint	Number of input parameters in the stored procedure.

7.3.13.18 ADM_SCHEDULER_JOB_ARGS

ADM_SCHEDULER_JOB_ARGS displays parameters related to all jobs in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-300 ADM_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported yet. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.19 ADM_SCHEDULER_JOBS

ADM_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduler jobs in the database. By default, only users with the SYSADMIN

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-301 ADM_SCHEDULER_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduler job.
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported yet. Its value is **NULL**.
job_style	text	Action mode of a scheduler job. It is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported yet. Its value is **NULL**.
global_uid	character varying(33)	Not supported yet. Its value is **NULL**.
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Inline program type of a scheduled task. The options are as follows: • **PLSQL_BLOCK**: fast anonymous stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job. The value ranges from 0 to 255.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schedule_owner	character varying(4000)	Not supported yet. Its value is **NULL**.
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported yet. Its value is **NULL**.
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported yet. Its value is **NULL**.
event_queue_name	character varying(128)	Not supported yet. Its value is **NULL**.
event_queue_agent	character varying(523)	Not supported yet. Its value is **NULL**.
event_condition	character varying(4000)	Not supported yet. Its value is **NULL**.
event_rule	character varying(261)	Not supported yet. Its value is **NULL**.
file_watcher_owner	character varying(261)	Not supported yet. Its value is **NULL**.
file_watcher_name	character varying(261)	Not supported yet. Its value is **NULL**.
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported yet. Its value is **NULL**.
restart_on_failure	character varying(5)	Not supported yet. Its value is **NULL**.
state	"char"	Status of a scheduler job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_priority	numeric	Not supported yet. Its value is **NULL**.
run_count	numeric	Not supported yet. Its value is **NULL**.
uptime_run_count	numeric	Not supported yet. Its value is **NULL**.
max_runs	numeric	Not supported yet. Its value is **NULL**.
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported yet. Its value is **NULL**.
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported yet. Its value is **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.
schedule_limit	interval day to second(0)	Not supported yet. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported yet. Its value is **NULL**.
logging_level	character varying(11)	Not supported yet. Its value is **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported yet. Its value is **NULL**.
instance_stickiness	character varying(5)	Not supported yet. Its value is **NULL**.
raise_events	character varying(4000)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
system	character varying(5)	Not supported yet. Its value is **NULL**.
job_weight	numeric	Not supported yet. Its value is **NULL**.
nls_env	character varying(4000)	Not supported yet. Its value is **NULL**.
source	character varying(128)	Not supported yet. Its value is **NULL**.
number_of_destinations	numeric	Not supported yet. Its value is **NULL**.
destination_owner	character varying(261)	Not supported yet. Its value is **NULL**.
destination	text	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported yet. Its value is **NULL**.
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported yet. Its value is **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported yet. Its value is **NULL**.
comments	text	Comments of a scheduler job.
flags	numeric	Not supported yet. Its value is **NULL**.
restartable	character varying(5)	Not supported yet. Its value is **NULL**.
has_constraints	character varying(5)	Not supported yet. Its value is **NULL**.
connect_credential_owner	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
connect_credential_name	character varying(128)	Not supported yet. Its value is **NULL**.
fail_on_script_error	character varying(5)	Not supported yet. Its value is **NULL**.

7.3.13.20 ADM_SCHEDULER_PROGRAM_ARGS

ADM_SCHEDULER_PROGRAM_ARG displays parameters related to all programs in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-302 ADM_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
metadata_attribute	character varying(19)	Not supported yet. Its value is **NULL**.
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported yet. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.21 ADM_SCHEDULER_PROGRAMS

ADM_SCHEDULER_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-303 ADM_SCHEDULER_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program.
program_name	text	Name of a scheduler program.
program_type	character varying(16)	Type of a scheduler program. The options are as follows: • **PLSQL_BLOCK**: fast anonymous stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
program_action	text	Action performed by a scheduler program.
number_of_arguments	numeric	Number of scheduler program parameters. The value ranges from 0 to 255.
enabled	character varying(5)	Specifies whether a scheduler program is enabled.
comments	text	Comments of a scheduler program.
detached	character varying(5)	Not supported yet. Its value is **NULL**.
schedule_limit	interval day to second(0)	Not supported yet. Its value is **NULL**.
priority	numeric	Not supported yet. Its value is **NULL**.
weight	numeric	Not supported yet. Its value is **NULL**.
max_runs	numeric	Not supported yet. Its value is **NULL**.
max_failures	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_run_duration	interval day to second(0)	Not supported yet. Its value is **NULL**.
has_constraints	character varying(5)	Not supported yet. Its value is **NULL**.
nls_env	character varying(4000)	Not supported yet. Its value is **NULL**.

7.3.13.22 ADM_SCHEDULER_RUNNING_JOBS

ADM_SCHEDULER_RUNNING_JOBS displays information about all **DBE_SCHEDULER** jobs that are being executed in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-304 ADM_SCHEDULER_RUNNING_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduler job.
job_name	character varying(128)	Name of a scheduler job.
job_subname	character varying(128)	Not supported yet. Its value is **NULL**.
job_style	character varying(17)	Action mode of a scheduler job. It is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
detached	character varying(5)	Not supported yet. Its value is **NULL**.
session_id	numeric	ID of the session that executes a scheduler job
slave_process_id	numeric	Not supported yet. Its value is **NULL**.
slave_os_process_id	character varying(12)	ID of the process that executes a scheduler job
running_instance	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
resource_consumer_group	character varying(32)	Not supported yet. Its value is **NULL**.
elapsed_time	interval day to second(2)	Execution duration of a scheduler job
cpu_used	interval day to second(2)	Not supported yet. Its value is **NULL**.
destination_owner	character varying(261)	Not supported yet. Its value is **NULL**.
destination	character varying(261)	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported yet. Its value is **NULL**.
credential_name	character varying(128)	Certificate name of a scheduler job.
log_id	numeric	Not supported yet. Its value is **NULL**.

7.3.13.23 ADM_SEGMENTS

ADM_SEGMENTS displays the storage space allocated to all segments in the database. It exists in the PG_CATALOG and SYS schemas. Only system administrators can access this view. The information cannot be obtained from the system catalog. The view is empty.

Table 7-305 ADM_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported yet. Its value is **NULL**.
segment_name	character varying(128)	Not supported yet. Its value is **NULL**.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
segment_type	character varying(18)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_subtype	character varying(10)	Not supported yet. Its value is **NULL**.
tablespace_name	character varying(30)	Not supported yet. Its value is **NULL**.
header_file	numeric	Not supported yet. Its value is **NULL**.
header_block	numeric	Not supported yet. Its value is **NULL**.
bytes	numeric	Not supported yet. Its value is **NULL**.
blocks	numeric	Not supported yet. Its value is **NULL**.
extents	numeric	Not supported yet. Its value is **NULL**.
initial_extent	numeric	Not supported yet. Its value is **NULL**.
next_extent	numeric	Not supported yet. Its value is **NULL**.
min_extents	numeric	Not supported yet. Its value is **NULL**.
max_extents	numeric	Not supported yet. Its value is **NULL**.
max_size	numeric	Not supported yet. Its value is **NULL**.
retention	character varying(7)	Not supported yet. Its value is **NULL**.
minretention	numeric	Not supported yet. Its value is **NULL**.
pct_increase	numeric	Not supported yet. Its value is **NULL**.
freelists	numeric	Not supported yet. Its value is **NULL**.
freelist_groups	numeric	Not supported yet. Its value is **NULL**.
relative_fno	numeric	Not supported yet. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
inmemory	character varying(8)	Not supported yet. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported yet. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported yet. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported yet. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported yet. Its value is **NULL**.
cellmemory	character varying(24)	Not supported yet. Its value is **NULL**.

7.3.13.24 ADM_SEQUENCES

ADM_SEQUENCES displays information about all sequences in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-306 ADM_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Increment of a sequence.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. The value can be **y** or **n**. • **y**: yes. • **n**: no.
order_flag	character(1)	Specifies whether a sequence is an ordered sequence. Value range: • **y**: yes. • **n**: no.

7.3.13.25 ADM_SOURCE

ADM_SOURCE displays the definition information about all stored procedures, functions, and triggers in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-307 ADM_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.26 ADM_SYNONYMS

ADM_SYNONYMS displays all synonyms in the database. By default, only users with the SYSADMIN permission can access this view. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-308 ADM_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which a synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

7.3.13.27 ADM_TAB_COL_STATISTICS

ADM_TAB_COL_STATISTICS displays column statistics and histogram information extracted from ADM_TAB_COLUMNS. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-309 ADM_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	date	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
notes	character varying(99)	Not supported yet. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.

7.3.13.28 ADM_TAB_COLS

ADM_TAB_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM_TAB_COLS. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas. The number of rows displayed in this view is the same as that in the ADM_TAB_COLUMNS view. Only columns are different.

Table 7-310 ADM_TAB_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported yet. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_precision	numeric	Precision of the data type. This column is valid for the numeric data type and is **NULL** for other types.
data_scale	numeric	Number of digits to the right of the decimal point. This column is valid for the numeric data type and is **0** for other types.
nullable	character varying(1)	Specifies whether the column can be null. For PRIMARY KEY constraints and NOT NULL constraints, the value is **n**.
column_id	numeric	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is **NO**.
user_stats	character varying(3)	Not supported. Its value is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Length of a column (in characters). This column is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported currently. ● **B**: varchar, bpchar, and char. ● **C**: nvarchar2. ● **NULL**: other types.
v80_fmt_image	character varying(3)	Not supported yet. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported. Its value is **YES**.
hidden_column	character varying(3)	Not supported yet. Its value is **NULL**.
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). ● **YES**: yes. ● **NO**: no.
segment_column_id	numeric	Not supported yet. Its value is **NULL**.
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of **COLUMN_ID**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. ● **NONE**: no histogram. ● **FREQUENCY**: frequency histogram. ● **EQUI_WIDTH**: equal-width histogram.
qualified_col_name	character varying(64)	Qualified column name, which is the same as **COLUMN_NAME**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
user_generated	character varying(3)	Not supported. Its value is **YES**.
default_on_null	character varying(3)	Not supported yet. Its value is **NULL**.
identity_column	character varying(3)	Specifies whether a column is an identity column. • **yes**: It is an identity column. • **no**: It is not an identity column.
sensitive_column	character varying(3)	Not supported yet. Its value is **NULL**.
evaluation_edition	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_before	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported yet. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported yet. Its value is **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

- During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.
- Currently, the CREATE TABLE syntax does not support the creation of tables with identity columns. When the ADM_TAB_COLS view is queried, the value of **identity_column** in the returned result is always **no**.

7.3.13.29 ADM_TAB_COLUMNS

ADM_TAB_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM_TAB_COLUMNS. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-311 ADM_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported yet. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Specifies whether the column can be null. Value range: • **y**: yes. • **n**: no. For PRIMARY KEY constraints and NOT NULL constraints, the value is **n**.
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes. This column is left blank if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported yet. Its value is **no**.
user_stats	character varying(3)	Not supported yet. Its value is **no**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters), which takes effect only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported yet. • **b**: varchar, bpchar, and char. • **c**: nvarchar2. • **NULL**: other types.
v80_fmt_image	character varying(3)	Not supported yet. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported yet. Its value is **yes**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **none**: no histogram. • **frequency**: frequency histogram. • **equi-width**: equal-width histogram.
default_on_null	character varying(3)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
identity_column	character varying(3)	Specifies whether a column is an identity column. • **yes**: It is an identity column. • **no**: It is not an identity column.
sensitive_column	character varying(3)	Not supported yet. Its value is **NULL**.
evaluation_edition	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_before	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported yet. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

- During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.
- Currently, the CREATE TABLE syntax does not support the creation of tables with identity columns. When the ADM_TAB_COLUMNS view is queried, the value of **identity_column** in the returned result is always **no**.

7.3.13.30 ADM_TAB_COMMENTS

ADM_TAB_COMMENTS displays comments about all tables and views in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-312 ADM_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

7.3.13.31 ADM_TAB_HISTOGRAMS

ADM_TAB_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-313 ADM_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported yet. Its value is **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported yet. Its value is **NULL**.
endpoint_repeat_count	numeric	Not supported yet. Its value is **NULL**.
scope	character varying(7)	Not supported. The value is **shared**.

7.3.13.32 ADM_TAB_STATISTICS

ADM_TAB_STATISTICS displays optimizer statistics for all tables in the database. This view exists in the PG_CATALOG and SYS schemas. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-314 ADM_TAB_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
partition_position	numeric	Not supported yet. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported yet. Its value is **NULL**.
subpartition_position	numeric	Not supported yet. Its value is **NULL**.
object_type	character varying(12)	Object type. The options are as follows: • **TABLE** • **PARTITION** • **SUBPARTITION**
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported yet. Its value is **NULL**.
empty_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_space	numeric	Not supported yet. Its value is **NULL**.
chain_cnt	numeric	Not supported yet. Its value is **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.
num_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_cached_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_cache_hit_ratio	numeric	Not supported yet. Its value is **NULL**.
im_imcu_count	numeric	Not supported yet. Its value is **NULL**.
im_block_count	numeric	Not supported yet. Its value is **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
scan_rate	numeric	Not supported yet. Its value is **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
stattype_locked	character varying(5)	Not supported yet. Its value is **NULL**.
stale_stats	character varying(7)	Not supported yet. Its value is **NULL**.
notes	character varying(25)	Not supported yet. Its value is **NULL**.
scope	character varying(7)	Not supported. The default value is **SHARED**.

7.3.13.33 ADM_TAB_STATS_HISTORY

ADM_TAB_STATS_HISTORY provides historical statistics about all tables in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-315 ADM_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported yet. Its value is **NULL**.
stats_update_time	timestamp(6) with time zone	Time when the statistics were updated. Database restart is not supported. Otherwise, data loss will occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.34 ADM_TABLES

ADM_TABLES displays all tables in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 7-316 ADM_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. ● **yes**: deleted. ● **no**: not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. ● **valid**: The current table is valid. ● **unusable**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. ● **y**: It is a temporary table. ● **n**: It is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioned	character varying(3)	Specifies whether the table is a partitioned table. • **yes**: It is a partitioned table. • **no**: It is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **enabled**: Partition row movement is allowed. • **disabled**: Partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable table compression. • **enabled**: Table compression is enabled. • **disabled**: Table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
logical_replication	character varying(8)	Specifies whether to enable logical replication. • **enabled**: Logical replication is enabled. • **disabled**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is a foreign table. • **yes**: It is a foreign table. • **no**: It is not a foreign table.
logging	character varying(3)	Specifies whether to log changes made to the table. • **yes**: The database logs changes made to the table. • **no**: The database does not log changes made to the table.
default_collation	character varying(100)	Default collation of a table. • default
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable table-level lock. • **enabled**: Table-level lock is enabled. • **disabled**: Table-level lock is disabled.
nested	character varying(3)	Specifies whether the table is a nested table. • **yes**: It is a nested table. • **no**: It is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **enabled**: Corrupted blocks will be skipped. • **disabled**: Corrupted blocks will not be skipped.
has_identity	character varying(3)	Specifies whether the table has an identity column. • **yes**: It has an identity column. • **no**: It has no identity column.
inmemory	character varying(8)	Not supported. The value is **disabled**.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **yes**: A table segment has been created. • **no**: No table segment is created.
monitoring	character varying(3)	Specifies whether to track changes made to the table. • **yes**: The database tracks changes made to the table. • **no**: The database does not track changes made to the table.
cluster_name	character varying(128)	Not supported yet. Its value is **NULL**.
iot_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_used	numeric	Not supported yet. Its value is **NULL**.
initial_extent	numeric	Not supported yet. Its value is **NULL**.
next_extent	numeric	Not supported yet. Its value is **NULL**.
min_extents	numeric	Not supported yet. Its value is **NULL**.
max_extents	numeric	Not supported yet. Its value is **NULL**.
pct_increase	numeric	Not supported yet. Its value is **NULL**.
freelists	numeric	Not supported yet. Its value is **NULL**.
freelist_groups	numeric	Not supported yet. Its value is **NULL**.
backed_up	character varying(1)	Not supported yet. Its value is **NULL**.
blocks	numeric	Not supported yet. Its value is **NULL**.
empty_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_space	numeric	Not supported yet. Its value is **NULL**.
chain_cnt	numeric	Not supported yet. Its value is **NULL**.
avg_space_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.
num_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.

7.3.13.36 ADM_TRIGGERS

ADM_TRIGGERS displays information about triggers in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-318 ADM_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Time when a trigger is triggered. Value range: **before statement**, **before each row**, **after statement**, **after each row**, and **instead of**.
triggering_event	character varying	Event that triggers the trigger. Value range: **update**, **insert**, **delete**, and **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Defines the basic object of a trigger. Value range: **table** and **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported yet. Its value is **NULL**.
referencing_name	character varying(422)	Not supported. Its value is **referencing new as new old as old**.
when_clause	character varying(4000)	Content of the WHEN clause. **trigger_body** can be executed only when the value is **true**.
status	character varying(64)	Trigger status. • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description. It is used to create the trigger creation statement again.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is **no**.
before_statement	character varying(3)	Not supported. Its value is **no**.
before_row	character varying(3)	Not supported. Its value is **no**.
after_row	character varying(3)	Not supported. Its value is **no**.
after_statement	character varying(3)	Not supported. Its value is **no**.
instead_of_row	character varying(3)	Not supported. Its value is **no**.
fire_once	character varying(3)	Not supported yet. Its value is **NULL**.
apply_server_only	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.37 ADM_TYPE_ATTRS

ADM_TYPE_ATTRS displays the attributes of the current database object type. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 7-319 ADM_TYPE_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type
type_name	name	Data type name
attr_name	name	Column name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **-1** for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type
attr_type_name	name	Data type attribute name. Currently, this column records the type name after conversion.
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. ● The value **-1** indicates a "varlena" type (one that has a length word). ● The value **-2** indicates a NULL-terminated C string.
precision	integer	Precision of the numeric type
scale	integer	Range of the numeric type
character_set_name	character(1)	Character set name of an attribute. ● **C**: CHAR_CS. ● **N**: NCHAR_CS.
attr_no	smallint	Attribute number
inherited	character(1)	Specifies whether the attribute is inherited from the super type (**y** or **n**).
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). The raw type is not recorded due to kernel implementation.

7.3.13.38 ADM_TYPES

ADM_TYPES describes all object types in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-320 ADM_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type identifier (OID).
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported yet. Its value is **NULL**.
instantiable	character varying(3)	Not supported yet. Its value is **NULL**.
persistable	character varying(3)	Not supported yet. Its value is **NULL**.
supertype_owner	character varying(128)	Not supported yet. Its value is **NULL**.
supertype_name	character varying(128)	Not supported yet. Its value is **NULL**.
local_attributes	numeric	Not supported yet. Its value is **NULL**.
local_methods	numeric	Not supported yet. Its value is **NULL**.
typeid	raw	Not supported yet. Its value is **NULL**.

7.3.13.39 ADM_VIEWS

ADM_VIEWS displays views in the database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-321 ADM_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported yet. Its value is **NULL**.
type_text	character varying(4000)	Not supported yet. Its value is **NULL**.
oid_text_length	numeric	Not supported yet. Its value is **NULL**.
oid_text	character varying(4000)	Not supported yet. Its value is **NULL**.
view_type_owner	character varying(128)	Not supported yet. Its value is **NULL**.
view_type	character varying(128)	Not supported yet. Its value is **NULL**.
superview_name	character varying(128)	Not supported yet. Its value is **NULL**.
editioning_view	character varying(1)	Not supported yet. Its value is **NULL**.
read_only	character varying(1)	Not supported yet. Its value is **NULL**.
container_data	character varying(1)	Not supported yet. Its value is **NULL**.
bequeath	character varying(12)	Not supported yet. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported yet. Its value is **NULL**.
default_collation	character varying(100)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
containers_default	character varying(3)	Not supported yet. Its value is **NULL**.
container_map	character varying(3)	Not supported yet. Its value is **NULL**.
extended_data_link	character varying(3)	Not supported yet. Its value is **NULL**.
extended_data_link_map	character varying(3)	Not supported yet. Its value is **NULL**.
has_sensitive_column	character varying(3)	Not supported yet. Its value is **NULL**.
admit_null	character varying(3)	Not supported yet. Its value is **NULL**.
pdb_local_only	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.40 DB_ARGUMENTS

DB_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in both PG_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

Table 7-322 DB_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Not supported yet. Its value is **NULL**.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	The *n*th overloaded function of the same name.
subprogram_id	numeric	Not supported yet. Its value is **NULL**.
argument_name	character varying(128)	Parameter name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
position	numeric	Position of the parameter in the parameter list. The value is **0** for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value of this column is always **0** because only one row is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: • **y**: yes. • **n**: no.
default_value	text	Not supported yet. Its value is **NULL**.
default_length	numeric	Not supported yet. Its value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: The options are as follows: • **in**: input parameter. • **out**: output parameter. • **in/out**: input and output parameters. • **variadic**: VARIADIC parameter.
data_length	numeric	Not supported yet. Its value is **NULL**.
data_precision	numeric	Not supported yet. Its value is **NULL**.
data_scale	numeric	Not supported yet. Its value is **NULL**.
radix	numeric	Radix of a numeric parameter. Its value is **10** for smallint, integer, bigint, numeric, and float, and **NULL** for other types.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
type_owner	character varying(128)	Owner of the data type.
type_name	character varying(128)	Parameter type name. Only the user-defined type is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type_subname	character varying(128)	Not supported yet. Its value is **NULL**.
type_link	character varying(128)	Not supported yet. Its value is **NULL**.
type_object_type	character varying(7)	Types of types of the **type_owner**, **type_name**, and **type_subname** columns: • **table**: The parameter is of the table type. • **view**: The parameter is of the view type. • **NULL**: The parameter is not of the table or view type.
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported yet. Its value is **NULL**.
char_used	character varying(1)	Not supported. • The value **b** is for the varchar, nvarchar2, bpchar, or char type. • The value **NULL** is for other data types.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.41 DB_ALL_TABLES

DB_ALL_TABLES displays tables or views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-323 DB_ALL_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of a table or view.
tablespace_name	name	Tablespace where a table or view is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.42 DB_COL_COMMENTS

DB_COL_COMMENTS displays comment information about table columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-324 DB_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

7.3.13.43 DB_COLL_TYPES

DB_COLL_TYPES displays information about collection types that can be accessed by the current user. By default, they are accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 7-325 DB_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported yet. Its value is **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
precision	numeric	Not supported yet. Its value is **NULL**.
scale	numeric	Not supported yet. Its value is **NULL**.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
elem_storage	character varying(7)	Not supported yet. Its value is **NULL**.
nulls_stored	character varying(3)	Not supported yet. Its value is **NULL**.
char_used	character varying(1)	Not supported yet. Its value is **NULL**.

7.3.13.44 DB_CONS_COLUMNS

DB_CONS_COLUMNS displays information about constraint columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-326 DB_CONS_COLUMNS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

7.3.13.45 DB_CONSTRAINTS

DB_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-327 DB_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
constraint_type	text	Constraint type. • **c**: CHECK constraint. • **f**: FOREIGN KEY constraint. • **p**: PRIMARY KEY constraint. • **u**: UNIQUE constraint.
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
owner	character varying(64)	Constraint creator.

7.3.13.46 DB_DEPENDENCIES

DB_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 7-328 DB_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported yet. Its value is **NULL**.
dependency_type	character varying(4)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.47 DB_IND_COLUMNS

DB_IND_COLUMNS displays all index columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-329 DB_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length.
char_length	numeric	Length of a column (character type).
descend	character varying(4)	Sorting mode of a column. The options are as follows: • **DESC**: descending order. • **ASC**: ascending order.
collated_column_id	numeric	Internal serial number of the language sorting columns.

7.3.13.48 DB_IND_EXPRESSIONS

DB_IND_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-330 DB_IND_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

7.3.13.49 DB_INDEXES

DB_INDEXES displays information about indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-331 DB_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
generated	character varying(1)	Specifies whether the name of the index is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported yet. Its value is **NULL**.

join_index	character varying(3)	Not supported yet. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported yet. Its value is **NULL**.
dropped	character varying(3)	Not supported yet. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is visible to the optimizer.
domidx_management	character varying(14)	Not supported yet. Its value is **NULL**.
segment_created	character varying(3)	Not supported yet. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported yet. Its value is **NULL**.
indexing	character varying(7)	Not supported yet. Its value is **NULL**.
auto	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.50 DB_OBJECTS

DB_OBJECTS displays all database objects accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-332 DB_OBJECTS columns

Name	Type	Description
owner	name	Object owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object class.
namespace	oid	ID of the namespace where an object resides.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. • **valid**: The object is valid. • **invalid**: The object is invalid.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported yet. Its value is **NULL**.
timestamp	character varying(19)	Not supported yet. Its value is **NULL**.
secondary	character varying(1)	Not supported yet. Its value is **NULL**.
edition_name	character varying(128)	Not supported yet. Its value is **NULL**.
sharing	character varying(18)	Not supported yet. Its value is **NULL**.
editionable	character varying(1)	Not supported yet. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported yet. Its value is **NULL**.
application	character varying(1)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
duplicated	character varying(1)	Not supported yet. Its value is **NULL**.
sharded	character varying(1)	Not supported yet. Its value is **NULL**.
created_appid	numeric	Not supported yet. Its value is **NULL**.
modified_appid	numeric	Not supported yet. Its value is **NULL**.
created_vsnid	numeric	Not supported yet. Its value is **NULL**.
modified_vsnid	numeric	Not supported yet. Its value is **NULL**.

NOTICE

For details about the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

7.3.13.51 DB_PROCEDURES

DB_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-333 DB_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

7.3.13.52 DB_SCHEDULER_JOB_ARGS

DB_SCHEDULER_JOB_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-334 DB_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported yet. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.53 DB_SCHEDULER_PROGRAM_ARGS

DB_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-335 DB_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
metadata_attribute	character varying(19)	Not supported yet. Its value is **NULL**.
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.54 DB_SEQUENCES

DB_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-336 DB_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: • **y**: yes. • **n**: no.
order_flag	character(1)	Specifies whether a sequence is an ordered sequence. Value range: • **y**: yes. • **n**: no.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported yet. Its value is **NULL**.
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported yet. Its value is **NULL**.
session_flag	character varying(1)	Specifies whether a sequence is a private session. Not supported yet. Its value is **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported yet. Its value is **NULL**.

7.3.13.55 DB_SOURCE

DB_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-337 DB_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.56 DB_SYNONYMS

DB_SYNONYMS displays all synonyms accessible to the current user.

Table 7-338 DB_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym. The owner of the PUBLIC synonym is PUBLIC.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.57 DB_TAB_COL_STATISTICS

DB_TAB_COL_STATISTICS displays column statistics and histogram information extracted from DB_TAB_COLUMNS. All users can access this view. This view exists in both PG_CATALOG and SYS schemas.

Table 7-339 DB_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/ NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	date	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
notes	character varying(99)	Not supported yet. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.

7.3.13.58 DB_TAB_COLUMNS

DB_TAB_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in both PG_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

Table 7-340 DB_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. This column is valid for the numeric data type and is **NULL** for other types.
data_scale	integer	Number of digits to the right of the decimal point. This column is valid for the numeric data type and is **0** for other types.
nullable	bpchar	Specifies whether the column can be null. Value range: • **y**: yes. • **n**: no. For PRIMARY KEY constraints and NOT NULL constraints, the value is **n**.
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_stats	character varying(3)	Not supported. The value is **NO**.
user_stats	character varying(3)	Not supported. The value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters) which is valid only for varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **b** for the varchar, bpchar, or char data type. Set it to **c** for the nvarchar2 data type. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported yet. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported. The value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **none**: no histogram. • **frequency**: frequency histogram. • **equi_width**: equal-width histogram.
default_on_null	character varying(3)	Not supported yet. Its value is **NULL**.
identity_column	character varying(3)	Specifies whether a column is an identity column. • **yes**: It is an identity column. • **no**: It is not an identity column.
evaluation_edition	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_before	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported yet. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

- During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.
- Currently, the CREATE TABLE syntax does not support the creation of tables with identity columns. When the DB_TAB_COLUMNS view is queried, the value of **identity_column** in the returned result is always **no**.

7.3.13.59 DB_TAB_COMMENTS

DB_TAB_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-341 DB_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. The value is **0**.
schema	character varying(64)	Name of the namespace to which the table belongs.

7.3.13.60 DB_TAB_HISTOGRAMS

DB_TAB_HISTOGRAMS displays histogram statistics about the tables and views accessible to the current user, that is, the distribution of data in each column of the table. All users can access this view. This view exists in both PG_CATALOG and SYS schemas.

Table 7-342 DB_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported yet. Its value is **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported yet. Its value is **NULL**.
endpoint_repeat_count	numeric	Not supported yet. Its value is **NULL**.
scope	character varying(7)	Not supported. The value is **shared**.

7.3.13.61 DB_TAB_MODIFICATIONS

DB_TAB_MODIFICATIONS displays statistics about modifications to tables accessible to the current user since the last statistics collection on the tables. Currently, this view displays only the statistics data of tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in both PG_CATALOG and SYS schemas.

Table 7-343 DB_TAB_MODIFICATIONS columns

Name	Type	Description
table_owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is **NULL**. • **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
truncated	character varying(3)	Not supported yet. Its value is **NULL**.
drop_segments	numeric	Not supported yet. Its value is **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **timestamp** column in the view is changed to **datea**.

7.3.13.62 DB_TAB_STATS_HISTORY

DB_TAB_STATS_HISTORY records the tables, partitions, or subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 7-344 DB_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported yet. Its value is **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.63 DB_TABLES

DB_TABLES displays all tables accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 7-345 DB_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. • **yes**: deleted. • **no**: not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. • **valid**: The current table is valid. • **unusable**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. • **y**: The table is a temporary table. • **n**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. • **yes**: The table is a partitioned table. • **no**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **enabled**: The partition row movement is allowed. • **disabled**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable table compression. • **enabled**: Table compression is enabled. • **disabled**: Table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **enabled**: Logical replication is enabled. • **disabled**: Logical replication is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
external	character varying(3)	Specifies whether the table is a foreign table. • **yes**: The table is a foreign table. • **no**: The table is not a foreign table.
logging	character varying(3)	Specifies whether to record logs for table changes. • **yes**: Logs are recorded for table changes. • **no**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. • **enabled**: The table lock is enabled. • **disabled**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. • **yes**: The table is a nested table. • **no**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **enabled**: The corrupted block is skipped. • **disabled**: The corrupted block is not skipped.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
has_identity	character varying(3)	Specifies whether the table has an identity column. • **yes**: It has an identity column. • **no**: It has no identity column.
inmemory	character varying(8)	Not supported. The value is **disabled**.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **yes**: The table segment has been created. • **no**: The table segment is not created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **yes**: The modification of the table is monitored. • **no**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported yet. Its value is **NULL**.
iot_name	character varying(128)	Not supported yet. Its value is **NULL**.
pct_used	numeric	Not supported yet. Its value is **NULL**.
initial_extent	numeric	Not supported yet. Its value is **NULL**.
next_extent	numeric	Not supported yet. Its value is **NULL**.
min_extents	numeric	Not supported yet. Its value is **NULL**.
max_extents	numeric	Not supported yet. Its value is **NULL**.

7.3.13.64 DB_TRIGGERS

DB_TRIGGERS displays information about triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 7-346 DB_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_name	character varying(64)	Relational table name.
table_owner	character varying(64)	Role name.
status	character varying(64)	Trigger status. • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.65 DB_TYPES

DB_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 7-347 DB_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type identifier (OID).
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported yet. Its value is **NULL**.
instantiable	character varying(3)	Not supported yet. Its value is **NULL**.
persistable	character varying(3)	Not supported yet. Its value is **NULL**.

local_methods	numeric	Not supported yet. Its value is **NULL**.
typeid	raw	Not supported yet. Its value is **NULL**.

7.3.13.66 DB_VIEWS

DB_VIEWS displays the description about all views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-348 DB_VIEWS columns

Name	Type	Description
owner	name	Owner of the view.
view_name	name	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported yet. Its value is **NULL**.
type_text	character varying(4000)	Not supported yet. Its value is **NULL**.
oid_text_length	numeric	Not supported yet. Its value is **NULL**.

pdb_local_only	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.67 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 7-349 DICT columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

7.3.13.68 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-350 DICTIONARY columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

7.3.13.69 DUAL

The DUAL view is a virtual view created by the system. It has one row and one column and is mainly used to execute queries that do not require actual data tables. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 7-351 DUAL columns

Name	Type	Description
dummy	text	Fixed content "X".

7.3.13.70 DV_SESSIONS

DV_SESSIONS displays information about all active background threads. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized.

Table 7-352 DV_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active background thread of the current session.
serial#	integer	Sequence number of the background thread of the current activity, which is **0** in GaussDB.
user#	oid	OID of the user logged in to the background thread. The OID is **0** if the background thread is a global auxiliary thread.
username	name	Name of the user logged in to the background process. **username** is null if the background thread is a global auxiliary thread. **application_name** can be identified by associating with **pg_stat_get_activity()**. Example: `SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.71 DV_SESSION_LONGOPS

DV_SESSION_LONGOPS displays the progress of ongoing operations. Users can access this view only after being authorized.

Table 7-353 DV_SESSION_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running background thread.
serial#	integer	Sequence number of the running background thread, which is **0** in GaussDB.
sofar	integer	Completed workload, which is null in GaussDB.
totalwork	integer	Total workload, which is null in GaussDB.

7.3.13.72 GET_GLOBAL_PREPARED_XACTS

GET_GLOBAL_PREPARED_XACTS displays prepared transactions on all nodes globally.

Table 7-354 GET_GLOBAL_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	XID of a prepared transaction
gid	text	GID of the prepared transaction
prepared	timestamp with time zone	Prepared time of the prepared transaction.
owner	name	Owner of the prepared transaction.
database	name	Database to which the prepared transaction belongs.
node_name	text	Name of the node where the prepared transaction resides

7.3.13.73 GLOBAL_BAD_BLOCK_INFO

GLOBAL_BAD_BLOCK_INFO is executed on the CN to collect statistics on damaged data pages of all instances. The queried result displays basic information about damaged pages. The execution result on the DN is empty. Based on the information, you can use the page detection and repair function in **Data Damage Detection and Repair Functions** to perform further repair operations. By default, only the initial user, users with the SYSADMIN permission, users with the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

OPRADMIN permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted permissions.

Table 7-355 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Node information of the damaged page.
spc_node	oid	ID of the tablespace corresponding to the damaged page.
db_node	oid	ID of the database corresponding to the damaged page.
rel_node	oid	relfilenode of the relation corresponding to the damaged page.
bucket_node	integer	Bucket node of the damaged page. This column is used to specify whether a table is a segment-page table during repair. ● **-1**: non-segment page table. ● Non-zero value: segment-page table.
block_num	oid	Number of the damaged page.
fork_num	integer	File forknum of the damaged page.
file_path	text	Relative path of the current damaged page. The logical path instead of the actual file is displayed for a segment-page table.
check_time	timestamp with time zone	Time when a fault is detected on the damaged page.
repair_time	timestamp with time zone	Time when the damaged page is repaired.

7.3.13.74 GLOBAL_CLEAR_BAD_BLOCK_INFO

GLOBAL_CLEAR_BAD_BLOCK_INFO is executed on the CN to clear information about repaired pages in all instances. The execution result on DNs is empty. By default, only the initial user, users with the SYSADMIN permission, users with the OPRADMIN permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted permissions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-356 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Information about the node for clearing repaired pages.
result	boolean	Execution result of clearing repaired pages of the current instance.

7.3.13.75 GLOBAL_SQL_PATCH

GLOBAL_SQL_PATCH stores information about all SQL patches. This view is available only in the PG_CATALOG schema.

Table 7-357 GLOBAL_SQL_PATCH columns

Name	Type	Description
node_name	text	Name of the node where the SQL PATCH is located.
patch_name	name	Name of the SQL PATCH.
unique_sql_id	bigint	Global unique query ID.
owner	oid	ID of the user created using the SQL PATCH.
enable	Boolean	Specifies whether the SQL patch takes effect.
status	"char"	SQL patch status (reserved column).
abort	Boolean	Specifies whether a hint is discarded.
hint_string	text	Hint text.
description	text	SQL patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the SQL patch takes effect. • Its value is **0** for statements outside the stored procedure. • For a statement within a stored procedure, the value is the globally unique ID of the statement that calls the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
original_query	text	SQL text.

7.3.13.76 GLOBAL_STAT_HOTKEYS_INFO

GLOBAL_STAT_HOTKEYS_INFO queries the statistics of hotspot keys in the entire cluster. The query results are sorted by **count** in descending order.

Table 7-358 GLOBAL_STAT_HOTKEYS_INFO columns

Name	Type	Description
database_name	text	Name of the database where the hot key is located.
schema_name	text	Name of the mode where the hotspot key is located.
table_name	text	Name of the table where the hotspot key is located.
key_value	text	Value of the hotspot key
hash_value	bigint	Hash value of the hot key in the database. For a list or range distribution table, the value of this column is **0**.
count	numeric	Frequency of accessing the hotspot key.

7.3.13.77 GLOBAL_WAL_SENDER_STATUS

GLOBAL_WAL_SENDER_STATUS displays the redo log transfer and replay status of the primary DN in the current cluster. Only users with the SYSADMIN or MONADMIN permission can query this view.

Table 7-359 GLOBAL_WAL_SENDER_STATUS columns

Name	Type	Description
nodename	text	Name of the primary node
source_ip	text	IP address of the primary node
source_port	integer	Port of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port of the standby node
sender_pid	integer	PID of the sending thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
local_role	text	Type of the primary node • **UNKNOWN_MODE**: The status is unknown. • **NORMAL_MODE**: single-host node type. • **PRIMARY_MODE**: The node is a primary node. • **STANDBY_MODE**: The node is a standby node. • **CASCADE_STANDBY_MODE**: The node is a cascaded standby node. • **PENDING_MODE**: The node is in the arbitration phase. • **RECOVERY_MODE**: The node is in the restoration phase. • **STANDBY_CLUSTER_MODE**: The node is a standby cluster node. • **MAIN_STANDBY_MODE**: main standby cluster node. **NOTE** The expected values of the primary node type are **NORMAL_MODE**, **PRIMARY_MODE**, **PENDING_MODE**, and **RECOVERY_MODE**. If other node types are displayed, contact Huawei technical support.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
peer_role	text	Type of the standby node • **UNKNOWN_MODE**: The status is unknown. • **NORMAL_MODE**: single-host node type. • **PRIMARY_MODE**: The node is a primary node. • **STANDBY_MODE**: The node is a standby node. • **CASCADE_STANDBY_MODE**: The node is a cascaded standby node. • **PENDING_MODE**: The node is in the arbitration phase. • **RECOVERY_MODE**: The node is in the restoration phase. • **STANDBY_CLUSTER_MODE**: The node is a standby cluster node. • **MAIN_STANDBY_MODE**: main standby cluster node. **NOTE** The expected values of the standby node type are **NORMAL_MODE**, **STANDBY_MODE**, **CASCADE_STANDBY_MODE**, **PENDING_MODE**, **RECOVERY_MODE**, **STANDBY_CLUSTER_MODE**, and **MAIN_STANDBY_MODE**. If other node types are displayed, contact Huawei technical support.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
peer_state	text	Status of the standby node • **UNKNOWN_STATE**: The node status is unknown. • **NORMAL_STATE**: The node is started properly. • **NEEDREPAIR_STATE**: The current node needs to be repaired. • **STARTING_STATE**: The node is being started. • **WAITING_STATE**: The node is waiting to be upgraded. • **DEMOTING_STATE**: The node is being downgraded. • **PROMOTING_STATE**: The standby node is being upgraded to the primary node. • **BUILDING_STATE**: The standby node fails to be started and needs to be rebuilt. • **CATCHUP_STATE**: The standby node is catching up with the primary node. • **COREDUMP_STATE**: The node breaks down.
state	text	WAL sender status • **WALSNDSTATE_STARTUP**: startup state. • **WALSNDSTATE_BACKUP**: backup state. • **WALSNDSTATE_CATCHUP**: catch-up state. • **WALSNDSTATE_STREAMING**: streaming replication state.
sender_sent_location	text	Sending position of the primary node
sender_write_location	text	Writing position of the primary node
sender_flush_location	text	Location where the master node writes the cache to the disk.
sender_replay_location	text	Redo position of the primary node
receiver_received_location	text	Receiving position of the standby node
receiver_write_location	text	Writing position of the standby node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
receiver_flush_location	text	Location where the standby node writes the cache to the disk.
receiver_replay_location	text	Redo location of the standby node

7.3.13.78 GS_ALL_CONTROL_GROUP_INFO

GS_ALL_CONTROL_GROUP_INFO displays all Cgroup information in a database.

Table 7-360 GS_ALL_CONTROL_GROUP_INFO columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: Class Cgroup, which does not control any thread. • **GROUP_BAKWD**: backend thread Cgroup. • **GROUP_DEFWD**: default Cgroup, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	**Class** Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	**Workload** Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.79 GS_ALL_PREPARED_STATEMENTS

GS_ALL_PREPARED_STATEMENTS displays information about prepared statements that are available in all sessions. By default, this view is accessible only to SYSADMINs.

Table 7-361 GS_ALL_PREPARED_STATEMENTS columns

Name	Type	Description
pid	bigint	Background thread ID. **NOTE** In thread pool mode, **pid** indicates the ID of the thread bound to the current session. When a session is executed on different threads, **pid** changes accordingly. In thread pool mode, statements are associated with **sessionid** but not **pid**. You are advised to use **sessionid** for join query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Prepared statement identifier.
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself. For the plan cache generated by stream PBE, CNs record the preceding content, whereas DNs record the statement executed for the first time.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter type of the prepared statement in the form of a regtype array. The OID corresponding to this array can be obtained by converting the regtype value. For the plan cache generated by stream PBE, DNs leave this column blank.
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement. • **False** if the statement was prepared through the frontend/backend protocol.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_deleted	boolean	Specifies whether the plan cache is cleared. The GUC parameter **max_plancache_memory_ratio** is used to set the clearance threshold. • **TRUE** if the plan cache is cleared. • **FALSE** if the plan cache is not cleared.
size	bigint	Size of the memory occupied by the plan cache, in bytes.
valid	boolean	Expiration status of the plan cache. • **TRUE** if the status is valid. • **FALSE** if the status is invalidated.
is_reused	boolean	Specifies whether the cache is reused. • **TRUE** if the cache is reused. • **FALSE** if the cache is not reused.

7.3.13.80 GS_AUTONOMOUS_TRANSACTION_DETAIL

GS_AUTONOMOUS_TRANSACTION_DETAIL displays the autonomous transaction session to which the user belongs and the relationships of parent transactions and sub-transactions in all sessions on the current CN. If the current user has the MONADMIN or SYSADMIN permission, they can view all autonomous transaction sessions and the relationships of parent transactions and sub-transactions on the current CN. Calling on DNs is not allowed.

Table 7-362 GS_AUTONOMOUS_TRANSACTION_DETAIL columns

Name	Type	Description
autonomous_transaction_session_id	bigint	Session ID of an autonomous transaction.
autonomous_transaction_thread_id	bigint	Thread ID of an autonomous transaction.
parent_autonomous_transaction_session_id	bigint	Parent session ID of an autonomous transaction.

7.3.13.81 GS_BUCKET_LOCKS

GS_BUCKET_LOCKS displays information about locks held by open transactions. Only CNs in distributed mode can be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-363 GS_BUCKET_LOCKS columns

Name	Type	Reference	Description
node_name	text	-	Node name.
database	oid	**oid** in **PG_DATABASE**	OID of the database in which the locked target exists.
virtualtransaction	text	-	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread. The options are **AccessShareLock** and **AccessExclusiveLock**.
granted	boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	-	The value is **TRUE** if the lock is obtained through fast-path. The value is **FALSE** if the lock is obtained through database-level lock information or two-phase commit.
global_sessionid	text	-	Global session ID.
bucketlist	text	-	List of locked buckets.
bucket_group	smallint	-	Bucket group to which the locked bucket belongs. The value is fixed to **0** and is not supported in the current version.

7.3.13.82 GS_GET_CONTROL_GROUP_INFO

GS_GET_CONTROL_GROUP_INFO displays information about all Cgroups. By default, only users with the SYSADMIN permission can access this view.

Table 7-364 GS_GET_CONTROL_GROUP_INFO columns

Name	Type	Description
group_name	text	Name of a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
group_type	text	Type of the Cgroup. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: class Cgroup, which does not control any thread. • **GROUP_BAKWD**: backend thread Cgroup. • **GROUP_DEFWD**: default Cgroup, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	**Class** Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The options are as follows: • **i**: installation node group • **n**: node group in a common cluster. • **e**: elastic cluster

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.83 GS_GLC_MEMORY_DETAIL

GS_GLC_MEMORY_DETAIL displays the memory usage of the global PL/pgSQL cache in all databases. This view is available only when **enable_global_plsqlcache** is set to **on**.

Table 7-365 GS_GLC_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of a memory object.
database	text	Database to which the memory object belongs. **"pkg_bucket"** and **"func_bucket"** are displayed as **"NULL"**.
schema	text	Schema to which the memory object belongs. **"pkg_bucket"** and **"func_bucket"** are displayed as **"NULL"**.
type	text	Object type: ● **"pkg_bucket"**: indicates that the object is the parent node of a package object. ● **"func_bucket"**: indicates that the object is the parent node of a function or stored procedure. ● **"pkg"**: indicates that the object is a package object. ● **"func"**: indicates that the object is a function or stored procedure.
status	text	Status of the cached object. **"valid"** indicates that the cached object is available, and **'invalid'** indicates that the cached object is unavailable. The **"pkg_bucket"** and **"func_bucket"** objects have no status and are displayed as **"NULL"**.
location	text	Current location of a cached object. It is displayed as **"in_global_hash_table"** in the cache hash table and **"in_global_expired_list"** in the invalid linked list. The **"pkg_bucket"** and **"func_bucket"** objects are displayed as **"NULL"**.
env	bigint	Environment parameter when an object is created, that is, the value of **behavior_compat_flags**. The **"pkg_bucket"** and **"func_bucket"** objects are displayed as **0**.
usedsize	bigint	Size of a cached object.
usecount	bigint	Number of objects that are referencing the global cache. When no object references the global compilation product, the number is 0.
oid	integer	OID of a memory object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
isspec	boolean	Specifies whether the memory object is a packet header.
searchpath	text	The memory object accesses the schema and other environment variables of the compilation product.
invalidreason	text	Reason why a memory object becomes invalid.

7.3.13.84 GS_GLOBAL_ARCHIVE_STATUS

GS_GLOBAL_ARCHIVE_STATUS describes the archiving progress of CNs and all shards, including the shard name (**node_name**), archiving location (**restart_lsn**), name of the primary or standby node (**archive_node**), and current log location (**current_xlog_location**). To query this view, you need to enable the archiving functionality of the database and query the view from the CN. Only users with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-366**.

Table 7-366 GS_GLOBAL_ARCHIVE_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

7.3.13.85 GS_GSC_MEMORY_DETAIL

GS_GSC_MEMORY_DETAIL displays the global SysCache memory usage of the current process on the current node. The data is displayed only when Global SysCache is enabled. For details about the columns, see **Table 7-367**.

The query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

Table 7-367 GS_GSC_MEMORY_DETAIL columns

Name	Type	Description
db_id	text	Database ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

7.3.13.86 GS_GTT_ATTACHED_PIDS

GS_GTT_ATTACHED_PIDS is used to check which sessions are using global temporary tables on DNs by calling the gs_gtt_attached_pid() function.

Table 7-368 GS_GTT_ATTACHED_PIDS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint[]	Session ID.
cn_session_ids	text[]	List of global session IDs on the CN in distributed mode.

7.3.13.87 GS_GLOBAL_AUTONOMOUS_TRANSACTION_DETAIL

GS_GLOBAL_AUTONOMOUS_TRANSACTION_DETAIL displays the autonomous transaction session to which the user belongs and the relationships of parent transactions and sub-transactions in all sessions on each CN. If the current user has the MONADMIN or SYSADMIN permission, they can view all autonomous transaction sessions and the relationships of parent transactions and sub-transactions on each CN. Calling on DNs is not allowed.

NOTE

When the GUC parameter **enable_nonsysadmin_execute_direct** is set to **off**, this view can be called only by users with the MONADMIN or SYSADMIN permissions.

Table 7-369 GS_GLOBAL_AUTONOMOUS_TRANSACTION_DETAIL columns

Name	Type	Description
node_name	text	CN name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autonomous_transaction_session_id	bigint	Session ID of an autonomous transaction.
autonomous_transaction_thread_id	bigint	Thread ID of an autonomous transaction.
parent_autonomous_transaction_session_id	bigint	Parent session ID of an autonomous transaction.

7.3.13.88 GS_GLOBAL_GTT_ATTACHED_PIDS

GS_GLOBAL_GTT_ATTACHED_PIDS displays which sessions are using global temporary tables on DNs on a CN.

Table 7-370 GS_GLOBAL_GTT_ATTACHED_PIDS columns

Name	Type	Description
node_name	text	Node name.
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint[]	Session ID.
cn_session_ids	text[]	List of global session IDs on the CN in distributed mode.

7.3.13.89 GS_GLOBAL_DIST_GTT_REMAIN_SESSIONS

GS_GLOBAL_DIST_GTT_REMAIN_SESSIONS displays all session information that remains on DNs on a CN.

Table 7-371 GS_GTT_ATTACHED_PIDS columns

Name	Type	Description
dn_name	text	DN name.
cn_name	text	CN name.
cn_timeline	integer	Timeline of the CN.
cn_sequence	integer	Session sequence of the CN.
cn_session_id	bigint	Session ID of the CN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.90 GS_LOGICALSTANDBY_SKIP

GS_LOGICALSTANDBY_SKIP displays the defined skip rules. When **skiptype** is set to **1** or **3** (for details, see **GS_SQLAPPLY_SKIP**), the following columns are obtained from the system catalog GS_SQLAPPLY_SKIP to create or update the system view. The view is empty and reserved in distributed scenarios.

Table 7-372 GS_LOGICALSTANDBY_SKIP columns

Name	Type	Description
createtime	timestamp with time zone	SKIP definition time.
error	text	Specifies whether it is triggered only if an error occurs.
dump	"char"	Dump type.
stmt	text	SKIP statement or KEYWORD.
dbname	text	Database name.
schemaname	text	Schema name.
objectname	text	Object name.

7.3.13.91 GS_LOGICALSTANDBY_SKIP_TRANSACTION

GS_LOGICALSTANDBY_SKIP_TRANSACTION displays the defined SKIP rules. When **skiptype** is set to **2** (for details, see **GS_SQLAPPLY_SKIP**), the following columns are obtained from the system catalog GS_SQLAPPLY_SKIP to create or update the system view. The view is empty and reserved in distributed scenarios.

Table 7-373 GS_LOGICALSTANDBY_SKIP_TRANSACTION columns

Name	Type	Attribute
createtime	timestamp with time zone	SKIP definition time.
dump	"char"	Dump type.
commitcsn	text	Transaction CSN.
xid	text	Transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.92 GS_LSC_MEMORY_DETAIL

GS_LSC_MEMORY_DETAIL displays the memory usage of the local system cache of all threads based on the MemoryContext node. The data is displayed only when Global SysCache is enabled. For details about the columns, see **Table 7-374**.

Table 7-374 GS_LSC_MEMORY_DETAIL columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.sessionid*).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Total size of used memory in the memory context, in bytes.

7.3.13.93 GS_MY_PLAN_TRACE

GS_MY_PLAN_TRACE is a view of the GS_PLAN_TRACE system catalog. This view displays the plan traces of the current user. For details about the columns, see **Table 7-375**. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

Table 7-375 GS_MY_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this column cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this column cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this column cannot exceed 300 MB.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

7.3.13.94 GS_SESSION_ALL_SETTINGS

GS_SESSION_ALL_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only SYSADMIN and MONADMIN can query this view. For details about the columns, see **Table 7-376**.

Table 7-376 GS_SESSION_ALL_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

7.3.13.95 GS_SQL_COUNT

GS_SQL_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database. For details about the columns, see **Table 7-377**.

- When a common user queries the GS_SQL_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS_SQL_COUNT view, statistics about the current node of all users are displayed.
- When the cluster or node is restarted, the count is cleared and then restarted.
- The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-377 GS_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.
select_count	bigint	Statistical result of the SELECT statement.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement.
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.

7.3.13.96 GS_SYSTEM_OBJECT_VERSION_DETAILS

GS_SYSTEM_OBJECT_VERSION_DETAILS displays the version information about system objects and details about the corresponding system objects.

The system object types in this system view include views, functions, tables, indexes, types, rules, and type casting relationships (CAST).

Table 7-378 GS_SYSTEM_OBJECTS_VERSION columns

Name	Type	Description
object_oid	oid	Identifier of a system object. For different types of system objects, the relationships are as follows: Unique identifier of a view, table, or index in **PG_CLASS**, or unique identifier of a type, function, rule, or type cast in **PG_TYPE**, **PG_PROC**, **PG_REWRITE**, or **PG_CAST**.
object_namespace	oid	OID of the schema of the system object. If the system object is a type cast, this column is empty.
object_name	character varying	Name of the system object. If the system object is a type cast, the value of this column is in the format of "*source data type* (*OID of the source data type*) AS *target data type* (*OID of the target data type*)".
object_schema	name	Name of the schema of the system object.
object_args	text	If the system object is a function, this column is the data type array of the function parameters, including only input parameters (including **INOUT** parameters). The display format is "[arg1,..., argn]". If the system object is of another type, this column is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_type	text	Type of a system object. • **view** • **function** • **table**: ordinary table. • **index** • **composite type** • **domain**: domain type. • **rule** • **cast**: type cast.
object_version	bigint	Version number of the system object. **0**: initial version number. **-1**: version number of a deleted object. Other version numbers are used for subsequent object changes.

