4.7.1 Upgrading a Cluster.....	589
4.7.2 Obtaining Cluster Upgrade Task Details.....	595
4.7.3 Retrying a Cluster Upgrade Task.....	598
4.7.4 Suspending a Cluster Upgrade Task (Deprecated).....	599
4.7.5 Continuing to Execute a Cluster Upgrade Task (Deprecated).....	600
4.7.6 Obtaining a List of Cluster Upgrade Task Details.....	601
4.7.7 Pre-upgrade Check.....	604
4.7.8 Obtaining Details About a Pre-upgrade Check Task of a Cluster.....	613
4.7.9 Obtaining a List of Pre-upgrade Check Tasks of a Cluster.....	621
4.7.10 Post-upgrade Check.....	630
4.7.11 Cluster Backup.....	633
4.7.12 Obtaining a List of Cluster Backup Task Details.....	634
4.7.13 Obtaining the Cluster Upgrade Information.....	638
4.7.14 Obtaining a Cluster Upgrade Path.....	641

4.7.15 Obtaining the Configuration of Cluster Upgrade Feature Gates.....	644
4.7.16 Enabling the Cluster Upgrade Process Booting Task.....	646
4.7.17 Obtaining a List of Upgrade Workflows.....	651
4.7.18 Obtaining Details About a Specified Cluster Upgrade Task.....	655
4.7.19 Updating the Status of a Specified Cluster Upgrade Booting Task.....	660
4.8 Quota Management.....	666
4.8.1 Querying Resource Quotas.....	666
4.9 API Versions.....	668
4.9.1 Obtaining API Versions.....	668
4.10 Tag Management.....	670
4.10.1 Adding Resource Tags to a Specified Cluster in Batches.....	670
4.10.2 Deleting Resource Tags of a Specified Cluster in Batches.....	672
4.11 Configuration Management.....	675
4.11.1 Obtaining the Parameters That Can Be Configured for a Node Pool.....	675
4.11.2 Obtaining the List of Parameters That Can Be Configured for a Cluster.....	677
4.11.3 Obtaining the Parameters That Can Be Configured for a Node Pool.....	680
4.11.4 Changing the Values of Configuration Parameters of a Node Pool.....	683
4.12 Chart Management.....	689
4.12.1 Uploading a Chart.....	689
4.12.2 Obtaining a Chart List.....	691
4.12.3 Obtaining a Release List.....	693
4.12.4 Updating a Chart.....	696
4.12.5 Creating a Release.....	699
4.12.6 Deleting a Chart.....	702
4.12.7 Updating a Release.....	704
4.12.8 Obtaining a Chart.....	707
4.12.9 Deleting a Release.....	709
4.12.10 Downloading a Chart.....	711
4.12.11 Obtaining a Release.....	712
4.12.12 Obtaining Chart Values.....	714
4.12.13 Obtaining Historical Records of a Release.....	716
4.12.14 Obtaining the Quota of a User Chart.....	719
<b>5 Kubernetes APIs.....</b>	<b>721</b>
<b>6 Permissions and Supported Actions.....</b>	<b>726</b>
<b>7 Appendix.....</b>	<b>733</b>
7.1 Status Code.....	733
7.2 Error Codes.....	737
7.3 Obtaining a Project ID.....	742
7.4 Obtaining an Account ID.....	743
7.5 Specifying Add-ons to Be Installed During Cluster Creation.....	743
7.6 How to Obtain Parameters in the API URI.....	752

7.7 Creating a VPC and Subnet.....	753
7.8 Creating a Key Pair.....	754
7.9 Node Flavor Description.....	754
7.10 Adding a Salt in the password Field When Creating a Node.....	755
7.11 Maximum Number of Pods That Can Be Created on a Node.....	757
7.12 Node OS.....	759
7.13 Data Disk Space Allocation.....	763
7.14 Attaching Disks to a Node.....	769

# 1

## Before You Start

### 1.1 Overview

Cloud Container Engine (CCE) is a container service that allows you to run containers efficiently in the cloud. CCE provides highly scalable, high-performance, enterprise-class Kubernetes clusters and supports Docker containers. With CCE, you can easily deploy, manage, and scale containerized applications in the cloud.

This document describes how to use APIs for performing operations on CCE, such as creating or deleting CCE resources, modifying resource specifications, or adding NICs. For details about all supported operations, see [API Overview](#).

If you plan to access CCE resources through an API, ensure that you are familiar with CCE concepts.

CCE supports both Kubernetes-native APIs and proprietary APIs. With these APIs, you can use all functions of CCE.

- CCE has opened APIs through API gateway to support operations on cloud service infrastructures (for example, creating a node). Operations on cluster resources (such as [creating a workload](#)) are also supported.
- Kubernetes-native APIs: You can perform operations on cluster resources (such as [creating a workload](#)) using the Kubernetes-native API server. However, operations on cloud service infrastructures (such as creating a node) are not supported.

For details about Kubernetes-native API versions, see <https://kubernetes.io/docs/concepts/overview/kubernetes-api/>.

#### NOTE

- The Kubernetes-native APIs called in the current version do not support HTTP persistent connections.
- The Kubernetes-native APIs in the current version include Beta APIs, whose version names include **beta**, for example, **v1beta1**. This type of APIs varies according to Kubernetes-native APIs. Therefore, you are advised to use this type of APIs in unimportant scenarios, for example, short-term test clusters.

## 1.2 API Calling

CCE supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [3 Calling APIs](#).

## 1.3 Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. An endpoint can be obtained from the administrator.

Select an endpoint based on your service requirements.

- The URL format for cluster, node, node pool, add-on, and quota management is **https://Endpoint/uri**. *uri* indicates the resource path, that is, the API access path.
- The URL format for Kubernetes APIs, storage management, and add-on management is **https://{clusterid}.Endpoint/uri**. In the URL, *{clusterid}* indicates the cluster ID, and *uri* indicates the resource path, that is, the path for API access.

 **NOTE**

- The format of the URL called by the add-on management APIs is **https://*{clusterid}*.Endpoint/uri**. However, *{clusterid}* is used only for the domain name and is not verified or used by the APIs. Set *{clusterid}* in the query or body. For details about *{clusterid}*, see the add-on management sections.
- *{clusterid}* is required for Kubernetes APIs and storage management, which indicates the cluster that needs to be accessed by calling the API.

**Table 1-1** URL parameters

Parameter	Description
{clusterid}	Cluster ID. After a cluster is created, call the <a href="#">API for obtaining a cluster in a specified project</a> to obtain the cluster ID.
Endpoint	Entry (URL) for a web service. Endpoints vary depending on services and regions.
uri	Access path of an API for performing an operation. Obtain the path from the URI of an API. For example, the <b>resource-path</b> of the API used to obtain a user token is <b>v3/auth/tokens</b> .

## 1.4 Constraints

- CCE imposes a quota on the number and capacity of resources that a user can access. By default, you can create a maximum of five clusters in each region and a cluster can have a maximum of 50 nodes.

- For more constraints, see API description.

## 1.5 Concepts

- Account

An account is created upon successful registration. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity, which should not be used directly to perform routine management. For security purposes, create Identity and Access Management (IAM) users and grant them permissions for routine management.

- User

An IAM user is created using an account to use cloud services. Each IAM user has their own identity credentials (password and access keys).

The account name, username, and password will be required for API authentication.

- Region

Regions are divided based on geographical location and network latency. Public services, such as Elastic Cloud Server (ECS), Elastic Volume Service (EVS), Object Storage Service (OBS), Virtual Private Cloud (VPC), Elastic IP (EIP), and Image Management Service (IMS), are shared within the same region. Regions are classified into universal regions and dedicated regions. A universal region provides universal cloud services for common tenants. A dedicated region provides specific services for specific tenants.

For details, see [Region and AZ](#).

- AZ

An AZ comprises of one or more physical data centers equipped with independent ventilation, fire, water, and electricity facilities. Computing, network, storage, and other resources in an AZ are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow you to build cross-AZ high-availability systems.

- Project

A project corresponds to a region. Default projects are defined. Users can be granted permissions in a default project to access all resources under their accounts in the region associated with the project. If you need more refined access control, create subprojects under a default project and create resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.

- Enterprise project

Enterprise projects group and manage resources across regions. Resources in different enterprise projects are logically isolated.

For details about enterprise projects and about how to obtain enterprise project IDs, see [Enterprise Management User Guide](#).

# 2 API Overview

APIs provided by CCE are classified into two types: proprietary APIs and Kubernetes-native APIs. By using these two types of APIs, you can use all functions provided by CCE, including creating clusters and nodes, using the Kubernetes-native APIs to create workloads, and using the proprietary CCE APIs to monitor application data.

Type	Subtype	Description
Proprietary CCE APIs	<a href="#">Cluster-related APIs</a>	Manage clusters, including creating and deleting clusters. You can use APIs in this category to create clusters and obtain information about created clusters.
	<a href="#">Node-related APIs</a>	Manage nodes, including creating and deleting nodes. You can use these APIs in this category to add nodes to clusters and obtain information about created nodes.
	<a href="#">Node Pool-related APIs</a>	Manage node pools, including creating and deleting node pools. You can use APIs in this category to create node pools and obtain information about created node pools.
	<a href="#">Add-on-related APIs</a>	Manage add-ons, including querying AddonTemplates and creating, updating, deleting, and obtaining AddonInstances.
	<a href="#">Quota-related API</a>	Query quotas of CCE resources.

Type	Subtype	Description
Kubernetes-native APIs	None	<p>For details about how to call Kubernetes-native APIs, see <a href="#">Kubernetes APIs</a>.</p> <p><b>NOTE</b> The Kubernetes-native APIs called in the current version do not support HTTP persistent connections.</p>

## Cluster-related APIs

**Table 2-1** Cluster-related APIs

API	Description
<a href="#">Creating a Cluster</a>	Create an empty cluster, which has only master nodes but do not have worker nodes.
<a href="#">Reading a Specified Cluster</a>	Obtain details about a specified cluster.
<a href="#">Listing Clusters in a Specified Project</a>	Obtain details about all clusters in a specified project.
<a href="#">Updating a Specified Cluster</a>	Update information about a specified cluster.
<a href="#">Deleting a Cluster</a>	Delete a specified cluster.
<a href="#">Hibernating a Cluster</a>	Hibernate a specified cluster.
<a href="#">Waking Up a Cluster</a>	Wake up a hibernated cluster.
<a href="#">Obtaining Cluster Certificates</a>	Obtain certificates of a specified cluster.
<a href="#">Obtaining Job Information</a>	Obtain the progress of a job with a specified job ID returned after a job request is issued.

## Node-related APIs

**Table 2-2** Node-related APIs

API	Description
<a href="#">Creating a Node</a>	Create a node in a specified cluster.
<a href="#">Reading a Specified Node</a>	Obtain details about a node with a specified node ID.

API	Description
<a href="#">Reading all Nodes in a Cluster</a>	Obtain details about all nodes in a cluster with a specified cluster ID.
<a href="#">Updating a Specified Node</a>	Update information about a specified node.
<a href="#">Deleting a Node</a>	Delete a specified node
<a href="#">Accepting a Node</a>	Accept a node into a specified cluster.
<a href="#">Resetting a Node</a>	Reset a node in a specified cluster.
<a href="#">Removing a Node</a>	Remove a node from a specified cluster.
<a href="#">Migrating a Node</a>	Migrate a node from a specified cluster to another cluster.

## Node Pool-related APIs

**Table 2-3** Node pool-related APIs

API	Description
<a href="#">Creating a Node Pool</a>	Create a node pool in a specified cluster.
<a href="#">Reading a Specified Node Pool</a>	Obtain details about a node with a specified node ID.
<a href="#">Listing All Node Pools in a Specified Cluster</a>	Obtain details about all node pools in a cluster with a specified cluster ID.
<a href="#">Updating a Specified Node Pool</a>	Update information about a specified node pool.
<a href="#">Deleting a Node Pool</a>	Delete a specified node pool.

## Add-on-related APIs

**Table 2-4** Add-on-related APIs

API	Description
<a href="#">Installing an Add-on Instance</a>	Install an add-on by using the add-on template. One or more instances will be created for the installed add-on.
<a href="#">Listing Add-on Templates</a>	Query add-on information.

API	Description
<a href="#">Updating an Add-on Instance</a>	Update an add-on instance.
<a href="#">Deleting an Add-on Instance</a>	Delete an add-on instance.
<a href="#">Reading an Add-on Instance</a>	Obtain details about an add-on instance.
<a href="#">Listing Add-on Instances</a>	List all add-on instances in the cluster.

## Quota-related API

Table 2-5 Quota-related API

API	Description
<a href="#">Querying Resource Quotas</a>	Query resource quotas.

## Kubernetes APIs

API	Function	URI
Node	Reading a specified node	GET /api/v1/nodes/{name}
	Listing all nodes	GET /api/v1/nodes
	Updating a specified node	PATCH /api/v1/nodes/{name}
Namespace	Creating a namespace	POST /api/v1/namespaces
	Deleting a namespace	DELETE /api/v1/namespaces/{name}
	Querying a specified namespace	GET /api/v1/namespaces/{name}
	Replacing a specified namespace	PUT /api/v1/namespaces/{name}
	Replacing the status of a specified namespace	PUT /api/v1/namespaces/{name}/status
	Replacing the finalize values of a specified namespace	PUT /api/v1/namespaces/{name}/finalize
	Listing namespaces	GET /api/v1/namespaces
	Updating a specified namespace	PATCH /api/v1/namespaces/{name}

API	Function	URI
Resource quotas	Querying resource quotas	GET /api/v1/resourcequotas
	Creating a resource quota	POST /api/v1/namespaces/{namespace}/resourcequotas
	Updating a resource quota	PUT /api/v1/namespaces/{namespace}/resourcequotas/{name}
	Deleting a resource quota	DELETE /api/v1/namespaces/{namespace}/resourcequotas/{name}
Pod	Creating a pod	POST /api/v1/namespaces/{namespace}/pods
	Deleting a pod	DELETE /api/v1/namespaces/{namespace}/pods/{name}
	Deleting all pods	DELETE /api/v1/namespaces/{namespace}/pods
	Reading a specified pod	GET /api/v1/namespaces/{namespace}/pods/{name}
	Replacing a specified pod	PUT /api/v1/namespaces/{namespace}/pods/{name}
	Replacing the status of a specified pod	PUT /api/v1/namespaces/{namespace}/pods/{name}/status
	Listing all pods in a specified namespace	GET /api/v1/namespaces/{namespace}/pods
	Listing pods	GET /api/v1/pods
	Updating a specified pod	PATCH /api/v1/namespaces/{namespace}/pods/{name}
Deployment	Creating a Deployment	POST /apis/apps/v1/namespaces/{namespace}/deployments
	Rolling back a Deployment	PATCH /apis/apps/v1/namespaces/{namespace}/deployments/{name} (for clusters of v1.17 or later) POST /apis/apps/v1beta1/namespaces/{namespace}/deployments/{name}/rollback (for clusters of v1.15 and earlier) POST /apis/extensions/v1beta1/namespaces/{namespace}/deployments/{name}/rollback (for clusters of v1.15 and earlier)
	Deleting a Deployment	DELETE /apis/apps/v1/namespaces/{namespace}/deployments/{name}

API	Function	URI
Deployment	Deleting all Deployments	DELETE /apis/apps/v1/namespaces/{namespace}/deployments
	Reading a specified Deployment	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}
	Reading the status of a specified Deployment	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/status
	Reading the scaling operation of a specified Deployment	GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale
	Replacing a specified Deployment	PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}
	Replacing the status of a specified Deployment	PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}/status
	Replacing the scaling operation of a specified Deployment	PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale
	Listing Deployments in a specified namespace	GET /apis/apps/v1/namespaces/{namespace}/deployments
	Listing all Deployments	GET /apis/apps/v1/deployments
	Updating a specified Deployment	PATCH /apis/apps/v1/namespaces/{namespace}/deployments/{name}
	Updating the status of a specified Deployment	PATCH /apis/apps/v1/namespaces/{namespace}/deployments/{name}/status
	Updating the scaling operation of a specified Deployment	PATCH /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale
StatefulSet	Creating a StatefulSet	POST /apis/apps/v1/namespaces/{namespace}/statefulsets
	Deleting a specified StatefulSet	DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}
	Deleting all StatefulSets	DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets
	Reading a specified StatefulSet	GET /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}
	Reading the status of a specified StatefulSet	GET /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status
	Replacing a specified StatefulSet	PUT /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}

API	Function	URI
	Replacing the status of a specified StatefulSet	PUT /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status
	Listing StatefulSets in a specified namespace	GET /apis/apps/v1/namespaces/{namespace}/statefulsets
	Listing all StatefulSets	GET /apis/apps/v1/statefulsets
	Updating a specified StatefulSet	PATCH /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}
	Updating the status of a specified StatefulSet	PATCH /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status
Daemon Set	Creating a DaemonSet	POST /apis/apps/v1/namespaces/{namespace}/daemonsets
	Deleting a specified DaemonSet	DELETE /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}
	Deleting all DaemonSets	DELETE /apis/apps/v1/namespaces/{namespace}/daemonsets
	Reading a specified DaemonSet	GET /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}
	Reading the status of a specified DaemonSet	GET /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}/status
	Updating a specified DaemonSet	PATCH /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}
	Updating the status of a specified DaemonSet	PATCH /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}/status
	Listing all DaemonSets	GET /apis/apps/v1/daemonsets
	Listing DaemonSets in a specified namespace	GET /apis/apps/v1/namespaces/{namespace}/daemonsets
	Replacing a specified DaemonSet	PUT /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}
Job	Replacing the status of a specified DaemonSet	PUT /apis/apps/v1/namespaces/{namespace}/daemonsets/{name}/status
	Creating a job	POST /apis/batch/v1/namespaces/{namespace}/jobs
	Deleting a job	DELETE /apis/batch/v1/namespaces/{namespace}/jobs/{name}
	Deleting all jobs	DELETE /apis/batch/v1/namespaces/{namespace}/jobs

API	Function	URI
Job	Reading a specified job	GET /apis/batch/v1/namespaces/{namespace}/jobs/{name}
	Reading the status of a specified job	GET /apis/batch/v1/namespaces/{namespace}/jobs/{name}/status
	Replacing a specified job	PUT /apis/batch/v1/namespaces/{namespace}/jobs/{name}
	Replacing the status of a specified job	PUT /apis/batch/v1/namespaces/{namespace}/jobs/{name}/status
	Listing jobs in a specified namespace	GET /apis/batch/v1/namespaces/{namespace}/jobs
	Listing all jobs	GET /apis/batch/v1/jobs
	Updating the status of a specified job	PATCH /apis/batch/v1/namespaces/{namespace}/jobs/{name}/status
	Updating a specified job	PATCH /apis/batch/v1/namespaces/{namespace}/jobs/{name}
CronJob	Creating a cron job	POST /apis/batch/v1beta1/namespaces/{namespace}/cronjobs
	Deleting a cron job	DELETE /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}
	Deleting all cron jobs	DELETE /apis/batch/v1beta1/namespaces/{namespace}/cronjobs
	Reading a specified cron job	GET /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}
	Reading the status of a specified cron job	GET /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}/status
	Replacing a specified cron job	PUT /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}
	Replacing the status of a specified cron job	PUT /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}/status
	Listing cron jobs under a specified namespace	GET /apis/batch/v1beta1/namespaces/{namespace}/cronjobs
	Listing all cron jobs	GET /apis/batch/v1beta1/cronjobs
	Updating the status of a specified cron job	PATCH /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}/status
	Updating a specified cron job	PATCH /apis/batch/v1beta1/namespaces/{namespace}/cronjobs/{name}

API	Function	URI
ReplicaSet	Listing ReplicaSets	GET /apis/apps/v1/namespaces/{namespace}/replicasets
	Reading a specified ReplicaSet	GET /apis/apps/v1/namespaces/{namespace}/replicasets/{name}
	Listing all ReplicaSets	GET /apis/apps/v1/replicasets
ReplicationController	Creating a ReplicationController	POST /api/v1/namespaces/{namespace}/replicationcontrollers
	Deleting a ReplicationController	DELETE /api/v1/namespaces/{namespace}/replicationcontrollers/{name}
	Deleting all ReplicationControllers	DELETE /api/v1/namespaces/{namespace}/replicationcontrollers
	Reading a ReplicationController under a specified namespace	GET /api/v1/namespaces/{namespace}/replicationcontrollers/{name}
	Replacing a ReplicationController under a specified namespace	PUT /api/v1/namespaces/{namespace}/replicationcontrollers/{name}
	Replacing the status of a ReplicationController under a specified namespace	PUT /api/v1/namespaces/{namespace}/replicationcontrollers/{name}/status
	Listing ReplicationControllers in a specified namespace	GET /api/v1/namespaces/{namespace}/replicationcontrollers
	Listing ReplicationControllers	GET /api/v1/replicationcontrollers
	Updating a specified ReplicationController	PATCH /api/v1/namespaces/{namespace}/replicationcontrollers/{name}
Endpoints	Creating an endpoint	POST /api/v1/namespaces/{namespace}/endpoints
	Deleting an endpoint	DELETE /api/v1/namespaces/{namespace}/endpoints/{name}
	Deleting all endpoints	DELETE /api/v1/namespaces/{namespace}/endpoints
	Querying a specified endpoint	GET /api/v1/namespaces/{namespace}/endpoints/{name}

API	Function	URI
	Replacing a specified endpoint	PUT /api/v1/namespaces/{namespace}/endpoints/{name}
	Listing endpoints	GET /api/v1/endpoints
	Listing endpoints in a specified namespace	GET /api/v1/namespaces/{namespace}/endpoints
	Updating a specified endpoint	PATCH /api/v1/namespaces/{namespace}/endpoints/{name}
Service	Creating a Service	POST /api/v1/namespaces/{namespace}/services
	Deleting a specified Service	DELETE /api/v1/namespaces/{namespace}/services/{name}
	Obtaining a specified Service	GET /api/v1/namespaces/{namespace}/services/{name}
	Replacing a specified Service	PUT /api/v1/namespaces/{namespace}/services/{name}
	Listing Services in a specified namespace	GET /api/v1/namespaces/{namespace}/services
	Listing Services	GET /api/v1/services
	Updating a specified Service	PATCH /api/v1/namespaces/{namespace}/services/{name}
Ingress	Creating an ingress	POST /apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses (for clusters of v1.21 and later) POST /apis/networking.k8s.io/v1beta1/namespaces/{namespace}/ingresses (for clusters from v1.15 to v1.21) POST /apis/extensions/v1beta1/namespaces/{namespace}/ingresses (for clusters earlier than v1.15)
	Updating a specified ingress	PATCH /apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name} (for clusters of v1.21 and later) PATCH /apis/networking.k8s.io/v1beta1/namespaces/{namespace}/ingresses/{name} (for clusters from v1.15 to v1.21) PATCH /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name} (for clusters earlier than v1.15)

API	Function	URI
	Replacing a specified ingress	PUT /apis/networking.k8s.io/v1/namespaces/{namespace}/ingresses/{name} (for clusters of v1.21 and later) PUT /apis/networking.k8s.io/v1beta1/namespaces/{namespace}/ingresses/{name} (for clusters from v1.15 to v1.21) PUT /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name} (for clusters earlier than v1.15)

	Listing events in a specified namespace	GET /api/v1/namespaces/{namespace}/events

# 3 Calling APIs

## 3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for as an example to demonstrate how to call an API. The obtained token can then be used to authenticate the calling of other APIs.

### Request URI

A request URI is in the following format:

**{URI-scheme}://{Endpoint}/{resource-path}?{query-string}**

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be transmitted separately.

**Table 3-1** URI parameters

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. The endpoint varies between services in different regions. It can be obtained from the administrator. For example, the endpoint of IAM in region <b>Dublin</b> is <b>iam.myhuaweicloud.eu</b> .
resource-path	Access path of an API for performing an operation. Obtain the path from the URI of an API. For example, the <b>resource-path</b> of the API used to obtain a user token is <b>/v3/auth/tokens</b> .
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of <i>Parameter name=Parameter value</i> . For example, <b>?limit=10</b> indicates that a maximum of 10 data records will be displayed.

 NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

## Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server.

**Table 3-2** HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

For example, in the case of the API used to obtain a user token, the request method is **POST**. The request is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens
```

## Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Common request header fields are as follows.

**Table 3-3** Common request header fields

Parameter	Description	Mandatory	Example Value
Host	Specifies the server domain name and port number of the resources being requested. The value can be obtained from the URL of the service API. The value is in the format of <i>Hostname:Port number</i> . If the port number is not specified, the default port is used. The default port number for <b>https</b> is <b>443</b> .	No This field is mandatory for AK/SK authentication.	code.test.com or code.test.com:443
Content-Type	Specifies the type (or format) of the message body. The default value <b>application/json</b> is recommended. Other values of this field will be provided for specific APIs if any.	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Project-Id	Specifies the project ID. Obtain the project ID by following the instructions in <a href="#">Obtaining a Project ID</a> .	No	e9993fc787d94b6c886cb aa340f9c0f4

Parameter	Description	Mandatory	Example Value
X-Auth-Token	<p>Specifies the user token.</p> <p>It is a response to the API for obtaining a user token (This is the only API that does not require authentication).</p> <p>After the request is processed, the value of <b>X-Subject-Token</b> in the response header is the token value.</p>	No  This field is mandatory for token authentication.	The following is part of an example token: MIIPAgYJKoZIhvcNAQc-Co...ggg1BBIINPXsidG9rZ

#### NOTE

In addition to supporting authentication using tokens, APIs support authentication using AK/SK, which uses SDKs to sign a request. During the signature, the **Authorization** (signature authentication) and **X-Sdk-Date** (time when a request is sent) headers are automatically added in the request.

For more details, see "Authentication Using AK/SK" in [Authentication](#).

The API used to obtain a user token does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens  
Content-Type: application/json
```

## (Optional) Request Body

This part is optional. The body of a request is often sent in a structured format as specified in the **Content-Type** header field. The request body transfers content except the request header.

The request body varies between APIs. Some APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

In the case of the API used to obtain a user token, the request parameters and parameter description can be obtained from the API request. The following provides an example request with a body included. Replace **username**, **domainname**, **\*\*\*\*\*** (login password), and **xxxxxxxxxxxxxxxxxxxx** (project name) with the actual values. Obtain a project name from the administrator.

#### NOTE

The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see [Obtaining a User Token](#).

```
POST https://{{endpoint}}/v3/auth/tokens
Content-Type: application/json

{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxxxxxxxxxxxxx"
      }
    }
  }
}
```

If all data required for the API request is available, you can send the request to call the API through [curl](#), [Postman](#), or coding. In the response to the API used to obtain a user token, **x-subject-token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

## 3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token authentication: Requests are authenticated using tokens.
- AK/SK authentication: Requests are encrypted using an AK/SK. AK/SK-based authentication is recommended because it is more secure than token-based authentication.

### Token-based Authentication

#### NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API.

You can obtain a token by calling the Obtaining a User Token API. When you call the API, set **auth.scope** in the request body to **project**.

```
{
  "auth": {
    "identity": {
      "methods": [

```

```
        "password"
    ],
    "password": {
        "user": {
            "name": "username",
            "password": "*****",
            "domain": {
                "name": "domainname"
            }
        }
    }
},
"scope": {
    "project": {
        "name": "xxxxxxx"
    }
}
}
```

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
POST https://{{endpoint}}/v3/auth/projects
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

## AK/SK Authentication

AK/SK authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.

In AK/SK authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key, which is used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK authentication, you can use an AK/SK to sign requests based on the signature algorithm or using the signing SDK. For details about how to sign requests and use the signing SDK, see [API Request Signing Guide](#).

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

## 3.3 Response

### Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Code](#).

For example, if status code **201** is returned for calling the API used to obtain a user token, the request is successful.

## Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

**Figure 3-1** shows the response header fields for the API used to obtain a user token. The **x-subject-token** header field is the desired user token. This token can then be used to authenticate the calling of other APIs.

**Figure 3-1** Header fields of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopener
x-frame-options → SAMEORIGIN
x-lam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5
x-subject-token
x-xss-protection → 1; mode=block;
```

## Response Body

The body of a response is often returned in structured format as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following is part of the response body for the API used to obtain a user token.