7.3.13.97 GS_THRDSTREAM_WORKER_INFO

GS_THRDSTREAM_WORKER_INFO displays information about stream thread pool reuse. The query can be performed only on DNs running in thread pool mode. Only users with the PUBLIC permission can access this view.

Table 7-379 GS_THRDSTREAM_WORKER_INFO columns

Name	Type	Description
node_name	text	Instance name.
group_id	integer	Group ID of the thread pool.
db_info	text	Dynamic database statistics about the running stream thread pool of the current group. The information includes: • **total stream reusing db**: number of databases that are being used or reused in the stream thread pool. • **free session db**: number of databases that do not have running sessions in the stream thread pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stream_info	text	Dynamic stream thread statistics about the running stream thread pool of the current group. The information includes: • **actual**: number of actually started stream threads. • **idle**: number of idle stream threads. • **using**: number of stream threads in use. • **init session threads**: number of stream threads for initializing a session. • **reuse session threads**: number of stream threads that reuse sessions.

7.3.13.98 GS_TOTAL_NODEGROUP_MEMORY_DETAIL

GS_TOTAL_NODEGROUP_MEMORY_DETAIL returns the memory usage (in MB) of the current node group of the database. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable. For details about the columns, see **Table 7-380**.

Table 7-380 GS_TOTAL_NODEGROUP_MEMORY_DETAIL columns

Name	Type	Description
ngname	text	Node group name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **ng_total_memory**: total memory size of the node group. • **ng_used_memory**: memory used by the node group. • **ng_estimate_memory**: estimated memory used by the node group. • **ng_foreignrp_memsize**: total memory of the external resource pool of the node group. • **ng_foreignrp_usedsize**: memory used by the external resource pool of the node group. • **ng_foreignrp_peaksize**: peak memory used by the external resource pool of the node group. • **ng_foreignrp_mempct**: percentage of the external resource pool of the node group to the total memory of the node group. • **ng_foreignrp_estmsize**: estimated memory used by the external resource pool of the node group.
memorymbytes	integer	Size of allocated memory-typed memory.

7.3.13.99 GS_WORKLOAD_RULE_STAT

GS_WORKLOAD_RULE_STAT displays information about SQL concurrency control rules. Only the SYSADMIN can access the system view. For details about the columns, see **Table 7-381**.

Table 7-381 GS_WORKLOAD_RULE_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, **"resource"**, and **"client"** are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.
option_val	text[]	Parameter values of a concurrency control rule, including the SQL IDs, keyword lists, resource limitations, client IP addresses, and application names. For details, see **gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)**.
is_valid	Boolean	Determines whether a concurrency control rule takes effect. If it times out, the value is set to **false**.
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.100 GV_INSTANCE

GV_INSTANCE displays information about the current database instance. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-382**.

Table 7-382 GV_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported yet. Its value is **NULL**.
version	character varying(17)	Not supported yet. Its value is **NULL**.
version_legacy	character varying(17)	Not supported yet. Its value is **NULL**.
version_full	character varying(17)	Not supported yet. Its value is **NULL**.
startup_time	date	Not supported yet. Its value is **NULL**.
status	character varying(12)	Not supported yet. Its value is **NULL**.
parallel	character varying(3)	Not supported yet. Its value is **NULL**.
thread#	numeric	Not supported yet. Its value is **NULL**.
archiver	character varying(7)	Not supported yet. Its value is **NULL**.
log_switch_wait	character varying(15)	Not supported yet. Its value is **NULL**.
logins	character varying(10)	Not supported yet. Its value is **NULL**.
shutdown_pending	character varying(3)	Not supported yet. Its value is **NULL**.
database_status	character varying(17)	Not supported yet. Its value is **NULL**.
instance_role	character varying(18)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active_state	character varying(9)	Not supported yet. Its value is **NULL**.
blocked	character varying(3)	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.
instance_mode	character varying(11)	Not supported yet. Its value is **NULL**.
edition	character varying(7)	Not supported yet. Its value is **NULL**.
family	character varying(80)	Not supported yet. Its value is **NULL**.
database_type	character varying(15)	Not supported yet. Its value is **NULL**.

7.3.13.101 GV_SESSION

GV_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas. When the thread pool is enabled (**enable_thread_pool** is set to **on**), all session information is displayed. When the thread pool is disabled (**enable_thread_pool** is set to **off**), the sessions connected by users are not displayed. For details about the columns, see **Table 7-383**.

Table 7-383 GV_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. Set it to **NULL**.
saddr	raw	Not supported. Set it to **NULL**.
sid	bigint	Session ID.
serial#	integer	Sequence number of the active background thread, which is **0** in GaussDB.
audsid	numeric	Not supported. Set it to **NULL**.
paddr	raw	Not supported. Set it to **NULL**.
schema#	numeric	Not supported. Set it to **NULL**.
schemaname	name	Name of the user logged in to the background.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
user#	oid	OID of the user logged in to the background thread. (**0** if the background thread is a global auxiliary thread).
username	name	Name of the user logged in to the background process. **username** is empty if the background thread is a global auxiliary thread.
command	numeric	Not supported. Set it to **NULL**.
ownerid	numeric	Not supported. Set it to **NULL**.
taddr	character varying(16)	Not supported. Set it to **NULL**.
lockwait	character varying(16)	Not supported. Set it to **NULL**.
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	ID of a query.
client_info	text	Client information
event	text	Queuing status of a statement. The value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**.
program	text	Name of the application connected to the background.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	text	Overall status of this background. The value can be: • **active**: The background is executing a query. • **idle**: The background is waiting for a new client command. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background.
server	character varying(9)	Not supported. Set it to **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	text	OS username of the server.
terminal	character varying(30)	Not supported. Set it to **NULL**.
type	character varying(10)	Not supported. Set it to **NULL**.
sql_address	raw	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_hash_value	numeric	Not supported. Set it to **NULL**.
sql_child_number	numeric	Not supported. Set it to **NULL**.
sql_exec_id	numeric	Not supported. Set it to **NULL**.
prev_sql_addr	raw	Not supported. Set it to **NULL**.
prev_hash_value	numeric	Not supported. Set it to **NULL**.
prev_sql_id	character varying(13)	Not supported. Set it to **NULL**.
prev_child_number	numeric	Not supported. Set it to **NULL**.
prev_exec_start	date	Not supported. Set it to **NULL**. • **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
prev_exec_id	numeric	Not supported. Set it to **NULL**.
plsql_entry_object_id	numeric	Not supported. Set it to **NULL**.
plsql_entry_subprogram_id	numeric	Not supported. Set it to **NULL**.
plsql_object_id	numeric	Not supported. Set it to **NULL**.
plsql_subprogram_id	numeric	Not supported. Set it to **NULL**.
module	text	Name of the running module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE.
module_hash	numeric	Not supported. Set it to **NULL**.
action	text	Name of the current operation in the current module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE or DBE_APPLICATION_INFO.SET_ACTION.
action_hash	numeric	Not supported. Set it to **NULL**.
fixed_table_sequence	numeric	Not supported. Set it to **NULL**.
row_wait_obj#	numeric	Not supported. Set it to **NULL**.
row_wait_file#	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
row_wait_block#	numeric	Not supported. Set it to **NULL**.
row_wait_row#	numeric	Not supported. Set it to **NULL**.
top_level_call#	numeric	Not supported. Set it to **NULL**.
pdml_enabled	character varying(3)	Not supported. Set it to **NULL**.
failover_type	character varying(13)	Not supported. Set it to **NULL**.
failover_method	character varying(10)	Not supported. Set it to **NULL**.
failed_over	character varying(3)	Not supported. Set it to **NULL**.
resource_consumer_group	character varying(32)	Not supported. Set it to **NULL**.
pddl_status	character varying(8)	Not supported. Set it to **NULL**.
pq_status	character varying(8)	Not supported. Set it to **NULL**.
current_queue_duration	numeric	Not supported. Set it to **NULL**.
client_identifier	character varying(64)	Not supported. Set it to **NULL**.
blocking_session_status	character varying(11)	Not supported. Set it to **NULL**.
blocking_instance	numeric	Not supported. Set it to **NULL**.
blocking_session	numeric	Not supported. Set it to **NULL**.
final_blocking_session_status	character varying(11)	Not supported. Set it to **NULL**.
final_blocking_instance	numeric	Not supported. Set it to **NULL**.
final_blocking_session	numeric	Not supported. Set it to **NULL**.
seq#	numeric	Not supported. Set it to **NULL**.
event#	numeric	Not supported. Set it to **NULL**.
p1text	character varying(64)	Not supported. Set it to **NULL**.
p1	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
p1raw	raw	Not supported. Set it to **NULL**.
p2text	character varying(64)	Not supported. Set it to **NULL**.
p2	numeric	Not supported. Set it to **NULL**.
p2raw	raw	Not supported. Set it to **NULL**.
p3text	character varying(64)	Not supported. Set it to **NULL**.
p3	numeric	Not supported. Set it to **NULL**.
p3raw	raw	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Not supported. Set it to **NULL**.
wait_time	numeric	Not supported. Set it to **NULL**.
seconds_in_wait	numeric	Not supported. Set it to **NULL**.
state	character varying(19)	Not supported. Set it to **NULL**.
wait_time_micro	numeric	Not supported. Set it to **NULL**.
time_remaining_micro	numeric	Not supported. Set it to **NULL**.
time_since_last_wait_micro	numeric	Not supported. Set it to **NULL**.
service_name	character varying(64)	Not supported. Set it to **NULL**.
sql_trace	character varying(8)	Not supported. Set it to **NULL**.
sql_trace_waits	character varying(5)	Not supported. Set it to **NULL**.
sql_trace_binds	character varying(5)	Not supported. Set it to **NULL**.
sql_trace_plan_stats	character varying(10)	Not supported. Set it to **NULL**.
session_edition_id	numeric	Not supported. Set it to **NULL**.
creator_addr	raw	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
creator_serial#	numeric	Not supported. Set it to **NULL**.
ecid	character varying(64)	Not supported. Set it to **NULL**.
sql_translation_profile_id	numeric	Not supported. Set it to **NULL**.
pga_tunable_mem	numeric	Not supported. Set it to **NULL**.
shard_ddl_status	character varying(8)	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.
external_name	character varying(1024)	Not supported. Set it to **NULL**.
plsql_debugger_connected	character varying(5)	Not supported. Set it to **NULL**.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **logon_time** column in the view is changed to **datea**.

7.3.13.102 MPP_TABLES

MPP_TABLES displays information about tables in PGXC_CLASS. For details about the columns, see **Table 7-384**.

Table 7-384 MPP_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace containing the table.
pgroup	name	Name of the node.
nodeoids	oidvector_extend	List of distributed table node OIDs.

7.3.13.103 MY_AUDIT_TRAIL

MY_AUDIT_TRAIL displays the standard audit trail entries related to the current user. The GaussDB audit information is mainly obtained through the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_query_audit() function. This view exists in both the PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on MY_AUDIT_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information. The **action_name** column of GaussDB is different from that of Oracle Database in terms of the audit actions. The type of the **transactionid** column is the same as that in Oracle Database. In GaussDB, the **sql_text** column is the parsed SQL statement, which is not completely the same as the executed SQL statement. For details about the columns, see **Table 7-385**.

CAUTION

In a distributed system, the gs_query_audit() function can only be used to query the audit information of the current node.

Table 7-385 MY_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported yet. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported yet. Its value is **NULL**.
terminal	character varying(255)	Not supported yet. Its value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported yet. Its value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the **action** column.
new_owner	character varying(128)	Not supported yet. Its value is **NULL**.
new_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
obj_privilege	character varying(32)	Not supported yet. Its value is **NULL**.
sys_privilege	character varying(40)	Not supported yet. Its value is **NULL**.
admin_option	character varying(1)	Not supported yet. Its value is **NULL**.
grantee	character varying(128)	Not supported yet. Its value is **NULL**.
audit_option	character varying(40)	Not supported yet. Its value is **NULL**.
ses_actions	character varying(19)	Not supported yet. Its value is **NULL**.
logoff_time	date	Not supported yet. Its value is **NULL**.
logoff_lread	numeric	Not supported yet. Its value is **NULL**.
logoff_pread	numeric	Not supported yet. Its value is **NULL**.
logoff_lwrite	numeric	Not supported yet. Its value is **NULL**.
logoff_dlock	character varying(40)	Not supported yet. Its value is **NULL**.
comment_text	character varying(4000)	Not supported yet. Its value is **NULL**.
sessionid	numeric	Not supported yet. Its value is **NULL**.
entryid	numeric	Not supported yet. Its value is **NULL**.
statementid	numeric	Not supported yet. Its value is **NULL**.
returncode	numeric	Not supported yet. Its value is **NULL**.
priv_used	character varying(40)	Not supported yet. Its value is **NULL**.
client_id	character varying(128)	Not supported yet. Its value is **NULL**.
econtext_id	character varying(64)	Not supported yet. Its value is **NULL**.
session_cpu	numeric	Not supported yet. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_uid	character varying(32)	Not supported yet. Its value is **NULL**.
instance_number	numeric	Not supported yet. Its value is **NULL**.
os_process	character varying(16)	Not supported yet. Its value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported yet. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported yet. Its value is **NULL**.
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported yet. Its value is **NULL**.
dbid	numeric	Not supported yet. Its value is **NULL**.
rls_info	clob	Not supported yet. Its value is **NULL**.
current_user	character varying(128)	Not supported yet. Its value is **NULL**.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **timestamp** column in the view is changed to **datea**.

7.3.13.104 MY_COL_COMMENTS

MY_COL_COMMENTS displays column comments of the table accessible to the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-386**.

Table 7-386 MY_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
origin_con_id	numeric	Not supported. The value is **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

7.3.13.105 MY_COLL_TYPES

MY_COLL_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-387**.

Table 7-387 MY_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported yet. Its value is **NULL**.
elem_type_mod	character varying(7)	Not supported yet. Its value is **NULL**.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported yet. Its value is **NULL**.
precision	numeric	Not supported yet. Its value is **NULL**.
scale	numeric	Not supported yet. Its value is **NULL**.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
elem_storage	character varying(7)	Not supported yet. Its value is **NULL**.
nulls_stored	character varying(3)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
char_used	character varying(1)	Not supported yet. Its value is **NULL**.

7.3.13.106 MY_CONS_COLUMNS

MY_CONS_COLUMNS displays information about PRIMARY KEY constraint columns in tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-388**.

Table 7-388 MY_CONS_COLUMNS columns

Name	Type	Description
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

7.3.13.107 MY_CONSTRAINTS

MY_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-389**.

Table 7-389 MY_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: CHECK constraint. • **f**: FOREIGN KEY constraint. • **p**: PRIMARY KEY constraint. • **u**: UNIQUE constraint.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the UNIQUE constraint and PRIMARY KEY constraint).
owner	character varying(64)	Constraint creator.

7.3.13.108 MY_DEPENDENCIES

MY_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-390**.

Table 7-390 MY_DEPENDENCIES columns

Name	Type	Description
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is **REF**. The default value is **HARD**, indicating hard reference.

7.3.13.109 MY_IND_COLUMNS

MY_IND_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-391**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-391 MY_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, its value is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Specifies whether columns are sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported yet. Its value is **NULL**.

7.3.13.110 MY_IND_EXPRESSIONS

MY_IND_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-392**.

Table 7-392 MY_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

7.3.13.111 MY_INDEXES

MY_INDEXES displays index information about the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-393**.

Table 7-393 MY_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is a unique index. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the index name is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported yet. Its value is **NULL**.
prefix_length	numeric	Not supported yet. Its value is **NULL**.
ini_trans	numeric	Not supported yet. Its value is **NULL**.
max_trans	numeric	Not supported yet. Its value is **NULL**.
initial_extent	numeric	Not supported yet. Its value is **NULL**.
next_extent	numeric	Not supported yet. Its value is **NULL**.
min_extents	numeric	Not supported yet. Its value is **NULL**.
max_extents	numeric	Not supported yet. Its value is **NULL**.
pct_increase	numeric	Not supported yet. Its value is **NULL**.
pct_threshold	numeric	Not supported yet. Its value is **NULL**.
include_column	numeric	Not supported yet. Its value is **NULL**.
freelists	numeric	Not supported yet. Its value is **NULL**.
freelist_groups	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_free	numeric	Not supported yet. Its value is **NULL**.
logging	character varying(3)	Not supported yet. Its value is **NULL**.
blevel	numeric	Not supported yet. Its value is **NULL**.
leaf_blocks	numeric	Not supported yet. Its value is **NULL**.
distinct_keys	numeric	Not supported yet. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported yet. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported yet. Its value is **NULL**.
clustering_factor	numeric	Not supported yet. Its value is **NULL**.
num_rows	numeric	Not supported yet. Its value is **NULL**.
sample_size	numeric	Not supported yet. Its value is **NULL**.
last_analyzed	date	Not supported yet. Its value is **NULL**.
degree	character varying(40)	Not supported yet. Its value is **NULL**.
instances	character varying(40)	Not supported yet. Its value is **NULL**.
temporary	character varying(1)	Not supported yet. Its value is **NULL**.
secondary	character varying(1)	Not supported yet. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported yet. Its value is **NULL**.
flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
duration	character varying(15)	Not supported yet. Its value is **NULL**.
pct_direct_access	numeric	Not supported yet. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ityp_name	character varying(128)	Not supported yet. Its value is **NULL**.
parameters	character varying(1000)	Not supported yet. Its value is **NULL**.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
domidx_status	character varying(12)	Not supported yet. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported yet. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported yet. Its value is **NULL**.
join_index	character varying(3)	Not supported yet. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported yet. Its value is **NULL**.
dropped	character varying(3)	Not supported yet. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is visible to the optimizer.
domidx_management	character varying(14)	Not supported yet. Its value is **NULL**.
segment_created	character varying(3)	Not supported yet. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported yet. Its value is **NULL**.
indexing	character varying(7)	Not supported yet. Its value is **NULL**.
auto	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.112 MY_JOBS

MY_JOBS displays details about the scheduled tasks owned by the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-394**.

Table 7-394 MY_JOBS columns

Name	Type	Description
job	bigint	Job ID.
log_user	name	Username of the job creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduler job.
start_date	timestamp without time zone	Time when a job starts to be executed for the first time.
start_suc	text	Start time of the first successful job execution.
last_date	timestamp without time zone	Start time of the last job execution.
last_suc	text	Start time of the last successful job execution.
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of the ongoing job execution.
this_suc	text	Start time of the ongoing job execution.
this_sec	text	Start time of an ongoing job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next job execution.
next_sec	text	Schedule time of the next job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
broken	text	If the value of the **status** column is **d**, the value of **broken** is **y**. Otherwise, the value of **broken** is **n**.
status	"char"	Status of the current job. The value can be **r**, **s**, **f**, or **d**. The default value is **r**. • **r**: running • **s**: successful execution • **f**: failed execution • **d**: canceling an execution
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to **null**, the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.
nls_env	character varying(4000)	Not supported yet. Its value is **NULL**.
misc_env	raw	Not supported yet. Its value is **NULL**.
instance	numeric	Not supported yet. Its value is **NULL**.

7.3.13.113 MY_OBJECTS

MY_OBJECTS displays database objects accessible to the current user. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-395**.

Table 7-395 MY_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type, including table, index, sequence, view, and global secondary index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
namespace	oid	Namespace that an object belongs to.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported yet. Its value is **NULL**.
timestamp	character varying(19)	Not supported yet. Its value is **NULL**.
secondary	character varying(1)	Not supported yet. Its value is **NULL**.
edition_name	character varying(128)	Not supported yet. Its value is **NULL**.
sharing	character varying(18)	Not supported yet. Its value is **NULL**.
editionable	character varying(1)	Not supported yet. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported yet. Its value is **NULL**.
application	character varying(1)	Not supported yet. Its value is **NULL**.
duplicated	character varying(1)	Not supported yet. Its value is **NULL**.
sharded	character varying(1)	Not supported yet. Its value is **NULL**.
created_appid	numeric	Not supported yet. Its value is **NULL**.
modified_appid	numeric	Not supported yet. Its value is **NULL**.
created_vsnid	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
modified_vsnid	numeric	Not supported yet. Its value is **NULL**.

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

7.3.13.114 MY_PROCEDURES

MY_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in both PG_CATALOG and SYS schemas. This view can be accessed by all users. Only the information about the current user can be viewed. For details about the columns, see **Table 7-396**.

Table 7-396 MY_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if **object_name** is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	The *n*th overloaded function of the same name.
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **yes** • **no**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pipelined	character varying(3)	Not supported. The value is **no**.
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. The value is **no**.
interface	character varying(3)	Not supported. The value is **no**.
deterministic	character varying(3)	Not supported. The value is **no**.
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: • **definer**: The creator permission is used. • **current_user**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported yet. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.
polymorphic	character varying(5)	Not supported yet. Its value is **NULL**.
argument_number	smallint	Number of input parameters in the stored procedure.

7.3.13.115 MY_SCHEDULER_JOB_ARGS

MY_SCHEDULER_JOB_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-397**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-397 MY_SCHEDULER_JOB_ARGS columns

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported yet. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.116 MY_SCHEDULER_JOBS

MY_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduled tasks owned by the current user in the database. By default, this view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-398**.

Table 7-398 MY_SCHEDULER_JOBS columns

Name	Type	Description
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported yet. Its value is **NULL**.
job_style	text	Style of a scheduled job, which is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported yet. Its value is **NULL**.
global_uid	character varying(33)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Type of the inline program of a scheduler job.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job. The value ranges from 0 to 255.
schedule_owner	character varying(4000)	Not supported yet. Its value is **NULL**.
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported yet. Its value is **NULL**.
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported yet. Its value is **NULL**.
event_queue_name	character varying(128)	Not supported yet. Its value is **NULL**.
event_queue_agent	character varying(523)	Not supported yet. Its value is **NULL**.
event_condition	character varying(4000)	Not supported yet. Its value is **NULL**.
event_rule	character varying(261)	Not supported yet. Its value is **NULL**.
file_watcher_owner	character varying(261)	Not supported yet. Its value is **NULL**.
file_watcher_name	character varying(261)	Not supported yet. Its value is **NULL**.
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported yet. Its value is **NULL**.
restart_on_failure	character varying(5)	Not supported yet. Its value is **NULL**.
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported yet. Its value is **NULL**.
run_count	numeric	Not supported yet. Its value is **NULL**.
uptime_run_count	numeric	Not supported yet. Its value is **NULL**.
max_runs	numeric	Not supported yet. Its value is **NULL**.
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported yet. Its value is **NULL**.
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported yet. Its value is **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.
schedule_limit	interval day to second(0)	Not supported yet. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported yet. Its value is **NULL**.
logging_level	character varying(11)	Not supported yet. Its value is **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
instance_stickiness	character varying(5)	Not supported yet. Its value is **NULL**.
raise_events	character varying(4000)	Not supported yet. Its value is **NULL**.
system	character varying(5)	Not supported yet. Its value is **NULL**.
job_weight	numeric	Not supported yet. Its value is **NULL**.
nls_env	character varying(4000)	Not supported yet. Its value is **NULL**.
source	character varying(128)	Not supported yet. Its value is **NULL**.
number_of_destinations	numeric	Not supported yet. Its value is **NULL**.
destination_owner	character varying(261)	Not supported yet. Its value is **NULL**.
destination	text	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported yet. Its value is **NULL**.
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported yet. Its value is **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported yet. Its value is **NULL**.
comments	text	Comments of a scheduler job.
flags	numeric	Not supported yet. Its value is **NULL**.
restartable	character varying(5)	Not supported yet. Its value is **NULL**.
has_constraints	character varying(5)	Not supported yet. Its value is **NULL**.
connect_credential_owner	character varying(128)	Not supported yet. Its value is **NULL**.
connect_credential_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fail_on_script_error	character varying(5)	Not supported yet. Its value is **NULL**.

7.3.13.117 MY_SCHEDULER_PROGRAM_ARGS

MY_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-399**.

Table 7-399 MY_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
metadata_attribute	character varying(19)	Not supported yet. Its value is **NULL**.
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported yet. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

7.3.13.118 MY_SEQUENCES

MY_SEQUENCES displays the sequence information about the current user. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-400**.

Table 7-400 MY_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. The values are as follows: • **y**: yes. • **n**: no.
order_flag	character(1)	Specifies whether a sequence is an ordered sequence. The values are as follows: • **y**: yes. • **n**: no.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to **NULL**.
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported yet. Its value is **NULL**.
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported yet. Its value is **NULL**.
session_flag	character varying(1)	Specifies whether a sequence has a private session. This is not supported. The value is **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.119 MY_SOURCE

MY_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-401**.

Table 7-401 MY_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.120 MY_SYNONYMS

MY_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-402**.

Table 7-402 MY_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.

7.3.13.121 MY_TAB_COL_STATISTICS

MY_TAB_COL_STATISTICS displays column statistics and histogram information extracted from MY_TAB_COLUMNS. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-403**.

Table 7-403 MY_TAB_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Date when a column was last analyzed. After the database is restarted, data loss will occur.
sample_size	numeric	Sample size used to analyze a column.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
notes	character varying(99)	Not supported yet. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **none**: no histogram. • **frequency**: frequency histogram. • **equi-width**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is **shared** (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.

7.3.13.122 MY_TAB_COLUMNS

MY_TAB_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas. All users can access this view. Only the information about the user is displayed. For details about the columns, see **Table 7-404**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-404 MY_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported yet. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It takes effect on the numeric type. For other types, the value is **NULL**.
data_scale	integer	Number of decimal places. It takes effect on the numeric type. For other types, the value is **0**.
nullable	bpchar	Specifies whether a column can be empty (**n** for a PRIMARY KEY constraint or NOT NULL constraint).
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported yet. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported yet. Its value is **no**.
user_stats	character varying(3)	Not supported yet. Its value is **no**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters). It takes effect only on the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** for the varchar, bpchar, or char data type. Set it to **C** for the nvarchar2 data type. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported yet. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported yet. Its value is **yes**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **none**: no histogram. • **frequency**: frequency histogram. • **equi-width**: equal-width histogram.
default_on_null	character varying(3)	Not supported yet. Its value is **NULL**.
identity_column	character varying(3)	Specifies whether a column is an identity column. • **yes**: It is an identity column. • **no**: It is not an identity column.
sensitive_column	character varying(3)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
evaluation_edition	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_before	character varying(128)	Not supported yet. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported yet. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

NOTE

- During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **last_analyzed** column in the view is changed to **datea**.
- Currently, the CREATE TABLE syntax does not support the creation of tables with identity columns. When the MY_TAB_COLUMNS view is queried, the value of **identity_column** in the returned result is always **no**.

7.3.13.123 MY_TAB_COMMENTS

MY_TAB_COMMENTS displays comments on all tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-405**.

Table 7-405 MY_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.124 MY_TAB_HISTOGRAMS

MY_TAB_HISTOGRAMS displays histogram information about the tables and views owned by the current user. All users can access this view. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-406**.

Table 7-406 MY_TAB_HISTOGRAMS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported yet. Its value is **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported yet. Its value is **NULL**.
endpoint_repeat_count	numeric	Not supported yet. Its value is **NULL**.
scope	character varying(7)	Not supported. The value is **shared**.

7.3.13.125 MY_TAB_MODIFICATIONS

MY_TAB_MODIFICATIONS displays statistics about modifications to tables owned by the current user since the last statistics collection on the tables. Currently, this view displays only tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-407**.

Table 7-407 MY_TAB_MODIFICATIONS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is **NULL**. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
truncated	character varying(3)	Not supported yet. Its value is **NULL**.
drop_segments	numeric	Not supported yet. Its value is **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **timestamp** column in the view is changed to **datea**.

7.3.13.126 MY_TAB_STATS_HISTORY

MY_TAB_STATS_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-408**.

Table 7-408 MY_TAB_STATS_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

7.3.13.127 MY_TAB_STATISTICS

MY_TAB_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-409**.

Table 7-409 MY_TAB_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported yet. Its value is **NULL**.
partition_position	numeric	Not supported yet. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported yet. Its value is **NULL**.
subpartition_position	numeric	Not supported yet. Its value is **NULL**.
object_type	character varying(12)	Object type • **TABLE** • **PARTITION** • **SUBPARTITION**
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported yet. Its value is **NULL**.
empty_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_space	numeric	Not supported yet. Its value is **NULL**.
chain_cnt	numeric	Not supported yet. Its value is **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.
num_freelist_blocks	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_cached_blocks	numeric	Not supported yet. Its value is **NULL**.
avg_cache_hit_ratio	numeric	Not supported yet. Its value is **NULL**.
im_imcu_count	numeric	Not supported yet. Its value is **NULL**.
im_block_count	numeric	Not supported yet. Its value is **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported yet. Its value is **NULL**.
scan_rate	numeric	Not supported yet. Its value is **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported yet. Its value is **NULL**.
user_stats	character varying(3)	Not supported yet. Its value is **NULL**.
stattype_locked	character varying(5)	Not supported yet. Its value is **NULL**.
stale_stats	character varying(7)	Not supported yet. Its value is **NULL**.
notes	character varying(25)	Not supported yet. Its value is **NULL**.
scope	character varying(7)	Not supported. The default value is **SHARED**.

7.3.13.128 MY_TABLES

MY_TABLES displays information about the tables owned by the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-410**.

Table 7-410 MY_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. • **yes**: deleted. • **no**: not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. • **valid**: The current table is valid. • **unusable**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. • **y**: It is a temporary table. • **n**: It is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether the table is a partitioned table. • **yes**: It is a partitioned table. • **no**: It is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **enabled**: Partition row movement is allowed. • **disabled**: Partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable table compression. • **enabled**: Table compression is enabled. • **disabled**: Table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether to enable logical replication. • **enabled**: Logical replication is enabled. • **disabled**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is a foreign table. • **yes**: It is a foreign table. • **no**: It is not a foreign table.
logging	character varying(3)	Specifies whether to log changes made to the table. • **yes**: The database logs changes made to the table. • **no**: The database does not log changes made to the table.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_lock	character varying(8)	Specifies whether to enable table-level lock. • **enabled**: Table-level lock is enabled. • **disabled**: Table-level lock is disabled.
nested	character varying(3)	Specifies whether the table is a nested table. • **yes**: It is a nested table. • **no**: It is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **enabled**: Corrupted blocks will be skipped. • **disabled**: Corrupted blocks will not be skipped.
has_identity	character varying(3)	Specifies whether the table has an identity column. • **yes**: It has an identity column. • **no**: It has no identity column.
inmemory	character varying(8)	Not supported. The value is **disabled**.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **yes**: A table segment has been created. • **no**: No table segment has been created.
monitoring	character varying(3)	Specifies whether to track changes made to the table. • **yes**: The database tracks changes made to the table. • **no**: The database does not track changes made to the table.

7.3.13.130 MY_TRIGGERS

MY_TRIGGERS displays information about the triggers owned by the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-412**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-412 MY_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger type, which can be **before statement**, **before each row**, **after statement**, **after each row**, or **instead of**.
triggering_event	character varying	Event that triggers a trigger. The value can be **update**, **insert**, **delete**, or **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be **table** or **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported yet. Its value is **NULL**.
referencing_name	character varying(422)	Not supported. The value is **referencing new as new old as old**.
when_clause	character varying(4000)	Content of the WHEN clause. **trigger_body** can be executed only when the value is **true**.
status	character varying(64)	• **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
before_statement	character varying(3)	Not supported yet. Its value is **NULL**.
before_row	character varying(3)	Not supported yet. Its value is **NULL**.
after_row	character varying(3)	Not supported yet. Its value is **NULL**.
after_statement	character varying(3)	Not supported yet. Its value is **NULL**.
instead_of_row	character varying(3)	Not supported yet. Its value is **NULL**.
fire_once	character varying(3)	Not supported yet. Its value is **NULL**.
apply_server_only	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.131 MY_TYPE_ATTRS

MY_TYPE_ATTRS displays all types of attributes owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-413**.

Table 7-413 MY_TYPE_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name.
attr_type_mod	character varying(7)	Type modifier of an attribute: • **REF** • **POINT**
attr_type_owner	character varying(128)	Owner of an attribute type.
attr_type_name	character varying(128)	Name of an attribute type.
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute.
scale	numeric	Decimal places for a NUMERIC or DECIMAL attribute.
character_set_name	character varying(44)	Character set name (**CHAR_CS** or **NCHAR_CS**) of an attribute.
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. • **YES**: It is inherited from a supertype. • **NO**: It is not inherited from a supertype.

7.3.13.132 MY_TYPES

MY_TYPES describes all object types owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-414**.

Table 7-414 MY_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type identifier (OID).
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
final	character varying(3)	Not supported yet. Its value is **NULL**.
instantiable	character varying(3)	Not supported yet. Its value is **NULL**.
persistable	character varying(3)	Not supported yet. Its value is **NULL**.
supertype_owner	character varying(128)	Not supported yet. Its value is **NULL**.
supertype_name	character varying(128)	Not supported yet. Its value is **NULL**.
local_attributes	numeric	Not supported yet. Its value is **NULL**.
local_methods	numeric	Not supported yet. Its value is **NULL**.
typeid	raw	Not supported yet. Its value is **NULL**.

7.3.13.133 MY_VIEWS

MY_VIEWS displays information about all views of the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-415**.

Table 7-415 MY_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported yet. Its value is **NULL**.
type_text	character varying(4000)	Not supported yet. Its value is **NULL**.
oid_text_length	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
oid_text	character varying(4000)	Not supported yet. Its value is **NULL**.
view_type_owner	character varying(128)	Not supported yet. Its value is **NULL**.
view_type	character varying(128)	Not supported yet. Its value is **NULL**.
superview_name	character varying(128)	Not supported yet. Its value is **NULL**.
editioning_view	character varying(1)	Not supported yet. Its value is **NULL**.
read_only	character varying(1)	Not supported yet. Its value is **NULL**.
container_data	character varying(1)	Not supported yet. Its value is **NULL**.
bequeath	character varying(12)	Not supported yet. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported yet. Its value is **NULL**.
default_collation	character varying(100)	Not supported yet. Its value is **NULL**.
containers_default	character varying(3)	Not supported yet. Its value is **NULL**.
container_map	character varying(3)	Not supported yet. Its value is **NULL**.
extended_data_link	character varying(3)	Not supported yet. Its value is **NULL**.
extended_data_link_map	character varying(3)	Not supported yet. Its value is **NULL**.
has_sensitive_column	character varying(3)	Not supported yet. Its value is **NULL**.
admit_null	character varying(3)	Not supported yet. Its value is **NULL**.
pdb_local_only	character varying(3)	Not supported yet. Its value is **NULL**.

7.3.13.134 NLS_DATABASE_PARAMETERS

NLS_DATABASE_PARAMETERS lists the permanent NLS parameters of the database server. This view exists in the PG_CATALOG and SYS schemas. It is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in Oracle Database. For details about the columns, see **Table 7-416**.

Table 7-416 NLS_DATABASE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

7.3.13.135 NLS_INSTANCE_PARAMETERS

NLS_INSTANCE_PARAMETERS lists the permanent NLS parameters of the database client. This view exists in the PG_CATALOG and SYS schemas. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in Oracle Database. For details about the columns, see **Table 7-417**.

Table 7-417 NLS_INSTANCE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

7.3.13.136 PG_AVAILABLE_EXTENSION_VERSIONS

PG_AVAILABLE_EXTENSION_VERSIONS displays extension versions of certain database features. For details about the columns, see **Table 7-418**.

Table 7-418 PG_AVAILABLE_EXTENSION_VERSIONS columns

Name	Type	Description
name	name	Extension name
version	text	Version name
installed	boolean	Specifies whether this extension version is installed. Otherwise, the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
superuser	boolean	Specifies whether only SYSADMINs are allowed to install the extension. Otherwise, the value is **false**.
relocatable	boolean	Specifies whether the extension can be relocated to another schema. Otherwise, the value is **false**.
schema	name	Name of the schema that the extension must be installed into (**NULL** if the extension is partially or fully relocatable)
requires	name[]	Names of prerequisite extensions (**NULL** if none)
comment	text	Comment from the extension's control file.

7.3.13.137 PG_AVAILABLE_EXTENSIONS

PG_AVAILABLE_EXTENSIONS displays the extension information about certain database features. For details about the columns, see **Table 7-419**.

Table 7-419 PG_AVAILABLE_EXTENSIONS columns

Name	Type	Description
name	name	Extension name
default_version	text	Name of the default version (**NULL** if none is specified)
installed_version	text	Currently installed version of the extension (**NULL** if no version is installed)
comment	text	Comment from the extension's control file.

7.3.13.138 PG_CONTROL_GROUP_CONFIG

PG_CONTROL_GROUP_CONFIG displays Cgroup configuration information in a system. Only users with the SYSADMIN permission can query this view. For details about the columns, see **Table 7-420**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-420 PG_CONTROL_GROUP_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

7.3.13.139 PG_CURSORS

PG_CURSORS displays cursors that are currently available. For details about the columns, see **Table 7-421**.

Table 7-421 PG_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change.
is_holdable	boolean	**True** if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); **false** otherwise
is_binary	boolean	Specifies whether the cursor is declared BINARY. If it is, the value is **TRUE**. Otherwise, the value is **FALSE**.
is_scrollable	boolean	Specifies whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is **TRUE**. Otherwise, the value is **FALSE**.
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

7.3.13.140 PG_EXT_STATS

PG_EXT_STATS displays extended statistics stored in **PG_STATISTIC_EXT**. The extension statistics means multiple columns of statistics. For details about the columns, see **Table 7-422**.

Table 7-422 PG_EXT_STATS columns

Name	Type	Reference	Description
schemaname	name	**nspname** in **PG_NAMESPACE**	Name of the schema that contains a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
tablename	name	**relname** in PG_CLASS	Table name.
attname	int2vector	PG_STATISTIC_EXT.stakey	Columns to be combined for collecting statistics.
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is **false**.
null_frac	real	-	Percentage of column combinations that are null to all records.
avg_width	integer	-	Average width of column combinations, in bytes.
n_distinct	real	-	• Estimated number of distinct values in a column combination if the value is greater than 0. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, **-1** indicates that the number of distinct values is the same as the number of rows for a column combination. 1. The negative form is used because ANALYZE assumes that the number of distinct values increases as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column combination. • Exact number of distinct values if the value is greater than 0. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if a value in a column combination appears twice in average, **n_dndistinct** equals **-0.5**. • The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be **NULL**. None of the most common values in the column is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals** is **NULL**, the value of this column is **NULL**.
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be **NULL**. At least one of the common values in the column is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals_null** is **NULL**, the value of this column is **NULL**.
histogram_bounds	anyarray	-	Boundary value list of the histogram
partitionname	name	**relname** in PG_PARTITION	Name of the partition in the partitioned table. For a non-partitioned table, this column is left blank.
subpartitionname	name	**relname** in PG_PARTITION	Name of the subpartition in the partitioned table. For a distributed system, this column is left blank.

7.3.13.141 PG_GET_SENDERS_CATCHUP_TIME

PG_GET_SENDERS_CATCHUP_TIME displays catchup information of the currently active primary/standby instance sender thread on the DN. For details about the columns, see **Table 7-423**.

Table 7-423 PG_GET_SENDERS_CATCHUP_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Current sender's replication status • **Startup**: startup state. • **Backup**: backup state. • **Catchup**: catch-up state, which indicates that the standby node is catching up with the primary node. • **Streaming**: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.
type	text	Current sender type • **Wal**: type that logs are written in advance. • **Data**: data type.
catchup_start	timestamp with time zone	Startup time of a catchup task
catchup_end	timestamp with time zone	End time of the catchup task

7.3.13.142 PG_GROUP

PG_GROUP displays the database role authentication and the relationship between group members. For details about the columns, see **Table 7-424**.

Table 7-424 PG_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID.
grolist	oid[]	Array containing the IDs of all roles in the group.

7.3.13.143 PG_GTT_STATS

PG_GTT_STATS displays statistics about a single column in all global temporary tables of the current session by calling pg_get_gtt_statistics(). Before using this function, perform ANALYZE on the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-425 PG_GTT_STATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
attname	name	Attribute name.
inherited	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
null_frac	real	Percentage of column entries that are null.
avg_width	integer	Average stored width, in bytes, of non-null entries.
n_distinct	real	Number of distinct, non-null data values in the column.
most_common_vals	text[]	List of the most common values, which is sorted by occurrence frequency.
most_common_freqs	real[]	Frequencies of the most common values.
histogram_bounds	text[]	Data distribution (excluding the most common values) in a frequency histogram description column.
correlation	real	Correlation coefficient.
most_common_elems	text[]	List of the most common element values, which is used for the array type or some other type.
most_common_elem_freqs	real[]	Frequencies of the most common element values.
elem_count_histogram	real[]	Array type histogram.

7.3.13.144 PG_GTT_RELSTATS

PG_GTT_RELSTATS displays basic information about all global temporary tables of the current session by calling pg_get_gtt_relstats(). The query result of the distributed global temporary table on a CN is not meaningful, and the query result on a DN is empty. Therefore, it is not recommended in distributed mode.

Table 7-426 PG_GTT_RELSTATS columns

Name	Type	Description
schemaname	name	Schema name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tablename	name	Name of a global temporary table.
relfilenode	oid	ID of a file object.
relpages	integer	Number of disk pages of a global temporary table.
reltuples	real	Number of records in a global temporary table
relallvisible	integer	Number of pages that are marked as all visible
relfrozenxid	xid	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.
relminmxid	xid	Reserved

7.3.13.145 PG_GTT_ATTACHED_PIDS

PG_GTT_ATTACHED_PIDS displays which sessions are using global temporary tables by calling the pg_get_attached_pid() function. In distributed mode, GS_GTT_ATTACHED_PIDS or GS_GLOBAL_GTT_ATTACHED_PIDS is recommended.

Table 7-427 PG_GTT_ATTACHED_PIDS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint[]	Thread PID list.
sessionids	bigint[]	Session ID list.

7.3.13.146 PG_INDEXES

PG_INDEXES displays information about each index in the database. For details about the columns, see **Table 7-428**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-428 PG_INDEXES columns

Name	Type	Reference	Description
schemaname	name	**nspname** in PG_NAMESPACE	Name of the schema that contains tables and indexes.
tablename	name	**relname** in PG_CLASS	Name of the table where the index is located.
indexname	name	**relname** in PG_CLASS	Index name
tablespace	name	**nspname** in PG_TABLESPACE	Name of the tablespace that contains the index.
indexdef	text	-	Index definition (a reconstructed **CREATE INDEX** command)

7.3.13.147 PG_LOCKS

PG_LOCKS displays information about locks held by open transactions. For details about the columns, see **Table 7-429**.

Table 7-429 PG_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	**oid** in PG_DATABASE	OID of the database in which the locked target exists. • The OID is **0** if the target is a shared object. • The OID is **NULL** if the locked object is a transaction.
relation	oid	**oid** in PG_CLASS	OID of the relationship targeted by the lock (**NULL** if the object is not a relation or part of a relation).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
page	integer	-	Page number targeted by the lock within the relation (**NULL** if the object is not a relation page or row page).
tuple	smallint	-	Row number targeted by the lock within the page (**NULL** if the object is not a row).
bucket	integer	-	Hash bucket ID.
virtualxid	text	-	ID of the virtual transaction The value is **NULL** if the object is not a virtual transaction.
transactionid	xid	-	ID of the transaction. The value is **NULL** if the object is not a transaction.
classid	oid	**oid** in **PG_CLASS**	OID of the system catalog that contains the object (**NULL** if the object is not a general database object).
objid	oid	-	OID of the lock target within its system catalog (**NULL** if the target is not a general database object).
objsubid	smallint	-	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	-	Virtual ID of the virtual transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread. The value can be **AccessShareLock**, **RowShareLock**, **RowExclusiveLock**, **ShareLock**, **ShareRowExclusiveLock**, **ExclusiveLock**, or **AccessExclusive-Lock**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
granted	boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	-	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the locktag_decode() function.
global_sessionid	text	-	Global session ID.

7.3.13.148 PG_NODE_ENV

PG_NODE_ENV displays the environment variable information of the current node. Only users with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-430**.

Table 7-430 PG_NODE_ENV columns

Name	Type	Description
node_name	text	Current node name
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node
log_directory	text	Log directory of the node

7.3.13.149 PG_OS_THREADS

PG_OS_THREADS provides status information about all the threads under the current node. For details about the columns, see **Table 7-431**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-431 PG_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.
dbid	oid	ID of the database to which a thread belongs.

7.3.13.150 PG_PREPARED_STATEMENTS

PG_PREPARED_STATEMENTS displays information about all prepared statements that are available in the current session. For details about the columns, see **Table 7-432**.

Table 7-432 PG_PREPARED_STATEMENTS columns

Name	Type	Description
name	text	Identifier of the prepared statement
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of **regtype**. The OID corresponding to an element of this array can be obtained by converting the **regtype** value to an OID value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement. • **False** if the statement was prepared through the frontend/backend protocol.

7.3.13.151 PG_PREPARED_XACTS

PG_PREPARED_XACTS displays information about transactions that are currently prepared for two-phase commit. For details about the columns, see **Table 7-433**.

Table 7-433 PG_PREPARED_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric identifier of the prepared transaction.
gid	text	-	Global identifier of the prepared transaction.
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	**rolname** in **PG_AUTHID**	Name of the user who executes the transaction.
database	name	**PG_DATABASE**.datname	Name of the database that executes the transaction.

7.3.13.152 PG_REPLICATION_SLOTS

PG_REPLICATION_SLOTS displays replication slot information. For details about the columns, see **Table 7-434**.

Table 7-434 PG_REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Specifies whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.
confirmed_flush	text	Dedicated logical replication slot. The client confirms the location of the received log.
confirmed_csn	xid	Dedicated logical replication slot. The client confirms the CSN corresponding to the last transaction in the received log.

Example:

```
-- Perform query on the DN.
gaussdb=# SELECT * FROM pg_replication_slots;
 slot_name |      plugin      | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
-----------+------------------+-----------+--------+----------+--------+------+--------------+-------------+---------------
+-----------------+---------------
 dn_6002   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f             |
 dn_6003   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f             |
 slot_lsn  | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36252350  | f             |
0/362523D0      |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 slot_test | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36251718  | f
|               |      10025527
(4 rows)

-- Perform query on the CN.
gaussdb=# SELECT * FROM pg_replication_slots;
 slot_name |      plugin      | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
-----------+----------------+-----------+--------+----------+--------+------+--------------+-------------+---------------
+-----------------+---------------
 slot_test | mppdb_decoding | logical   | 139264 | db_test  | f      |      |              |             | f
|               |
(1 row)
```

NOTICE

When a query is performed on a DN, the **confirmed_csn** query result of the LSN-based logical replication slot is empty, and the **confirmed_flush** query result of the CSN-based logical replication slot is empty. When a query is performed on the CN, **catalog_xmin**, **restart_lsn**, **confirmed_flush**, and **confirmed_csn** of the CSN-based logical replication slot are not displayed and the query result is empty.

7.3.13.153 PG_RULES

PG_RULES displays useful information about rewriting rules. For details about the columns, see **Table 7-435**.

Table 7-435 PG_RULES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Name of the table to which the rule applies
rulename	name	Rule name
definition	text	Rule definition (reconstructed by the CREATE statement).

7.3.13.154 PG_RUNNING_XACTS

PG_RUNNING_XACTS displays information about running transactions on the current node. For details about the columns, see **Table 7-436**.

Table 7-436 PG_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
gxid	xid	Transaction ID.
state	tinyint	Transaction status. • **3**: prepared. • **0**: starting.
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is lazy vacuum. • **t** (true): yes • **f** (false): no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the prepared state; otherwise, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

7.3.13.155 PG_SESSION_IOSTAT

PG_SESSION_IOSTAT displays I/O workload management information about the task currently executed by the user. Only the user with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-437**.

IOPS is counted by 10 thousands per second.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 7-437 PG_SESSION_IOSTAT columns

Name	Type	Description
query_id	bigint	Job ID.
mincurriops	integer	Minimum I/O of the current job across each DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
maxcurriops	integer	Maximum I/O of the current job across each DN.
minpeakiops	integer	Minimum I/O peak at each DN during job running.
maxpeakiops	integer	Maximum I/O peak at each DN during job running.
io_limits	integer	**io_limits** set for the job.
io_priority	text	**io_priority** set for the job.
query	text	Job.
node_group	text	Node group of the user to which a job belongs.
curr_io_limits	integer	Real-time value of **io_limits** when **io_priority** is used to control I/Os.

7.3.13.156 PG_SETTINGS

PG_SETTINGS displays information about parameters of the running database. For details about the columns, see **Table 7-438**.

Table 7-438 PG_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value.
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

NOTE

The query results of the PG_SETTINGS columns do not contain empty character strings in ORA-compatible mode, but may contain empty character strings instead of **NULL** in other compatible modes.

7.3.13.157 PG_SHARED_MEMORY_DETAIL

PG_SHARED_MEMORY_DETAIL displays usage information about all the shared memory contexts. For details about the columns, see **Table 7-439**.

Table 7-439 PG_SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory, in bytes.
freesize	bigint	Remaining size of the shared memory, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usedsize	bigint	Used size of the shared memory, in bytes.

7.3.13.158 PG_STATS

PG_STATS displays single-column statistics stored in the pg_statistic table. The GUC parameter **autovacuum_naptime** specifies the interval for updating statistics recorded in the view. For details about the columns, see **Table 7-440**.

Table 7-440 PG_STATS columns

Name	Type	Reference	Description
schemaname	name	**nspname** in **PG_NAMESPACE**	Name of the schema that contains a table.
tablename	name	**relname** in **PG_CLASS**	Table name.
attname	name	**PG_ATTRIBUTE**.attname	Column name.
inherited	boolean	-	Inherited tables are not supported currently. The value **f** (false) indicates no.
null_frac	real	-	Percentage of column entries that are null.
avg_width	integer	-	Average width in bytes of column's entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
n_distinct	real	-	• Estimated number of distinct values in the column if the value is greater than 0. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, value **–1** indicates that the number of distinct values is the same as the number of rows for a unique column. 1. The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column. • Exact number of distinct values if the value is greater than **0**. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if the value of a column appears twice in average, set **n_dndistinct** to **-0.5**. • The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. The value is **NULL** if the value of **most_common_vals** is **NULL**.
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MCVs. If a value appears in the value of **most_common_vals**, it does not appear in the histogram. If the column data type does not have the < operator or the list specified by **most_common_vals** contains all values of the column, the histogram information of the column is **NULL**.
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from –1 to +1. When the value is close to –1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is **NULL** if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values.
partitionname	name	**relname** in **PG_PARTITION**	Name of the partition in the partitioned table. For a non-partitioned table, this column is left blank.
subpartitionname	name	**relname** in **PG_PARTITION**	Name of the subpartition in the partitioned table. For a distributed system, this column is left blank.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.159 PG_STAT_ACTIVITY

PG_STAT_ACTIVITY displays information about the current user's queries. The columns save information about the last query. For details about the columns, see **Table 7-441**.

NOTE

When PG_STAT_ACTIVITY is queried, GaussDB determines whether to allow the access based on the permissions of **current_user**. If **current_user** is an initial user or a SYSADMIN, they can query information about all sessions. If **current_user** is a common user, they can only view their own session information (**session_user** refers to the information about the current user).

Table 7-441 PG_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the background.
datname	name	Name of the database that the user session connects to in the background.
pid	bigint	Background thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the background.
usename	name	Name of the user logged in to the background.
application_name	text	Name of the application connected to the background.
client_addr	inet	IP address of the client connected to the background. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the background (**-1** if a Unix socket is used).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started (**NULL** if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of **state** is not **active**. For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	boolean	Specifies whether the background is waiting for a lock. • **t** (true): yes. • **f** (false): no.
enqueue	text	Queuing status of a statement. The value must be one of the following: • **waiting in queue**: The statement is in the queue. • Empty: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this background. The value must be one of the following: • **active**: The background is executing a query. • **idle**: The background is waiting for a new client command. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the background. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed. When a stored procedure is executed, the content displayed in this column is affected by the GUC parameter **track_procedure_sql**. ● When the GUC parameter **track_procedure_sql** is set to **on**, this column also prints the statements that are being executed in the stored procedure. ● When the GUC parameter **track_procedure_sql** is set to **off**, this column prints only the statements that are called by the stored procedure.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter **connection_info**.
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID. When a stored procedure is executed, the value of this column is affected by the GUC parameter **instr_unique_sql_track_type**. ● When the GUC parameter **instr_unique_sql_track_type** is set to **ALL**, this column displays **unique_sql_id** of statements executed in the stored procedure. ● When the GUC parameter **instr_unique_sql_track_type** is set to **TOP**, this column displays **unique_sql_id** of executed top-level statements.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Size of Xlogs currently used by a transaction, in bytes.

7.3.13.160 PG_STAT_ACTIVITY_NG

PG_STAT_ACTIVITY_NG displays information about all queries in the node group of the current user. For details about the columns, see **Table 7-442**.

Table 7-442 PG_STAT_ACTIVITY_NG columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the background.
datname	name	Name of the database that the user session connects to in the background.
pid	bigint	Background thread ID.
sessionid	bigint	Session ID.
global_sessionid	text	Global session ID.
usesysid	oid	OID of the user logged in to the background.
username	name	Name of the user logged in to the background.
application_name	text	Name of the application connected to the background.
client_addr	inet	IP address of the client connected to the background. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the background (**-1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started (**NULL** if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of **state** is not **active**. For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the background is waiting for a lock. • **t** (true): yes. • **f** (false): no.
enqueue	text	Queuing status of a statement. The value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this background. The value can be: • **active**: The background is executing a query. • **idle**: The background is waiting for a new client command. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity_ng; datname | usename | usesysid | state | pid ----------+----------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the background. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
node_group	text	Node group of the user to which the statement belongs.

7.3.13.161 PG_STAT_ALL_INDEXES

PG_STAT_ALL_INDEXES displays statistics about accesses to a specific index by querying each index row in the current database. For details about the columns, see **Table 7-443**.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg_stat_all_indexes.idx_tup_read** count(s) for the index(es) it uses, and it increments the **pg_stat_all_tables.idx_tup_fetch** count for the table, but it does not affect **pg_stat_all_indexes.idx_tup_fetch**.

Table 7-443 PG_STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.162 PG_STAT_ALL_TABLES

PG_STAT_ALL_TABLES queries information about each table in the current database (including TOAST tables) and displays statistics about a specific table. For details about the columns, see **Table 7-444**.

Table 7-444 PG_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (that is, with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Time when the data in the table changes last time. Operations that cause data changes include insert, update, delete, and truncate on the table and exchange, truncate, and drop on the table partitions (partitions/subpartitions). This column is not recorded in the system catalog. Data in this column is recorded only on the local CN.

7.3.13.163 PG_STAT_BAD_BLOCK

PG_STAT_BAD_BLOCK displays statistics about page verification failures after a node is started. For details about the columns, see **Table 7-445**.

Table 7-445 PG_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	OID of a database.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	File type. The options are as follows: • **0**: main data file. • **1**: FSM file. • **2**: VM file. • **3**: BCM file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
error_count	integer	Number of verification failures.
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

7.3.13.164 PG_STAT_BGWRITER

PG_STAT_BGWRITER displays statistics about the activity of the background writer process. For details about the columns, see **Table 7-446**.

Table 7-446 PG_STAT_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

7.3.13.165 PG_STAT_DATABASE

PG_STAT_DATABASE displays statistics about each database in cluster. For details about the columns, see **Table 7-447**.

Table 7-447 PG_STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of a database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database. This is the only column in the view that returns the status value. Other columns return the accumulated value since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of times that disk blocks have been found in the buffer cache and therefore the disk blocks do not need to be read (only those found in the buffer cache are counted, excluding those found in the file system cache of the OS).
tup_returned	bigint	Number of rows returned by queries in this database.
tup_fetched	bigint	Number of rows fetched by queries in this database.
tup_inserted	bigint	Number of rows inserted by queries in this database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_updated	bigint	Number of rows updated by queries in this database.
tup_deleted	bigint	Number of rows deleted by queries in this database.
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see **PG_STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. Calculates all temporary files, regardless of why the temporary files are created (such as sorting or hashing) or the setting of the **log_temp_files** parameter.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. Calculates all temporary files, regardless of why the temporary files are created or the setting of the **log_temp_files** parameter.
deadlocks	bigint	Number of all deadlocks detected in the database since the last reset of statistics.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds.
blk_write_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds.
stats_reset	timestamp with time zone	Time when the status statistics are reset.

7.3.13.166 PG_STAT_DATABASE_CONFLICTS

PG_STAT_DATABASE_CONFLICTS displays statistics about database conflicts. For details about the columns, see **Table 7-448**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-448 PG_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	ID of a database
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

7.3.13.167 PG_STAT_REPLICATION

PG_STAT_REPLICATION displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs. For details about the columns, see **Table 7-449**.

Table 7-449 PG_STAT_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread
usesysid	oid	User system ID.
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the log synchronization thread: • **startup**: The thread is being started. • **catchup**: The thread is establishing a connection between the standby node and the primary node. • **streaming**: The thread has established a connection between the standby node and the primary node and is replicating data streams. • **backup**: The thread is sending a backup. • **stopping**: The thread is being stopped.
sender_sent_location	text	Location of the last Xlog sent by the sender to the receiver.
receiver_write_location	text	Location of the last Xlog written by the receiver to the file system.
receiver_flush_location	text	Location of the last Xlog flushed by the receiver to disk.
receiver_replay_location	text	Location of the last Xlog replayed by the receiver.
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sync_state	text	Synchronization state: • **async**: asynchronous replication. • **sync**: synchronous replication. • **potential**: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous. • **quorum**: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby nodes. Generally, the number of synchronous standby nodes is (n +1)/2-1, where *n* indicates the total number of copies. Whether the standby node is synchronous depends on whether logs are received first. For details, see the description of the **synchronous_standby_names** parameter.

7.3.13.168 PG_STAT_SYS_INDEXES

PG_STAT_SYS_INDEXES displays index status information about all the system catalogs in the pg_catalog and information_schema schemas. For details about the columns, see **Table 7-450**.

Table 7-450 PG_STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

7.3.13.169 PG_STAT_SYS_TABLES

PG_STAT_SYS_TABLES displays statistics about the system catalogs of all the namespaces in pg_catalog and information_schema schemas. For details about the columns, see **Table 7-451**.

Table 7-451 PG_STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

7.3.13.170 PG_STAT_USER_FUNCTIONS

PG_STAT_USER_FUNCTIONS shows user-defined function status information in a namespace. (The language of the function is non-internal language.) For details about the columns, see **Table 7-452**.

Table 7-452 PG_STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	Function ID.
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

7.3.13.171 PG_STAT_USER_INDEXES

PG_STAT_USER_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables. For details about the columns, see **Table 7-453**.

Table 7-453 PG_STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

7.3.13.172 PG_STAT_USER_TABLES

PG_STAT_USER_TABLES displays information about user-defined ordinary tables and TOAST tables in the namespaces. For details about the columns, see **Table 7-454**.

Table 7-454 PG_STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

7.3.13.173 PG_STAT_XACT_ALL_TABLES

PG_STAT_XACT_ALL_TABLES displays transaction status information about all ordinary tables and TOAST tables in the namespaces. For details about the columns, see **Table 7-455**.

Table 7-455 PG_STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

7.3.13.174 PG_STAT_XACT_SYS_TABLES

PG_STAT_XACT_SYS_TABLES displays transaction status information of the system catalog in the namespace. For details about the columns, see **Table 7-456**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-456 PG_STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

7.3.13.175 PG_STAT_XACT_USER_FUNCTIONS

PG_STAT_XACT_USER_FUNCTIONS contains statistics on the execution of each function. For details about the columns, see **Table 7-457**.

Table 7-457 PG_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	Function ID.
schemaname	name	Schema name.
funcname	name	Function name.
calls	bigint	Number of times that the function has been called.
total_time	double precision	Total time spent in the function and all other functions called by it.
self_time	double precision	Total time spent in the function itself, excluding other functions called by it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.176 PG_STAT_XACT_USER_TABLES

PG_STAT_XACT_USER_TABLES displays transaction status information of the user table in the namespace. For details about the columns, see **Table 7-458**.

Table 7-458 PG_STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

7.3.13.177 PG_STATIO_ALL_INDEXES

PG_STATIO_ALL_INDEXES displays information about each index row in the current database, showing statistics about I/O on that specific index. For details about the columns, see **Table 7-459**.

Table 7-459 PG_STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table where the index is located.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the table where the index is located.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

7.3.13.178 PG_STATIO_ALL_SEQUENCES

PG_STATIO_ALL_SEQUENCES displays the I/O statistics of each sequence in the current database. For details about the columns, see **Table 7-460**.

Table 7-460 PG_STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema where the sequence is located.
relname	name	Name of the sequence.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in this sequence.

7.3.13.179 PG_STATIO_ALL_TABLES

PG_STATIO_ALL_TABLES displays the I/O statistics of each table (including TOAST tables) in the current database. For details about the columns, see **Table 7-461**.

Table 7-461 PG_STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table.
idx_blks_hit	bigint	Number of cache hits of all indexes in the table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

7.3.13.180 PG_STATIO_SYS_INDEXES

PG_STATIO_SYS_INDEXES displays I/O status information for all system catalog indexes in a namespace. For details about the columns, see **Table 7-462**.

Table 7-462 PG_STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table where the index is located.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

7.3.13.181 PG_STATIO_SYS_SEQUENCES

PG_STATIO_SYS_SEQUENCES displays I/O status information about all the sequences in a namespace. For details about the columns, see **Table 7-463**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-463 PG_STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema where the sequence is located.
relname	name	Name of the sequence.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in this sequence.

7.3.13.182 PG_STATIO_SYS_TABLES

PG_STATIO_SYS_TABLES shows I/O status information about all the system catalogs in a namespace. For details about the columns, see **Table 7-464**.

Table 7-464 PG_STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from the index in the table.
idx_blks_hit	bigint	Number of cache hits in the table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.183 PG_STATIO_USER_INDEXES

PG_STATIO_USER_INDEXES displays I/O status information about all the user relationship table indexes in a namespace. For details about the columns, see **Table 7-465**.

Table 7-465 PG_STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table where the index is located.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

7.3.13.184 PG_STATIO_USER_SEQUENCES

PG_STATIO_USER_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespaces. For details about the columns, see **Table 7-466**.

Table 7-466 PG_STATIO_USER_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema where the sequence is in.
relname	name	Name of the sequence.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in this sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.185 PG_STATIO_USER_TABLES

PG_STATIO_USER_TABLES displays I/O status information about all the user relationship tables in the namespace. For details about the columns, see **Table 7-467**.

Table 7-467 PG_STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from the index in the table.
idx_blks_hit	bigint	Number of cache hits in the table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

7.3.13.186 PG_TABLES

PG_TABLES is used to query useful information about each table in a database. For details about the columns, see **Table 7-468**.

Table 7-468 PG_TABLES columns

Name	Type	Reference	Description
schemaname	name	**nspname** in **PG_NAMESPACE**	Name of the schema that contains a table.
tablename	name	**relname** in **PG_CLASS**	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
tableowner	name	pg_get_userbyid(**PG_CLASS**.relowner)	Table owner.
tablespace	name	**spcname** in **PG_TABLESPACE**	Tablespace that contains the table. The default value is null.
hasindexes	boolean	**PG_CLASS**.relhasindex	The value is **t** if the table has (or recently had) an index; otherwise, the value is **f**.
hasrules	boolean	**PG_CLASS**.relhasrules	The value is **t** if the table has rules; otherwise, the value is **f**.
hastriggers	boolean	**PG_CLASS**.RELHASTRIGGERS	The value is **t** if the table has triggers; otherwise, the value is **f**.
tablecreator	name	pg_get_userbyid(**PG_OBJECT**.creator)	Table owner.
created	timestamp with time zone	**PG_OBJECT**.ctime	Time when a table is created.
last_ddl_time	timestamp with time zone	**PG_OBJECT**.mtime	Time when the last DDL operation is performed on a table.

7.3.13.187 PG_THREAD_WAIT_STATUS

PG_THREAD_WAIT_STATUS allows you to test the blocking status about the worker thread and auxiliary thread of the current instance. For details about the columns, see **Table 7-469**.

Table 7-469 PG_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details, see **Table 7-470**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

Table 7-470 shows the waiting status in the **wait_status** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-470 Waiting states

Value	Description	Cause	Suggestions
wait cmd	Waits for reading network communication packets to complete.	The local end waits for the next command from the peer end.	Network communication is often more time-consuming than other operations. If a connection stays in this state for a long time, you can check why the peer end has not sent commands by examining the pg_stat_activity, gs_stack, dbe_perf.pooler_status, and pg_thread_wait_status views.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait pooler get conn	Waits for pooler to obtain connections.	The local node attempts to acquire connections to other nodes from the connection pool. If no suitable connection is found, the local node will try to establish a new connection. If the connection can be reused directly from the connection pool, the time taken to obtain the connection is minimal. When service traffic is high and connections are frequently rebuilt (such as when the connection pool is cleared or connections are not reclaimed due to errors), acquiring connections can be time-consuming.	Modify the GUC parameters **minimum_pool_size** and **pooler_maximum_idle_time** according to the service scenario and review the current connection status using logs. If many connection destruction logs are observed, investigate the root cause.
wait pooler abort conn	Waits for pooler to terminate connections.	This state is activated by the clean connection operation and waits for the transaction that meets the conditions to exit and release the connection.	Stop services before clearing connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait pooler clean conn	Waits for pooler to clear connections.	This state is activated by the clean connection operation and waits for the thread that meets the conditions to exit and release the connection.	Stop services before clearing connections.
pooler create conn	Waits for the pooler to establish a connection. The connection is being established with the node specified by **nodename**, and there are *N* connections waiting to be established.	If the network connection is poor or the peer service is busy, the connection setup time is prolonged.	Check the network status or reduce the service traffic.
set cmd	Waits for running the **SET**, **RESET**, **TRANSACTION BLOCK LEVEL PARA SET**, or **SESSION LEVEL PARA SET** statement on the connection. The statement is being executed on the node specified by **nodename**.	The **SET**, **RESET**, **TRANSACTION BLOCK LEVEL PARA SET**, or **SESSION LEVEL PARA SET** statement is being executed on the specified node.	Check the network status or reduce the service traffic.
cancel query	Cancels the SQL statement that is being executed through a connection.	After sending a statement cancellation command to the peer end, the local end waits for the execution result from the peer end.	Check the network status or reduce the service traffic.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
stop query	Stops the query that is being executed through a connection.	After sending a statement cancellation command to the peer end, the local end waits for the execution result from the peer end.	Check the network status or reduce the service traffic.
wait node	Waits for receiving data from a connected node. The system is waiting for data from the plevel thread of the node specified by **nodename**. The data of *N* connections is waiting to be returned. If **phase** is included, the possible phases are as follows: • **begin**: The transaction is being started. • **commit**: The transaction is being committed. • **rollback**: The transaction is being rolled back.	After sending the command, the local end waits for the execution result from the peer end.	Network communication is often more time-consuming than other operations. If a connection stays in this state for a long time, you can check why the peer end has not sent commands by examining the pg_stat_activity, gs_stack, dbe_perf.pooler_status, and pg_thread_wait_status views.
wait transaction sync	Waits for synchronizing the transaction specified by **xid**.	The local transaction is waiting for completion.	Modify the **transaction_sync_naptime** parameter.
wait wal sync	Waits for WALs of a specified LSN to be synchronized to the standby node.	Forcible synchronization of primary and standby logs is enabled.	Change the commit mode to local commit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait data sync	Waits for data pages to be synchronized to the standby node.	Forcible synchronization of data pages to the standby instance is enabled.	Disable the mixed streaming replication function (**enable_mix_replication**).
wait wal flush	In the primary node, Xlogs are waiting to be flushed to disks and the primary node is waiting to reach consensus with the standby node in DCF mode. In the standby node, the minimum recovery point is waiting to be updated and the standby node is waiting to reach consensus with the primary node in DCF mode.	Logs are waiting to be flushed to disk or the minimum recovery point is waiting to be updated.	Check the I/O performance.
wait data sync queue	Waits for putting the row-store data pages into the synchronization queue.	Forcible synchronization of data pages to the standby instance is enabled.	Disable the mixed streaming replication function (**enable_mix_replication**).
flush data	Waits for sending data to the plevel thread of the node specified by **nodename**. If **phase** is included, the possible phase is **wait quota**, indicating that the current communication flow is waiting for the quota value.	Data has been sent to other nodes.	Check the network status or reduce the service traffic.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait reserve td	The tdslot of the U-heap page is allocated when DML is performed on the U-heap page.	DML operations have been performed on the Ustore table.	Reduce concurrent DML operations on the Ustore table.
wait td rollback	Rolls back the transactions to be rolled back on the tdslot of the U-heap page.	When DML is executed on the Ustore table, no tdslot can be directly used. The tdslot that is aborted and not rolled back needs to be released.	Reduce concurrent DML operations on the Ustore table.
wait available td	Waits for the idle TD of the U-heap and UB-tree pages.	When DML is performed on the Ustore table, no TD can be allocated on the U-heap and UB-tree pages.	Reduce concurrent DML operations on the Ustore table.
wait transaction rollback	Waits for the undo rollback corresponding to a transaction ID to complete.	When DML is performed on the Ustore table, the transaction is aborted.	Reduce the number of abort transactions that perform DML operations on the Ustore table.
prune table	Waits for a heap table to clear historical deleted data.	Page cleanup has been triggered.	Reduce the number of concurrent DML statements in the Ustore table.
prune index	Waits for an index to clear historical deleted data.	The **VACUUM** command is issued.	Reduce parallel VACUUM operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
stream get conn	Waits for connecting to the consumer object of the node specified by **nodename** when the stream flow is initialized. There are *N* consumers waiting to be connected.	A connection setup request has been sent to the peer end and no result has returned yet.	View PG_COMM_RECV_STREAM on the peer end to check the logical connection status, or network status.
wait producer ready	Waits for each producer to be ready when the stream flow is initialized. The system is waiting for the procedure of the plevel thread on the node specified by **nodename** to be ready. There are *N* producers waiting to be ready.	The stream consumer waits for the producer to complete the execution and receive the data sent by the producer.	Check the network status or reduce the service traffic.
synchronize quit	Waits for the threads in the stream thread group to exit when the stream plan ends. If information similar to "synchronize quit, total *m*, remain *n*" is displayed in the **wait_status** column, there are **m** concurrent tasks, and **n** of them are not in the unified exit state.	Threads in the stream thread group have not exited yet.	This wait event occurs in the SQL statements of the stream plan and SMP plan. You can add hints for non-stream plans or disable **enable_stream_operator** to avoid this problem.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait stream group destroy	Waits for the stream node group to be destroyed.	Waits for destroying the stream node group when the stream plan ends.	This wait event occurs in the SQL statements of the stream plan and SMP plan. You can add hints for non-stream plans or disable **enable_stream_operator** to avoid this problem.
wait stream thread ready	Waits for the stream producer to be ready. It is blocked until its thread ID is successfully set.	The stream producer fails to update the thread ID.	This wait event occurs in the SQL statements of the stream plan and SMP plan. You can add hints for non-stream plans or disable **enable_stream_operator** to avoid this problem.
wait create stream thread	Waits for the stream thread to start.	The stream thread has not started because of reasons such as the upper limit of resources.	This wait event occurs in the SQL statements of the stream plan and SMP plan. You can add hints for non-stream plans or disable **enable_stream_operator** to avoid this problem.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait active statement	Waits for job execution under resource and load control.	The number of concurrent requests exceeds the upper limit.	Reduce concurrent operations.
wait memory	Waits for obtaining the memory.	A thread is waiting for the memory.	-
Sort	Currently, the Sort operator is used for sorting.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the filter criteria are not pushed down.	Modify the SQL statement to adjust the execution plan.
Sort - fetch tuple	Currently, the Sort operator is used for sorting. **fetch tuple** indicates that the Sort operator is obtaining tuples.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate.	Modify the SQL statement to adjust the execution plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
Sort - write file	Currently, the Sort operator is used for sorting. **write file** indicates that the Sort operator is writing data to disks.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the filter criteria are not pushed down. 3. The current worker thread is experiencing memory insufficiency due to either inadequate configured memory or memory occupation by other threads.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.
Material	Currently, the Material operator is used.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the filter criteria are not pushed down.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
Material - write file	The **Material** operator is being executed. **write file** indicates that the **Material** operator is writing data to disks.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the filter criteria are not pushed down. 3. The current worker thread is experiencing memory insufficiency due to either inadequate configured memory or memory occupation by other threads.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.
HashJoin - build hash	The **HashJoin** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashJoin** operator is creating a hash table.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate.	Modify the SQL statement to adjust the execution plan and add the corresponding index to accelerate the inner hash table building by hash join.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
HashJoin - write file	The **HashJoin** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **write file**: The **HashJoin** operator is writing data to disks.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate. 3. The current worker thread is experiencing memory insufficiency due to either inadequate configured memory or memory occupation by other threads.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.
HashAgg - build hash	The **HashAgg** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashAgg** operator is creating a hash table.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.

Value	Description	Cause	Suggestions
HashAgg - write file	The **HashAgg** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **write file**: The **HashAgg** operator is writing data to disks.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate. 3. The current worker thread is experiencing memory insufficiency due to either inadequate configured memory or memory occupation by other threads.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.
HashSetop - build hash	The **HashSetop** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashSetop** operator is creating a hash table.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate.	Modify the SQL statement to adjust the execution plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
HashSetop - write file	The **HashSetop** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **write file**: The **HashSetop** operator is writing data to disks.	1. A large amount of data is queried. 2. The plan is not appropriate. For example, the tables' join reordering is not appropriate. 3. The current worker thread is experiencing memory insufficiency due to either inadequate configured memory or memory occupation by other threads.	1. Modify the SQL statement to adjust the execution plan. 2. Increase the memory.
create index	Waits for index creation.	An index has been created.	Do not create indexes on non-key columns or columns with low differentiation.
analyze	Executes ANALYZE for the table specified by **relname**. If **phase** is included, the possible phase is **autovacuum**, indicating that the database automatically enables the autovacuum thread to execute **ANALYZE**.	Automatic or manual analysis has been triggered.	Modify **default_statistics_target** to reduce the sampling rate, or increase **autovacuum_analyze_scale_factor** and **autovacuum_analyze_threshold** to reduce the analysis interval.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
vacuum	Executes VACUUM for the table specified by **relname**. If **phase** is included, the possible phase is **autovacuum**, indicating that the database automatically enables the autovacuum thread to execute **VACUUM**.	The **VACUUM** or **ANALYZE** command has been issued.	Cancel the **VACUUM** or **ANALYZE** operation. For the autovacuum thread, you can reduce the number of concurrent DML statements on the page.
vacuum full	Executes **VACUUM FULL** for the table specified by **relname**.	The **VACUUM FULL** command has been issued.	Avoid repeated update operations on the table to prevent table bloats.
vacuum gpi	Clears the global partitioned index of a partitioned table during the VACUUM or autovacuum process.	A partitioned table has a GPI. After the DDL statement is executed on the partitioned table, dead tuples generated by the GPI depend on autovacuum/ VACUUM for asynchronous clearance.	Reduce the DDL frequency of the partitioned table or use the local index.
gtm connect	Waits for connecting to GTM.	The connection to the GTM is being established.	Check the GTM and network status.
gtm get csn	Waits for obtaining the CSN from GTM.	A transaction is committed but the CSN has not been obtained from the GTM.	Check the GTM and network status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
gtm get snapshot	Waits for obtaining transaction snapshots from GTM.	A transaction is committed but the snapshots have not been obtained from the GTM.	Check the GTM and network status.
gtm create sequence	Waits for GTM to create a sequence.	A message has been sent to the GTM to create a sequence.	Check the GTM and network status.
gtm alter sequence	Waits for GTM to modify a sequence.	A message has been sent to the GTM to modify the sequence.	Check the GTM and network status.
gtm get sequence val	Waits for obtaining the next value of a sequence from GTM.	A message has been sent to the GTM to obtain the sequence.	Check the GTM and network status.
gtm set sequence val	Waits for GTM to set a sequence value.	A message has been sent to the GTM to set the sequence.	Check the GTM and network status.
gtm drop sequence	Waits for GTM to delete a sequence.	A message has been sent to the GTM to delete a sequence.	Check the GTM and network status.
gtm rename sequence	Waits for GTM to rename a sequence.	A message has been sent to the GTM to rename a sequence.	Check the GTM and network status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
gtm set disaster cluster	Waits for the static configuration information of the standby cluster for DR to be set in the GTM.	A standby cluster for DR is set up, and a switchover is performed between the primary and standby clusters, or the GTM communication is abnormal.	In normal cases, the waiting time is less than 1s. If this wait event persists for a long time, check whether the communication between GaussDB and GTM is normal.
gtm get disaster cluster	Waits for obtaining the static configuration information of the standby cluster for DR from the GTM.	A standby cluster for DR is set up, and a switchover occurs between the primary and standby clusters. The topology of the primary cluster node changes, or the GTM communication is abnormal.	In normal cases, the waiting time is less than 1s. If this wait event persists for a long time, check whether the communication between GaussDB and GTM is normal.
gtm del disaster cluster	Waits for the static configuration information of the standby cluster for DR to be deleted in the GTM.	A standby cluster for DR is set up, and a switchover is performed between the primary and standby clusters, or the GTM communication is abnormal.	In normal cases, the waiting time is less than 1s. If this wait event persists for a long time, check whether the communication between GaussDB and GTM is normal.
gtm set standby read info	Waits for GTM to write the read on standby information.	The standby node reads the CSN information and commit time from the GTM.	Check the GTM and network status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
gtm get standby read info	Waits for obtaining the read on standby information from the GTM.	The standby node obtains the last information from the GTM.	Check the GTM and network status.
gtm set target standby info	Reserved for new features.	Reserved for new features.	Reserved for new features.
gtm get target standby info	Reserved for new features.	Reserved for new features.	Reserved for new features.
gtm reset standby read csn	Reserved for new features.	Reserved for new features.	Reserved for new features.
wait sync consumer next step	The consumer waits for the next iteration.	Waits for the data of the next iteration during the execution of the RecursiveUnion operator. This is available only in distributed mode.	Set **enable_stream_recursive** to **off**.
wait sync producer next step	The producer waits for the next iteration.	Waits for the next iteration during the execution of the producer corresponding to the RecursiveUnion operator. This function is available only in distributed mode.	Set **enable_stream_recursive** to **off**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
gtm set consistency point	Waits for the GTM to set the global consistency snapshot of the standby cluster for DR.	When the standby cluster for DR is running properly, the CN collects and calculates consistency snapshots and reports them to the GTM.	In normal cases, the waiting time is less than 1s. If this wait event persists for a long time, check whether the communication between GaussDB and GTM is normal.
wait sync bgworkers	Waits for an index worker thread created in parallel to complete local scanning and sorting.	Parallel index creation has been triggered.	Disable parallel index creation.
flush local buffer for GTT	Waits for the local buffer to flush dirty pages.	The local buffer is waiting for dirty page flushing.	Reduce the service volume and check the I/O performance.
standby get snapshot	Waits for obtaining snapshots in the read on standby scenario during parallel replay.	In parallel replay mode, if the standby node is replaying page cleanup logs when the query on the standby node obtains snapshots, it is important to wait until the replay is finished to avoid potential data inconsistencies.	Reduce the execution frequency of **VACUUM** on the host or enable the ultimate RTO replay mode.
recovery conflict with lock	The level-8 lock log replay on the standby node conflicts with the query. The system waits until the query is complete.	The primary node executes DDL statements.	Reduce the DDL execution frequency on the primary node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
recovery conflict with snapshot	The page cleanup log replay on the standby node conflicts with the query. The system waits until the query is complete.	The primary node executes VACUUM.	Reduce the VACUUM execution frequency on the primary node.
recovery conflict with tablespace	The tablespace deletion log replay on the standby node conflicts with the query. The system waits until the query is complete.	The primary node deletes the tablespace.	Reduce the DDL execution frequency on the primary node.
recovery conflict with database	The database deletion log replay on the standby node conflicts with the query. The system waits until the query is complete.	The primary node deletes the database.	Reduce the DDL execution frequency on the primary node.
recovery conflict with truncate	The file truncation log replay on the standby node conflicts with the query. The system waits until the query is complete.	The primary node generates file truncation logs after executing VACUUM.	Reduce the VACUUM execution frequency on the primary node.
recovery conflict with standby query timeout	When the ultimate RTO read on standby is performed, the query times out and is canceled.	The query times out.	Reduce the query time.
recovery conflict with force recycle	When the ultimate RTO read on standby is performed, forcible recycling occurs, and the query is canceled.	The space usage of historical files for ultimate RTO read on standby exceeds the threshold.	Increase the value of the GUC parameter **max_standby_base_page_size**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
recovery conflict with buffer pin	The replayer thread is resolving the conflict between the query and replay of the buffer pin type.	Database restoration conflicts with buffer locking.	Optimize the buffer management policy to reduce the conflict between the restoration operation and buffer locking.
wait io control	Waits for job execution under I/O control.	I/O operations are restricted by the system control mechanism, such as I/O resource quota or priority control.	Check and adjust the I/O control policy to ensure that key I/O operations can be performed in a timely manner.
wait gs_sleep	Waits for the server thread delay.	Internal scheduling mechanism of the database, which is used to control the execution pace of threads.	Check the configuration parameters of the database. If necessary, adjust the thread scheduling policy.
wait vacuum delay	Waits for VACUUM delay.	The automatic vacuum process delays the execution, or the manual vacuum operation waits for a proper execution window.	Adjust the vacuum execution policy. For example, increase the frequency of automatic vacuum or execute the vacuum when the system load is low.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait seq scan	Execution time of seq scan.	The database performs sequential scans due to lack of indexes or insufficient query optimization.	Optimize the query statement and add proper indexes to reduce full table scanning and improve the query efficiency.
wait index scan	Execution time of index scan.	The database performs index scan because the index design is improper or the query condition does not match the index.	Check the index validity and query conditions, optimize the index structure, and improve the index scan efficiency.
wait checkpoint start	Start time of the checkpoint phase.	The checkpoint operation of the database starts due to an I/O performance bottleneck.	Optimize the I/O performance, adjust the checkpoint frequency and time, and reduce the I/O wait time.
wait checkpoint done	End time of the checkpoint phase.	The checkpoint operation of the database ends due to an I/O performance bottleneck.	Optimize the I/O performance and adjust the checkpoint configuration to reduce the waiting time.
wait xact start command	Start time of xact.	At the beginning of a transaction, a transaction log bottleneck or lock wait occurs.	Optimize the transaction log processing to reduce the transaction start delay.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait xact commit command	Commit time of xact.	In the transaction commit phase, a lock wait or transaction log bottleneck occurs.	Optimize the transaction processing process to reduce lock contention and improve the transaction log processing efficiency.
Accept client conn - Total Time	Time for waiting for a client connection.	Client connection time is collected.	Reduce service concurrency.
Accept client conn - ThrdPool - add epoll	Waits for the listening events to join the epoll.	Statistics on joined listening events are collected.	Reduce service concurrency.
Accept client conn - ThrdPool - wait worker	Wait for the worker to process the session.	Statistics on the time for waiting for a worker are collected.	Reduce service concurrency.
Accept client conn - ThrdPool - init session	Waits for session initialization.	Statistics on the session initialization time are collected.	Reduce service concurrency.
Accept client conn - Worker - init proc	Wait for proc initialization.	Statistics on the proc initialization time are collected.	Reduce service concurrency.
Accept client conn - Worker - init session	Waits for session initialization.	Statistics on the session initialization time are collected.	Reduce service concurrency.
security audit write pipe	Waits for writing audit logs to the pipe.	The security audit log system encounters a bottleneck when writing logs.	Optimize the audit log system, add resources, or adjust the audit policy to reduce the write wait time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description	Cause	Suggestions
wait ugin cleanup proc	Waits for clearing the UGIN index buffer.	The UGIN index buffer is being cleared.	This is called when the UGIN index buffer is cleared. You are advised to reduce the value of **gin_pending_list_limit**.
wait gin cleanup proc	Waits for clearing the GIN index buffer.	The GIN index buffer is being cleared.	This is called when the GIN index buffer is cleared. You are advised to reduce the value of **gin_pending_list_limit**.
wait fetch undo record	Waits for reading the target undo record.	A transaction is rolled back synchronously or asynchronously.	Reduce transaction aborts in DML operations.
deadlock check	Waits for deadlock detection to complete.	If the lock waiting time exceeds the configured deadlock detection time, deadlock detection is triggered.	Optimize the service process to reduce lock conflicts, or increase the value of **deadlock_timeout** to avoid frequent deadlock detection.
invalid wait event	Unexpected wait event.	An unexpected wait event occurs.	Contact Huawei technical support.

If **wait_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the lightweight lock corresponding to **wait_event** or transaction lock.

Table 7-471 describes the corresponding wait events when **wait_status** is **acquire lwlock**. If **wait_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-471 List of wait events corresponding to lightweight locks

wait_event	Description	Cause	Suggestions
OidGenLock	Used to prevent different threads from generating the same OID.	The OID allocation concurrency is high.	Reduce concurrent operations.
XidGenLock	Used to prevent two transactions from obtaining the same XID.	The XID allocation concurrency is high.	Reduce concurrent DDL and DML operations.
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array.	There are a large number of threads in the system.	Reduce the number of concurrent threads.
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.	A read lock is added when invalid messages in the invalid queue are read.	Reduce the DDL execution frequency and the number of invalid message sending times.
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.	A write lock is added when an invalid message is inserted into an invalid queue or a non-read-only operation is performed on an invalid queue.	Reduce the DDL execution frequency and the number of invalid message sending times.
WALBufMappingLock	Used to protect the mapping between WAL cache pages and LSN offsets in the shared memory to prevent records from being inserted into uninitialized WAL files.	Inserting records and initializing WAL files are concurrent.	Increase the wal_buffers size.
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk.	WAL files are written to disks concurrently.	Reduce the service volume and check the I/O performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file.	The **pg_control** file is concurrently accessed in scenarios such as database initialization, checkpoint, backup and restoration, log archiving, and primary and standby synchronization.	Reduce concurrent access to the **pg_control** file.
CheckpointLock	Used to prevent multi-checkpoint concurrent execution.	The checkpoint logic has been triggered.	Reduce concurrency.
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.	A large number of concurrent MultiXact IDs are allocated.	Reduce concurrent DML operations.
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**.	The number of concurrent **pg_multixact/offset** operations is too large.	Reduce concurrency.
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**.	The number of concurrent **pg_multixact/members** operations is too large.	Reduce concurrency.
RelCacheInitLock	Used to add a lock before an operation is performed on the **init** file when messages are invalid.	When the relcache is initialized or the relcache init file is invalidated, the init file is locked.	Do not frequently destroy the creation thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.	After dirty pages are generated during dirty page flushing, shrink, and truncate operations, sync requests are collected.	Reduce the number of concurrent operations.
TablespaceCreateLock	Used to check whether a tablespace exists.	A tablespace is created or dropped.	Reduce the number of concurrent DROP or CREATE operations on a tablespace.
BtreeVacuumLock	Used to prevent VACUUM from clearing pages that are being used by B-tree indexes.	The **VACUUM** command is issued.	Reduce parallel VACUUM operations.
AutovacuumLock	Used to access the autovacuum worker array in serial mode.	Autovacuum Launcher is scheduling worker threads.	Adjust the Autovacuum worker thread information. No optimization is required.
AutovacuumScheduleLock	Used to distribute tables requiring VACUUM in serial mode.	The Autovacuum thread determines whether the table needs to be cleared.	Reduce concurrent DML operations on the Astore table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.	When a plan is generated, if no statistics have been collected in the base table, the statistics are automatically collected. A maximum of 10 threads can be used to automatically collect statistics on a single node at the same time. This lightweight lock is used to control the resource allocation for automatic statistics collection.	If a large number of conflicts exist in the lightweight lock, a large number of tables whose reltuples/relpages is 0 exist in the service database for a long time. In this case, you do not need to automatically collect statistics. You can disable the autoanalyze parameter for optimization.
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning.	The **synchronized sequential scan** command is issued.	Reduce concurrent scanning operations.
BarrierLock	Used to ensure that only one thread is creating a barrier at a time.	Two threads are creating barriers at the same time.	Reduce the number of create barrier operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
NodeTableLock	Protects the shared structure that stores CN and DN information.	During distributed scale-out or scale-in, the pgxc_pool_reload function is called to update the cluster topology cached in the node pool. An exclusive lock is required. In this case, the read lock in the distributed statement parsing and execution phases is blocked.	Perform cluster scaling during off-peak hours to reduce service conflicts.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.	The lock obtains a connection from the connection pool.	Generally, this wait event is not triggered during stable service running. If the alarm is triggered frequently, reduce the service volume.
AlterPortLock	Used to protect the coordinator node from changing the registration port number.	The port number is registered during thread initialization.	Generally, this wait event is not triggered during stable service running. If the alarm is triggered frequently, check whether the background thread is frequently started.
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.	**pg_filenode.map** is concurrently created.	Reduce concurrent access to pg_filenode.map.
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.	There is concurrent access to serializable transactions.	Reduce concurrent access to serializable transactions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.	There is concurrent access to serializable transactions.	Reduce concurrent access to serializable transactions.
SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks.	There is concurrent access to serializable transactions.	Reduce concurrent access to serializable transactions.
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.	There is concurrent access to serializable transactions.	Reduce concurrent access to serializable transactions.
FileStatLock	Used to protect a data structure that stores statistics file information.	When reading files, the storage system calls pgstat to report statistics.	The size of the built-in statistics array is fixed and will reach the limit quickly. No workaround is required.
SyncRepLock	Used to protect Xlog synchronization information during primary/standby replication.	Waits for the standby node to return the Xlog flushing information.	The delay is related to the network delay between the primary and standby nodes and the I/O performance of the standby node.
DataSyncRepLock	Used to protect data page synchronization information during primary-standby replication.	Waits for the standby node to return the data page flushing information.	Disable the mixed streaming replication function (**enable_mix_replication**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
ExtensionConnectorLibLock	1. Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios. (deprecated for EC) 2. Heterogeneous database links are used to initialize OCI connections. They are locked when OCI-related dynamic libraries are loaded or uninstalled.	Heterogeneous database links are used to connect to the Oracle Database.	Do not use heterogeneous database links.
GTMHostInfoLock	Used to prevent concurrent access to or concurrent modification on GTM host information.	There is concurrent access to the GTM host.	Check the GTM and network status.
ReplicationSlotAllocationLock	Used to add a lock when a primary node allocates streaming replication slots during primary-standby replication.	Create or clear a replication slot, or change the replication slot status.	Used only when a replication slot is created or cleared and the replication slot status is changed. No optimization is required.
ReplicationSlotControlLock	Used to prevent concurrent update of streaming replication slot status during primary-standby replication.	The replication slot status has been changed.	Used only when the replication slot status is changed. No optimization is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
FullBuildXlogCopyStartPtrLock	Controls the concurrent access and storage of the start position of full build to protect Xlog replication operations in full build.	Full build	Used for the build operation. No optimization needed.
LogicalReplicationSlotPersistentDataLock	Used to control the concurrent sequence of logical replication slot persistence, which protects data modified in the logical replication slot during logical replication.	The logical replication slot data needs to be modified.	Used only when the logical replication slot data is modified. No optimization is required.
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.	A lock is applied for when the resource pool hash table is read or updated.	The lock is applied for when a resource pool is added, deleted, queried, or modified. The lock is frequently applied for during peak hours. You can reduce the two operations to reduce the possibility of lock waiting.
WorkloadCGroupHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains Cgroup information.	A lock is applied for when the Cgroup information hash table is read or updated.	Reduce service pressure.
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.	-	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
WorkloadUserInfoLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains user information about workload management.	A lock is applied for when the workload management user information hash table is read or updated.	Reduce service pressure.
WorkloadIOUtilLock	Used to protect a structure that records **iostat** and CPU load information.	A lock is applied for when load information such as IOSTAT and CPU is read or updated.	Reduce service pressure.
WorkloadNodeGroupLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains node group information in memory.	A lock is applied for when node group information is read or updated.	Reduce service pressure.
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.	Lock for the scheduler thread and worker thread to access the scheduled task list.	Disable scheduled tasks.
OBSRuntimeLock	Obtains environment variables, for example, *GAUSSHOME*.	-	-
LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.	After the **enable_codegen_print** parameter is enabled, this wait event occurs when the codegen is triggered.	Set **enable_codegen_print** to **off** (default value). This parameter is enabled only for fault locating.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.	When the query triggers the codegen execution, the wait event occurs. Generally, the wait time is very short.	Set **enable_codegen** to **off**.
RPNumberLock	Deprecated.	Deprecated.	Deprecated.
ClusterRPLock	Deprecated.	Deprecated.	Deprecated.
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.	When updating or querying the wait count hash table, a wait may occur due to lock contention.	Optimize the access logic of the wait count hash table to reduce lock contention or optimize the query performance.
InstrWorkloadLock	Protects the access to the memory hash table that stores workload management statistics.	A lock is requested when the hash table that stores workload transaction statistics is read or updated.	Use the GUC parameter **enable_resource_track** to disable the workload transaction statistics function.
CBMParseXlogLock	Protection lock used when CBM parses Xlogs to control the concurrent access and storage of CBM files.	Two threads are using the lock at the same time.	Try again.
DelayDDLLock	Used to control the concurrent sequence of DDL and delay backup function of the deletion.	DDL delay is triggered.	After the DDL delay operation is complete, perform the disable delay DDL operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
BadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores statistics about damaged shared pages.	When the bad block statistics are updated or queried, the wait may occur due to lock contention.	Optimize the access frequency of bad block statistics, reduce lock contention, or increase the degree of parallelism for processing bad blocks.
RowPageReplicationLock	Used to control the concurrency sequence of row-store page replication and is used to manage data page replication of row store.	-	-
RcvWriteLock	Used to control the concurrent sequence of the WAL receiver writer to prevent concurrent calls to WalDataRcvWrite.	WAL data is written.	Reduce the service volume and check the I/O performance.
InstanceTimeLock	Used to protect the global variable **g_instance.stat_cxt.gInstanceTimeInfo**, which is used to collect statistics on the node-level time model.	Node-level time model information is refreshed or read.	No workaround is required for node-level time model indicator statistics.
PercentileLock	Used to protect the global percentile buffers.	A lock is applied for when the global cache of percentile statistics or results is read or updated.	Disable the percentile function or increase the calculation period.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
XlogRemoveSegLock	Used to control the concurrent access and storage of the latest deleted WAL file information to protect the recycling of Xlog segment files.	The Xlog of the checkpoint is replayed.	Reduce checkpoints.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.	A lock is applied for when the space usage information hash table corresponding to a session is read or updated.	Reduce sessions.
CsnMinLock	Used to control the concurrent access and storage of CSN MIN.	There are a large number of threads in the system.	Reduce the number of concurrent threads.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.	GPC cleans up plans to be eliminated.	This is a normal GPC operation. You can manually clear the data in the dbe_perf.global_plancache_clean view or disable **enable_global_plancache**.
CaptureViewFileHashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.	Collect data from multiple tables at the same time.	It is mainly used to locate slow SQL statements. No workaround is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UndoZoneLock	Used to lock the bitmap of the undo zone, which protects the concurrent access and storage of the undo zone.	Each worker thread needs to be allocated with an undo zone. The undo zone allocation is managed by the bitmap. During allocation, the bitmap needs to be locked to ensure that each thread is allocated to a different undo zone.	Reduce the number of concurrent DML operations on the Ustore table.
RollbackReqHashLock	Used to lock the asynchronous rollback hash table, which manages concurrent access and storage of the hash table that stores the rollback request information in the shared memory.	The asynchronous rollback mechanism performs rollback in the background, which does not affect the execution of other statements. During asynchronous rollback, you need to add an asynchronous rollback task to a task hash table. Operations on hash tables must be locked to prevent concurrency problems.	Minimize rollback transactions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.	This prevents address access exceptions caused by concurrent addition and deletion of global-level virtual indexes in multiple sessions.	This function is disabled by default. It is used during SQL optimization and does not affect database performance.
WALWritePaxosLock	Used to protect the concurrent sequence of WALs written to the paxos replication component.	This avoids Xlog disorder caused by concurrent write operations of multiple threads.	Generally, this lock is required only when the Xlog flushing thread is called non-concurrently or the WAL buffer is full. This does not affect the performance.
BlockchainVersionLock	Used to control the concurrent read and write of global block numbers in the ledger database.	In the tamper-proof table feature of the ledger database, to ensure uniqueness of a block number in the global blockchain table, an incremental block number needs to be generated by means of locking when each record is generated.	To avoid frequent addition, deletion, and modification operations on the ledger table, you can adjust the scope of the tamper-proof table based on service requirements and use the sharding policy to reduce concurrent modification on the global blockchain table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
GlobalPrevHashLock	Used to control the concurrent read and write of global verification hash tables in the ledger database.	In a tamper-proof table feature of the ledger database, to ensure that chain tampering verification information can be generated between a record in the global blockchain table and a previous row, each record needs to be locked when being generated to generate a continuous hash value. A locking mechanism can ensure security of concurrent write.	To avoid frequent addition, deletion, and modification operations on the ledger table, you can adjust the scope of the tamper-proof table based on service requirements and use the sharding policy to reduce concurrent modification on the global blockchain table.
PldebugLock	Used for the lock processing operation in the stored procedure debugging function.	The pldebugger is turned on or off.	-
LocalBarrierBufferLock	Controls the modification of the local barrier file to avoid concurrent update.	The local barrier files are updated at the same time.	Wait until the update operation is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
RoleIdLock	Used to control concurrent read and write operations on the pg_user_status system catalog.	Providing password protection policies. When a user logs in to the system using an incorrect password, the system catalog pg_user_status is updated to record the number of login failures and update the lock status. This ensures the security of database accounts.	Login using an incorrect password is insecure. The possible cause is that the password is changed but the user is not aware of the change, or malicious users continuously attempt to change the database password. The database administrator can periodically check the locking status of all users and analyze the locked accounts to reduce the number of login attempts with incorrect passwords. The following situations are involved: 1. If the database is attacked, the administrator must analyze the cause in a timely manner, find out the attack source, and take corresponding measures. 2. If the password is changed but the user is unaware of the change, the system prompts the user to change the password in a timely manner to ensure account security.