```
{
  "token": {
    "expires_at": "2019-02-13T06:52:13.855000Z",
    "methods": [
      "password"
    ],
    "catalog": [
      {
        "endpoints": [
          {
            "region_id": "eu-west-101",
.....
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{  
    "error_msg": "The format of message is error",  
    "error_code": "AS.0001"  
}
```

In the response body, **error\_code** is an error code, and **error\_msg** provides information about the error.

# 4 APIs

## 4.1 API URL

- The URL format for cluster, node, node pool, add-on, and quota management is **https://Endpoint/uri**. *uri* indicates the resource path, that is, the API access path.
- The URL format for Kubernetes APIs, storage management, and add-on management is **https://{clusterid}.Endpoint/uri**. In the URL, *{clusterid}* indicates the cluster ID, and *uri* indicates the resource path, that is, the path for API access.

### NOTE

- The format of the URL called by the add-on management APIs is **https://*{clusterid}*.Endpoint/uri**. However, *{clusterid}* is used only for the domain name and is not verified or used by the APIs. Set *{clusterid}* in the query or body. For details about *{clusterid}*, see the add-on management sections.
- *{clusterid}* is required for Kubernetes APIs and storage management, which indicates the cluster that needs to be accessed by calling the API.

**Table 4-1** URL parameters

Parameter	Description
{clusterid}	Cluster ID. After a cluster is created, call the <a href="#">API for obtaining a cluster in a specified project</a> to obtain the cluster ID.
Endpoint	URL that is the entry point for a web service. You can obtain it from <a href="#">Endpoints</a> .
uri	Access path of an API for performing an operation. Obtain the path from the URI of an API. For example, the <b>resource-path</b> of the API used to obtain a user token is <b>v3/auth/tokens</b> .

## 4.2 Cluster Management

### 4.2.1 Creating a Cluster

#### Function

This API is used to create an empty cluster, which has only master nodes but no worker nodes. After creating a cluster by calling this API, you can add nodes by [creating nodes](#).

##### NOTE

- The URL for cluster management is in the format of `https://Endpoint/uri`, in which `uri` indicates the resource path, that is, the path for API access.
- By default, ICAgent is not installed when you call this API to create a cluster. If you need to install ICAgent, add `"cluster.install.addons.external/install": [{"addonTemplateName": "icagent"}]` to **annotations** in the request body. ICAgent will be automatically installed during cluster creation. ICAgent is an O&M data collection agent used by Application Performance Management (APM). It runs on each server to collect data from probes in real time. ICAgent is the prerequisite for achieving application O&M. If ICAgent is not installed, the application O&M functions cannot be used.

#### Constraints

Before calling the CCE API to create a cluster, ensure that the following conditions are met:

- A **VPC** is available.
- CIDR blocks have been properly set for containers and Services. They are not editable after cluster creation, unless you create a new cluster.
- An agency has been correctly created and is not deleted. If the agency verification fails, the cluster fails to be created. You can log in to the CCE console. If no agency is created, the system prompts you to create one. If an agency has been created, no message is displayed.
- By default, an account can create a maximum of five clusters in each region. If you need to create more clusters, you can submit an application to increase the quota.

#### URI

POST /api/v3/projects/{project\_id}/clusters

**Table 4-2** Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .

## Request Parameters

**Table 4-3** Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format).
X-Auth-Token	Yes	String	Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> .

**Table 4-4** Request body parameters

Parameter	Mandatory	Type	Description
kind	Yes	String	API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.
apiVersion	Yes	String	API version. The value is fixed at <b>v3</b> and cannot be changed.
metadata	Yes	<a href="#">ClusterMetadata</a> object	Basic information about a cluster. Metadata is a collection of attributes.
spec	Yes	<a href="#">ClusterSpec</a> object	Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> .
status	No	<a href="#">ClusterStatus</a> object	Cluster status and job ID of the cluster creation job.

**Table 4-5 ClusterMetadata**

Parameter	Mandatory	Type	Description
name	Yes	String	Cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.
uid	No	String	Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.
alias	No	String	Alias of a cluster name displayed on the CCE console, and the name can be changed. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. A cluster alias must be unique. In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.

Parameter	Mandatory	Type	Description
annotations	No	Map<String, String>	<p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {     "key1" : "value1",     "key2" : "value2" }</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b>: Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external / install": "[{"addonTemplateName": "icagent"}]".</li></ul>
labels	No	Map<String, String>	<p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>
creationTimestamp	No	String	Time when the cluster was created.
updateTimestamp	No	String	Time when the cluster was updated.

**Table 4-6** ClusterSpec

Parameter	Mandatory	Type	Description
category	No	String	Cluster type. Options: <ul style="list-style-type: none"><li>• <b>CCE</b>: CCE cluster. CCE cluster supports hybrid deployment of VMs and BMSs, and heterogeneous nodes such as GPU and NPU nodes, allowing you to run your containers in a secure and stable container runtime environment based on a high-performance network model.</li></ul>
type	No	String	Master node architecture: <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: x86</li></ul>

Parameter	Mandatory	Type	Description
flavor	Yes	String	<p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul>

Parameter	Mandatory	Type	Description
			<p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul>

Parameter	Mandatory	Type	Description
version	No	String	<p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended. You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>

Parameter	Mandatory	Type	Description
platformVersion	No	String	<p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul>
description	No	String	Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.

Parameter	Mandatory	Type	Description
customSan	No	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
ipv6enable	No	Boolean	Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.
hostNetwork	Yes	<a href="#">HostNetwork</a> object	Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.
containerNetwork	Yes	<a href="#">ContainerNetwork</a> object	Container networking parameters, including the container network model and container CIDR block.
serviceNetwork	No	<a href="#">ServiceNetwork</a> object	Service CIDR block, including IPv4 CIDR blocks.
authentication	No	<a href="#">Authentication</a> object	Configurations of the cluster authentication mode.
billingMode	No	Integer	Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.
masters	No	Array of <a href="#">MasterSpec</a> objects	Advanced configurations of master nodes

Parameter	Mandatory	Type	Description
kubernetesSvcIpRange	No	String	Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.
clusterTags	No	Array of <a href="#">ResourceTag</a> objects	Cluster resource tags.
kubeProxyMode	No	String	Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul>
az	No	String	AZ. This field is returned only for a query.

Parameter	Mandatory	Type	Description
extendParam	No	<a href="#">ClusterExtendedParam</a> object	Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.
supportIstio	No	Boolean	Whether Istio is supported.
configurationsOverride	No	Array of <a href="#">PackageConfiguration</a> objects	Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see

**Table 4-7** HostNetwork

Parameter	Mandatory	Type	Description
vpc	Yes	String	ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>Method 2: Use the VPC API to query the VPC ID.</li></ul>
subnet	Yes	String	Network ID of the subnet used to create a master node. Methods: <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets...</li></ul>

Parameter	Mandatory	Type	Description
SecurityGroup	No	String	Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications.

**Table 4-8** ContainerNetwork

Parameter	Mandatory	Type	Description
mode	Yes	String	Container network model. Select one of the following possible values: <ul style="list-style-type: none"><li>• <b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li>• <b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul>
cidr	No	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported. Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)

Parameter	Mandatory	Type	Description
cids	No	Array of <a href="#">ContainerCID</a> R objects	List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block.  The configuration cannot be modified after the cluster is created.

**Table 4-9** ContainerCIDR

Parameter	Mandatory	Type	Description
cidr	Yes	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-10** EniNetwork

Parameter	Mandatory	Type	Description
eniSubnetId	Yes	String	IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>
eniSubnetCIDR	Yes	String	ENI subnet CIDR (being discarded)

Parameter	Mandatory	Type	Description
subnets	Yes	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs

**Table 4-11** NetworkSubnet

Parameter	Mandatory	Type	Description
subnetID	Yes	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and click the target subnet on the <a href="#">Subnets</a> page. You can view the IPv4 subnet ID on the displayed page.</li> <li>Method 2: Use the VPC API for querying subnets.</li> </ul>

**Table 4-12** ServiceNetwork

Parameter	Mandatory	Type	Description
IPv4CIDR	No	String	<p>Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used.</p>

**Table 4-13** Authentication

Parameter	Mandatory	Type	Description
mode	No	String	Cluster authentication mode. <ul style="list-style-type: none"><li>• Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>• Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul>
authenticatin gProxy	No	<b>Authenticati ngProxy</b> object	Configuration related to the authenticating_proxy mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .

**Table 4-14** AuthenticatingProxy

Parameter	Mandatory	Type	Description
ca	No	String	X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB
cert	No	String	Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

Parameter	Mandatory	Type	Description
privateKey	No	String	Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

**Table 4-15** MasterSpec

Parameter	Mandatory	Type	Description
availabilityZone	No	String	AZ

**Table 4-16** ResourceTag

Parameter	Mandatory	Type	Description
key	No	String	<p>Key.</p> <ul style="list-style-type: none"><li>• Cannot be null. Max characters: 128.</li><li>• Use letters, digits, and spaces in UTF-8 format.</li><li>• Can contain the following special characters: _.:=/=+-@.</li><li>• Cannot start with <code>_sys_</code>.</li></ul>

Parameter	Mandatory	Type	Description
value	No	String	<p>Value.</p> <ul style="list-style-type: none"><li>• Can be null but not the default. Max characters: 255.</li><li>• Use letters, digits, and spaces in UTF-8 format.</li><li>• Can contain the following special characters: _.:;/=-+@.</li></ul>

**Table 4-17** ClusterExtendParam

Parameter	Mandatory	Type	Description
clusterAZ	No	String	<p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li>• <b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li>• <i>AZ of the dedicated cloud computing pool.</i> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>

Parameter	Mandatory	Type	Description
dssMasterVolumes	No	String	<p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format:  <code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"> <li>• <b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li> <li>• <b>dssPoolID</b> indicates the ID of the DSS storage pool.</li> <li>• <b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li> </ul> <p>Example:  <code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edbc2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b>  This field cannot be configured for non-dedicated CCE clusters.</p>
enterpriseProjectId	No	String	<p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• An enterprise project can be configured only after the enterprise project function is enabled.</li> <li>• The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li> </ul>

Parameter	Mandatory	Type	Description
kubeProxyMode	No	String	<p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b> This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p>
clusterExternalIP	No	String	EIP of the master node

Parameter	Mandatory	Type	Description
alpha.cce/ fixPoolMask	No	String	<p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>
decMasterFlavor	No	String	Specifications of the master node in the dedicated hybrid cluster.
dockerUmaskMode	No	String	Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.
kubernetes.io/ cpuManagerPolicy	No	String	<p>Cluster CPU management policy. The value can be <b>none</b> (or null) or <b>static</b>. The default value is <b>none</b> (or null).</p> <ul style="list-style-type: none"> <li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li> <li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li> </ul>

Parameter	Mandatory	Type	Description
upgradefrom	No	String	Records of how the cluster is upgraded to the current version

**Table 4-18** PackageConfiguration

Parameter	Mandatory	Type	Description
name	No	String	Component name.
configurations	No	Array of ConfigurationItem objects	Component configuration item.

**Table 4-19** ConfigurationItem

Parameter	Mandatory	Type	Description
name	No	String	Component configuration item name.
value	No	Object	Component configuration item value.

**Table 4-20** ClusterStatus

Parameter	Mandatory	Type	Description
phase	No	String	<p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>● <b>Available</b>: The cluster is running properly.</li><li>● <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>● <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>● <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>● <b>Creating</b>: The cluster is being created.</li><li>● <b>Deleting</b>: The cluster is being deleted.</li><li>● <b>Upgrading</b>: The cluster is being upgraded.</li><li>● <b>Resizing</b>: Cluster specifications are being changed.</li><li>● <b>RollingBack</b>: The cluster is being rolled back.</li><li>● <b>RollbackFailed</b>: The rollback is abnormal.</li><li>● <b>Empty</b>: The cluster has no resources.</li></ul>

Parameter	Mandatory	Type	Description
jobID	No	String	<p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"> <li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li> <li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li> </ul> <p><b>NOTE</b> Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>
reason	No	String	Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.
message	No	String	Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.
endpoints	No	Array of <a href="#">ClusterEndpo ints</a> objects	Access address of kube-apiserver in the cluster.
deleteOption	No	Object	Whether to delete configurations. This parameter is contained only in the response to the deletion request.
deleteStatus	No	Object	Whether to delete the status information. This parameter is contained only in the response to the deletion request.

**Table 4-21** ClusterEndpoints

Parameter	Mandatory	Type	Description
url	No	String	Access address of kube-apiserver in the cluster.
type	No	String	Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul>

## Response Parameters

Status code: 201

**Table 4-22** Response body parameters

Parameter	Type	Description
kind	String	API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.
apiVersion	String	API version. The value is fixed at <b>v3</b> and cannot be changed.
metadata	<a href="#">ClusterMetadata</a> object	Basic information about a cluster. Metadata is a collection of attributes.
spec	<a href="#">ClusterSpec</a> object	Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> .
status	<a href="#">ClusterStatus</a> object	Cluster status and job ID of the cluster creation job.

**Table 4-23** ClusterMetadata

Parameter	Type	Description
name	String	Cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.

Parameter	Type	Description
uid	String	Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.
alias	String	<p>Alias of a cluster name displayed on the CCE console, and the name can be changed. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <p>A cluster alias must be unique.</p> <p>In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.</p>
annotations	Map<String, String>	<p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {     "key1" : "value1",     "key2" : "value2" }</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations:</b> Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external/install":"[{"addonTemplateName":"icagent"}]".</li></ul>
labels	Map<String, String>	<p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>
creationTimestamp	String	Time when the cluster was created.
updateTimestamp	String	Time when the cluster was updated.

**Table 4-24** ClusterSpec

Parameter	Type	Description
category	String	Cluster type. Options: <ul style="list-style-type: none"><li>• <b>CCE</b>: CCE cluster CCE cluster supports hybrid deployment of VMs and BMSs, and heterogeneous nodes such as GPU and NPU nodes, allowing you to run your containers in a secure and stable container runtime environment based on a high-performance network model.</li></ul>
type	String	Master node architecture: <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: x86</li></ul>

Parameter	Type	Description
flavor	String	<p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul>

Parameter	Type	Description
version	String	<p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended.</p> <p>You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>
platformVersion	String	<p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul>
description	String	<p>Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.</p>

Parameter	Type	Description
customSan	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
ipv6enable	Boolean	Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.
hostNetwork	<a href="#">HostNetwork</a> object	Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.
containerNetwork	<a href="#">ContainerNetwork</a> object	Container networking parameters, including the container network model and container CIDR block.
serviceNetwork	<a href="#">ServiceNetwork</a> object	Service CIDR block, including IPv4 CIDR blocks.
authentication	<a href="#">Authentication</a> object	Configurations of the cluster authentication mode.
billingMode	Integer	Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.
masters	Array of <a href="#">MasterSpec</a> objects	Advanced configurations of master nodes
kubernetesSvcIpRange	String	Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.
clusterTags	Array of <a href="#">ResourceTag</a> objects	Cluster resource tags.

Parameter	Type	Description
kubeProxyMode	String	Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul>
az	String	AZ. This field is returned only for a query.
extendParam	<a href="#">ClusterExtendedParam</a> object	Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.
supportIstio	Boolean	Whether Istio is supported.
configurationsOverride	Array of <a href="#">PackageConfiguration</a> objects	Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see

**Table 4-25 HostNetwork**

Parameter	Type	Description
vpc	String	ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>• Method 2: Use the VPC API to query the VPC ID.</li></ul>

Parameter	Type	Description
subnet	String	<p>Network ID of the subnet used to create a master node. Methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets. . .</li></ul>
SecurityGroup	String	Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications.

**Table 4-26** ContainerNetwork

Parameter	Type	Description
mode	String	<p>Container network model. Select one of the following possible values:</p> <ul style="list-style-type: none"><li><b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li><b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul>
cidr	String	<p>Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported.</p> <p>Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)</p>

Parameter	Type	Description
cids	Array of <a href="#">ContainerCIDR</a> objects	List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block. The configuration cannot be modified after the cluster is created.

**Table 4-27** ContainerCIDR

Parameter	Type	Description
cidr	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-28** EniNetwork

Parameter	Type	Description
eniSubnetId	String	IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>
eniSubnetCIDR	String	ENI subnet CIDR (being discarded)
subnets	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs

**Table 4-29** NetworkSubnet

Parameter	Type	Description
subnetID	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>

**Table 4-30** ServiceNetwork

Parameter	Type	Description
IPv4CIDR	String	Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used.

**Table 4-31** Authentication

Parameter	Type	Description
mode	String	<p>Cluster authentication mode.</p> <ul style="list-style-type: none"><li>Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul>
authenticatin gProxy	<b>Authenticati ngProxy</b> object	Configuration related to the <b>authenticating_proxy</b> mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .

**Table 4-32** AuthenticatingProxy

Parameter	Type	Description
ca	String	X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB
cert	String	Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .
privateKey	String	Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

**Table 4-33** MasterSpec

Parameter	Type	Description
availabilityZone	String	AZ

**Table 4-34** ResourceTag

Parameter	Type	Description
key	String	Key. <ul style="list-style-type: none"><li>● Cannot be null. Max characters: 128.</li><li>● Use letters, digits, and spaces in UTF-8 format.</li><li>● Can contain the following special characters: _.:;/=-@.</li><li>● Cannot start with <b>_sys_</b>.</li></ul>

Parameter	Type	Description
value	String	<p>Value.</p> <ul style="list-style-type: none"><li>Can be null but not the default. Max characters: 255.</li><li>Use letters, digits, and spaces in UTF-8 format.</li><li>Can contain the following special characters: _:/=-@.</li></ul>

**Table 4-35** ClusterExtendParam

Parameter	Type	Description
clusterAZ	String	<p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li><b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li><b>AZ of the dedicated cloud computing pool:</b> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>
dssMasterVolumes	String	<p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format: <code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"><li><b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li><li><b>dssPoolID</b> indicates the ID of the DSS storage pool.</li><li><b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li></ul> <p>Example: <code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edb2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b> This field cannot be configured for non-dedicated CCE clusters.</p>

Parameter	Type	Description
enterpriseProjectId	String	<p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>An enterprise project can be configured only after the enterprise project function is enabled.</li><li>The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li></ul>
kubeProxyMode	String	<p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li><b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li><b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b> This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p>
clusterExternalIP	String	EIP of the master node
alpha.cce/fixPoolMask	String	<p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>
decMasterFlavor	String	Specifications of the master node in the dedicated hybrid cluster.

Parameter	Type	Description
dockerUmaskMode	String	Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.
kubernetes.io/cpuManagerPolicy	String	<p>Cluster CPU management policy. The value can be none (or null) or static. The default value is none (or null).</p> <ul style="list-style-type: none"><li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li><li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li></ul>
upgradefrom	String	Records of how the cluster is upgraded to the current version

**Table 4-36** PackageConfiguration

Parameter	Type	Description
name	String	Component name.
configurations	Array of <a href="#">ConfigurationItem</a> objects	Component configuration item.

**Table 4-37** ConfigurationItem

Parameter	Type	Description
name	String	Component configuration item name.
value	Object	Component configuration item value.

**Table 4-38** ClusterStatus

Parameter	Type	Description
phase	String	<p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>Available</b>: The cluster is running properly.</li><li>• <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>• <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>• <b>Creating</b>: The cluster is being created.</li><li>• <b>Deleting</b>: The cluster is being deleted.</li><li>• <b>Upgrading</b>: The cluster is being upgraded.</li><li>• <b>Resizing</b>: Cluster specifications are being changed.</li><li>• <b>RollingBack</b>: The cluster is being rolled back.</li><li>• <b>RollbackFailed</b>: The rollback is abnormal.</li><li>• <b>Empty</b>: The cluster has no resources.</li></ul>
jobID	String	<p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"><li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li><li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li></ul> <p><b>NOTE</b> Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>
reason	String	Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.
message	String	Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.
endpoints	Array of <a href="#">ClusterEndpoints</a> objects	Access address of kube-apiserver in the cluster.

Parameter	Type	Description
deleteOption	Object	Whether to delete configurations. This parameter is contained only in the response to the deletion request.
deleteStatus	Object	Whether to delete the status information. This parameter is contained only in the response to the deletion request.

**Table 4-39** ClusterEndpoints

Parameter	Type	Description
url	String	Access address of kube-apiserver in the cluster.
type	String	Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul>

## Example Requests

- Create an HA CCE cluster of v1.19 with 50 nodes.

```
/api/v3/projects/{project_id}/clusters

{
  "kind" : "Cluster",
  "apiVersion" : "v3",
  "metadata" : {
    "name" : "cluster"
  },
  "spec" : {
    "category" : "CCE",
    "flavor" : "cce.s2.small",
    "version" : "v1.19",
    "hostNetwork" : {
      "vpc" : "030bfb19-5fa7-42ad-8a0d-c0721d268867",
      "subnet" : "ca964acf-8468-4735-8229-97940ef6c881"
    },
    "containerNetwork" : {
      "mode" : "vpc-router",
      "cidr" : "10.0.0.0/16"
    },
    "kubernetesSvclpRange" : "10.247.0.0/16",
    "description" : "",
    "billingMode" : 0,
    "extendParam" : {
      "kubeProxyMode" : "iptables",
      "alpha.cce/fixPoolMask" : "25",
      "enterpriseProjectId" : "0"
    },
    "authentication" : {
      "mode" : "rbac"
    },
    "ipv6enable" : false
  }
}
```

- Create an HA CCE cluster of v1.19 with 50 nodes and install ICAgent in the cluster.

```
/api/v3/projects/{project_id}/clusters

{
  "kind" : "Cluster",
  "apiVersion" : "v3",
  "metadata" : {
    "name" : "cluster",
    "annotations" : {
      "cluster.install.addons.external/install" : "[{\\"addonTemplateName\\":\\"icagent\\"}]"
    }
  },
  "spec" : {
    "category" : "CCE",
    "flavor" : "cce.s2.small",

## Status Codes

Status Code	Description
201	The cluster creation job is successfully delivered.

## Error Codes

See [Error Codes](#).

### 4.2.2 Reading a Specified Cluster

#### Function

This API is used to obtain details about a specified cluster.

 NOTE

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

## URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}

**Table 4-40** Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .
cluster_id	Yes	String	Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .

**Table 4-41** Query Parameters

Parameter	Mandatory	Type	Description
detail	No	String	Whether the details about a cluster are queried. If this parameter is set to <b>true</b> , the total number of nodes (totalNodesNumber), number of normal nodes (activeNodesNumber), total CPUs (totalNodesCPU), total memory size (totalNodesMemory), and installed add-ons (installedAddonInstances) will be added to the annotation. The details of installed add-ons include the add-on name (addonTemplateName), version (version), and status (status).

## Request Parameters

**Table 4-42** Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format).
X-Auth-Token	Yes	String	Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> .

## Response Parameters

**Status code: 200**

**Table 4-43** Response body parameters

Parameter	Type	Description
kind	String	API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.
apiVersion	String	API version. The value is fixed at <b>v3</b> and cannot be changed.
metadata	<a href="#">ClusterMetadata</a> object	Basic information about a cluster. Metadata is a collection of attributes.
spec	<a href="#">ClusterSpec</a> object	Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> .
status	<a href="#">ClusterStatus</a> object	Cluster status.

**Table 4-44** ClusterMetadata

Parameter	Type	Description
name	String	Cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.

Parameter	Type	Description
uid	String	Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.
alias	String	<p>Alias of a cluster name displayed on the CCE console, and the name can be changed. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <p>A cluster alias must be unique.</p> <p>In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.</p>
annotations	Map<String, String>	<p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {     "key1" : "value1",     "key2" : "value2" }</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations:</b> Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external/install":"[{"addonTemplateName":"icagent"}]".</li></ul>
labels	Map<String, String>	<p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>
creationTimestamp	String	Time when the cluster was created.
updateTimestamp	String	Time when the cluster was updated.

**Table 4-45** ClusterSpec

Parameter	Type	Description
category	String	Cluster type. Options: <ul style="list-style-type: none"><li>• <b>CCE</b>: CCE cluster CCE cluster supports hybrid deployment of VMs and BMSs, and heterogeneous nodes such as GPU and NPU nodes, allowing you to run your containers in a secure and stable container runtime environment based on a high-performance network model.</li></ul>
type	String	Master node architecture: <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: x86</li></ul>

Parameter	Type	Description
flavor	String	<p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul>

Parameter	Type	Description
version	String	<p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended.</p> <p>You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>
platformVersion	String	<p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul>
description	String	<p>Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.</p>

Parameter	Type	Description
customSan	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
ipv6enable	Boolean	Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.
hostNetwork	<a href="#">HostNetwork</a> object	Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.
containerNetwork	<a href="#">ContainerNetwork</a> object	Container networking parameters, including the container network model and container CIDR block.
serviceNetwork	<a href="#">ServiceNetwork</a> object	Service CIDR block, including IPv4 CIDR blocks.
authentication	<a href="#">Authentication</a> object	Configurations of the cluster authentication mode.
billingMode	Integer	Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.
masters	Array of <a href="#">MasterSpec</a> objects	Advanced configurations of master nodes
kubernetesSvcIpRange	String	Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.
clusterTags	Array of <a href="#">ResourceTag</a> objects	Cluster resource tags.

Parameter	Type	Description
kubeProxyMode	String	Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul>
az	String	AZ. This field is returned only for a query.
extendParam	<a href="#">ClusterExtendedParam</a> object	Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.
supportIstio	Boolean	Whether Istio is supported.
configurationsOverride	Array of <a href="#">PackageConfiguration</a> objects	Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see

**Table 4-46** HostNetwork

Parameter	Type	Description
vpc	String	ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>• Method 2: Use the VPC API to query the VPC ID.</li></ul>

Parameter	Type	Description
subnet	String	<p>Network ID of the subnet used to create a master node. Methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets. . .</li></ul>
SecurityGroup	String	Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications.

**Table 4-47** ContainerNetwork

Parameter	Type	Description
mode	String	<p>Container network model. Select one of the following possible values:</p> <ul style="list-style-type: none"><li><b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li><b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul>
cidr	String	<p>Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported.</p> <p>Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)</p>

Parameter	Type	Description
cids	Array of <a href="#">ContainerCIDR</a> objects	List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block. The configuration cannot be modified after the cluster is created.

**Table 4-48** ContainerCIDR

Parameter	Type	Description
cidr	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-49** EniNetwork

Parameter	Type	Description
eniSubnetId	String	IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>
eniSubnetCIDR	String	ENI subnet CIDR (being discarded)
subnets	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs

**Table 4-50** NetworkSubnet

Parameter	Type	Description
subnetID	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>

**Table 4-51** ServiceNetwork

Parameter	Type	Description
IPv4CIDR	String	Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used.

**Table 4-52** Authentication

Parameter	Type	Description
mode	String	<p>Cluster authentication mode.</p> <ul style="list-style-type: none"><li>Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul>
authenticatin gProxy	<b>Authenticati ngProxy</b> object	Configuration related to the authenticating_proxy mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .

**Table 4-53** AuthenticatingProxy

Parameter	Type	Description
ca	String	X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB
cert	String	Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .
privateKey	String	Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

**Table 4-54** MasterSpec

Parameter	Type	Description
availabilityZone	String	AZ

**Table 4-55** ResourceTag

Parameter	Type	Description
key	String	Key. <ul style="list-style-type: none"><li>● Cannot be null. Max characters: 128.</li><li>● Use letters, digits, and spaces in UTF-8 format.</li><li>● Can contain the following special characters: _.:;/=-@.</li><li>● Cannot start with <b>_sys_</b>.</li></ul>

Parameter	Type	Description
value	String	<p>Value.</p> <ul style="list-style-type: none"><li>Can be null but not the default. Max characters: 255.</li><li>Use letters, digits, and spaces in UTF-8 format.</li><li>Can contain the following special characters: _:/=-@.</li></ul>

**Table 4-56** ClusterExtendParam

Parameter	Type	Description
clusterAZ	String	<p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li><b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li><b>AZ of the dedicated cloud computing pool:</b> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>
dssMasterVolumes	String	<p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format: <code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"><li><b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li><li><b>dssPoolID</b> indicates the ID of the DSS storage pool.</li><li><b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li></ul> <p>Example: <code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edb2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b> This field cannot be configured for non-dedicated CCE clusters.</p>

Parameter	Type	Description
enterpriseProjectId	String	<p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>An enterprise project can be configured only after the enterprise project function is enabled.</li><li>The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li></ul>
kubeProxyMode	String	<p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li><b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li><b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b> This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p>
clusterExternalIP	String	EIP of the master node
alpha.cce/fixPoolMask	String	<p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>
decMasterFlavor	String	Specifications of the master node in the dedicated hybrid cluster.

Parameter	Type	Description
dockerUmaskMode	String	Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.
kubernetes.io/cpuManagerPolicy	String	<p>Cluster CPU management policy. The value can be none (or null) or static. The default value is none (or null).</p> <ul style="list-style-type: none"><li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li><li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li></ul>
upgradefrom	String	Records of how the cluster is upgraded to the current version

**Table 4-57** PackageConfiguration

Parameter	Type	Description
name	String	Component name.
configurations	Array of <a href="#">ConfigurationItem</a> objects	Component configuration item.

**Table 4-58** ConfigurationItem

Parameter	Type	Description
name	String	Component configuration item name.
value	Object	Component configuration item value.

**Table 4-59** ClusterStatus

Parameter	Type	Description
phase	String	<p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>Available</b>: The cluster is running properly.</li><li>• <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>• <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>• <b>Creating</b>: The cluster is being created.</li><li>• <b>Deleting</b>: The cluster is being deleted.</li><li>• <b>Upgrading</b>: The cluster is being upgraded.</li><li>• <b>Resizing</b>: Cluster specifications are being changed.</li><li>• <b>RollingBack</b>: The cluster is being rolled back.</li><li>• <b>RollbackFailed</b>: The rollback is abnormal.</li><li>• <b>Empty</b>: The cluster has no resources.</li></ul>
jobID	String	<p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"><li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li><li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li></ul> <p><b>NOTE</b> Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>
reason	String	Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.
message	String	Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.
endpoints	Array of <a href="#">ClusterEndpoints</a> objects	Access address of kube-apiserver in the cluster.

Parameter	Type	Description
deleteOption	Object	Whether to delete configurations. This parameter is contained only in the response to the deletion request.
deleteStatus	Object	Whether to delete the status information. This parameter is contained only in the response to the deletion request.

**Table 4-60** ClusterEndpoints

Parameter	Type	Description
url	String	Access address of kube-apiserver in the cluster.
type	String	Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul>

## Example Requests

See [Error Codes](#).

### 4.2.3 Listing Clusters in a Specified Project

#### Function

This API is used to obtain details about all clusters in a specified project.

#### URI

GET /api/v3/projects/{project\_id}/clusters

**Table 4-61** Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .

**Table 4-62** Query Parameters

Parameter	Mandatory	Type	Description
detail	No	String	Whether the details about a cluster are queried. If this parameter is set to <b>true</b> , the total number of nodes (totalNodesNumber), number of normal nodes (activeNodesNumber), total CPUs (totalNodesCPU), total memory size (totalNodesMemory), and installed add-ons (installedAddonInstances) will be added to the annotation. The details of installed add-ons include the add-on name (addonTemplateName), version (version), and status (status).
status	No	String	Cluster status. Possible values: <ul style="list-style-type: none"><li>• <b>Available:</b> The cluster is running properly.</li><li>• <b>Unavailable:</b> The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp:</b> Nodes are being added to the cluster.</li><li>• <b>ScalingDown:</b> The cluster is being downsized to fewer nodes.</li><li>• <b>Creating:</b> The cluster is being created.</li><li>• <b>Deleting:</b> The cluster is being deleted.</li><li>• <b>Upgrading:</b> The cluster is being upgraded.</li><li>• <b>Resizing:</b> Cluster specifications are being changed.</li><li>• <b>RollingBack:</b> The cluster is being rolled back.</li><li>• <b>RollbackFailed:</b> The rollback is abnormal.</li><li>• <b>Empty:</b> The cluster has no resources.</li></ul>

Parameter	Mandatory	Type	Description
type	No	String	Cluster type. Options: <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: CCE cluster</li><li>• <b>ARM64</b>: Kunpeng cluster</li></ul>
version	No	String	Cluster version filtering.

## Request Parameters

**Table 4-63** Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format).
X-Auth-Token	Yes	String	Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> .

## Response Parameters

Status code: 200

**Table 4-64** Response body parameters

Parameter	Type	Description
kind	String	Api type
apiVersion	String	API version
items	Array of <a href="#">Cluster</a> objects	A list of details for all clusters in the current project. You can filter clusters by <b>items.metadata.name</b> .

**Table 4-65** Cluster

Parameter	Type	Description
kind	String	API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.

Parameter	Type	Description
apiVersion	String	API version. The value is fixed at <b>v3</b> and cannot be changed.
metadata	<a href="#">ClusterMetadata</a> object	Basic information about a cluster. Metadata is a collection of attributes.
spec	<a href="#">ClusterSpec</a> object	Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> .
status	<a href="#">ClusterStatus</a> object	Cluster status and job ID of the cluster creation job.

**Table 4-66** ClusterMetadata

Parameter	Type	Description
name	String	Cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.
uid	String	Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.
alias	String	Alias of a cluster name displayed on the CCE console, and the name can be changed. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. A cluster alias must be unique. In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.

Parameter	Type	Description
annotations	Map<String, String>	<p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {     "key1" : "value1",     "key2" : "value2" }</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b>: Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external/install":"[{"addonTemplateName":"icagent"}]".</li></ul>
labels	Map<String, String>	<p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>
creationTimestamp	String	Time when the cluster was created.
updateTimestamp	String	Time when the cluster was updated.

**Table 4-67** ClusterSpec

Parameter	Type	Description
category	String	<p>Cluster type. Options:</p> <ul style="list-style-type: none"><li>• <b>CCE</b>: CCE cluster CCE cluster supports hybrid deployment of VMs and BMSs, and heterogeneous nodes such as GPU and NPU nodes, allowing you to run your containers in a secure and stable container runtime environment based on a high-performance network model.</li></ul>
type	String	<p>Master node architecture:</p> <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: x86</li></ul>

Parameter	Type	Description
flavor	String	<p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul>

Parameter	Type	Description
version	String	<p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended.</p> <p>You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>
platformVersion	String	<p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul>
description	String	<p>Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.</p>

Parameter	Type	Description
customSan	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
ipv6enable	Boolean	Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.
hostNetwork	<a href="#">HostNetwork</a> object	Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.
containerNetwork	<a href="#">ContainerNetwork</a> object	Container networking parameters, including the container network model and container CIDR block.
serviceNetwork	<a href="#">ServiceNetwork</a> object	Service CIDR block, including IPv4 CIDR blocks.
authentication	<a href="#">Authentication</a> object	Configurations of the cluster authentication mode.
billingMode	Integer	Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.
masters	Array of <a href="#">MasterSpec</a> objects	Advanced configurations of master nodes
kubernetesSvcIpRange	String	Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.
clusterTags	Array of <a href="#">ResourceTag</a> objects	Cluster resource tags.

Parameter	Type	Description
kubeProxyMode	String	Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul>
az	String	AZ. This field is returned only for a query.
extendParam	<a href="#">ClusterExtendedParam</a> object	Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.
supportIstio	Boolean	Whether Istio is supported.
configurationsOverride	Array of <a href="#">PackageConfiguration</a> objects	Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see

**Table 4-68** HostNetwork

Parameter	Type	Description
vpc	String	ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>• Method 2: Use the VPC API to query the VPC ID.</li></ul>

Parameter	Type	Description
subnet	String	<p>Network ID of the subnet used to create a master node. Methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets. . .</li></ul>
SecurityGroup	String	Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications.

**Table 4-69** ContainerNetwork

Parameter	Type	Description
mode	String	<p>Container network model. Select one of the following possible values:</p> <ul style="list-style-type: none"><li><b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li><b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul>
cidr	String	<p>Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported.</p> <p>Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)</p>

Parameter	Type	Description
cids	Array of <a href="#">ContainerCIDR</a> objects	List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block. The configuration cannot be modified after the cluster is created.

**Table 4-70** ContainerCIDR

Parameter	Type	Description
cidr	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-71** EniNetwork

Parameter	Type	Description
eniSubnetId	String	IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>
eniSubnetCIDR	String	ENI subnet CIDR (being discarded)
subnets	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs

**Table 4-72** NetworkSubnet

Parameter	Type	Description
subnetID	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>

**Table 4-73** ServiceNetwork

Parameter	Type	Description
IPv4CIDR	String	Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used.

**Table 4-74** Authentication

Parameter	Type	Description
mode	String	<p>Cluster authentication mode.</p> <ul style="list-style-type: none"><li>Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul>
authenticatin gProxy	<b>Authenticati ngProxy</b> object	Configuration related to the <b>authenticating_proxy</b> mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .

**Table 4-75** AuthenticatingProxy

Parameter	Type	Description
ca	String	X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB
cert	String	Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .
privateKey	String	Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

**Table 4-76** MasterSpec

Parameter	Type	Description
availabilityZone	String	AZ

**Table 4-77** ResourceTag

Parameter	Type	Description
key	String	Key. <ul style="list-style-type: none"><li>● Cannot be null. Max characters: 128.</li><li>● Use letters, digits, and spaces in UTF-8 format.</li><li>● Can contain the following special characters: _.:;/=-@.</li><li>● Cannot start with <b>_sys_</b>.</li></ul>

Parameter	Type	Description
value	String	<p>Value.</p> <ul style="list-style-type: none"><li>Can be null but not the default. Max characters: 255.</li><li>Use letters, digits, and spaces in UTF-8 format.</li><li>Can contain the following special characters: _:/=-@.</li></ul>

**Table 4-78** ClusterExtendParam

Parameter	Type	Description
clusterAZ	String	<p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li><b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li><b>AZ of the dedicated cloud computing pool:</b> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>
dssMasterVolumes	String	<p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format: <code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"><li><b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li><li><b>dssPoolID</b> indicates the ID of the DSS storage pool.</li><li><b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li></ul> <p>Example: <code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edb2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b> This field cannot be configured for non-dedicated CCE clusters.</p>

Parameter	Type	Description
enterpriseProjectId	String	<p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>An enterprise project can be configured only after the enterprise project function is enabled.</li><li>The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li></ul>
kubeProxyMode	String	<p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li><b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li><b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b> This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p>
clusterExternalIP	String	EIP of the master node
alpha.cce/fixPoolMask	String	<p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>
decMasterFlavor	String	Specifications of the master node in the dedicated hybrid cluster.