wait_event	Description	Cause	Suggestions
InstrStmtTrackCtlLock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.	In the dynamic full SQL capture scenario, different unique query IDs are frequently tracked, or the same unique query ID is frequently tracked and untracked.	It is mainly used to locate slow SQL statements. No workaround is required.
HashUidLock	Protects the addition, deletion, modification, and query of UIDs.	A table with users is accessed.	-
ParallelDecodeLock	A lock is used to allocate global slots for parallel decoding to protect the concurrent sequence of parallel decoding.	Parallel decoding is not used.	Reduce the startup of parallel decoding services.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.	There are a large number of threads in the system.	Reduce the number of concurrent threads.
DisasterCacheLock	Lock of the node mapping table in the standby cluster for DR, which protects the concurrent access and storage of the DR information cache in the shared memory.	A standby cluster for DR is set up, a switchover is performed between the primary and standby clusters, the topology of the nodes in the primary cluster changes, or the node mapping is rebuilt.	This is a normal scenario and does not require optimization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.	DR read is triggered.	-
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.	CRC corruption or LSN corruption is detected, and the page corruption information is recorded.	Prevent bad blocks.
ReplicationOriginLock	Locks are used for creating, deleting, and changing the status of publication and subscription.	Publication and subscription are used.	Reduce the startup of publication and subscription.
LogicalRepWorkerLock	Locks are used for starting, stopping, and associating the background replayer thread in the publication and subscription.	Publication and subscription are used.	Reduce the startup of publication and subscription.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.	The xgboost open-source library is incompatible with the openEuler system and needs to be dynamically called. The dlopen needs to be locked during loading.	The loading of the xgboost library is a passive call to special events. If no DB4AI-related operations (such as model creation and prediction task execution) are performed, the lock does not affect the database performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
NgroupDestoryLock	Adds a lock to the concurrent modification of the Node Group hash table.	When operations such as pgxc_pool_reload are performed to clear the entire hash table, an exclusive (X) lock is added. The X lock is mutually exclusive with other S locks, and a wait event occurs.	This wait event occurs only when pgxc_pool_reload or other operations involving node groups are performed.
SQLAdvisorLock	Used to manage the concurrent access and storage of recommended hash tables in distribution key management.	-	-
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.	Audit log management depends on the audit index information in the memory. The aging and rotation of audit logs in the audit thread update the index information. The worker thread reads the index information during audit query or deletion. Locks are used to ensure that the index information is correctly updated or read.	In normal cases, the critical area for reading and writing audit index information is displayed only when audit query and deletion are triggered. If a lock is waiting for a long time, you can stop the audit query or deletion, or use the GUC parameter to control the speed of generating audit logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
GsStackLock	Used to ensure that the gs_stack function is not concurrently called.	Preventing gs_stack from concurrent calls.	The lock is applied for only when gs_stack is used. If gs_stack is not used, the performance is not affected. No workaround is required.
DropArchiveSlotLock	Used to protect the concurrent sequence of deleting the archive slot.	Concurrent operations are performed on the archive slot at the same time.	Try again.
AboCacheLock	Controls the concurrent read and write of the ABO multi-column intelligent statistics model cache.	When a multi-column intelligent statistics model is trained and called, the system attempts to cache and read the cached model to optimize performance. A lock is required to ensure that the model is correctly read.	Set **enable_ai_stats** to **off**.
DistributeDecodeSlotLock	The creation of replication slots for distributed logical decoding is mutually exclusive.	Distributed logical decoding is used concurrently.	-
ExrtoSnapshotLock	Locks the read on standby snapshot in ultimate RTO mode.	The lock is held when a snapshot is generated during normal replay. When the query is canceled during DDL log replay, the lock may be held for a long time.	Reduce the DDL execution frequency on the primary node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LocalBarrierRecordFlushLock	Flushes the barrier information in the memory to disk.	The barrier flushing operation is called at the same time.	Wait until the disk flushing operation is complete.
ClogTruncateLock	Locks the concurrent Clog file delete and read/write operations.	Avoid the concurrent Clog file delete and read/write errors.	-
RedoTruncateLock	Lock used when a truncated file is replayed.	Avoid concurrent checkpoint and truncate operations.	Infrequent DDL operations have little impact on performance.
SysToastOidGeneratorLock	Generates the OID information of the TOAST table if the TOAST table is involved during fine-grained restoration.	The IMPDP table operation is called at the same time.	Wait until the fine-grained restoration is complete.
RedoStatisticLock	Locks the DFX statistics replay.	Avoid concurrent query and modification.	-
DisasterCSNInfoListLock	Locks the CSN and LSN mapping table read by the ultimate RTO DR.	When barrier logs are replayed, the mapping between CSNs and LSNs is generated.	The lock is not held for a long time. The operation is lightweight.
WorkloadRuleLock	Locks workloads to prevent concurrent operations.	A lock is added when workload resources are read and written.	Reduce service concurrency.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
AcmFeedbackLock	Controls the concurrent read and write of global variables related to the operator collection of the feedback cardinality estimation model.	During operator collection and model training, the collected global information about the operator linked list and operator quantity needs to be maintained. Locks are required to ensure that the information is correct.	Set **enable_adaptive_cost** to **off**.
AcmFeedbackModelCacheLock	Controls the concurrent read and write of the ABO-based feedback cardinality estimation model cache.	When the feedback cardinality estimation model is trained and called, performance is optimized by caching and attempting to read cached models. When this operation is performed, a lock needs to be added to ensure that the model is correctly read.	Set **enable_adaptive_cost** to **off**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
AcmParameterLock	Controls the concurrent read and write of global variables during the training and update of the intelligent cost estimation model.	When the intelligent cost model is trained and updated, the model parameters in the global variable *acm_trainer* need to be updated. A lock needs to be added to ensure that the update and reading are correct.	Set **enable_adaptive_cost** to **off**.
ArchiveTaskLock	Adds or deletes tasks to or from the archive task queue during archiving.	Multiple archive tasks add data to or delete data from the archive queue at the same time.	Wait for the next task.
TruncateFileLock	Lock held when the standby node replays truncated file logs.	The primary node generates file truncation logs after executing VACUUM.	Do not delete a large amount of primary node data in a short period of time.
TmpBarrierBufferLock	Clears and merges local barriers.	There are multiple operations of clearing and merging local barriers.	Wait until the local barrier is cleared and merged.
RedoBarrierBufferLock	Locks and updates the barrier information in the memory.	Information in the redo barrier is read or updated.	Wait until the update is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
AdioToggleLock	AdioToggleLock adds a write lock when the ADIO feature is enabled, and it adds a shared lock when pread_wrapper and pwrite_wrapper are enabled.	When the ADIO feature is enabled, the read and write calls are mutually exclusive.	Non-performance-sensitive lock, which does not need to be optimized.
LedgerRepairLock	Controls the concurrent execution of archive and repair operations in the ledger database.	The locking mechanism secures the concurrent writing of the archive and repair operations in the ledger database.	Do not perform concurrent archive and repair operations on the ledger table.
ConsistencyVerifyStatHashLock	Protects the concurrent access and storage of the hash table used for data-index consistency check entry registration in the shared memory.	The data-index consistency check is performed.	Avoid data index inconsistency (for example, fault injection) and concurrent data-index consistency check.
PreLogicalStandbyControlLock	Controls the concurrency of logical standby system function execution and replay flushing.	Physical-to-logical conversion or logical replay.	Non-performance-sensitive lock, which does not need to be optimized.
LogicalStandbyMetaFlushLock	Controls the concurrent write operations when the physical-to-logical switchover is prepared for decoding metadata.	Physical-to-logical switchover to collect decoding metadata.	Non-performance-sensitive lock, which does not need to be optimized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LogicalStandbyMetaControlLock	Controls concurrent modification of the logical standby metadata directory.	Concurrent metadata maintenance is controlled during logical replay.	Non-performance-sensitive lock, which does not need to be optimized.
WALReceiverDieLock	walrcv exit lock.	The concurrent walrcv exits are prevented when data is written to the buffer.	Non-performance-sensitive lock, which does not need to be optimized.
TSDictionaryDefinitionLock	Global lock of the dictionary system catalog gs_ts_dict_definition.	The mutual exclusion between read and write operations on the gs_ts_dict_definition system catalog is controlled to ensure the integrity and consistency of the dictionary content.	Reduce concurrent ALTER TEXT SEARCH, gs_ts_dict_add_definition, and cache loading operations on TokenWeight dictionaries.
RespoolBufferContextBlockLock	Buffer pool lock.	The buffer pool is read and written.	Reduce service concurrency.
ParallelBuildIdentifierLock	Lock for allocating build IDs during parallel build.	Parallel build is enabled.	The lock is not held for a long time. The operation is lightweight.
ParallelBuildQueueLock	Lock for processing the file name queue during parallel build.	Parallel build is enabled.	The lock is not held for a long time. The operation is lightweight.
InstrStmtGstraceCtlLock	Prevents GSTrace from being concurrently called when it registers a trace function.	GSTrace is prevented from being concurrently called when it registers a trace function.	This lock is requested only when the GSTrace trace API is called. No workaround is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
InstrStmtGstraceSQLCtlLock	Prevents GSTrace from being concurrently called when it registers a trace SQL statement.	GSTrace is prevented from being concurrently called when it registers a trace SQL statement.	This lock is requested only when the GSTrace SQL registration API is called or when SQL statements are registered and traced. No workaround is required.
InconsistencyAlarmHashLock	Protects the concurrent access and storage of the hash table used for data-index consistency check entry registration in the shared memory.	The data-index consistency check is performed.	Avoid data index inconsistency (for example, fault injection) and concurrent data-index consistency check.
StackAddrToNameLock	Prevents gs_stack from being concurrently called when it converts symbolic addresses to symbolic names.	gs_stack is prevented from being concurrently called when it converts symbolic addresses to symbolic names.	This lock is requested only when gs_stack or the perf flame graph function is called. No optimization is required.
BufMappingLock	Used to protect operations on a table mapped to shared buffer.	Partition lock of the hash table mapped to buffer.	Adjust the number of partitions to avoid excessive conflicts.
BucketBufMappingLock	Partition lock of the private buffer during bucket scale-out.	Private buffer contention during bucket scale-out.	This is involved only in the scale-out process and does not affect services. No adjustment method is available.
LockMgrLock	Used to protect a common lock structure.	Competing to write to the primary lock table when obtaining a regular lock.	Modify the GUC parameter **num_internal_lock_partitions**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions.	Used to protect a lock structure that has serializable transactions.	-
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.	-	-
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.	When updating or querying the operator history, a wait may occur due to lock contention.	Optimize the logic for accessing historical operator information to reduce lock contention or optimize the query performance.
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.	A lock is applied for when the hash table of real-time session statistics is read or updated.	Reduce the number of sessions.
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.	A lock is applied for when the hash table of historical session statistics is read or updated.	Reduce the number of sessions.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.	A lock is requested when the instance statistics hash table is read or updated.	Reduce service pressure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
CSNBufMappingLock	Used to control the concurrent access and storage of mapping in the shared CSNlog page.	There is concurrent access to the CSN page.	Reduce the number of concurrent transactions.
CLogBufMappingLock	Used to manage the cache of commit logs.	Used to manage the cache of commit logs.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UniqueSQLMappingLock	Unique SQL statistics are stored in the unique SQL hash table in the memory. UniqueSQLMappingLock is set to LWLOCK to protect data in the hash table.	Unique SQL statistics are stored in the unique SQL hash table in the memory. The current version has 128 hash partitions. When data is updated in a partition, an S lock needs to be added to the corresponding partition to prevent a memory problem from being triggered by a deletion action during the update. In this case, if a new statement template falls into the partition, the statement template can be added only after the update operation is complete and the lock is released. When a statement template needs to be added to or deleted from a hash table, an exclusive (X) lock needs to be added to the partition to avoid adding, deleting, and writing operations on the partition. In this case, any	Generally, statement templates are not added or deleted during stable service running. Therefore, the wait event is not triggered. If the wait event occurs frequently, perform the following operations to avoid this problem: 1. If there are a large number of select in statements in the service model, you can set **instr_unique_sql_combination_options** to **'in_clause'**. Principle: Normalize multiple parameters in the SELECT IN () statement to reduce the number of newly generated statement templates and the number of exclusive (X) locks added to the hash table. Impact: The **unique_sql_id** in the original SELECT IN () statement changes. If the SQL patch has been installed for this type of statement, you need to collect statistics on the new ID of the corresponding statement and install the patch again. 2. If the wait event is caused by cause 2 ("[UniqueSQL] clean unique sql finished." is frequently printed in logs), run the **reset_unique_sql**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
		operation on the statement information in the partition needs to be performed after the insertion and deletion are complete. The possible causes of UniqueSQLMappingLock wait event are as follows: 1. A large number of new statement templates are generated due to high concurrency. 2. The unique_sql reset function reset_unique_sql() is called when the service concurrency is high.	command during off-peak hours. Principle: The unique SQL hash table is frequently updated during peak hours. The reset operation adds an exclusive (X) lock to the hash table, causing large-scale blocking. The reset operation during off-peak hours can reduce the impact of the lock on services. Impact: none 3. If the wait event is caused by cause 2 ("[UniqueSQL] Auto-cleanup over, %d uniquesqls are recycled." is frequently printed in logs), set **enable_auto_clean_unique_sql** to **off** or increase **instr_unique_sql_count**. Principle: Disabling the automatic eviction function can prevent the hash table from being locked and deleted during the running. Increasing the value of **instr_unique_sql_count** can increase the capacity of the unique SQL hash table and reduce the frequency of automatic eviction. Impact: If the automatic elimination function is disabled, new statement templates will not be recorded after the hash table is full. As a result,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
			some statistics are lost (the existing templates can still be recorded). If **instr_unique_sql_count** is increased, the memory usage of the unique_sql hash table increases. You need to modify **instr_unique_sql_count** based on the current memory usage. 4. If a large number of services are frequently blocked by UniqueSQLMapping-Lock and the preceding conditions are not met, disable the unique SQL function and set **instr_unique_sql_count** to **0**. Principle: Manually disable the unique SQL function. After the function is disabled, the unique SQL hash table is not operated and the wait event is not triggered. Impact: The loss of statement-level statistics affects fault locating. (The SQL statistics panel in the full SQL, ASP, and WDR reports depends on the unique SQL function. If the unique SQL function is disabled, the preceding functions are affected.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.	The hash table is concurrently used when user login and logout information is read or updated.	This lock is applied for when a user logs in to or out of the system or queries user login and logout information. This reduces the number of users or prevents users from logging in to or out of the system at the same time, reducing the possibility of waiting for the lock.
GPCMappingLock	Used to manage the global plan cache.	The plan has been obtained, saved, or cleared upon expiration.	This is a normal lock obtaining operation during GPC execution. The write lock may take a long time during plan expiration clearance. You can reduce the DDL frequency or disable **enable_global_plancache**.
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.	There are a large number of threads in the system.	Reduce the number of concurrent threads.
ASPMappingLock	Used to manage the concurrent access and storage of the ASP hash table.	The ASP obtains data from the uniqueSQL.	The ASP is used to obtain the uniqueSQL data. No workaround is required.
RecoveryXidMappingLock	Protects the shared memory required for recovering two-phase transactions.	A prepared transaction exists before the fault occurs.	Reduce the number of prepare commit transactions before the process is restarted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
BufferIOLock	Used to protect the concurrent I/O for loading or evicting a single page in the shared buffer.	Access lock of the hash table mapped to buffer.	Reduce concurrent I/O operations on the same page.
BufferContentLock	Used to protect the concurrent read and modification operations on a single page in the shared buffer.	Buffer page content lock.	Reduce concurrent read and write operations on the same page.
BucketBufferIOLock	I/O lock of the private buffer during bucket scale-out.	The private buffer is contended for during bucket scale-out.	-
BucketBufferContentLock	Content lock of the private buffer during bucket scale-out.	The private buffer is contended for during bucket scale-out.	-
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.	Each worker thread is bound to an undo zone. When the metadata of the undo zone is modified, the undo zone needs to be locked to prevent concurrent modification of the worker thread and recycling thread.	Reduce DML operations on the Ustore table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UndoSpaceLock	Used to protect the concurrent access and storage of undo spaces.	Each undo zone is bound to an undo space to manage physical files. When the metadata of the undo space is modified, the undo space needs to be locked to prevent concurrent modification of the worker thread and recycling thread.	Reduce DML operations on the Ustore table.
PGPROCLock	Used to protect the concurrent access and storage of global shared thread array.	A lock conflict occurs between the process of allocating proc resources when a connection is created or the connection exits and the process of obtaining snapshots.	Avoid frequent connection establishment.
ReplicationSlotLock	Used to protect a replication slot.	A replication slot is flushed to disk.	Background tasks do not need to be optimized.
Async Ctl	Used to protect the shared memory structure of the asynchronous control module.	Data consistency is ensured during concurrent access of multiple processes.	Reduce concurrent operations.
CLOG Ctl	Protects concurrent access and storage of Clogs.	Each node needs to access the Clog to update the transaction state information.	Reduce the number of concurrent transactions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
CSNLOG Ctl	Protects concurrent access and storage of CSN logs.	Each node needs to update the CSN of a transaction to the CSN log when committing the transaction.	Reduce the number of concurrent transactions.
MultiXactOffset Ctl	Protects concurrent access and storage of transaction ID offsets in multixact logs.	When multiple transactions operate a tuple at the same time, multixact IDs need to be allocated and stored in logs.	Reduce the number of transactions that modify or lock the same tuple.
MultiXactMember Ctl	Protects concurrent access and storage of transaction IDs in multixact logs.	When multiple transactions operate a tuple at the same time, multixact IDs need to be allocated and stored in logs.	Reduce the number of transactions that modify or lock the same tuple.
OldSerXid SLRU Ctl	Protects the shared memory of serialized transactions.	When the transaction isolation level is set to serialization, multiple transactions modify tuples at the same time.	Reduce the scenarios where serialized transactions modify the same tuple.
WALInsertLock	Used to prevent concurrent execution with WAL insertion.	WAL records are inserted.	Reduce the service volume and check the I/O performance.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing. During snapshot backup, the doublewrite page cannot be flushed to disks.	Snapshot backup is being performed.	Wait until the snapshot backup is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
DoubleWriteLock	Used to manage doublewrite operations.	Doublewrite files are written.	The number of pagewriters is no longer maintained and is equal to the number of doublewrite files.
DWSingleFlushFirstLock	Used to control the concurrent sequence of non-segment-page single-page doublewrite files.	Single-page doublewrite files are written.	Avoid concurrent page eviction.
DWSingleFlushSecondLock	Used to control the concurrent sequence of segment-page single-page doublewrite files.	Single-page doublewrite files are written.	Avoid concurrent page eviction.
DWSingleFlushSecondBufTagLock	Used to control the concurrent access and storage of metadata of segment-page single-page doublewrite files.	Single-page doublewrite files are written.	Avoid concurrent page eviction.
RestartPointQueueLock	Incremental checkpoint redo update lock concurrently controls the redo update position during the replay process.	The redo point update position is concurrently controlled during replay.	Reduce the checkpoint frequency of the primary node and reduce concurrent access during restoration and on-demand replay.
PruneDirtyQueueLock	Lock for clearing the dirty page queue at an incremental checkpoint.	Avoid the conflict between checkpoint update of the dirty page tail position and dirty page queue clearing by the pagewriter main thread during restoration.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.	All physical files of a table are deleted.	Reduce DDL operations.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.	A specified forked physical file is deleted.	Reduce DDL operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LWTRANCHE_ACCOUNT_TABLE	Controls the concurrent read and write of the hash table that stores the account locking records on the standby node.	A password protection policy is provided. When a user uses an incorrect password to log in to the standby node, the hash table is updated to record the number of login failures and the updated lock status, and the information is stored in the system memory. When the number of login failures reaches the maximum, the user is not allowed to log in to the standby node, ensuring the security of the standby node.	Optimization suggestion: Login using an incorrect password is insecure. The possible cause is that the password is changed but the user is not aware of the change, or malicious users continuously attempt to change the database password. The database administrator can periodically check the locking status of all users and analyze the locked accounts to reduce the number of login attempts with incorrect passwords. The following situations are involved: (1) Malicious attacks on the database: Administrators can analyze the login account based on logs, find out the attack source, and take corresponding measures. (2) Password changed without user's awareness: Remind users to promptly update their passwords to ensure normal service operations.
MPFLLOCK	Maximum LSN that has been replayed and flushed to disk.	The maximum LSN that has been replayed and flushed to disk is updated.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
GlobalTempTableControl	Protects the local shared hash table of the global temporary table.	A global temporary table is inserted, deleted, modified, truncated, or accessed.	Reduce concurrent DDL and DML operations on global temporary tables.
NGroupMappingLock	Adds a lock to the concurrent modification of a single bucket that protects the node group hash table.	An exclusive (X) lock is added when a node group in a single bucket is inserted or deleted. This lock is mutually exclusive with other X or S locks, and a wait event is generated.	This wait event occurs only when operations involving node groups are performed.
MatviewSeqnoLock	Used to maintain the **seqno** column in the Mlog table in the fast-refresh materialized view function.	When a fast-refresh materialized view is defined, the incremental data of the base table is maintained through the Mlog table. This lock is applied for when incremental data in the base table is written to the Mlog table. The **seqno** column ensures that the written incremental data has a unique and incremental sequence number (marking the sequence of the incremental data).	When a fast-refresh materialized view is defined, this lock is called when incremental data in the base table is written to the Mlog table. If the IUD performance of a table is important, do not create a fast-refresh materialized view for the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
IOStatLock	Used to concurrently maintain the I/O statistics hash table of resource management.	A lock is requested when the I/O statistics hash table is read or updated.	Reduce I/O operations.
StandbyStmtHistLock	It is mainly used for the FullSQL locating capability of the standby node.	When slow SQL files are flushed to disks, the standby_statement_history function is protected from out-of-bounds read on the same resource.	It is mainly used to locate slow SQL statements. No workaround is required.
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.	The WAL buffer is initialized.	Triggered only during initialization. No optimization needed.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.	Xlogs are pre-initialized.	Triggered only during initialization. No optimization needed.
SegmentHeadPartitionLock	Used to protect the partition lock of metadata in the segment-page header.	When the extent of a segment-page object changes, the segment header needs to be locked to prevent concurrency exceptions.	-
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).	Used to protect the status information of two-phase transactions (in each partition).	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
RoleIdPartLock	Protects the addition, deletion, and query of process role IDs.	Process role IDs in thread pool mode are added, deleted, and queried.	-
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.	In the high-concurrency autonomous transaction session scenario, there is a possibility that the lock wait event occurs.	Reduce the number of concurrent sessions in autonomous transactions.
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.	Incremental checkpoint.	Reduce checkpoints.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.	Concurrent access to the barrier_hash_table. During normal distributed DR running, the pre-parsing thread parses barriers and inserts them into the hash table. After replaying barrier logs, the replayer thread removes barriers from the hash table.	-
PageRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired pages.	CRC corruption or LSN corruption is detected, and bad blocks are recorded.	Prevent bad blocks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.	Information is recorded when a file is damaged.	Prevent file damage.
ReplicationOriginLock	Locks are used for creating, deleting, and changing the status of publication and subscription.	Publication and subscription are used.	Reduce the startup of publication and subscription.
PCABufferContentLock	The cross-page transparent compression feature requires a cache page to cache the cmap page to protect the consistency of the cache page. The function is similar to the content lock of shared_buffer.	The consistency of cache pages is protected.	-
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.	Ensure that WALs are consistent on multiple nodes, which may be caused by network latency or node performance differences.	Optimize the network configuration and node performance to reduce the WAL consensus time, or adjust the transaction commit policy to reduce the dependency on consensus mechanism.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
SegMappingLock	Protects concurrent access to segment-page cache hash tables.	The segment-page mode maintains a hash table to store the mapping between logical and physical locations. The hash table is accessed concurrently and needs to be locked.	-
PendingDelLock	Protects concurrent modification of the pending list on threads.	If there are too many operations such as creation, deletion, and modification in a transaction, the pending list may be too long, and it may take a long time to operate the pending list.	Reduce the number of DDL operations in a transaction.
AutonomousSessionLock	Locks are added when autonomous transactions are connected.	Autonomous transactions are established in sequence in high concurrency scenarios.	Reduce the number of concurrent autonomous transactions.
CgroupHashLock	Prevents concurrent initialization locks.	Concurrent initialization.	Reduce service concurrency.
IMCVInfoHashTblLock	Protects the hash table that stores all IMCVDescs in HTAP.	The hash table that stores all IMCVDescs in HTAP is protected.	Use partitioned tables to construct multiple gs_imcv to reduce conflicts.
IMCVDescExpandLock	Protects the concurrent security of a single IMCVDesc.	The concurrent security of a single IMCVDesc is protected.	Reduce the number of concurrent COLVIEW loading operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LogicalStandbyWalLock	Mutual exclusion occurs when the logical standby node pulls and processes remote WALs.	Logical replay is used.	-
DelayDdlInfoLock	Lock held by the standby node for delayed DDL statements.	The primary node executes DDL statements.	Reduce the DDL execution frequency on the primary node.
NvmeLSPosLock	Protects the read and write operations on each of the 4096 NVMe hash partitions.	Statistics on the time of the partition lock range are collected to locate hang and performance problems on the live network.	Adjust the index structure to disperse the distribution of hot pages.
BucketWriterLock	Sync lock of the private buffer during bucket scale-out.	Private buffer contention during bucket scale-out.	-
ClogBucketLock	Protects the bucket Clog control file.	A large number of bucket table services concurrently extend the Clog page.	-
BufFreelistLock	Deprecated.	Deprecated.	Deprecated.

Table 7-472 describes the corresponding wait events when **wait_status** is **wait io**.

Table 7-472 I/O wait events

wait_event	Description	Cause	Suggestions
buffile_read	Waits for reading data from the temporary file.	The query statement generates temporary files.	Increase the value of **work_mem**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
buffile_write	Waits for writing temporary files.	The query statement generates temporary files.	Increase the value of **work_mem**.
BufHashTableSearch	Searches the hash table in the shared buffer (page eviction may be triggered).	A specified buffer is searched from the buffer.	Increase the size of the shared buffer to increase the buffer hit ratio.
buffer_strategy_get	Time required for finding the buffer in the buffer replacement policy.	The available buffer is obtained.	Reduce the checkpoint time, pagewriter_sleep time, and bgwriter_delay time to accelerate the cache scanning frequency and reduce concurrency.
ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.	During database startup, checkpoint execution, and primary and standby verification, data is loaded from the control file.	Reduce the operations of starting and stopping the database, checkpoint, and switchover.
ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.	When the database is started, data in the **pg_control** file is flushed to the disk.	Reduce the number of database startup and stopping operations.
ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.	During database startup, checkpoint execution, and primary and standby verification, data in the **pg_control** file is flushed to disks.	Reduce the operations of starting and stopping the database, checkpoint, and switchover.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
ControlFileWrite	Writes the **pg_control** file, mainly during database initialization.	When the database is started, the control file is initialized and written to the disk.	Reduce the number of database startup and stopping operations.
ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.	During database startup, checkpointer execution, and primary and standby verification, the control file change information needs to be written into the **pg_control** file.	Reduce the operations of starting and stopping the database, checkpoint, and switchover.
CopyFileRead	Reads a file during file copying.	The file I/O performance bottleneck occurs or the source file is locked by other operations.	Optimize the I/O performance or ensure that the source file is not locked by other operations for a long time to reduce lock contention.
CopyFileWrite	Writes a file during file copying.	The file I/O performance bottleneck occurs or the target file is locked by other operations.	Optimize the I/O performance or ensure that the target file is not locked by other operations for a long time to reduce lock contention.
DataFileExtend	Writes content to a file during file extending.	The file is extended.	Reduce the service volume and check the I/O performance.
DataFileImmediateSync	Flushes a table data file to a disk immediately.	The checkpoint logic has been triggered.	Adjust the checkpoint interval and check the I/O performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
DataFilePrefetch	Reads a table data file asynchronously.	The table data file information is missing in the memory and needs to be loaded from the disk.	Adjust the value of **shared_buffers** and check the I/O performance.
DataFileRead	Reads a table data file synchronously.	The table data file information is missing in the memory and needs to be loaded from the disk.	Adjust the value of **shared_buffers** and check the I/O performance.
DataFileSync	Flushes table data file modifications to a disk.	The checkpoint logic has been triggered.	Adjust the checkpoint interval and check the I/O performance.
DataFileTruncate	Truncates a table data file.	Truncate operation has been triggered.	Reduce concurrent operations on the truncate table.
DataFileWrite	Writes a table data file.	The checkpoint logic has been triggered.	Adjust the checkpoint interval and check the I/O performance.
SegFileExtend	Extends segment-page files.	When the database requires more storage space, the segment file is extended. Due to the performance limitation of the file system, the segment files will wait.	Optimize the I/O performance of the file system or allocate sufficient storage space in advance to reduce expansion operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
SegReadDisk	Reads segment-page files.	When accessing data, the database needs to read segment files from disks. Due to I/O performance restrictions, the database waits for the segment files to be read.	Optimize the I/O performance of the storage device or increase the cache to reduce read operations.
SegWriteDisk	Writes segment-page files.	When updating data, the database needs to write data to the segment file. Due to the I/O performance limitation, the database waits for data to be written to the segment file.	Optimize the I/O performance of the storage device or increase the parallelism of write operations.
SegSync	Flushes segment-page files.	After data is modified, you need to ensure data persistence. Therefore, you need to wait for file synchronization.	Optimize the I/O performance of the storage device, or adjust the synchronization frequency to reduce the waiting time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
SegFileShrink	Collapses segment-page files.	When the database releases unnecessary storage space, segment files are shrunk. Due to the performance limitation of the file system, the segment files will wait.	Optimize the I/O performance of the file system or reduce the frequency of segment file shrinking.
LsnInfoPageDiskRead	I/O delay of reading the LSN info page when read on standby in ultimate RTO mode is enabled.	Read on standby in ultimate RTO mode is enabled.	Enhance the I/O capability.
BlkInfoMetaDiskRead	I/O delay of reading the block info page when read on standby in ultimate RTO mode is enabled.	Read on standby in ultimate RTO mode is enabled.	Enhance the I/O capability.
BasePageDiskRead	I/O delay of reading the base page when read on standby in ultimate RTO mode is enabled.	Read on standby in ultimate RTO mode is enabled.	Enhance the I/O capability.
LockFileAddToDataDirRead	Reads the **postmaster.pid** file.	The **postmaster.pid** file has been read concurrently.	Reduce service concurrency.
LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.	The **postmaster.pid** file has been flushed concurrently.	Reduce service concurrency.
LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.	The **postmaster.pid** file has been written concurrently.	Reduce service concurrency.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
LockFileCreateRead	Reads the LockFile file **%s.lock**.	The LockFile file has been read concurrently.	Reduce service concurrency.
LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.	The LockFile file has been flushed concurrently.	Reduce service concurrency.
LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.	The LockFile file has been written concurrently.	Reduce service concurrency.
ReplicationSlotRead	Reads a streaming replication slot file This operation is performed during a restart.	Slot persistence information has been read.	Used only when the process is started and the replication slot information is loaded. No optimization is required.
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk This operation is performed during a restart.	Replication slot persistence information has been synchronized from disks.	Used only when the process is started and the replication slot information is loaded. No optimization is required.
ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.	Replication slot information has been flushed to a disk.	Used only when the replication slot status is created or refreshed. No optimization is required.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.	Replication slot information has been written to a temporary file.	Used only when the replication slot status is created or refreshed. No optimization is required.
SLRUFlushSync	Flushes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files to a disk, mainly during checkpoint execution and database shutdown.	The checkpoint logic has been triggered.	Decrease the checkpoint interval and check the I/O performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
SLRURead	Reads the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.	The Clog and CSNlog information is missing in the memory and needs to be loaded from the disk.	Increase the **shared_buffers** size and check the I/O performance.
SLRUSync	Writes dirty pages into the **pg_clog**, **pg_subtrans**, and **pg_multixact** files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.	The checkpoint logic has been triggered.	Decrease the checkpoint interval and check the I/O performance.
SLRUWrite	Writes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.	The checkpoint logic has been triggered.	Decrease the checkpoint interval and check the I/O performance.
Twophase FileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.	The **pg_twophase** information is missing in the memory and needs to be loaded from the disk.	Increase the **shared_buffers** size and check the I/O performance.
Twophase FileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.	During a two-phase transaction, dirty pages are flushed to disks.	Decrease the checkpoint interval and check the I/O performance.
Twophase FileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.	Disk files have been rebuilt during a two-phase transaction.	Decrease the checkpoint interval and check the I/O performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UndoFileExtend	Extends an undo file.	DML generates undo records. When the space is insufficient, the undo file needs to be expanded to store new undo records.	Reduce DML operations on the Ustore table.
UndoFilePrefetch	Asynchronously reads undo files.	When the system supports posix_fadvise () calls, the database pre-reads the scan to improve performance.	Reduce DML operations on the Ustore table.
UndoFileRead	Reads an undo file.	When a service needs to access a historical tuple version or a transaction needs to be rolled back, the undo record is read.	Reduce DML operations on the Ustore table.
UndoFileWrite	Writes an undo file.	DML generates undo records. The undo records are written to the buffer and then flushed to disks in the pagewriter thread. This wait event is generated in the flushing process.	Reduce DML operations on the Ustore table.
UndoFileSync	Synchronously flushes undo files to disk.	Undo records have been synchronously flushed to disk.	Reduce DML operations on the Ustore table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UndoFileUnlink	Deletes an undo file.	Undo records are generated when DML operations are performed on each Ustore table. Unnecessary undo records must be deleted in a timely manner to prevent the undo space from increasing.	Reduce DML operations on the Ustore table.
UndoSegFileExtend	Extends undo segment-page files.	DML generates undo records. When the space is insufficient, the undo segment-page file needs to be expanded to store new undo records.	Reduce DML operations on the Ustore table.
UndoSegReadDisk	Reads undo segment-page files.	When a service needs to access a historical tuple version or a transaction needs to be rolled back, the undo record is read.	Reduce DML operations on the Ustore table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
UndoSegWriteDisk	Writes undo segment-page files.	DML generates undo records. The undo records are written to the buffer and then flushed to disks in the pagewriter thread. This wait event is generated in the flushing process.	Reduce DML operations on the Ustore table.
UndoSegSync	Synchronously flushes undo segment-page files to disk.	Undo records have been synchronously flushed to disk.	Reduce DML operations on the Ustore table.
UndoMetaSync	Synchronously flushes undo metadata files to disk.	The undo metadata is flushed to disk with each checkpoint. Ensure that the undo metadata is flushed in real time after the checkpoint is updated.	Increase the value of **incremental_checkpoint_timeout**.
WALBootstrapSync	Flushes initialized WAL files to a disk during database initialization.	The database has been initialized.	Triggered only during initialization. No optimization needed.
WALBootstrapWrite	Writes initialized WAL files during database initialization.	The database has been initialized.	Triggered only during initialization. No optimization needed.
WALCopyRead	Records read operations generated when existing WAL files are read for replication after archiving and restoration.	Archive restoration has been triggered.	Related to the I/O performance, which can be optimized on the hard disk.
WALCopySync	Flushes replicated WAL files to a disk after archive restoration.	Archive restoration has been triggered.	Related to the I/O performance, which can be optimized on the hard disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
WALCopyWrite	Records write operations generated when existing WAL files are read for replication after archiving and restoration.	Archive restoration has been triggered.	Related to the I/O performance, which can be optimized on the hard disk.
WALInitSync	Flushes a newly initialized WAL file to a disk during log recycling or writing.	A log file has been created.	Related to the I/O performance, which can be optimized on the hard disk.
WALInitWrite	Initializes a newly created WAL file to **0** during log recycling or writing.	A log file has been created.	Related to the I/O performance, which can be optimized on the hard disk.
WALRead	Reads data from Xlogs during redo operations on two-phase files.	Log transfer or logical decoding has been triggered.	Related to the I/O performance, which can be optimized on the hard disk.
ShareStorageWalRead	Reads log files from the shared disk.	The WAL read speed of the shared storage is slow. As a result, the read operation is time-consuming.	Optimize the network and storage performance, or increase the read parallelism of WAL files.
ShareStorageWalWrite	Writes log files to the shared disk.	The WAL write speed of the shared storage is slow. As a result, the write operation is time-consuming.	Optimize the storage performance or adjust the WAL generation configuration to reduce the waiting time of write operations.
ShareStorageCtlInfoRead	Reads control information from the shared disk.	The speed of reading the control information of the shared storage is slow. As a result, the read operation is time-consuming.	Optimize the storage performance or reduce the frequency of reading control information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
ShareStorageCtlInfoWrite	Writes control information to the shared disk.	The write speed of the shared storage control information is slow. As a result, the write operation is time-consuming.	Optimize the storage performance or reduce the frequency of writing control information.
WALSyncMethodAssign	Flushes all open WAL files to a disk.	The **wal_sync_method** parameter has been modified.	Related to the I/O performance, which can be optimized on the hard disk.
WALWrite	Writes a WAL file.	Xlog files are written.	Related to the I/O performance, which can be optimized on the hard disk.
WALBufferAccess	Accesses WAL buffer. (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.)	WAL records are inserted.	The time consumption is not counted, and no optimization is required.
WALBufferFull	Writes WAL files when the WAL buffer is full.	The WAL buffer is full and waits for flushing.	Increase the wal_buffers size.
DoubleWriteFileRead	Waits for reading the doublewrite file.	During database startup, pages in the doublewrite file are scanned and half-write pages are repaired.	Reduce the number of database startup and stop operations to avoid half-write.
DoubleWriteFileWrite	Waits for writing the doublewrite file.	The checkpoint logic has been triggered.	Reduce checkpoints.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
DWSingleFlushGetPos	Searches for an available location for a single-page doublewrite file.	When a full checkpoint is performed at an incremental checkpoint, the single-page doublewrite file is truncated.	Check the manual checkpoint operation.
DWSingleFlushWrite	Flushes a single-page doublewrite file to a disk.	A single-page doublewrite file is written during dirty page eviction.	Reduce page eviction and increase the value of **shared_buffers**.
CkptWaitPageWriterFlush	Waits for page refreshing during full checkpoint execution.	The dirty page refresh speed is slow. As a result, the checkpoint operation is blocked.	Optimize the I/O performance or increase the number of writers to improve the write efficiency.
CkptWaitPageWriterSync	Waits for the modified file to be synchronized to the disk before checkpointing.	The dirty page synchronization speed is slow. As a result, the checkpoint operation is blocked.	Optimize the I/O performance or adjust the checkpoint configuration to reduce the synchronization waiting time.
CkptWaitCommitTransactionFinish	Waits until all transactions are committed before checkpointing.	Checkpoints need to wait for all active transactions to be committed to ensure data consistency.	Optimize the transaction processing process, reduce long transactions, or adjust the frequency of triggering checkpoints.
PredoProcessPending	Waits for the replay of other records to complete during parallel log replay.	Logs to be synchronized, such as DDL-related logs, are displayed.	Reduce DDL operations.
PredoApply	Waits for the replay of other threads to the LSN of the current thread during parallel log replay.	Logs to be synchronized, such as DDL-related logs, are displayed.	Reduce DDL operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
DisableConnectFileRead	Reads the HA lock fragment logic file.	HA build is successful, and the primary and standby configuration files are synchronized.	Related to the I/O performance, which can be optimized on the hard disk.
DisableConnectFileSync	Forcibly flushes the HA lock fragment logic file to disks.	HA build is successful, and the primary and standby configuration files are synchronized.	Related to the I/O performance, which can be optimized on the hard disk.
DisableConnectFileWrite	Writes the HA lock fragment logic file.	HA build is successful, and the primary and standby configuration files are synchronized.	Related to the I/O performance, which can be optimized on the hard disk.
MPFL_INIT	Initiates **max_page_flush_lsn**.	The control file has been initialized.	Related to the I/O performance, which can be optimized on the hard disk.
MPFL_READ	Reads **max_page_flush_lsn**.	The control file has been read.	Related to the I/O performance, which can be optimized on the hard disk.
MPFL_WRITE	Writes **max_page_flush_lsn**.	The control file has been written.	Related to the I/O performance, which can be optimized on the hard disk.
LOGCTRL_SLEEP	Waits for the standby node to catch up with replay.	Enable flow control.	Disable flow control.
WALRcvBufFull	The buffer is full when walreceiver of the standby node receives Xlogs and stores them in the buffer.	The capacity of the WAL receive buffer is insufficient. As a result, the received WALs cannot be processed in a timely manner.	Related to the I/O performance, which can be optimized on the hard disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
WALFileSync	Flushes the WAL file to a disk.	After the WAL write operation is performed, you need to ensure that the data is persistent. Therefore, file synchronization is waited.	Related to the I/O performance, which can be optimized on the hard disk.
VlogInitSync	Waits for initializing the Vlog file.	A new Vlog file is created after the page verification persistence is enabled.	Related to the I/O performance, which can be optimized on the hard disk.
VlogWrite	Waits for writing Vlog records to a file.	Vlog records are written to a file after the page verification persistence is enabled.	Related to the I/O performance, which can be optimized on the hard disk.
OBSWrite	Deprecated.	Deprecated.	Deprecated.
invalid io event	Unexpected read/write event.	An unexpected read/write event occurs.	Contact Huawei technical support.

Table 7-473 describes the corresponding wait events when **wait_status** is **acquire lock**.

Table 7-473 List of wait events corresponding to transaction locks

wait_event	Description	Cause	Suggestions
relation	Adds a lock to a table.	A conflict occurs when the service statement obtains the table lock.	Do not perform DML and DDL operations on the same table concurrently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
extend	Adds a lock to a table being scaled out.	A conflict occurs when the same table is frequently extended.	Do not concurrently insert too much data into a single table
partition	Adds a lock to a partitioned table.	A conflict occurs when the service statement obtains the partitioned table lock.	Do not perform DML and DDL operations on the same partitioned table concurrently.
partition_seq	Adds a lock to a partition of a partitioned table.	A conflict occurs when the service statement obtains the partitioned table lock of the partitioned table.	Do not perform DML and DDL operations concurrently on partitions of the same partitioned table.
page	Adds a lock to a table page.	A conflict occurs when service statements are used to add, delete, or modify vector metadata.	Reduce concurrent DML operations on vector columns in the vector table.
tuple	Adds a lock to a tuple on a page.	A tuple is locked when DML is executed.	Reduce concurrent DML operations.
transactionid	Adds a lock to a transaction ID.	A transaction has been concurrently accessed.	Reduce concurrent access to the same transaction.
virtualxid	Adds a lock to a virtual transaction ID.	A virtual transaction has been concurrently accessed.	Reduce concurrent access to the same virtual transaction.
object	Adds a lock to an object.	The internal object lock of the database conflicts.	Analyze the specific process code.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
advisory	Adds an advisory lock.	A lock conflict occurs when the advisory lock function is called. For example, if session 1 calls the pg_advisory_lock_int8 function and does not release the lock for a long time, session 2 enters the waiting state when calling the same parameter of the pg_advisory_lock_int8 function.	Optimize the service process to prevent lock conflicts.
filenode	Adds a lock to a file name and controls the concurrent sequence of file-level operations.	When multiple sessions concurrently access the same file, the system needs to lock the file to control the concurrency sequence and prevent data conflicts.	Optimize the access logic to reduce concurrent operations on the same file.
subtransactionid	Adds a lock to a sub-transaction ID.	A sub-transaction has been concurrently accessed.	Reduce concurrent access to the same sub-transaction.
tuple_uid	Adds a lock to the UID hidden column in the tuple header.	DML operations have been performed on the Ustore table.	Reduce concurrent DML operations on the Ustore table.
spectoken	Protects the upsert process.	The upsert operation is concurrently executed in a transaction.	Prevent transactions from executing upsert concurrently or optimize the upsert performance.
bucket	Adds a bucket lock.	A conflict occurs when the service statement obtains the bucket lock.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description	Cause	Suggestions
vector_ccbuild	Locks the tuple of an index.	When a vector index is created, the tuple of the index is locked.	Reduce concurrent creation operations.
cstore_freespace	Deprecated.	Deprecated.	Deprecated.
userlock	Deprecated.	Deprecated.	Deprecated.

7.3.13.188 PG_TIMEZONE_ABBREVS

PG_TIMEZONE_ABBREVS displays information about all available time zones. For details about the columns, see **Table 7-474**.

Table 7-474 PG_TIMEZONE_ABBREVS columns

Name	Type	Description
abbrev	text	Time zone name abbreviation.
utc_offset	interval	Offset from UTC.
is_dst	boolean	Specifies whether the DST is being used. If the DST is being used, the value is **t**; otherwise, the value is **f**.

7.3.13.189 PG_TIMEZONE_NAMES

PG_TIMEZONE_NAMES displays all time zone names that can be recognized by SET TIMEZONE, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses. For details about the columns, see **Table 7-475**.

Table 7-475 PG_TIMEZONE_NAMES columns

Name	Type	Description
name	text	Name of the time zone.
abbrev	text	Abbreviation of the ime zone name.
utc_offset	interval	Offset from UTC.
is_dst	boolean	Specifies whether the DST is being used. If the DST is being used, the value is **t**; otherwise, the value is **f**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.190 PG_TOTAL_MEMORY_DETAIL

PG_TOTAL_MEMORY_DETAIL displays memory usage of a node in the database. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable. For details about the columns, see **Table 7-476**.

Table 7-476 PG_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name
memorytype	text	Memory name
memorymbytes	integer	Size of the used memory, in MB

7.3.13.191 PG_TOTAL_USER_RESOURCE_INFO

PG_TOTAL_USER_RESOURCE_INFO displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**. I/O monitoring items are valid only when **enable_logical_io_statistics** is set to **on**. For details about the columns, see **Table 7-477**.

Table 7-477 PG_TOTAL_USER_RESOURCE_INFO columns

Name	Type	Description
username	name	Username.
used_memory	integer	This column is deprecated in the current version. The query result is meaningless.
total_memory	integer	This column is deprecated in the current version. The query result is meaningless.
used_cpu	double precision	This column is deprecated in the current version. The query result is meaningless.
total_cpu	integer	This column is deprecated in the current version. The query result is meaningless.
used_space	bigint	Used permanent table storage space, in KB.
total_space	bigint	Available permanent table storage space, in KB (**-1** if the storage space is not limited).
used_temp_space	bigint	Used temporary space, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited).
used_spill_space	bigint	Size of the used operator flushing space, in KB.
total_spill_space	bigint	Total size of the available operator flushing space, in KB (**-1** if the space is not limited).
read_kbytes	bigint	CN: total bytes read by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	CN: total bytes written by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	CN: total number of read times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	CN: total number of write times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of write times of the user's complex jobs from the instance startup time to the current time
read_speed	double precision	CN: average read rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average read rate of the user's complex jobs on the DN in the last 5 seconds, in KB/s

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_speed	double precision	CN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s

NOTE

- There may be a ±5% difference between the used disk space calculated in the PG_TOTAL_USER_RESOURCE_INFO view and the actual used disk space. You can run the **SELECT gs_wlm_readjust_user_space(0)** statement to correct the difference. The database also periodically (every seven days) corrects the space used by users. If data is inserted into the table during the execution of this statement, the statistics may be inaccurate.
- After DROP DATABASE is performed, the user space information collected in the PG_TOTAL_USER_RESOURCE_INFO view is not cleared immediately. When the CPU usage is high, it takes one to two hours to clear the information and restore the accuracy of the statistics.

7.3.13.192 PG_TOTAL_USER_RESOURCE_INFO_OID

PG_TOTAL_USER_RESOURCE_INFO_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**. For details about the columns, see **Table 7-478**.

Table 7-478 PG_TOTAL_USER_RESOURCE_INFO_OID columns

Name	Type	Description
userid	oid	User ID.
used_memory	integer	This column is deprecated in the current version. The query result is meaningless.
total_memory	integer	This column is deprecated in the current version. The query result is meaningless.
used_cpu	double precision	This column is deprecated in the current version. The query result is meaningless.
total_cpu	integer	This column is deprecated in the current version. The query result is meaningless.
used_space	bigint	Used storage space, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_space	bigint	Available storage space (unit: KB). The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB.
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited).
used_spill_space	bigint	Used disk space for spilling, in KB.
total_spill_space	bigint	Total available disk space for spilling, in KB. The value **-1** indicates that the space is not limited.
read_kbytes	bigint	Amount of data read from the disk, in KB.
write_kbytes	bigint	Amount of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

7.3.13.193 PG_VARIABLE_INFO

PG_VARIABLE_INFO records information about transaction IDs and OIDs of the current node in a cluster. For details about the columns, see **Table 7-479**.

Table 7-479 PG_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name.
next_oid	oid	OID generated next time for the node.
next_xid	xid	Transaction ID generated next time for the node.
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point that triggers forcible autovacuum.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node.
last_extend_csn_logpage	xid	Number of the last extended CSNlog page.
start_extend_csn_logpage	xid	Number of the page from which csnlog extending starts.
next_commit_seqno	xid	CSN generated next time for the node.
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commit or rollback.
startup_max_xid	xid	Last transaction ID before the node is powered off.

7.3.13.194 PG_VIEWS

PG_VIEWS displays useful information about each view in the database. For details about the columns, see **Table 7-480**.

Table 7-480 PG_VIEWS columns

Name	Type	Reference	Description
schemaname	name	**nspname** in **PG_NAMESPACE**	Schema name of a view.
viewname	name	**relname** in **PG_CLASS**	View name.
viewowner	name	**PG_AUTHID**.rolname	Owner of the view
definition	text	-	Definition of the view.

7.3.13.195 PGXC_COPY_ERROR_LOG

The PGXC_COPY_ERROR_LOG system view is used to capture error rows related to the COPY FROM procedure for future reference.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-481 PGXC_COPY_ERROR_LOG columns

Name	Type	Description
relname	text	Table name, in the form of *Schema name*.*Table name*.
begintime	timestamp with time zone	Time when a data format error was reported.
filename	text	Name of the source data file where a data format error occurs.
lineno	bigint	Number of the row where a data format error occurs in a source data file.
rawrecord	text	Raw record of a data format error in the source data file.
detail	text	Error details.
custom_id	text	Value of **copy_custom_id** in the COPY syntax, which indicates the information about the imported custom identifier.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- When the pg_catalog.pgxc_copy_error_log system view is queried, data in the pg_catalog.gs_copy_error_log table on all CNs and DNs is displayed. It is equivalent to running the following statement:
  ```
  SELECT * FROM pg_catalog.pgxc_copy_error_func(false, false);
  ```
- By default, the view does not perform the UNION ALL operation on the pg_catalog.gs_copy_error_old table. To be compatible with the queried data in the pg_catalog.gs_copy_error_old table, run the following statement:
  ```
  SELECT * FROM pg_catalog.pgxc_copy_error_func(true, false);
  ```
- In this version and later versions, pgxc_copy_error_log is changed from a system catalog to a system view. Therefore, the TRUNCATE operation cannot be performed on this view, otherwise, an error message is displayed indicating that the operation cannot be performed on the view. You can clear the copy-related error data as follows:
  - In non-separation-of-duties scenarios, the SYSADMIN needs to run the following statement to clear the data:
    ```
    TRUNCATE TABLE pg_catalog.gs_copy_error_log;
    ```
  - In separation-of-duties scenarios, clear the pgxc_copy_error_log table in the schema with the same name as a common user.
- In separation-of-duties scenarios, error logs are not recorded in pg_catalog.pgxc_copy_error_log or pg_catalog.gs_copy_error_log. If error information needs to be recorded for the **load_user** user, execute the following statement to create the error log in the schema with the same name as the user:
  ```
  CREATE TABLE load_user.pgxc_copy_error_log (relname varchar, begintime timestamptz, filename varchar, lineno int8, rawrecord text, detail text);
  CREATE INDEX copy_error_log_relname_idx ON load_user.pgxc_copy_error_log(relname);
  ```

  (Optional) Add the **custom_id** column to the table.

  ```
  ALTER TABLE load_user.pgxc_copy_error_log ADD COLUMN custom_id varchar(64);
  ```

7.3.13.196 PGXC_GET_STAT_ALL_TABLES

PGXC_GET_STAT_ALL_TABLES displays information about insertion, update, and deletion operations on tables and the dirty page rate of tables. Before running **VACUUM FULL** to a system catalog with a high dirty page rate, ensure that no user is performing operations on it. This view is a new feature of GaussDB, and will not collect statistics on insertion, update, and deletion operations in earlier versions. You are advised to run **VACUUM FULL** to tables (excluding system catalogs) whose dirty page rate exceeds 30% or run it based on service scenarios. Only users with the SYSADMIN or MONADMIN permissions can view the information. For details about the columns, see **Table 7-482**.

Table 7-482 PGXC_GET_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
relname	name	Table name.
schemaname	name	Name of the schema that contains a table.
n_tup_ins	numeric	Number of inserted tuples.
n_tup_upd	numeric	Number of updated tuples.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_del	numeric	Number of deleted tuples.
n_live_tup	numeric	Number of live tuples.
n_dead_tup	numeric	Number of dead tuples. It indicates the number of inactive row pointers in Ustore tables.
dirty_page_rate	numeric(5,2)	Dirty page rate (%) of a table.

7.3.13.197 PGXC_GET_TABLE_SKEWNESS

PGXC_GET_TABLE_SKEWNESS displays the data skew on tables in the current database. Only users with the SYSADMIN permission can access. For details about the columns, see **Table 7-483**.

Table 7-483 PGXC_GET_TABLE_SKEWNESS columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
tablename	name	Table name.
totalsize	numeric	Total size of the table, in bytes.
avgsize	numeric(1000,0)	Average table size (total table size divided by the number of DNs), which is the ideal size of tables distributed on each DN.
maxratio	numeric(4,3)	Ratio of the maximum table size on a single DN to the total table size.
minratio	numeric(4,3)	Ratio of the minimum table size on a single DN to the total table size.
skewsize	bigint	Table skew rate (the maximum table size on a single DN minus the minimum table size on a single DN).
skewratio	numeric(4,3)	Table skew rate (skew size divided by total table size).
skewstddev	numeric(1000,0)	Standard deviation of table distribution. (For two tables of the same size, a larger deviation indicates a more severe skew.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.198 PGXC_NODE_ENV

PGXC_NODE_ENV displays environmental variables of all nodes in a cluster. Only users with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-484**.

Table 7-484 PGXC_NODE_ENV columns

Name	Type	Description
node_name1	text	Name of a node in a cluster.
host1	text	Host names of the nodes in the cluster.
process1	integer	Process IDs of the nodes in the cluster.
port1	integer	Port numbers of the nodes in the cluster.
installpath1	text	Installation directory of the nodes in the cluster.
datapath1	text	Data directory of the nodes in the cluster.
log_directory1	text	Log directory of the nodes in the cluster.

7.3.13.199 PGXC_OS_THREADS

PGXC_OS_THREADS displays thread status information under all normal nodes in the current cluster. Only users with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-485**.

Table 7-485 PGXC_OS_THREADS columns

Name	Type	Description
node_name	text	Names of normal nodes in a cluster.
pid	bigint	IDs of running threads among normal node processes in the current cluster.
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dbid	oid	ID of the database to which a thread belongs.

7.3.13.200 PGXC_PREPARED_XACTS

PGXC_PREPARED_XACTS displays two-phase transactions in the prepared phase. Only users with the system admin or monitor admin permission can view the information. For details about the columns, see **Table 7-486**.

Table 7-486 PGXC_PREPARED_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the prepared phase.

7.3.13.201 PGXC_RUNNING_XACTS

PGXC_RUNNING_XACTS displays information about running transactions on each node in the cluster. The content is the same as that displayed by PG_RUNNING_XACTS. Only users with the system admin or monitor admin permission can view the information. For details about the columns, see **Table 7-487**.

Table 7-487 PGXC_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status. (**3**: prepared; **0**: starting.)
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is lazy vacuum. • **t** (true): yes. • **f** (false): no.
timeline	bigint	Number of database restarts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
prepare_xid	xid	Transaction ID in the **prepared** state. If the status is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

7.3.13.202 PGXC_STAT_ACTIVITY

PGXC_STAT_ACTIVITY displays information about the current user's queries on all CNs in the current cluster. Only users with the MONADMIN or SYSADMIN permission can view the view. Three columns are added to version 505.0.0. During the gray upgrade observation period, an error is reported. You need to use PG_STAT_ACTIVITY to directly connect to the target node for query. For details about the columns, see **Table 7-488**.

Table 7-488 PGXC_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	Name of a CN in the current cluster.
datid	oid	OID of the database that the user session connects to in the background.
datname	text	Name of the database that the user session connects to in the background.
pid	bigint	Background thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the background.
usename	text	Name of the user logged in to the background.
application_name	text	Name of the application connected to the background.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_addr	inet	IP address of the client connected to the background. If this column is **null**, either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null for IP connections only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the background (**-1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current transaction was started (**null** if no transaction is active). If the current query is the first of its transaction, this column is equal to the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or if **state** is not **active**, when the last query was started.
state_change	timestamp with time zone	Time when the last **status** was changed.
waiting	boolean	Specifies whether the background is currently waiting for a lock. If the background is currently waiting for a lock, the value is **true**. Otherwise, the value is **false**. If a lock is being waited for on a DN, determine the DN based on the **wait_status** column in the pg_thread_wait_status view and query the **waiting** column in pg_stat_activity on the DN to check whether a lock wait occurs.
enqueue	text	Queuing status of a statement. Its value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Background status. Its value can be: • **active**: The background is executing a query. • **idle**: The background is waiting for a new client command. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background. **NOTE** Only system administrators can view the session status of their accounts. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pgxc_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pgxc_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query in the background. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter **connection_info**.
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Size of Xlogs currently used by a transaction, in bytes.

7.3.13.203 PGXC_STAT_BAD_BLOCK

PGXC_STAT_BAD_BLOCK displays statistics about page verification failures after all nodes in a cluster are started. Only users with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 7-489**.

Table 7-489 PGXC_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	integer	File type. The options are as follows: • **0**: main data file. • **1**: FSM file. • **2**: VM file. • **3**: BCM file.
error_count	integer	Number of verification failures.
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

7.3.13.204 PGXC_SQL_COUNT

PGXC_SQL_COUNT displays node-level and user-level statistical results for the SELECT, INSERT, UPDATE, DELETE, and MERGE INTO statements in real time, identifies query types with heavy load, and measures the capability of a cluster or node to perform a specific type of query. For example, you can calculate QPS based on the quantities of the five types of SQL statements at certain time points. **USER1 SELECT** is counted as **X1** at T1 and as **X2** at T2. The **SELECT** QPS of the user can be calculated as follows: (X2 – X1)/(T2 – T1). In this way, the system can draw cluster-user-level QPS curve graphs and determine cluster throughput, tracing changes in the service load of each user. If there are drastic changes, the system can locate the specific statement type (such as SELECT, INSERT, UPDATE, DELETE, and MERGE INTO). You can also observe QPS curves to determine the time points when problems occur and then locate the problems using other tools. The curves provide a basis for optimizing cluster performance and locating problems. Only users with the SYSADMIN or MONADMIN permission can query this view. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_SQL_COUNT';** statement is not supported.

Columns in the PGXC_SQL_COUNT view are the same as those in the GS_SQL_COUNT view. For details about the columns, see **GS_SQL_COUNT**.

NOTE

If a MERGE INTO statement can be pushed down and a DN receives it, the statement will be counted on the DN and the value of the **mergeinto_count** column will be incremented by 1. If pushdown is not allowed, the DN will receive an UPDATE or INSERT statement. In this case, the **update_count** or **insert_count** column will be incremented by 1.

7.3.13.205 PGXC_THREAD_WAIT_STATUS

PGXC_THREAD_WAIT_STATUS displays all the call layer hierarchy relationship between threads of the SQL statements on all the nodes in a cluster, and the waiting status of the block for each thread, so that you can easily locate the causes of process response failures and similar phenomena. For details about the columns, see **Table 7-490**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The definitions of PGXC_THREAD_WAIT_STATUS and PG_THREAD_WAIT_STATUS are the same, because the essence of PGXC_THREAD_WAIT_STATUS is the query summary of PG_THREAD_WAIT_STATUS on each node in the cluster.

Table 7-490 PGXC_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Parallel thread ID.
wait_status	text	Waiting status of the current thread. For details, see **Table 7-470**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

Example:

Assume that you run a statement on coordinator1, and no response is returned after a long period of time. In this case, establish another connection to coordinator1 to check the thread status on it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM pg_thread_wait_status WHERE query_id > 0;
-[ RECORD 1 ]----+-------------------------------------
node_name        | cn_5001

7.3.13.206 PGXC_TOTAL_MEMORY_DETAIL

PGXC_TOTAL_MEMORY_DETAIL displays memory usage in the cluster. The query can be performed only on the CN. The EXECUTE DIRECT ON (dn) 'SELECT * FROM PGXC_TOTAL_MEMORY_DETAIL'; statement is not supported. Only users with the SYSADMIN or MONADMIN permission can query this view. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable. For details about the columns, see **Table 7-491**.

Table 7-491 PGXC_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: memory occupied by the GaussDB instance • **process_used_memory**: memory occupied by the GaussDB process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic memory peak. • **dynamic_used_shrctx**: maximum dynamic shared memory context. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_backend_memory**: maximum memory that can be used when the HA port is used to execute services. • **backend_used_memory**: memory that has been used when the HA port is used to execute services. • **high_backend_thread_memory**: memory used by high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **high_backend_thread_max_memory**: memory reserved for high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_memory**: memory used by medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_max_memory**: memory reserved for medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
		• **low_backend_thread_memory**: memory used by low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_max_memory**: memory reserved for low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for the communications library. • **sctpcomm_used_memory**: memory used by the communications library. • **sctpcomm_peak_memory**: memory peak of the communications library. • **other_used_memory**: other used memory. • **llvm_used_memory**: memory occupied by the expression IR that is generated by Codegen and is not released.
memorymbytes	integer	Size of the used memory (unit: MB).

7.3.13.207 PGXC_VARIABLE_INFO

PGXC_VARIABLE_INFO records information about transaction IDs and OIDs of all nodes in a cluster. Only users with the SYSADMIN or MONADMIN permission can query this view. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_VARIABLE_INFO';** statement is not supported. For details about the columns, see **Table 7-492**.

Table 7-492 PGXC_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
next_oid	oid	OID generated next time on the node.
next_xid	xid	Transaction ID generated next time on the node.
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum.
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node.
last_extend_csn_logpage	xid	Number of the last extended CSNlog page.
start_extend_csn_logpage	xid	Number of the page from which CSNlog extending starts.
next_commit_seqno	xid	CSN generated next time for the node.
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commit or rollback.
startup_max_xid	xid	Last transaction ID before the node is powered off.

7.3.13.208 PLAN_TABLE

PLAN_TABLE displays plan information collected by EXPLAIN PLAN. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in both PG_CATALOG and SYS schemas.

Table 7-493 PLAN_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID.
id	integer	ID of each operator in a generated plan.
operation	character varying(30)	Operation description of an operator in a plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
options	character varying(255)	Operation action.
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.
remarks	character varying(4000)	Not supported yet. Its value is **NULL**.
timestamp	date	Not supported yet. Its value is **NULL**. **NOTE** During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of this column is changed to **datea**.
object_node	character varying(128)	Not supported yet. Its value is **NULL**.
object_alias	character varying(261)	Not supported yet. Its value is **NULL**.
object_instance	numeric	Not supported yet. Its value is **NULL**.
optimizer	character varying(255)	Not supported yet. Its value is **NULL**.
search_columns	numeric	Not supported yet. Its value is **NULL**.
parent_id	numeric	Not supported yet. Its value is **NULL**.
depth	numeric	Not supported yet. Its value is **NULL**.
position	numeric	Not supported yet. Its value is **NULL**.
bytes	numeric	Not supported yet. Its value is **NULL**.
other_tag	character varying(255)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partition_start	character varying(255)	Not supported yet. Its value is **NULL**.
partition_stop	character varying(255)	Not supported yet. Its value is **NULL**.
partition_id	numeric	Not supported yet. Its value is **NULL**.
other	character varying	Not supported yet. Its value is **NULL**.
other_xml	clob	Not supported yet. Its value is **NULL**.
distribution	character varying(20)	Not supported yet. Its value is **NULL**.
cpu_cost	numeric	Not supported yet. Its value is **NULL**.
io_cost	numeric	Not supported yet. Its value is **NULL**.
temp_space	numeric	Not supported yet. Its value is **NULL**.
access_predicates	character varying(4000)	Not supported yet. Its value is **NULL**.
filter_predicates	character varying(4000)	Not supported yet. Its value is **NULL**.
time	numeric	Not supported yet. Its value is **NULL**.
qblock_name	character varying(128)	Not supported yet. Its value is **NULL**.