Parameter	Type	Description
dockerUmaskMode	String	Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.
kubernetes.io/cpuManagerPolicy	String	<p>Cluster CPU management policy. The value can be none (or null) or static. The default value is none (or null).</p> <ul style="list-style-type: none"><li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li><li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li></ul>
upgradefrom	String	Records of how the cluster is upgraded to the current version

**Table 4-79** PackageConfiguration

Parameter	Type	Description
name	String	Component name.
configurations	Array of <a href="#">ConfigurationItem</a> objects	Component configuration item.

**Table 4-80** ConfigurationItem

Parameter	Type	Description
name	String	Component configuration item name.
value	Object	Component configuration item value.

**Table 4-81** ClusterStatus

Parameter	Type	Description
phase	String	<p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>Available</b>: The cluster is running properly.</li><li>• <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>• <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>• <b>Creating</b>: The cluster is being created.</li><li>• <b>Deleting</b>: The cluster is being deleted.</li><li>• <b>Upgrading</b>: The cluster is being upgraded.</li><li>• <b>Resizing</b>: Cluster specifications are being changed.</li><li>• <b>RollingBack</b>: The cluster is being rolled back.</li><li>• <b>RollbackFailed</b>: The rollback is abnormal.</li><li>• <b>Empty</b>: The cluster has no resources.</li></ul>
jobID	String	<p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"><li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li><li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li></ul> <p><b>NOTE</b> Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>
reason	String	Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.
message	String	Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.
endpoints	Array of <a href="#">ClusterEndpoints</a> objects	Access address of kube-apiserver in the cluster.

Parameter	Type	Description
deleteOption	Object	Whether to delete configurations. This parameter is contained only in the response to the deletion request.
deleteStatus	Object	Whether to delete the status information. This parameter is contained only in the response to the deletion request.

**Table 4-82 ClusterEndpoints**

Parameter	Type	Description
url	String	Access address of kube-apiserver in the cluster.
type	String	Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul>

## Status Codes

Status Code	Description
200	The cluster list is successfully obtained.

## Error Codes

See [Error Codes](#).

### 4.2.4 Updating a Specified Cluster

#### Function

This API is used to update information about a specified cluster.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}

**Table 4-83** Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .

Parameter	Mandatory	Type	Description
cluster_id	Yes	String	Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .

## Request Parameters

**Table 4-84** Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format).
X-Auth-Token	Yes	String	Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> .

**Table 4-85** Request body parameters

Parameter	Mandatory	Type	Description
spec	Yes	<a href="#">ClusterInformationSpec object</a>	Detailed cluster parameters
metadata	No	<a href="#">ClusterMetadataForUpdate object</a>	Basic cluster information, including name-related fields

**Table 4-86** ClusterInformationSpec

Parameter	Mandatory	Type	Description
description	No	String	<p>Cluster description.</p> <p>1. A maximum of 200 characters are allowed. The value cannot contain the following special characters: ~\$%^&amp;*&lt;&gt;[]{} ()'"#\`</p> <p>2. Only clusters in the Available, ScalingUp, and ScalingDown states can be modified.</p>
customSan	No	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <p>1. Duplicate names are not allowed.</p> <p>2. Must comply with the IP address and domain name formats.</p> <p><b>Example:</b> SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
containerNetwork	No	<a href="#">ContainerNet workUpdate</a> object	Container networking parameters, including information about the container CIDR block.
eniNetwork	No	<a href="#">EniNetworkU pdate</a> object	Cloud Native Network 2.0 network configuration, including the container subnet information of the CCE Turbo cluster.
hostNetwork	No	<a href="#">hostNetwork</a> object	Node network parameters, including the default security group settings.

**Table 4-87** ContainerNetworkUpdate

Parameter	Mandatory	Type	Description
cidrs	No	Array of <a href="#">ContainerCIDR</a> objects	List of container CIDR blocks. For a clusters of v1.21 or later, if it uses a VPC network, a maximum of 20 container CIDR blocks can be added incrementally. The configuration cannot be modified after the cluster is updated.

**Table 4-88** ContainerCIDR

Parameter	Mandatory	Type	Description
cidr	Yes	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-89** EniNetworkUpdate

Parameter	Mandatory	Type	Description
subnets	No	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs. CCE Turbo clusters of version 1.19.10 and later support multiple container subnets. In addition, the container subnet list can be incrementally updated. Subnets can be added, not deleted. Exercise caution when selecting a subnet. The request body must contain all existing subnets.

**Table 4-90** NetworkSubnet

Parameter	Mandatory	Type	Description
subnetID	Yes	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>

**Table 4-91** hostNetwork

Parameter	Mandatory	Type	Description
SecurityGroup	No	String	The default security group of the worker node in the cluster needs to allow traffic through some ports to ensure normal communication. The modified security group applies only to nodes newly created or accepted. For existing nodes, you need to manually modify the security group rules for them.

**Table 4-92** ClusterMetadataForUpdate

Parameter	Mandatory	Type	Description
alias	No	String	<p>Alias of a cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <p>A cluster alias must be unique. If this parameter is left blank, the alias is not changed.</p>

## Response Parameters

Status code: 200

**Table 4-93** Response body parameters

Parameter	Type	Description
kind	String	API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.
apiVersion	String	API version. The value is fixed at <b>v3</b> and cannot be changed.
metadata	<b>ClusterMetadata</b> object	Basic information about a cluster. Metadata is a collection of attributes.
spec	<b>ClusterSpec</b> object	Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> .
status	<b>ClusterStatus</b> object	Cluster status and job ID of the cluster creation job.

**Table 4-94** ClusterMetadata

Parameter	Type	Description
name	String	Cluster name. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.
uid	String	Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.

Parameter	Type	Description
alias	String	<p>Alias of a cluster name displayed on the CCE console, and the name can be changed.</p> <p>Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <p>A cluster alias must be unique.</p> <p>In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.</p>
annotations	Map<String, String>	<p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {     "key1" : "value1",     "key2" : "value2" }</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations:</b> Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external/install":"[{"addonTemplateName":"icagent"}]".</li></ul>
labels	Map<String, String>	<p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>
creationTimestamp	String	Time when the cluster was created.
updateTimestamp	String	Time when the cluster was updated.

**Table 4-95** ClusterSpec

Parameter	Type	Description
category	String	Cluster type. Options: <ul style="list-style-type: none"><li>• <b>CCE</b>: CCE cluster CCE cluster supports hybrid deployment of VMs and BMSs, and heterogeneous nodes such as GPU and NPU nodes, allowing you to run your containers in a secure and stable container runtime environment based on a high-performance network model.</li></ul>
type	String	Master node architecture: <ul style="list-style-type: none"><li>• <b>VirtualMachine</b>: x86</li></ul>

Parameter	Type	Description
flavor	String	<p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul>

Parameter	Type	Description
version	String	<p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended.</p> <p>You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>
platformVersion	String	<p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul>
description	String	<p>Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.</p>

Parameter	Type	Description
customSan	Array of strings	<p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com SAN 2: DNS Name=www.example.com SAN 3: DNS Name=example.net SAN 4: IP Address=93.184.216.34</p>
ipv6enable	Boolean	Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.
hostNetwork	<a href="#">HostNetwork</a> object	Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.
containerNetwork	<a href="#">ContainerNetwork</a> object	Container networking parameters, including the container network model and container CIDR block.
serviceNetwork	<a href="#">ServiceNetwork</a> object	Service CIDR block, including IPv4 CIDR blocks.
authentication	<a href="#">Authentication</a> object	Configurations of the cluster authentication mode.
billingMode	Integer	Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.
masters	Array of <a href="#">MasterSpec</a> objects	Advanced configurations of master nodes
kubernetesSvcIpRange	String	Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.
clusterTags	Array of <a href="#">ResourceTag</a> objects	Cluster resource tags.

Parameter	Type	Description
kubeProxyMode	String	Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul>
az	String	AZ. This field is returned only for a query.
extendParam	<a href="#">ClusterExtendedParam</a> object	Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.
supportIstio	Boolean	Whether Istio is supported.
configurationsOverride	Array of <a href="#">PackageConfiguration</a> objects	Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see

**Table 4-96** HostNetwork

Parameter	Type	Description
vpc	String	ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>• Method 2: Use the VPC API to query the VPC ID.</li></ul>

Parameter	Type	Description
subnet	String	<p>Network ID of the subnet used to create a master node. Methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets. . .</li></ul>
SecurityGroup	String	Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications.

**Table 4-97** ContainerNetwork

Parameter	Type	Description
mode	String	<p>Container network model. Select one of the following possible values:</p> <ul style="list-style-type: none"><li><b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li><b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul>
cidr	String	<p>Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported.</p> <p>Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)</p>

Parameter	Type	Description
cids	Array of <a href="#">ContainerCIDR</a> objects	List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block. The configuration cannot be modified after the cluster is created.

**Table 4-98** ContainerCIDR

Parameter	Type	Description
cidr	String	Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19

**Table 4-99** EniNetwork

Parameter	Type	Description
eniSubnetId	String	IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>
eniSubnetCIDR	String	ENI subnet CIDR (being discarded)
subnets	Array of <a href="#">NetworkSubnet</a> objects	List of IPv4 subnet IDs

**Table 4-100** NetworkSubnet

Parameter	Type	Description
subnetID	String	<p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul>

**Table 4-101** ServiceNetwork

Parameter	Type	Description
IPv4CIDR	String	Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used.

**Table 4-102** Authentication

Parameter	Type	Description
mode	String	<p>Cluster authentication mode.</p> <ul style="list-style-type: none"><li>Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul>
authenticatin gProxy	<b>Authenticati ngProxy</b> object	Configuration related to the authenticating_proxy mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .

**Table 4-103** AuthenticatingProxy

Parameter	Type	Description
ca	String	X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB
cert	String	Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .
privateKey	String	Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .

**Table 4-104** MasterSpec

Parameter	Type	Description
availabilityZone	String	AZ

**Table 4-105** ResourceTag

Parameter	Type	Description
key	String	Key. <ul style="list-style-type: none"><li>● Cannot be null. Max characters: 128.</li><li>● Use letters, digits, and spaces in UTF-8 format.</li><li>● Can contain the following special characters: _.:;/=-@.</li><li>● Cannot start with <b>_sys_</b>.</li></ul>

Parameter	Type	Description
value	String	<p>Value.</p> <ul style="list-style-type: none"><li>Can be null but not the default. Max characters: 255.</li><li>Use letters, digits, and spaces in UTF-8 format.</li><li>Can contain the following special characters: _:/=-@.</li></ul>

**Table 4-106** ClusterExtendParam

Parameter	Type	Description
clusterAZ	String	<p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li><b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li><b>AZ of the dedicated cloud computing pool:</b> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>
dssMasterVolumes	String	<p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format: <code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"><li><b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li><li><b>dssPoolID</b> indicates the ID of the DSS storage pool.</li><li><b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li></ul> <p>Example: <code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edb2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b> This field cannot be configured for non-dedicated CCE clusters.</p>

Parameter	Type	Description
enterpriseProjectId	String	<p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>An enterprise project can be configured only after the enterprise project function is enabled.</li><li>The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li></ul>
kubeProxyMode	String	<p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li><b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li><b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b> This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p>
clusterExternalIP	String	EIP of the master node
alpha.cce/fixPoolMask	String	<p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>
decMasterFlavor	String	Specifications of the master node in the dedicated hybrid cluster.

Parameter	Type	Description
dockerUmaskMode	String	Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.
kubernetes.io/cpuManagerPolicy	String	<p>Cluster CPU management policy. The value can be none (or null) or static. The default value is none (or null).</p> <ul style="list-style-type: none"><li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li><li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li></ul>
upgradefrom	String	Records of how the cluster is upgraded to the current version

**Table 4-107** PackageConfiguration

Parameter	Type	Description
name	String	Component name.
configurations	Array of <a href="#">ConfigurationItem</a> objects	Component configuration item.

**Table 4-108** ConfigurationItem

Parameter	Type	Description
name	String	Component configuration item name.
value	Object	Component configuration item value.

**Table 4-109** ClusterStatus

Parameter	Type	Description
phase	String	<p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>Available</b>: The cluster is running properly.</li><li>• <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>• <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>• <b>Creating</b>: The cluster is being created.</li><li>• <b>Deleting</b>: The cluster is being deleted.</li><li>• <b>Upgrading</b>: The cluster is being upgraded.</li><li>• <b>Resizing</b>: Cluster specifications are being changed.</li><li>• <b>RollingBack</b>: The cluster is being rolled back.</li><li>• <b>RollbackFailed</b>: The rollback is abnormal.</li><li>• <b>Empty</b>: The cluster has no resources.</li></ul>
jobID	String	<p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"><li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li><li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li></ul> <p><b>NOTE</b> Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>
reason	String	Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.
message	String	Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.
endpoints	Array of <a href="#">ClusterEndpoints</a> objects	Access address of kube-apiserver in the cluster.

Parameter	Type	Description
deleteOption	Object	Whether to delete configurations. This parameter is contained only in the response to the deletion request.
deleteStatus	Object	Whether to delete the status information. This parameter is contained only in the response to the deletion request.

**Table 4-110** ClusterEndpoints

Parameter	Type	Description
url	String	Access address of kube-apiserver in the cluster.
type	String	Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul>

## Example Requests

- Updating only the description of a cluster

```
{  
  "spec": {  
    "description": "new description"  
  }  
}
```

- Updating only the custom SAN of the cluster certificate

```
{  
  "spec": {  
    "customSan": [ "192.168.1.0", "example.com" ]  
  }  
}
```

- Updating both the cluster description and custom certificate SAN

```
{  
  "spec": {  
    "description": "new description",  
    "customSan": [ "192.168.1.0", "example.com" ]  
  }  
}
```

- Configure a CIDR block for a cluster that uses VPCs and is of a version later than v1.21.

```
{  
  "spec": {  
    "containerNetwork": {  
      "cidrs": [ {  
        "cidr": "10.10.0.0/16"  
      }, {  
        "cidr": "10.11.0.0/16"  
      } ]  
    }  
  }  
}
```

- ```

        }
    }

● Modify the default security group of a node in a cluster.

```

```

/api/v3/projects/{project_id}/clusters/{cluster_id}

{
  "spec" : {
    "hostNetwork" : {
      "SecurityGroup" : "6ee29825-8f49-4796-b33a-fc76f84a59ae"
    }
  }
}

```

## Example Responses

| 200         | Information about the specified cluster is successfully updated. |

## Error Codes

See [Error Codes](#).

### 4.2.5 Deleting a Cluster

#### Function

This API is used to delete a specified cluster.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

DELETE /api/v3/projects/{project\_id}/clusters/{cluster\_id}

**Table 4-111** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

**Table 4-112** Query Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delete_efs | No        | String | Whether to delete SFS Turbo volumes. Value options: <ul style="list-style-type: none"><li>• <b>true</b> or <b>block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false</b> or <b>skip</b> (The object is not deleted. These are the default value options.)</li></ul> |
| delete_evs | No        | String | Whether to delete EVS disks. Value options: <ul style="list-style-type: none"><li>• <b>true</b> or <b>block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false</b> or <b>skip</b> (The object is not deleted. These are the default value options.)</li></ul>         |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delete_net | No        | String | <p>Whether to delete cluster Service and ingress resources, such as ELB load balancers. Value options:</p> <ul style="list-style-type: none"><li>• <b>true or block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false or skip</b> (Skip the deletion.)</li></ul> |
| delete_obs | No        | String | <p>Whether to delete OBS volumes. Value options:</p> <ul style="list-style-type: none"><li>• <b>true or block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false or skip</b> (The object is not deleted. These are the default value options.)</li></ul>          |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delete_sfs   | No        | String | Whether to delete SFS volumes. Value options: <ul style="list-style-type: none"><li>• <b>true or block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false or skip</b> (The object is not deleted. These are the default value options.)</li></ul>       |
| delete_sfs30 | No        | String | Whether to delete an SFS 3.0 volume. Example value: <ul style="list-style-type: none"><li>• <b>true or block</b> (The system starts to delete the object. If the deletion fails, subsequent processes are blocked.)</li><li>• <b>try</b> (The system starts to delete the object. If the deletion fails, no deletion retry is performed, and subsequent processes are not blocked.)</li><li>• <b>false or skip</b> (The object is not deleted. These are the default value options.)</li></ul> |

## Request Parameters

**Table 4-113** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-114** Response body parameters

| Parameter  | Type                                   | Description                                                                                               |
|------------|----------------------------------------|-----------------------------------------------------------------------------------------------------------|
| kind       | String                                 | API type. The value is fixed at <b>Cluster</b> or <b>cluster</b> and cannot be changed.                   |
| apiVersion | String                                 | API version. The value is fixed at <b>v3</b> and cannot be changed.                                       |
| metadata   | <a href="#">ClusterMetadata</a> object | Basic information about a cluster. Metadata is a collection of attributes.                                |
| spec       | <a href="#">ClusterSpec</a> object     | Detailed description of the cluster. CCE creates or updates objects by defining or updating <b>spec</b> . |
| status     | <a href="#">ClusterStatus</a> object   | Cluster status and job ID of the cluster creation job.                                                    |

**Table 4-115** ClusterMetadata

| Parameter | Type   | Description                                                                                                                                                                 |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Cluster name.<br>Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | String              | Cluster ID, which uniquely identifies a cluster. This ID is automatically generated after a cluster is created. Only the automatically generated ID will take effect. When you create a yearly/monthly cluster, no cluster ID will be returned in the response body.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| alias             | String              | <p>Alias of a cluster name displayed on the CCE console, and the name can be changed. Enter 4 to 128 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <p>A cluster alias must be unique.</p> <p>In the request body for creating or updating a cluster, if the cluster alias is not specified or set to null, the cluster name will be used as the cluster alias. In the response body for obtaining a cluster, the cluster alias is returned. If it is not configured, the cluster name will be returned.</p>                                                                                                             |
| annotations       | Map<String, String> | <p>Cluster annotations, in the format of key-value pairs.</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations:</b> Does not label or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This field is not stored in the database and is used only to specify the add-ons to be installed in the cluster.</li><li>• Install ICAgent during cluster creation by adding the key-value pair "cluster.install.addons.external/install":"[{"addonTemplateName":"icagent"}]".</li></ul> |
| labels            | Map<String, String> | <p>Cluster labels, in the format of key-value pairs.</p> <p><b>NOTE</b></p> <p>The value of this field is automatically generated by the system and is used by the frontend to identify the features supported by the cluster during the upgrade. Customized values are invalid.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| creationTimestamp | String              | Time when the cluster was created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| updateTimestamp   | String              | Time when the cluster was updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String | <p>Default value. When you create a CCE cluster, the value is <b>cce.s1.small</b> for non-dedicated cloud scenarios and <b>cce.dec.s1.small</b> for dedicated cloud scenarios.</p> <p>Cluster flavor. Only the flavors of clusters v1.15 or later versions can be changed after a cluster is created. Select a cluster flavor based on your requirements.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2000 worker nodes</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: a CCE cluster with one master node</li><li>• <b>s2</b>: a CCE cluster with multiple master nodes</li><li>• <b>dec</b>: a dedicated CCE cluster. For example, <b>cce.dec.s1.small</b> indicates a small-scale dedicated CCE cluster with one master node and a maximum of 50 worker nodes.</li><li>• Maximum number of worker nodes: The maximum number of worker nodes in a cluster. Select a cluster flavor based on your requirements.</li><li>• A CCE cluster with one master node: If the master node is down, the cluster will become unavailable, but the running workloads will not be affected.</li><li>• A cluster with multiple master nodes: This is an HA cluster. If a master node is down, the cluster can still be functionally available.</li></ul> |

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version         | String | <p>Cluster version, which mirrors the baseline version of the Kubernetes community. The latest version is recommended.</p> <p>You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, log in to the CCE console, create a cluster, and check the <b>Cluster Version</b> parameter. You can call APIs to create clusters of other versions. However, these cluster versions will be gradually terminated. For details about the support policy, see the CCE announcement.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If not specified, a cluster of the latest version will be created.</li><li>• If a baseline cluster version is specified but the R version is not specified, a cluster of the latest R version will be created by default. It is a good practice not to specify the R version.</li></ul>                                                                                                       |
| platformVersion | String | <p>CCE cluster platform version, indicating the internal version under the cluster version (<b>version</b>). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. This parameter cannot be customized. When you create a cluster, the latest corresponding platform version is automatically selected.</p> <p>The format of <b>platformVersion</b> is <b>cce.X.Y</b>.</p> <ul style="list-style-type: none"><li>• <b>X</b>: internal feature version, indicating changes in features, patches, or OS support in the cluster version. The value starts from <b>1</b> and increases monotonically.</li><li>• <b>Y</b>: patch version of an internal feature version. It is used only for software package update after the feature version is brought online. No other modification is involved. The value starts from <b>0</b> and increases monotonically.</li></ul> |
| description     | String | <p>Cluster description, for example, which purpose the cluster is intended to serve. By default, this field is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API for updating cluster information</a> or go to the cluster details page on the CCE console. Only UTF-8 encoding is supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter            | Type                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| customSan            | Array of strings                             | <p>Custom SAN field in the server certificate of the cluster API server, which must comply with the SSL and X509 format specifications.</p> <ol style="list-style-type: none"><li>1. Duplicate names are not allowed.</li><li>2. Must comply with the IP address and domain name formats.</li></ol> <p>Example:</p> <p>SAN 1: DNS Name=example.com<br/>SAN 2: DNS Name=www.example.com<br/>SAN 3: DNS Name=example.net<br/>SAN 4: IP Address=93.184.216.34</p> |
| ipv6enable           | Boolean                                      | Whether the cluster supports IPv6 addresses. This field is supported in clusters of v1.15 and later versions.                                                                                                                                                                                                                                                                                                                                                  |
| hostNetwork          | <a href="#">HostNetwork</a> object           | Node networking parameters, including VPC and subnet ID. This field is mandatory because nodes in a cluster communicate with each other by using a VPC.                                                                                                                                                                                                                                                                                                        |
| containerNetwork     | <a href="#">ContainerNetwork</a> object      | Container networking parameters, including the container network model and container CIDR block.                                                                                                                                                                                                                                                                                                                                                               |
| serviceNetwork       | <a href="#">ServiceNetwork</a> object        | Service CIDR block, including IPv4 CIDR blocks.                                                                                                                                                                                                                                                                                                                                                                                                                |
| authentication       | <a href="#">Authentication</a> object        | Configurations of the cluster authentication mode.                                                                                                                                                                                                                                                                                                                                                                                                             |
| billingMode          | Integer                                      | Billing mode of a cluster. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul> Defaults to pay-per-use.                                                                                                                                                                                                                                                                                                                                           |
| masters              | Array of <a href="#">MasterSpec</a> objects  | Advanced configurations of master nodes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| kubernetesSvcIpRange | String                                       | Service CIDR blocks for Kubernetes clusterIPs. This field is available only for clusters of v1.11.7 and later. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. This parameter is deprecated. Use <b>serviceNetwork</b> instead. The new field contains the IPv4 CIDR blocks.                                                                                                                  |
| clusterTags          | Array of <a href="#">ResourceTag</a> objects | Cluster resource tags.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter              | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kubeProxyMode          | String                                                | Service forwarding mode. Two modes are available: <ul style="list-style-type: none"><li>• <b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li>• <b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> |
| az                     | String                                                | AZ. This field is returned only for a query.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| extendParam            | <a href="#">ClusterExtendedParam</a> object           | Extended field to decide whether the cluster will span across AZs or belong to a specified enterprise project, or whether a dedicated CCE cluster is to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| supportIstio           | Boolean                                               | Whether Istio is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| configurationsOverride | Array of <a href="#">PackageConfiguration</a> objects | Whether to overwrite the default component configurations of the cluster. If a component or a parameter that is not supported by the component is specified, this configuration is ignored. For details about the supported configurable components and their parameters, see                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-117** HostNetwork

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                            |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vpc       | String | ID of the VPC used to create a master node. Obtain the public address by performing the following steps: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console, and click the name of a VPC to view the VPC ID on the displayed details page.</li><li>• Method 2: Use the VPC API to query the VPC ID.</li></ul> |

| Parameter     | Type   | Description                                                                                                                                                                                                                                                                                                                                |
|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet        | String | <p>Network ID of the subnet used to create a master node. Methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to VPC console and click the target subnet on the <b>Subnets</b> tab page. You can view the network ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets. . .</li></ul>          |
| SecurityGroup | String | Default worker node security group ID of the cluster. If specified, the cluster will be bound to the target security group. Otherwise, the system will automatically create a default worker node security group for you. The default worker node security group needs to allow access from certain ports to ensure normal communications. |

**Table 4-118** ContainerNetwork

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode      | String | <p>Container network model. Select one of the following possible values:</p> <ul style="list-style-type: none"><li><b>overlay_l2</b>: an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS).</li><li><b>vpc-router</b>: an underlay_l2 network built for containers by using IPvlan and custom VPC routes.</li></ul> |
| cidr      | String | <p>Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, or 192.168.0.0/16-19. If the selected CIDR block conflicts with existing ones, an error will be reported.</p> <p>Not editable after the cluster is created. (deprecated. A specified <b>cids</b> will make <b>cidr</b> invalid.)</p>                                                    |

| Parameter | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cids      | Array of <a href="#">ContainerCIDR</a> objects | List of container CIDR blocks. In clusters of v1.21 or later, the <b>cids</b> field is used. When the cluster network type is <b>vpc-router</b> , you can configure a maximum of 20 container CIDR blocks. In cluster versions earlier than v1.21, if the <b>cids</b> field is used, the first CIDR element in the array is used as the container CIDR block. The configuration cannot be modified after the cluster is created. |

**Table 4-119** ContainerCIDR

| Parameter | Type   | Description                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------|
| cidr      | String | Container CIDR block. Recommended: 10.0.0.0/12-19, 172.16.0.0/16-19, and 192.168.0.0/16-19 |

**Table 4-120** EniNetwork

| Parameter     | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eniSubnetId   | String                                         | IPv4 subnet ID of ENI subnet. (IPv6 is not supported and is being discarded.) You can obtain it in either of the following ways: <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul> |
| eniSubnetCIDR | String                                         | ENI subnet CIDR (being discarded)                                                                                                                                                                                                                                                                                                                                                           |
| subnets       | Array of <a href="#">NetworkSubnet</a> objects | List of IPv4 subnet IDs                                                                                                                                                                                                                                                                                                                                                                     |

**Table 4-121** NetworkSubnet

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetID  | String | <p>IPv4 subnet ID of the subnet for creating master nodes. Currently, IPv6 is not supported. You can obtain it in either of the following ways:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the IPv4 subnet ID on the displayed page.</li><li>Method 2: Use the VPC API for querying subnets.</li></ul> |

**Table 4-122** ServiceNetwork

| Parameter | Type   | Description                                                                                                                                                                |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4CIDR  | String | Value range of the Kubernetes clusterIP IPv4 CIDR blocks. If this parameter is not specified during cluster creation, the default value <b>10.247.0.0/16</b> will be used. |

**Table 4-123** Authentication

| Parameter            | Type                               | Description                                                                                                                                                                                                                                                                                                                                         |
|----------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode                 | String                             | <p>Cluster authentication mode.</p> <ul style="list-style-type: none"><li>Clusters of Kubernetes v1.11 or earlier support <b>x509</b>, <b>rbac</b>, and <b>authenticating_proxy</b>. Defaults to <b>x509</b>.</li><li>Clusters of Kubernetes v1.13 or later support <b>rbac</b> and <b>authenticating_proxy</b>. Defaults to <b>rbac</b>.</li></ul> |
| authenticatin gProxy | <b>Authenticati ngProxy</b> object | Configuration related to the <b>authenticating_proxy</b> mode. This field is mandatory when the authentication mode is <b>authenticating_proxy</b> .                                                                                                                                                                                                |

**Table 4-124** AuthenticatingProxy

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ca         | String | X509 CA certificate (Base64-encoded) configured in authenticating_proxy mode. This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . Maximum size: 1 MB                                                                                                                                                                                                                                                           |
| cert       | String | Client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> .                                                                                                                                         |
| privateKey | String | Private key of the client certificate issued by the X509 CA certificate configured in authenticating_proxy mode, which is used for authentication from kube-apiserver to the extended API server. The private key used by the Kubernetes cluster does not support password encryption. Use an unencrypted private key. (The value must be Base64-encoded.) This field is mandatory when the cluster authentication mode is <b>authenticating_proxy</b> . |

**Table 4-125** MasterSpec

| Parameter        | Type   | Description |
|------------------|--------|-------------|
| availabilityZone | String | AZ          |

**Table 4-126** ResourceTag

| Parameter | Type   | Description                                                                                                                                                                                                                                                        |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Key. <ul style="list-style-type: none"><li>● Cannot be null. Max characters: 128.</li><li>● Use letters, digits, and spaces in UTF-8 format.</li><li>● Can contain the following special characters: _.:;/=-@.</li><li>● Cannot start with <b>_sys_</b>.</li></ul> |

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | String | <p>Value.</p> <ul style="list-style-type: none"><li>Can be null but not the default. Max characters: 255.</li><li>Use letters, digits, and spaces in UTF-8 format.</li><li>Can contain the following special characters: _:/=-@.</li></ul> |

**Table 4-127** ClusterExtendParam

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterAZ        | String | <p>AZ of master nodes in the cluster.</p> <ul style="list-style-type: none"><li><b>multi_az:</b> (Optional) The cluster will span across AZs. This field is configurable only for high-availability clusters.</li><li><b>AZ of the dedicated cloud computing pool:</b> The cluster will be deployed in the AZ of Dedicated Cloud (DeC). This parameter is mandatory for dedicated CCE clusters.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| dssMasterVolumes | String | <p>Whether the system and data disks of a master node use dedicated distributed storage. If this parameter is omitted or left unspecified, EVS disks are used by default.</p> <p>This parameter is mandatory for dedicated CCE clusters. It is in the following format:<br/><code>&lt;rootVol.dssPoolID&gt;.&lt;rootVol.volType&gt;;&lt;dataVol.dssPoolID&gt;.&lt;dataVol.volType&gt;</code></p> <p>Field description:</p> <ul style="list-style-type: none"><li><b>rootVol</b> is the system disk. <b>dataVol</b> is the data disk.</li><li><b>dssPoolID</b> indicates the ID of the DSS storage pool.</li><li><b>volType</b> indicates the storage volume type of the DSS storage pool, such as SAS and SSD.</li></ul> <p>Example:<br/><code>c950ee97-587c-4f24-8a74-3367e3da570f.sas;6edb2f4-1507-44f8-ac0d-eed1d2608d38.ssd</code></p> <p><b>NOTE</b><br/>This field cannot be configured for non-dedicated CCE clusters.</p> |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterpriseProjectId   | String | <p>ID of the enterprise project that a cluster belongs to.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>An enterprise project can be configured only after the enterprise project function is enabled.</li><li>The enterprise project to which the cluster belongs must be the same as that to which other cloud service resources associated with the cluster belong.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| kubeProxyMode         | String | <p>Service forwarding mode. Two modes are available:</p> <ul style="list-style-type: none"><li><b>iptables</b>: Traditional kube-proxy uses iptables rules to implement Service load balancing. In this mode, too many iptables rules will be generated when many Services are deployed. In addition, non-incremental updates will cause latency and even tangible performance issues in the case of service traffic spikes.</li><li><b>ipvs</b>: Optimized kube-proxy mode with higher throughput and faster speed. This mode supports incremental updates and can keep connections uninterrupted during Service updates. It is suitable for large-sized clusters.</li></ul> <p><b>NOTE</b><br/>This parameter has been deprecated. If this parameter and <b>kubeProxyMode</b> in <b>ClusterSpec</b> are specified at the same time, the latter is used.</p> |
| clusterExternalIP     | String | EIP of the master node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| alpha.cce/fixPoolMask | String | <p>Number of mask bits of the fixed IP address pool of the container network model. This field is supported only for the VPC network model (vpc-router).</p> <p>This parameter determines the number of container IP addresses that can be allocated to a node. The maximum number of pods that can be created on a node is decided by this parameter and <b>maxPods</b> set during node creation. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> <p>For integer characters, the value ranges from 24 to 28.</p>                                                                                                                                                                                                                                                                                                  |
| decMasterFlavor       | String | Specifications of the master node in the dedicated hybrid cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerUmaskMode                | String | Default UmaskMode configuration of Docker in a cluster. The value can be <b>secure</b> or <b>normal</b> . If this parameter is not specified, <b>normal</b> is used by default.                                                                                                                                                                                                                                                                                                |
| kubernetes.io/cpuManagerPolicy | String | <p>Cluster CPU management policy. The value can be none (or null) or static. The default value is none (or null).</p> <ul style="list-style-type: none"><li>• <b>none</b> or <b>null</b>: disables pods from exclusively occupying CPUs. Select this option if you want a large pool of shareable CPU cores.</li><li>• <b>static</b>: enables pods to exclusively occupy CPUs. Select this option if your workload is sensitive to CPU cache and scheduling latency.</li></ul> |
| upgradefrom                    | String | Records of how the cluster is upgraded to the current version                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-128** PackageConfiguration

| Parameter      | Type                                               | Description                   |
|----------------|----------------------------------------------------|-------------------------------|
| name           | String                                             | Component name.               |
| configurations | Array of <a href="#">ConfigurationItem</a> objects | Component configuration item. |

**Table 4-129** ConfigurationItem

| Parameter | Type   | Description                         |
|-----------|--------|-------------------------------------|
| name      | String | Component configuration item name.  |
| value     | Object | Component configuration item value. |

**Table 4-130** ClusterStatus

| Parameter | Type                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase     | String                                               | <p>Cluster status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>Available</b>: The cluster is running properly.</li><li>• <b>Unavailable</b>: The cluster is exhibiting unexpected behavior. Manually delete the cluster.</li><li>• <b>ScalingUp</b>: Nodes are being added to the cluster.</li><li>• <b>ScalingDown</b>: The cluster is being downsized to fewer nodes.</li><li>• <b>Creating</b>: The cluster is being created.</li><li>• <b>Deleting</b>: The cluster is being deleted.</li><li>• <b>Upgrading</b>: The cluster is being upgraded.</li><li>• <b>Resizing</b>: Cluster specifications are being changed.</li><li>• <b>RollingBack</b>: The cluster is being rolled back.</li><li>• <b>RollbackFailed</b>: The rollback is abnormal.</li><li>• <b>Empty</b>: The cluster has no resources.</li></ul> |
| jobID     | String                                               | <p>ID of the task associated with the cluster in the current state. Options:</p> <ul style="list-style-type: none"><li>• ID of the associated task returned when creating a cluster. You can use it to obtain the auxiliary tasks for creating a cluster.</li><li>• ID of the associated task returned when a cluster fails to be deleted or is deleted. If this parameter is not empty, you can use the task ID to obtain the auxiliary tasks for deleting a cluster.</li></ul> <p><b>NOTE</b><br/>Tasks are short-lived. Do not use task information in scenarios such as cluster status determination.</p>                                                                                                                                                                                                                            |
| reason    | String                                               | Reason of cluster state change. This parameter is returned if the cluster is not in the Available state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| message   | String                                               | Detailed information about why the cluster changes to the current state. This parameter is returned if the cluster is not in the Available state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| endpoints | Array of<br><a href="#">ClusterEndpoints</a> objects | Access address of kube-apiserver in the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter    | Type   | Description                                                                                                         |
|--------------|--------|---------------------------------------------------------------------------------------------------------------------|
| deleteOption | Object | Whether to delete configurations. This parameter is contained only in the response to the deletion request.         |
| deleteStatus | Object | Whether to delete the status information. This parameter is contained only in the response to the deletion request. |

**Table 4-131** ClusterEndpoints

| Parameter | Type   | Description                                                                                                                                                                                               |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url       | String | Access address of kube-apiserver in the cluster.                                                                                                                                                          |
| type      | String | Type of the cluster access address. <ul style="list-style-type: none"><li>• <b>Internal:</b> address for internal network access</li><li>• <b>External:</b> address for external network access</li></ul> |

## Example Requests

None

## Example Responses

Status code: 200

The job for deleting a cluster is successfully delivered.

```
        "mode" : "x509",
        "authenticatingProxy" : { }
    },
    "billingMode" : 0
},
"status" : {
    "phase" : "Available",

| 200         | The job for deleting a cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

### 4.2.6 Hibernating a Cluster

#### Function

This API is used to hibernate a running cluster. After a cluster is hibernated, master node resources stop being billed.

#### Constraints

1. After a cluster is hibernated, resources such as workloads cannot be created or managed in the cluster.
2. After a pay-per-use cluster is hibernated, master node resources are not billed. Other resources such as the nodes to which the cluster belongs, bound EIP, and bandwidth are billed based on their billing mode (yearly/monthly or pay-per-use).

#### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/hibernate

**Table 4-132** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-133** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-137** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-138** Request body parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| duration  | Yes       | Integer | Validity period of the cluster certificate. The minimum value is 1 day and the maximum value is 5 years. Therefore, the value ranges from 1 to 1827. (The unit is day. The actual limit depends on the number of leap years in the five years. For example, if there is a leap year in the five years, the upper limit is 1826 days.) If this parameter is set to -1, the maximum value is 5 years. |

## Response Parameters

Status code: 200

**Table 4-139** Response header parameters

| Parameter | Type   | Description                        |
|-----------|--------|------------------------------------|
| Port-ID   | String | Port ID of the cluster master node |

**Table 4-140** Response body parameters

| Parameter       | Type                             | Description                                                                                                                                           |
|-----------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind            | String                           | API type. The value is fixed at <b>Config</b> and cannot be changed.                                                                                  |
| apiVersion      | String                           | API version. The value is fixed at <b>v1</b> .                                                                                                        |
| preferences     | Object                           | This field is not used currently and is left unspecified by default.                                                                                  |
| clusters        | Array of <b>Clusters</b> objects | Cluster list                                                                                                                                          |
| users           | Array of <b>Users</b> objects    | Certificate information and client key information of a specified user                                                                                |
| contexts        | Array of <b>Contexts</b> objects | Context list                                                                                                                                          |
| current-context | String                           | Current context. If <b>publicIp</b> (VM EIP) exists, the value is <b>external</b> . If <b>publicIp</b> does not exist, the value is <b>internal</b> . |

**Table 4-141** Clusters

| Parameter | Type                      | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String                    | Cluster name. <ul style="list-style-type: none"><li>• If <b>publicIp</b> does not exist (that is, no VM EIP exists), there is only one cluster in the cluster list, and the value of this parameter is <b>internalCluster</b>.</li><li>• If <b>publicIp</b> exists (that is, the EIP exists), there are at least two clusters in the cluster list, and the value of this parameter is <b>externalCluster</b>.</li></ul> |
| cluster   | <b>ClusterCert</b> object | Cluster information                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 4-142** ClusterCert

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| server    | String | Server IP address |

| Parameter                  | Type    | Description                                                                                                                     |
|----------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------|
| certificate-authority-data | String  | Certificate authorization data                                                                                                  |
| insecure-skip-tls-verify   | Boolean | Whether to skip the server certificate verification. If the cluster type is <b>externalCluster</b> , the value is <b>true</b> . |

**Table 4-143** Users

| Parameter | Type                        | Description                                                            |
|-----------|-----------------------------|------------------------------------------------------------------------|
| name      | String                      | The value is fixed at <b>user</b> .                                    |
| user      | <a href="#">User</a> object | Certificate information and client key information of a specified user |

**Table 4-144** User

| Parameter               | Type   | Description                                    |
|-------------------------|--------|------------------------------------------------|
| client-certificate-data | String | Client certificate                             |
| client-key-data         | String | PEM encoding data from the TLS client key file |

**Table 4-145** Contexts

| Parameter | Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String                         | Context name. <ul style="list-style-type: none"><li>• If <b>publicIp</b> does not exist (that is, no VM EIP exists), there is only one cluster in the cluster list, and the value of this parameter is <b>internal</b>.</li><li>• If <b>publicIp</b> exists (that is, the EIP exists), there are at least two clusters in the cluster list, and the value of this field for all extension contexts is <b>external</b>.</li></ul> |
| context   | <a href="#">Context</a> object | Context information                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-146** Context

| Parameter | Type   | Description     |
|-----------|--------|-----------------|
| cluster   | String | Cluster context |
| user      | String | User context    |

## Example Requests

Applying for a cluster access certificate valid for 30 days

```
{  
    "duration" : 30  
}
```

## Example Responses

**Status code: 200**

The certificate of the specified cluster is successfully obtained. For details about the certificate file format, see the Kubernetes v1.Config structure.

```

| 200         | The certificate of the specified cluster is successfully obtained. For details about the certificate file format, see the Kubernetes v1.Config structure. |

## Error Codes

See [Error Codes](#).

### 4.2.9 Modifying Cluster Specifications

#### Function

This API is used to modify the specifications of a specified cluster.

- The URL for cluster management is in the format of `https://Endpoint/uri`, where `uri` indicates the resource path for API access.

#### URI

`POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/resize`

**Table 4-147** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-148** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-149** Request body parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavorResize | Yes       | String | <p>Target specifications:</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale CCE cluster with multiple master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale CCE cluster with multiple master nodes and a maximum of 200 nodes</li><li>• <b>cce.s2.large</b>: a large-scale CCE cluster with multiple master nodes and a maximum of 1,000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale CCE cluster with multiple master nodes and a maximum of 2,000 nodes</li></ul> |

| Parameter   | Mandatory | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

If not specified, auto payment is not enabled.</p> |

## Response Parameters

Status code: 201

**Table 4-151** Response body parameters

| Parameter | Type   | Description                                                                         |
|-----------|--------|-------------------------------------------------------------------------------------|
| jobID     | String | ID of the job                                                                       |
| orderID   | String | ID of the order for modifying the specifications of a yearly/monthly billed cluster |

## Example Requests

- Modifying the specifications of the yearly/monthly cluster (automatic payment)

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/resize

{
  "flavorResize" : "cce.s1.medium",
  "extendParam" : {
    "isAutoPay" : "true"
  }
}
```

- Modifying the specifications of the pay-per-use cluster

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/resize

{
  "flavorResize" : "cce.s1.medium"
}
```

## Example Responses

Status code: 201

The job for modifying the specifications of the pay-per-use cluster is delivered.

```
{
  "jobID" : "13b8d958-8fcf-11ed-aef3-0255ac1001bd"
}
```

## Status Codes

| Status Code | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| 201         | The job for modifying the specifications of the pay-per-use cluster is delivered. |

## Error Codes

See [Error Codes](#).

## 4.2.10 Querying a Job

### Function

This API is used to obtain information about a job via the job ID returned after a query request is delivered.

#### NOTE

- The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.
- You can call this API when:
  - Creating or deleting a cluster
  - Creating or deleting a node

### URI

GET /api/v3/projects/{project\_id}/jobs/{job\_id}

**Table 4-152** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| job_id     | Yes       | String | Job ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .     |

### Request Parameters

**Table 4-153** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-154** Response body parameters

| Parameter  | Type                      | Description                                                         |
|------------|---------------------------|---------------------------------------------------------------------|
| kind       | String                    | API type. The value is fixed at <b>Job</b> and cannot be changed.   |
| apiVersion | String                    | API version. The value is fixed at <b>v3</b> and cannot be changed. |
| metadata   | <b>JobMetadata</b> object | Job metadata                                                        |
| spec       | <b>JobSpec</b> object     | Detailed job parameters                                             |
| status     | <b>JobStatus</b> object   | Job status                                                          |

**Table 4-155** JobSpec

| Parameter    | Type                        | Description                                                                                                                                                                                                                                         |
|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type         | String                      | Job type. An example value is <b>CreateCluster</b> .                                                                                                                                                                                                |
| clusterUID   | String                      | ID of the cluster where the job runs.                                                                                                                                                                                                               |
| resourceID   | String                      | ID of the resource on which the job is executed.                                                                                                                                                                                                    |
| resourceName | String                      | Name of the resource on which the job is executed.                                                                                                                                                                                                  |
| extendParam  | Map<String, String>         | Extended parameters                                                                                                                                                                                                                                 |
| subJobs      | Array of <b>Job</b> objects | Subjob list. <ul style="list-style-type: none"><li>• The list contains details about all subjobs.</li><li>• Generally, a cluster/node creation job consists of multiple subjobs. The job is complete only after all subjobs are complete.</li></ul> |

**Table 4-156** Job

| Parameter  | Type                      | Description                                                         |
|------------|---------------------------|---------------------------------------------------------------------|
| kind       | String                    | API type. The value is fixed at <b>Job</b> and cannot be changed.   |
| apiVersion | String                    | API version. The value is fixed at <b>v3</b> and cannot be changed. |
| metadata   | <b>JobMetadata</b> object | Job metadata                                                        |
| spec       | <b>JobSpec</b> object     | Detailed job parameters                                             |
| status     | <b>JobStatus</b> object   | Job status                                                          |

**Table 4-157** JobMetadata

| Parameter         | Type   | Description                   |
|-------------------|--------|-------------------------------|
| uid               | String | Job ID                        |
| creationTimestamp | String | Time when the job was created |
| updateTimestamp   | String | Time when the job was updated |

**Table 4-158** JobStatus

| Parameter | Type   | Description                                                                                                                                                                                                                                                              |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase     | String | Job status. Possible values: <ul style="list-style-type: none"><li>• JobPhaseInitializing JobPhase = "Initializing"</li><li>• JobPhaseRunning JobPhase = "Running"</li><li>• JobPhaseFailed JobPhase = "Failed"</li><li>• JobPhaseSuccess JobPhase = "Success"</li></ul> |
| reason    | String | Reason why the job is in the current state.                                                                                                                                                                                                                              |

## Example Requests

None

## Example Responses

**Status code: 200**

The progress of the specified job is successfully obtained.

```
{  
    "kind" : "Job",

## Status Codes

| Status Code | Description                                                 |
|-------------|-------------------------------------------------------------|
| 200         | The progress of the specified job is successfully obtained. |

## Error Codes

See [Error Codes](#).

### 4.2.11 Binding/Unbinding Public API Server Address

#### Function

This API is used to bind or unbind the public API server address of the cluster by cluster ID.

The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.

#### URI

`PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/mastereip`

**Table 4-159** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-160** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-161** Request body parameters

| Parameter | Mandatory | Type                        | Description                                                                                  |
|-----------|-----------|-----------------------------|----------------------------------------------------------------------------------------------|
| spec      | Yes       | MasterEIPRequestSpec object | Parameters in the request for binding or unbinding the public APIServer address of a cluster |

**Table 4-162** MasterEIPRequestSpec

| Parameter | Mandatory | Type        | Description                                                                                                                                                                                          |
|-----------|-----------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action    | No        | String      | Binding or unbinding. Mandatory. <ul style="list-style-type: none"><li>• Binding: The value is fixed at {"action":"bind"}.</li><li>• Unbinding: The value is fixed at {"action":"unbind"}.</li></ul> |
| spec      | No        | spec object | Configuration attributes of the elastic IP address to be bound                                                                                                                                       |
| bandwidth | No        | String      | Bandwidth (This field has expired and is not recommended.)                                                                                                                                           |
| elasticip | No        | String      | ENI IP (This field has expired and is not recommended.)                                                                                                                                              |

**Table 4-163** spec

| Parameter | Mandatory | Type   | Description                                                                                               |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------|
| id        | No        | String | Specifies the ENI ID. This parameter is mandatory for binding an ENI and is invalid for unbinding an ENI. |

## Response Parameters

Status code: 200

**Table 4-164** Response body parameters

| Parameter | Type                         | Description                                                                 |
|-----------|------------------------------|-----------------------------------------------------------------------------|
| metadata  | Metadata object              | Basic information about the object. Metadata is a collection of attributes. |
| spec      | MasterEIPResponseSpec object | Configuration of the bound public API Server address of a cluster           |
| status    | status object                | Status information                                                          |

**Table 4-165** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-166** MasterEIPResponseSpec

| Parameter | Type        | Description                                                    |
|-----------|-------------|----------------------------------------------------------------|
| action    | String      | A binding operation                                            |
| spec      | spec object | Configuration attributes of the elastic IP address to be bound |
| elasticip | String      | EIP                                                            |

**Table 4-167** spec

| Parameter | Type   | Description |
|-----------|--------|-------------|
| id        | String | ENI ID      |

| Parameter | Type           | Description                 |
|-----------|----------------|-----------------------------|
| eip       | EipSpec object | EIP details                 |
| IsDynamic | Boolean        | Dynamic provisioning or not |

**Table 4-168 EipSpec**

| Parameter | Type             | Description           |
|-----------|------------------|-----------------------|
| bandwidth | bandwidth object | Bandwidth information |

**Table 4-169 bandwidth**

| Parameter | Type    | Description    |
|-----------|---------|----------------|
| size      | Integer | Bandwidth size |
| sharetype | String  | Bandwidth type |

**Table 4-170 status**

| Parameter       | Type   | Description                                                             |
|-----------------|--------|-------------------------------------------------------------------------|
| privateEndpoint | String | Private IP for accessing the cluster (VIP in the case of an HA cluster) |
| publicEndpoint  | String | Public IP for accessing the cluster                                     |

## Example Requests

Bind the public API server address to a cluster.

```
{  
  "spec": {  
    "action": "bind",  
    "spec": {  
      "id": "a757a69e-f920-455a-b1ba-d7a22db0fd50"  
    }  
  }  
}
```

## Example Responses

**Status code: 200**

This indicates that the public API server address of the cluster is successfully bound. No response body is returned if the unbinding is successful.

```
{  
    "metadata" : { },  
    "spec" : {  
        "action" : "bind",  
        "spec" : {  
            "id" : "a757a69e-f920-455a-b1ba-d7a22db0fd50",  
            "eip" : {  
                "bandwidth" : {  
                    "size" : 5,  
                    "sharetype" : "PER"  
                }  
            },  
            "IsDynamic" : false  
        },  
        "elasticIp" : "8.8.8.8"  
    },  
    "status" : {  
        "privateEndpoint" : "https://192.168.3.238:5443",  
        "publicEndpoint" : "https://8.8.8.8:5443"  
    }  
}
```

## Status Codes

| Status Code | Description                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 200         | This indicates that the public API server address of the cluster is successfully bound. No response body is returned if the unbinding is successful. |

## Error Codes

See [Error Codes](#).

## 4.2.12 Obtaining Cluster Access Address

### Function

This API is used to obtain the cluster access addresses by cluster ID, including the private IP (VIP returned by an HA cluster) and public IP.

#### NOTE

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/openapi

**Table 4-171** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-172** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-173** Response body parameters

| Parameter | Type                               | Description                                                                 |
|-----------|------------------------------------|-----------------------------------------------------------------------------|
| metadata  | <a href="#">Metadata object</a>    | Basic information about the object. Metadata is a collection of attributes. |
| spec      | <a href="#">OpenAPISpec object</a> | Parameters for configuring the address for accessing the cluster            |
| status    | <a href="#">status object</a>      | Status information                                                          |

**Table 4-174** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-175** OpenAPISpec

| Parameter | Type                        | Description                       |
|-----------|-----------------------------|-----------------------------------|
| spec      | <a href="#">spec object</a> | Address for accessing the cluster |

**Table 4-176** spec

| Parameter | Type                           | Description                 |

See [Error Codes](#).

## 4.2.13 Obtaining a Cluster's Logging Configurations

### Function

This API is used to obtain LTS configurations reported by the cluster components.

## URI

GET /api/v3/projects/{project\_id}/cluster/{cluster\_id}/log-configs

**Table 4-180** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

**Table 4-181** Query Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | No        | String | <p>Component type. Options: <b>control</b>, <b>audit</b>, and <b>system-addon</b>. If this parameter is not specified, all component types will be obtained.</p> <ul style="list-style-type: none"><li>• <b>control</b>: Logs of the components on the master nodes will be obtained.</li><li>• <b>audit</b>: Audit logs of the master nodes will be obtained.</li><li>• <b>system-addon</b>: Logs of system add-ons will be obtained.</li></ul> |

## Request Parameters

**Table 4-182** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-183** Response body parameters

| Parameter   | Type                                         | Description             |
|-------------|----------------------------------------------|-------------------------|
| ttl_in_days | Integer                                      | Time for storage        |
| log_configs | Array of <a href="#">log_configs</a> objects | Log configuration items |

**Table 4-184** log\_configs

| Parameter | Type    | Description              |
|-----------|---------|--------------------------|
| name      | String  | Log type                 |
| enable    | Boolean | Whether to collect logs. |

## Example Requests

The following example describes how to obtain add-on log configurations.

```
/api/v3/projects/{project_id}/cluster/{cluster_id}/log-configs?system-addon
```

## Example Responses

Status code: 200

Cluster log configurations are obtained successfully.

```
{
  "log_configs": [
    {
      "name": "volcano",
      "enable": true
    },
    {
      "name": "coredns",
      "enable": true
    }
  ]
}
```

```
        "enable" : false
    }, {
        "name" : "everest",
        "enable" : false
    }
}
```

## Status Codes

| Status Code | Description                                           |
|-------------|-------------------------------------------------------|
| 200         | Cluster log configurations are obtained successfully. |

## Error Codes

See [Error Codes](#).

### 4.2.14 Configuring Cluster Logs

#### Function

This API is used to select the master node components whose logs are reported to LTS.

#### URI

PUT /api/v3/projects/{project\_id}/cluster/{cluster\_id}/log-configs

**Table 4-185** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-186** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-187** Request body parameters

| Parameter   | Mandatory | Type                                         | Description             |
|-------------|-----------|----------------------------------------------|-------------------------|
| ttl_in_days | No        | Integer                                      | Time for storage        |
| log_configs | No        | Array of <a href="#">log_configs</a> objects | Log configuration items |

**Table 4-188** log\_configs

| Parameter | Mandatory | Type    | Description              |
|-----------|-----------|---------|--------------------------|
| name      | No        | String  | Log type                 |
| enable    | No        | Boolean | Whether to collect logs. |

## Response Parameters

Status code: 200

**Table 4-189** Response body parameters

| Parameter   | Type                                         | Description             |
|-------------|----------------------------------------------|-------------------------|
| ttl_in_days | Integer                                      | Time for storage        |
| log_configs | Array of <a href="#">log_configs</a> objects | Log configuration items |

**Table 4-190 log\_configs**

| Parameter | Type    | Description              |
|-----------|---------|--------------------------|
| name      | String  | Log type                 |
| enable    | Boolean | Whether to collect logs. |

## Example Requests

The following example describes how to configure cluster logs that are reported to LTS.

```
/api/v3/projects/{project_id}/cluster/{cluster_id}/log-configs

{
  "log_configs" : [ {
    "name" : "kube-apiserver",
    "enable" : true
  }, {
    "name" : "kube-controller-manager",
    "enable" : false
  }, {
    "name" : "kube-scheduler",
    "enable" : false
  }, {
    "name" : "volcano",
    "enable" : true
  }, {
    "name" : "coredns",
    "enable" : false
  }, {
    "name" : "everest",
    "enable" : false
  } ]
}
```

## Example Responses

### Status code: 200

Cluster logs are configured successfully.

```
{
  "ttl_in_days" : 7,
  "log_configs" : [ {
    "name" : "kube-controller-manager",
    "enable" : true
  }, {
    "name" : "kube-apiserver",
    "enable" : true
  }, {
    "name" : "kube-scheduler",
    "enable" : true
  }, {
    "name" : "audit",
    "enable" : true
  } ]
}
```

## Status Codes

| Status Code | Description                               |
|-------------|-------------------------------------------|
| 200         | Cluster logs are configured successfully. |

## Error Codes

See [Error Codes](#).

## 4.2.15 Obtaining the Partition List

### Function

This API is used to obtain the partition list.

### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/partitions

**Table 4-191** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

None

### Response Parameters

| hostNetwork       | hostNetwork object                | Partition subnet                  |
| containerNetwork  | Array of containerNetwork objects | Container subnet in the partition |
| publicBorderGroup | String                            | Group                             |
| category          | String                            | Category                          |

**Table 4-207** hostNetwork

| Parameter | Type   | Description |
|-----------|--------|-------------|
| subnetID  | String | Subnet ID   |

**Table 4-208** containerNetwork

| Parameter | Type   | Description |
|-----------|--------|-------------|
| subnetID  | String | Subnet ID   |

## Example Requests

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/partitions
{
    "kind": "Partition",
    "apiVersion": "v3",
    "metadata": {
        "name": "partitionName"
    },
    "spec": {
        "hostNetwork": {
            "subnetID": "subnetID"
        },
        "containerNetwork": [ {
```

```
        "subnetID" : "subnetID"
    } ],
    "publicBorderGroup" : "publicBorderGroup",
    "category" : "category"
}
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "kind" : "Partition",
  "apiVersion" : "v3",
  "metadata" : {
    "name" : "partitionName",
    "creationTimestamp" : "2000-1-1 00:00:35.451967 +0000 UTC"
  },
  "spec" : {
    "hostNetwork" : {
      "subnetID" : "subnetID"
    },
    "containerNetwork" : [ {
      "subnetID" : "subnetID"
    }],
    "publicBorderGroup" : "publicBorderGroup",
    "category" : "category"
  }
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

### 4.2.17 Obtaining Partition Details

#### Function

This API is used to obtain partition details.

#### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/partitions/{partition\_name}

**Table 4-209** Path Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                          |
|----------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id     | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id     | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| partition_name | Yes       | String | Partition name                                                                                                       |

## Request Parameters

None

## Response Parameters

**Status code: 200**

**Table 4-210** Response body parameters

| Parameter  | Type                            | Description              |
|------------|---------------------------------|--------------------------|
| kind       | String                          | Resource type            |
| apiVersion | String                          | API version              |
| metadata   | <a href="#">metadata</a> object | Metadata of partitions   |
| spec       | <a href="#">spec</a> object     | Partition configurations |

**Table 4-211** metadata

| Parameter         | Type   | Description    |
|-------------------|--------|----------------|
| name              | String | Partition name |
| creationTimestamp | String | Creation time  |

**Table 4-212** spec

| Parameter         | Type                              | Description                       |
|-------------------|-----------------------------------|-----------------------------------|
| hostNetwork       | hostNetwork object                | Partition subnet                  |

## 4.2.18 Updating a Partition

### Function

This API is used to update a partition.

### URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}/partitions/{partition\_name}

**Table 4-215** Path Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                          |
|----------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id     | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id     | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| partition_name | Yes       | String | Partition name                                                                                                       |

### Request Parameters

**Table 4-216** Request body parameters

| Parameter  | Mandatory | Type   | Description   |
|------------|-----------|--------|---------------|
| kind       | No        | String | Resource type |
| apiVersion | No        | String | API version   |

| Parameter | Mandatory | Type                            | Description              |
|-----------|-----------|---------------------------------|--------------------------|
| metadata  | No        | <a href="#">metadata object</a> | Metadata of partitions   |
| spec      | No        | <a href="#">spec object</a>     | Partition configurations |

**Table 4-217** metadata

| Parameter | Mandatory | Type   | Description    |
|-----------|-----------|--------|----------------|
| name      | No        | String | Partition name |

**Table 4-218** spec

| Parameter         | Mandatory | Type                                              | Description                       |
|-------------------|-----------|---------------------------------------------------|-----------------------------------|
| hostNetwork       | No        | <a href="#">hostNetwork object</a>                | Partition subnet                  |
| containerNetwork  | No        | Array of <a href="#">containerNetwork objects</a> | Container subnet in the partition |
| publicBorderGroup | No        | String                                            | Group                             |
| category          | No        | String                                            | Category                          |

**Table 4-219** hostNetwork

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| subnetID  | No        | String | Subnet ID   |

**Table 4-220** containerNetwork

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| subnetID  | No        | String | Subnet ID   |

## Response Parameters

Status code: 200

**Table 4-221** Response body parameters

| Parameter  | Type                            | Description              |
|------------|---------------------------------|--------------------------|
| kind       | String                          | Resource type            |
| apiVersion | String                          | API version              |
| metadata   | <a href="#">metadata</a> object | Metadata of partitions   |
| spec       | <a href="#">spec</a> object     | Partition configurations |

**Table 4-222** metadata

| Parameter         | Type   | Description    |
|-------------------|--------|----------------|
| name              | String | Partition name |
| creationTimestamp | String | Creation time  |

**Table 4-223** spec

| Parameter         | Type                                              | Description                       |
|-------------------|---------------------------------------------------|-----------------------------------|
| hostNetwork       | <a href="#">hostNetwork</a> object                | Partition subnet                  |
| containerNetwork  | Array of <a href="#">containerNetwork</a> objects | Container subnet in the partition |
| publicBorderGroup | String                                            | Group                             |
| category          | String                                            | Category                          |

**Table 4-224** hostNetwork

| Parameter | Type   | Description |
|-----------|--------|-------------|
| subnetID  | String | Subnet ID   |

**Table 4-225** containerNetwork

| Parameter | Type   | Description |
|-----------|--------|-------------|
| subnetID  | String | Subnet ID   |

## Example Requests

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/partitions/{partition_name}

{
  "kind" : "Partition",
  "apiVersion" : "v3",
  "metadata" : {
    "name" : "partitionName"
  },
  "spec" : {
    "hostNetwork" : {
      "subnetID" : "subnetID"
    },
    "containerNetwork" : [ {
      "subnetID" : "subnetID"
    }],
    "publicBorderGroup" : "publicBorderGroup",
    "category" : "category"
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "kind" : "Partition",
  "apiVersion" : "v3",
  "metadata" : {
    "name" : "partitionName",
    "creationTimestamp" : "2000-1-1 00:00:35.451967 +0000 UTC"
  },
  "spec" : {
    "hostNetwork" : {
      "subnetID" : "subnetID"
    },
    "containerNetwork" : [ {
      "subnetID" : "subnetID"
    }],
    "publicBorderGroup" : "publicBorderGroup",
    "category" : "category"
  }
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

See [Error Codes](#).

## 4.3 Node Management

### 4.3.1 Creating a Node

#### Function

This API is used to create a node in a specified cluster.

##### NOTE

- If there is no cluster, [create one](#).
- The URL for cluster management is in the format of <https://Endpoint/uri>. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### Constraints

Only KVM nodes can be created. Non-KVM nodes cannot be used after being created.

#### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes

**Table 4-226** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

**Table 4-227** Query Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                 |
|-----------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodepoolScaleUp | No        | String | Whether the request is delivered by the node pool. If the value is not <b>NodepoolScaleUp</b> , the number of pods in the corresponding node pool is automatically updated. |

## Request Parameters

**Table 4-228** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-229** Request body parameters

| Parameter  | Mandatory | Type                                | Description                                                                                            |
|------------|-----------|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| kind       | Yes       | String                              | API type. The value is fixed at <b>Node</b> and cannot be changed.                                     |
| apiVersion | Yes       | String                              | API version. The value is fixed at <b>v3</b> and cannot be changed.                                    |
| metadata   | No        | <a href="#">NodeMetadata</a> object | Node metadata, which is a collection of attributes.                                                    |
| spec       | Yes       | <a href="#">NodeSpec</a> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> . |

**Table 4-230** NodeMetadata

| Parameter | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | No        | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid       | No        | String              | Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | No        | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p><b>Example:</b></p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter         | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | No        | Map<String, String> | <p>CCE node annotations, in key-value pairs (not the native Kubernetes annotations).</p> <p>Example:</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul> |
| creationTimestamp | No        | String              | Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| updateTimestamp   | No        | String              | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 4-231** NodeSpec

| Parameter | Mandatory | Type   | Description                                                                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| flavor    | Yes       | String | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> . |
| az        | Yes       | String | Name of the AZ where the node to be created is located. . .                                                                    |

| Parameter   | Mandatory | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|-----------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os          | No        | String                                  | <p>The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <code>alpha.cce/NodeImageID</code> in <code>extendParam</code> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login       | Yes       | <a href="#">Login object</a>            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| rootVolume  | Yes       | <a href="#">Volume object</a>           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| dataVolumes | Yes       | Array of <a href="#">Volume objects</a> | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <code>rootVolume</code> .                                                                                                                                                                                                                           |

| Parameter   | Mandatory | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|-----------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| storage     | No        | <a href="#">Storage object</a>      | Disk initialization management parameter.<br>This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> .<br>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | No        | <a href="#">NodePublicIP object</a> | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nodeNicSpec | No        | <a href="#">NodeNicSpec object</a>  | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| count       | No        | Integer                             | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                               |

| initializedConditions | No        | Array of strings | <p>Custom initialization flag, which is left blank by default. Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>  conditions:<br/>    - type: CCEInitial<br/>      status: 'True'<br/>    - type: CustomedInitial<br/>      status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li></ol> |

| Parameter      | Mandatory | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|-----------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |           |                                        | <p>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.</p> <ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul> |
| extendParam    | No        | <a href="#">NodeExtendParam</a> object | Extended parameters for creating a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| hostnameConfig | No        | <a href="#">HostnameConfig</a> object  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 4-232** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-233** UserPassword

| Parameter | Mandatory | Type   | Description                              |
|-----------|-----------|--------|------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-234** Volume

| Parameter   | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| size        | Yes       | Integer             | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul>                                                                                                                                                                                                                                                                                                                 |
| volumetype  | Yes       | String              | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul> |
| extendParam | No        | Map<String, Object> | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                   |

| Parameter      | Mandatory | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|-----------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id     | No        | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                           |
| cluster_type   | No        | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                              |
| hw:passthrough | No        | Boolean                               | <ul style="list-style-type: none"><li>Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | No        | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                        |

**Table 4-235** VolumeMetadata

| Parameter                       | Mandatory | Type   | Description                                                                                                                                                                                                                                             |
|---------------------------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__system_encrypted</code> | No        | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Mandatory | Type   | Description                                                                                                |
|-----------------------------|-----------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | No        | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-236 Storage**

| Parameter                     | Mandatory | Type                                     | Description                                                                                        |
|-------------------------------|-----------|------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Yes       | Array of <b>StorageSelectors</b> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Yes       | Array of <b>StorageGroups</b> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-237 StorageSelectors**

| Parameter                | Mandatory | Type                      | Description                                                                                                                                                                                                                                                               |
|--------------------------|-----------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | Yes       | String                    | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | Yes       | String                    | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | No        | <b>matchLabels</b> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-238** matchLabels

| Parameter         | Mandatory | Type   | Description                                                                                                                       |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| size              | No        | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited. Example: 100                              |
| volumeType        | No        | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.                              |
| metadataEncrypted | No        | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkid     | No        | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | No        | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-239** StorageGroups

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name       | Yes       | String  | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged | No        | Boolean | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                       |

| Parameter     | Mandatory | Type                                 | Description                                                                                                                                           |
|---------------|-----------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| selectorNames | Yes       | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group. |
| virtualSpaces | Yes       | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                |

**Table 4-240 VirtualSpace**

| Parameter     | Mandatory | Type                        | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String                      | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes:</b> Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime:</b> runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user:</b> user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | Yes       | String                      | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | No        | <b>LVMConfig</b> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | No        | <b>RuntimeConfig</b> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-241** LVMConfig

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | No        | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-242** RuntimeConfig

| Parameter | Mandatory | Type   | Description                                                                                                                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-243** NodePublicIP

| Parameter | Mandatory | Type                               | Description                                                                                                                                                                                     |
|-----------|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | No        | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | No        | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | No        | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-244** NodeEIPSpec

| Parameter | Mandatory | Type                                 | Description                                                                  |
|-----------|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | Yes       | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | No        | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-245** NodeBandwidth

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | No        | String  | <p>Bandwidth billing mode.</p> <ul style="list-style-type: none"><li>If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |
| size       | No        | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter | Mandatory | Type   | Description                                                             |
|-----------|-----------|--------|-------------------------------------------------------------------------|
| sharetype | No        | String | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth) |

**Table 4-246** NodeNicSpec

| Parameter  | Mandatory | Type                            | Description                                                                                         |

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | No        | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | No        | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |

| Parameter | Mandatory | Type   | Description                                                                                                                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipBlock   | No        | String | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time. |

**Table 4-248** Taint

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |
| value     | No        | String | Value.      |
| effect    | Yes       | String | Effect.     |

**Table 4-249** UserTag

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| key       | No        | String | Key of the cloud server label. The value cannot start with <b>CCE-</b> or <b>_type_baremetal</b> . |
| value     | No        | String | Value of the cloud server label.                                                                   |

**Table 4-250** Runtime

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | No        | String | Container runtime. Default value: <ul style="list-style-type: none"><li>• Clusters earlier than v1.25: The default value is <b>docker</b>.</li><li>• Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <b>docker</b>; for nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul> |

**Table 4-251** NodeExtendParam

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ecs:performancetype | No        | String  | ECS flavor types. This field is returned in the response.                                                                                                                                                                                                                                                                                                                |
| maxPods             | No        | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> |

| Parameter               | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DockerLVMConfigOverride | No        | String | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.)</p> <p>Example default configuration:<br/>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</p> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"><li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li><li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li><li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li><li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li><li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li><li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li></ul> |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | No        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | No        | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | No        | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| alpha.cce/postInstall | No        | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| alpha.cce/NodeImageID | No        | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| type      | Yes       | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

## Response Parameters

**Status code: 201**

**Table 4-253 Response body parameters**

| Parameter  | Type   | Description                                                         |
|------------|--------|---------------------------------------------------------------------|
| kind       | String | API type. The value is fixed at <b>Node</b> and cannot be changed.  |
| apiVersion | String | API version. The value is fixed at <b>v3</b> and cannot be changed. |

| Parameter | Type                                | Description                                                                                                                  |
|-----------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| metadata  | <a href="#">NodeMetadata</a> object | Node metadata, which is a collection of attributes.                                                                          |
| spec      | <a href="#">NodeSpec</a> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> .                       |
| status    | <a href="#">NodeStatus</a> object   | Node status, which is dynamically recorded. A user-defined value will not function when a node is being created or modified. |

**Table 4-254 NodeMetadata**

| Parameter | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid       | String              | Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p>Example:</p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | Map<String, String> | <p>CCE node annotations, in key-value pairs (not the native Kubernetes annotations). Example:</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul> |
| creationTimestamp | String              | Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| updateTimestamp   | String              | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-255** NodeSpec

| Parameter | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String                       | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                          |
| az        | String                       | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| os        | String                       | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml). <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login     | <a href="#">Login</a> object | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <b>rootVolume</b> .                                                                                                                                                                                                                         |
| storage     | <a href="#">Storage</a> object          | <p>Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b><br/>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p> |
| publicIP    | <a href="#">NodePublicIP</a> object     | <p>EIP of a node.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node to a node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                           |
| billingMode | Integer                                 | <p>Node billing mode.</p> <ul style="list-style-type: none"> <li>• 0: pay-per-use</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | Array of <b>Taint</b> objects | <p>You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:</p> <pre>"taints": [ { "key": "status", "value": "unavailable", "effect": "NoSchedule" }, { "key": "looks", "value": "bad", "effect": "NoSchedule" } ]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"> <li>Clusters of v1.25 or earlier: <b>docker</b>.</li> <li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li> </ul>                                                                                                                                                                                                  |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-256** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-257** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-258** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-259** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-260 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-261 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-262 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-263 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-264** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>● <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>● <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>● <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-265** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-266** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-267** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-268** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-269** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-270** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-271** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-272** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-273** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-274** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-275** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-276 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

**Table 4-277** NodeStatus

| Parameter     | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                     | Node status, which is the status of a node during its lifecycle (such as installation and uninstallation) or the status of a node in a Kubernetes cluster. Options: <ul style="list-style-type: none"><li>• <b>Build</b>: The node is being created.</li><li>• <b>Installing</b>: The node is being managed.</li><li>• <b>Upgrading</b>: The node is being upgraded.</li><li>• <b>Active</b>: The node is running properly.</li><li>• <b>Abnormal</b>: The node is abnormal.</li><li>• <b>Deleting</b>: The node is being deleted.</li><li>• <b>Error</b>: The node is faulty.</li></ul> |
| lastProbeTime | String                     | Last time when the node status was checked. If the cluster is in the abnormal, frozen, or intermediate state (for example, creating), the node status check may be affected. The node status that takes more than five minutes to check has no reference value.                                                                                                                                                                                                                                                                                                                          |
| jobID         | String                     | ID of a creation or deletion job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| serverId      | String                     | ID of the underlying ECS or BMS node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| privateIP     | String                     | IP address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privateIPv6IP | String                     | IPv6 address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| publicIP      | String                     | Node EIP. If the ECS data is not synchronized in real time, you can click <b>Sync Node Data</b> on the console to manually update the data.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deleteStatus  | <b>DeleteStatus</b> object | Resource status during resource deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 4-278** DeleteStatus

| Parameter      | Type    | Description                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------|
| previous_total | Integer | Total number of existing cluster resource records when the cluster is deleted.                       |
| current_total  | Integer | Latest number of resource records, which is generated based on the current cluster resource records. |

| Parameter | Type    | Description                                                           |
|-----------|---------|-----------------------------------------------------------------------|
| updated   | Integer | Total number of resource records updated when the cluster is deleted. |
| added     | Integer | Total number of resource records updated when the cluster is deleted. |
| deleted   | Integer | Total number of resource records deleted when the cluster is deleted. |

## Example Requests

Create a node with the flavor of 2 vCPUs and 4 GiB of memory. The node runs EulerOS 2.5 for Docker containers. The sizes of the system disk and data disk of the node are 50 GB and 100 GB, respectively. Both the disks are of the high I/O type.

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes
```