NOTE

- A valid **object_type** value consists of a relkind type defined in **PG_CLASS** (**TABLE** for ordinary tables, **INDEX**, **SEQUENCE**, **VIEW**, **FOREIGN TABLE**, **COMPOSITE TYPE**, or **TOASTVALUE** for TOAST tables) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE_QUERY**).
- For RangeTableEntry (RTE), **object_owner** is the object description used in the plan. Non-user-defined objects do not have **object_owner**.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN_TABLE** supports only SELECT and DELETE and does not support other DML operations.

7.3.13.209 PV_FILE_STAT

PV_FILE_STAT records statistics about data file I/O to indicate I/O performance and detect performance problems such as abnormal I/O operations. For details about the columns, see **Table 7-494**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-494 PV_FILE_STAT columns

Name	Type	Description
filenum	oid	File ID
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

7.3.13.210 PV_INSTANCE_TIME

Records time consumption information of the current node. For details about the columns, see **Table 7-495**. The time consumption information is classified into the following types:

- DB_TIME: effective time spent by jobs in multi-core scenarios
- CPU_TIME: CPU time spent
- EXECUTION_TIME: time spent in executors
- PARSE_TIME: time spent in parsing SQL statements
- PLAN_TIME: time spent on generating plans
- REWRITE_TIME: time spent for SQL rewriting
- PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure
- NET_SEND_TIME: time spent on the network
- DATA_IO_TIME: I/O time spent

Table 7-495 PV_INSTANCE_TIME columns

Name	Category	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in µs

7.3.13.211 PV_OS_RUN_INFO

PV_OS_RUN_INFO displays the running status of the OS. For details about the columns, see **Table 7-496**.

Table 7-496 PV_OS_RUN_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	boolean	Specifies whether the value of the OS running status is cumulative.

7.3.13.212 PV_REDO_STAT

PV_REDO_STAT displays the log replay of session threads. For details about the columns, see **Table 7-497**.

Table 7-497 PV_REDO_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay
phyblkwrt	bigint	Number of data blocks written during log replay
writetim	bigint	Total time required for writing data during log replay.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avgiotim	bigint	Average time required for writing data during log replay.
lstiotim	bigint	Time consumed by the last data write operation during log replay
miniotim	bigint	Minimum time consumed by a single data write operation during log replay
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay

7.3.13.213 PV_SESSION_MEMORY

PV_SESSION_MEMORY collects statistics about memory usage at the session level, including all the memory allocated to gaussdb and Stream threads on DNs for jobs currently executed by users. For details about the columns, see **Table 7-498**.

Table 7-498 PV_SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB.
used_mem	integer	Memory allocated to the currently executed jobs, in MB.
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB.

7.3.13.214 PV_SESSION_MEMORY_CONTEXT

PV_SESSION_MEMORY_CONTEXT displays the memory usage of all sessions based on the MemoryContext node. This view is valid only when **enable_thread_pool** is set to **on**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts. For details about the columns, see **Table 7-499**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-499 PV_SESSION_MEMORY_CONTEXT columns

Name	Type	Description
sessid	text	Session start time+session ID (character string: *timestamp.sessionid*).
threadid	bigint	ID of the thread bound to a session (**-1** if no thread is bound).
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

NOTICE

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

7.3.13.215 PV_SESSION_MEMORY_DETAIL

PV_SESSION_MEMORY_DETAIL displays the memory usage of sessions based on the MemoryContext node. When **enable_thread_pool** is set to **on**, this view contains memory usage of all threads and sessions.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the SELECT * FROM PV_SESSION_MEMCTX_DETAIL(*threadid*, ''); statement to record information about all memory contexts of a thread into the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

threadid_timestamp.**log** file in the *$GAUSSLOG*/**gs_log/***${node_name}*/**dumpmem** directory. *threadid* can be obtained from **sessid** in Table 7-500.

Table 7-500 PV_SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	• When the thread pool is disabled (**enable_thread_pool = off**), this column indicates the thread start time + session ID (string: **timestamp.sessionid**). • When the thread pool is enabled (**enable_thread_pool = on**): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: **timestamp.threadid**). If the memory context is at the session level, the column indicates the thread start time + session ID (string: **timestamp.sessionid**).
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

NOTICE

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.3.13.216 PV_SESSION_STAT

PV_SESSION_STAT collects statistics about session states based on session threads or the AutoVacuum thread. For details about the columns, see **Table 7-501**.

Table 7-501 PV_SESSION_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

7.3.13.217 PV_SESSION_TIME

PV_SESSION_TIME displays the running time of session threads and time consumed in each execution phase. For details about the columns, see **Table 7-502**.

Table 7-502 PV_SESSION_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time
stat_id	integer	Statistics ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stat_name	text	Name of the session type • **DB_TIME**: effective time spent by jobs in multi-core scenarios • **CPU_TIME**: CPU time spent • **EXECUTION_TIME**: time spent within executors • **PARSE_TIME**: time spent in parsing SQL statements • **PLAN_TIME**: time spent on generating plans • **REWRITE_TIME**: time spent on rewriting SQL statements • **PL_EXECUTION_TIME**: execution time of the PL/pgSQL stored procedure • **PL_COMPILATION_TIME**: compilation time of the PL/pgSQL stored procedure • **NET_SEND_TIME**: time spent on the network. • **DATA_IO_TIME**: I/O time spent
value	bigint	Session value

7.3.13.218 PV_THREAD_MEMORY_CONTEXT

PV_THREAD_MEMORY_CONTEXT displays the memory usage of all threads based on the MemoryContext node. This view is equivalent to the **PV_SESSION_MEMORY_DETAIL** view when **enable_thread_pool** is set to **off**. For details about the columns, see **Table 7-503**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 7-503 PV_THREAD_MEMORY_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time and ID (string: *timestamp.sessionid*).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tid	bigint	Thread ID.
thrdtype	text	Thread type It can be any thread type in the system, such as wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

7.3.13.219 PV_TOTAL_MEMORY_DETAIL

PV_TOTAL_MEMORY_DETAIL displays statistics about memory usage of the current database node in the unit of MB. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable. For details about the columns, see **Table 7-504**.

Table 7-504 PV_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **max_process_memory**: memory occupied by a GaussDB cluster instance. • **process_used_memory**: memory occupied by a GaussDB process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak memory. • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_backend_memory**: maximum memory that can be used when the HA port is used to execute services. • **backend_used_memory**: memory that has been used when the HA port is used to execute services. • **high_backend_thread_memory**: memory used by high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **high_backend_thread_max_memory**: memory reserved for high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_memory**: memory used by medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_max_memory**: memory reserved for medium-priority threads. This is valid only when

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
		enable_threads_memory_reserve is set to **on**. • **low_backend_thread_memory**: memory used by low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_max_memory**: memory reserved for low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for the communications library. • **sctpcomm_used_memory**: memory used by the communications library. • **sctpcomm_peak_memory**: memory peak of the communications library. • **other_used_memory**: other used memory. • **llvm_used_memory**: memory occupied by the expression IR that is generated by Codegen and is not released.
memorymbytes	integer	Size of allocated memory-typed memory.

7.3.13.220 SYS_DUMMY

SYS_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. It is accessible to all users. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-505**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-505 SYS_DUMMY columns

Name	Type	Description
dummy	text	Expression calculation result

7.3.13.221 V_INSTANCE

V_INSTANCE displays instance information in current database. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-506**.

Table 7-506 V_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Host name
version	character varying(17)	Not supported yet. Its value is **NULL**.
version_legacy	character varying(17)	Not supported yet. Its value is **NULL**.
version_full	character varying(17)	Not supported yet. Its value is **NULL**.
startup_time	date	Not supported yet. Its value is **NULL**.
status	character varying(12)	Not supported yet. Its value is **NULL**.
parallel	character varying(3)	Not supported yet. Its value is **NULL**.
thread#	numeric	Not supported yet. Its value is **NULL**.
archiver	character varying(7)	Not supported yet. Its value is **NULL**.
log_switch_wait	character varying(15)	Not supported yet. Its value is **NULL**.
logins	character varying(10)	Not supported yet. Its value is **NULL**.
shutdown_pending	character varying(3)	Not supported yet. Its value is **NULL**.

edition	character varying(7)	Not supported yet. Its value is **NULL**.
family	character varying(80)	Not supported yet. Its value is **NULL**.
database_type	character varying(15)	Not supported yet. Its value is **NULL**.

7.3.13.222 V_MYSTAT

V_MYSTAT displays statistics about all sessions in the database. Only system administrators can access this view. Common users can access this view only after being authorized. This view exists in both the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-507**.

Table 7-507 V_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID.
statistic#	numeric	Not supported yet. Its value is **NULL**.
value	numeric	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.

7.3.13.223 V_SESSION

V_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access this view only after being authorized. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-508**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-508 V_SESSION columns

Name	Type	Description
saddr	raw	Not supported yet. Its value is **NULL**.
sid	bigint	Session ID.
serial#	integer	Sequence number of the active background thread, which is **0** in GaussDB
audsid	numeric	Not supported yet. Its value is **NULL**.
paddr	raw	Not supported yet. Its value is **NULL**.
schema#	numeric	Not supported yet. Its value is **NULL**.
schemaname	name	Name of the user logged in to the background.
user#	oid	OID of the user logged in to the background thread. The OID is **0** if the background thread is a global auxiliary thread.
username	name	Name of the user logged in to the background process. **username** is null if the background thread is a global auxiliary thread.
command	numeric	Not supported yet. Its value is **NULL**.
ownerid	numeric	Not supported yet. Its value is **NULL**.
taddr	character varying(16)	Not supported yet. Its value is **NULL**.
lockwait	character varying(16)	Not supported yet. Its value is **NULL**.
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	ID of a query statement.
client_info	text	Client information.
event	text	Queuing status of a statement. The value must be one of the following: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**.
program	text	Name of the application connected to the background.
status	text	Overall status of this background. The value must be one of the following: • **active**: The background is executing a query. • **idle**: The background is waiting for a new client command. • **idle in transaction**: The background is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The background is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The background is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this background.
server	character varying(9)	Not supported yet. Its value is **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
last_call_et	integer	Duration when the status of the current session changes last time.

wait_class	character varying(64)	Not supported yet. Its value is **NULL**.
wait_time	numeric	Not supported yet. Its value is **NULL**.
seconds_in_wait	numeric	Not supported yet. Its value is **NULL**.
state	character varying(19)	Not supported yet. Its value is **NULL**.
wait_time_micro	numeric	Not supported yet. Its value is **NULL**.
time_remaining_micro	numeric	Not supported yet. Its value is **NULL**.
time_since_last_wait_micro	numeric	Not supported yet. Its value is **NULL**.
service_name	character varying(64)	Not supported yet. Its value is **NULL**.
sql_trace	character varying(8)	Not supported yet. Its value is **NULL**.
sql_trace_waits	character varying(5)	Not supported yet. Its value is **NULL**.
sql_trace_binds	character varying(5)	Not supported yet. Its value is **NULL**.
sql_trace_plan_stats	character varying(10)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
session_edition_id	numeric	Not supported yet. Its value is **NULL**.
creator_addr	raw	Not supported yet. Its value is **NULL**.
creator_serial#	numeric	Not supported yet. Its value is **NULL**.
ecid	character varying(64)	Not supported yet. Its value is **NULL**.
sql_translation_profile_id	numeric	Not supported yet. Its value is **NULL**.
pga_tunable_mem	numeric	Not supported yet. Its value is **NULL**.
shard_ddl_status	character varying(8)	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.
external_name	character varying(1024)	Not supported yet. Its value is **NULL**.
plsql_debugger_connected	character varying(5)	Not supported yet. Its value is **NULL**.

NOTE

During database initialization, if the GUC parameter **mapping_date_to_datea** is set to **on**, the type of the **logon_time** column in the view is changed to **datea**.

7.3.13.224 V$GLOBAL_OPEN_CURSOR

V$GLOBAL_OPEN_CURSOR displays information about all opened cursors on all current nodes. For details about the columns, see **Table 7-509**.

Table 7-509 V$GLOBAL_OPEN_CURSOR columns

Name	Type	Description
node_name	name	Node name.
saddr	raw	Not supported yet. Its value is **NULL**.
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported yet. Its value is **NULL**.
hash_value	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_id	character varying(13)	ID of a query statement.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported yet. Its value is **NULL**. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
sql_exec_id	numeric	Not supported yet. Its value is **NULL**.
cursor_type	character varying(64)	Cursor type. • **OPEN-PL/SQL**: opened PL/SQL cursor. • **OPEN**: other open cursors.
child_address	raw	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.
dbid	oid	ID of the database to which the cursor belongs.

7.3.13.225 V$GLOBAL_TRANSACTION

V$GLOBAL_TRANSACTION displays information about currently active global transactions. By default, only users with the SYSADMIN permission can access the system view. Common users must be authorized to access the system view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-510**.

Table 7-510 V$GLOBAL_TRANSACTION columns

Name	Type	Description
formatid	numeric	Global transaction format identifier. Not supported yet. Its value is **NULL**.
globalid	raw	Global transaction identifier.
branchid	raw	Global transaction branch identifier. Not supported yet. Its value is **NULL**. Each individual transaction of a global transaction is called a branch.
branches	numeric	Total number of global transaction branches.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
refcount	numeric	Number of siblings for the global transaction (must be the same as branches).
preparecount	numeric	Number of prepared global transaction branches. If the value of **system_view_version** is greater than **0** and no prepared global transaction branch exists, the value is **0**. Otherwise, the value is **NULL**.
state	character varying(38)	Status of the global transaction branch.
flags	numeric	Numeric representation of the status.
coupling	character varying(15)	Specifies whether the branch is free (`FREE`), loosely coupled (`LOOSELY COUPLED`), or tightly coupled (TIGHTLY COUPLED). Not supported yet. Its value is **NULL**.
con_id	numeric	ID of the container related to data. Not supported. The value is **0**.

7.3.13.226 V$LOCK

V$LOCK displays information about locks held by open transactions. By default, only users with the SYSADMIN permission can access the system view. Common users must be authorized to access the system view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-511**.

Table 7-511 V$LOCK columns

Name	Type	Description
addr	raw	Not supported yet. Its value is **NULL**.
kaddr	raw	Not supported yet. Its value is **NULL**.
sid	numeric	ID of the session that owns the lock.
type	character varying(2)	TM or TX. • TM: corresponding relation lock in pg_locks. • TX: other locks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
id1	numeric	• TM lock: **relationId** corresponding to the object ID. • TX lock: not supported. The value is **0**.
id2	numeric	• TM lock: The default value is **0**. • TX lock: not supported. The value is **0**.
lmode	numeric	For details, see **Table 7-512**.
request	numeric	For details, see **Table 7-512**.
ctime	numeric	Not supported yet. Its value is **NULL**.
block	numeric	Specifies whether it is blocked by other sessions. **1**: blocked; **0**: not blocked.
con_id	numeric	Not supported yet. Its value is **NULL**.
blocksid	bigint	ID of another thread blocked by the current thread.

Table 7-512 Lock mode

Level	GaussDB
-	NULL
0	INVALID
1	AccessShare
2	RowShare
3	RowExclusive
4	ShareUpdateExclusive
5	Share
6	ShareRowExclusive
7	Exclusive
8	AccessExclusive

7.3.13.227 V$NLS_PARAMETERS

V$NLS_PARAMETERS displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-513**.

Table 7-513 V$NLS_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name.
value	character varying(64)	NLS parameter value.
con_id	numeric	Not supported. The value is **0**.

7.3.13.228 V$OPEN_CURSOR

V$OPEN_CURSOR displays information about cursors opened by all sessions on the current node. By default, only users with the SYSADMIN permission can access the system view. Common users must be authorized to access the system view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-514**.

Table 7-514 V$OPEN_CURSOR columns

Name	Type	Description
saddr	raw	Not supported yet. Its value is **NULL**.
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported yet. Its value is **NULL**.
hash_value	numeric	Not supported yet. Its value is **NULL**.
sql_id	character varying(13)	ID of a query statement.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported yet. Its value is **NULL**. **TIMESTAMP (0) WITHOUT TIME ZONE** is displayed in an O-compatible database.
sql_exec_id	numeric	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cursor_type	character varying(64)	Cursor type. • **OPEN-PL/SQL**: opened PL/SQL cursor. • **OPEN**: other open cursors.
child_address	raw	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported yet. Its value is **NULL**.
dbid	oid	ID of the database to which the cursor belongs.

7.3.13.229 V$SESSION_WAIT

V$SESSION_WAIT displays the current wait event or the last wait event of each session of each user. By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-515**.

Table 7-515 V$SESSION_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the **V$SESSION.SID** column.
seq#	numeric	Not supported yet. Its value is **NULL**.
event	character varying(64)	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64)	Not supported yet. Its value is **NULL**.
p1	numeric	Not supported yet. Its value is **NULL**.
p1raw	raw	Not supported yet. Its value is **NULL**.
p2text	character varying(64)	Not supported yet. Its value is **NULL**.
p2	numeric	Not supported yet. Its value is **NULL**.
p2raw	raw	Not supported yet. Its value is **NULL**.
p3text	character varying(64)	Not supported yet. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
p3	numeric	Not supported yet. Its value is **NULL**.
p3raw	raw	Not supported yet. Its value is **NULL**.
wait_class_id	numeric	Not supported yet. Its value is **NULL**.
wait_class#	numeric	Not supported yet. Its value is **NULL**.
wait_class	character varying(64)	Name of a wait event type
wait_time	numeric	If the session is waiting, the value is **0**. If the session is not waiting, the options are as follows: ● **>0**: duration of the last wait (unit: centisecond). ● **–1**: The duration of the last wait is less than a centisecond. ● **–2**: The **TIMED_STATISTICS** parameter is set to **false**. This column has been deprecated and replaced by **WAIT_TIME_MICRO** and **STATE**.
second_in_wait	numeric	If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started. This column has been deprecated and replaced by the **WAIT_TIME_MICRO** and **TIME_SINCE_LAST_WAIT_MICRO** columns.
state	character varying(64)	Waiting state. The options are as follows: ● **WAITING**: The session is waiting. ● **WAITED UNKNOWN TIME**: The duration of the last wait is unknown. This value is used when **TIMED_STATISTICS** is set to **false**. ● **WAITED SHORT TIME**: The duration of the last wait is less than a centisecond. ● **WAITED KNOWN TIME**: duration of the last wait specified in the **WAIT_TIME** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
wait_time_micro	numeric	Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.
time_remaining_micro	numeric	Not supported yet. Its value is **NULL**.
time_since_last_wait_micro	numeric	Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is **0**.
con_id	numeric	Not supported. The value is **0**.

7.3.13.230 V$SYSSTAT

V$SYSSTAT displays the resource usage of the entire database instance since the database instance is started. By default, only the initial user or MONADMIN can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in the PG_CATALOG and SYS schemas. Contact an administrator to enable the memory resource management function in the Arm environment. For details about the columns, see **Table 7-516**.

Table 7-516 V$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported yet. Its value is **NULL**.
value	numeric	Statistical item value.
stat_id	numeric	Not supported yet. Its value is **NULL**.
con_id	numeric	Not supported. The value is **0**.

7.3.13.231 V$SYSTEM_EVENT

V$SYSTEM_EVENT displays information about all the wait events (summary of each wait event since the instance is started). By default, only users with the SYSADMIN permission can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 7-517**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-517 V$SYSTEM_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events
total_waits_fg	numeric	Not supported yet. Its value is **NULL**.
total_timeouts_fg	numeric	Not supported yet. Its value is **NULL**.
time_waited_fg	numeric	Not supported yet. Its value is **NULL**.
average_wait_fg	numeric	Not supported yet. Its value is **NULL**.
time_waited_micro_fg	numeric	Not supported yet. Its value is **NULL**.
event_id	numeric	Not supported yet. Its value is **NULL**.
wait_class_id	numeric	Not supported yet. Its value is **NULL**.
wait_class#	numeric	Not supported yet. Its value is **NULL**.
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. The value is **0**.

7.3.13.232 V$VERSION

V$VERSION displays the version number of the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 7-518**.

Table 7-518 V$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
banner_full	character varying(160)	Database version and specific version number
banner_legacy	character varying(80)	Database version
con_id	numeric	Not supported. It is always **0**.

7.3.14 Deprecated System Views/System Catalogs

- The following views in GaussDB have been deprecated in the current version:
  - GS_IMCU_SLOT_STATUS
  - GS_IMCV_STATUS
  - GS_DATABASE_DETAILS
  - MTD_USER
- The following lists in GaussDB have been deprecated in the current version:
  - GS_PDB
  - GS_RESOURCE_PLANS
  - GS_RESOURCE_PLAN_DIRECTIVES

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8 Schemas

GaussDB describes the schemas of **Table 8-1**.

NOTE

Do not create service data of users in schemas that provide functional APIs. In addition, system objects such as functions and data types in these schemas cannot be depended on, including but not limited to tables and functions (such as dbe_* and pkg_*).

Table 8-1 Schemas supported in GaussDB

Schema	Description
blockchain	Stores the user history table that is automatically created when a tamper-proof table is created in the ledger database.
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and MONADMIN have permission to view views and functions in the **DBE_PERF** schema by default.
snapshot	Manages data related to WDR snapshots. By default, the initial user or MONADMIN can access the data.
sqladvsior	Recommends distribution keys. For details, see **Distribution Key Recommendation Functions**.
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
public	Public schema, which is used to store public objects. If **search_path** is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.
pkg_service	Manages information about the package service.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Schema	Description
pkg_util	Manages information about the package tool.
dbe_raw	Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package **dbe_session**, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package **dbe_match**, which is used to compare character string similarity.
dbe_task	Advanced function package **dbe_task**, which is used to schedule job tasks, including committing tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package **dbe_sql**, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package **dbe_file**, which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package **dbe_output**, which is used to print output information.
dbe_random	Advanced function package **dbe_random**, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package **dbe_application_info**, which is used for recording client information.
dbe_utility	Advanced function package **dbe_utility**, which is used to call the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package **dbe_scheduler**, which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_sql_util	SQL O&M function, including the O&M API of SQL patches.
dbe_xmlgen	Advanced function package **dbe_xmlgen**, which is used to convert query results into XML character strings.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Schema	Description
dbe_describe	Advanced function package **dbe_describe**, which is used to query parameter information about stored procedures or functions.
dbe_stats	Advanced function package **dbe_stats**, which is used to manage statistics.

Table 8-2 Schemas disabled in GaussDB

Schema	Description
dbe_pldebugger	Debugs PL/SQL functions and stored procedures. Currently, this view is not supported. An error message "unsupported" is displayed when the API is called in this view.
db4ai	Manages data of different versions in AI training.

8.1 Information Schema

An information schema named INFORMATION_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint_table_usage, domain_constraints, domain_udt_usage, domains, enabled_roles, key_column_usage, parameters, referential_constraints, applicable_roles, administrable_role_authorizations, attributes, character_sets, check_constraint_routine_usage, check_constraints, collations, collation_character_set_applicability, column_domain_usage, column_privileges, column_udt_usage, columns, constraint_column_usage, role_column_grants, routine_privileges, role_routine_grants, routines, schemata, sequences, table_constraints, table_privileges, role_table_grants, tables, triggered_update_columns, udt_privileges, role_udt_grants, usage_privileges, role_usage_grants, user_defined_types, view_column_usage, view_routine_usage, view_table_usage, views, data_type_privileges, element_types, column_options, foreign_data_wrapper_options, foreign_data_wrappers, foreign_server_options, foreign_servers, foreign_table_options, foreign_tables, user_mapping_options, user_mappings, sql_features, sql_implementation_info, sql_languages, sql_packages, sql_parts, sql_sizing, and sql_sizing_profiles.

The following sections display only the views that are not listed in the preceding description.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Only the initial user can rebuild views in the information_schema schema using the CREATE OR REPLACE syntax. Exercise caution when performing this operation because unauthorized operations may occur. For example, if a user-defined function is bound to the definition of a rebuilt view, it may be used for privilege escalation.

8.1.1 INFORMATION_SCHEMA._PG_FOREIGN_DATA_WRAPPERS

Displays information about a foreign data wrapper, as described in **Table 8-3**. Only the SYSADMIN user has the permission to view this view.

Table 8-3 INFORMATION_SCHEMA._PG_FOREIGN_DATA_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign data wrapper.
fdwowner	oid	OID of the owner of the foreign data wrapper.
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of *keyword*=*value*.
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign data wrapper.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign data wrapper.
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign data wrapper.

8.1.2 INFORMATION_SCHEMA._PG_FOREIGN_SERVERS

Displays information about a foreign server, as described in **Table 8-4**. Only the SYSADMIN user has the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-4 INFORMATION_SCHEMA._PG_FOREIGN_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server.
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of *keyword*=*value*.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign data wrapper.
foreign_server_type	information_schema.character_data	Type of the foreign server.
foreign_server_version	information_schema.character_data	Version of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server.

8.1.3 INFORMATION_SCHEMA._PG_FOREIGN_TABLE_COLUMNS

Displays column information about a foreign table, as described in **Table 8-5**. Only the SYSADMIN user has the permission to view this view.

Table 8-5 INFORMATION_SCHEMA._PG_FOREIGN_TABLE_COLUMNS columns

Name	Type	Description
nspname	name	Schema name.
relname	name	Table name.
attname	name	Column name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attfdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of *keyword*=*value*.

8.1.4 INFORMATION_SCHEMA._PG_FOREIGN_TABLES

Stores information about all foreign tables defined in the current database, as described in **Table 8-6**, whereas displays information about foreign tables accessible to the current user. Only the SYSADMIN user has the permission to view this view.

Table 8-6 INFORMATION_SCHEMA._PG_FOREIGN_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database).
foreign_table_schema	name	Name of the schema that the foreign table is in.
foreign_table_name	name	Name of the foreign table.
ftoptions	text[]	Foreign table options.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner.

8.1.5 INFORMATION_SCHEMA._PG_USER_MAPPINGS

Stores mappings from local users to remote users, as described in **Table 8-7**. Only the SYSADMIN user has the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-7 INFORMATION_SCHEMA._PG_USER_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user.
umoptions	text[]	User mapping specific options, expressed in a string in the format of *keyword*=*value*.
umuser	oid	OID of the local user being mapped (**0** if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
srvowner	information_schema.sql_identifier	Owner of the foreign server.

8.1.6 INFORMATION_SCHEMA.INFORMATION_SCHEMA_CATALOG_NAME

Displays the name of the current database, as described in **Table 8-8**.

Table 8-8 INFORMATION_SCHEMA.INFORMATION_SCHEMA_CATALOG_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name.

8.1.7 INFORMATION_SCHEMA.TRIGGERS

Displays all triggers defined on the tables and views in the current database. Only the triggers owned by the current user or those on which the current user has permissions other than SELECT are displayed, as shown in **Table 8-9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-9 INFORMATION_SCHEMA.TRIGGERS columns

Name	Type	Description
trigger_catalog	information_schema.sql_identifier	Name of the database that contains the trigger.
trigger_schema	information_schema.sql_identifier	Name of the schema that contains the trigger.
trigger_name	information_schema.sql_identifier	Trigger name.
event_manipulation	information_schema.character_data	Type of the event that triggers the trigger. The value can be **INSERT**, **UPDATE**, or **DELETE**.
event_object_catalog	information_schema.sql_identifier	Name of the database that contains the table where the trigger is located.
event_object_schema	information_schema.sql_identifier	Name of the schema that contains the table where the trigger is located.
event_object_table	information_schema.sql_identifier	Name of the table where the trigger is located.
action_order	information_schema.cardinal_number	Trigger sequence of triggers with the same **event_manipulation**, **action_timing** and **action_orientation** in the same table.
action_condition	information_schema.character_data	WHEN condition of a trigger. By default, this column is left blank.
action_statement	information_schema.character_data	Statement executed by the trigger.
action_orientation	information_schema.character_data	Specifies whether the trigger fires once for each row being processed or once for each statement.
action_timing	information_schema.character_data	Specifies when the trigger fires. The value can be **BEFORE**, **AFTER**, or **INSTEAD OF**.
action_reference_old_table	information_schema.sql_identifier	This parameter is meaningless and is left blank.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_reference_new_table	information_schema.sql_identifier	This parameter is meaningless and is left blank.
action_reference_old_row	information_schema.sql_identifier	This parameter is meaningless and is left blank.
action_reference_new_row	information_schema.sql_identifier	This parameter is meaningless and is left blank.
created	information_schema.time_stamp	This parameter is meaningless and is left blank.

NOTE

INFORMATION_SCHEMA.TRIGGERS displays only triggers whose event types are INSERT, UPDATE, and DELETE. Triggers whose event type is TRUNCATE are not displayed.

8.2 DBE_PERF Schema

In the DBE_PERF schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After a database is installed, only the initial user and users with the MONADMIN permission have permissions to view views and functions in this schema by default. To ensure compatibility with earlier versions, the permission on the dbe_perf schema has no change before and after an upgrade. In the current version, all users are not allowed to create operators in this schema. Existing operators are not affected. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- A view starting with **GLOBAL_** requests data from a CN or DN and returns the data without processing the data.
- A view starting with **SUMMARY_** summarizes data in a cluster. In most cases, data from a CN or DN (sometimes only a CN) is processed, aggregated, and returned.
- A view that does not start with **GLOBAL_** or **SUMMARY_** is a local view and does not request data from any other CN or DN.

8.2.1 OS

8.2.1.1 DBE_PERF.OS_RUNTIME

Displays the running status of the current OS, as described in **Table 8-10**.

Table 8-10 DBE_PERF.OS_RUNTIME columns

Name	Type	Description
id	integer	ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

8.2.1.2 DBE_PERF.GLOBAL_OS_RUNTIME

Provides OS running status information about all normal nodes in the entire cluster, as described in **Table 8-11**.

Table 8-11 DBE_PERF.GLOBAL_OS_RUNTIME columns

Name	Type	Description
node_name	name	Node name.
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

8.2.1.3 DBE_PERF.OS_THREADS

Provides status information about all threads on the current node, as described in **Table 8-12**.

Table 8-12 DBE_PERF.OS_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process.
lwpid	integer	Lightweight thread ID corresponding to the PID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.
dbid	oid	ID of the database to which the thread belongs.

8.2.1.4 DBE_PERF.GLOBAL_OS_THREADS

Provides thread status for all normal nodes in the entire cluster, as outlined in **Table 8-13**.

Table 8-13 DBE_PERF.GLOBAL_OS_THREADS columns

Name	Type	Description
node_name	text	Node name.
pid	bigint	ID of the thread running within the current node process.
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.
dbid	oid	ID of the database to which the thread belongs.

8.2.1.5 DBE_PERF.PERF_QUERY

Provides the name, tree structure, and percentage of the stack information collected on the current node, as described in **Table 8-14**. The MONADMIN permission is required.

Before using this view to query stack information, you need to execute the gs_perf_start function to collect flame graph data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-14 DBE_PERF.PERF_QUERY columns

Name	Type	Description
backtrace	text	Text of the stack information tree structure.
overhead	double precision	Percentage of the time occupied by the current stack information in the entire stack collection process.

8.2.1.6 DBE_PERF.SHAKING_COLLECT_STATUS

If this view is queried on a CN, the performance jitter monitoring status of all nodes is returned. If this view is queried on a DN, the performance jitter status of the current instance is returned. The MONADMIN permission is required. **Table 8-15** displays the monitoring status. When some shards are upgraded, this view is unavailable.

Table 8-15 Return values of DBE_PERF.SHAKING_COLLECT_STATUS

Name	Type	Description
nodename	text	Node name.
status	text	Specifies whether performance jitter monitoring has been enabled on the host where the node is located. • **NOT IN SHAKE MODE**: The monitoring is not enabled. • **IN SHAKE MODE**: The monitoring is enabled. • **NO PERF SERVICE**: The collection process does not respond. • Unexpected Result: get_shaking_connect_status error. **Detail**: Error details, indicating the query fails.

8.2.2 Instance

8.2.2.1 DBE_PERF.INSTANCE_TIME

Provides various time consumption information under the current cluster node, as described in **Table 8-16**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-16 DBE_PERF.INSTANCE_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID.
stat_name	text	Type name. • DB_TIME: effective time spent by jobs in multi-core scenarios. • CPU_TIME: CPU time cost. • EXECUTION_TIME: time spent in the executor. • PARSE_TIME: time spent on parsing SQL statements. • PLAN_TIME: time spent on generating plans. • REWRITE_TIME: time spent on rewriting SQL statements. • PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure. • PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure. • NET_SEND_TIME: time spent on the network. • DATA_IO_TIME: time spent on I/Os.
value	bigint	Time value (unit: μs).

8.2.2.2 DBE_PERF.GLOBAL_INSTANCE_TIME

Provides various time consumption information under all normal nodes in the entire cluster, as described in **Table 8-17**.

Table 8-17 DBE_PERF.GLOBAL_INSTANCE_TIME columns

Name	Type	Description
node_name	name	Node name.
stat_id	integer	Statistics ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stat_name	text	Type name. • DB_TIME: effective time spent by jobs in multi-core scenarios. • CPU_TIME: CPU time cost. • EXECUTION_TIME: time spent in the executor. • PARSE_TIME: time spent on parsing SQL statements. • PLAN_TIME: time spent on generating plans. • REWRITE_TIME: time spent on rewriting SQL statements. • PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure. • PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure. • NET_SEND_TIME: time spent on the network. • DATA_IO_TIME: time spent on I/Os.
value	bigint	Time value (unit: μs).

8.2.3 Memory

8.2.3.1 DBE_PERF.MEMORY_NODE_DETAIL

Displays memory usage of a node in the database, as shown in **Table 8-18**.

Table 8-18 DBE_PERF.MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak value of the memory. • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **high_backend_thread_memory**: memory used by high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **high_backend_thread_max_memory**: memory reserved for high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_memory**: memory used by medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_max_memory**: memory reserved for medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_memory**: memory used by low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_max_memory**: memory reserved for low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication. • **sctpcomm_used_memory**: used memory for TCP proxy communication. • **sctpcomm_peak_memory**: memory peak of TCP proxy communication.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
		• **other_used_memory**: other used memory. • **gpu_max_dynamic_memory**: maximum dynamic GPU memory. • **gpu_dynamic_used_memory**: used dynamic GPU memory. • **gpu_dynamic_peak_memory**: dynamic peak GPU memory. • **pooler_conn_memory**: memory allocated to the connection pool. • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool. • **storage_compress_memory**: memory used by the storage module for compression. • **udf_reserved_memory**: reserved memory for the UDF.
memorymbytes	integer	Size of the used memory in the unit of MB.

8.2.3.2 DBE_PERF.GLOBAL_MEMORY_NODE_DETAIL

Displays the memory usage on all normal nodes in the cluster, as described in **Table 8-19**.

Table 8-19 DBE_PERF.GLOBAL_MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak value of the memory. • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **high_backend_thread_memory**: memory used by high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **high_backend_thread_max_memory**: memory reserved for high-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_memory**: memory used by medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **medium_backend_thread_max_memory**: memory reserved for medium-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_memory**: memory used by low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **low_backend_thread_max_memory**: memory reserved for low-priority threads. This is valid only when **enable_threads_memory_reserve** is set to **on**. • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication. • **sctpcomm_used_memory**: used memory for TCP proxy communication. • **sctpcomm_peak_memory**: memory peak of TCP proxy communication.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
		• **other_used_memory**: other used memory. • **gpu_max_dynamic_memory**: maximum dynamic GPU memory. • **gpu_dynamic_used_memory**: used dynamic GPU memory. • **gpu_dynamic_peak_memory**: dynamic peak GPU memory. • **pooler_conn_memory**: memory allocated to the connection pool. • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool. • **storage_compress_memory**: memory used by the storage module for compression. • **udf_reserved_memory**: reserved memory for the UDF.
memorymbytes	integer	Size of the used memory in the unit of MB.

8.2.3.3 DBE_PERF.MEMORY_NODE_NG_DETAIL

Table 8-20 describes the memory usage of a node group.

Table 8-20 DBE_PERF.MEMORY_NODE_NG_DETAIL columns

Name	Type	Description
ngname	text	Node group name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **ng_total_memory**: total memory configured in the node group. • **ng_used_memory**: used memory. • **ng_estimate_memory**: memory used by the optimizer for evaluation. • **ng_foreignrp_memsize**: memory configured in the foreign resource pool. • **ng_foreignrp_usedsize**: memory used by the foreign resource pool. • **ng_foreignrp_peaksize**: peak memory used by the foreign resource pool. • **ng_foreignrp_mempct**: percentage of the system memory configured in attributes of the foreign resource pool. • **ng_foreignrp_estmsize**: memory used by the optimizer for job evaluation in the foreign resource pool.
memorymbytes	integer	Size of the used memory in the unit of MB.

8.2.3.4 DBE_PERF.SHARED_MEMORY_DETAIL

Displays the usage information about shared memory contexts on the current node, as shown in **Table 8-21**.

Table 8-21 DBE_PERF.SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).
usedsize	bigint	Used size of the shared memory (unit: byte).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.3.5 DBE_PERF.GLOBAL_SHARED_MEMORY_DETAIL

Displays the usage information about shared memory contexts on all normal nodes in the entire cluster, as described in **Table 8-22**.

Table 8-22 DBE_PERF.GLOBAL_SHARED_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name.
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).
usedsize	bigint	Used size of the shared memory (unit: byte).

8.2.3.6 DBE_PERF.TRACK_MEMORY_CONTEXT_DETAIL

Queries the detailed memory allocation information about the memory context set by DBE_PERF.TRACK_MEMORY_CONTEXT, as described in **Table 8-23**. Only the initial user or a user with the MONADMIN permission can query this view.

Table 8-23 DBE_PERF.TRACK_MEMORY_CONTEXT_DETAIL columns

Name	Type	Description
context_name	text	Name of the memory context.
file	text	File to which the memory allocation location belongs.
line	integer	Line number of the memory allocation location.
size	bigint	Total size of memory that is applied for (unit: byte).

8.2.4 File

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.4.1 DBE_PERF.FILE_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations, as described in **Table 8-24**.

Table 8-24 DBE_PERF.FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: μs).
writetim	bigint	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

8.2.4.2 DBE_PERF.SUMMARY_FILE_IOSTAT

Records the summary of statistics about data file I/Os of each node in the cluster to reflect performance issues such as exceptions in I/O operations, as described in **Table 8-25**.

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-25 DBE_PERF.SUMMARY_FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
readtim	numeric	Total duration of reading (unit: μs).
writetim	numeric	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

8.2.4.3 DBE_PERF.GLOBAL_FILE_IOSTAT

Displays statistics about data file I/Os on all nodes in the cluster, as described in **Table 8-26**.

Table 8-26 DBE_PERF.GLOBAL_FILE_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: μs).
writetim	bigint	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

8.2.4.4 DBE_PERF.FILE_REDO_IOSTAT

Records statistics about redo logs (WALs) on the current node, as described in **Table 8-27**.

Table 8-27 DBE_PERF.FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). The value is **writetim** divided by **phywrts**.
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

8.2.4.5 DBE_PERF.SUMMARY_FILE_REDO_IOSTAT

Records redo log (WAL) statistics of all nodes in the cluster, as described in **Table 8-28**. The values of the **phywrts**, **phyblkwrt**, and **writetim** columns are accumulated based on the data of each node. The value of **avgiotim** is the average value of each node (summed up **writetim** or **phywrts**). The values of **lstiotim** and **maxiowtm** are the maximum values of each node, and the value of **miniotim** is the minimum value of each node.

Table 8-28 DBE_PERF.SUMMARY_FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer.
phyblkwrt	numeric	Number of blocks written into the WAL buffer.
writetim	numeric	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). The value is **writetim** divided by **phywrts**.
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

8.2.4.6 DBE_PERF.GLOBAL_FILE_REDO_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the cluster, as described in **Table 8-29**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-29 DBE_PERF.GLOBAL_FILE_REDO_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). The value is **writetim** divided by **phywrts**.
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

8.2.4.7 DBE_PERF.LOCAL_REL_IOSTAT

Displays the accumulated I/O status of all data files on the current node, as described in **Table 8-30**.

Table 8-30 DBE_PERF.LOCAL_REL_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
dbid	oid	In the current version, the value is always **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.4.8 DBE_PERF.SUMMARY_REL_IOSTAT

Obtains statistics about data file I/Os on all nodes, as described in **Table 8-31**.

Table 8-31 DBE_PERF.SUMMARY_REL_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
dbid	oid	In the current version, the value is always **0**.

8.2.4.9 DBE_PERF.GLOBAL_REL_IOSTAT

Obtains statistics about data file I/Os on all nodes in the cluster, as described in **Table 8-32**.

Table 8-32 DBE_PERF.GLOBAL_REL_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
dbid	oid	In the current version, the value is always **0**.

8.2.5 Object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.1 DBE_PERF.STAT_USER_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node, as described in **Table 8-33**.

Table 8-33 DBE_PERF.STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.2 DBE_PERF.SUMMARY_STAT_USER_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas on each node of a cluster. It is used on the CN. The status information about user-defined ordinary tables on each DN is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 8-34**.

Table 8-34 DBE_PERF.SUMMARY_STAT_USER_TABLES

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	numeric	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.

8.2.5.3 DBE_PERF.GLOBAL_STAT_USER_TABLES

Displays the status of user-defined ordinary tables in all schemas on each node in cluster. It is used on CNs. The status information about user-defined ordinary tables on each DN is displayed but not summed up, as described in **Table 8-35**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-35 DBE_PERF.GLOBAL_STAT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

8.2.5.4 DBE_PERF.STAT_USER_INDEXES

Displays the index status information about the user-defined ordinary tables on the current node, as described in **Table 8-36**.

Table 8-36 DBE_PERF.STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.5 DBE_PERF.SUMMARY_STAT_USER_INDEXES

Displays the sum of the index status of user-defined ordinary tables in all schemas on each node of a cluster. It applies to CNs only and the index status information about user-defined ordinary tables on each CN is summed up, as described in **Table 8-37**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-37 DBE_PERF.SUMMARY_STAT_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

8.2.5.6 DBE_PERF.GLOBAL_STAT_USER_INDEXES

Displays the index status information about user-defined ordinary tables in all schemas on each node of the cluster. The information is about CNs and DNs. It is used on CNs and information is not summed up, as described in **Table 8-38**.

Table 8-38 DBE_PERF.GLOBAL_STAT_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.7 DBE_PERF.STAT_SYS_TABLES

Displays status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas on the current node, as described in Table 8-39.

Table 8-39 DBE_PERF.STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting VACUUM FULL).
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.8 DBE_PERF.SUMMARY_STAT_SYS_TABLES

Displays the sum of status of all system catalogs in the pg_catalog, information_schema, and pg_toast schemas on each node in the cluster. The statistics are used on CNs and include data on CNs and DNs. The status information in the system catalog on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 8-40**.

Table 8-40 DBE_PERF.SUMMARY_STAT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	numeric	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.

8.2.5.9 DBE_PERF.GLOBAL_STAT_SYS_TABLES

Displays the status information of all system catalogs in pg_catalog, information_schema, and pg_toast modes on each node in the cluster. The status information includes that of CNs and DNs. It is used on CNs and is not summed up, as described in **Table 8-41**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-41 DBE_PERF.GLOBAL_STAT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

8.2.5.10 DBE_PERF.STAT_SYS_INDEXES

Displays index status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas, as described in **Table 8-42**.

Table 8-42 DBE_PERF.STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.11 DBE_PERF.SUMMARY_STAT_SYS_INDEXES

Displays the sum of index status statistics of all system catalogs in the pg_catalog, information_schema, and pg_toast schemas on each node in the cluster. It is used on CNs and the index status information of system catalogs on each node is summed up, as described in **Table 8-43**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-43 DBE_PERF.SUMMARY_STAT_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

8.2.5.12 DBE_PERF.GLOBAL_STAT_SYS_INDEXES

Displays the index status information of all system catalogs in pg_catalog, information_schema, and pg_toast schemas on each node in the cluster. The index status information is about CNs and DNs. It is used on CNs and information is not summed up, as described in **Table 8-44**.

Table 8-44 DBE_PERF.GLOBAL_STAT_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.13 DBE_PERF.STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) of the current node in the database, as described in **Table 8-45**.

Table 8-45 DBE_PERF.STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.14 DBE_PERF.SUMMARY_STAT_ALL_TABLES

Displays the sum of the status information of each table (including the TOAST table) on each node in the cluster. It is used on the CN. The status information in the table on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 8-46**.

Table 8-46 DBE_PERF.SUMMARY_STAT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

8.2.5.15 DBE_PERF.GLOBAL_STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) on each node in the cluster. It is used on CNs and the status of each table on each node is not summed up, as described in **Table 8-47**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-47 DBE_PERF.GLOBAL_STAT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autovacuum_count	bigint	Number of times that the table is vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

8.2.5.16 DBE_PERF.STAT_ALL_INDEXES

Displays the access information about each index of the current node in the database, as described in **Table 8-48**.

Table 8-48 DBE_PERF.STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.5.17 DBE_PERF.SUMMARY_STAT_ALL_INDEXES

Displays the sum of access statistics of each index on each database node in a cluster. It is used on CNs. The access statistics of each node index are summed up.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The timestamp column is not summed up, and only the latest value of the column on all nodes is used, as described in **Table 8-49**.

Table 8-49 DBE_PERF.SUMMARY_STAT_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

8.2.5.18 DBE_PERF.GLOBAL_STAT_ALL_INDEXES

Displays the access information about each index on each node of the database in the cluster. It is used on the CN. The status information of each index on each node is not summed up, as described in **Table 8-50**.

Table 8-50 DBE_PERF.GLOBAL_STAT_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

8.2.5.19 DBE_PERF.STAT_DATABASE

Displays the statistics of the current node in the database, as described in **Table 8-51**.

Table 8-51 DBE_PERF.STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of the database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **DBE_PERF.STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

8.2.5.20 DBE_PERF.SUMMARY_STAT_DATABASE

Sums up node status information in the cluster. (It is used on CNs. The node status information in the database is summed up by database name. However, columns of a timestamp type are not summed up; instead, only their latest values are obtained from all nodes.) **Table 8-52** describe related columns.

Table 8-52 DBE_PERF.SUMMARY_STAT_DATABASE columns

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **DBE_PERF.STAT_DATABASE_CONFLICTS**.
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.21 DBE_PERF.GLOBAL_STAT_DATABASE

Displays the statistics of each node in the cluster, as described in **Table 8-53**. (It is used on CNs and the status statistics of each database are not summed up.)

Table 8-53 DBE_PERF.GLOBAL_STAT_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	OID of the database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **DBE_PERF.STAT_DATABASE_CONFLICTS**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

8.2.5.22 DBE_PERF.STAT_DATABASE_CONFLICTS

Displays statistics about the conflict status of the current node in the database, as described in **Table 8-54**.

Table 8-54 DBE_PERF.STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.23 DBE_PERF.SUMMARY_STAT_DATABASE_CONFLICTS

Displays the sum of conflict status statistics of each node in the cluster. It is used on CNs and the conflict status statistics of each node are summed up by database name, as described in **Table 8-55**.

Table 8-55 DBE_PERF.SUMMARY_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

8.2.5.24 DBE_PERF.GLOBAL_STAT_DATABASE_CONFLICTS

Displays statistics about the conflict status of each node in the cluster. It is used on CNs and the status information of each database node is not summed up, as described in **Table 8-56**.

Table 8-56 DBE_PERF.GLOBAL_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.25 DBE_PERF.STAT_XACT_ALL_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in schemas on the current node, as described in **Table 8-57**.

Table 8-57 DBE_PERF.STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.26 DBE_PERF.SUMMARY_STAT_XACT_ALL_TABLES

Displays the sum of transaction status of all ordinary tables and TOAST tables in schemas of each node in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 8-58**.

Table 8-58 DBE_PERF.SUMMARY_STAT_XACT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.27 DBE_PERF.GLOBAL_STAT_XACT_ALL_TABLES

Displays the transaction status information of all ordinary tables and TOAST tables in the schemas of each node in the cluster, as described in **Table 8-59**. (It is used on CNs. The transaction status information of the same table name on different nodes is not summed up.)

Table 8-59 DBE_PERF.GLOBAL_STAT_XACT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.28 DBE_PERF.STAT_XACT_SYS_TABLES

Displays transaction status information about the system catalogs in the schemas of the current node, as described in **Table 8-60**.

Table 8-60 DBE_PERF.STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.29 DBE_PERF.SUMMARY_STAT_XACT_SYS_TABLES

Displays the sum of the transaction status of system catalogs in schemas on each node in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 8-61**.

Table 8-61 DBE_PERF.SUMMARY_STAT_XACT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.30 DBE_PERF.GLOBAL_STAT_XACT_SYS_TABLES

Displays the transaction status information of the system catalogs in the schemas of each node in the cluster, as described in **Table 8-62**. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

Table 8-62 DBE_PERF.GLOBAL_STAT_XACT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.31 DBE_PERF.STAT_XACT_USER_TABLES

Displays transaction status information about the user tables in schemas on the current node, as described in **Table 8-63**.

Table 8-63 DBE_PERF.STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.32 DBE_PERF.SUMMARY_STAT_XACT_USER_TABLES

Displays the sum of the transaction status of user tables in schemas on each node in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 8-64**.

Table 8-64 DBE_PERF.SUMMARY_STAT_XACT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

8.2.5.33 DBE_PERF.GLOBAL_STAT_XACT_USER_TABLES

Displays the transaction status information of the user tables in the schemas of each node in the cluster, as described in **Table 8-65**. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

Table 8-65 DBE_PERF.GLOBAL_STAT_XACT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.34 DBE_PERF.STAT_XACT_USER_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node, as described in **Table 8-66**.

Table 8-66 DBE_PERF.STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

8.2.5.35 DBE_PERF.SUMMARY_STAT_XACT_USER_FUNCTIONS

Displays the summary of function execution statistics in the current transaction on each node in the cluster, as described in **Table 8-67**. (It is used on CNs.)

Table 8-67 DBE_PERF.SUMMARY_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

8.2.5.36 DBE_PERF.GLOBAL_STAT_XACT_USER_FUNCTIONS

Displays statistics about function execution in the current transaction on each node in the cluster, as described in **Table 8-68**. (It is used on CNs.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-68 DBE_PERF.GLOBAL_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

8.2.5.37 DBE_PERF.STAT_BAD_BLOCK

Obtains the information about table and index read failures on the current node, as described in **Table 8-69**.

Table 8-69 DBE_PERF.STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship filenode.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

8.2.5.38 DBE_PERF.SUMMARY_STAT_BAD_BLOCK

Obtains the sum of the table and index read failure information on each node in the cluster, as described in **Table 8-70**. It is used on CNs. The statistics of different

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DNs is summed up. The value of **first_time** is the statistics collection start time, and the value of **last_time** is the statistics collection end time.

Table 8-70 DBE_PERF.SUMMARY_STAT_BAD_BLOCK columns

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship filenode.
forknum	bigint	Fork number.
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

8.2.5.39 DBE_PERF.GLOBAL_STAT_BAD_BLOCK

Obtains information about table and index read failures on each node in the cluster, as described in **Table 8-71**. It is used on CNs. The read failure information of DNs is displayed only, but not summed up.

Table 8-71 DBE_PERF.GLOBAL_STAT_BAD_BLOCK columns

Name	Type	Description
node_name	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship filenode.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.40 DBE_PERF.STAT_USER_FUNCTIONS

Displays statistics about user-defined functions (the function language is not an internal language) in all the schemas of the current node, as described in **Table 8-72**.

Table 8-72 DBE_PERF.STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Schema name.
funcname	name	User-defined function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

8.2.5.41 DBE_PERF.SUMMARY_STAT_USER_FUNCTIONS

Displays the sum of statistics about user-defined functions on each node in the cluster. It is used on CNs and the status information of user-defined functions on each node is summed up by function name, as described in **Table 8-73**.

Table 8-73 DBE_PERF.SUMMARY_STAT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	User-defined function name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.5.42 DBE_PERF.GLOBAL_STAT_USER_FUNCTIONS

Displays statistics about user-defined functions on each node in the cluster, as described in **Table 8-74**. (It is used on CNs. Status information about functions with the same name on different nodes is not summed up.)

Table 8-74 DBE_PERF.GLOBAL_STAT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	User-defined function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

8.2.6 Workload

8.2.6.1 DBE_PERF.WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on the current node, as described in **Table 8-75**.

Table 8-75 DBE_PERF.WORKLOAD_SQL_COUNT columns

Name	Type	Description
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
dbid	oid	ID of the database to which the statistics belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.
fqs_count	bigint	Number of Fast Query Shipping (FQS) statements. The statistical result contains the FQS statements executed by users and the FQS statements executed by the database background thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lightproxy_count	bigint	Number of lightweight CN statements. The statistical result contains the lightweight CN statements executed by users and the lightweight CN statements executed by the database background thread.
stream_count	bigint	Number of stream statements. The statistical result contains the stream statements executed by users and the stream statements executed by the database background thread.
pgxc_count	bigint	Number of PGXC statements. The statistical result contains the PGXC statements executed by users and the stream statements executed by the database background thread.

8.2.6.2 DBE_PERF.SUMMARY_WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on each CN in the cluster, as described in **Table 8-76**.

Table 8-76 DBE_PERF.SUMMARY_WORKLOAD_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
dbid	oid	ID of the database to which the statistics belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.
fqs_count	bigint	Number of Fast Query Shipping (FQS) statements. The statistical result contains the FQS statements executed by users and the FQS statements executed by the database background thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lightproxy_count	bigint	Number of lightweight CN statements. The statistical result contains the lightweight CN statements executed by users and the lightweight CN statements executed by the database background thread.
stream_count	bigint	Number of stream statements. The statistical result contains the stream statements executed by users and the stream statements executed by the database background thread.
pgxc_count	bigint	Number of PGXC statements. The statistical result contains the PGXC statements executed by users and the PGXC statements executed by the database background thread.

8.2.6.3 DBE_PERF.WORKLOAD_TRANSACTION

Displays information about transactions loaded on the current node, as described in **Table 8-77**.

Table 8-77 DBE_PERF.WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dist_commit_counter	bigint	Number of distributed transactions that are committed.
dist_rollback_counter	bigint	Number of distributed transactions that are rolled back.
dist_resp_min	bigint	Minimum response time of distributed transactions (unit: μs).
dist_resp_max	bigint	Maximum response time of distributed transactions (unit: μs).
dist_resp_avg	bigint	Average response time of distributed transactions (unit: μs).
dist_resp_total	bigint	Total response time of distributed transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

NOTE

Only the information about the main transaction is collected. The information about the sub-transaction is not collected.

8.2.6.4 DBE_PERF.SUMMARY_WORKLOAD_TRANSACTION

Displays the information about transactions in the cluster, as described in **Table 8-78**.

Table 8-78 DBE_PERF.SUMMARY_WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	numeric	Number of user transactions committed.
rollback_counter	numeric	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	numeric	Total response time of user transactions (unit: μs).
bg_commit_counter	numeric	Number of background transactions committed.
bg_rollback_counter	numeric	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	numeric	Total response time of background transactions (unit: μs).
dist_commit_counter	bigint	Number of distributed transactions that are committed.
dist_rollback_counter	bigint	Number of distributed transactions that are rolled back.
dist_resp_min	bigint	Minimum response time of distributed transactions (unit: μs).
dist_resp_max	bigint	Maximum response time of distributed transactions (unit: μs).
dist_resp_avg	bigint	Average response time of distributed transactions (unit: μs).
dist_resp_total	bigint	Total response time of distributed transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

NOTE

Only the information about the main transaction is collected. The information about the sub-transaction is not collected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.6.5 DBE_PERF.GLOBAL_WORKLOAD_TRANSACTION

Displays workload information on each node in the cluster, as described in **Table 8-79**.

Table 8-79 DBE_PERF.GLOBAL_WORKLOAD_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dist_commit_counter	bigint	Number of distributed transactions that are committed.
dist_rollback_counter	bigint	Number of distributed transactions that are rolled back.
dist_resp_min	bigint	Minimum response time of distributed transactions (unit: μs).
dist_resp_max	bigint	Maximum response time of distributed transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dist_resp_avg	bigint	Average response time of distributed transactions (unit: μs).
dist_resp_total	bigint	Total response time of distributed transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

NOTE

Only the information about the main transaction is collected. The information about the sub-transaction is not collected.

8.2.6.6 DBE_PERF.WORKLOAD_SQL_ELAPSE_TIME

Collects statistics about the select, update, insert, and delete (SUID) operations on (service) workloads, as described in **Table 8-80**.

Table 8-80 DBE_PERF.WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
workload	name	Service workload name.
total_select_elapse	bigint	Total time spent on SELECT statements (unit: μs)
max_select_elapse	bigint	Maximum time spent on SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum time spent on SELECT statements (unit: μs).
avg_select_elapse	bigint	Average time spent on SELECT statements (unit: μs).
total_update_elapse	bigint	Total time spent on UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum time spent on UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum time spent on UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average time spent on UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total time spent on INSERT statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_insert_elapse	bigint	Maximum time spent on INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum time spent on INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average time spent on INSERT statements (unit: μs).
total_delete_elapse	bigint	Total time spent on DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum time spent on DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum time spent on DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average time spent on DELETE statements (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

8.2.6.7 DBE_PERF.SUMMARY_WORKLOAD_SQL_ELAPSE_TIME

Collects statistics about the select, update, insert, and delete (SUID) operations on the (service) workloads of all CNs, as described in **Table 8-81**.

Table 8-81 DBE_PERF.SUMMARY_WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
node_name	name	Node name.
workload	name	Service workload name.
total_select_elapse	bigint	Total time spent on SELECT statements (unit: μs)
max_select_elapse	bigint	Maximum time spent on SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum time spent on SELECT statements (unit: μs).
avg_select_elapse	bigint	Average time spent on SELECT statements (unit: μs).
total_update_elapse	bigint	Total time spent on UPDATE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_update_elapse	bigint	Maximum time spent on UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum time spent on UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average time spent on UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total time spent on INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum time spent on INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum time spent on INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average time spent on INSERT statements (unit: μs).
total_delete_elapse	bigint	Total time spent on DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum time spent on DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum time spent on DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average time spent on DELETE statements (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

8.2.6.8 DBE_PERF.USER_TRANSACTION

Collects statistics about transactions executed by users, as described in **Table 8-82**. MONADMIN can view information about transactions executed by all users.

Table 8-82 DBE_PERF.USER_TRANSACTION columns

Name	Type	Description
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of transactions committed by users (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
resp_max	bigint	Maximum response time of transactions committed by users (unit: μs).
resp_avg	bigint	Average response time of transactions committed and rolled back by users (unit: μs).
resp_total	bigint	Total response time of transactions committed by users (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dist_commit_counter	bigint	Number of distributed transactions that are committed.
dist_rollback_counter	bigint	Number of distributed transactions that are rolled back.
dist_resp_min	bigint	Minimum response time of distributed transactions that are committed (unit: μs).
dist_resp_max	bigint	Maximum response time of distributed transactions that are committed (unit: μs).
dist_resp_avg	bigint	Average response time of distributed transactions that are committed and rolled back (unit: μs).
dist_resp_total	bigint	Total response time of distributed transactions that are committed (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

NOTE

Only the information about the main transaction is collected. The information about the sub-transaction is not collected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.6.9 DBE_PERF.GLOBAL_USER_TRANSACTION

Collects statistics about transactions executed by all users, as described in **Table 8-83**.

Table 8-83 DBE_PERF.GLOBAL_USER_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of transactions committed by users (unit: μs).
resp_max	bigint	Maximum response time of transactions committed by users (unit: μs).
resp_avg	bigint	Average response time of transactions committed and rolled back by users (unit: μs).
resp_total	bigint	Total response time of transactions committed by users (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dist_commit_counter	bigint	Number of distributed transactions that are committed.
dist_rollback_counter	bigint	Number of distributed transactions that are rolled back.
dist_resp_min	bigint	Minimum response time of distributed transactions that are committed (unit: μs).
dist_resp_max	bigint	Maximum response time of distributed transactions that are committed (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dist_resp_avg	bigint	Average response time of distributed transactions that are committed and rolled back (unit: μs).
dist_resp_total	bigint	Total response time of distributed transactions that are committed (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

NOTE

Only the information about the main transaction is collected. The information about the sub-transaction is not collected.

8.2.7 Session and Thread

8.2.7.1 DBE_PERF.SESSION_STAT

Collects statistics about session status on the current node based on session threads or the AutoVacuum thread, as described in **Table 8-84**.

Table 8-84 DBE_PERF.SESSION_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Session value.

8.2.7.2 DBE_PERF.GLOBAL_SESSION_STAT

Collects statistics about session status on each node based on session threads or the AutoVacuum thread, as described in **Table 8-85**.

Table 8-85 DBE_PERF.GLOBAL_SESSION_STAT columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Session value.

8.2.7.3 DBE_PERF.SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on the current node, as described in **Table 8-86**.

Table 8-86 DBE_PERF.SESSION_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

8.2.7.4 DBE_PERF.GLOBAL_SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on each node, as described in **Table 8-87**.

Table 8-87 DBE_PERF.GLOBAL_SESSION_TIME columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

8.2.7.5 DBE_PERF.SESSION_MEMORY

Collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as described in **Table 8-88**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-88 DBE_PERF.SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

8.2.7.6 DBE_PERF.GLOBAL_SESSION_MEMORY

Collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as described in **Table 8-89**.

Table 8-89 DBE_PERF.GLOBAL_SESSION_MEMORY columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

8.2.7.7 DBE_PERF.SESSION_MEMORY_DETAIL

Collects statistics on the memory usage of threads on the current node, in the unit specified by **MemoryContext**, as described in **Table 8-90**.

Table 8-90 DBE_PERF.SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the allocated memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

8.2.7.8 DBE_PERF.GLOBAL_SESSION_MEMORY_DETAIL

Collects statistics about thread memory usage on each node by **MemoryContext**, as described in **Table 8-91**.

Table 8-91 DBE_PERF.GLOBAL_SESSION_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the allocated memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

8.2.7.9 DBE_PERF.SESSION_STAT_ACTIVITY

Displays information about threads that are running on the current node, as described in **Table 8-92**.

Table 8-92 DBE_PERF.SESSION_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Background thread ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a UDS on the server or this is an internal thread. For an autovacuum worker thread, this column will display **autovacuum**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in pg_stat_activity is empty. gaussdb=# SELECT datname, usename, usesysid,state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+-------- +-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
trace_id	text	Trace ID specified by the driver, which is used to identify a request of an application.

8.2.7.10 DBE_PERF.GLOBAL_SESSION_STAT_ACTIVITY

Displays information about threads that are running on each node in the cluster, as described in **Table 8-93**.

Table 8-93 DBE_PERF.GLOBAL_SESSION_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	CN name.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Background thread ID.
usesysid	oid	OID of the user logged in to the backend.
usename	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a UDS on the server or this is an internal thread. For an autovacuum worker thread, this column will display **autovacuum**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	If the background is waiting for a lock, the value is **true**. Otherwise, the value is **false**. If a lock is being waited for on a DN, determine the DN based on the **wait_status** column in the pg_thread_wait_status view and query the **waiting** column in pg_stat_activity on the DN to check whether a lock wait occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in pg_stat_activity is empty. gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname | username | usesysid | state | pid ----------+----------+----------+-------- +-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
trace_id	text	Trace ID specified by the driver, which is used to identify a request of an application.

8.2.7.11 DBE_PERF.THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on the current node, as described in **Table 8-94**. For details about events, see **Table 8-192**.

Table 8-94 DBE_PERF.THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Parallel thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 8-192**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

8.2.7.12 DBE_PERF.GLOBAL_THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on all nodes, as described in **Table 8-95**. For details about the events, see **Table 8-192**.

In GLOBAL_THREAD_WAIT_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the cluster, and the blocking status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL_THREAD_WAIT_STATUS and THREAD_WAIT_STATUS are the same because the essence of the GLOBAL_THREAD_WAIT_STATUS view is the query summary of the THREAD_WAIT_STATUS view on each node in the cluster.

Table 8-95 DBE_PERF.GLOBAL_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Parallel thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 8-192**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

8.2.7.13 DBE_PERF.LOCAL_THREADPOOL_STATUS

Displays the status of worker threads and sessions in a thread pool, as described in **Table 8-96**. This view is valid only when **enable_thread_pool** is set to **on**.

Table 8-96 DBE_PERF.LOCAL_THREADPOOL_STATUS columns

Name	Type	Description
node_name	text	Node name.
group_id	integer	ID of the thread pool group.
bind_numa_id	integer	NUMA ID to which the thread pool group is bound.
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is **NULL**.
listener	integer	Number of listener threads in the thread pool group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: • **default**: Number of initial threads in the thread pool group. • **new**: Number of new threads in the thread pool group. • **expect**: Expected number of threads in the thread pool group. • **actual**: Actual number of threads in the thread pool group. • **idle**: Number of idle threads in the thread pool group. • **pending**: Number of pending threads in the thread pool group.
session_info	text	Information about sessions in the thread pool, including: • **total**: Total number of sessions in the thread pool group. • **waiting**: Number of sessions pending scheduling in the thread pool group. • **running**: Number of running sessions in the thread pool group. • **idle**: Number of idle sessions in the thread pool group.
stream_info	text	Information about streams in the thread pool, including: • **total**: total number of stream threads in the thread pool group. • **running**: number of running stream threads in the thread pool group. • **idle**: number of idle stream threads in the thread pool group.

NOTE

The thread pool has a dynamic scaling mechanism. When a new thread is idle after scaling, the thread pool scales in about 3 minutes. After dynamic scale-in, the number of threads in the thread pool is not less than the initial number of threads.

8.2.7.14 DBE_PERF.GLOBAL_THREADPOOL_STATUS

Displays the status of worker threads and sessions in thread pools on all nodes.

For details about columns, see **Table 8-96**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.7.15 DBE_PERF.SESSION_CPU_RUNTIME

Displays information about CPU usage of ongoing complex jobs executed by the current user, as described in **Table 8-97**.

Table 8-97 DBE_PERF.SESSION_CPU_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
usename	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
query	text	Statement being executed.
node_group	text	Node group of the user to which the statement belongs.
top_cpu_dn	text	Top *N* CPU usage.

8.2.7.16 DBE_PERF.SESSION_MEMORY_RUNTIME

Displays information about memory usage of ongoing complex jobs executed by the current user, as described in **Table 8-98**.

Table 8-98 DBE_PERF.SESSION_MEMORY_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
usename	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
min_peak_memory	integer	Minimum peak memory of the statement among all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement among all DNs (unit: MB).
spill_info	text	Statement spill information on all DNs. • **None**: No data has been spilled to disks on all DNs. • **All**: Data has been spilled to disks on all DNs. • **[*a*:*b*]**: Data has been spilled to disks on *a* of *b* DNs.
query	text	Statement being executed.
node_group	text	Node group of the user to which the statement belongs.
top_mem_dn	text	Top *N* memory usage.

8.2.7.17 DBE_PERF.STATEMENT_IOSTAT_COMPLEX_RUNTIME

Displays I/O workload management information about ongoing jobs executed by the current user, as described in **Table 8-99**. IOPS is counted by 10 thousands per second.

Table 8-99 DBE_PERF.STATEMENT_IOSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
query_id	bigint	Job ID.
mincurriops	integer	Minimum I/O of the current job across DNs.
maxcurriops	integer	Maximum I/O of the current job across DNs.
minpeakiops	integer	Minimum peak I/O of the current job across DNs.
maxpeakiops	integer	Maximum peak I/O of the current job across DNs.
io_limits	integer	**io_limits** set for the job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_priority	text	**io_priority** set for the job.
query	text	Job.
node_group	text	Node group of the user to which a job belongs.
curr_io_limits	integer	Real-time value of **iolimits** when **io_priority** is used to control I/Os.

8.2.7.18 DBE_PERF.LOCAL_ACTIVE_SESSION

Displays samples in the ACTIVE SESSION PROFILE memory on the current node, as described in **Table 8-100**.

Table 8-100 DBE_PERF.LOCAL_ACTIVE_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	ID of the unique SQL statement.
unique_query_id	bigint	ID of the normalized SQL statement.
user_id	oid	User ID in the key of the unique query
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized text string of the unique SQL statement.
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.
parent_unique_sql_id	bigint	SQL_Id of the parent statement that calls the statement.
control_status	text	The value is **under_cpu_throttle** when CPU resource for abnormal SQL statements is controlled. Otherwise, the value is **normal**.
top_unique_query_id	bigint	If the sampled statement belongs to a stored procedure, this column displays the **unique_query_id** of the top-level SQL statement of the stored procedure.
top_unique_query	text	If the sampled statement belongs to a stored procedure, this column displays the **unique_query** of the top-level SQL statement of the stored procedure.
sql_hash	bigint	Hash value of the SQL statement, which is **0**.
plan_hash	bigint	Hash value of the execution plan of the SQL statement, which is **0**.

8.2.7.19 DBE_PERF.GLOBAL_ACTIVE_SESSION

Displays a summary of samples in the ACTIVE SESSION PROFILE memory on CN and main DN nodes, as described in **Table 8-101**. The **event_start_time**, **current_xid**, and **top_xid** columns are added to GaussDB Kernel 505.0. After GaussDB Kernel is upgraded to GaussDB Kernel 505.0 or later, the columns cannot be queried during the upgrade observation period.

Table 8-101 DBE_PERF.GLOBAL_ACTIVE_SESSION columns

Name	Type	Description
node_name	text	Node name.
sampleid	bigint	Sample ID.
sample_time	timestamp without time zone	Sampling time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
need_flush_sample	Boolean	Specifies whether the sample needs to be refreshed.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp without time zone	Start time of a session.
event	text	Specified event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	ID of the unique SQL statement.
unique_query_id	bigint	ID of the normalized SQL statement.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
locktag	text	Information of a lock that the session waits for. It can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.
parent_unique_sql_id	bigint	SQL_Id of the parent statement that calls the statement.
sql_hash	bigint	Hash value of the SQL statement, which is **0**.
plan_hash	bigint	Hash value of the execution plan of the SQL statement, which is **0**.

8.2.8 Transaction

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.8.1 DBE_PERF.TRANSACTIONS_RUNNING_XACTS

Displays information about running transactions on the current node, as described in **Table 8-102**.

Table 8-102 DBE_PERF.TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes. • **false**: no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

8.2.8.2 DBE_PERF.SUMMARY_TRANSACTIONS_RUNNING_XACTS

Displays information about running transactions on each CN in the cluster, as described in **Table 8-103**.

Table 8-103 DBE_PERF.SUMMARY_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes. • **false**: no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

8.2.8.3 DBE_PERF.GLOBAL_TRANSACTIONS_RUNNING_XACTS

Displays information about the running transactions on each CN and DN in the cluster, as described in **Table 8-104**.

Table 8-104 DBE_PERF.GLOBAL_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes • **false**: no
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.8.4 DBE_PERF.TRANSACTIONS_PREPARED_XACTS

Displays information about transactions that are prepared for two-phase commit, as described in **Table 8-105**.

Table 8-105 DBE_PERF.TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction.
database	name	Name of the database in which the transaction is executed.

8.2.8.5 DBE_PERF.SUMMARY_TRANSACTIONS_PREPARED_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN in the cluster, as described in **Table 8-106**.

Table 8-106 DBE_PERF.SUMMARY_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction.
database	name	Name of the database in which the transaction is executed.

8.2.8.6 DBE_PERF.GLOBAL_TRANSACTIONS_PREPARED_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN and DN in the cluster, as described in **Table 8-107**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-107 DBE_PERF.GLOBAL_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction.
database	name	Name of the database in which the transaction is executed.

8.2.9 Query

8.2.9.1 DBE_PERF.STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node, as described in **Table 8-108**. You can view all statistics about normalized SQL statements received by the CN, whereas you can view only the statistics about normalized SQL statements executed on the current DN.

NOTE

The **unique_sql_id** generated by different **savepoint_name** values is different. When a large number of **savepoint_name** is used, the number of **unique_sql_id** values generated in the system increases rapidly. If the number of **unique_sql_id** values is greater than the number of **instr_unique_sql_count** values, the newly generated **unique_sql_id** information is not counted.

Table 8-108 DBE_PERF.STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID (**node_id** in **pgxc_node**).
user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Normalized SQL statement. Note: The length is controlled by **instr_unique_sql_size**.
n_calls	bigint	Number of actual calls. The number of times that the FETCH statement in a stored procedure is triggered is the same as the **n_calls** increment of the statement executed by the cursor.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs).
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of logical reads.
n_blocks_hit	bigint	Number of memory hits.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. (This is meaningless for non-DML statements.)
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. The parsing of complex data types, for example, the smalldatetime type, also increases the number of parsing times. (This is meaningless for non-DML statements.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
db_time	bigint	Valid internal database time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs). (If an exception occurs during parsing, **parse_time** is not recorded.)
plan_time	bigint	SQL plan generation time (unit: μs). (If an exception occurs during plan generation, **plan_time** is not recorded.)
rewrite_time	bigint	SQL rewriting time (unit: μs). (If an exception occurs during rewriting, **rewrite_time** is not recorded.)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	Time spent on I/O (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting execution time (unit: μs), including the time of the sort operator and its sub-operators.
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: μs).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
lock_wait_time	bigint	SQL lock waiting time (unit: μs).
total_used_memory	bigint	Total memory used by normalized statements, in MB.
max_used_memory	integer	Maximum memory usage of a single statement, in MB.
min_used_memory	integer	Minimum memory usage of a single statement, in MB.
db_name	name	Name of the database connected to the backend. If the database where the query statement is executed does not exist, ***REMOVED_DB*** is displayed.
db_id	oid	OID of the database that the backend is connected to.
eliminated_count	bigint	Number of plan cache evictions generated by the prepare statement.
plan_count	text	Total number of SQL execution plans, including LP, FQS, STREAM, and PGXC.
aplan_count	bigint	Number of Aplan execution times.
aplan_parse_time	bigint	Aplan parsing time.
aplan_execution_time	bigint	Aplan execution time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
hard_parse_reason	text	Hard parsing reason. The causes are as follows: • **first_execute**: number of hard parsing times for the first execution. • **cplan**: number of hard parsing times for generating a Cplan. • **gplan**: number of hard parsing times for generating a Gplan. • **aplan**: number of hard parsing times for generating an Aplan. • **revalid**: number of hard parsing times for rebuilding a plan after the plan becomes invalid. • **memory_control**: number of hard parsing times for rebuilding a plan after the plan is evicted by memory control. The preceding reasons are logically overlapped. For example, if the plan is executed for the first time and the Cplan is generated, the value of **hard_parse_reason** is **{"first_execute":1, "cplan":1, "gplan":0, "aplan":0, "revalid":0, "memory_control":0}**. If the value of **revalid** is not **0**, the cause and number of times that the plan expires are displayed, for example, "revalid":1{invalid reason: guc changed:1}.
sql_hash	bigint	Hash value of the current SQL statement. In the current schema, it is recorded as **0**.
plan_hash	bigint	Hash value of the current SQL plan. In the current schema, it is recorded as **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- SQL plan management does not support the distributed mode. Therefore, **sql_hash** and **plan_hash** do not take effect in the distributed mode.
- Statistics about statements in a stored procedure on a DN are aggregated only to the outermost statement. The statements called at the middle layer do not contain statistics about substatements.
- The following types of statements can be recorded in a stored procedure: **DML statements**, **dynamic statements**, **OPEN/FETCH cursor statements**, **nested subprograms**, **RETURN QUERY statements**, and PERFORM statements (statements that call a stored procedure using the PERFORM keyword or statements that call a stored procedure without **OUT** output parameters).
- When a dynamic statement is used as a loop variable, cursor, or RETURN QUERY, no record is generated for the dynamic statement.
- After a stored procedure is executed, if you clear the records in the **DBE_PERF.STATEMENT** table and execute the same stored procedure again, no new execution record is generated due to plan reuse.
- After user A executes a stored procedure, if another user executes the same stored procedure, no new execution record is generated due to plan reuse.
- The **CPU_TIME** value of the statement in the stored procedure is **0**.
- If an error is reported when a statement in a stored procedure is executed in the statistics reporting phase, the statistical columns recorded by the statement in DBE_PERF.STATEMENT may all be 0.

8.2.9.2 DBE_PERF.SUMMARY_STATEMENT

Obtains full information (including DNs) about the executed statements (normalized SQL statements) on each CN, as shown in **Table 8-109**.

Table 8-109 DBE_PERF.SUMMARY_STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID (**node_id** in **pgxc_node**).
user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.
query	text	Normalized SQL statement. Note: The length is controlled by **instr_unique_sql_size**.
n_calls	bigint	Number of actual calls. The number of times that the FETCH statement in a stored procedure is triggered is the same as the **n_calls** increment of the statement executed by the cursor.

db_id	oid	OID of the database that the backend is connected to.
eliminated_count	bigint	Number of plan cache evictions generated by the prepared statement.
plan_count	text	Total number of SQL execution plans, including LP, FQS, STREAM, and PGXC.
aplan_count	bigint	Number of Aplan execution times.
aplan_parse_time	bigint	Aplan parsing time.
aplan_execution_time	bigint	Aplan execution time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
hard_parse_reason	text	Hard parsing reason. The causes are as follows: • **first_execute**: number of hard parsing times for the first execution. • **cplan**: number of hard parsing times for generating a Cplan. • **gplan**: number of hard parsing times for generating a Gplan. • **aplan**: number of hard parsing times for generating an Aplan. • **revalid**: number of hard parsing times for rebuilding a plan after the plan becomes invalid. • **memory_control**: number of hard parsing times for rebuilding a plan after the plan is evicted by memory control. The preceding reasons are logically overlapped. For example, if the plan is executed for the first time and the Cplan is generated, the value of **hard_parse_reason** is **{"first_execute":1, "cplan":1, "gplan":0, "aplan":0, "revalid":0, "memory_control":0}**. If the value of **revalid** is not 0, the reason and number of times that the plan becomes invalid are displayed, for example, **"revalid":1{invalid reason: guc changed:1}**.
sql_hash	bigint	Hash value of the current SQL statement. In the current schema, it is recorded as **0**.
plan_hash	bigint	Hash value of the current SQL plan. In the current schema, it is recorded as **0**.

8.2.9.3 DBE_PERF.STATEMENT_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database, as described in **Table 8-110**.

NOTE

An administrator can query the STATEMENT_COUNT view to view the statistics of all users on the current node. When the cluster or node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including a query inside the cluster. For example, if the CN receives a query that contains multiple subqueries, the subqueries are counted separately when they are delivered to a single DN or multiple DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-110 DBE_PERF.STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
select_count	bigint	Statistical result of SELECT statements.
update_count	bigint	Statistical result of UPDATE statements.
insert_count	bigint	Statistical result of INSERT statements.
delete_count	bigint	Statistical result of DELETE statements.
mergeinto_count	bigint	Statistical result of MERGE INTO statements.
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
total_select_elapse	bigint	Total time spent on SELECT statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_select_elapse	bigint	Average time spent on SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum time spent on SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum time spent on SELECT statements (unit: μs).
total_update_elapse	bigint	Total time spent on UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average time spent on UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum time spent on UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum time spent on UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total time spent on INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average time spent on INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum time spent on INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum time spent on INSERT statements (unit: μs).
total_delete_elapse	bigint	Total time spent on DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average time spent on DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum time spent on DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum time spent on DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.

8.2.9.4 DBE_PERF.GLOBAL_STATEMENT_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on each node of the database, as described in **Table 8-111**.

Table 8-111 DBE_PERF.GLOBAL_STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
select_count	bigint	Statistical result of SELECT statements.
update_count	bigint	Statistical result of UPDATE statements.
insert_count	bigint	Statistical result of INSERT statements.
delete_count	bigint	Statistical result of DELETE statements.
mergeinto_count	bigint	Statistical result of MERGE INTO statements.
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
total_select_elapse	bigint	Total time spent on SELECT statements (unit: μs)
avg_select_elapse	bigint	Average time spent on SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum time spent on SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum time spent on SELECT statements (unit: μs).
total_update_elapse	bigint	Total time spent on UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average time spent on UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum time spent on UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum time spent on UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total time spent on INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average time spent on INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum time spent on INSERT statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_insert_elapse	bigint	Minimum time spent on INSERT statements (unit: μs).
total_delete_elapse	bigint	Total time spent on DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average time spent on DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum time spent on DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum time spent on DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.

8.2.9.5 DBE_PERF.SUMMARY_STATEMENT_COUNT

Displays the summary statistics of five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) and DDL, DML, and DCL statements executed on each database node, as shown in **Table 8-112**.

Table 8-112 DBE_PERF.SUMMARY_STATEMENT_COUNT columns

Name	Type	Description
user_name	text	Username.
select_count	numeric	Statistical result of SELECT statements.
update_count	numeric	Statistical result of UPDATE statements.
insert_count	numeric	Statistical result of INSERT statements.
delete_count	numeric	Statistical result of DELETE statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
mergeinto_count	numeric	Statistical result of MERGE INTO statements.
ddl_count	numeric	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, CLUSTER, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, and ALTER SESSION), REINDEX, COMMENT, BARRIER, SECURITY LABEL ON, PURGE, TIMECAPSULE, REFRESH, IMPDP, and EXPDP statements.
dml_count	numeric	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SELECT, UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, LOCK, COPY, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, CURSOR, and LOAD statements.
dcl_count	numeric	Number of DCL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including SHOW, CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, SET, RESET, and ALTER SESSION statements.
total_select_elapse	numeric	Total time spent on SELECT statements (unit: μs)
avg_select_elapse	bigint	Average time spent on SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum time spent on SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum time spent on SELECT statements (unit: μs).
total_update_elapse	numeric	Total time spent on UPDATE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_update_elapse	bigint	Average time spent on UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum time spent on UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum time spent on UPDATE statements (unit: μs).
total_insert_elapse	numeric	Total time spent on INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average time spent on INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum time spent on INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum time spent on INSERT statements (unit: μs).
total_delete_elapse	numeric	Total time spent on DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average time spent on DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum time spent on DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum time spent on DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users. The value of **user_dml_count** is equal to the value of **dml_count** minus the value of **bg_dml_count**.
bg_dml_count	bigint	Number of DML statements executed by background threads (excluding WORKER and THREADPOOL_WORKER) in the database in all scenarios. **NOTE** The DML statements executed by the current stored procedure cannot be counted.

8.2.9.6 DBE_PERF.STATEMENT_RESPONSETIME_PERCENTILE

Obtains the response times of 80% and 95% SQL statements in the cluster, as described in **Table 8-113**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-113 DBE_PERF.STATEMENT_RESPONSETIME_PERCENTILE columns

Name	Type	Description
p80	bigint	Response time of 80% SQL statements in the cluster (unit: μs)
p95	bigint	Response time of 95% SQL statements in the cluster (unit: μs)

8.2.9.7 DBE_PERF.STATEMENT_HISTORY

Displays information about statements executed on the current node. The result can be queried only in the system database but cannot be queried in the user database, as described in **Table 8-114**.

Table 8-114 DBE_PERF.STATEMENT_HISTORY columns

Name	Type	Description
db_name	name	Database name.
schema_name	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of **debug_query_id** in the Parse packet, DCL statements, and TCL statements is **0**. Statements in a stored procedure use the same ID.
query	text	Normalized SQL (available only on CNs).
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. (This is meaningless for non-DML statements.)
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**. The parsing of complex data types, for example, smalldatetime, also increases the number of parsing times. (This is meaningless for non-DML statements.)
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned, that is, number of times that TABLE ACCESS BY INDEX ROWID is performed. The process of TABLE ACCESS BY INDEX ROWID is as follows: When you use indexes to query data, if the columns to be queried are not in the indexes, the database engine needs to access the main table again through the primary key or unique identifier in the indexes to obtain the required complete data rows.
n_tuples_returned	bigint	Number of rows sequentially scanned, that is, the sum of the number of live rows obtained by sequential scans and the number of index entries returned by index scans.
n_tuples_inserted	bigint	Number of rows inserted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block accesses, indicating the total number of blocks read from the buffer and disk.
n_blocks_hit	bigint	Number of buffer block hits, indicating the number of blocks read from the buffer.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	Time consumed on the CPU (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs). (If an exception occurs during parsing, **parse_time** is not recorded.)
plan_time	bigint	SQL plan generation time (unit: μs). (If an exception occurs during plan generation, **plan_time** is not recorded.)
rewrite_time	bigint	SQL rewriting time (unit: μs). (If an exception occurs during rewriting, **rewrite_time** is not recorded.)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	Time spent on I/O (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with clients, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_count	bigint	Number of lightweight lock waits.
lwlock_time	bigint	Time required for lightweight locking (reserved).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwlock_wait_time	bigint	Time required for lightweight lock wait.
details	bytea	List of wait events, statement lock events, and GSTrace function running time. When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For key events in the kernel, see **Table 8-192**. Alternatively, view the list of all events in the system in the wait_event_info view. For details about the impact of each transaction lock on services, see **LOCK**. In the GStrace full-link tracing function, the **function** field of GStrace indicates the function name, and the parent-child relationship of the function is expressed in a tree structure. The **duration** field of GStrace indicates the function running time, in microseconds. When the record level is **L2**, the list of statement lock events starts to be recorded in chronological order. The number of recorded lock events is determined by the **track_stmt_details_size** parameter. This column is in binary format and needs to be read by using the parsing function pg_catalog.statement_detail_decode. For details, see **Table 1-204**. Events include: • LOCK_START: Start locking. • LOCK_END: Complete locking. • LOCK_WAIT_START: Start lock waiting. • LOCK_WAIT_END: Complete lock waiting. • LOCK_RELEASE: Release the lock. • LWLOCK_WAIT_START: Start lightweight lock waiting. • LWLOCK_WAIT_END: Complete lightweight lock waiting.
is_slow_sql	boolean	Specifies whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. **NOTE** If the statement is executed in SQLBypass mode (you can run the explain command to view the plan. For details, see **enable_opfusion**), there is no slow SQL risk and the information in this field may be missing.
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is **0**.
finish_status	text	Statement completion status. The default value is **normal**. **cancelled** indicates cancellation or termination. **error** indicates that the operation ends due to other exceptions except **cancelled**.
used_memory	integer	Memory usage of a single statement (unit: MB).
lock_max_local_count	bigint	Maximum number of locks that can be held by the locallock mechanism.
lock_max_fastpath_count	bigint	Maximum number of locks that can be held by the fastpath mechanism.
lock_max_global_count	bigint	Maximum number of locks that can be held by the main lock table.
driver_start_time	timestamp with time zone	Time when the JDBC driver starts the execution.
driver_wait_response	timestamp with time zone	Time when the JDBC driver starts to wait for the data returned by the database after sending a packet.
driver_finish_time	timestamp with time zone	Time when the JDBC driver receives the data returned by the database.
driver_info	json	Time when the JDBC driver sends and receives packets. After the **track_stmt_stat_level** parameter is modified, the modification takes effect only for new sessions.
kernel_info	json	Time when database packets are sent and received.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
adaptive_join_states	text	Specifies the chosen connection mode of the adaptive connection operator. The format is **[plan_node_id, use_hashjoin]**. The first digit indicates the corresponding **plan_node_id**, and the second digit specifies whether to use HashJoin. The value **1** indicates yes, and the value **0** indicates no.
aplan_count	bigint	Number of Aplan execution times.
aplan_parse_time	bigint	Aplan parsing time.
aplan_execution_time	bigint	Aplan execution time.
sql_hash	bigint	Hash value of the current SQL statement.
plan_hash	bigint	Hash value of the current SQL plan.
plan_hash_prev	bigint	For a generic plan, the value is the hash value of the previous plan.
relids	text	pg_class.oid involving tables in the statement. Separate multiple tables with commas (,).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If the values in **track_stmt_stat_level** for controlling full SQL statements and slow SQL statements are not **OFF**, the **is_slow_sql** field is recorded as **true** for an SQL statement that exceeds the **log_min_duration_statement** threshold. Other fields are recorded based on the levels in **track_stmt_stat_level**.
- Adaptive join does not support distributed mode. Therefore, **adaptive_join_states** does not take effect in distributed mode.
- SQL plan management does not support the distributed mode. Therefore, **sql_hash**, **plan_hash**, and **plan_hash_prev** do not take effect in the distributed mode.
- Lock-related metrics of sub-statements in a distributed stored procedure are not aggregated to the top-level statements.
- If a query plan fails to be recorded, the cause of the failure is displayed in the **query_plan** column. The following are some examples:
  - In the LightProxy scenario, statements are pushed down, and the plan is recorded on DNs instead of CNs. Message: "The current plan is lightproxy. Please check the query_plan on the DN node."
  - In the Stream scenario, the plan is pushed down and recorded on CNs instead of DNs. Message: "The current plan is streaming. Please check the query_plan on the CN node."
  - For COMMIT statements that are automatically committed by DML statements, related plans are not recorded. Message: "The current record is a transaction commit of a DML statement. Please check the plan of this DML statement."
  - Plans are not recorded for non-DML/DQL statements. Message: "Do not record plans for non-DML/DQL statements." For DDL statements, in a cluster with multiple CNs, query_plan records information about interactions between nodes.
  - Plans are not recorded for substatements that are not adapted or have no plan in a stored procedure, such as simple expressions, OPEN CURSOR, CLOSE, and BYPASS path statements. Plans for substatements executed in a stored procedure are not recorded on DNs. Message: "Statement has no plan or is unsupported for plan recording."
  - For SQL statements that have entered the PARSE phase, no plan has been generated and therefore the statements are not recorded. Message: "This statement is a PARSE statement and has not yet generated a query plan."
  - When the system checks whether **query_plan** needs to be reported, the SQL statement execution is not slow, but the overall execution of the SQL statements is slow due to subsequent tasks such as cleanup. Message: "Check the reported query_plan time is 2026-01-01 08:05:01.735619+08, at this time the SQL is not slow."
  - If the statement execution status is abnormal, the plan may fail to be recorded. In this case, check the logs to analyze the cause. Message: "An error occurred during statement execution. Please check the log for analysis."
  - For other scenarios where the recording fails, check the logs to analyze the cause. Message: "The query plan failed to be recorded. Please check the log analysis."

8.2.9.8 DBE_PERF.GLOBAL_STATEMENT_COMPLEX_HISTORY

Displays workload management information about completed jobs executed on each node, as described in **Table 8-115**.

Table 8-115 DBE_PERF.GLOBAL_STATEMENT_COMPLEX_HISTORY columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
dbname	text	Name of the database that the backend is connected to.
schemaname	text	Schema name.
nodename	text	Name of the CN where the statement is executed.
username	text	Username used for connecting to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**–1** if a Unix socket is used).
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms).
start_time	timestamp with time zone	Time when the statement execution starts.
finish_time	timestamp with time zone	Time when the statement execution ends.
duration	bigint	Execution time of the statement (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms).
status	text	Final statement execution status. The value can be **finished** (normal) or **aborted** (abnormal).
abort_info	text	Exception information displayed if the final statement execution status is **aborted**.
resource_pool	text	Resource pool used by the user.
control_group	text	Cgroup used by the statement.
estimate_memory	integer	Estimated memory used by the statement.
min_peak_memory	integer	Minimum peak memory of the statement among all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement among all DNs (unit: MB).
average_peak_memory	integer	Average memory usage during statement execution (unit: MB).
memory_skew_percent	integer	Memory usage skew of the statement among each DN.
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms).
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms).
dntime_skew_percent	integer	Execution time skew of the statement among each DN.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
cpu_skew_percent	integer	CPU time skew of the statement among DNs.
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs (unit: 10 thousands per second).
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs (unit: 10 thousands per second).
average_peak_iops	integer	Average peak IOPS of the statement across all DNs (unit: 10 thousands per second).
iops_skew_percent	integer	I/O skew across DNs.
warning	text	Warning. The following warnings are displayed: ● Spill file size larger than 256MB ● Broadcast size larger than 100MB ● Early spill ● Spill times is greater than 3 ● Spill on memory adaptive ● Hash table conflict
queryid	bigint	Internal query ID used for statement execution.
query	text	Statement executed.
query_plan	text	Execution plan of the statement.
cpu_top1_node_name	text	Name of the node with the highest CPU usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_top2_node_name	text	Name of the node with the second highest CPU usage.
cpu_top3_node_name	text	Name of the node with the third highest CPU usage.
cpu_top4_node_name	text	Name of the node with the fourth highest CPU usage.
cpu_top5_node_name	text	Name of the node with the fifth highest CPU usage.
mem_top1_node_name	text	Name of the node with the highest memory usage.
mem_top2_node_name	text	Name of the node with the second highest memory usage.
mem_top3_node_name	text	Name of the node with the third highest memory usage.
mem_top4_node_name	text	Name of the node with the fourth highest memory usage.
mem_top5_node_name	text	Name of the node with the fifth highest memory usage.
cpu_top1_value	bigint	1st CPU usage.
cpu_top2_value	bigint	2nd CPU usage.
cpu_top3_value	bigint	3rd CPU usage.
cpu_top4_value	bigint	4th CPU usage.
cpu_top5_value	bigint	5th CPU usage.
mem_top1_value	bigint	1st memory usage.
mem_top2_value	bigint	2nd memory usage.
mem_top3_value	bigint	3rd memory usage.
mem_top4_value	bigint	4th memory usage.
mem_top5_value	bigint	5th memory usage.
top_mem_dn	text	Top N memory usage.
top_cpu_dn	text	Top N CPU usage.
node_group	text	Node group of the user to which the statement belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.9.9 DBE_PERF.GLOBAL_STATEMENT_COMPLEX_HISTORY_TABLE

Displays workload management information about completed jobs executed on each node. Data is dumped from the kernel to this system catalog. If the GUC parameter **enable_resource_record** is set to **on**, the system imports records from **DBE_PERF.GLOBAL_STATEMENT_COMPLEX_HISTORY** to this system catalog every 3 minutes. You are advised not to enable this function because it occupies storage space and affects performance.

For details about the columns, see **DBE_PERF.GLOBAL_STATEMENT_COMPLEX_HISTORY**.

8.2.9.10 DBE_PERF.STATEMENT_WLMSTAT_COMPLEX_RUNTIME

Displays workload management information about ongoing jobs executed by the current user, as described in **Table 8-116**.

Table 8-116 DBE_PERF.STATEMENT_WLMSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to.
datname	name	Name of the database that the backend is connected to.
threadid	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
usesysid	oid	OID of the user logged in to the backend.
appname	text	Name of the application connected to the backend.
usename	name	Username for logging in to the backend.
priority	bigint	Priority of Cgroup where the statement is located.
attribute	text	Statement attribute: • **Ordinary**: default attribute of a statement before it is parsed by the database. • **Simple**: simple statement. • **Complicated**: complicated statement. • **Internal**: internal statement of the database.
block_time	bigint	Pending duration of the statement by now, in seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
elapsed_time	bigint	Actual execution duration of the statement by now, in seconds.
total_cpu_time	bigint	Total CPU usage duration of the statement on the DN in the last period, in seconds.
cpu_skew_percent	integer	CPU usage inclination ratio of the statement on the DN in the last period.
statement_mem	integer	Memory used for executing the statement (reserved column).
active_points	integer	Number of concurrently active points occupied by the statement in the resource pool.
dop_value	integer	DOP value obtained by the statement from the resource pool.
control_group	text	Cgroup currently used by the statement.
status	text	Statement status, which can be: • **pending**: waiting to be executed. • **running**: being executed. • **finished**: finished normally. (If **enqueue** is set to **StoredProc** or **Transaction**, this state indicates that only a part of jobs in the statement has been executed. This state persists until this statement is complete.) • **aborted**: terminated unexpectedly. • **active**: a normal state except for those above. • **unknown**: unknown.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
enqueue	text	Queuing status of the statement, including: • **Global**: queuing in the global queue. • **Respool**: queuing in the resource pool queue. • **CentralQueue**: queuing on the CCN. • **Transaction**: queuing in a transaction block. • **StoredProc**: queuing in a stored procedure. • **None**: not in a queue. • **Forced None**: (transaction block statement or stored procedure statement) being forcibly executed because the statement waiting time exceeds the specified value.
resource_pool	name	Resource pool where the statement is located.
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In all other states, it shows the last query that was executed.

8.2.9.11 DBE_PERF.SESSION_SQL_MEMORY

Displays the memory usage of the statements being executed by the current user on the current node, as described in **Table 8-117**.

Table 8-117 DBE_PERF.SESSION_SQL_MEMORY columns

Name	Type	Description
pid	bigint	Thread ID.
sessionid	bigint	Session ID.
unique_sql_id	bigint	Unique SQL statement ID.
query_id	bigint	Debug query ID of a statement.
query	text	Current running statement of the session.
peak_used_memory	integer	Peak memory usage of the statement, in MB.
current_used_memory	integer	Current memory usage of the statement, in MB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.9.12 DBE_PERF.GLOBAL_SESSION_SQL_MEMORY

Displays the memory usage of the statements being executed by the current user on each node, as shown in **Table 8-118**.

Table 8-118 DBE_PERF.GLOBAL_SESSION_SQL_MEMORY columns

Name	Type	Description
node_name	text	Name of the node in the current cluster.
pid	bigint	Thread ID.
sessionid	bigint	Session ID.
unique_sql_id	bigint	Unique SQL statement ID.
query_id	bigint	Debug query ID of a statement.
query	text	Current running statement of the session.
peak_used_memory	integer	Peak memory usage of the statement, in MB.
current_used_memory	integer	Current memory usage of the statement, in MB.

8.2.9.13 DBE_PERF.GS_PLANCACHE_STAT

Displays the parameterized statements of all sessions in the current process, as shown in **Table 8-119**. Only users with the MONADMIN permission can query this view.

NOTE

The same statement may generate different plans under the influence of GUC parameters, resulting in multiple occurrences of the statement in the view.

Table 8-119 DBE_PERF.GS_PLANCACHE_STAT columns

Name	Type	Description
pid	bigint	Background thread ID.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
database_id	oid	Database ID.
parameterized_sql	text	Template SQL statement after parameterization.
saved_time	timestamp with time zone	Saves the timestamp when the template SQL statement is cached.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_used_time	timestamp with time zone	Saves the timestamp when the template SQL statement is last accessed.
parameter_types	regtype[]	Expected parameter type of the template SQL statement.
search_path	text	Search Path.
used_count	bigint	Number of times that the template SQL statement is used.
is_deleted	bool	Specifies whether the plan cache of the SQL statement has been evicted by memory control.
size	bigint	Memory size occupied by the SQL statement cache plan, in bytes.
valid	bool	Specifies whether the SQL statement cache plan is valid.
is_parameterized	bool	Specifies whether the SQL statement is parameterized.
opcache_reuse_cnt	integer	Number of times that the execution cache is reused.
opcache_mem_size	bigint	Memory size occupied by the execution cache.

8.2.9.14 DBE_PERF.GS_DIST_PLANCACHE_STAT

Displays the parameterized statement information of all processes (including the standby node), as shown in **Table 8-120**. Only users with the MONADMIN permission can query this view.

NOTE

Different plans may be generated for the same statement affected by GUC parameters. The statement is displayed multiple times in the view.

Table 8-120 DBE_PERF.GS_DIST_PLANCACHE_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	Background thread ID.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
database_id	oid	Database ID.
parameterized_sql	text	Template SQL statement after parameterization.
saved_time	timestamp with time zone	Saves the timestamp when the template SQL statement is cached.
last_used_time	timestamp with time zone	Saves the timestamp when the template SQL statement is last accessed.
parameter_types	regtype[]	Expected parameter type of the template SQL statement.
search_path	text	Search Path.
used_count	bigint	Number of times that the template SQL statement is used.
is_deleted	bool	Specifies whether the plan cache of the SQL statement has been evicted by memory control.
size	bigint	Memory size occupied by the SQL statement cache plan, in bytes.
valid	bool	Specifies whether the SQL statement cache plan is valid.

8.2.10 Cache and I/O

8.2.10.1 DBE_PERF.STATIO_USER_TABLES

Displays I/O status information about all user relationship tables in the namespace, as described in **Table 8-121**.

Table 8-121 DBE_PERF.STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.2 DBE_PERF.SUMMARY_STATIO_USER_TABLES

Displays a summary of I/O status information about user relationship tables of each node in the cluster, as described in **Table 8-122**.

Table 8-122 DBE_PERF.SUMMARY_STATIO_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table.

8.2.10.3 DBE_PERF.GLOBAL_STATIO_USER_TABLES

Displays I/O status information about all user relationship tables in namespaces on each node, as described in **Table 8-123**.

Table 8-123 DBE_PERF.GLOBAL_STATIO_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table.

8.2.10.4 DBE_PERF.STATIO_USER_INDEXES

Displays I/O status information about all user relationship table indexes in namespaces on the current node, as described in **Table 8-124**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-124 DBE_PERF.STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.5 DBE_PERF.SUMMARY_STATIO_USER_INDEXES

Displays a summary of I/O status information about all user relationship table indexes in namespaces in the cluster, as described in **Table 8-125**.

Table 8-125 DBE_PERF.SUMMARY_STATIO_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

8.2.10.6 DBE_PERF.GLOBAL_STATIO_USER_INDEXES

Displays I/O status information about all user relationship table indexes in namespaces on each node, as described in **Table 8-126**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-126 DBE_PERF.GLOBAL_STATIO_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

8.2.10.7 DBE_PERF.STATIO_USER_SEQUENCES

Displays I/O status information about all user relationship table sequences in namespaces on the current node, as described in **Table 8-127**.

Table 8-127 DBE_PERF.STATIO_USER_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

8.2.10.8 DBE_PERF.SUMMARY_STATIO_USER_SEQUENCES

Displays I/O status information about all user relationship table sequences in namespaces in the cluster, as described in **Table 8-128**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-128 DBE_PERF.SUMMARY_STATIO_USER_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

8.2.10.9 DBE_PERF.GLOBAL_STATIO_USER_SEQUENCES

Displays I/O status information about all user relationship table sequences in namespaces on each node, as described in **Table 8-129**.

Table 8-129 DBE_PERF.GLOBAL_STATIO_USER_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

8.2.10.10 DBE_PERF.STATIO_SYS_TABLES

Displays the I/O status information about all system catalogs in namespaces on the current node, as described in **Table 8-130**.

Table 8-130 DBE_PERF.STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.11 DBE_PERF.SUMMARY_STATIO_SYS_TABLES

Displays a summary of I/O status information about system catalogs of each node in the cluster, as described in **Table 8-131**.

Table 8-131 DBE_PERF.SUMMARY_STATIO_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.

8.2.10.12 DBE_PERF.GLOBAL_STATIO_SYS_TABLES

Displays I/O status information about all system catalogs in namespaces on each node, as described in **Table 8-132**.

Table 8-132 DBE_PERF.GLOBAL_STATIO_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.

8.2.10.13 DBE_PERF.STATIO_SYS_INDEXES

Displays the I/O status information about all system catalog indexes in the current namespace, as described in **Table 8-133**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-133 DBE_PERF.STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.14 DBE_PERF.SUMMARY_STATIO_SYS_INDEXES

Displays a summary of I/O status information about all system catalog indexes in namespaces in the cluster, as described in **Table 8-134**.

Table 8-134 DBE_PERF.SUMMARY_STATIO_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

8.2.10.15 DBE_PERF.GLOBAL_STATIO_SYS_INDEXES

Displays I/O status information about all system catalog indexes in namespaces on each node, as described in **Table 8-135**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-135 DBE_PERF.GLOBAL_STATIO_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

8.2.10.16 DBE_PERF.STATIO_SYS_SEQUENCES

Displays the I/O status information about all the system sequences in the current namespace, as described in **Table 8-136**.

Table 8-136 DBE_PERF.STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

8.2.10.17 DBE_PERF.SUMMARY_STATIO_SYS_SEQUENCES

Displays I/O status information about all system sequences in namespaces in the cluster, as described in **Table 8-137**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-137 DBE_PERF.SUMMARY_STATIO_SYS_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

8.2.10.18 DBE_PERF.GLOBAL_STATIO_SYS_SEQUENCES

Displays I/O status information about all system sequences in namespaces on each node, as described in **Table 8-138**.

Table 8-138 DBE_PERF.GLOBAL_STATIO_SYS_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

8.2.10.19 DBE_PERF.STATIO_ALL_TABLES

Displays the I/O status information about each table (including TOAST tables) of the current node in the database, as described in **Table 8-139**.

Table 8-139 DBE_PERF.STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.20 DBE_PERF.SUMMARY_STATIO_ALL_TABLES

Displays a summary of the I/O status information about each table (including TOAST tables) of each node in the cluster, as described in **Table 8-140**.

Table 8-140 DBE_PERF.SUMMARY_STATIO_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

8.2.10.21 DBE_PERF.GLOBAL_STATIO_ALL_TABLES

Displays the I/O status information about each table (including TOAST tables) of each node in the cluster, as described in **Table 8-141**.

Table 8-141 DBE_PERF.GLOBAL_STATIO_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

8.2.10.22 DBE_PERF.STATIO_ALL_INDEXES

Contains one row for each index in the current database, showing I/O statistics about specific indexes, as described in **Table 8-142**.

Table 8-142 DBE_PERF.STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.10.23 DBE_PERF.SUMMARY_STATIO_ALL_INDEXES

Contains one row for each index in the cluster database, showing a summary of I/O statistics about specific indexes, as described in **Table 8-143**.

Table 8-143 DBE_PERF.SUMMARY_STATIO_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.

Name	Type	Description
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

8.2.10.24 DBE_PERF.GLOBAL_STATIO_ALL_INDEXES

Contains one row for each index in databases on each node, showing I/O statistics about specific indexes, as described in **Table 8-144**.

Table 8-144 DBE_PERF.GLOBAL_STATIO_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

8.2.10.25 DBE_PERF.STATIO_ALL_SEQUENCES

Contains one row for each sequence in the current database, showing I/O statistics about specific sequences, as described in **Table 8-145**.

Table 8-145 DBE_PERF.STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

8.2.10.26 DBE_PERF.SUMMARY_STATIO_ALL_SEQUENCES

Contains I/O statistics about one row of each sequence in databases in the cluster, as described in **Table 8-146**.

Table 8-146 DBE_PERF.SUMMARY_STATIO_ALL_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

8.2.10.27 DBE_PERF.GLOBAL_STATIO_ALL_SEQUENCES

Contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences, as described in **Table 8-147**.

Table 8-147 DBE_PERF.GLOBAL_STATIO_ALL_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.11 Communications Library

8.2.11.1 DBE_PERF.COMM_DELAY

Displays the TCP proxy communications library status for a single DN, as described in **Table 8-148**.

Table 8-148 DBE_PERF.COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs). **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs).

8.2.11.2 DBE_PERF.GLOBAL_COMM_DELAY

Displays the TCP proxy communications library status for all the DNs, as described in **Table 8-149**.

Table 8-149 DBE_PERF.GLOBAL_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs). **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs).

8.2.11.3 DBE_PERF.COMM_RECV_STREAM

Displays the receiving stream status of all TCP proxy communications libraries on a single DN, as described in **Table 8-150**.

Table 8-150 DBE_PERF.COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

8.2.11.4 DBE_PERF.GLOBAL_COMM_RECV_STREAM

Displays the receiving stream status of all TCP proxy communications libraries on all the DNs, as described in **Table 8-151**.