|-------------|-------------------------------------------------------------------------------|
| 201         | The job for creating a node in a specified cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

### 4.3.2 Reading a Specified Node

#### Function

This API is used to obtain details about a specified node via the node ID.

The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.

#### URI

`GET /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/{node_id}`

**Table 4-279** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| node_id    | Yes       | String | Node ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .    |

## Request Parameters

**Table 4-280** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-281** Response body parameters

| Parameter  | Type   | Description                                                         |
|------------|--------|---------------------------------------------------------------------|
| kind       | String | API type. The value is fixed at <b>Node</b> and cannot be changed.  |
| apiVersion | String | API version. The value is fixed at <b>v3</b> and cannot be changed. |

| Parameter | Type                                | Description                                                                                                                  |
|-----------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| metadata  | <a href="#">NodeMetadata</a> object | Node metadata, which is a collection of attributes.                                                                          |
| spec      | <a href="#">NodeSpec</a> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> .                       |
| status    | <a href="#">NodeStatus</a> object   | Node status, which is dynamically recorded. A user-defined value will not function when a node is being created or modified. |

**Table 4-282 NodeMetadata**

| Parameter | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid       | String              | Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p>Example:</p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | Map<String, String> | <p>CCE node annotations, in key-value pairs (not the native Kubernetes annotations). Example:</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul> |
| creationTimestamp | String              | Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| updateTimestamp   | String              | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-283** NodeSpec

| Parameter | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String                       | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                          |
| az        | String                       | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| os        | String                       | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml). <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login     | <a href="#">Login</a> object | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <b>rootVolume</b> .                                                                                                                                                                                                                         |
| storage     | <a href="#">Storage</a> object          | <p>Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b><br/>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p> |
| publicIP    | <a href="#">NodePublicIP</a> object     | <p>EIP of a node.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node to a node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                           |
| billingMode | Integer                                 | <p>Node billing mode.</p> <ul style="list-style-type: none"> <li>• 0: pay-per-use</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | Array of <b>Taint</b> objects | <p>You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:</p> <pre>"taints": [ { "key": "status", "value": "unavailable", "effect": "NoSchedule" }, { "key": "looks", "value": "bad", "effect": "NoSchedule" } ]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| k8sTags         | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:</p> <pre>"k8sTags": {<br/>    "key": "value"<br/>}</pre> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>• Clusters of v1.25 or earlier: <b>docker</b>.</li><li>• Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                 |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-284** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-285** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-286** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-287** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-288 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-289 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-290 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-291 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-292** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-293** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-294** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-295** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-296** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-297** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-298** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-299** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-300** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-301** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-302** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-303** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-304 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-305** NodeStatus

| Parameter     | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                     | Node status, which is the status of a node during its lifecycle (such as installation and uninstallation) or the status of a node in a Kubernetes cluster. Options: <ul style="list-style-type: none"><li>• <b>Build</b>: The node is being created.</li><li>• <b>Installing</b>: The node is being managed.</li><li>• <b>Upgrading</b>: The node is being upgraded.</li><li>• <b>Active</b>: The node is running properly.</li><li>• <b>Abnormal</b>: The node is abnormal.</li><li>• <b>Deleting</b>: The node is being deleted.</li><li>• <b>Error</b>: The node is faulty.</li></ul> |
| lastProbeTime | String                     | Last time when the node status was checked. If the cluster is in the abnormal, frozen, or intermediate state (for example, creating), the node status check may be affected. The node status that takes more than five minutes to check has no reference value.                                                                                                                                                                                                                                                                                                                          |
| jobID         | String                     | ID of a creation or deletion job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| serverId      | String                     | ID of the underlying ECS or BMS node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| privateIP     | String                     | IP address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privateIPv6IP | String                     | IPv6 address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| publicIP      | String                     | Node EIP. If the ECS data is not synchronized in real time, you can click <b>Sync Node Data</b> on the console to manually update the data.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deleteStatus  | <b>DeleteStatus</b> object | Resource status during resource deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 4-306** DeleteStatus

| Parameter      | Type    | Description                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------|
| previous_total | Integer | Total number of existing cluster resource records when the cluster is deleted.                       |
| current_total  | Integer | Latest number of resource records, which is generated based on the current cluster resource records. |

| Parameter | Type    | Description                                                           |
|-----------|---------|-----------------------------------------------------------------------|
| updated   | Integer | Total number of resource records updated when the cluster is deleted. |
| added     | Integer | Total number of resource records updated when the cluster is deleted. |
| deleted   | Integer | Total number of resource records deleted when the cluster is deleted. |

## Example Requests

## Error Codes

See [Error Codes](#).

### 4.3.3 Listing All Nodes in a Cluster

#### Function

This API is used to obtain details about all nodes in a specified cluster with the cluster ID.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes

**Table 4-307** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-308** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-309** Response body parameters

| Parameter  | Type                         | Description                                                                                                |
|------------|------------------------------|------------------------------------------------------------------------------------------------------------|
| kind       | String                       | API type. The value is fixed at <b>List</b> .                                                              |
| apiVersion | String                       | API version. The value is fixed at <b>v3</b> .                                                             |
| items      | Array of <b>Node</b> objects | List of details for all nodes in the current cluster. You can filter nodes by <b>items.metadata.name</b> . |

**Table 4-310** Node

| Parameter  | Type                       | Description                                                                                                                  |
|------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                     | API type. The value is fixed at <b>Node</b> and cannot be changed.                                                           |
| apiVersion | String                     | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                          |
| metadata   | <b>NodeMetadata</b> object | Node metadata, which is a collection of attributes.                                                                          |
| spec       | <b>NodeSpec</b> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> .                       |
| status     | <b>NodeStatus</b> object   | Node status, which is dynamically recorded. A user-defined value will not function when a node is being created or modified. |

**Table 4-311** NodeMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid               | String              | <p>Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| labels            | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p>Example:</p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| annotations       | Map<String, String> | <p>CCE node annotations, in key-value pairs (not the native Kubernetes annotations). Example:</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul>                                                                                                                                                                                                                                                                            |
| creationTimestamp | String              | <p>Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter       | Type   | Description                                                                                                                                    |
|-----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------|
| updateTimestamp | String | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect. |

**Table 4-312 NodeSpec**

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor      | String                                  | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                            |
| az          | String                                  | Name of the AZ where the node to be created is located...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| os          | String                                  | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).<br><b>NOTE</b> <ul style="list-style-type: none"><li>The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>If <code>alpha.cce/NodeImageID</code> in <code>extendParam</code> is specified during node creation, you do not need to configure this parameter.</li><li>This parameter is mandatory when creating a node pool.</li></ul> |
| login       | <a href="#">Login</a> object            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <code>rootVolume</code> .                                                                                                                                                                                                          |

| Parameter   | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| storage     | <a href="#">Storage</a> object      | Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> .<br><br>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | <a href="#">NodePublicIP</a> object | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object  | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| count       | Integer                             | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                |
| billingMode | Integer                             | Node billing mode. <ul style="list-style-type: none"><li>• <b>0:</b> pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"> <li>Clusters of v1.25 or earlier: <b>docker</b>.</li> <li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li> </ul>                                                                                                                                                                                                  |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-313** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-314** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-315** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-316** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-317 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-318 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-319 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-320 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | <p>Name of a virtual storage group, which must be unique.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li> <li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li> <li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li> </ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                                            |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                               |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-321** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-322** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-323** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-324** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-325** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-326** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-327** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-328** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-329** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-330** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-331** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-332** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-333 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

**Table 4-334** NodeStatus

| Parameter     | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                     | Node status, which is the status of a node during its lifecycle (such as installation and uninstallation) or the status of a node in a Kubernetes cluster. Options: <ul style="list-style-type: none"><li>• <b>Build</b>: The node is being created.</li><li>• <b>Installing</b>: The node is being managed.</li><li>• <b>Upgrading</b>: The node is being upgraded.</li><li>• <b>Active</b>: The node is running properly.</li><li>• <b>Abnormal</b>: The node is abnormal.</li><li>• <b>Deleting</b>: The node is being deleted.</li><li>• <b>Error</b>: The node is faulty.</li></ul> |
| lastProbeTime | String                     | Last time when the node status was checked. If the cluster is in the abnormal, frozen, or intermediate state (for example, creating), the node status check may be affected. The node status that takes more than five minutes to check has no reference value.                                                                                                                                                                                                                                                                                                                          |
| jobID         | String                     | ID of a creation or deletion job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| serverId      | String                     | ID of the underlying ECS or BMS node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| privateIP     | String                     | IP address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privateIPv6IP | String                     | IPv6 address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| publicIP      | String                     | Node EIP. If the ECS data is not synchronized in real time, you can click <b>Sync Node Data</b> on the console to manually update the data.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deleteStatus  | <b>DeleteStatus</b> object | Resource status during resource deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 4-335** DeleteStatus

| Parameter      | Type    | Description                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------|
| previous_total | Integer | Total number of existing cluster resource records when the cluster is deleted.                       |
| current_total  | Integer | Latest number of resource records, which is generated based on the current cluster resource records. |

| Parameter | Type    | Description                                                           |
|-----------|---------|-----------------------------------------------------------------------|
| updated   | Integer | Total number of resource records updated when the cluster is deleted. |
| added     | Integer | Total number of resource records updated when the cluster is deleted. |
| deleted   | Integer | Total number of resource records deleted when the cluster is deleted. |

## Example Requests

None

## Example Responses

### Status code: 200

Information about all the nodes in the specified cluster is successfully obtained.

See [Error Codes](#).

### 4.3.4 Updating a Specified Node

#### Function

This API is used to update information about a specified node.

- Currently, only the **name** field in **metadata** can be updated. This field indicates the node name.
- The URL for cluster management is in the format of **https://Endpoint/uri**. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes/{node\_id}

**Table 4-336** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| node_id    | Yes       | String | Node ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .    |

## Request Parameters

**Table 4-337** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-338** Request body parameters

| Parameter | Mandatory | Type                                                  | Description                                         |
|-----------|-----------|-------------------------------------------------------|-----------------------------------------------------|
| metadata  | Yes       | <a href="#">ClusterNodeInformationMetadata</a> object | Node metadata, which is a collection of attributes. |

**Table 4-339** ClusterNodeInformationMetadata

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <p>Node name</p> <p><b>NOTE</b></p> <p>After the node name is changed, the ECS name (VM name) will be changed accordingly. Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |

## Response Parameters

**Status code: 200**

**Table 4-340** Response body parameters

| Parameter  | Type                       | Description                                                                                                                  |
|------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                     | API type. The value is fixed at <b>Node</b> and cannot be changed.                                                           |
| apiVersion | String                     | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                          |
| metadata   | <b>NodeMetadata</b> object | Node metadata, which is a collection of attributes.                                                                          |
| spec       | <b>NodeSpec</b> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> .                       |
| status     | <b>NodeStatus</b> object   | Node status, which is dynamically recorded. A user-defined value will not function when a node is being created or modified. |

**Table 4-341** NodeMetadata

| Parameter | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid       | String              | <p>Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| labels    | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p><b>Example:</b></p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | Map<String, String> | <p>CCE node annotations, in key-value pairs (not the native Kubernetes annotations). Example:</p> <pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul> |
| creationTimestamp | String              | Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| updateTimestamp   | String              | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-342** NodeSpec

| Parameter | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String                       | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                          |
| az        | String                       | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| os        | String                       | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml). <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login     | <a href="#">Login</a> object | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <b>rootVolume</b> .                                                                                                                                                                                                                         |
| storage     | <a href="#">Storage</a> object          | <p>Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b><br/>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p> |
| publicIP    | <a href="#">NodePublicIP</a> object     | <p>EIP of a node.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node to a node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                           |
| billingMode | Integer                                 | <p>Node billing mode.</p> <ul style="list-style-type: none"> <li>• 0: pay-per-use</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | Array of <b>Taint</b> objects | <p>You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:</p> <pre>"taints": [ { "key": "status", "value": "unavailable", "effect": "NoSchedule" }, { "key": "looks", "value": "bad", "effect": "NoSchedule" } ]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| k8sTags         | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:<br/>"k8sTags": {<br/>  "key": "value"<br/>}</p> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-343** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-344** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-345** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-346** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-347 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-348 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-349 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-350 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-351** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-352** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-353** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-354** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-355** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-356** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-357** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-358** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-359** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-360** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-361** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-362** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-363 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-364** NodeStatus

| Parameter     | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                     | Node status, which is the status of a node during its lifecycle (such as installation and uninstallation) or the status of a node in a Kubernetes cluster. Options: <ul style="list-style-type: none"><li>• <b>Build</b>: The node is being created.</li><li>• <b>Installing</b>: The node is being managed.</li><li>• <b>Upgrading</b>: The node is being upgraded.</li><li>• <b>Active</b>: The node is running properly.</li><li>• <b>Abnormal</b>: The node is abnormal.</li><li>• <b>Deleting</b>: The node is being deleted.</li><li>• <b>Error</b>: The node is faulty.</li></ul> |
| lastProbeTime | String                     | Last time when the node status was checked. If the cluster is in the abnormal, frozen, or intermediate state (for example, creating), the node status check may be affected. The node status that takes more than five minutes to check has no reference value.                                                                                                                                                                                                                                                                                                                          |
| jobID         | String                     | ID of a creation or deletion job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| serverId      | String                     | ID of the underlying ECS or BMS node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| privateIP     | String                     | IP address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privateIPv6IP | String                     | IPv6 address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| publicIP      | String                     | Node EIP. If the ECS data is not synchronized in real time, you can click <b>Sync Node Data</b> on the console to manually update the data.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deleteStatus  | <b>DeleteStatus</b> object | Resource status during resource deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 4-365** DeleteStatus

| Parameter      | Type    | Description                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------|
| previous_total | Integer | Total number of existing cluster resource records when the cluster is deleted.                       |
| current_total  | Integer | Latest number of resource records, which is generated based on the current cluster resource records. |

| Parameter | Type    | Description                                                           |
|-----------|---------|-----------------------------------------------------------------------|
| updated   | Integer | Total number of resource records updated when the cluster is deleted. |
| added     | Integer | Total number of resource records updated when the cluster is deleted. |
| deleted   | Integer | Total number of resource records deleted when the cluster is deleted. |

## Example Requests

Update the name of a specified node.

```
{  
  "metadata": {  
    "name": "new-hostname"  
  }  
}
```

## Example Responses

**Status code: 200**

Information about the specified node is successfully updated.

```
{  
  "kind": "Node",  
  "apiVersion": "v3",  
  "metadata": {  
    "name": "new-hostname",  
    "uid": "4d1ecb2c-229a-11e8-9c75-0255ac100ceb",  
    "creationTimestamp": "2017-08-20T21:11:09Z",  
    "updateTimestamp": "2017-08-20T21:11:09Z",  
    "annotations": {  
      "kubernetes.io/node-pool.id": "az1.dc1#s1.medium#EulerOS 2.2"  
    }  
  },  
  "spec": {  
    "flavor": "s1.medium",

  }  
}
```

```
    "privateIP" : "192.168.1.23"
}
```

## Status Codes

| Status Code | Description                                                   |
|-------------|---------------------------------------------------------------|
| 200         | Information about the specified node is successfully updated. |

## Error Codes

See [Error Codes](#).

### 4.3.5 Deleting a Node

#### Function

This API is used to delete a specified node.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

DELETE /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes/{node\_id}

**Table 4-366** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| node_id    | Yes       | String | Node ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .    |

**Table 4-367** Query Parameters

| Parameter         | Mandatory | Type   | Description                                                                                                                                                             |
|-------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodepoolScaleDown | No        | String | Whether the request is delivered by the node pool. If the value is not <b>NoScaleDown</b> , the number of pods in the corresponding node pool is automatically updated. |

## Request Parameters

**Table 4-368** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-369** Response body parameters

| Parameter  | Type                                | Description                                                                                            |
|------------|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| kind       | String                              | API type. The value is fixed at <b>Node</b> and cannot be changed.                                     |
| apiVersion | String                              | API version. The value is fixed at <b>v3</b> and cannot be changed.                                    |
| metadata   | <a href="#">NodeMetadata</a> object | Node metadata, which is a collection of attributes.                                                    |
| spec       | <a href="#">NodeSpec</a> object     | Detailed description of the node. CCE creates or updates objects by defining or updating <b>spec</b> . |

| Parameter | Type                        | Description                                                                                                                  |
|-----------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| status    | <b>NodeStatus</b><br>object | Node status, which is dynamically recorded. A user-defined value will not function when a node is being created or modified. |

**Table 4-370** NodeMetadata

| Parameter | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String              | <p>Node name</p> <p><b>NOTE</b></p> <p>Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. If <b>name</b> is left empty or is not specified, the node name is generated based on the default rule, which is <i>Cluster name-Random characters</i>. Only the first 36 characters are kept for a long cluster name. If the number of nodes (<b>count</b>) is greater than 1, some random characters are added to the end of the entered node name according to the default rule, which is <i>User-defined name-Random characters</i>. Only the first 50 characters in the custom name are kept, followed by some random characters. Names of nodes running in clusters v1.28.1, v1.27.3, v1.25.6, v1.23.11, v1.21.12 or later support periods (.), but this configuration is not recommended.</p> |
| uid       | String              | Node ID, which is unique and automatically generated after the resource is created. A user-defined ID will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | Map<String, String> | <p>CCE node label (not the native Kubernetes label).</p> <p>Labels are used to select objects that meet certain criteria. A label is a key-value pair.</p> <p><b>Example:</b></p> <pre>"labels": {<br/>    "key" : "value"<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | Map<String, String> | CCE node annotations, in key-value pairs (not the native Kubernetes annotations). Example:<br><pre>"annotations": {<br/>    "key1" : "value1",<br/>    "key2" : "value2"<br/>}</pre> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>annotations</b> are not used to identify or select objects. The metadata in <b>annotations</b> may be small or large, structured or unstructured, and may include characters that are not allowed in labels.</li><li>• This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.</li></ul> |
| creationTimestamp | String              | Time when the object was created. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| updateTimestamp   | String              | Time when the object was updated. The value is automatically generated after the object is created. A user-defined value will not take effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-371** NodeSpec

| Parameter | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String                       | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                          |
| az        | String                       | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| os        | String                       | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml). <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login     | <a href="#">Login</a> object | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <b>rootVolume</b> .                                                                                                                                                                                                       |
| storage     | <a href="#">Storage</a> object          | Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> . If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | <a href="#">NodePublicIP</a> object     | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                         |
| billingMode | Integer                                 | Node billing mode. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>• Clusters of v1.25 or earlier: <b>docker</b>.</li><li>• Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                 |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-372** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-373** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-374** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-375** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-376 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-377 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-378 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-379 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | <p>Name of a virtual storage group, which must be unique.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li> <li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li> <li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li> </ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                                            |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                               |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-380** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-381** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-382** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-383** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-384** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-385** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-386** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-387** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-388** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-389** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-390** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-391** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-392 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

**Table 4-393** NodeStatus

| Parameter     | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                     | Node status, which is the status of a node during its lifecycle (such as installation and uninstallation) or the status of a node in a Kubernetes cluster. Options: <ul style="list-style-type: none"><li>• <b>Build</b>: The node is being created.</li><li>• <b>Installing</b>: The node is being managed.</li><li>• <b>Upgrading</b>: The node is being upgraded.</li><li>• <b>Active</b>: The node is running properly.</li><li>• <b>Abnormal</b>: The node is abnormal.</li><li>• <b>Deleting</b>: The node is being deleted.</li><li>• <b>Error</b>: The node is faulty.</li></ul> |
| lastProbeTime | String                     | Last time when the node status was checked. If the cluster is in the abnormal, frozen, or intermediate state (for example, creating), the node status check may be affected. The node status that takes more than five minutes to check has no reference value.                                                                                                                                                                                                                                                                                                                          |
| jobID         | String                     | ID of a creation or deletion job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| serverId      | String                     | ID of the underlying ECS or BMS node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| privateIP     | String                     | IP address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privateIPv6IP | String                     | IPv6 address in the private network segment of the primary NIC on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| publicIP      | String                     | Node EIP. If the ECS data is not synchronized in real time, you can click <b>Sync Node Data</b> on the console to manually update the data.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deleteStatus  | <b>DeleteStatus</b> object | Resource status during resource deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 4-394** DeleteStatus

| Parameter      | Type    | Description                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------|
| previous_total | Integer | Total number of existing cluster resource records when the cluster is deleted.                       |
| current_total  | Integer | Latest number of resource records, which is generated based on the current cluster resource records. |

| Parameter | Type    | Description                                                           |
|-----------|---------|-----------------------------------------------------------------------|
| updated   | Integer | Total number of resource records updated when the cluster is deleted. |
| added     | Integer | Total number of resource records updated when the cluster is deleted. |
| deleted   | Integer | Total number of resource records deleted when the cluster is deleted. |

## Example Requests

None

## Example Responses

### Status code: 200

The job for deleting a node is successfully delivered.

## Error Codes

See [Error Codes](#).

### 4.3.6 Accepting a Node

#### Function

This API is used to accept a node into a specified cluster.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

#### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes/add

**Table 4-395** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-396** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-397** Request body parameters

| Parameter  | Mandatory | Type                            | Description                                    |
|------------|-----------|---------------------------------|------------------------------------------------|
| apiVersion | Yes       | String                          | API version. The value is fixed at <b>v3</b> . |
| kind       | Yes       | String                          | API type. The value is fixed at <b>List</b> .  |
| nodeList   | Yes       | Array of <b>AddNode</b> objects | List of the nodes to be accepted.              |

**Table 4-398** AddNode

| Parameter | Mandatory | Type                            | Description                                                                                              |
|-----------|-----------|---------------------------------|----------------------------------------------------------------------------------------------------------|
| serverID  | Yes       | String                          | Server ID. For details about how to obtain the server ID, see the ECS or BMS documentation.              |
| spec      | Yes       | <b>ReinstallNodeSpec</b> object | Node reinstallation configuration parameters. Currently, accepted nodes cannot be added into node pools. |

**Table 4-399** ReinstallNodeSpec

| Parameter     | Mandatory | Type                                             | Description                                                                                                                                                                                                                                                                                      |
|---------------|-----------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os            | Yes       | String                                           | Operating system. If you specify a custom image, the actual OS version in the IMS image is used. Select an OS version supported by the current cluster, for example, EulerOS 2.5, CentOS 7.6, or EulerOS 2.8.                                                                                    |
| login         | Yes       | <a href="#">Login object</a>                     | Node login mode.                                                                                                                                                                                                                                                                                 |
| name          | No        | String                                           | Node name.<br><b>NOTE</b><br>Specifying this field during reinstallation will change the node name, and the server name will change accordingly. By default, the current server name is used as the node name. Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). |
| serverConfig  | No        | <a href="#">ReinstallServerConfig object</a>     | Server configuration.                                                                                                                                                                                                                                                                            |

|-----------------------|-----------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | No        | Array of strings                     | <p>Custom initialization flag. Before CCE nodes are initialized, they are tainted with <b>node.cloudprovider.kubernetes.io/uninitialized</b> to prevent pods from being scheduled to them.</p> <p>CCE supports custom initialization flags. After receiving the <b>initializedConditions</b> parameter, CCE converts the parameter value into a node label and provisions the label with the node, for example, <b>cloudprovider.openvessel.io/inject-initialized-conditions=CCEInitial_CustomedInitial</b>.</p> <p>After the node is labeled, its <b>status.Conditions</b> is polled to check whether the <b>type of conditions</b> has a flag name, such as <b>CCEInitial</b> and <b>CustomedInitial</b>. If all input flags exist and their status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</p> <ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li></ul> |
| extendParam           | No        | <b>ReinstallExtendedParam</b> object | Extended reinstallation parameter, which is discarded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| hostnameConfig        | No        | <b>HostnameConfig</b> object         | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 4-400** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-401** UserPassword

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-402 ReinstallServerConfig**

| Parameter  | Mandatory | Type                                       | Description                                                                                                                                                                                                                                               |
|------------|-----------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags   | No        | Array of <a href="#">UserTag</a> objects   | Cloud server labels. The key of a label must be unique. The maximum number of user-defined labels supported by CCE depends on the region. In the region that supports the least number of labels, you can still create up to 5 labels for a cloud server. |
| rootVolume | No        | <a href="#">ReinstallVolumeSpec</a> object | System disk configurations used in reinstallation.                                                                                                                                                                                                        |

**Table 4-403 UserTag**

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| key       | No        | String | Key of the cloud server label. The value cannot start with <b>CCE-</b> or <b>_type_baremetal</b> . |
| value     | No        | String | Value of the cloud server label.                                                                   |

**Table 4-404 ReinstallVolumeSpec**

| Parameter | Mandatory | Type   | Description                                                                                    |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------|
| imageID   | No        | String | Custom image ID.                                                                               |
| cmkID     | No        | String | User master key ID. If this parameter is left blank by default, the EVS disk is not encrypted. |

**Table 4-405** ReinstallVolumeConfig

| Parameter | Mandatory | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvmConfig | No        | String         | <p>Docker data disk configurations.</p> <p>The following is an example default configuration:<br/><code>"lvmConfig":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</code></p> <p>The following fields are included:</p> <ul style="list-style-type: none"><li>• <b>userLV</b>: size of the user space, for example, <b>vgpaas/20%VG</b>.</li><li>• <b>userPath</b>: mount path of the user space, for example, <b>/home/wqt-test</b>.</li><li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li><li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li><li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li><li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li></ul> |
| storage   | No        | Storage object | <p>Disk initialization management parameter.</p> <p>This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b><br/>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p>                                                                                                                                                                                                                                                                                                     |

**Table 4-406 Storage**

| Parameter        | Mandatory | Type                                              | Description                                                                                        |
|------------------|-----------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| storageSelectors | Yes       | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| storageGroups    | Yes       | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-407 StorageSelectors**

| Parameter   | Mandatory | Type                               | Description                                                                                                                                                                                                                                                               |
|-------------|-----------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | Yes       | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| storageType | Yes       | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| matchLabels | No        | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-408 matchLabels**

| Parameter | Mandatory | Type   | Description                                                                                          |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------|
| size      | No        | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited. Example: 100 |

| Parameter         | Mandatory | Type   | Description                                                                                                                       |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| volumeType        | No        | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.                              |
| metadataEncrypted | No        | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkid     | No        | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | No        | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-409 StorageGroups**

| Parameter     | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String           | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | No        | Boolean          | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Yes       | Array of strings | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |

| Parameter     | Mandatory | Type                                 | Description                                            |
|---------------|-----------|--------------------------------------|--------------------------------------------------------|
| virtualSpaces | Yes       | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group. |

**Table 4-410 VirtualSpace**

| Parameter     | Mandatory | Type                        | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String                      | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | Yes       | String                      | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | No        | <b>LVMConfig</b> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | No        | <b>RuntimeConfig</b> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-411 LVMConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | No        | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-412 RuntimeConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-413** ReinstallRuntimeConfig

| Parameter      | Mandatory | Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize | No        | Integer                        | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| runtime        | No        | <a href="#">Runtime object</a> | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 4-414** Runtime

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For nodes running EulerOS 2.5, the default container runtime is <b>docker</b>; for nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul> |

**Table 4-415** ReinstallK8sOptionsConfig

| Parameter | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| labels    | No        | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li>• <b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string.</li></ul> <p>Example:</p> <pre>"k8sTags": {<br/>    "key": "value"<br/>}</pre> |

| Parameter | Mandatory | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | No        | Array of <a href="#">Taint</a> objects | <p>Taints can be added for anti-affinity when creating nodes. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>.</li></ul> <p>Example:</p> <pre>"taints": [{ "key": "status", "value": "unavailable", "effect": "NoSchedule"}, { "key": "looks", "value": "bad", "effect": "NoSchedule"}]</pre> |
| maxPods   | No        | Integer                                | Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 4-416 Taint**

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| value     | No        | String | Value.      |
| effect    | Yes       | String | Effect.     |

**Table 4-417 NodeLifecycleConfig**

| Parameter   | Mandatory | Type   | Description                                                                                                                             |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| preInstall  | No        | String | Pre-installation script.<br><b>NOTE</b><br>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)  |
| postInstall | No        | String | Post-installation script.<br><b>NOTE</b><br>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64) |

**Table 4-418 ReinstallExtendParam**

| Parameter                 | Mandatory | Type   | Description                                                                                                                                                                                         |
|---------------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha.cce/<br>NodeImageID | No        | String | (Discarded) ID of the user image to run the target OS. Specifying this parameter is equivalent to specifying <b>imageID</b> in <b>ReinstallVolumeSpec</b> . The original value will be overwritten. |

**Table 4-419 HostnameConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

## Response Parameters

**Status code: 200**

**Table 4-420 Response body parameters**

| Parameter | Type   | Description                                                                                           |
|-----------|--------|-------------------------------------------------------------------------------------------------------|
| jobid     | String | Job ID returned after the job is delivered. The job ID can be used to query the job execution status. |

## Example Requests

Add a node running EulerOS 2.5 to a cluster.

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/add

{
  "kind" : "List",
  "apiVersion" : "v3",
  "nodeList" : [ {
    "serverID" : "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
    "spec" : {
      "name" : "my-ecs-0001",
      "os" : "EulerOS 2.5",
      "login" : {
        "sshKey" : "KeyPair-001"
      }
    }
  } ]
}
```

## Example Responses

**Status code: 200**

The job for accepting a node into a specified cluster is successfully delivered.

```
{
  "jobid" : "2ec9b78d-9368-46f3-8f29-d1a95622a568"
}
```

## Status Codes

| Status Code | Description                                                                      |
|-------------|----------------------------------------------------------------------------------|
| 200         | The job for accepting a node into a specified cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

### 4.3.7 Resetting a Node

#### Function

This API is used to reset a node in a specified cluster.

**NOTE**

The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.

#### URI

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/reset
```

**Table 4-421** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-422** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-423** Request body parameters

| Parameter  | Mandatory | Type                              | Description                                    |
|------------|-----------|-----------------------------------|------------------------------------------------|
| apiVersion | Yes       | String                            | API version. The value is fixed at <b>v3</b> . |
| kind       | Yes       | String                            | API type. The value is fixed at <b>List</b> .  |
| nodeList   | Yes       | Array of <b>ResetNode</b> objects | List of the nodes to be reset.                 |

**Table 4-424** ResetNode

| Parameter | Mandatory | Type                                     | Description                                                                                                                                                                                                                           |
|-----------|-----------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodeID    | Yes       | String                                   | Node ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .                                                                                                                     |
| spec      | Yes       | <a href="#">ReinstallNodeSpec</a> object | Node reinstallation configuration parameters. Nodes in a node pool cannot be specified externally. These nodes will be reinstalled based on the node pool settings. By default, this parameter is mandatory for nodes in a node pool. |

**Table 4-425** ReinstallNodeSpec

| Parameter    | Mandatory | Type                                         | Description                                                                                                                                                                                                                                                                                      |
|--------------|-----------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os           | Yes       | String                                       | Operating system. If you specify a custom image, the actual OS version in the IMS image is used. Select an OS version supported by the current cluster, for example, EulerOS 2.5, CentOS 7.6, or EulerOS 2.8.                                                                                    |
| login        | Yes       | <a href="#">Login</a> object                 | Node login mode.                                                                                                                                                                                                                                                                                 |
| name         | No        | String                                       | Node name.<br><b>NOTE</b><br>Specifying this field during reinstallation will change the node name, and the server name will change accordingly. By default, the current server name is used as the node name. Enter 1 to 56 characters starting with a letter and not ending with a hyphen (-). |
| serverConfig | No        | <a href="#">ReinstallServerConfig</a> object | Server configuration.                                                                                                                                                                                                                                                                            |
| volumeConfig | No        | <a href="#">ReinstallVolumeConfig</a> object | Volume management configuration.                                                                                                                                                                                                                                                                 |

| Parameter             | Mandatory | Type                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| initializedConditions | No        | Array of strings                                 | <p>Custom initialization flag. Before CCE nodes are initialized, they are tainted with <b>node.cloudprovider.kubernetes.io/uninitialized</b> to prevent pods from being scheduled to them.</p> <p>CCE supports custom initialization flags. After receiving the <b>initializedConditions</b> parameter, CCE converts the parameter value into a node label and provisions the label with the node, for example, <a href="#">cloudprovider.openvessel.io/inject-initialized-conditions=CCEInitial_CustomedInitial</a>.</p> <p>After the node is labeled, its <b>status.Conditions</b> is polled to check whether the <b>type of conditions</b> has a flag name, such as <b>CCEInitial</b> and <b>CustomedInitial</b>. If all input flags exist and their status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</p> <ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li></ul> |
| extendParam           | No        | <a href="#">ReinstallExtendParam object</a>      | Extended reinstallation parameter, which is discarded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter      | Mandatory | Type                                  | Description                                                                                                                                      |
|----------------|-----------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| hostnameConfig | No        | <a href="#">HostnameConfig object</a> | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-426** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-427** UserPassword

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-428** ReinstallServerConfig

| Parameter  | Mandatory | Type                                       | Description                                                                                                                                                                                                                                               |
|------------|-----------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags   | No        | Array of <a href="#">UserTag</a> objects   | Cloud server labels. The key of a label must be unique. The maximum number of user-defined labels supported by CCE depends on the region. In the region that supports the least number of labels, you can still create up to 5 labels for a cloud server. |
| rootVolume | No        | <a href="#">ReinstallVolumeSpec</a> object | System disk configurations used in reinstallation.                                                                                                                                                                                                        |

**Table 4-429** UserTag

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| key       | No        | String | Key of the cloud server label. The value cannot start with <b>CCE-</b> or <b>_type_baremetal</b> . |
| value     | No        | String | Value of the cloud server label.                                                                   |

**Table 4-430** ReinstallVolumeSpec

| Parameter | Mandatory | Type   | Description                                                                                    |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------|
| imageID   | No        | String | Custom image ID.                                                                               |
| cmkID     | No        | String | User master key ID. If this parameter is left blank by default, the EVS disk is not encrypted. |

**Table 4-431** ReinstallVolumeConfig

| Parameter | Mandatory | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvmConfig | No        | String         | <p>Docker data disk configurations.</p> <p>The following is an example default configuration:<br/><code>"lvmConfig":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</code></p> <p>The following fields are included:</p> <ul style="list-style-type: none"><li>• <b>userLV</b>: size of the user space, for example, <b>vgpaas/20%VG</b>.</li><li>• <b>userPath</b>: mount path of the user space, for example, <b>/home/wqt-test</b>.</li><li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li><li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li><li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li><li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li></ul> |
| storage   | No        | Storage object | <p>Disk initialization management parameter.</p> <p>This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b><br/>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p>                                                                                                                                                                                                                                                                                                     |

**Table 4-432 Storage**

| Parameter        | Mandatory | Type                                              | Description                                                                                        |
|------------------|-----------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| storageSelectors | Yes       | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| storageGroups    | Yes       | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-433 StorageSelectors**

| Parameter   | Mandatory | Type                               | Description                                                                                                                                                                                                                                                               |
|-------------|-----------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | Yes       | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| storageType | Yes       | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| matchLabels | No        | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-434 matchLabels**

| Parameter | Mandatory | Type   | Description                                                                                          |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------|
| size      | No        | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited. Example: 100 |

| Parameter         | Mandatory | Type   | Description                                                                                                                       |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| volumeType        | No        | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.                              |
| metadataEncrypted | No        | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkid     | No        | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | No        | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-435 StorageGroups**

| Parameter     | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String           | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | No        | Boolean          | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                       |
| selectorNames | Yes       | Array of strings | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                          |

| Parameter     | Mandatory | Type                                 | Description                                            |
|---------------|-----------|--------------------------------------|--------------------------------------------------------|
| virtualSpaces | Yes       | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group. |

**Table 4-436 VirtualSpace**

| Parameter     | Mandatory | Type                        | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String                      | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | Yes       | String                      | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | No        | <b>LVMConfig</b> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | No        | <b>RuntimeConfig</b> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-437 LVMConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | No        | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-438 RuntimeConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-439** ReinstallRuntimeConfig

| Parameter      | Mandatory | Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize | No        | Integer                        | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| runtime        | No        | <a href="#">Runtime object</a> | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 4-440** Runtime

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |

| taints    | No        | Array of <a href="#">Taint</a> objects | <p>Taints can be added for anti-affinity when creating nodes. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>.</li></ul> <p>Example:</p> <pre>"taints": [{ "key": "status", "value": "unavailable", "effect": "NoSchedule"}, { "key": "looks", "value": "bad", "effect": "NoSchedule"}]</pre> |
| maxPods   | No        | Integer                                | Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 4-442 Taint**

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| value     | No        | String | Value.      |
| effect    | Yes       | String | Effect.     |

**Table 4-443 NodeLifecycleConfig**

| Parameter   | Mandatory | Type   | Description                                                                                                                             |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| preInstall  | No        | String | Pre-installation script.<br><b>NOTE</b><br>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)  |
| postInstall | No        | String | Post-installation script.<br><b>NOTE</b><br>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64) |

**Table 4-444 ReinstallExtendParam**

| Parameter                 | Mandatory | Type   | Description                                                                                                                                                                                         |
|---------------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha.cce/<br>NodeImageID | No        | String | (Discarded) ID of the user image to run the target OS. Specifying this parameter is equivalent to specifying <b>imageID</b> in <b>ReinstallVolumeSpec</b> . The original value will be overwritten. |

**Table 4-445 HostnameConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

## Response Parameters

**Status code: 200**

**Table 4-446 Response body parameters**

| Parameter | Type   | Description                                                                                           |
|-----------|--------|-------------------------------------------------------------------------------------------------------|
| jobid     | String | Job ID returned after the job is delivered. The job ID can be used to query the job execution status. |

## Example Requests

- Reset the nodes running EulerOS 2.5 in the default node pool.

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/reset
```

```
{  
    "kind" : "List",  
    "apiVersion" : "v3",  
    "nodeList" : [ {  
        "nodeID" : "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyyyy",  
        "spec" : {  
            "name" : "my-ecs-0001",  
            "os" : "EulerOS 2.5",  
            "login" : {  
                "sshKey" : "KeyPair-001"  
            }  
        }  
    } ]  
}
```

- Reset a node in a node pool (invalid spec).

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/reset
```

```
{  
    "kind" : "List",  
    "apiVersion" : "v3",  
    "nodeList" : [ {  
        "nodeID" : "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",  
        "spec" : {  
            "name" : "my-ecs-0001",  
            "os" : "EulerOS 2.5",  
            "login" : {  
                "sshKey" : "KeyPair-001"  
            }  
        }  
    } ]  
}
```

## Example Responses

### Status code: 200

The job for resetting a node in a specified cluster is successfully delivered.

```
{  
    "jobid" : "2ec9b78d-9368-46f3-8f29-d1a95622a568"  
}
```

## Status Codes

| Status Code | Description                                                                    |
|-------------|--------------------------------------------------------------------------------|
| 200         | The job for resetting a node in a specified cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

## 4.3.8 Removing a Node

### Function

This API is used to remove a node from a specified cluster.

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

### URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes/operation/remove

**Table 4-447** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-448** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-449** Request body parameters

| Parameter  | Mandatory | Type                         | Description                                              |
|------------|-----------|------------------------------|----------------------------------------------------------|
| apiVersion | No        | String                       | API version. The value is fixed at <b>v3</b> .           |
| kind       | No        | String                       | API type. The value is fixed at <b>RemoveNodesTask</b> . |
| spec       | Yes       | <b>RemoveNodeSpec</b> object | Configuration information.                               |
| status     | No        | <b>TaskStatus</b> object     | Job status.                                              |

**Table 4-450** RemoveNodesSpec

| Parameter | Mandatory | Type                             | Description                   |
|-----------|-----------|----------------------------------|-------------------------------|
| login     | Yes       | <b>Login</b> object              | Node login mode.              |
| nodes     | Yes       | Array of <b>NodeItem</b> objects | List of nodes to be operated. |

**Table 4-451** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-452** UserPassword

| Parameter | Mandatory | Type   | Description                              |
|-----------|-----------|--------|------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-453** NodeItem

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| uid       | Yes       | String | Node ID.    |

**Table 4-454** TaskStatus

| Parameter | Mandatory | Type   | Description                                                    |
|-----------|-----------|--------|----------------------------------------------------------------|
| jobID     | No        | String | Job ID, which is used by the caller to query the job progress. |

## Response Parameters

**Status code: 200**

**Table 4-455** Response body parameters

| Parameter  | Type                          | Description                                              |
|------------|-------------------------------|----------------------------------------------------------|
| apiVersion | String                        | API version. The value is fixed at <b>v3</b> .           |
| kind       | String                        | API type. The value is fixed at <b>RemoveNodesTask</b> . |
| spec       | <b>RemoveNodesSpec</b> object | Configuration information.                               |
| status     | <b>TaskStatus</b> object      | Job status.                                              |

**Table 4-456** RemoveNodesSpec

| Parameter | Type                             | Description                   |
|-----------|----------------------------------|-------------------------------|
| login     | <b>Login</b> object              | Node login mode.              |
| nodes     | Array of <b>NodeItem</b> objects | List of nodes to be operated. |

**Table 4-457** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-458** UserPassword

| Parameter | Type   | Description                              |
|-----------|--------|------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> . |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:.,/?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-459** NodeItem

| Parameter | Type   | Description |
|-----------|--------|-------------|
| uid       | String | Node ID.    |

**Table 4-460** TaskStatus

| Parameter | Type   | Description                                                    |
|-----------|--------|----------------------------------------------------------------|
| jobID     | String | Job ID, which is used by the caller to query the job progress. |

## Example Requests

### Removing a Node

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/operation/remove

{
  "spec": {
    "login": {
      "sshKey": "KeyPair-001"
    },
    "nodes": [
      {
        "uid": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
      },
      {
        "uid": "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyyyy"
      }
    ]
  }
}
```

## Example Responses

### Status code: 200

The job for removing a node in a specified cluster is successfully delivered.

```
{  
  "spec": {  
    "login": {  
      "sshKey": "KeyPair-001"  
    },  
    "nodes": [ {  
      "uid": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxx"  
    }, {  
      "uid": "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyy"  
    } ]  
  },  
  "status": {  
    "jobID": "2ec9b78d-9368-46f3-8f29-d1a95622a568"  
  }  
}
```

## Status Codes

| Status Code | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| 200         | The job for removing a node in a specified cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

### 4.3.9 Migrating a Node

#### Function

This API is used to migrate a node from a specified cluster to another cluster. The node can be migrated only between different clusters in the same VPC and project, and the cluster types before and after the migration must be the same.

#### NOTE

The URL for cluster management is in the format of **https://Endpoint/uri**, where **uri** indicates the resource path for API access.

#### Constraints

- Data can be migrated only between clusters in the same VPC and project.
- Data cannot be migrated between CCE Turbo clusters and CCE standard clusters.
- Data cannot be migrated between DEC and non-DEC clusters.
- Data cannot be migrated between clusters with IPv6 enabled and clusters without IPv6 enabled.

- Data can be migrated only to the default node pool of the target cluster.

## URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodes/operation/migrateto/{target\_cluster\_id}

**Table 4-461** Path Parameters

| Parameter         | Mandatory | Type   | Description                                                                                                          |
|-------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id        | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id        | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| target_cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-462** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-463** Request body parameters

| Parameter  | Mandatory | Type   | Description                                    |
|------------|-----------|--------|------------------------------------------------|
| apiVersion | No        | String | API version. The value is fixed at <b>v3</b> . |

| Parameter | Mandatory | Type                          | Description                                               |
|-----------|-----------|-------------------------------|-----------------------------------------------------------|
| kind      | No        | String                        | API type. The value is fixed at <b>MigrateNodesTask</b> . |
| spec      | Yes       | <b>MigrateNodeSpec</b> object | Configuration data.                                       |
| status    | No        | <b>TaskStatus</b> object      | Job status.                                               |

**Table 4-464** MigrateNodesSpec

| Parameter   | Mandatory | Type                                 | Description                                                                                                                                                                                 |
|-------------|-----------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os          | Yes       | String                               | Operating system type, which must be accurate to the version number. When <b>alpha.cce/NodeImageID</b> is specified, the value of <b>os</b> must be the same as the OS of the custom image. |
| extendParam | No        | <b>MigrateNodeExtendParam</b> object | Extended parameters for node migration.                                                                                                                                                     |
| login       | Yes       | <b>Login</b> object                  | Node login mode.                                                                                                                                                                            |
| runtime     | No        | <b>Runtime</b> object                | Container runtime                                                                                                                                                                           |
| nodes       | Yes       | Array of <b>NodeItem</b> objects     | List of nodes to be operated.                                                                                                                                                               |

**Table 4-465** MigrateNodeExtendParam

| Parameter | Mandatory | Type    | Description                                                                                                                                                                  |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods   | No        | Integer | Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods. |

| Parameter               | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DockerLVMConfigOverride | No        | String | <p>Docker data disk configurations.</p> <p>The disk type of the nodes to be migrated must be the same as that specified during node creation (that is, the value of diskType in DockerLVMConfigOverride must be the same as that specified during node creation). Ensure that the disk types of the nodes selected for a single API call are the same.</p> <p>The following is the default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</pre> <p>The configuration contains the following fields:</p> <ul style="list-style-type: none"><li>• userLV (optional): size of the user space, for example, vgpaas/20%VG.</li><li>• (Optional) userPath: mount path of the user space, for example, /home/wqt-test.</li><li>• diskType: specifies the disk type. Currently, only evs, hdd, and ssd are supported.</li><li>• lvType: type of the logical volume. Currently, the value can be linear or striped. For example, striped.</li><li>• dockerThinpool: Docker disk size, for example, vgpaas/60%VG.</li><li>• kubernetesLV: Kubelet space size, for example, vgpaas/20%VG.</li></ul> |
| alpha.cce/preInstall    | No        | String | <p>Pre-installation script.</p> <p><b>NOTE</b></p> <p>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter                 | Mandatory | Type   | Description                                                                                                                                                              |
|---------------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha.cce/<br>postInstall | No        | String | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                      |

**Table 4-466** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-467** UserPassword

| Parameter | Mandatory | Type   | Description                              |
|-----------|-----------|--------|------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-468** Runtime

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | No        | String | Container runtime. Default value: <ul style="list-style-type: none"><li>• Clusters earlier than v1.25: The default value is <b>docker</b>.</li><li>• Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <b>docker</b>; for nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul> |

**Table 4-469** NodeItem

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| uid       | Yes       | String | Node ID.    |

**Table 4-470** TaskStatus

| Parameter | Mandatory | Type   | Description                                                    |
|-----------|-----------|--------|----------------------------------------------------------------|
| jobID     | No        | String | Job ID, which is used by the caller to query the job progress. |

## Response Parameters

Status code: 200

**Table 4-471** Response body parameters

| Parameter  | Type                          | Description                                               |
|------------|-------------------------------|-----------------------------------------------------------|
| apiVersion | String                        | API version. The value is fixed at <b>v3</b> .            |
| kind       | String                        | API type. The value is fixed at <b>MigrateNodesTask</b> . |
| spec       | <b>MigrateNodeSpec</b> object | Configuration data.                                       |
| status     | <b>TaskStatus</b> object      | Job status.                                               |

**Table 4-472** MigrateNodesSpec

| Parameter   | Type                                 | Description                                                                                                                                                                                  |
|-------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os          | String                               | Operating system type, which must be accurate to the version number. When <b>alpha.cce/NodelImageID</b> is specified, the value of <b>os</b> must be the same as the OS of the custom image. |
| extendParam | <b>MigrateNodeExtendParam</b> object | Extended parameters for node migration.                                                                                                                                                      |
| login       | <b>Login</b> object                  | Node login mode.                                                                                                                                                                             |

| Parameter | Type                      | Description                   |
|-----------|---------------------------|-------------------------------|
| runtime   | Runtime object            | Container runtime             |
| nodes     | Array of NodeItem objects | List of nodes to be operated. |

**Table 4-473** MigrateNodeExtendParam

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DockerLVMConfigOverride | String  | <p>Docker data disk configurations. The disk type of the nodes to be migrated must be the same as that specified during node creation (that is, the value of diskType in DockerLVMConfigOverride must be the same as that specified during node creation). Ensure that the disk types of the nodes selected for a single API call are the same.</p> <p>The following is the default configuration:<br/>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</p> <p>The configuration contains the following fields:</p> <ul style="list-style-type: none"><li>• userLV (optional): size of the user space, for example, vgpaas/20%VG.</li><li>• (Optional) userPath: mount path of the user space, for example, /home/wqt-test.</li><li>• diskType: specifies the disk type. Currently, only evs, hdd, and ssd are supported.</li><li>• lvType: type of the logical volume. Currently, the value can be linear or striped. For example, striped.</li><li>• dockerThinpool: Docker disk size, for example, vgpaas/60%VG.</li><li>• kubernetesLV: Kubelet space size, for example, vgpaas/20%VG.</li></ul> |
| alpha.cce/preInstall    | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter                 | Type   | Description                                                                                                                                                                     |
|---------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha.cce/<br>postInstall | String | <p>Post-installation script.</p> <p><b>NOTE</b></p> <p>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                      |
| alpha.cce/<br>NodeImageID | String | <p>ID of the user image to run the target OS.</p> <p>When <b>alpha.cce/NodeImageID</b> is specified, the value of <b>os</b> must be the same as the OS of the custom image.</p> |

**Table 4-474** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-475** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>Contains 8 to 26 characters.</li><li>Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_-=+[{}]:.,/?~#*)</li><li>Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-476** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>• Clusters earlier than v1.25: The default value is <b>docker</b>.</li><li>• Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <b>docker</b>; for nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul> |

**Table 4-477** NodeItem

| Parameter | Type   | Description |
|-----------|--------|-------------|
| uid       | String | Node ID.    |

**Table 4-478** TaskStatus

| Parameter | Type   | Description                                                    |
|-----------|--------|----------------------------------------------------------------|
| jobID     | String | Job ID, which is used by the caller to query the job progress. |

## Example Requests

- Migrate a node running EulerOS 2.5 to another cluster.

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/operation/migrateto/{target_cluster_id}

{
  "spec" : {
    "os" : "EulerOS 2.5",
    "login" : {
      "sshKey" : "KeyPair-001"
    },
    "nodes" : [ {
      "uid" : "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
    }, {
      "uid" : "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyyyy"
    }
  }
}
```

- Migrate a node running EulerOS 2.5 and created using a specified image ID to another cluster.

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/operation/migrateto/{target_cluster_id}

{
  "spec" : {
    "os" : "EulerOS 2.5",
    "extendParam" : {

```

```
        "alpha.cce/NodeImageID" : "cc697ad7-9563-11e8-8ea7-0255ac106311"
    },
    "login" : {
        "sshKey" : "KeyPair-001"
    },
    "nodes" : [ {
        "uid" : "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
    }, {
        "uid" : "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyyyy"
    } ]
}
```

## Example Responses

### Status code: 200

The job for migrating a node from a specified cluster to another cluster is successfully delivered.