Table 8-151 DBE_PERF.GLOBAL_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

8.2.11.5 DBE_PERF.COMM_SEND_STREAM

Displays the sending stream status of all TCP proxy communications libraries on a single DN, as described in **Table 8-152**.

Table 8-152 DBE_PERF.COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.11.6 DBE_PERF.GLOBAL_COMM_SEND_STREAM

Displays the sending stream status of all TCP proxy communications libraries on all the DNs, as described in **Table 8-153**.

Table 8-153 DBE_PERF.GLOBAL_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

8.2.11.7 DBE_PERF.COMM_STATUS

Displays the TCP proxy communications library status on a single DN, as described in **Table 8-154**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-154 DBE_PERF.COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the bigint node, in KByte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the bigint node, in KByte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the gs_sender_flow_controller thread.
used_rflow	integer	Real-time usage of the gs_receiver_flow_controller thread.
used_rloop	integer	Highest real-time usage among multiple gs_receivers_loop threads.
stream	integer	Total number of used logical connections.

8.2.11.8 DBE_PERF.GLOBAL_COMM_STATUS

Displays the TCP proxy communications library status on all the DNs, as described in **Table 8-155**.

Table 8-155 DBE_PERF.GLOBAL_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the bigint node, in KByte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the bigint node, in KByte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the gs_sender_flow_controller thread.
used_rflow	integer	Real-time usage of the gs_receiver_flow_controller thread.
used_rloop	integer	Highest real-time usage among multiple gs_receivers_loop threads.
stream	integer	Total number of used logical connections.

8.2.11.9 DBE_PERF.GLOBAL_COMM_CHECK_CONNECTION_STATUS

Displays the connection status of all CNs and all active nodes (CNs and primary DNs). The permission control is inherited from the **DBE_PERF** schema, as described in **Table 8-156**.

Table 8-156 DBE_PERF.GLOBAL_COMM_CHECK_CONNECTION_STATUS columns

Name	Type	Description
node_name	name	Instance name.
remote_name	name	Name of the peer instance.
remote_host	text	IP address of the peer instance.
remote_port	bigint	Port number of the peer instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_connected	boolean	Detects the network status between the current instance and the peer instance: • **t** (true): The network between instances is normal. • **f** (false): The network between instances is abnormal.
no_error_occur	boolean	Pooler connection result between the current instance and the peer instance. • **t** (true) indicates that the pooler connection is normal. • **f** (false) indicates that the pooler connection is abnormal.

8.2.12 Utility

8.2.12.1 DBE_PERF.REPLICATION_STAT

Describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 8-157**.

Table 8-157 DBE_PERF.REPLICATION_STAT columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
usename	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Log replication state: • Catch-up state. • Consistent streaming state.
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication. • Synchronous replication. • Potential synchronization.
dbid	oid	ID of the database to which the statistics belong.

8.2.12.2 DBE_PERF.GLOBAL_REPLICATION_STAT

Displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 8-158**.

Table 8-158 DBE_PERF.GLOBAL_REPLICATION_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
usename	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: • Catch-up state. • Consistent streaming state.
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication. • Synchronous replication. • Potential synchronization.
dbid	oid	ID of the database to which the statistics belong.

8.2.12.3 DBE_PERF.REPLICATION_SLOTS

Displays replication slot information, as described in **Table 8-159**.

Table 8-159 DBE_PERF.REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system-catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter. Specifies whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes. • **f** (false): no.

8.2.12.4 DBE_PERF.GLOBAL_REPLICATION_SLOTS

Displays information about replicated slots on each node in the cluster, as described in **Table 8-160**.

Table 8-160 DBE_PERF.GLOBAL_REPLICATION_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system-catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter. Specifies whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes. • **f** (false): no.

8.2.12.5 DBE_PERF.BGWRITER_STAT

Displays statistics about the BGWRITER thread's activities, as described in **Table 8-161**.

Table 8-161 DBE_PERF.BGWRITER_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time spent on performing write operations during checkpointing, in milliseconds.
checkpoint_sync_time	double precision	Total time spent on performing sync operations during checkpointing, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written during checkpointing.
buffers_clean	bigint	Number of buffers written by the BGWRITER thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
maxwritten_clean	bigint	Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time when the statistics of the current row were reset last time.

8.2.12.6 DBE_PERF.GLOBAL_BGWRITER_STAT

Displays statistics about the bgwriter thread's activities on all instances, as described in **Table 8-162**.

Table 8-162 DBE_PERF.GLOBAL_BGWRITER_STAT columns

Name	Type	Description
node_name	name	Instance name.
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time spent on performing write operations during checkpointing, in milliseconds.
checkpoint_sync_time	double precision	Total time spent on performing sync operations during checkpointing, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written during checkpointing.
buffers_clean	bigint	Number of buffers written by the BGWRITER thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
maxwritten_clean	bigint	Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time when the statistics of the current row were reset last time.

8.2.12.7 DBE_PERF.POOLER_STATUS

Queries the cache connection status of the pooler module on the local CN, as described in **Table 8-163**.

Table 8-163 DBE_PERF.POOLER_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	bigint	Port number of the node connected.
fdsock	bigint	Port file descriptor.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

8.2.12.8 DBE_PERF.POOLER_AGENT

Queries information about the pooler agent on the connected CN to help locate connection pool problems. If a DN is connected for query, an empty table is returned. Only users with the SYSADMIN permission can access this view. For details about the return values, see **Table 8-164**.

Table 8-164 DBE_PERF.POOLER_AGENT columns

Name	Type	Description
index	bigint	Index of the current agent in the global agents.
database_name	text	Name of the database in the current session.
user_name	text	Username of the current session.
session_id	bigint	• ID of the thread connected to the CN for non-thread pool logic. • Session ID for connecting to the CN for thread pool logic.
dn_oids	oid[]	List of recorded DN OIDs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cn_oids	oid[]	List of recorded CN OIDs.
agent_init	timestamp with time zone	Time when the agent is initialized. The agent is initialized when a session is created or the pgxc catalog information is reloaded.

8.2.12.9 DBE_PERF.GLOBAL_CKPT_STATUS

Displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in **Table 8-165**.

Table 8-165 DBE_PERF.GLOBAL_CKPT_STATUS columns

Name	Type	Description
node_name	text	Instance name.
ckpt_redo_point	text	Checkpoint of the current instance.
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time.
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time.
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time.
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time.
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time.

8.2.12.10 DBE_PERF.GLOBAL_DOUBLE_WRITE_STATUS

Displays the information about doublewrite files of all instances in the entire cluster, as described in **Table 8-166**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-166 DBE_PERF.GLOBAL_DOUBLE_WRITE_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	bigint	Sequence number of the doublewrite file.
curr_start_page	bigint	Start page for restoring the doublewrite file.
file_trunc_num	bigint	Number of times that the doublewrite file is reused.
file_reset_num	bigint	Number of reset times after the doublewrite file is full.
total_writes	bigint	Total number of I/Os of the doublewrite file.
low_threshold_writes	bigint	Number of I/Os for inefficient doublewrite files.
high_threshold_writes	bigint	Number of I/Os for efficient doublewrite files.
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area.
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency.
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency.
file_id	bigint	ID of the current doublewrite file.

8.2.12.11 DBE_PERF.GLOBAL_PAGEWRITER_STATUS

Displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in **Table 8-167**.

Table 8-167 DBE_PERF.GLOBAL_PAGEWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name.
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup to the current time.
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch.
remain_dirty_page_num	bigint	Estimated number of remaining dirty pages.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
queue_head_page_rec_lsn	text	**recovery_lsn** of the first dirty page in the dirty page queue of the current instance.
queue_rec_lsn	text	**recovery_lsn** of the dirty page queue of the current instance.
current_xlog_insert_lsn	text	Position where Xlogs of the current instance are written. This parameter is invalid for a standby node.
ckpt_redo_point	text	Checkpoint of the current instance.

8.2.12.12 DBE_PERF.GLOBAL_POOLER_STATUS

Queries the cache connection status of the pooler modules on all CNs, as described in **Table 8-168**.

Table 8-168 DBE_PERF.GLOBAL_POOLER_STATUS columns

Name	Type	Description
source_node_name	name	Source node name.
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the connected node.
node_port	bigint	Port number of the node connected.
fdsock	bigint	Port file descriptor.
remote_pid	bigint	Thread ID of the remote node connected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

8.2.12.13 DBE_PERF.GLOBAL_RECORD_RESET_TIME

Obtains statistics about the reset (restart, active/standby switchover, and database deletion) time of each node in the cluster, as described in **Table 8-169**.

Table 8-169 DBE_PERF.GLOBAL_RECORD_RESET_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset.

8.2.12.14 DBE_PERF.GLOBAL_REDO_STATUS

Displays the replaying of logs about instances in the entire cluster, as described in **Table 8-170**.

Table 8-170 DBE_PERF.GLOBAL_REDO_STATUS columns

Name	Type	Description
node_name	text	Instance name.
redo_start_ptr	bigint	Start point for replaying the instance logs.
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed.
redo_done_time	bigint	End time (UTC) when the instance logs are replayed.
curr_time	bigint	Current time (UTC) of the instance.
min_recovery_point	bigint	Minimum barrier for the current instance log to provide services after the replay is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
read_ptr	bigint	Position for reading the instance logs.
last_replayed_read_ptr	bigint	Position for replaying the instance logs.
recovery_done_ptr	bigint	Replay position after the instance is started.
read_xlog_io_counter	bigint	Number of I/Os when the current instance reads and replays logs.
read_xlog_io_total_dur	bigint	Total I/O duration when the current instance reads and replays logs.
read_data_io_counter	bigint	Number of data page I/O reads during replay in the current instance log.
read_data_io_total_dur	bigint	Total I/O duration reads during replay in the current instance log.
write_data_io_counter	bigint	Number of data page I/O writes during replay in the current instance log.
write_data_io_total_dur	bigint	Total I/O duration writes during replay in the current instance log.
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance log.
process_pending_total_dur	bigint	Synchronization duration of log distribution threads during replay in the instance log.
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance log.
apply_total_dur	bigint	Synchronization duration of replay threads during replay in the instance log.
speed	bigint	Log replay rate of the current instance. The value is updated every time when a 256 MB log is replayed. The unit is byte/s.
local_max_ptr	bigint	Maximum number of replay logs received by the localhost after the instance is started.
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk.
worker_info	text	Replay thread information of the instance. If parallel replay is not enabled, the value is null.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.12.15 DBE_PERF.GLOBAL_RECOVERY_STATUS

Displays log flow control information about the primary and standby nodes, as described in **Table 8-171**.

Table 8-171 DBE_PERF.GLOBAL_RECOVERY_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes).
standby_node_name	text	Name of the standby node.
source_ip	text	IP address of the primary node.
source_port	integer	Port number of the primary node.
dest_ip	text	IP address of the standby node.
dest_port	integer	Port number of the standby node.
current_rto	bigint	Current log flow control time of the standby node (unit: s).
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s).
current_sleep_time	bigint	Sleep time (in microseconds) required by the host to achieve the expected RTO.

8.2.12.16 DBE_PERF.CLASS_VITAL_INFO

Checks whether the OIDs of the same table or index are consistent for WDR snapshots, as described in **Table 8-172**.

Table 8-172 DBE_PERF.CLASS_VITAL_INFO columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Schema name.
relname	name	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relkind	"char"	Object type. Its value can be: • **r**: ordinary table. • **t**: TOAST table. • **i**: index. • **G**: global secondary index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

8.2.12.17 DBE_PERF.USER_LOGIN

Records the number of user logins and logouts, as described in **Table 8-173**.

Table 8-173 DBE_PERF.USER_LOGIN columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
user_id	integer	User OID (Its value is the same as that of **oid** in pg_authid.)
login_counter	bigint	Number of logins.
logout_counter	bigint	Number of logouts.
dbid	oid	ID of the database to which the user logs in.

8.2.12.18 DBE_PERF.SUMMARY_USER_LOGIN

Records information about user logins and logouts on all CNs, as described in **Table 8-174**.

Table 8-174 DBE_PERF.SUMMARY_USER_LOGIN columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
user_id	integer	User OID (Its value is the same as that of **oid** in pg_authid.)
login_counter	bigint	Number of logins.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
logout_counter	bigint	Number of logouts.
dbid	oid	ID of the database to which the user logs in.

8.2.12.19 DBE_PERF.GLOBAL_GET_BGWRITER_STATUS

Displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer eviction information, as described in **Table 8-175**.

Table 8-175 DBE_PERF.GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name.
bgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time.
bgwr_last_flush_num	integer	Number of dirty pages flushed by the bgwriter thread in the previous batch.
candidate_slots	integer	Number of pages in the current candidate buffer chain.
get_buffer_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction.

8.2.12.20 DBE_PERF.GLOBAL_SINGLE_FLUSH_DW_STATUS

Displays information about doublewrite files eliminated on a single page of all instances in the entire cluster, as described in **Table 8-176**. In the displayed information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version. The doublewrite page flushing status of the first version refers to performing single-page eviction doublewrite on a non-segment page, and the doublewrite page flushing case of the second version refers to performing single-page eviction doublewrite on a segment page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-176 DBE_PERF.GLOBAL_SINGLE_FLUSH_DW_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	text	Sequence number of the doublewrite file.
curr_start_page	text	Start position of the current doublewrite file.
total_writes	text	Total number of data write pages in the current doublewrite file.
file_trunc_num	text	Number of times that the doublewrite file is reused.
file_reset_num	text	Number of reset times after the doublewrite file is full.

8.2.12.21 DBE_PERF.GLOBAL_CANDIDATE_STATUS

Displays the number of candidate buffers and buffer eviction information of all instances in the database, as described in **Table 8-177**.

Table 8-177 DBE_PERF.GLOBAL_CANDIDATE_STATUS columns

Name	Type	Description
node_name	text	Node name.
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool.
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool.
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool.
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool.
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.12.22 DBE_PERF.PARALLEL_DECODE_STATUS

Displays parallel decoding information about replication slots on the current node, as described in **Table 8-178**. This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

Table 8-178 DBE_PERF.PARALLEL_DECODE_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamp with time zone	Time when the replication slot reads the logical log for the last time.

8.2.12.23 DBE_PERF.GLOBAL_PARALLEL_DECODE_STATUS

Displays parallel decoding information about replication slots on each primary DN in a cluster, as described in **Table 8-179**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 8-179 DBE_PERF.GLOBAL_PARALLEL_DECODE_STATUS columns

Name	Type	Description
node_name	name	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamp with time zone	Time when the replication slot reads the logical log for the last time.

8.2.12.24 DBE_PERF.PARALLEL_DECODE_THREAD_INFO

Displays information about threads that perform parallel decoding on the current node, as described in **Table 8-180**. This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

Table 8-180 DBE_PERF.PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.12.25 DBE_PERF.GLOBAL_PARALLEL_DECODE_THREAD_INFO

Displays information about threads that perform parallel decoding on each primary DN in a cluster, as described in **Table 8-181**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 8-181 DBE_PERF.GLOBAL_PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
node_name	name	Node name.
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

8.2.12.26 DBE_PERF.GLOBAL_ADIO_COMPLETER_STATUS

Displays statistics about the AIO Completer thread in all cluster instances, as described in **Table 8-182**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 8-182 DBE_PERF.GLOBAL_ADIO_COMPLETER_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
tid	bigint	ID of the AIO Completer thread.
thread_type	text	AIO Completer thread type (read or write).
aio_submitted_num	bigint	Number of committed asynchronous I/O requests of the AIO Completer thread.
aio_completed_num	bigint	Number of completed asynchronous I/O requests of the AIO Completer thread.
aio_incompleted_num	bigint	Number of asynchronous I/O requests that are not completed of the AIO Completer thread.
slot_count_left	bigint	Indicates the number of idle slots.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.12.27 DBE_PERF.GLOBAL_AIO_SLOT_USAGE_STATUS

Displays statistics about asynchronous I/O commit slots in all cluster instances, as described in **Table 8-183**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 8-183 DBE_PERF.GLOBAL_AIO_SLOT_USAGE_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
slot_id	integer	Slot ID.
slot_type	"char"	Slot type. The value can be **r** (read) or **w** (write).
status	boolean	Slot usage status.
buffer_id	bigint	Buffer ID corresponding to the slot.
relfilenode_blocknum	text	Position of the physical page where the buffer corresponding to the slot is located.
lsn	bigint	LSN corresponding to the page.
submitted_time	bigint	Time when a page is committed asynchronously.
elapsed_time	bigint	Waiting time of the page.

8.2.12.28 DBE_PERF.GLOBAL_XLOG_REDO_STAT

This view displays statistics about various types of logs that have been replayed on each standby DN in the cluster, as shown in **Table 8-184**.

Table 8-184 DBE_PERF.GLOBAL_XLOG_REDO_STAT columns

Parameter	Type	Description
node_name	text	Instance name.
xlog_type	text	Log types.
rmid	xid	Resource manager ID.
num	xid	Number of replayed statements.
extra	xid	The valid values for page replay logs and xact logs are different: • Number of pages read from the disk if the log is of the page type. • Number of deleted files if the log is of the xact type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.12.29 DBE_PERF.EMERGENCY_OPERATION_RECORDS

This view is used to view the usage of the UDS O&M channel on each CN or DN, as shown in **Table 8-185**.

Table 8-185 DBE_PERF.EMERGENCY_OPERATION_RECORDS columns

Parameter	Type	Description
record_time	timestamptz	Time when the O&M channel is used.
action	text	Operations performed through the O&M channel.
source	text	Source of the O&M channel. The value can be **gsql** or **cm**.
detail	text	Operation result.

8.2.12.30 DBE_PERF.KERNEL_INFO

Displays key data of the corresponding module on each CN or DN, as described in **Table 8-186**.

Table 8-186 DBE_PERF.KERNEL_INFO columns

Parameter	Type	Description
node_name	text	Node name.
module	text	Module name. • **XACT** (transaction module) • **STANDBY** (standby module) • **UNDO** (undo module) • **HOTPATH** (hot patch module) • **LOCK** (lock module) • FULL_SQL • SQL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
name	text	Name of the key data in the memory state. • **startup_max_xid** (**XACT**: maximum XID when a thread is started) • **recent_local_xmin** (**XACT**: minimum XID of local active transactions) • **recent_global_xmin** (**XACT**: minimum XID of global active transactions) • **standby_xmin** (**STANDBY**: minimum XID of an active transaction on the standby node) • **standby_redo_cleanup_xmin** (**STANDBY**: minimum XID of cleanup logs during redo on the standby node) • **standby_redo_cleanup_xmin_lsn** (**STANDBY**: LSN of the minimum XID of cleanup logs during redo on the standby node) • **local_csn_min** (**XACT**: minimum CSN of a local active transaction) • **replication_slot_xmin** (**XACT**: minimum XID of a replication slot) • **replication_slot_catalog_xmin** (**XACT**: minimum XID of a catalog replication slot) • **global_recycle_xid** (**UNDO**: minimum XID of a global undo recycling transaction) • **global_frozen_xid** (**XACT**: minimum XID of a globally frozen transaction) • **recent_xmin XACT**: (minimum XID of active transactions in the current session) • **next_csn** (**XACT**: CSN of the next transaction) • **hotpatch_additional_info** (**HOTPATH**: reserved column for hot patches) • **stmt_session_discard_records** (**FULL SQL**: data volume discarded by full SQL statements due to full slots supported by the kernel) • **stmt_shm_flush_discard_records** (**FULL SQL**: data volume discarded by full SQL statements due to full ringbuf supported by the kernel) • **idle_in_trans_timeout_records** (**XACT**: accumulated data volume of idle transaction timeout counts supported by the kernel)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
		• **total_lock_usage** (**LOCK**: number of locks applied for through the primary lock table) • **total_lock_usage_rate** (**LOCK**: usage of the prim+ary lock tablespace) • **fastpath_strong_relation_locks_count** (**LOCK**: partition where FASTPATH strong lock conflicts exist and the number of strong locks corresponding to the partition) • **fastpath_failure_rate** (**LOCK**: percentage of locks that cannot be applied for through FASTPATH due to strong lock conflicts in the corresponding partition) • **lock_acquire_lack_fastpath_count** (**LOCK**: total number of times that locks fail to be applied for through FASTPATH because FASTPATH slots are used up) • **n_soft_parse** (**SQL**: number of soft parsing times) • **n_hard_parse** (**SQL**: number of hard parsing times)
value	text	Value of the key data in the memory state.

8.2.13 Lock

8.2.13.1 DBE_PERF.LOCKS

Displays information about locks held by each open transaction, as described in **Table 8-187**.

Table 8-187 DBE_PERF.LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket number.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock The value is **NULL** if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread.
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	Global session ID.

8.2.13.2 DBE_PERF.GLOBAL_LOCKS

Displays information about locks held by open transactions on each node, as described in **Table 8-188**.

Table 8-188 DBE_PERF.GLOBAL_LOCKS columns

Name	Type	Description
node_name	name	Node name.
locktype	text	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket ID.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
global_sessionid	text	Global session ID.
mode	text	Lock mode held or desired by this thread.
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the locktag_decode() function.

8.2.14 Wait Event

8.2.14.1 DBE_PERF.WAIT_EVENTS

Displays statistics about wait events on the current node, as described in **Table 8-189**. For details about key events in the kernel, see **Table 8-192**. Alternatively,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

view the list of all events in the system in the wait_event_info view. For details about the impact of each transaction lock on services, see **LOCK**.

The constraints on the query of this system catalog are as follows:

This system catalog is controlled by **track_activities** and **enable_instr_track_wait**. If the parameters are disabled, the system does not record wait events, and no data can be queried in this catalog.

Table 8-189 DBE_PERF.WAIT_EVENTS columns

Name	Type	Description
nodename	text	Database node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of times that the lock wait fails.
total_wait_time	bigint	Total waiting time (unit: μs).
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

8.2.14.2 DBE_PERF.GLOBAL_WAIT_EVENTS

Displays statistics about wait events on each node, as described in **Table 8-190**.

Table 8-190 DBE_PERF.GLOBAL_WAIT_EVENTS columns

Name	Type	Description
nodename	text	Database node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of times that the lock wait fails.
total_wait_time	bigint	Total waiting time (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

8.2.14.3 DBE_PERF.WAIT_EVENT_INFO

Displays the details about wait events, as described in **Table 8-191** and **Table 8-192**.

Table 8-191 DBE_PERF.WAIT_EVENT_INFO columns

Name	Type	Description
module	text	Name of the module an event belongs to.
type	text	Event type.
event	text	Event name.

Table 8-192 Wait event information list

Module Category	Event Category	Event	Description
Lock	Wait event	acquire lock	Waiting for locking until the locking succeeds or times out.
SharedMemory	LWLock event	ShmemIndexLock	Protects the primary index table, a hash table, in shared memory.
Shared buffer	LWLock event	BufMappingLock	Protects operations on a shared-buffer mapping table.
Lmgr	LWLock event	LockMgrLock	Protects the information about a common lock structure.
LWLock	Wait event	acquire lwlock	Waits for a lightweight lock.
I/O	Wait event	wait io	Waiting until the I/O is complete.
COMM	Wait event	wait cmd	Waits for reading network communication packets to complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
COMM	Wait event	wait pooler get conn	Waits for pooler to obtain connections.
COMM	Wait event	wait pooler abort conn	Waits for pooler to terminate connections.
COMM	Wait event	wait pooler clean conn	Waits for pooler to clear connections.
COMM	Wait event	get conn	Obtaining the connection to other nodes.
COMM	Wait event	set cmd	Waits for running the **SET**, **RESET**, or **TRANSACTION BLOCK LEVEL** statement on the connection.
COMM	Wait event	cancel query	Canceling the SQL statement that is being executed through the connection.
COMM	Wait event	stop query	Stopping the query that is being executed through the connection.
COMM	Wait event	wait node	Waits for receiving data through the connection to an instance.
COMM	Wait event	flush data	Waits for sending data to other nodes in the network.
COMM	Wait event	stream get conn	Waits for establishing connections to consumer nodes when the stream flow is initialized.
COMM	Wait event	wait producer ready	Waits for every producer to get ready when the stream flow is initialized.
Stream	Wait event	synchronize quit	Waits for the threads in the stream thread group to quit when the stream plan ends. If information similar to "synchronize quit, total *m*, remain *n*" is displayed in the **wait_status** column, there are **m** concurrent tasks, and **n** of them are not in the unified exit state.
Stream	Wait event	wait stream group destroy	Waits for destroying the stream node group when the stream plan ends.
Stream	Wait event	wait stream thread ready	Waits for the stream producer to be ready. It is blocked until its thread ID is successfully set.
Stream	Wait event	wait create stream thread	Waits for the stream thread to start.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Transaction	Wait event	wait transaction sync	Waits for transaction synchronization.
Transaction	Wait event	wait data sync	Waits for the completion of data page synchronization to the standby instance.
Transaction	Wait event	wait data sync queue	Waits for putting the row-store data pages into the synchronization queue.
Transaction	LWLock event	OidGenLock	Prevents different threads from generating the same OID.
Transaction	LWLock event	XidGenLock	Prevents two transactions from obtaining the same transaction ID.
Transaction	LWLock event	ProcArrayLock	Prevents concurrent access to or concurrent modification on ProcArray shared arrays.
Transaction	LWLock event	SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
Transaction	LWLock event	MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
Transaction	LWLock event	TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
Transaction	LWLock event	SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
Transaction	LWLock event	SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
Transaction	LWLock event	SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks.
Transaction	LWLock event	PredicateLockMgrLock	Used to protect the information about a lock structure that has serializable transactions.
Transaction	LWLock event	OldSerXid SLRU lwlock	Used to protect SLRU buffers of old transaction IDs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Transaction	LWLock event	OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
Transaction	Lock event	transactionid	Adds a lock to a transaction ID.
Transaction	Lock event	virtualxid	Adds a lock to a virtual transaction ID.
Checkpoint	LWLock event	CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
Checkpoint	LWLock event	CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
Analyze	LWLock event	AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
Vacuum	LWLock event	BtreeVacuumLock	Used to prevent **VACUUM** from clearing pages that are being used by B-tree indexes.
Vacuum	LWLock event	AutovacuumLock	Used to access the autovacuum worker array in serial mode.
Vacuum	LWLock event	AutovacuumScheduleLock	Used to distribute tables requiring **VACUUM** in serial mode.
Auto vacuum	LWLock event	AutovacuumLock	Protects the autovacuum shared memory structure.
Auto vacuum	LWLock event	AutovacuumScheduleLock	Used to protect the information about autovacuum workers.
Auto analyze	LWLock event	AutoanalyzeLock	Used to protect the *autoAnalyzeFreeProcess* variable and ensure that no more than 10 autoanalyze threads are running at the same time.
WAL	Wait event	wait wal sync	Waits for the completion of WAL of synchronization from the specified LSN to the standby instance.
WAL	I/O event	WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WAL	I/O event	WALBootstrapWrite	Writes an initialized WAL file during database initialization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
WAL	I/O event	WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WAL	I/O event	WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WAL	I/O event	WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WAL	I/O event	WALRead	Reads data from Xlogs during redo operations on two-phase files.
WAL	I/O event	WALSyncMethodAssign	Flushes all open WAL files to a disk.
WAL	I/O event	WALWrite	Writes a WAL file.
WAL	I/O event	LOGCTRL_SLEEP	Collects statistics on the number of stream control times and the sleep time of log stream control.
WAL	LWLock event	RcvWriteLock	Used to prevent concurrent call of **WalDataRcvWrite**.
WAL	LWLock event	WALBufMappingLock	An exclusive (X) lock needs to be added when the next page of an Xlog buffer is initialized.
WAL	LWLock event	WALInsertLock	Prevents multiple programs from writing data to the same Xlog buffer at the same time.
WAL	LWLock event	WALWriteLock	Used to prevent concurrent WAL write.
Relation	LWLock event	SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
Relation	LWLock event	SinvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
Relation	LWLock event	RelCacheInitLock	Used to add a lock before any operations are performed on the **init** file when messages are invalid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Relation	LWLock event	TablespaceCreateLock	Used to check whether a tablespace already exists.
Relation	LWLock event	RelfilenodeReuseLock	Used to prevent the link to a reused column attribute file from being canceled by mistake.
Relation	Lock event	relation	Adds a lock to a table.
Relation	Lock event	extend	Adds a lock to a table being scaled out.
Relation	Lock event	partition	Adds a lock to a partitioned table.
Relation	Lock event	partition_seq	Adds a lock to a partition of a partitioned table.
WLM	Wait event	wait active statement	Waits for active statements.
WLM	Wait event	wait memory	Waits for free memory.
DDL/DCL	Wait event	create index	Waits for the completion of index creation.
DDL/DCL	Wait event	analyze	Waits for analysis completion.
DDL/DCL	Wait event	vacuum	Waits for the completion of the **VACUUM** operation.
DDL/DCL	LWLock event	DelayDDLLock	Used to prevent concurrent DDL operations.
DDL/DCL	Wait event	vacuum full	Waits for the completion of the **VACUUM FULL** operation.
Executor	Wait event	Sort	Waits for the completion of tuple sorting.
Executor	Wait event	Sort - write file	Writes sorted data to a file temporarily since the memory is limited during merge sort.
Executor	Wait event	Material	Waits for tuple materialization.
Executor	Wait event	Material - write file	Waits for writing a materialized tuple to a file.
Executor	Wait event	HashJoin - build hash	Waits until a hash table is created when a hash join is executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Executor	Wait event	HashJoin - write file	Waits for writing the hash result of a tuple to a disk when a hash join is executed.
Executor	Wait event	HashAgg - build hash	Waits until a hash table is created when a hash aggregate is executed.
Executor	Wait event	HashAgg - write file	Waits for writing the hash result of a tuple to a disk when a hash aggregate is executed.
Executor	Wait event	HashSetop - build hash	Waits until a hash table is created when an OP operation is performed using the hash algorithm.
Executor	Wait event	HashSetop - write file	Waits for writing the hash result of a tuple to a disk when an OP operation is performed using the hash algorithm.
Executor	Wait event	wait sync consumer next step	Waits for the stream consumer to perform the next step.
Executor	Wait event	wait sync producer next step	Waits for the stream producer to perform the next step.
GTM	Wait event	gtm connect	Waits for connecting to GTM.
GTM	Wait event	gtm reset xmin	Waits for GTM to reset the minimum transaction ID.
GTM	Wait event	gtm get xmin	Waits for obtaining the minimum transaction ID from GTM.
GTM	Wait event	gtm get gxid	Waits for obtaining the global transaction ID from GTM during transaction startup.
GTM	Wait event	gtm get csn	Waits for obtaining the CSN from GTM during transaction startup.
GTM	Wait event	gtm get snapshot	Waits for obtaining snapshots from GTM during transaction startup.
GTM	Wait event	gtm begin trans	Waits for GTM to start a transaction.
GTM	Wait event	gtm commit trans	Waits for GTM to commit a transaction.
GTM	Wait event	gtm rollback trans	Waits for GTM to roll back transactions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
GTM	Wait event	gtm start preprare trans	Waits for GTM to complete the first phase during two-phase commit.
GTM	Wait event	gtm prepare trans	Waits for GTM to complete the second phase during two-phase commit.
GTM	Wait event	gtm open sequence	Waits for GTM to create a sequence.
GTM	Wait event	gtm close sequence	Waits for GTM to complete the **ALTER SEQUENCE** operation.
GTM	Wait event	gtm set sequence val	Waits for GTM to set a sequence value.
GTM	Wait event	gtm drop sequence	Waits for GTM to delete a sequence.
GTM	Wait event	gtm rename sequence	Waits for GTM to rename a sequence.
GTM	LWLock event	GTMHostInfo Lock	Used to protect GTM information.
Temp File	I/O event	BufFileRead	Reads data from a temporary file to a specified buffer.
Temp File	I/O event	BufFileWrite	Writes the content of a specified buffer to a temporary file.
Pg_control	I/O event	ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.
Pg_control	I/O event	ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileWrite	Writes the **pg_control** file, mainly during database initialization.
Pg_control	I/O event	ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Pg_control	LWLock event	ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file.
File operation	I/O event	CopyFileRead	Reads a file during file copying.
File operation	I/O event	CopyFileWrite	Writes a file during file copying.
File operation	I/O event	DataFileExtend	Writes a file during file name extension.
Table data file	I/O event	DataFileImmediateSync	Flushes a table data file to a disk immediately.
Table data file	I/O event	DataFilePrefetch	Reads a table data file asynchronously.
Table data file	I/O event	DataFileRead	Reads a table data file synchronously.
Table data file	I/O event	DataFileSync	Synchronizes a table data file to a disk.
Table data file	I/O event	DataFileTruncate	Truncates a table data file.
Table data file	I/O event	DataFileWrite	Writes a table data file.
Table data file	LWLock event	SyncScanLock	Used to determine the start position of a relfilenode during heap scanning
Table data file	LWLock event	RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
metadata	LWLock event	MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
postmaster.pid	I/O event	LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
postmaster.pid	I/O event	LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
postmaster.pid	I/O event	LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
Pid File	I/O event	LockFileCreateRead	Reads the LockFile file **%s.lock**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Pid File	I/O event	LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.
Pid File	I/O event	LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.
System catalog mapping file	I/O event	RelationMapRead	Reads the mapping file between system catalogs and storage locations.
System catalog mapping file	I/O event	RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
System catalog mapping file	I/O event	RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
Streaming replication	I/O event	ReplicationSlotRead	Reads a streaming replication slot file This operation is performed during a restart.
Streaming replication	I/O event	ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk.
Streaming replication	I/O event	ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
Streaming replication	I/O event	ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
Streaming replication	LWLock event	ReplicationSlotAllocationLock	Used to allocate a replication slot.
Streaming replication	LWLock event	ReplicationSlotControlLock	Used to detect replication slot name conflicts and identify replication slots that can be allocated.
Clog	I/O event	SLRUFlushSync	Flushes the **pg_clog** file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRURead	Reads the **pg_clog** file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Clog	I/O event	SLRUSync	Writes dirty pages into the **pg_clog** file, and flushes the file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRUWrite	Writes the **pg_clog** file.
Clog	LWLock event	CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
Clog	LWLock event	MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**.
Clog	LWLock event	MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**.
timelinehistory	I/O event	TimelineHistoryRead	Reads the **timelinehistory** file, during database startup.
timelinehistory	I/O event	TimelineHistorySync	Flushes the **timelinehistory** file to a disk, during database startup.
timelinehistory	I/O event	TimelineHistoryWrite	Writes the **timelinehistory** file.
pg_twophase	I/O event	TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
Cluster	LWLock event	NodeTableLock	Used to protect a shared structure that stores CNs and DNs information.
Concurrency	LWLock event	PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.
Concurrency	LWLock event	AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
Concurrency	LWLock event	AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Double write	I/O event	DoubleWriteFileWrite	Writes pages to a doublewrite file during the doublewrite process.
Double write	I/O event	DoubleWriteFileRead	Reads a doublewrite file during restoration for a halfwrite.
Statistics file	LWLock event	FileStatLock	Used to protect a data structure that stores statistics file information.
Master-slave replication	LWLock event	SyncRepLock	Protects Xlog synchronization information during primary/standby replication.
Master-slave replication	LWLock event	ReplicationSlotAllocationLock	Used to add a lock when a primary node allocates streaming replication slots during primary/standby replication.
Master-slave replication	LWLock event	ReplicationSlotControlLock	Used to prevent concurrent update of streaming replication slot status during primary/standby replication.
Master-slave replication	LWLock event	LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure.
Master-slave replication	LWLock event	DataSyncRepLock	Used to protect data page synchronization information during primary/standby replication.
Speed up the cluster	LWLock event	SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
Resource manage	LWLock event	ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.
OBS	LWLock event	OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
OBS	LWLock event	OBSRuntimeLock	Used to obtain environment variables, for example, *GAUSSHOME*.
LLVM	LWLock event	LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
LLVM	LWLock event	LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.
MPP is compatible with ORACLE scheduled task function	LWLock event	JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.
Operator history information statistics	LWLock event	OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
Operator history information statistics	LWLock event	OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
query history information statistics	LWLock event	SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
query history information statistics	LWLock event	SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
query history information statistics	LWLock event	WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
barrier	LWLock event	BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
CSN	LWLock event	CSNBufMappingLock	Used to protect CSN pages.
instrumentation	LWLock event	UniqueSQLMappingLock	Used to protect a unique SQL hash table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
instrumentation	LWLock event	InstrUserLock	Used to protect a user hash table.
instrumentation	LWLock event	PercentileLock	Used to protect global percentile buffers.
instrumentation	LWLock event	InstrWorkloadLock	Used to protect a workload transaction hash table.
Pgproc	LWLock event	Pgproc lwlock	Used to protect the PGPROC structure.
Async buffer	LWLock event	AsyncCtlLock	Used to protect asynchronization buffers.
MultiXact	LWLock event	MultiXactOffset lwlock	Used to protect SLRU buffers of a MultiXact offset.
MultiXact	LWLock event	MultiXactMemberlwlock	Used to protect SLRU buffer of a MultiXact member.
CBM	LWLock event	CBMParseXlogLock	Protects the lock used when CBM parses Xlogs.
BadBlock	LWLock event	BadBlockStatHashLock	Used to protect the hash table **global_bad_block_stat**.
Page	Lock event	page	Adds a lock to a table page.
Tuple	Lock event	tuple	Adds a lock to a tuple on a page.
object	Lock event	object	Adds a lock to an object.
user	Lock event	userlock	Adds a lock to a user.
advisor	Lock event	advisory	Adds an advisory lock.
ODBC	LWLock event	ExtensionConnectorLibLock	Adds a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
COMM	Wait event	Accept client conn - Total Time	(After GaussDB receives a connection request from a client) Total duration from the time when a connection is established to the time when the connection is successful.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
COMM	Wait event	Accept client conn - ThrdPool - add epoll	(After GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread pool adds the session handle to the epoll in thread pool mode.
COMM	Wait event	Accept client conn - ThrdPool - wait worker	(After GaussDB receives a connection request from a client) Duration from the time when the thread pool adds the session handle to the epoll to the time when the worker thread starts to work in thread pool mode.
COMM	Wait event	Accept client conn - ThrdPool - init session	(After GaussDB receives a connection request from a client) Duration from the time when the worker thread starts to work to the time when the session initialization ends in thread pool mode.
COMM	Wait event	Accept client conn - Worker - init proc	(After GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread initialization ends in non-thread pool mode.
COMM	Wait event	Accept client conn - Worker - init session	(After GaussDB receives a connection request from a client) Duration from the time when the thread initialization ends to the time when the session initialization ends in non-thread pool mode.

8.2.14.4 DBE_PERF.GLOBAL_DATANODES_WAIT_EVENTS

Displays statistics about wait events on the DN, as described in **Table 8-193**. When the **enable_direct_standby_datanodes** parameter is enabled, statistics about wait events on the standby DN are displayed.

Table 8-193 DBE_PERF.GLOBAL_DATANODES_WAIT_EVENTS columns

Name	Type	Description
nodename	text	Database node name.
type	text	Event type.
event	text	Event name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
wait	bigint	Number of times that the lock wait fails.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: μs).
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

8.2.15 Configuration

8.2.15.1 DBE_PERF.CONFIG_SETTINGS

Displays information about GUC parameters of the database, as described in Table 8-194.

Table 8-194 DBE_PERF.CONFIG_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value.
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

8.2.15.2 DBE_PERF.GLOBAL_CONFIG_SETTINGS

Displays information about GUC parameters of databases on each node, as described in **Table 8-195**.

Table 8-195 DBE_PERF.GLOBAL_CONFIG_SETTINGS columns

Name	Type	Description
node_name	text	Node name.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
source	text	Method of assigning the parameter value.
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

8.2.16 Operator

8.2.16.1 DBE_PERF.OPERATOR_HISTORY_TABLE

Displays records about operators of completed jobs. Data is dumped from the kernel to this system catalog, as described in **Table 8-196**.

Table 8-196 DBE_PERF.OPERATOR_HISTORY_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

8.2.16.2 DBE_PERF.OPERATOR_RUNTIME

Displays information about operators of the jobs that are being executed by the current user, as described in **Table 8-197**.

Table 8-197 DBE_PERF.OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

8.2.16.3 DBE_PERF.GLOBAL_OPERATOR_HISTORY

Displays the records about operators after jobs are executed by the current user on all CNs, as described in **Table 8-198**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-198 DBE_PERF.GLOBAL_OPERATOR_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

8.2.16.4 DBE_PERF.GLOBAL_OPERATOR_HISTORY_TABLE

Displays the records about operators of completed jobs on all CNs. Data is dumped from the kernel to the system catalog GS_WLM_OPERATOR_INFO. This view is an aggregated view for querying the system catalog GS_WLM_OPERATOR_INFO from all CNs.

Columns in this view are the same as those in **Table 8-198**.

8.2.16.5 DBE_PERF.GLOBAL_OPERATOR_RUNTIME

Displays information about operators of the jobs that are being executed by the current user on all CNs, as described in **Table 8-199**.

Table 8-199 DBE_PERF.GLOBAL_OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

8.2.17 Workload Manager

8.2.17.1 DBE_PERF.WLM_CGROUP_CONFIG

Displays information about a Cgroup for a job that is being executed, as described in **Table 8-200**.

Table 8-200 DBE_PERF.WLM_CGROUP_CONFIG columns

Name	Type	Description
cgroup_name	text	Cgroup name.
priority	integer	Job priority.
usage_percent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
cpuacct	bigint	Allocated CPU quota.
cpuset	text	Allocated CPU cores.
relpath	text	Relative path of the Cgroup.
valid	text	Specifies whether the Cgroup is valid.
node_group	text	Node group name.

8.2.17.2 DBE_PERF.WLM_CLUSTER_RESOURCE_RUNTIME

Displays a DN resource summary, as described in **Table 8-201**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-201 DBE_PERF.WLM_CLUSTER_RESOURCE_RUNTIME columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN.
max_mem_util	integer	Maximum memory usage of a DN.
min_cpu_util	integer	Minimum CPU usage of a DN.
max_cpu_util	integer	Maximum CPU usage of a DN.
min_io_util	integer	Minimum I/O usage of a DN.
max_io_util	integer	Maximum I/O usage of a DN.
used_mem_rate	integer	Maximum memory usage of a physical node.

8.2.17.3 DBE_PERF.WLM_CONTROLGROUP_CONFIG

Displays information about all Cgroups in the current database, as described in **Table 8-202**.

Table 8-202 DBE_PERF.WLM_CONTROLGROUP_CONFIG columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
limits	bigint	Limit of CPUs allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in a Cgroup.

8.2.17.4 DBE_PERF.WLM_CONTROLGROUP_NG_CONFIG

Displays information about all node groups in the database, as described in **Table 8-203**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-203 DBE_PERF.WLM_CONTROLGROUP_NG_CONFIG columns

Name	Type	Description
group_name	text	Cgroup name.
group_type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	Class Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
limits	bigint	Limit of CPUs allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in a Cgroup.
group_kind	text	Node group type. Its value can be **i**, **n**, **v**, or **e**. • **i**: installation node group. • **n**: node group in a common cluster. • **e**: elastic cluster.

8.2.17.5 DBE_PERF.WLM_RESOURCEPOOL_RUNTIME

Displays statistics about a resource pool, as described in **Table 8-204**.

Table 8-204 DBE_PERF.WLM_RESOURCEPOOL_RUNTIME columns

Name	Type	Description
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
control_group	name	Cgroup associated with the resource pool.
parentid	oid	OID of the parent resource pool.
ref_count	integer	Number of jobs associated with the resource pool.
active_points	integer	Number of used points in the resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
running_count	integer	Number of jobs running in the resource pool.
waiting_count	integer	Number of jobs queuing in the resource pool.
io_limits	integer	IOPS upper limit of the resource pool.
io_priority	integer	I/O priority of the resource pool.

8.2.17.6 DBE_PERF.WLM_USER_RESOURCE_CONFIG

Displays the resource configuration information of a user, as described in **Table 8-205**.

Table 8-205 DBE_PERF.WLM_USER_RESOURCE_CONFIG columns

Name	Type	Description
userid	oid	OID of the user.
username	name	Username.
sysadmin	boolean	Specifies whether the user has the SYSADMIN permission.
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
parentid	oid	OID of the parent user.
totalspace	bigint	Size of the occupied space.
spacelimit	bigint	Upper limit of the space size.
childcount	integer	Number of child users.
childlist	texto	Child user list.

8.2.17.7 DBE_PERF.WLM_USER_RESOURCE_RUNTIME

Displays resource usage of all users. Only administrators can query this view, as described in **Table 8-206**. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

Table 8-206 DBE_PERF.WLM_USER_RESOURCE_RUNTIME columns

Name	Type	Description
username	name	Username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
used_memory	integer	Size of the memory being used (unit: MB).
total_memory	integer	Available memory (unit: MB). The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space (unit: KB).
total_space	bigint	Available storage space (unit: KB). The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB).
total_temp_space	bigint	Available temporary space (reserved column; unit: KB). The value **-1** indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB).
total_spill_space	bigint	Available space for storing spilled data (reserved column; unit: KB). The value **-1** indicates that the maximum space for storing spilled data is not limited.

8.2.17.8 DBE_PERF.WLM_WORKLOAD_HISTORY_INFO

Displays information about workload management after a job is complete or the exception has been handled, as described in **Table 8-207**.

Table 8-207 DBE_PERF.WLM_WORKLOAD_HISTORY_INFO columns

Name	Type	Description
statement	text	Statement executed for exception handling.
block_time	bigint	Block time before the statement is executed.
elapsed_time	bigint	Elapsed time when the statement is executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_cpu_time	bigint	Total time used by the CPU on the DN when the statement is executed for exception handling.
qualification_time	bigint	Period when the statement checks the skew.
cpu_skew_percent	integer	CPU usage skew on the DN when the statement is executed for exception handling.
control_group	text	Cgroup used when the statement is executed for exception handling.
status	text	Statement status after statement are executed for exception handling, including: • **pending**: waiting to be executed. • **running**: being executed. • **finished**: finished normally. • **abort**: terminated unexpectedly.
action	text	Actions when statements are executed for exception handling, including: • **abort**: terminating the operation. • **adjust**: executing the Cgroup adjustment operations. Currently, you can only perform the demotion operation. • **finish**: finished normally.

8.2.17.9 DBE_PERF.WLM_WORKLOAD_RUNTIME

Displays the status of jobs being executed by the current user on the current CN, as described in **Table 8-208**.

Table 8-208 DBE_PERF.WLM_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
time_stamp	bigint	Time when the statement starts to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Number of resources consumed by the statement in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.
status	text	Job execution status. Its value can be: • **pending**: blocked. • **running**: running. • **finished**: ended. • **aborted**: aborted. • **unknown**: unknown.
control_group	text	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue. • **RESPOOL**: resource pool queue. • **ACTIVE**: not in a queue.
query	text	Statement being executed.
node_group	text	Node group name.

8.2.17.10 DBE_PERF.GLOBAL_WLM_WORKLOAD_RUNTIME

Displays the status of jobs executed by the current user on CNs, as described in Table 8-209. This view is accessible only to users with the MONADMIN permission.

Table 8-209 DBE_PERF.GLOBAL_WLM_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	LWP ID of the thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Maximum number of resources in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.
status	text	Job execution status. Its value can be: • **pending**: blocked status. • **running**: running status. • **finished**: final status. • **aborted**: termination status. • **unknown**: unknown status.
control_group	name	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue. • **RESPOOL**: resource pool queue. • **ACTIVE**: not in a queue.
query	text	Statement being executed.
node_group	text	Node group name.

8.2.17.11 DBE_PERF.LOCAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on the current node, as described in Table 8-210.

Table 8-210 DBE_PERF.LOCAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_per_second	double precision	Number of write completions per second.
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

8.2.17.12 DBE_PERF.GLOBAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on all nodes, as described in **Table 8-211**.

Table 8-211 DBE_PERF.GLOBAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.
write_per_second	double precision	Number of write completions per second.
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.18 Global Plan Cache

Global plan cache (GPC) views are valid only when the GUC parameter **enable_global_plancache** is enabled.

8.2.18.1 DBE_PERF.LOCAL_PLANCACHE_STATUS

Displays the status of the GPC plan cache on the current node, as described in Table 8-212. To query this view, you must have the MONADMIN permission.

Table 8-212 DBE_PERF.LOCAL_PLANCACHE_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to.
query	text	Text of query statements.
refcount	integer	Number of times that the plan cache is referenced.
valid	bool	Specifies whether the plan cache is valid.
databaseid	oid	ID of the database that the plan cache belongs to.
schema_name	text	Schema that the plan cache belongs to.
params_num	integer	Number of parameters.
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is **0**.
pkg_id	oid	Package to which the stored procedure where the plancache is located belongs. If the stored procedure does not belong to a package, the value is **0**.
stmt_id	integer	Sequence number of the statement plan in the stored procedure.
size	bigint	Size of the memory occupied by the plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parameterized_info	text	This column specifies the path for saving the plan to the GPC. • Automatic parameterization paths: Forcibly bind parameters (the value is **force**) or reuse a plan for the same statement (the value is **exact**). • Non-automatic parameterization path: The value is **normal**.
sql_hash	bigint	Unique ID of the SQL statement in the SPM. In distributed mode, the value is **0**.
plan_hash	bigint	Unique ID of the plan under the current SQL statement in the SPM. In distributed mode, the value is **0**.
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
outline	text	The combination character string of all hints of the outline corresponding to the current plan. In distributed mode, the value is empty.
last_used_time	timestamp with time zone	Last time when the plan cache was used. The last use time is not recorded for invalid plans.
depend_object_ids	text	List of OID objects on which the plan cache depends.
hash_value	bigint	Hash value of a parameter, which may not be unique.
plan_info	text	Displays detailed information about valid plans. By default, this column is empty in the view.
opcache_reuse_cnt	integer	Number of times that the execution cache is reused.
opcache_mem_size	bigint	Memory size occupied by the execution cache.

8.2.18.2 DBE_PERF.GLOBAL_PLANCACHE_STATUS

Displays the status of GPC plan caches on all nodes. To query this view, you must have the MONADMIN permission.

For details about the columns, see **DBE_PERF.LOCAL_PLANCACHE_STATUS**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.18.3 DBE_PERF.LOCAL_PREPARE_STATEMENT_STATUS

Displays the information about prepared statements corresponding to the GPC on the current node, as described in **Table 8-213**.

Table 8-213 LOCAL_PREPARE_STATEMENT_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the statement belongs to.
cn_sess_id	bigint	Session ID of the CN that the statement is sent from.
cn_node_id	integer	Node ID of the CN that the statement is sent from.
cn_time_line	integer	Number of restart times of the CN that the statement is sent from.
statement_name	text	Statement name.
refcount	integer	Number of times that the corresponding plan cache is referenced.
is_shared	bool	Specifies whether the corresponding plan cache is shared.
query	text	Corresponding query statement.

8.2.18.4 DBE_PERF.GLOBAL_PREPARE_STATEMENT_STATUS

Displays information about prepared statements corresponding to GPC plan caches on all nodes.

For details about the columns, see **Table 8-213**.

8.2.18.5 DBE_PERF.LOCAL_PLANCACHE_CLEAN

Clears the unused global plan cache on the current node. The return type is Boolean.

After a cluster is created, by default, you must have the MONADMIN permission to query this view.

8.2.18.6 DBE_PERF.GLOBAL_PLANCACHE_CLEAN

Clears the unused global plan cache on all nodes. The return value is of the Boolean type.

After a cluster is created, by default, you must have the MONADMIN permission to query this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.19 RTO & RPO

8.2.19.1 DBE_PERF.GLOBAL_RTO_STATUS

Displays log flow control information about the primary and standby nodes (except the current node and DNs), as described in **Table 8-214**.

Table 8-214 DBE_PERF.GLOBAL_RTO_STATUS columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes).
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby node, the expected flow control time (unit: second) specified by the GUC parameter, and the primary node sleep time (unit: μs) required to reach the expectation.

8.2.19.2 DBE_PERF.GLOBAL_STREAMING_HADR_RTO_AND_RPO_STAT

Displays the log flow control information about the primary and standby clusters for streaming DR, as described in **Table 8-215**. (This view can be used only on the CN in the primary cluster and cannot obtain statistics from the DN or standby cluster.)

Table 8-215 DBE_PERF.GLOBAL_STREAMING_HADR_RTO_AND_RPO_STAT columns

Parameter	Type	Description
hadr_sender_node_name	text	Name of the primary cluster and the main standby node in the standby cluster.
hadr_receiver_node_name	text	Name of the main standby node in the standby cluster.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby clusters (unit: second). **-1** indicates that the majority of the standby cluster for DR is abnormal.
target_rto	int	Flow control information, that is, RTO time between the target primary and standby clusters (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby clusters (unit: second). **-1** indicates that the majority of the standby cluster for DR is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
target_rpo	int	Flow control information, that is, RPO time between the target primary and standby clusters (unit: second).
rto_sleep_time	int	RTO flow control information, that is, expected sleep time (unit: μs) required by WAL sender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: μs) required by xlogInsert on the host to reach the specified RPO.