```
{
    "spec" : {
        "os" : "EulerOS 2.5",
        "login" : {
            "sshKey" : "KeyPair-001"
        },
        "runtime" : {
            "name" : "docker"
        },
        "nodes" : [ {
            "uid" : "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
        }, {
            "uid" : "yyyyyyyy-yyyy-yyyy-yyyy-yyyyyyyyyyyy"
        } ]
    },
    "status" : {
        "jobID" : "2ec9b78d-9368-46f3-8f29-d1a95622a568"
    }
}
```

## Status Codes

| Status Code | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| 200         | The job for migrating a node from a specified cluster to another cluster is successfully delivered. |

## Error Codes

See [Error Codes](#).

## 4.4 Node Pool Management

## 4.4.1 Creating a Node Pool

### Function

This API is used to create a node pool in a specified cluster. This API can be called only when the cluster is in the available, scaling-out, or scaling-in state.

When creating a node pool in a cluster of v1.21, you can bind security groups to the node pool. A maximum of five security groups can be bound to a node pool.

After the security groups of a node pool are updated, the update takes effect only for newly created pods. You are advised to evict the original pods on the node.

#### NOTE

If there is no cluster, [create one](#). The URL for cluster management is in the format of **https://Endpoint/uri**. In the URL, **uri** indicates the resource path, that is, the path for API access.

### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodepools

**Table 4-479** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-480** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-481** Request body parameters

| Parameter  | Mandatory | Type                           | Description                                       |
|------------|-----------|--------------------------------|---------------------------------------------------|
| kind       | Yes       | String                         | API type. The value is fixed at <b>NodePool</b> . |
| apiVersion | Yes       | String                         | API version. The value is fixed at <b>v3</b> .    |
| metadata   | Yes       | <b>NodePoolMetadata</b> object | Metadata information of the node pool             |
| spec       | Yes       | <b>NodePoolSpec</b> object     | Node pool specifications                          |
| status     | No        | <b>NodePoolStatus</b> object   | Node pool status                                  |

**Table 4-482** NodePoolMetadata

| Parameter         | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                    |
|-------------------|-----------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | Yes       | String              | Node pool name.<br><b>NOTE</b><br>Naming rules:<br>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid               | No        | String              | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                             |
| annotations       | No        | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.                                                                                                                                         |
| updateTimestamp   | No        | String              | Update time.                                                                                                                                                                                                                                                                                                   |
| creationTimestamp | No        | String              | Creation time.                                                                                                                                                                                                                                                                                                 |

**Table 4-483** NodePoolSpec

When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                                                                                                                                                                                                                         |
| autoscaling          | No        | <a href="#">NodePoolNodeAutoscaling</a> object | Auto scaling parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| nodeManagement       | No        | <a href="#">NodeManagement</a> object          | Node management configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| podSecurityGroups    | No        | Array of <a href="#">SecurityID</a> objects    | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| customSecurityGroups | No        | Array of strings                               | <p>Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group.</p> <ul style="list-style-type: none"><li>• Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li><li>• Specifying a valid security group ID will put new nodes in that security group.</li><li>• When specifying a security group, do not modify the rules of the port on which CCE running depends.</li></ul> |

**Table 4-484** NodeSpec

| Parameter   | Mandatory | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor      | Yes       | String                                  | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| az          | Yes       | String                                  | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| os          | No        | String                                  | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).<br><b>NOTE</b> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <code>alpha.cce/NodeImageID</code> in <code>extendParam</code> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login       | Yes       | <a href="#">Login</a> object            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rootVolume  | Yes       | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| dataVolumes | Yes       | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <code>rootVolume</code> .                                                                                                                                                                                                                |

| Parameter   | Mandatory | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|-----------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| storage     | No        | <a href="#">Storage object</a>      | Disk initialization management parameter.<br>This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> .<br>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | No        | <a href="#">NodePublicIP object</a> | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| nodeNicSpec | No        | <a href="#">NodeNicSpec object</a>  | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| count       | No        | Integer                             | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                               |
| billingMode | No        | Integer                             | Node billing mode. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| initializedConditions | No        | Array of strings | <p>Custom initialization flag, which is left blank by default. Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li></ol> |

| Parameter      | Mandatory | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|-----------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |           |                                        | <p>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.</p> <ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul> |
| extendParam    | No        | <a href="#">NodeExtendParam</a> object | Extended parameters for creating a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| hostnameConfig | No        | <a href="#">HostnameConfig</a> object  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 4-485** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-486** UserPassword

| Parameter | Mandatory | Type   | Description                              |
|-----------|-----------|--------|------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-487** Volume

| Parameter   | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| size        | Yes       | Integer             | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul>                                                                                                                                                                                                                                                                                                                 |
| volumetype  | Yes       | String              | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul> |
| extendParam | No        | Map<String, Object> | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                   |

| Parameter      | Mandatory | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|-----------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id     | No        | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                           |
| cluster_type   | No        | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                              |
| hw:passthrough | No        | Boolean                               | <ul style="list-style-type: none"><li>Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | No        | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                        |

**Table 4-488** VolumeMetadata

| Parameter                       | Mandatory | Type   | Description                                                                                                                                                                                                                                             |
|---------------------------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>__system_encrypted</code> | No        | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Mandatory | Type   | Description                                                                                                |
|-----------------------------|-----------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | No        | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-489 Storage**

| Parameter                     | Mandatory | Type                                     | Description                                                                                        |
|-------------------------------|-----------|------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Yes       | Array of <b>StorageSelectors</b> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Yes       | Array of <b>StorageGroups</b> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-490 StorageSelectors**

| Parameter                | Mandatory | Type                      | Description                                                                                                                                                                                                                                                               |
|--------------------------|-----------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | Yes       | String                    | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | Yes       | String                    | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | No        | <b>matchLabels</b> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-491** matchLabels

| Parameter         | Mandatory | Type   | Description                                                                                                                       |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| size              | No        | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited. Example: 100                              |
| volumeType        | No        | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.                              |
| metadataEncrypted | No        | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkid     | No        | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | No        | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-492** StorageGroups

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name       | Yes       | String  | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged | No        | Boolean | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                       |

| Parameter     | Mandatory | Type                                 | Description                                                                                                                                           |
|---------------|-----------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| selectorNames | Yes       | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group. |
| virtualSpaces | Yes       | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                |

**Table 4-493 VirtualSpace**

| Parameter     | Mandatory | Type                        | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String                      | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes:</b> Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime:</b> runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user:</b> user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | Yes       | String                      | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | No        | <b>LVMConfig</b> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | No        | <b>RuntimeConfig</b> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-494 LVMConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | No        | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-495 RuntimeConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | Yes       | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-496 NodePublicIP**

| Parameter | Mandatory | Type                               | Description                                                                                                                                                                                     |
|-----------|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | No        | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | No        | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | No        | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-497** NodeEIPSpec

| Parameter | Mandatory | Type                                 | Description                                                                  |
|-----------|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | Yes       | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | No        | <a href="#">NodeBandwidth object</a> | Bandwidth parameters of the EIP                                              |

**Table 4-498** NodeBandwidth

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | No        | String  | <p>Bandwidth billing mode.</p> <ul style="list-style-type: none"><li>If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |
| size       | No        | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter | Mandatory | Type   | Description                                                             |
|-----------|-----------|--------|-------------------------------------------------------------------------|
| sharetype | No        | String | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth) |

**Table 4-499** NodeNicSpec

| Parameter  | Mandatory | Type                            | Description                                                                                         |

**Table 4-500** NicSpec

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | No        | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | No        | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |

| Parameter | Mandatory | Type   | Description                                                                                                                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipBlock   | No        | String | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time. |

**Table 4-501** Taint

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |
| value     | No        | String | Value.      |
| effect    | Yes       | String | Effect.     |

**Table 4-502** UserTag

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| key       | No        | String | Key of the cloud server label. The value cannot start with <b>CCE-</b> or <b>_type_baremetal</b> . |
| value     | No        | String | Value of the cloud server label.                                                                   |

**Table 4-503** Runtime

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | No        | String | Container runtime. Default value: <ul style="list-style-type: none"><li>• Clusters earlier than v1.25: The default value is <b>docker</b>.</li><li>• Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <b>docker</b>; for nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul> |

**Table 4-504** NodeExtendParam

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ecs:performancetype | No        | String  | ECS flavor types. This field is returned in the response.                                                                                                                                                                                                                                                                                                                |
| maxPods             | No        | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256. This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p> |

| Parameter               | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DockerLVMConfigOverride | No        | String | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.)</p> <p>Example default configuration:<br/>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/90%VG;kubernetesLV=vgpaas/10%VG;diskType=evs;lvType=linear"</p> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"><li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li><li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li><li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li><li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li><li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li><li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li></ul> |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | No        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | No        | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | No        | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| alpha.cce/postInstall | No        | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded. (Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| alpha.cce/NodeImageID | No        | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                      |
|--------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargingMode       | No        | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                            |
| agency_name        | No        | String  | Name of an agency<br>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation. |
| kubeReservedMem    | No        | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                               |
| systemReservedMem  | No        | Integer | Reserved node memory, which is reserved for system components.                                                                                                                                                                                                   |
| init-node-password | No        | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed.                                                                                                                                                               |

**Table 4-505 HostnameConfig**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

**Table 4-506 NodePoolNodeAutoscaling**

| Parameter    | Mandatory | Type    | Description                                                                                                                                                     |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | No        | Boolean | Whether to enable auto scaling.                                                                                                                                 |
| minNodeCount | No        | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications. |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                           |
|-----------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxNodeCount          | No        | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |
| scaleDownCooldownTime | No        | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted.                                                                                            |
| priority              | No        | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                                                                                                                         |

**Table 4-507 NodeManagement**

| Parameter            | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | No        | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-508 SecurityID**

| Parameter | Mandatory | Type   | Description       |
|-----------|-----------|--------|-------------------|
| id        | No        | String | Security group ID |

**Table 4-509** NodePoolStatus

| Parameter    | Mandatory | Type    | Description                                                                                 |
|--------------|-----------|---------|---------------------------------------------------------------------------------------------|
| currentNode  | No        | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted) |
| creatingNode | No        | Integer | Number of nodes in the creation process in the node pool                                    |
| deletingNode | No        | Integer | Number of nodes being deleted in the current node pool.                                     |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase     | No        | String | <p>Node pool status.</p> <ul style="list-style-type: none"><li>• Null: available (the number of current nodes in the node pool has reached the expected value, and no node scaling is being performed.)</li><li>• Synchronizing: scaling in progress (the number of current nodes in the node pool does not reach the expected value and no node scaling is being performed.)</li><li>• Synchronized: pending scaling (the number of current nodes in the node pool does not reach the expected value, or node scaling is being performed.)</li><li>• SoldOut: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li></ul> <p><b>NOTE</b><br/>This node pool status has been discarded and is reserved only for compatibility. You are not advised to use it. The replacements are as follows:</p> <ul style="list-style-type: none"><li>• Node pool scaling status: You can obtain accurate status of the current node pool based on parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li><li>• Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li><li>• <b>Deleting</b>: The object is being deleted.</li><li>• <b>Error</b>: An error occurs.</li></ul> |

| Parameter  | Mandatory | Type                                               | Description                                                                                              |
|------------|-----------|----------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| jobId      | No        | String                                             | ID of a job executed on the node pool. This field is available only when the node pool is being deleted. |
| conditions | No        | Array of <a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                          |

**Table 4-510 NodePoolCondition**

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type          | No        | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status        | No        | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime | No        | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter       | Mandatory | Type   | Description                            |
|-----------------|-----------|--------|----------------------------------------|
| lastTransitTime | No        | String | Time when the status was last changed  |
| reason          | No        | String | Reason why the status was last changed |
| message         | No        | String | Detailed condition description         |

## Response Parameters

Status code: 201

**Table 4-511** Response body parameters

| Parameter  | Type                                        | Description                                       |
|------------|---------------------------------------------|---------------------------------------------------|
| kind       | String                                      | API type. The value is fixed at <b>NodePool</b> . |
| apiVersion | String                                      | API version. The value is fixed at <b>v3</b> .    |
| metadata   | <a href="#">NodePoolMetadata object</a>     | Metadata of the node pool.                        |
| spec       | <a href="#">NodePoolSpec object</a>         | Node pool specifications.                         |
| status     | <a href="#">CreateNodePoolStatus object</a> | Node pool status.                                 |

**Table 4-512** NodePoolMetadata

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                    |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Node pool name.<br><b>NOTE</b><br>Naming rules:<br>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid       | String | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                             |

| Parameter         | Type                | Description                                                                                                                                                            |
|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotations       | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid. |
| updateTimestamp   | String              | Update time.                                                                                                                                                           |
| creationTimestamp | String              | Creation time.                                                                                                                                                         |

**Table 4-513** NodePoolSpec

| Parameter         | Type                                           | Description                                                                                                                                                                                                                                                                                         |
|-------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type              | String                                         | Node pool type. If this parameter is left blank, the value <b>vm</b> is used by default. <ul style="list-style-type: none"><li>● <b>vm</b>: ECS</li><li>● <b>ElasticBMS</b>: C6 general computing-plus BMS. An example flavor is <b>c6.22xlarge.2.physical</b>.</li><li>● <b>bms</b>: BMS</li></ul> |
| nodeTemplate      | <a href="#">NodeSpec</a> object                | Detailed parameters of the node pool template.                                                                                                                                                                                                                                                      |
| initialNodeCount  | Integer                                        | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                  |
| autoscaling       | <a href="#">NodePoolNodeAutoscaling</a> object | Auto scaling parameters                                                                                                                                                                                                                                                                             |
| nodeManagement    | <a href="#">NodeManagement</a> object          | Node management configuration                                                                                                                                                                                                                                                                       |
| podSecurityGroups | Array of <a href="#">SecurityID</a> objects    | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                              |

| Parameter            | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| customSecurityGroups | Array of strings | <p>Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group.</p> <ul style="list-style-type: none"><li>Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li><li>Specifying a valid security group ID will put new nodes in that security group.</li><li>When specifying a security group, do not modify the rules of the port on which CCE running depends.</li></ul> |

**Table 4-514** NodeSpec

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor      | String                                  | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| az          | String                                  | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| os          | String                                  | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).<br><b>NOTE</b> <ul style="list-style-type: none"><li>The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>This parameter is mandatory when creating a node pool.</li></ul> |
| login       | <a href="#">Login</a> object            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <b>rootVolume</b> .                                                                                                                                                                                                    |

| Parameter   | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| storage     | <a href="#">Storage</a> object      | Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> .<br><br>If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | <a href="#">NodePublicIP</a> object | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object  | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| count       | Integer                             | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                |
| billingMode | Integer                             | Node billing mode. <ul style="list-style-type: none"><li>• <b>0:</b> pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | Array of <b>Taint</b> objects | <p>You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:</p> <pre>"taints": [ { "key": "status", "value": "unavailable", "effect": "NoSchedule" }, { "key": "looks", "value": "bad", "effect": "NoSchedule" } ]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:<br/>"k8sTags": {<br/>  "key": "value"<br/>}</p> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-515** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-516** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-517** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-518** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-519 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-520 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-521 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-522 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-523** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-524** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-525** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-526** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-527** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-528** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-529** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-530** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-531** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-532** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-533** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-534** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-535 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-536 NodePoolNodeAutoscaling**

| Parameter    | Type    | Description                                                                                                                                                                                                           |
|--------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | Boolean | Whether to enable auto scaling.                                                                                                                                                                                       |
| minNodeCount | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications.                                                       |
| maxNodeCount | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |

| Parameter             | Type    | Description                                                                                                                |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| scaleDownCooldownTime | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted. |
| priority              | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                              |

**Table 4-537** NodeManagement

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-538** SecurityID

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Security group ID |

**Table 4-539** CreateNodePoolStatus

| Parameter    | Type    | Description                                                                                  |
|--------------|---------|----------------------------------------------------------------------------------------------|
| currentNode  | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted). |
| creatingNode | Integer | Number of nodes that are being created in the node pool.                                     |
| deletingNode | Integer | Number of nodes that are being deleted in the current node pool.                             |

| Parameter  | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                                                | <p>Node pool status. Options:</p> <ul style="list-style-type: none"><li>• Null: The node pool is available. (The number of nodes in the current node pool has reached the expected value, and no node scaling is being performed.)</li><li>• <b>Synchronizing</b>: The node pool is being scaled. (The number of nodes in the current node pool has not reached the expected value, and no node scaling is being performed.)</li><li>• <b>Synchronized</b>: The node pool scaling is pending. (The number of nodes in the current node pool has not reached the expected value, or node scaling is being performed.)</li><li>• <b>SoldOut</b>: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li></ul> <p><b>NOTE</b><br/>This node pool status has been deprecated. It is reserved only for compatibility. Do not use it anymore. Use the following instead:</p> <ul style="list-style-type: none"><li>• Node pool scaling status: You can obtain the status of the current node pool using parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li><li>• Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li><li>• <b>Deleting</b>: The node pool is being deleted.</li><li>• <b>Error</b>: An error occurred in the node pool.</li></ul> |
| conditions | Array of<br><a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-540** NodePoolCondition

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type            | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status          | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime   | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example Requests

Create a node pool with the following configurations: The number of nodes is 0. The node pool flavor is 2 vCPUs and 4 GiB of memory. The node OS is EulerOS 2.5. Docker containers are deployed. The sizes of the system disk and data disk of the node are 40 GB and 100 GB, respectively. Both the disks are of the high I/O type.

## Error Codes

See [Error Codes](#).

### 4.4.2 Reading a Specified Node Pool

#### Function

This API is used to obtain details about a specified node pool.

##### NOTE

The URL for cluster management is in the format of https://Endpoint/uri. In the URL, **uri** indicates the resource path, that is, the path for API access.

## URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodepools/{nodepool\_id}

**Table 4-541** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                          |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id  | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| nodepool_id | Yes       | String | Node pool ID.                                                                                                        |

## Request Parameters

**Table 4-542** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-543** Response body parameters

| Parameter  | Type                                    | Description                                       |
|------------|-----------------------------------------|---------------------------------------------------|
| kind       | String                                  | API type. The value is fixed at <b>NodePool</b> . |
| apiVersion | String                                  | API version. The value is fixed at <b>v3</b> .    |
| metadata   | <a href="#">NodePoolMetadata</a> object | Metadata of the node pool.                        |

| Parameter | Type                                  | Description               |
|-----------|---------------------------------------|---------------------------|
| spec      | <a href="#">NodePoolSpec object</a>   | Node pool specifications. |
| status    | <a href="#">NodePoolStatus object</a> | Node pool status.         |

**Table 4-544** NodePoolMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                    |
|-------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | String              | Node pool name.<br><b>NOTE</b><br>Naming rules:<br>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid               | String              | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                             |
| annotations       | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.                                                                                                                                         |
| updateTimestamp   | String              | Update time.                                                                                                                                                                                                                                                                                                   |
| creationTimestamp | String              | Creation time.                                                                                                                                                                                                                                                                                                 |

**Table 4-545** NodePoolSpec

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                         |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | Node pool type. If this parameter is left blank, the value <b>vm</b> is used by default. <ul style="list-style-type: none"><li>• <b>vm</b>: ECS</li><li>• <b>ElasticBMS</b>: C6 general computing-plus BMS. An example flavor is <b>c6.22xlarge.2.physical</b>.</li><li>• <b>bms</b>: BMS</li></ul> |

| Parameter            | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodeTemplate         | <a href="#">NodeSpec object</a>                | Detailed parameters of the node pool template.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| initialNodeCount     | Integer                                        | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                                                                                                                                                                                                                |
| autoscaling          | <a href="#">NodePoolNodeAutoscaling object</a> | Auto scaling parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| nodeManagement       | <a href="#">NodeManagement object</a>          | Node management configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| podSecurityGroups    | Array of <a href="#">SecurityID objects</a>    | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                                                                                                                                                                                                                            |
| customSecurityGroups | Array of strings                               | Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group. <ul style="list-style-type: none"> <li>Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li> <li>Specifying a valid security group ID will put new nodes in that security group.</li> <li>When specifying a security group, do not modify the rules of the port on which CCE running depends.</li> </ul> |

**Table 4-546** NodeSpec

| Parameter | Type   | Description                                                                                                                    |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> . |
| az        | String | Name of the AZ where the node to be created is located...                                                                      |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os          | String                                  | <p>The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <code>alpha.cce/NodeImageID</code> in <code>extendParam</code> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul>                      |
| login       | <a href="#">Login</a> object            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <code>rootVolume</code> .                                                                                                                                                                                                                                                |
| storage     | <a href="#">Storage</a> object          | <p>Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the <code>DockerLVMConfigOverride</code> (discarded) parameter in <code>extendParam</code>. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b></p> <p>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p> |
| publicIP    | <a href="#">NodePublicIP</a> object     | EIP of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter   | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| count       | Integer                                | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| billingMode | Integer                                | Node billing mode.<br>• 0: pay-per-use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| taints      | Array of <a href="#">Taint</a> objects | You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters: <ul style="list-style-type: none"><li>• <b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li><li>• <b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p><b>Example:</b></p> <pre>"taints": [{"key": "status", "value": "unavailable", "effect": "NoSchedule"}, {"key": "looks", "value": "bad", "effect": "NoSchedule"}]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| k8sTags         | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:<br/>"k8sTags": {<br/>  "key": "value"<br/>}</p> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-547** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-548** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-549** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-550** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-551 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-552 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-553 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-554 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-555** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-556** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-557** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-558** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-559** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-560** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-561** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-562** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-563** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-564** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-565** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-566** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-567 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-568 NodePoolNodeAutoscaling**

| Parameter    | Type    | Description                                                                                                                                                                                                           |
|--------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | Boolean | Whether to enable auto scaling.                                                                                                                                                                                       |
| minNodeCount | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications.                                                       |
| maxNodeCount | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |

| Parameter             | Type    | Description                                                                                                                |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| scaleDownCooldownTime | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted. |
| priority              | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                              |

**Table 4-569** NodeManagement

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-570** SecurityID

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Security group ID |

**Table 4-571** NodePoolStatus

| Parameter    | Type    | Description                                                                                 |
|--------------|---------|---------------------------------------------------------------------------------------------|
| currentNode  | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted) |
| creatingNode | Integer | Number of nodes in the creation process in the node pool                                    |
| deletingNode | Integer | Number of nodes being deleted in the current node pool.                                     |

| Parameter  | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                                                | <p>Node pool status.</p> <ul style="list-style-type: none"><li>• Null: available (the number of current nodes in the node pool has reached the expected value, and no node scaling is being performed.)</li><li>• Synchronizing: scaling in progress (the number of current nodes in the node pool does not reach the expected value and no node scaling is being performed.)</li><li>• Synchronized: pending scaling (the number of current nodes in the node pool does not reach the expected value, or node scaling is being performed.)</li><li>• SoldOut: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li></ul> <p><b>NOTE</b><br/>This node pool status has been discarded and is reserved only for compatibility. You are not advised to use it. The replacements are as follows:</p> <ul style="list-style-type: none"><li>• Node pool scaling status: You can obtain accurate status of the current node pool based on parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li><li>• Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li><li>• <b>Deleting</b>: The object is being deleted.</li><li>• <b>Error</b>: An error occurs.</li></ul> |
| jobId      | String                                                | ID of a job executed on the node pool. This field is available only when the node pool is being deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| conditions | Array of<br><a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 4-572** NodePoolCondition

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type            | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status          | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime   | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| lastTransitTime | String | Time when the status was last changed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Error Codes

See [Error Codes](#).

### 4.4.3 Listing All Node Pools in a Specified Cluster

#### Function

This API is used to obtain information about all node pools in a specified cluster.

 NOTE

- The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.
- A node pool is a group of nodes within a cluster that all have the same configuration.

## URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodepools

**Table 4-573** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

**Table 4-574** Query Parameters

| Parameter           | Mandatory | Type   | Description                                                                                                                                                                       |
|---------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| showDefaultNodePool | No        | String | Whether to display the default node pool. By default, the default node pool is not displayed. If this parameter is set to <code>true</code> , the default node pool is displayed. |

## Request Parameters

**Table 4-575** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-576** Response body parameters

| Parameter  | Type                                          | Description                            |
|------------|-----------------------------------------------|----------------------------------------|
| kind       | String                                        | API type. The value is fixed to List.  |
| apiVersion | String                                        | API version. The value is fixed to v3. |
| items      | Array of <a href="#">NodePoolResp</a> objects | /                                      |

**Table 4-577** NodePoolResp

| Parameter  | Type                                    | Description                                                |
|------------|-----------------------------------------|------------------------------------------------------------|
| kind       | String                                  | API type. The value is fixed at <a href="#">NodePool</a> . |
| apiVersion | String                                  | API version. The value is fixed at <a href="#">v3</a> .    |
| metadata   | <a href="#">NodePoolMetadata</a> object | Metadata of the node pool.                                 |
| spec       | <a href="#">NodePoolSpec</a> object     | Node pool specifications.                                  |
| status     | <a href="#">NodePoolStatus</a> object   | Node pool status.                                          |

**Table 4-578** NodePoolMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | String              | <p>Node pool name.</p> <p><b>NOTE</b></p> <p>Naming rules:</p> <p>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid               | String              | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                                                |
| annotations       | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.                                                                                                                                                            |
| updateTimestamp   | String              | Update time.                                                                                                                                                                                                                                                                                                                      |
| creationTimestamp | String              | Creation time.                                                                                                                                                                                                                                                                                                                    |

**Table 4-579** NodePoolSpec

| Parameter        | Type                                           | Description                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type             | String                                         | <p>Node pool type. If this parameter is left blank, the value <b>vm</b> is used by default.</p> <ul style="list-style-type: none"><li>• <b>vm</b>: ECS</li><li>• <b>ElasticBMS</b>: C6 general computing-plus BMS. An example flavor is <b>c6.22xlarge.2.physical</b>.</li><li>• <b>bms</b>: BMS</li></ul> |
| nodeTemplate     | <a href="#">NodeSpec</a> object                | Detailed parameters of the node pool template.                                                                                                                                                                                                                                                             |
| initialNodeCount | Integer                                        | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                         |
| autoscaling      | <a href="#">NodePoolNodeAutoscaling</a> object | Auto scaling parameters                                                                                                                                                                                                                                                                                    |

| Parameter            | Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodeManagement       | <a href="#">NodeManagement object</a>       | Node management configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| podSecurityGroups    | Array of <a href="#">SecurityID objects</a> | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                                                                                                                                                                                                                              |
| customSecurityGroups | Array of strings                            | Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group. <ul style="list-style-type: none"><li>• Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li><li>• Specifying a valid security group ID will put new nodes in that security group.</li><li>• When specifying a security group, do not modify the rules of the port on which CCE running depends.</li></ul> |

**Table 4-580 NodeSpec**

| Parameter  | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor     | String                        | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                      |
| az         | String                        | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| os         | String                        | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).<br><b>NOTE</b> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul> |
| login      | <a href="#">Login object</a>  | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rootVolume | <a href="#">Volume object</a> | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <a href="#">rootVolume</a> .                                                                                                                                                                                              |
| storage     | <a href="#">Storage</a> object          | Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> . If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | <a href="#">NodePublicIP</a> object     | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                         |
| billingMode | Integer                                 | Node billing mode. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-581** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-582** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-583** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-584** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-585 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-586 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-587 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-588 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | <p>Name of a virtual storage group, which must be unique.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li> <li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li> <li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li> </ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                                            |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                               |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-589** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-590** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-591** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-592** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-593** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-594** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-595** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-596** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-597** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-598** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-599** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>• Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>• Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-600** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-601 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-602 NodePoolNodeAutoscaling**

| Parameter    | Type    | Description                                                                                                                                                                                                           |
|--------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | Boolean | Whether to enable auto scaling.                                                                                                                                                                                       |
| minNodeCount | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications.                                                       |
| maxNodeCount | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |

| Parameter             | Type    | Description                                                                                                                |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| scaleDownCooldownTime | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted. |
| priority              | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                              |

**Table 4-603** NodeManagement

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-604** SecurityID

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Security group ID |

**Table 4-605** NodePoolStatus

| Parameter    | Type    | Description                                                                                 |
|--------------|---------|---------------------------------------------------------------------------------------------|
| currentNode  | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted) |
| creatingNode | Integer | Number of nodes in the creation process in the node pool                                    |
| deletingNode | Integer | Number of nodes being deleted in the current node pool.                                     |

| Parameter  | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                                                | <p>Node pool status.</p> <ul style="list-style-type: none"> <li>Null: available (the number of current nodes in the node pool has reached the expected value, and no node scaling is being performed.)</li> <li>Synchronizing: scaling in progress (the number of current nodes in the node pool does not reach the expected value and no node scaling is being performed.)</li> <li>Synchronized: pending scaling (the number of current nodes in the node pool does not reach the expected value, or node scaling is being performed.)</li> <li>SoldOut: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li> </ul> <p><b>NOTE</b><br/>This node pool status has been discarded and is reserved only for compatibility. You are not advised to use it. The replacements are as follows:</p> <ul style="list-style-type: none"> <li>Node pool scaling status: You can obtain accurate status of the current node pool based on parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li> <li>Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li> <li><b>Deleting</b>: The object is being deleted.</li> <li><b>Error</b>: An error occurs.</li> </ul> |
| jobId      | String                                                | ID of a job executed on the node pool. This field is available only when the node pool is being deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| conditions | Array of<br><a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 4-606** NodePoolCondition

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type            | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status          | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime   | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Error Codes

See [Error Codes](#).

### 4.4.4 Updating a Specified Node Pool

#### Function

This API is used to update information about a specified node pool. This API can be called only when the cluster is in the Available, Scale Out, or Scale In state.

##### NOTE

- The URL for cluster management is in the following format: `https://Endpoint/uri`. `uri` indicates the resource path, that is, the API access path.
- Currently, only the node pool name can be updated. `initialNodeCount`, `k8sTags`, `taints`, `login` and `userTags` under `spec` are related to the scaling configuration of the node pool. If no value is set for this update, the initial value is used by default.

#### URI

`PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}`

**Table 4-607** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                          |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id  | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| nodepool_id | Yes       | String | Node pool ID.                                                                                                        |

## Request Parameters

**Table 4-608** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-609** Request body parameters

| Parameter | Mandatory | Type                                          | Description                            |
|-----------|-----------|-----------------------------------------------|----------------------------------------|
| metadata  | Yes       | <a href="#">NodePoolMetadataUpdate object</a> | Metadata information of the node pool. |
| spec      | Yes       | <a href="#">NodePoolSpecUpdate object</a>     | Node pool specifications.              |

**Table 4-610** NodePoolMetadataUpdate

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <p>Name of the node pool.</p> <p><b>NOTE</b></p> <p>Naming rules:</p> <ul style="list-style-type: none"><li>• Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</li><li>• You cannot create node pools named DefaultPool.</li></ul> |

**Table 4-611** NodePoolSpecUpdate

| Parameter        | Mandatory | Type                                            | Description                                                                                                                                |
|------------------|-----------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| nodeTemplate     | Yes       | <a href="#">NodeSpecUpdate</a> object           | Detailed parameters of the node pool template.                                                                                             |
| initialNodeCount | Yes       | Integer                                         | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool. The default value is 0. |
| autoscaling      | Yes       | <a href="#">NodePoolNo deAutoscaling</a> object | Auto scaling parameters. Only pay-per-use node pools support auto scaling.                                                                 |

**Table 4-612** NodeSpecUpdate

| Parameter | Mandatory | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taints    | Yes       | Array of <a href="#">Taint</a> objects | <p>You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. This parameter is left blank by default. Each taint contains the following parameters:</p> <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key.</li><li>• <b>Value:</b> Enter 1 to 63 characters with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.</li><li>• <b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>.</li></ul> <p><b>Example:</b></p> <pre>"taints": [{<br/>    "key": "status",<br/>    "value": "unavailable",<br/>    "effect": "NoSchedule"<br/>}, {<br/>    "key": "looks",<br/>    "value": "bad",<br/>    "effect": "NoSchedule"<br/>}]</pre> <p><b>NOTE</b><br/>If this parameter is not specified or left empty, the custom taints of the node pool will be deleted.</p> |

| Parameter | Mandatory | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| k8sTags   | Yes       | Map<String, String>                      | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed. This parameter is left blank by default.</p> <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. | userTags  | Yes       | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE varies depending on regions and cannot exceed 8. This parameter is left blank by default.</p> <p><b>NOTE</b><br/>If this parameter is not specified or left empty, the custom cloud server tags of the node pool will be deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter             | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | No        | Array of strings | <p>Custom initialization flag, which is left blank by default. Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured. Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:<pre>status:<br/>  conditions:<br/>    - type: CCEInitial<br/>      status: 'True'<br/>    - type: CustomedInitial<br/>      status: 'True'</pre></li></ol> <p>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</p> <p>2. <b>initializedConditions</b> allows you to configure a</p> |

| Parameter | Mandatory | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |           |                              | <p>timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.</p> <ul style="list-style-type: none"><li>• Use only letters and digits. | login     | No        | <a href="#">Login object</a> | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 4-613 Taint**

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |
| value     | No        | String | Value.      |
| effect    | Yes       | String | Effect.     |

**Table 4-614 UserTag**

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| key       | No        | String | Key of the cloud server label. The value cannot start with <b>CCE-</b> or <b>_type_baremetal</b> . |
| value     | No        | String | Value of the cloud server label.                                                                   |

**Table 4-615** Login

| Parameter | Mandatory | Type   | Description                          |
|-----------|-----------|--------|--------------------------------------|
| sshKey    | No        | String | Name of the key pair used for login. |

**Table 4-616** UserPassword

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | No        | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| password  | Yes       | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-617** NodePoolNodeAutoscaling

| Parameter    | Mandatory | Type    | Description                                                                                                                                                     |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | No        | Boolean | Whether to enable auto scaling.                                                                                                                                 |
| minNodeCount | No        | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications. |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                           |
|-----------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxNodeCount          | No        | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |
| scaleDownCooldownTime | No        | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted.                                                                                            |
| priority              | No        | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                                                                                                                         |

## Response Parameters

Status code: 200

**Table 4-618** Response body parameters

| Parameter  | Type                                        | Description                                       |
|------------|---------------------------------------------|---------------------------------------------------|
| kind       | String                                      | API type. The value is fixed at <b>NodePool</b> . |
| apiVersion | String                                      | API version. The value is fixed at <b>v3</b> .    |
| metadata   | <a href="#">NodePoolMetadata object</a>     | Metadata of the node pool.                        |
| spec       | <a href="#">NodePoolSpec object</a>         | Node pool specifications.                         |
| status     | <a href="#">UpdateNodePoolStatus object</a> | Node pool status.                                 |

**Table 4-619** NodePoolMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | String              | <p>Node pool name.</p> <p><b>NOTE</b></p> <p>Naming rules:</p> <p>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed.</p> <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid               | String              | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                                                |
| annotations       | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.                                                                                                                                                            |
| updateTimestamp   | String              | Update time.                                                                                                                                                                                                                                                                                                                      |
| creationTimestamp | String              | Creation time.                                                                                                                                                                                                                                                                                                                    |

**Table 4-620** NodePoolSpec

| Parameter        | Type                                           | Description                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type             | String                                         | <p>Node pool type. If this parameter is left blank, the value <b>vm</b> is used by default.</p> <ul style="list-style-type: none"><li>• <b>vm</b>: ECS</li><li>• <b>ElasticBMS</b>: C6 general computing-plus BMS. An example flavor is <b>c6.22xlarge.2.physical</b>.</li><li>• <b>bms</b>: BMS</li></ul> |
| nodeTemplate     | <a href="#">NodeSpec</a> object                | Detailed parameters of the node pool template.                                                                                                                                                                                                                                                             |
| initialNodeCount | Integer                                        | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                         |
| autoscaling      | <a href="#">NodePoolNodeAutoscaling</a> object | Auto scaling parameters                                                                                                                                                                                                                                                                                    |

| Parameter            | Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodeManagement       | <a href="#">NodeManagement object</a>       | Node management configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| podSecurityGroups    | Array of <a href="#">SecurityID objects</a> | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                                                                                                                                                                                                                               |
| customSecurityGroups | Array of strings                            | <p>Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group.</p> <ul style="list-style-type: none"><li>Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li><li>Specifying a valid security group ID will put new nodes in that security group.</li><li>When specifying a security group, do not modify the rules of the port on which CCE running depends.</li></ul> |

**Table 4-621** NodeSpec

| Parameter  | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor     | String                        | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| az         | String                        | Name of the AZ where the node to be created is located. . .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| os         | String                        | The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).<br><b>NOTE</b> <ul style="list-style-type: none"><li>The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>If <b>alpha.cce/NodeImageID</b> in <b>extendParam</b> is specified during node creation, you do not need to configure this parameter.</li><li>This parameter is mandatory when creating a node pool.</li></ul> |
| login      | <a href="#">Login object</a>  | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| rootVolume | <a href="#">Volume object</a> | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <a href="#">rootVolume</a> .                                                                                                                                                                                              |
| storage     | <a href="#">Storage</a> object          | Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a> . If this parameter retains its default, disks are managed based on the DockerLVMConfigOverride (discarded) parameter in extendParam. This parameter is supported by clusters of version 1.15.11 and later.<br><b>NOTE</b><br>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions. |
| publicIP    | <a href="#">NodePublicIP</a> object     | EIP of a node.<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| count       | Integer                                 | Number of nodes to be created in a batch. The value must be a positive integer greater than or equal to 1 and less than or equal to the defined limit. This parameter can be left blank when it is used for a node pool.                                                                                                                                                                                                                                                                                                                         |
| billingMode | Integer                                 | Node billing mode. <ul style="list-style-type: none"><li>• 0: pay-per-use</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| k8sTags         | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:<br/>"k8sTags": {<br/>  "key": "value"<br/>}</p> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-622** Login

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-623** UserPassword

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-624** Volume

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-625** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-626 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-627 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-628 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-629 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | <p>Name of a virtual storage group, which must be unique.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li> <li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li> <li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li> </ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                                            |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                               |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-630** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>● <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>● <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>● <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-631** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-632** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-633** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-634** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-635** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-636** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-637** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-638** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-639** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-640** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-641** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| alpha.cce/preInstall  | String  | <p>Pre-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-642 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"> <li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li> <li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li> <li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li> </ul> |

**Table 4-643 NodePoolNodeAutoscaling**

| Parameter    | Type    | Description                                                                                                                                                                                                           |
|--------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | Boolean | Whether to enable auto scaling.                                                                                                                                                                                       |
| minNodeCount | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications.                                                       |
| maxNodeCount | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |

| Parameter             | Type    | Description                                                                                                                |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| scaleDownCooldownTime | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted. |
| priority              | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                              |

**Table 4-644** NodeManagement

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-645** SecurityID

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Security group ID |

**Table 4-646** UpdateNodePoolStatus

| Parameter    | Type    | Description                                                                                  |
|--------------|---------|----------------------------------------------------------------------------------------------|
| currentNode  | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted). |
| creatingNode | Integer | Number of nodes that are being created in the node pool.                                     |
| deletingNode | Integer | Number of nodes that are being deleted in the current node pool.                             |

| Parameter  | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                                                | <p>Node pool status. Options:</p> <ul style="list-style-type: none"><li>• Null: The node pool is available. (The number of nodes in the current node pool has reached the expected value, and no node scaling is being performed.)</li><li>• <b>Synchronizing</b>: The node pool is being scaled. (The number of nodes in the current node pool has not reached the expected value, and no node scaling is being performed.)</li><li>• <b>Synchronized</b>: The node pool scaling is pending. (The number of nodes in the current node pool has not reached the expected value, or node scaling is being performed.)</li><li>• <b>SoldOut</b>: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li></ul> <p><b>NOTE</b><br/>This node pool status has been deprecated. It is reserved only for compatibility. Do not use it anymore. Use the following instead:</p> <ul style="list-style-type: none"><li>• Node pool scaling status: You can obtain the status of the current node pool using parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li><li>• Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li><li>• <b>Deleting</b>: The node pool is being deleted.</li><li>• <b>Error</b>: An error occurred in the node pool.</li></ul> |
| conditions | Array of<br><a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 4-647** NodePoolCondition

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type            | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status          | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime   | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| lastTransitTime | String | Time when the status was last changed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| reason          | String | Reason why the status was last changed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| message         | String | Detailed condition description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Example Requests

- Change the number of nodes in the node pool to 1.

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}

{
  "metadata": {
    "name": "lc-it-nodepool-3"
  },
  "spec": {
    "nodeTemplate": {
      "k8sTags": { },
      "taints": [ {
        "key": "status",
        "value": "unavailable",
        "effect": "NoSchedule"
      }],
      "userTags": [ ]
    },
    "autoscaling": {
      "enable": false,
      "minNodeCount": 0,
```

```
        "maxNodeCount" : 0,
        "scaleDownCooldownTime" : 0,
        "priority" : 0
    },
    "initialNodeCount" : 1
}
}
```

- **Modify the key pair.**

```
PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}
```

```
{
  "metadata" : {
    "name" : "lc-it-nodepool-2"
  },
  "spec" : {
    "nodeTemplate" : {
      "k8sTags" : { },
      "taints" : [ {
        "key" : "status",
        "value" : "unavailable",
        "effect" : "NoSchedule"
      }],
      "userTags" : [ ],
      "login" : {
        "sshKey" : "KeyPair-IES"
      }
    },
    "autoscaling" : {
      "enable" : false,
      "minNodeCount" : 0,
      "maxNodeCount" : 0,
      "scaleDownCooldownTime" : 0,
      "priority" : 0
    },
    "initialNodeCount" : 1
  }
}
```

## Example Responses

### Status code: 200

Information about the specified node pool is successfully updated.