8.2.20 AI Watchdog

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.20.1 DBE_PERF.AI_WATCHDOG_MONITOR_STATUS

Table 8-216 DBE_PERF.AI_WATCHDOG_MONITOR_STATUS columns

Parameter	Type	Description
metric_name	text	Metric names: • **tps**: TPS. • **tps_hourly**: average TPS per hour. • **shared_used_mem**: the used shared memory (MB). • **dynamic_used_shrctx**: the used shared memory context (MB). • **other_used_mem**: other used memory (MB). • **process_used_mem**: the used resident memory (MB). • **dynamic_used_mem**: the used dynamic memory (MB). • **malloc_failures**: the number of memory allocation failures in each collection interval. • **D_state_rate**: percentage of threads in the D state. • **R_state_rate**: percentage of threads in the R state. • **S_state_rate**: ratio of threads in the S state. • **db_state**: database state (**68** indicates D, **82** indicates R, and **83** indicates S). • **cpu_usage**: CPU usage. The upper limit is 100. • **disk_io**: disk I/O delay between two collection intervals. • **network_io**: network I/O delay between two collection intervals. • **threadpool_usage**: thread pool usage. • **threadpool_hang_rate**: percentage of the thread pool group in the hang state.
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is **null**.
last_report	timestamp	The last collection time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.20.2 DBE_PERF.AI_WATCHDOG_DETECTION_WARNINGS

Table 8-217 DBE_PERF.AI_WATCHDOG_DETECTION_WARNINGS columns

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.2.20.3 DBE_PERF.AI_WATCHDOG_PARAMETERS

Table 8-218 DBE_PERF.AI_WATCHDOG_PARAMETERS columns

Parameter	Type	Description
name	text	Parameter name. The options are as follows: • **enable_ai_watchdog**: determines whether to enable this function. • **ai_watchdog_max_consuming_time_ms**: specifies the maximum duration. • **ai_watchdog_used_memory_kb**: specifies the memory used by this function. • **ai_watchdog_detection_times**: specifies the number of detection times. • **enable_self_healing**: determines whether self-healing can be performed after a problem is detected. • **oom_detected_times**: specifies the number of detected OOMs. • **hang_detected_times**: specifies the number of detected hang times. • **enable_oom_detection**: specifies whether the OOM detection function is automatically enabled. • **in_wait_time**: specifies whether the system is waiting. • **other_used_memory_has_risk**: specifies whether other memory usage is risky. • **shared_used_mem_has_risk**: specifies whether risks exist when the shared memory context is used. • **dynamic_used_shrctx_has_risk**: specifies whether the dynamic memory usage is risky.
value	text	Parameter value.

8.2.20.4 DBE_PERF.AI_WATCHDOG_FTASK_STATUS

Table 8-219 DBE_PERF.AI_WATCHDOG_FTASK_STATUS columns

Parameter	Type	Description
name	text	Name of the counter clearing task.
timeout_threshold	int	Timeout threshold of the counter clearing task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
register_time	timestamp	Registration time of the counter clearing task.
thread_id	bigint	ID of the thread on which the counter clearing task is used.
thread_name	text	Name of the thread on which the counter clearing task is used.
last_feed	timestamp	Last time when the counter clearing task is executed. The default initial value is the same as the value of **register_time**.
restart_count	int	Number of times that the same name of counter clearing task is repeatedly registered due to the same background thread exception. This parameter is cleared after the task calls the API for canceling counter clearing task registration.
timeout_action	text	Timeout processing action specified during task registration. Currently, the following actions are provided: • **WATCHDOG_REPORT_WARNING**: Prompt the timeout locating and demarcation. • **WATCHDOG_SEND_SIGTERM**: Send SIGTERM signals to threads. • **WATCHDOG_SEND_SIGUSR2**: Send SIGUSR2 signals to threads. • **WATCHDOG_SEND_SIGQUIT**: Send SIGQUIT signals to threads. • **WATCHDOG_EXIT_PROCESS**: Exit the process.

8.2.21 Trace Function

8.2.21.1 DBE_PERF.pl_trace_func_start

Function for enabling the trace feature of a node. For details about the columns, see **Table 8-220**.

Table 8-220 DBE_PERF.pl_trace_func_start input parameters

Parameter	Type	Description
session_id	bigint	ID of the session for which the trace function needs to be enabled.
node	text	Name of the node on which the trace function is to be enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
max_num	integer	Maximum number of messages that can be traced. The value ranges from 100 to 10000.
level	text	Trace level. • **session**: session level. The trace function is always enabled before the pl_trace_func_end function is called or the session is closed. • **portal**: portal level. The trace function is automatically disabled after a stored procedure is executed. • **time**: session level. The statement execution time is displayed at the session level. • **threshold**: session level. At the time level, only statements whose values are greater than or equal to the threshold are recorded.
threshold	float8	Threshold of the current trace, in milliseconds. This parameter is valid only when **level** is **threshold**.

8.2.21.2 DBE_PERF.pl_trace_func_end

Function for disabling the trace function of a node. For details about the columns, see **Table 8-221**.

Table 8-221 DBE_PERF.pl_trace_func_end input parameters

Parameter	Type	Description
session_id	bigint	ID of the session for which the trace function needs to be disabled.
node	text	Name of the node on which the trace function is to be disabled.

8.2.21.3 DBE_PERF.pl_trace_info_clean

Function for clearing trace records of a node. For details about the columns, see **Table 8-222**.

Table 8-222 DBE_PERF.pl_trace_info_clean input parameters

Parameter	Type	Description
node	text	Name of the node whose trace records need to be cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
session_id	bigint	ID of the session whose trace information needs to be deleted. If this parameter is left empty, all information is deleted.

8.2.21.4 DBE_PERF.pl_get_trace_info

Function for checking trace records of the current node. For details about columns, see **Table 8-223**.

Table 8-223 DBE_PERF.pl_get_trace_info return values

Parameter	Type	Description
session_id	bigint	ID of the session to which the SQL statement belongs.
level	text	Level of the SQL statement.
database	text	Name of the database to which the SQL statement belongs.
func	oid	OID of the stored procedure to which the SQL statement belongs.
source	text	This SQL statement.
plan	text	Execution plan of this SQL statement.
time	text	Execution time of this SQL statement.
threshold	float8	Threshold of the SQL statement, in milliseconds.

8.2.21.5 DBE_PERF.pl_get_global_trace_info

Function for checking trace records of all nodes. For details about the columns, see **Table 8-224**.

Table 8-224 DBE_PERF.pl_get_global_trace_info return values

Parameter	Type	Description
session_id	bigint	ID of the session to which the SQL statement belongs.
node	text	Name of the node to which the SQL statement belongs.
level	text	Level of the SQL statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
database	text	Name of the database to which the SQL statement belongs.
func	oid	OID of the stored procedure to which the SQL statement belongs.
source	text	This SQL statement.
plan	text	Execution plan of this SQL statement.
time	text	Execution time of this SQL statement.
threshold	float8	Threshold of the SQL statement, in milliseconds.

8.2.22 Deprecated Views

8.2.22.1 Query

The following views in GaussDB have been deprecated in the current version:

- DBE_PERF.GS_SLOW_QUERY_HISTORY
- DBE_PERF.GLOBAL_SLOW_QUERY_HISTORY
- DBE_PERF.GLOBAL_SLOW_QUERY_INFO
- DBE_PERF.GLOBAL_STATEMENT_COMPLEX_RUNTIME

8.2.22.2 Operator

The following view in GaussDB has been deprecated in the current version:

DBE_PERF.OPERATOR_HISTORY

8.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), objects are created in the snapshot schema in the postgres database of the pg_default tablespace to persist WDR snapshot data. By default, the initial user or users with the MONADMIN permission can access and operate objects in the snapshot schema.

You can set the GUC parameter **wdr_snapshot_retention_days** to automatically manage the snapshot lifecycle.

8.3.1 Original Information of WDR Snapshots

8.3.1.1 SNAPSHOT.SNAPSHOT

SNAPSHOT records the index information, start time, and end time of WDR snapshots stored in the current system. The result can be queried only in the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

system database but cannot be queried in the user database, as described in **Table 8-225**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created. Only the initial user or MONADMIN has the permission to view the information.

Table 8-225 SNAPSHOT columns

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.423742+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:43.67726+08
version	int	Version of a WDR snapshot.	1
snap_flag	bigint	Attribute of the WDR snapshot. • **NULL**: The snapshot is of an earlier version. • **0**: The snapshot is a full snapshot. • **1**: The snapshot is an incremental snapshot.	0
base_snapshot_id	bigint	ID of the full snapshot corresponding to the WDR snapshot.	1

8.3.1.2 SNAPSHOT.TABLES_SNAP_TIMESTAMP

TABLES_SNAP_TIMESTAMP records the databases, table objects, and start and end time of all WDR snapshots, as described in **Table 8-226**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created. Only the initial user or users with MONADMIN permissions has the permission to view the information.

Table 8-226 TABLES_SNAP_TIMESTAMP columns

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
db_name	text	Database corresponding to a WDR snapshot.	tpcc1000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Example
tablename	text	Table corresponding to a WDR snapshot.	snap_summary_statement
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.425849+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:27.707398+08

8.3.1.3 SNAPSHOT.SNAP_SEQ

SNAP_SEQ is an ascending sequence, which provides IDs for WDR snapshots.

After the WDR snapshot is started (the GUC parameter **enable_wdr_snapshot** is enabled), the sequence is created.

8.3.1.4 SNAPSHOT.SNAP_QUERY

The SNAP_QUERY table records information about SQL statements in all stored WDR snapshots. After a WDR snapshot is started (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), the SNAP_QUERY table is created, as shown in **Table 8-227**.

Table 8-227 SNAP_QUERY columns

Name	Type	Description
snap_node_name	name	Node name.
snap_node_id	integer	Node ID.
snap_user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
snap_user_id	oid	User OID.
snap_unique_sql_id	bigint	ID of the normalized SQL statement.
snap_query	text	Normalized SQL statement. Note: The length is controlled by the GUC parameter **instr_unique_sql_size**.
snap_last_updated	timestamp with time zone	Last time when the statement was updated.
snap_parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
snap_db_name	name	Name of the database connected to the backend. If the database where the query statement is executed does not exist, ***REMOVED_DB*** is displayed.
snap_db_id	oid	OID of the database that the backend is connected to.

8.3.1.5 SNAPSHOT.SNAP_PLAN

The SNAP_PLAN table records information about SQL statements in all stored WDR snapshots. After a WDR snapshot is started (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), the SNAP_PLAN table is created, as shown in **Table 8-228**.

Table 8-228 SNAP_PLAN columns

Name	Type	Description
snap_node_id	integer	Node ID.
snap_user_id	oid	User OID.
snap_unique_sql_id	bigint	ID of a normalized SQL statement.
snap_last_updated	timestamp with time zone	Last time when a statement was updated.
snap_db_id	oid	OID of a database that the backend is connected to.
snap_sql_hash	bigint	Hash value of the SQL statement, which is **0**.
snap_plan_hash	bigint	Hash value of the execution plan of the SQL statement, which is **0**.
snap_query_plan	text	Execution plan of the SQL statement.

8.3.2 WDR Snapshot Data Table

The naming rule of a WDR snapshot data table is **snap**_*{source data table}*.

The source of WDR snapshot data tables is the view under **DBE_PERF Schema**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the WDR snapshot data table is created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The initial user or users with the MONADMIN permission can view the WDR snapshot data table.

8.4 DBE_PLDEBUGGER Schema

System functions in the DBE_PLDEBUGGER schema are used to debug stored procedures. Only administrators have the permission to execute these debugging APIs, but do not have the permission to modify or create functions. The following table describes the supported APIs.

NOTICE

- When a user is created in the function body, the plaintext password is returned when attach, next, continue, info_code, step, info_breakpoint, backtrace, or finish is called. You are advised not to create a user in the function body.
- Stored procedures can be debugged only on CNs, and the debugging end and the debugged end must be connected to the same CN.
- The debugging end and the debugged end must be connected to the same database. Otherwise, the API that uses the function OID to obtain function information is unavailable.
- After you use the dbe_pldebugger.turn_on function to enable stored procedure debugging in the current session, all PL/SQL stored procedures of the current session cannot be pushed down to DNs. Therefore, after the debugging is complete, use the dbe_pldebugger.turn_off function to disable stored procedure debugging in the current session in a timely manner.
- Triggers cannot be directly debugged. EXECUTE DIRECT ON cannot be used to deliver statements to DNs to trigger debugging.
- Prepared statements generated before the dbe_pldebugger.turn_on function is used to enable stored procedure debugging may fail to be debugged.
- The dbe_pldebugger.error_* functions can be used only when an error is reported.
- During the debugging of a stored procedure, if the stored procedure to be debugged calls lock operations, do not perform operations that may cause deadlocks on the debugging end.
- When separation of duties is enabled, only the initial user and owner can debug a function with the definer permission. When separation of duties is disabled, the system administrator, owner, and initial user can debug a function with the definer permission.

The administrator can run the following command to grant the gs_role_pldebugger role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Prepare for debugging.

  Use PG_PROC to find the OID of the stored procedure to be debugged and execute **DBE_PLDEBUGGER.turn_on(oid)**. In this case, the client functions as the server.

```
gaussdb=# CREATE OR REPLACE PROCEDURE test_debug ( IN  x INT)
AS
BEGIN
    INSERT INTO t1 (a) VALUES (x);
    DELETE FROM t1 WHERE a = x;
END;
/
CREATE PROCEDURE
gaussdb=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
  oid
-------
 16389
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
 nodename | port
----------+------
 datanode |    0
(1 row)
```

- Start debugging.

  When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by calling an executed stored procedure through a trigger.

```
gaussdb=# call test_debug(1);
```

  Start another client as the debug end and call DBE_PLDEBUGGER.attach to attach with the stored procedure for debugging based on the data returned by **turn_on**.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
 funcoid |  funcname  | lineno |              query
---------+------------+--------+----------------------------------
   16389 | test_debug |      3 |   INSERT INTO t1 (a) VALUES (x);
(1 row)
```

  Execute the next statement on the client where the attach operation is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.next();
 funcoid |  funcname  | lineno |        query
---------+------------+--------+----------------------
   16389 | test_debug |      0 | [EXECUTION FINISHED]
(1 row)
```

  Execute the following variable operations on the client where the attach command is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
 varname | vartype | value | package_name | isconst
---------+---------+-------+--------------+---------
 x       | int4    | 1     |              | f
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
 set_var
---------
 t
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
 varname | vartype | value | package_name | isconst
---------+---------+-------+--------------+---------
 x       | int4    | 2     |              | f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Directly execute the stored procedure that is being debugged.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |        query
---------+------------+--------+----------------------
   16389 | test_debug |      0 | [EXECUTION FINISHED]
(1 row)
```

When the stored procedure reports an error, the following information is displayed. In this case, the suspended process logic is triggered.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |            query
---------+------------+--------+------------------------------
   16389 | test_debug |      0 | [EXECUTION HAS ERROR OCCURRED!]
(1 row)
```

If the suspended process logic is triggered, you can call the error_info_locals,error_backtrace, error_end, and print_var APIs to view information. Other APIs cannot be used anymore. You need to use error_end to end the suspended process logic.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.error_end();
 funcoid |  funcname  | lineno |      query
---------+------------+--------+------------------
   16389 | test_debug |      0 | [END HANG ERROR!]
(1 row)
```

Exit the stored procedure that is being debugged (the suspended process logic is unavailable), and do not execute statements that have not been executed before.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.abort();
 abort
-------
 t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
 lineno |                          query                          | canbreak
--------+---------------------------------------------------------+----------
        | CREATE OR REPLACE PROCEDURE public.test_debug( IN  x INT) | f
      1 | AS  DECLARE                                               | f
      2 | BEGIN                                                     | f
      3 |     INSERT INTO t1 (a) VALUES (x);                        | t
      4 |     DELETE FROM t1 WHERE a = x;                           | t
      5 | END;                                                      | f
      6 | /                                                         | f
(7 rows)
```

Sets a breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
 breakpointno
--------------
            0
(1 row)
```

View the breakpoint information.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
 breakpointno | funcoid | lineno |             query             | enable
--------------+---------+--------+-------------------------------+--------
            0 |   16389 |      4 |     DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |             query
---------+------------+--------+---------------------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  16389 | test_debug |      4 |     DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server does not need to be debugged, run the **turn_off** command to disable the debugging or exit the session. **Table 8-229** describes the debugging APIs.

Table 8-229 DBE_PLDEBUGGER

API	Description
DBE_PLDEBUGGER.turn_on	Called by the server, indicating that the stored procedure can be debugged. After the API is called, the stored procedure is hung to wait for debugging information.
DBE_PLDEBUGGER.turn_off	Called by the server, indicating that debugging the stored procedure is disabled.
DBE_PLDEBUGGER.local_debug_server_info	Called by the server to print all stored procedures that have been turned on in the current session.
DBE_PLDEBUGGER.attach	Called by the debug end to attach with the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_locals	Called by the debug end to print the current values of variables in the stored procedure that is being debugged.
DBE_PLDEBUGGER.next	Called by the debug end to execute the next step.
DBE_PLDEBUGGER.continue	Called by the debug end to continue the execution until the breakpoint or stored procedure ends.
DBE_PLDEBUGGER.abort	Called by the debug end to stop debugging. The server reports a long jump error.
DBE_PLDEBUGGER.print_var	Called by the debug end to print the current values of specified variables in the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_code	Called by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.
DBE_PLDEBUGGER.step	Called by the debug end to execute step by step.
DBE_PLDEBUGGER.add_breakpoint	Called by the debug end to add a breakpoint.
DBE_PLDEBUGGER.delete_breakpoint	Called by the debug end to delete a breakpoint.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_PLDEBUGGER.info_breakpoints	Called by the debug end to view all breakpoints.
DBE_PLDEBUGGER.backtrace	Called by the debug end to check the current call stack.
DBE_PLDEBUGGER.enable_breakpoint	Called by the debug end to enable breakpoints.
DBE_PLDEBUGGER.disable_breakpoint	Called by the debug end to disable breakpoints.
DBE_PLDEBUGGER.finish	Called by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned.
DBE_PLDEBUGGER.set_var	Called by the debug end to assign a value to a variable.

8.4.1 DBE_PLDEBUGGER.turn_on

This function is used to mark a stored procedure as debuggable, as described in Table 8-230. After **turn_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG_PROC system catalog and transfer it to the function. After **turn_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged. The number of **turn_on** stored procedures cannot exceed 100.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

Table 8-230 DBE_PLDEBUGGER.turn_on input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
nodename	OUT text	Node name.
port	OUT integer	Port number of the connection.

8.4.2 DBE_PLDEBUGGER.turn_off

This function is used only to remove the debugging flag added by **turn_on** to the current session. The return value indicates success or failure, as described in Table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8-231. You can run the **DBE_PLDEBUGGER.local_debug_server_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

Table 8-231 DBE_PLDEBUGGER.turn_off input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
turn_off	OUT boolean	Specifies whether turn-off is successful.

8.4.3 DBE_PLDEBUGGER.local_debug_server_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use funcoid and pg_proc together to determine which stored procedures are to be debugged, as described in **Table 8-232**.

Table 8-232 DBE_PLDEBUGGER.local_debug_server_info return values

Name	Type	Description
nodename	OUT text	Node name.
port	OUT bigint	Port number.
funcoid	OUT oid	Stored procedure OID.

8.4.4 DBE_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end calls the attach function and transfers node name and port number to attach with the specified stored procedure, as described in **Table 8-233**.

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid. If the attach operation is performed repeatedly, the current stored procedure is disconnected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-233 DBE_PLDEBUGGER.attach input parameters and return values

Name	Type	Description
nodename	IN text	Node name.
port	IN integer	Connection port number.
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

8.4.5 DBE_PLDEBUGGER.info_locals

During debugging on the debug end, **info_locals** is called to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as described in **Table 8-234**.

Table 8-234 DBE_PLDEBUGGER.info_locals input parameters and return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Determines whether the value is a constant.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.6 DBE_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query, as described in **Table 8-235**.

Table 8-235 DBE_PLDEBUGGER.next return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

8.4.7 DBE_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query, as described in **Table 8-236**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

Table 8-236 DBE_PLDEBUGGER.continue return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.8 DBE_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value indicates whether the abort message is successfully sent, as described in **Table 8-237**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()
RETURN boolean;
```

Table 8-237 DBE_PLDEBUGGER.abort input parameters and return values

Name	Type	Description
abort	OUT boolean	Specifies whether the operation is successful.

8.4.9 DBE_PLDEBUGGER.print_var

During debugging on the debug end, print_var is called to print the name and value of the specified variable in the current stored procedure. You can also use this function to print variables when an error is reported. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as described in **Table 8-238**.

Table 8-238 DBE_PLDEBUGGER.print_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable.
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Package name corresponding to the variable. This parameter is reserved and is left empty currently.
isconst	OUT boolean	Determines whether the value is a constant.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.10 DBE_PLDEBUGGER.info_code

During debugging on the debug end, **info_code** is called to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty, as described in **Table 8-239**.

Table 8-239 DBE_PLDEBUGGER.info_code input parameters and return values

Name	Type	Description
funcoid	IN oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Source statement.
canbreak	OUT bool	Specifies whether the current line supports breakpoints.

8.4.11 DBE_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned, as described in **Table 8-240**.

Table 8-240 DBE_PLDEBUGGER.step input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

8.4.12 DBE_PLDEBUGGER.add_breakpoint

During debugging on the debug end, call **add_breakpoint** to add a breakpoint. If **–1** is returned, the specified breakpoint is invalid. Determine a proper breakpoint position by referring to the **canbreak** column. If the outer function does not have

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a breakpoint before entering the inner function, a breakpoint cannot be added to the outer function when the inner function is executed, as described in **Table 8-241**.

Table 8-241 DBE_PLDEBUGGER.add_breakpoint input parameters and return values

Name	Type	Description
funcoid	IN text	Function ID.
lineno	IN integer	Line number.
breakpointno	OUT integer	Breakpoint number.

8.4.13 DBE_PLDEBUGGER.delete_breakpoint

During debugging on the debug end, call delete_breakpoint to delete the existing breakpoint, as described in **Table 8-242**.

Table 8-242 DBE_PLDEBUGGER.delete_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Specifies whether the result is successful.

8.4.14 DBE_PLDEBUGGER.info_breakpoints

During debugging on the debug end, call **info_breakpoints** to view the current function breakpoint, as described in **Table 8-243**.

Table 8-243 DBE_PLDEBUGGER.info_breakpoints return values

Name	Type	Description
breakpointno	OUT integer	Breakpoint number.
funcoid	OUT oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
enable	OUT boolean	Specifies whether the value is valid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.15 DBE_PLDEBUGGER.backtrace

During debugging on the debug end, call backtrace to view the current call stack, as described in **Table 8-244**.

Table 8-244 DBE_PLDEBUGGER.backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

8.4.16 DBE_PLDEBUGGER.enable_breakpoint

During debugging on the debug end, calls enable_breakpoint to enable breakpoints, as described in **Table 8-245**.

Table 8-245 DBE_PLDEBUGGER.enable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Specifies whether the result is successful.

8.4.17 DBE_PLDEBUGGER.disable_breakpoint

During debugging on the debug end, call disable_breakpoint to disable breakpoints, as described in **Table 8-246**.

Table 8-246 DBE_PLDEBUGGER.disable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Specifies whether the result is successful.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.18 DBE_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed, as described in **Table 8-247**.

Table 8-247 DBE_PLDEBUGGER.finish input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

8.4.19 DBE_PLDEBUGGER.set_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter. If a stored procedure contains variables with the same name, set_var supports only the setting of the first variable value, as described in **Table 8-248**.

Table 8-248 DBE_PLDEBUGGER.set_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable name.
value	IN text	New value.
result	OUT boolean	Specifies whether the result is successful.

8.4.20 DBE_PLDEBUGGER.error_backtrace

If the server is suspended due to an error reported by the stored procedure, you can call error_backtrace on the debug end to view the current function call stack, as described in **Table 8-249**. (This function is used only for suspension after an error is reported.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-249 DBE_PLDEBUGGER.error_backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

8.4.21 DBE_PLDEBUGGER.error_end

If the server is suspended due to an error reported by the stored procedure, you can call error_end on the debug end to end the suspended process, end the debugging process, return the ended suspended process, and stop debugging, as described in **Table 8-250**. (This function is used only for suspension after an error is reported.)

Table 8-250 DBE_PLDEBUGGER.error_end return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	The next debugging line number (fixed value: **0**).
query	OUT text	Ends the suspended process and stops debugging.

8.4.22 DBE_PLDEBUGGER.error_info_locals

If the server is suspended due to an error reported by the stored procedure, you can call error_info_locals on the debug end to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without input parameters. By default, the top-layer stack variable is queried, as described in **Table 8-251**. (This function is used only for suspension after an error is reported.)

Table 8-251 DBE_PLDEBUGGER.error_info_locals return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Determines whether the value is a constant.

8.5 DBE_PLDEVELOPER

The DBE_PLDEVELOPER system catalog records information required for compiling PL/SQL packages, functions, and stored procedures.

8.5.1 DBE_PLDEVELOPER.GS_SOURCE

Records information about PL/SQL objects (stored procedures, functions, packages, and package bodies), as described in **Table 8-252**.

NOTE

- The gs_source table records only user-defined original object statements. Even if a user uses ALTER to change the created schema or name, the information in the gs_source table does not change. If the user changes the schema or name of an object, after the user deletes the object, the object is deleted from the gs_source table.
- The owner in the gs_source table is the user who creates the table, not the user specified when the user creates the stored procedure or package.
- After the GUC parameter **behavior_compat_options** is set to **"skip_insert_gs_source"**, information about PL/SQL objects (stored procedures, functions, packages, and package bodies) is not recorded in the gs_source table.
- The permissions of gs_source are the same as those of system catalogs in pg_catalog. System administrators and common users cannot perform DROP, ALTER, DELETE, UPDATE, and INSERT operations, but can perform the SELECT operation. The GUC parameter **allow_system_table_mods** is used to control the permissions of gs_source, and the default value is **off**. After modifying this parameter, you need to restart the database for the modification to take effect.

Table 8-252 DBE_PLDEVELOPER.GS_SOURCE columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	text	Object type (**procedure**/**function**/**package**/**package body**).
status	Boolean	Specifies whether the creation is successful.
src	text	Original statement for creating an object.

8.6 DBE_COMPRESSION Schema

DBE_COMPRESSION is a schema created by the ILM feature. It defines system functions for evaluating the sampling compression ratio of a specified data object or obtaining the compression type of data in a specified row based on input parameters. **Table 8-253** lists the APIs supported by DBE_COMPRESSION. Users can only use the APIs. For details, see **DBE_COMPRESSION**.

Table 8-253 DBE_COMPRESSION

API	Description
DBE_COMPRESSION.GET_COMPRESSION_RATIO	Evaluates the sampling compression ratio of a specified data object based on input parameters.
DBE_COMPRESSION.GET_COMPRESSION_TYPE	Obtains the compression type of data in a specified row based on input parameters.
DBE_COMPRESSION.GET_ACTUAL_COMPRESSION_RATIO	Evaluates the actual compression ratio of a specified data object based on input parameters.
DBE_COMPRESSION.GET_HOLE_RATIO	Evaluates the sampling hole rate of a specified cross-page transparent compression data object based on input parameters.
DBE_COMPRESSION.TURBO_COMPRESS_BUFFER_STATS	Outputs the usage of turbo_compress_shared_buffers.
DBE_COMPRESSION.GET_INDEX_COMPRESSION_TYPE	Obtains the compression type of data in a specified index page based on input parameters.

8.7 DBE_HEAT_MAP Schema

DBE_HEAT_MAP is a schema created by the ILM feature. It returns information such as the last modification time of a row in the target data block based on the input parameters. The information is used to browse the basis for determining cold and hot rows. This API is an O&M API and has no visibility check. That is, if

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the input CTID is a deleted row, this API still returns the latest status of the current row on the page. **Table 8-254** describes the APIs supported by DBE_HEAT_MAP. Users can only use the APIs. Cross-page transparent compression does not support this schema. For details, see **DBE_HEAT_MAP**.

Table 8-254 DBE_HEAT_MAP

API	Description
DBE_HEAT_MAP.ROW_HEAT_MAP	Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID.

8.8 DBE_ILM Schema

DBE_ILM is a schema created by the ILM feature. It is used to implement ILM policies, evaluate ILM policies, and stop compression jobs. **Table 8-255** lists the APIs supported by DBE_ILM. Users can only use the APIs. For details, see **DBE_ILM**.

Table 8-255 DBE_ILM

API	Description
DBE_ILM.EXECUTE_ILM	Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated.
DBE_ILM.STOP_ILM	Stops a compression job that is being executed based on parameters.

8.9 DBE_ILM_ADMIN Schema

DBE_ILM_ADMIN is a schema created by the ILM feature. It is used to implement ILM policies, implement background scheduling of ADO, and control flow control parameters. **Table 8-256** lists the APIs supported by DBE_ILM_ADMIN. Users can only use the APIs. For details, see **DBE_ILM_ADMIN**.

Table 8-256 DBE_ILM_ADMIN

API	Description
DBE_ILM_ADMIN.CUSTOMIZE_ILM	Customizes ILM policy attributes based on input parameters.
DBE_ILM_ADMIN.DISABLE_ILM	Disables background scheduling.
DBE_ILM_ADMIN.ENABLE_ILM	Enables background scheduling.
DBE_ILM_ADMIN.CREATE_ILM_DB_POLICY	Creates a database-level compression policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_ILM_ADMIN.DELETE_ILM_DB_POLICY	Deletes a database-level compression policy.

8.10 PRVT_ILM Schema

The PRVT_ILM API is an internal API of the ILM feature and cannot be directly called by users. This section lists only the API names and does not provide detailed API prototype description.

Table 8-257 PRVT_ILM

API	Description
be_active_ado_window	Updates the ILM window triggering time and action.
be_create_ado_window_for_each_db	Creates an ILM window in each database of the instance.
be_execute_ilm	Executes an ILM window for automatic evaluation.
be_execute_ilm_dn	Automatic evaluation is performed on distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
flush_task_executestate	The automatic scheduled job updates the task status.
generate_taskoid	CN generates a task ID for this scheduling.
evaluate_obj_policy	Data objects are evaluated after scheduling is triggered.
change_be_ilm	DBE_ILM_ADMIN.ENABLE_ILM() and DISABLE_ILM () help functions. This operation affects the overall ILM background scheduling of the cluster.
get_compression_ratio	DBE_COMPRESSION.GET_COMPRESSION_RATIO() help function.
get_compression_type	DBE_COMPRESSION.GET_COMPRESSION_TYPE() help function.
get_lastmodified_time	DBE_HEAT_MAP.ROW_HEAT_MAP() help function.
ilm_job_action	Compression task executor, which is used for distributed DNs.
delete_expired_ilm_log	Expired logs are cleared in distributed mode.
delete_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
insert_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_taskdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_object	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_param	System catalog related to the operation feature, which is used for distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
update_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
gs_ilm_ticker	The maintenance window performs an action, performs a dotting operation, and records the mapping between the LSN and time.
compress_blocks	PRVT_ILM.ILM_JOB_ACTION() help function.
compress_block_single	It is not supported in the current version.
get_job_status	DBE_ILM.STOP_ILM help function.
insert_gs_ilm_param	System catalogs related to the operation feature.
query_unfinishedjob_num	Queries whether there are jobs that are not complete, including jobs in the initial and running states.
update_gs_ilm_object_flag2	System catalog related to the operation feature, which is used for distributed DNs.
ilm_seq_nextval	Obtains the next sequence value of the ILM.
ilm_seq_setval	Sets the current sequence value of the ILM.
check_compatibility	Specifies a function used to determine a database compatibility mode in a unified manner.
set_pg_settings	Specifies a function used to set the GUC parameters for setting a database compatibility mode.
check_seq	Ensures that the current value of **GSILMTASK_SEQ** is greater than the maximum value of **taskoid** in the GS_ILM_TASK catalog. This parameter is used on distributed CNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
get_actual_compression_ratio	DBE_COMPRESSION.GET_ACTUAL_COMPRESSION_RATIO() help function.
get_turbo_compress_hole	DBE_COMPRESSION.GET_HOLE_RATIO() help function.
turbo_compress_buffer_stats	DBE_COMPRESSION.TURBO_COMPRESS_BUFFER_STATS() help function.
get_index_compression_type	DBE_COMPRESSION.GET_INDEX_COMPRESSION_TYPE() help function.
create_ilm_db_policy	DBE_ILM_ADMIN.CREATE_ILM_DB_POLICY() help function.
delete_ilm_db_policy	DBE_ILM_ADMIN.DELETE_ILM_DB_POLICY() help function.
compress_indexes	PRVT_ILM.ILM_JOB_ACTION() help function.
eval_comp_relgrowth	It is not supported in the current version.
delete_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.

9 WDR

Table 9-1 lists the content of a WDR.

Table 9-1 Main WDR content

Item	Description
Database Stat	• Database performance statistics: transactions, read and write operations, row activities, write conflicts, and deadlocks. • Cluster-wide report, which can be viewed only in cluster mode.
Load Profile	• Cluster performance statistics: CPU time, DB time, logical or physical read operation, I/O performance, login and logout, load strength, and load performance. • Cluster-wide report, which can be viewed only in cluster mode. • This report can be viewed only in non-database-level WDRs.
Instance Efficiency Percentages	• Cluster-level or node-level cache hit ratio. • Cluster- or node-wide report, which can be viewed in cluster or node mode. • This report can be viewed only in non-database-level WDRs.
Top 10 Events by Total Wait Time	• Most time-consuming event. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
Wait Classes by Total Wait Time	• Category of the wait time that is most time-consuming. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Item	Description
Host CPU	• CPU usage of the host. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
IO Profile	• I/O usage in the cluster or node dimension. • Cluster- or node-wide report, which can be viewed in cluster or node mode. • This report can be viewed only in non-database-level WDRs.
Memory Statistics	• Kernel memory usage distribution. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
Time Model	• Time distribution of database operations. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
SQL Statistics	• SQL statement performance statistics are displayed in the following dimensions: total time, average time, CPU duration, lock time, total memory usage, maximum memory usage, average memory usage, number of returned rows, number of scanned rows, number of execution times, number of logical reads, and number of physical reads. • Cluster- or node-wide report, which can be viewed in cluster or node mode.
Wait Events	• Statistics on wait events at the node level. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs. For details, see "Waiting state list", "List of wait events corresponding to lightweight locks", "List of wait events corresponding to I/Os", and "List of wait events corresponding to transaction locks" in "System Catalogs and System Views > System Views > Other System Views > PG_THREAD_WAIT_STATUS" in *Reference*.
Cache IO Stats	• I/O statistics on user tables and indexes. • Cluster- or node-wide report, which can be viewed in cluster or node mode. • This report can be viewed only in non-database-level WDRs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Item	Description
Utility status	• Status information about the replication slot and background checkpoint. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
Object stats	• Performance statistics in the index and table dimensions. • Cluster- or node-wide report, which can be viewed in cluster or node mode.
Configuration settings	• GUC parameter configuration information of a node: parameter name, current value, and default value. • Node-wide report, which can be viewed in node mode. • This report can be viewed only in non-database-level WDRs.
SQL Detail	• SQL statement text details. • Execution plan text details of the SQL statement. • Cluster- or node-wide report, which can be viewed in cluster or node mode.

9.1 Database Stat

Table 9-2 describes columns in the Database Stat report.

Table 9-2 Columns in the Database Stat report

Column	Description
DB Name	Database name.
Backends	Number of backends connected to this database.
Xact Commit	Number of transactions in this database that have been committed.
Xact Rollback	Number of transactions in this database that have been rolled back.
Blks Read	Number of disk blocks read in this database.
Blks Hit	Number of times that disk blocks have been found in the cache.
Tuple Returned	Number of rows sequentially scanned.
Tuple Fetched	Number of rows randomly scanned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Tuple Inserted	Number of rows inserted by queries in this database.
Tuple Updated	Number of rows updated by queries in this database.
Tup Deleted	Number of rows deleted by queries in this database.
Conflicts	Number of queries canceled due to conflicts.
Temp Files	Number of temporary files created by queries in this database.
Temp Bytes	Total amount of data written to temporary files by queries in this database.
Deadlocks	Number of deadlocks detected in this database.
Blk Read Time	Time spent in reading data file blocks by backends in this database (unit: ms).
Blk Write Time	Time spent in writing data file blocks by backends in this database (unit: ms).
Stats Reset	Time at which the current statistics were reset.

9.2 Load Profile

Table 9-3 lists metrics in the Load Profile report.

Table 9-3 Metrics in the Load Profile report

Statistical Item	Description
DB Time(us)	Total elapsed time of a job.
CPU Time(us)	Total CPU time used for job running.
Redo size(blocks)	Size of the generated WAL (blocks).
Logical read (blocks)	Number of logical reads for a table or an index (number of blocks).
Physical read (blocks)	Number of physical reads (blocks) on a table or an index.
Physical write (blocks)	Number of physical writes (blocks) on a table or an index.
Read IO requests	Number of reads for a table or an index.
Write IO requests	Number of writes for a table or an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Statistical Item	Description
Read IO (MB)	Size of reads for a table or an index (in MB).
Write IO (MB)	Size of writes for a table or an index (in MB).
Logins	Number of logins.
Executes (SQL)	Number of times SQL statements are executed.
Rollbacks	Number of rolled-back transactions.
Transactions	Number of transactions.
n_soft_parse	Number of soft parsing times.
n_hard_parse	Number of hard parsing times.
SQL response time P95(us)	Response time of 95% SQL queries, in microseconds.
SQL response time P80(us)	Response time of 80% SQL queries, in microseconds.

9.3 Instance Efficiency Percentages

Table 9-4 lists metrics in the Instance Efficiency Percentages report.

Table 9-4 Metrics in the Instance Efficiency Percentages report

Statistical Item	Description
Buffer Hit %	Hit ratio of the buffer pool.
Effective CPU %	Ratio of the CPU time to the database time.
WalWrite NoWait %	Ratio of the number of events that access the WAL buffer to the total number of wait events.
Soft Parse %	Ratio of the number of soft parsing times to the total number of parsing times.
Non-Parse CPU %	Ratio of the non-parse time to the total execution time.

9.4 Top 10 Events by Total Wait Time

Table 9-5 lists columns in the Top 10 Events by Total Wait Time report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-5 Contents of the Top 10 Events by Total Wait Time report

Column	Description
Event	Name of a wait event.
Waits	Number of wait times.
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.
Type	Wait event type.

9.5 Wait Classes by Total Wait Time

Table 9-6 lists columns in the Wait Classes by Total Wait Time report.

Table 9-6 Contents of the Wait Classes by Total Wait Time report

Column	Description
Type	Wait events are classified as follows: • **STATUS** • **LWLOCK_EVENT** • **LOCK_EVENT** • **IO_EVENT**
Waits	Number of wait times.
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.

9.6 Host CPU

Table 9-7 describes columns in the Host CPU report.

Table 9-7 Columns in the Host CPU report

Column	Description
Cpus	Number of CPUs.
Cores	Number of CPU cores.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Sockets	Number of CPU sockets.
Load Average Begin	Average load of the start snapshot.
Load Average End	Average load of the end snapshot.
%User	Percentage of CPU time occupied when the system is running in user mode.
%System	Percentage of CPU time occupied when the system is running in kernel mode.
%WIO	Percentage of CPU time occupied when the system is running in wait I/O mode.
%Idle	Percentage of CPU time occupied when the system is running in idle mode.

9.7 IO Profile

Table 9-8 lists metrics in the IO Profile report.

Table 9-8 Metrics in the IO Profile report

Statistical Item	Description
Database requests	Number of database I/O times.
Database (MB)	Database I/O data volume.
Database (blocks)	Number of database I/O data blocks.
Redo requests	Number of redo I/O times.
Redo (MB)	Redo I/O data volume.

9.8 Memory Statistics

Table 9-9 lists metrics in the Memory Statistics report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-9 Metrics in the Memory Statistics report

Statistical Item	Description
shared_used_memory	Size of the used shared memory, in MB.
max_shared_memory	Size of the maximum shared memory, in MB.
process_used_memory	Size of the used process memory, in MB.
max_process_memory	Size of the maximum process memory, in MB.

9.9 Time Model

Table 9-10 describes metrics in the Time Model report.

Table 9-10 Contents of the Time Model report

Name	Description
DB_TIME	Total end-to-end time consumed by all threads (unit: μs).
EXECUTION_TIME	Total time consumed on the executor (unit: μs).
PL_EXECUTION_TIME	Total time consumed for executing PL/SQL statements (unit: μs).
CPU_TIME	Total CPU time consumed by all threads (unit: μs).
PLAN_TIME	Total time consumed for generating an execution plan (unit: μs).
REWRITE_TIME	Total time consumed for rewriting queries (unit: μs).
PL_COMPILATION_TIME	Total time consumed for compiling SQL statements (unit: μs).
PARSE_TIME	Total time consumed for parsing SQL statements (unit: μs).
NET_SEND_TIME	Total time consumed for sending data over the network (unit: μs).
DATA_IO_TIME	Total time consumed for reading and writing data (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9.10 SQL Statistics

Table 9-11 describes columns in the SQL Statistics report.

Table 9-11 Columns in the SQL Statistics report

Column	Description
Unique SQL Id	ID of a normalized SQL statement.
DB Name	Database name.
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is **0** for non-stored procedure substatements.
Node Name	Node name.
User Name	Username.
Avg Tuples Fetched	Average number of rows randomly scanned.
Avg Tuples Returned	Average number of rows sequentially scanned.
Calls	Number of calls.
Total Elapsed Time(us)	Total execution time (unit: us).
Avg Elapsed Time(us)	Average execution time (unit: us).
Total Used Memory(MB)	Total used memory (unit: MB).
Max Used Memory(MB)	Maximum used memory of a single statement (unit: MB).
Min Used Memory(MB)	Minimum used memory of a single statement (unit: MB).
Returned Rows	Number of rows returned by SELECT.
Avg Returned Rows	Average number of rows returned by SELECT.
Tuples Affected	Number of rows affected by INSERT, UPDATE, and DELETE.
Avg Tuples Affected	Average number of rows affected by INSERT, UPDATE, and DELETE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Logical Read	Number of logical reads on the buffer.
Avg Logical Read	Average number of logical reads on the buffer.
Physical Read	Number of physical reads on the buffer.
Avg Physical Read	Average number of physical reads on the buffer.
CPU Time(us)	CPU time (unit: us).
Avg CPU Time(us)	Average CPU time (unit: us).
Data IO Time(us)	Time spent on I/O (unit: us).
Avg Data IO Time(us)	Average time spent on I/O (unit: us).
Lock Wait Time(us)	Lock wait time of an SQL statements (unit: us).
Avg Lock Wait Time(us)	Average lock wait time of each SQL statement (unit: us).
Sort Count	Number of sorting execution times.
Sort Time(us)	Sorting execution time (unit: us).
Sort Mem Used(KB)	Size of work memory used during sorting (unit: KB).
Sort Spill Count	Number of file writes when data is flushed to disks during sorting.
Sort Spill Size(KB)	File size used when data is flushed to disks during sorting (unit: KB).
Hash Count	Number of hashing execution times.
Hash Time(us)	Hashing execution time (unit: us).
Hash Mem Used(KB)	Size of work memory used during hashing (unit: KB).
Hash Spill Count	Number of file writes when data is flushed to disks during hashing.
Hash Spill Size(KB)	File size used when data is flushed to disks during hashing (unit: KB).
SQL Text	Normalized SQL character string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
SQL Hash	Hash value of the SQL statement.
Plan Hash	Hash value of the SQL statement execution plan.

9.11 Wait Events

Table 9-12 describes columns in the Wait Events report.

Table 9-12 Columns in the Wait Events report

Column	Description
Type	Wait events are classified as follows: • **STATUS** • **LWLOCK_EVENT** • **LOCK_EVENT** • **IO_EVENT**
Event	Name of a wait event.
Total Wait Time (us)	Total wait time (unit: us).
Waits	Total number of wait times.
Failed Waits	Number of wait failures.
Avg Wait Time (us)	Average wait time (unit: us).
Max Wait Time (us)	Maximum wait time (unit: us).

9.12 Cache IO Stats

The Cache IO Stats report consists of two tables, namely, **User table IO activity** and **User index IO activity**. Columns in the tables are described in Table 9-13 and Table 9-14.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

User table IO activity

Table 9-13 Columns in the User table IO activity table

Column	Description
DB Name	Database name.
Schema Name	Schema name.
Table Name	Table name.
%Heap Blks Hit Ratio	Hit ratio of the buffer pool in the table.
Heap Blks Read	Number of disk blocks read from the table.
Heap Blks Hit	Number of cache hits in the table.
Idx Blks Read	Number of disk blocks read from all indexes in the table.
Idx Blks Hit	Number of cache hits in indexes in the table.
Toast Blks Read	Number of disk blocks read from the TOAST table (if any) in the table.
Toast Blks Hit	Number of buffer hits in the TOAST table (if any) in the table.
Tidx Blks Read	Number of disk blocks read from the TOAST table index (if any) in the table.
Tidx Blks Hit	Number of buffer-hits in the TOAST table index (if any) in the table.

User index IO activity

Table 9-14 Columns in the User index IO activity table

Column	Description
DB Name	Database name.
Schema Name	Schema name.
Table Name	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Index Name	Index name.
%Idx Blks Hit Ratio	Index hit ratio.
Idx Blks Read	Number of disk blocks read from all indexes.
Idx Blks Hit	Number of cache hits of all indexes.

9.13 Utility status

The Utility status report consists of two tables, namely, **Replication slot** and **Replication stat**. Columns in the tables are described in **Table 9-15** and **Table 9-16**.

Replication slot

Table 9-15 Columns in the Replication slot table

Column	Description
Slot Name	Replication node name.
Slot Type	Type of the replication node.
DB Name	Name of the database on the replication node.
Active	Replication node status.
Xmin	Transaction ID of the replication node.
Restart Lsn	Xlog file information on the replication node.
Dummy Standby	Replication node as a dummy standby.

Replication stat

Table 9-16 Columns in the Replication stat table

Column	Description
Thread Id	PID of the thread.
Usesys Id	User system ID.
Usename	Username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Application Name	Application name.
Client Addr	Client address.
Client Hostname	Client host name.
Client Port	Port of the client.
Backend Start	Start time of an application.
State	Log replication status.
Sender Sent Location	Location where the sender sends logs.
Receiver Write Location	Location where the receiver writes logs.
Receiver Flush Location	Location where the receiver flushes logs.
Receiver Replay Location	Location where the receiver replays logs.
Sync Priority	Synchronization priority.
Sync State	Synchronization status.

9.14 Object Stats

Object Stats contains three tables: User Tables stats, User index stats, and Bad lock stats. Columns in the tables are described as follows.

User Tables stats

Table 9-17 Contents in the User Tables stats table

Column	Description
DB Name	Database name.
Schema	Schema name.
Relname	Relation name.
Seq Scan	Number of sequential scans initiated in the table.
Seq Tup Read	Number of live rows fetched by sequential scans.
Index Scan	Number of index scans initiated in the table.
Index Tup Fetch	Number of live rows fetched by index scans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Tuple Insert	Number of rows inserted.
Tuple Update	Number of rows updated.
Tuple Delete	Number of rows deleted.
Tuple Hot Update	Number of rows HOT updated (with no separate index update required).
Live Tuple	Estimated number of live rows.
Dead Tuple	Estimated number of inactive rows.
Last Vacuum	Last time at which this table was manually vacuumed (excluding VACUUM FULL).
Last Autovacuum	Last time when the table was vacuumed by the autovacuum daemon thread.
Last Analyze	Last time at which the table was manually analyzed
Last Autoanalyze	Last time when the table was analyzed by the autovacuum daemon thread.
Vacuum Count	Number of times this table is manually vacuumed (excluding VACUUM FULL).
Autovacuum Count	Number of times this table is vacuumed by the autovacuum daemon.
Analyze Count	Number of times this table is manually analyzed.
Autoanalyze Count	Number of times this table is analyzed by the autovacuum daemon thread.

User index stats

Table 9-18 Contents in the User index stats table

Column	Description
DB Name	Database name.
Schema	Schema name.
Relname	Relation name.
Index Relname	Index name.
Index Scan	Number of index scans initiated on the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Index Tuple Read	Number of index entries returned by scans on the index.
Index Tuple Fetch	Number of table rows fetched by simple index scans by using the index.

Bad lock stats

Table 9-19 Contents in the Bad lock stats table

Column	Description
DB Id	OID of the database.
Tablespace Id	Tablespace OID.
Relfilenode	File object ID.
Fork Number	File type.
Error Count	Number of failures.
First Time	First occurrence time.
Last Time	Last occurrence time.

9.15 Configuration settings

Table 9-20 describes columns in the Configuration settings report.

Table 9-20 Columns in the Configuration settings report

Column	Description
Name	GUC parameter name.
Abstract	GUC parameter description.
Type	Data type.
Current Value	Current value.
Min Value	Valid minimum value.
Max Value	Valid maximum value.
Category	GUC parameter type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Enum Values	All enumerated values.
Default Value	Default parameter value used upon the database startup.
Reset Value	Default parameter value used upon the database reset.

9.16 SQL Detail

Table 9-21 describes columns in the SQL Detail report.

Table 9-21 Columns in the SQL Detail report

Column	Description
Unique SQL Id	ID of a normalized SQL statement.
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is 0 for a statement that is executed independently.
DB Name	Database name. If the database that executes the query statement when the snapshot is generated does not exist, ***REMOVED_DB*** is displayed in the report.
User Name	Username. If the user who executes the query statement when the snapshot is generated does not exist, ***REMOVED_USER*** is displayed in the report.
Node Name	Node name. This column is not displayed in node mode.
SQL Hash	Hash value of the SQL statement.
Plan Hash	Hash value of the SQL statement execution plan.
SQL Text	Normalized SQL text.
Plan Text	Execution plan text of the SQL statement.

10 ASP

Table 10-1 Report header

Column	Description
Start Time	Start time.
End Time	End time.
Slot Count	Number of time segments for displaying metrics.
Elapsed Time	Time segment for generating a report.
Sample Count	Total number of samples for generating ASP.
Slice Count	Total number of samplings.
Average Active Sessions	Average number of active sessions.
Boundary Time	Time point when samples in the memory and disk samples are split.
Data Source	Number of samples in the memory and on the disk for generating ASP.

Table 10-2 System load

Column	Description
Host Node Name	Node name.
CPUs	Total number of CPU cores.
Cores	Number of cores per CPU.
Sockets	Number of CPU slots.
Physical Memory	Memory size.
GaussDB Version	GaussDB version.

Table 10-3 Top client

Column	Description
Client Addr	Client address that accounts for a high percentage of sampled active sessions. The **client_hostname** and **client_port** columns in the **GS_ASP** table are empty, indicating that the client is connected through the UDS on the server or the thread is an internal thread. **NOTE** A client is an application or tool that establishes a connection and session with a database and interacts with a server process.
User Id	User ID.
Application Name	Name of the client connection program. **NOTE** In addition to the shielded background threads, background processes or clients (in the kernel) may exist, such as autovacuum, StandByRead, ASP, gsql, Archiver, WAL Reader and WAL Sender. Distributed processes may exist, such as GTM, CN, and DN. External client processes (outside the kernel) may exist, such as JDBC, ODBC, PSYCOPG2, DRS, and DBMind.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
Avg Active Sessions	Average number of active sessions (Total number of active sessions/ Number of aspects).

Table 10-4 Active sessions

Column	Description
sample_time (x_axis)	Sampling time.
count (y_axis)	Number of sampled events.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-5 Top events summary

Column	Description
Wait Status	Wait status name.
Wait Status Count	Number of wait statuses.
%Wait Status	Percentage of wait status (Number of wait status/Number of samples).
Avg Active Session	Average number of active wait status sessions (Number of wait status sessions/Number of aspects).
Event	Name of a wait event.
Event Count	Number of wait events.

Table 10-6 Top events graph

Column	Description
sample_time (x_axis)	Sampling time.
count (y_axis)	Number of sampled events.

Table 10-7 Top sessions with top event

Column	Description
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of active sessions.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Event	Active session event.
Event Count	Number of wait events of the session.
%Event	Percentage of session events (Number of events/Number of samples).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-8 Top sessions with top event split by slots

Column	Description
Slot time	Slot time.
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Event	Active session event.
Event Count	Number of wait events of the session.
%Event	Percentage of session events (Number of events/Number of samples).

Table 10-9 Top sessions with top SQL

Column	Description
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity.
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Node Id	Node ID.
SQL Text	SQL statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-10 Top sessions with top SQL split by slots

Column	Description
Slot Time	Slot time.
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Node Id	Node ID.
SQLText	SQL statement.

Table 10-11 Top final blocking sessions with top event split by slots

Column	Description
Slot Time	Slot time.
Final Blocking Session Id	ID of a blocked session.
Session Start	Start time of a session that holds a lock.
Blocked count	Number of sessions blocked by the session.
Blocked%Activity	Percentage of blocked sessions to active sessions (Total number of blocked sessions/Number of samples).
Event Caused	A wait event of final blocking session.
Event Caused Count	Number of wait events of final blocking session.
%Event	Percentage of wait events (Number of wait events/Number of samples).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
PID	Thread ID.
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Current Xid	ID of the current transaction.
Top Xid	Top-level transaction ID.
Xact Start Time	Start time of a transaction that holds a lock.
Global Session Id	Global session ID

Table 10-12 Top blocked sessions with top SQL split by slots

Column	Description
Slot Time	Slot time.
Lock Tag	Lock tag.
Lock Mode	Lock mode.
Waiting Session Count	Number of waiting sessions.
Waiting Session Id	ID of a session waiting for a lock.
Session Start	Start time of a session that waits for a lock.
Session Count	Number of sessions that waits for a lock.
Block Session Id	ID of a blocked session.
Final Block Session Id	Session ID in the header of the blocked queue.
PID	Thread ID.
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Current Xid	ID of the current transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Top Xid	Top-level transaction ID.
Xact Start Time	Start time of a transaction that holds a lock.
Global Session Id	Global session ID
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Query Start	Start time of the SQL statement.
SQL Count	Number of SQL statements.
Node Id	Node ID.
SQL Text	SQL statement.

Table 10-13 Top SQL with top event

Column	Description
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Node Id	Node ID.
User Id	User ID.
Count	Number of session events.
%Activity	Percentage of activity (Total number of SQL sessions/Number of samples).
Event	Active session event.
Event Count	Number of wait events.
%Event	Percentage of session events (Number of SQL events/Number of samples).
SQL Text	SQL statement.

Table 10-14 Top SQL with top event split by slots

Column	Description
Slot Time	Slot time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Node Id	Node ID.
User Id	User ID.
Count	Number of session events.
%Activity	Percentage of activity (Total number of SQL sessions/Number of samples).
Event	Active session event.
Event Count	Number of wait events.
%Event	Percentage of session events (Number of SQL events/Number of samples).
SQL Text	SQL statement.

Table 10-15 Top SQL text

Column	Description
SQL Id	SQL ID.
Parent SQL Id	SQL ID of the parent statement that calls the statement.
Node Id	Node ID.
User Id	User ID.
SQL Text	SQL statement.