## Status Codes

| Status Code | Description                                                        |
|-------------|--------------------------------------------------------------------|
| 200         | Information about the specified node pool is successfully updated. |

## Error Codes

See [Error Codes](#).

### 4.4.5 Deleting a Node Pool

#### Function

This API is used to delete a specified node pool.

The URL for cluster management is in the format of `https://Endpoint/uri`. In the URL, `uri` indicates the resource path, that is, the path for API access.

#### URI

`DELETE /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}`

**Table 4-648** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                          |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id  | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| nodepool_id | Yes       | String | Node pool ID.                                                                                                        |

## Request Parameters

**Table 4-649** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-650** Response body parameters

| Parameter  | Type                                    | Description                                       |
|------------|-----------------------------------------|---------------------------------------------------|
| kind       | String                                  | API type. The value is fixed at <b>NodePool</b> . |
| apiVersion | String                                  | API version. The value is fixed at <b>v3</b> .    |
| metadata   | <a href="#">NodePoolMetadata object</a> | Metadata of the node pool.                        |
| spec       | <a href="#">NodePoolSpec object</a>     | Node pool specifications.                         |

| Parameter | Type                                        | Description       |
|-----------|---------------------------------------------|-------------------|
| status    | <a href="#">DeleteNodePoolStatus</a> object | Node pool status. |

**Table 4-651** NodePoolMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                                    |
|-------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | String              | Node pool name.<br><b>NOTE</b><br>Naming rules:<br>Enter 1 to 50 characters, starting with a lowercase letter and not ending with a hyphen (-). Only lowercase letters, digits, and hyphens (-) are allowed. <ul style="list-style-type: none"><li>• You cannot create node pools named DefaultPool.</li></ul> |
| uid               | String              | UID of the node pool. The value is automatically generated after the object is updated. A user-defined value will not take effect.                                                                                                                                                                             |
| annotations       | Map<String, String> | Annotations of a node pool in key-value pairs. This parameter is used only for query and cannot be input through a request. Entered data of this parameter is invalid.                                                                                                                                         |
| updateTimestamp   | String              | Update time.                                                                                                                                                                                                                                                                                                   |
| creationTimestamp | String              | Creation time.                                                                                                                                                                                                                                                                                                 |

**Table 4-652** NodePoolSpec

| Parameter    | Type                            | Description                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type         | String                          | Node pool type. If this parameter is left blank, the value <b>vm</b> is used by default. <ul style="list-style-type: none"><li>• <b>vm</b>: ECS</li><li>• <b>ElasticBMS</b>: C6 general computing-plus BMS. An example flavor is <b>c6.22xlarge.2.physical</b>.</li><li>• <b>bms</b>: BMS</li></ul> |
| nodeTemplate | <a href="#">NodeSpec</a> object | Detailed parameters of the node pool template.                                                                                                                                                                                                                                                      |

| Parameter            | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initialNodeCount     | Integer                                        | Initial number of nodes for the node pool. When queried, the value is the number of target nodes in the node pool.                                                                                                                                                                                                                                                                                                                                                                                  |
| autoscaling          | <a href="#">NodePoolNodeAutoscaling object</a> | Auto scaling parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| nodeManagement       | <a href="#">NodeManagement object</a>          | Node management configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| podSecurityGroups    | Array of <a href="#">SecurityID objects</a>    | Security group configuration. This parameter is available only for CCE Turbo clusters.                                                                                                                                                                                                                                                                                                                                                                                                              |
| customSecurityGroups | Array of strings                               | Custom security group settings for a node pool. New nodes scaled out in a node pool can be bound to a specified security group. <ul style="list-style-type: none"><li>• Specifying no security group ID will add the new nodes to the default security group of the worker nodes.</li><li>• Specifying a valid security group ID will put new nodes in that security group.</li><li>• When specifying a security group, do not modify the rules of the port on which CCE running depends.</li></ul> |

**Table 4-653 NodeSpec**

| Parameter | Type   | Description                                                                                                                    |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| flavor    | String | Node specifications. For details about the node specifications supported by CCE, see <a href="#">Node Flavor Description</a> . |
| az        | String | Name of the AZ where the node to be created is located. . .                                                                    |

| Parameter   | Type                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| os          | String                                  | <p>The OS type of the node. For details about the supported OSs, see [Node OS Description] (node-os.xml).</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The system automatically selects the supported OS based on the cluster version. If the current cluster does not support the OS, an error will be reported.</li><li>• If <code>alpha.cce/NodeImageID</code> in <code>extendParam</code> is specified during node creation, you do not need to configure this parameter.</li><li>• This parameter is mandatory when creating a node pool.</li></ul>                      |
| login       | <a href="#">Login</a> object            | Node login mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rootVolume  | <a href="#">Volume</a> object           | Information about disks on the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| dataVolumes | Array of <a href="#">Volume</a> objects | Data disk parameters of the node. Currently, you can add the second data disk for your node on the CCE console. This data disk is used by the container runtime and kubelet. Do not uninstall this disk. Otherwise, the node will become unavailable. For DeC nodes, the parameter description is the same as that for <code>rootVolume</code> .                                                                                                                                                                                                                                                |
| storage     | <a href="#">Storage</a> object          | <p>Disk initialization management parameter. This parameter is complex to configure. For details, see <a href="#">Attaching Disks to a Node</a>.</p> <p>If this parameter retains its default, disks are managed based on the <code>DockerLVMConfigOverride</code> (discarded) parameter in <code>extendParam</code>. This parameter is supported by clusters of version 1.15.11 and later.</p> <p><b>NOTE</b></p> <p>If a node specification involves local disks and EVS disks at the same time, do not retain the default value of this parameter to prevent unexpected disk partitions.</p> |
| publicIP    | <a href="#">NodePublicIP</a> object     | EIP of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| nodeNicSpec | <a href="#">NodeNicSpec</a> object      | NIC of the node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| taints      | Array of <a href="#">Taint</a> objects | You can add taints to created nodes to configure anti-affinity. A maximum of 20 taints can be added. Each taint contains the following parameters: <ul style="list-style-type: none"> <li><b>Key:</b> A key must contain 1 to 63 characters starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain name can be used as the prefix of a key.</li> <li><b>Value:</b> A value must start with a letter or digit and can contain a maximum of 63 characters, including letters, digits, hyphens (-), underscores (_), and periods (.).</li> <li><b>Effect:</b> Available options are <b>NoSchedule</b>, <b>PreferNoSchedule</b>, and <b>NoExecute</b>. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li> </ul> <b>Example:</b> <pre>"taints": [   {     "key": "status",     "value": "unavailable",     "effect": "NoSchedule"   },   {     "key": "looks",     "value": "bad",     "effect": "NoSchedule"   } ]</pre> |

| Parameter       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| k8sTags         | Map<String, String> | <p>Defined in key-value pairs. A maximum of 20 key-value pairs are allowed.</p> <ul style="list-style-type: none"><li><b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li><b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</li></ul> <p>Example:<br/>"k8sTags": {<br/>  "key": "value"<br/>}</p> |
| ecsGroupId      | String              | <p>ECS group ID. If this parameter is configured, nodes will be created in the specified ECS group.</p> <p><b>NOTE</b><br/>This configuration does not take effect when a node pool is created. To ensure that all nodes in a node pool are in the same ECS group, configure <b>nodeManagement</b> in the node pool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dedicatedHostId | String              | <p>ID of the DeH to which the node is scheduled.</p> <p><b>NOTE</b><br/>This parameter is not supported when you add a node during node pool creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userTags  | Array of <a href="#">UserTag</a> objects | <p>Cloud server tag. The key of a tag must be unique. The maximum number of custom tags supported by CCE depends on the region and cannot exceed 8. When creating a node, you can specify the initial value for this parameter and this field is not returned during query. In using node pools, the initial value can be specified in the node template and this field is returned during query. In other scenarios, this field is not returned during query.</p> <p><b>NOTE</b><br/>Use only letters, Unicode characters, digits, special characters(-,_). Max characters: 36</p> |
| runtime   | <a href="#">Runtime</a> object           | <p>Container runtime:</p> <ul style="list-style-type: none"><li>Clusters of v1.25 or earlier: <b>docker</b>.</li><li>Clusters of v1.25 or later: Container runtime varies with the OS. For nodes running EulerOS 2.5 or EulerOS 2.8, the default container runtime is <b>docker</b>. For nodes running other OSs, the default container runtime is <b>containerd</b>.</li></ul>                                                                                                                                                                                                     |

| Parameter             | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| initializedConditions | Array of strings | <p>Custom initialization flag, which is left blank by default.</p> <p>Before CCE nodes are initialized, <b>node.cloudprovider.kubernetes.io/uninitialized</b> is added to the nodes to prevent pods from being scheduled to these nodes. When creating a node, you can configure the <b>initializedConditions</b> parameter to control the taint removal time. By default, the timeout period is not configured.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Create a node and add parameter "initializedConditions": ["CCEInitial", "CustomedInitial"].</li><li>2. After custom initialization is complete, CCE will call a Kubernetes API (for example, <b>PATCH /v1/nodes/{node_ip}/status</b>) to update the node <b>conditions</b> by adding two labels of types <b>CCEInitial</b> and <b>CustomedInitial</b> and setting the status to <b>True</b>, as shown in the following:</li></ol> <pre>status:<br/>conditions:<br/>- type: CCEInitial<br/>  status: 'True'<br/>- type: CustomedInitial<br/>  status: 'True'</pre> <ol style="list-style-type: none"><li>1. CCE polls <b>status.Conditions</b> of nodes to check whether there are conditions of types <b>CCEInitial</b> and <b>CustomedInitial</b>. If such conditions exist and the status is <b>True</b>, the node initialization is complete and the initialization taint is removed.</li><li>2. <b>initializedConditions</b> allows you to configure a timeout period during node creation. For example, "initializedConditions": ["CCEInitial:15m", "CustomedInitial:15m"] indicates that the timeout period is 15 minutes. After the timeout period is reached, the initialization conditions will be automatically ignored and the initialization taint will be removed when CCE polls the node.<ul style="list-style-type: none"><li>• Use only letters and digits. Max. characters: 20.</li><li>• Max. flags: 2.</li><li>• The unit of the timeout period is minute (m).</li></ul></li></ol> |

| Parameter      | Type                                   | Description                                                                                                                                      |
|----------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| extendParam    | <a href="#">NodeExtendParam object</a> | Extended parameters for creating a node.                                                                                                         |
| hostnameConfig | <a href="#">HostnameConfig object</a>  | Kubernetes node name configuration parameter, which is supported by clusters of v1.23.6-r0 to v1.25 or clusters of v1.25.2-r0 or later versions. |

**Table 4-654 Login**

| Parameter | Type   | Description                          |
|-----------|--------|--------------------------------------|
| sshKey    | String | Name of the key pair used for login. |

**Table 4-655 UserPassword**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | String | Login account. Defaults to <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| password  | String | If a username and a password are used to create a node, this field is shielded in the response body. A password must meet the following complexity requirements: <ul style="list-style-type: none"><li>• Contains 8 to 26 characters.</li><li>• Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters (!@\$%^_=+[{}]:./?~#*)</li><li>• Cannot contain the username or the username spelled backwards. The <b>password</b> field must be salted during node creation. For details, see <a href="#">Adding a Salt in the password Field When Creating a Node</a>.</li></ul> |

**Table 4-656 Volume**

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| size      | Integer | Disk size, in GB. <ul style="list-style-type: none"><li>• System disk: 40 to 1024</li></ul> |

| Parameter      | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumetype     | String                                | Disk type. For details about possible values, see the description of the <b>root_volume</b> parameter in the API used to create an ECS. <ul style="list-style-type: none"><li>• <b>SAS</b>: high I/O SAS disk</li><li>• <b>SSD</b>: ultra-high I/O SSD disk</li><li>• <b>SATA</b>: common I/O SATA disk. SATA disks have been removed from EVS. You can find them attached only on existing nodes.</li></ul>                                                                 |
| extendParam    | Map<String, Object>                   | Extended disk parameters, defined in <b>extendparam</b> in the API used to create an ECS.                                                                                                                                                                                                                                                                                                                                                                                    |
| cluster_id     | String                                | ID of the storage pool used by the ECS system disk. This field is used only for DeC clusters, which functions as <b>dssPoolID</b> , that is, the ID of the DSS storage pool.                                                                                                                                                                                                                                                                                                 |
| cluster_type   | String                                | Storage class of the cloud server system disk. The value is always <b>dss</b> . This field is used only for DeC clusters.                                                                                                                                                                                                                                                                                                                                                    |
| hw:passthrough | Boolean                               | <ul style="list-style-type: none"><li>• Pay attention to this field if your ECS is SDI-compliant. If the value of this field is <b>true</b>, an SCSI disk will be created.</li><li>• If the node pool type is <b>ElasticBMS</b>, this field must be set to <b>true</b>.</li><li>• If a node specification involves local disks and EVS disks at the same time, set the disk initialization parameters. For details, see <a href="#">Attaching Disks to a Node</a>.</li></ul> |
| metadata       | <a href="#">VolumeMetadata</a> object | EVS disk encryption information. This field is mandatory only when you need to encrypt the system disk or data disks of the node to be created.                                                                                                                                                                                                                                                                                                                              |

**Table 4-657** VolumeMetadata

| Parameter         | Type   | Description                                                                                                                                                                                                                                             |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| _system_encrypted | String | Whether the EVS disk is encrypted. The value <b>0</b> indicates that the EVS disk is not encrypted, and the value <b>1</b> indicates that the EVS disk is encrypted.<br>If this parameter is not specified, EVS disks will not be encrypted by default. |

| Parameter                   | Type   | Description                                                                                                |
|-----------------------------|--------|------------------------------------------------------------------------------------------------------------|
| <code>_system_cm_kid</code> | String | CMK ID, which indicates encryption in <b>metadata</b> . This field is used with <b>_system_encrypted</b> . |

**Table 4-658 Storage**

| Parameter                     | Type                                              | Description                                                                                        |
|-------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>storageSelectors</code> | Array of <a href="#">StorageSelectors</a> objects | Disk selection. Matched disks are managed according to <b>matchLabels</b> and <b>storageType</b> . |
| <code>storageGroups</code>    | Array of <a href="#">StorageGroups</a> objects    | A storage group consists of multiple storage devices. It is used to divide storage space.          |

**Table 4-659 StorageSelectors**

| Parameter                | Type                               | Description                                                                                                                                                                                                                                                               |
|--------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>        | String                             | Selector name, used as the index of <b>selectorNames</b> in <b>storageGroup</b> . Therefore, the name of each selector must be unique.                                                                                                                                    |
| <code>storageType</code> | String                             | Specifies the storage type. Currently, only <b>evs</b> (EVS volumes) and <b>local</b> (local volumes) are supported. The local storage does not support disk selection. All local disks will form a VG. Therefore, only one storageSelector of the local type is allowed. |
| <code>matchLabels</code> | <a href="#">matchLabels</a> object | Matching field of an EVS volume. The <b>size</b> , <b>volumeType</b> , <b>metadataEncrypted</b> , <b>metadataCmkid</b> and <b>count</b> fields are supported.                                                                                                             |

**Table 4-660 matchLabels**

| Parameter               | Type   | Description                                                                                             |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------|
| <code>size</code>       | String | Matched disk size. If this parameter is left unspecified, the disk size is not limited.<br>Example: 100 |
| <code>volumeType</code> | String | EVS disk type. <b>SSD</b> , <b>GPSSD</b> , <b>SAS</b> , <b>ESSD</b> , and <b>SATA</b> are supported.    |

| Parameter         | Type   | Description                                                                                                                       |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| metadataEncrypted | String | Disk encryption identifier. <b>0</b> indicates that the disk is not encrypted, and <b>1</b> indicates that the disk is encrypted. |
| metadataCmkId     | String | Customer master key ID of an encrypted disk. The value is a 36-byte string.                                                       |
| count             | String | Number of disks to be selected. If this parameter is left blank, all disks of this type are selected.                             |

**Table 4-661 StorageGroups**

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtual storage group, which must be unique.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If <b>cceManaged</b> is set to <b>true</b>, the name must be set to <b>vgpass</b>.</li><li>• If the data disk is used as a temporary storage volume, the name must be <b>vg-everest-localvolume-ephemeral</b>.</li><li>• If the data disk is used as a persistent storage volume, the name must be <b>vg-everest-localvolume-persistent</b>.</li></ul> |
| cceManaged    | Boolean                              | Storage space for Kubernetes and runtime components. Only one group can be set to <b>true</b> . If this parameter is left blank, the default value <b>false</b> is used.                                                                                                                                                                                                                                                                                             |
| selectorNames | Array of strings                     | This parameter corresponds to <b>name</b> in <b>storageSelectors</b> . A group can match multiple selectors, but a selector can match only one group.                                                                                                                                                                                                                                                                                                                |
| virtualSpaces | Array of <b>VirtualSpace</b> objects | Detailed management of space configuration in a group.                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-662** VirtualSpace

| Parameter     | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | String                               | Name of a virtualSpace. <ul style="list-style-type: none"><li>• <b>Kubernetes</b>: Kubernetes space configuration. <b>lvmConfig</b> needs to be configured.</li><li>• <b>runtime</b>: runtime space configuration. <b>runtimeConfig</b> needs to be configured.</li><li>• <b>user</b>: user space configuration. <b>lvmConfig</b> needs to be configured.</li></ul> |
| size          | String                               | Size of a virtualSpace. The value must be an integer in percentage. Example: 90%.<br><b>NOTE</b><br>The sum of the percentages of all virtualSpaces in a group cannot exceed 100%.                                                                                                                                                                                  |
| lvmConfig     | <a href="#">LVMConfig</a> object     | LVM configurations, applicable to <b>kubernetes</b> and <b>user</b> spaces. Note that one virtual space supports only one config.                                                                                                                                                                                                                                   |
| runtimeConfig | <a href="#">RuntimeConfig</a> object | runtime configurations, applicable to the <b>runtime</b> space. Note that one virtual space supports only one config.                                                                                                                                                                                                                                               |

**Table 4-663** LVMConfig

| Parameter | Type   | Description                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance.                      |
| path      | String | Path to which the disk is attached. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. |

**Table 4-664** RuntimeConfig

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lvType    | String | LVM write mode. <b>linear</b> indicates the linear mode. <b>striped</b> indicates the striped mode, in which multiple disks are used to form a strip to improve disk performance. |

**Table 4-665** NodePublicIP

| Parameter | Type                               | Description                                                                                                                                                                                     |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ids       | Array of strings                   | IDs of existing EIPs. The quantity cannot be greater than the number of nodes to be created.<br><b>NOTE</b><br>If <b>ids</b> has been set, you do not need to set <b>count</b> and <b>eip</b> . |
| count     | Integer                            | Number of EIPs to be dynamically created.<br><b>NOTE</b><br><b>count</b> and <b>eip</b> must be set at the same time.                                                                           |
| eip       | <a href="#">NodeEIPSpec</a> object | EIP configuration.                                                                                                                                                                              |

**Table 4-666** NodeEIPSpec

| Parameter | Type                                 | Description                                                                  |
|-----------|--------------------------------------|------------------------------------------------------------------------------|
| iptype    | String                               | EIP type, specified in <b>publicip.type</b> in the API for assigning an EIP. |
| bandwidth | <a href="#">NodeBandwidth</a> object | Bandwidth parameters of the EIP                                              |

**Table 4-667** NodeBandwidth

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chargemode | String | Bandwidth billing mode. <ul style="list-style-type: none"><li>• If this field is not specified, the billing is based on bandwidth. - If the field is null, the billing is based on bandwidth.</li><li>• If the field value is <b>traffic</b>, the billing is based on traffic.</li><li>• If the value is out of the preceding options, the cloud server will fail to be created.</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• Billed by bandwidth: The billing will be based on the data transmission rate (in Mbps) of public networks. This billing mode is recommended if your bandwidth usage is higher than 10%.</li><li>• Billed by traffic: The billing is based on the total amount of data (in GB) transmitted over the public network. This mode is available only when you are creating a pay-per-use node. This billing mode is recommended if your bandwidth usage is lower than 10%.</li></ul> |

| Parameter | Type    | Description                                                                         |
|-----------|---------|-------------------------------------------------------------------------------------|
| size      | Integer | Bandwidth size, specified in <b>bandwidth.size</b> in the API for assigning an EIP. |
| sharetype | String  | Bandwidth sharing type. Value options: <b>PER</b> (exclusive bandwidth)             |

**Table 4-668** NodeNicSpec

| Parameter  | Type                            | Description                                                                                         |
|------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| primaryNic | <b>NicSpec</b> object           | Description of the primary NIC.                                                                     |
| extNics    | Array of <b>NicSpec</b> objects | Extension NIC<br><b>NOTE</b><br>This parameter is not supported when you add a node to a node pool. |

**Table 4-669** NicSpec

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnetId  | String           | Network ID of the subnet to which a NIC belongs. If <b>subnetId</b> is not specified when a primary NIC is creating, the cluster subnet will be used. If <b>subnetList</b> is also configured for a node pool, the <b>subnetList</b> field is used for adding subnets to the node pool. When creating an extension NIC, you must specify <b>subnetId</b> . |
| fixedIps  | Array of strings | The IP address of the primary ENI is specified using <b>fixedIps</b> . The number of IP addresses cannot be greater than the number of created nodes. Either <b>fixedIps</b> or <b>ipBlock</b> can be specified. <b>fixedIps</b> cannot be specified for extension ENIs.                                                                                   |
| ipBlock   | String           | CIDR format of the primary NIC IP range. The IP address of the created node falls in this range. <b>fixedIps</b> and <b>ipBlock</b> cannot be specified at the same time.                                                                                                                                                                                  |

**Table 4-670** Taint

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Value.      |
| effect    | String | Effect.     |

**Table 4-671** UserTag

| Parameter | Type   | Description                                                                                       |
|-----------|--------|---------------------------------------------------------------------------------------------------|
| key       | String | Key of the cloud server label. The value cannot start with CCE- or <code>_type_baremetal</code> . |
| value     | String | Value of the cloud server label.                                                                  |

**Table 4-672** Runtime

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Container runtime. Default value: <ul style="list-style-type: none"><li>Clusters earlier than v1.25: The default value is <code>docker</code>.</li><li>Clusters of v1.25 or later: The default container runtime varies depending on the OS. For nodes running EulerOS 2.5, the default container runtime is <code>docker</code>; for nodes running other OSs, the default container runtime is <code>containerd</code>.</li></ul> |

**Table 4-673** NodeExtendParam

| Parameter           | Type   | Description                                               |
|---------------------|--------|-----------------------------------------------------------|
| ecs:performancetype | String | ECS flavor types. This field is returned in the response. |

| Parameter               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxPods                 | Integer | <p>Maximum number of pods that can be created on a node, including the default system pods. Value range: 16 to 256.</p> <p>This limit prevents the node from being overloaded of pods.</p> <p>The number of pods that can be created on a node is determined by multiple parameters. For details, see <a href="#">Maximum Number of Pods That Can Be Created on a Node</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DockerLVMConfigOverride | String  | <p>Docker data disk configuration item. (This parameter has been discarded. Use the <b>storage</b> field instead.) Example default configuration:</p> <pre>"DockerLVMConfigOverride":"dockerThinpool=vgpaas/ 90%VG;kubernetesLV=vgpaas/ 10%VG;diskType=evs;lvType=linear"</pre> <p>By default, if no VD disk is available, an error occurs because the data disk fails to be found. Set <b>diskType</b> based on the actual drive letter type. The following fields are included:</p> <ul style="list-style-type: none"> <li>• <b>userLV</b> (optional): size of the user space, for example, <b>vgpaas/20%VG</b>.</li> <li>• <b>userPath</b> (optional): mount path of the user space, for example, <b>/home/wqt-test</b>.</li> <li>• <b>diskType</b>: disk type. Currently, only <b>evs</b>, <b>hdd</b>, and <b>ssd</b> are supported.</li> <li>• <b>lvType</b>: type of a logic volume. The value can be <b>linear</b> or <b>striped</b>.</li> <li>• <b>dockerThinpool</b>: Docker space size, for example, <b>vgpaas/60%VG</b>.</li> <li>• <b>kubernetesLV</b>: kubelet space size, for example, <b>vgpaas/20%VG</b>.</li> </ul> |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dockerBaseSize        | Integer | <p>Available disk space of a single container on a node, in GB.</p> <p>If this parameter is left blank or is set to <b>0</b>, the default value is used. In Device Mapper mode, the default value is <b>10</b>. In OverlayFS mode, the available space of a single container is not limited by default, and the <b>dockerBaseSize</b> setting takes effect only on EulerOS nodes in the cluster of the new version.</p> <p>For details about how to allocate the space for the container runtime, see <a href="#">Data Disk Space Allocation</a>.</p> <p>When Device Mapper is used, you are advised to set <b>dockerBaseSize</b> to a value less than or equal to 80 GB. If the value is too large, the container runtime may fail to be started due to long initialization. If there are special requirements for the container disk space, you can mount an external or local storage device.</p> |
| publicKey             | String  | Public key of a node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| alpha.cce/postInstall | String  | <p>Post-installation script.</p> <p><b>NOTE</b><br/>The input value must be Base64-encoded.<br/>(Command: echo -n "Content to be encoded"   base64)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha.cce/NodeImageID | String  | This parameter is required when a custom image is used to create a BMS node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| chargingMode          | Integer | Billing mode of a node. This parameter has been deprecated. Use the <b>billingMode</b> parameter in <b>NodeSpec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| agency_name           | String  | <p>Name of an agency</p> <p>An agency is created by a tenant administrator on Identity and Access Management (IAM) to provide temporary credentials for CCE nodes to access cloud servers. This parameter is returned only when it is transferred during node creation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| kubeReservedMem       | Integer | Reserved node memory, which is reserved for Kubernetes components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter          | Type    | Description                                                                                        |
|--------------------|---------|----------------------------------------------------------------------------------------------------|
| systemReservedMem  | Integer | Reserved node memory, which is reserved for system components.                                     |
| init-node-password | String  | Node password. If this parameter is used as a response parameter, asterisks (*) will be displayed. |

**Table 4-674 HostnameConfig**

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Configuration type of the Kubernetes node name. The default value is <b>privatelp</b>.</p> <ul style="list-style-type: none"><li>• <b>privatelp</b>: The Kubernetes node is named after its IP address.</li><li>• <b>cceNodeName</b>: The Kubernetes node is named after the CCE node.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• For a node which is configured using <b>cceNodeName</b>, the name is the same as the Kubernetes node name and the ECS name. The node name cannot be changed. If the ECS name is changed on the ECS console, the node name will retain unchanged after ECS synchronization.</li><li>• For a node which is configured using <b>cceNodeName</b>, to avoid a conflict between Kubernetes nodes, the system automatically adds a suffix to each node name. The suffix is in the format of <b>A hyphen (-) Five random characters</b>. The value of the random characters is a lowercase letter or a digit ranging from 0 to 9.</li></ul> |

**Table 4-675 NodePoolNodeAutoscaling**

| Parameter    | Type    | Description                                                                                                                                                                                                           |
|--------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable       | Boolean | Whether to enable auto scaling.                                                                                                                                                                                       |
| minNodeCount | Integer | Minimum number of nodes allowed if auto scaling is enabled. The value cannot be greater than the maximum number of nodes allowed by the cluster specifications.                                                       |
| maxNodeCount | Integer | Maximum number of nodes allowed if auto scaling is enabled. This value must be greater than or equal to the value of <b>minNodeCount</b> and cannot exceed the maximum number of nodes in the cluster specifications. |

| Parameter             | Type    | Description                                                                                                                |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| scaleDownCooldownTime | Integer | Interval between two scaling operations, in minutes. During this period, nodes added after a scale-up will not be deleted. |
| priority              | Integer | Weight of a node pool. A node pool with a higher weight has a higher priority during scaling.                              |

**Table 4-676 NodeManagement**

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serverGroupReference | String | Cloud server group ID. If this field is specified, all nodes in the node pool will be created in this group. The group ID can be specified only when you create the node pool and cannot be modified. When you specify a cloud server group, the number of nodes in the node pool cannot exceed the group quota. |

**Table 4-677 SecurityID**

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Security group ID |

**Table 4-678 DeleteNodePoolStatus**

| Parameter    | Type    | Description                                                                                  |
|--------------|---------|----------------------------------------------------------------------------------------------|
| currentNode  | Integer | Total number of nodes in the current node pool (excluding the nodes that are being deleted). |
| creatingNode | Integer | Number of nodes that are being created in the node pool.                                     |
| deletingNode | Integer | Number of nodes that are being deleted in the current node pool.                             |

| Parameter  | Type                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                                                | <p>Node pool status. Options:</p> <ul style="list-style-type: none"> <li>Null: The node pool is available. (The number of nodes in the current node pool has reached the expected value, and no node scaling is being performed.)</li> <li><b>Synchronizing</b>: The node pool is being scaled. (The number of nodes in the current node pool has not reached the expected value, and no node scaling is being performed.)</li> <li><b>Synchronized</b>: The node pool scaling is pending. (The number of nodes in the current node pool has not reached the expected value, or node scaling is being performed.)</li> <li><b>SoldOut</b>: The node pool cannot be scaled out. (This field is used in multiple scenarios, for example, resources in the node pool have been sold out or the resource quota is insufficient.)</li> </ul> <p><b>NOTE</b><br/>This node pool status has been deprecated. It is reserved only for compatibility. Do not use it anymore. Use the following instead:</p> <ul style="list-style-type: none"> <li>Node pool scaling status: You can obtain the status of the current node pool using parameters such as <b>currentNode</b>, <b>creatingNode</b>, or <b>deletingNode</b>.</li> <li>Node pool scale-out: You can use <b>conditions</b> to obtain the detailed status of a node pool. <b>Scalable</b> can replace <b>SoldOut</b>.</li> <li><b>Deleting</b>: The node pool is being deleted.</li> <li><b>Error</b>: An error occurred in the node pool.</li> </ul> |
| jobId      | String                                                | ID of a job executed on the node pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| conditions | Array of<br><a href="#">NodePoolCondition</a> objects | Node pool status details. For details, see the definition of <b>Condition</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 4-679** NodePoolCondition

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type            | String | Condition type. The options are as follows: <ul style="list-style-type: none"><li>• <b>Scalable</b>: whether a node pool can be scaled. If the status is <b>False</b>, node pool scaling will not be triggered again.</li><li>• <b>QuotaInsufficient</b>: Quotas on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>ResourceInsufficient</b>: Resources on which node pool scaling depends are insufficient, affecting the node pool scaling status.</li><li>• <b>UnexpectedError</b>: The node pool fails to be scaled out due to unexpected reasons, affecting the node pool scaling status.</li><li>• <b>Error</b>: A node pool error occurs. A common trigger is deletion failure.</li></ul> |
| status          | String | Current status of <b>Condition</b> . The options are as follows: <ul style="list-style-type: none"><li>• "True"</li><li>• "False"</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| lastProbeTime   | String | Time when the status was last checked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Error Codes

See [Error Codes](#).

## 4.5 Storage Management

## 4.5.1 Creating a PVC (to be discarded)

### Function

This API is used to create a PersistentVolumeClaim (PVC) in a specified namespace. A PVC is a request for PersistentVolume (PV). The PV carries details of real cloud storage such as EVS disks, SFS file systems, and OBS buckets. This API is to be deprecated. Use the corresponding Kubernetes PVC API instead.

#### NOTE

The URL for storage management is in the format of `https://{clusterid}.Endpoint/uri`. In the URL, `{clusterid}` indicates the cluster ID, and `uri` indicates the resource path, that is, the path for API access. If `https://Endpoint/uri` is used, the `X-Cluster-ID` parameter in the request header must be specified.

### URI

POST /api/v1/namespaces/{namespace}/cloudpersistentvolumeclaims

**Table 4-680** Path Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace | Yes       | String | <p>Namespace where the PVC is located.</p> <p>Constraints:</p> <ul style="list-style-type: none"><li>Custom namespace. You must create a namespace in the cluster before using it.</li><li>The namespace provided by the system is namespace <b>default</b>.</li><li>Namespaces <b>kube-system</b> and <b>kube-public</b> cannot be used.</li></ul> |

### Request Parameters

**Table 4-681** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |
| X-Cluster-ID | No        | String | Cluster ID. This field is mandatory when the URL format <code>https://Endpoint/uri</code> is used. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .                                   |

**Table 4-682** Request body parameters

| Parameter  | Mandatory | Type                                        | Description                                                                                                      |
|------------|-----------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| apiVersion | Yes       | String                                      | API version. The value is fixed at <b>v1</b> .                                                                   |
| kind       | Yes       | String                                      | API type. The value is fixed at <b>PersistentVolumeClaim</b> .                                                   |
| metadata   | Yes       | <b>PersistentVolumeClaimMetadata</b> object | Cluster object metadata, which is a collection of attributes.                                                    |
| spec       | Yes       | <b>PersistentVolumeClaimSpec</b> object     | Detailed description of the cluster object. CCE creates or updates objects by defining or updating <b>spec</b> . |
| status     | No        | <b>PersistentVolumeClaimStatus</b> object   | PVC status. The request to create a PVC does not need to carry this parameter.                                   |

**Table 4-683 PersistentVolumeClaimMetadata**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | PVC name. Enter 1 to 253 characters starting and ending with a letter or digit. Only lowercase letters, digits, hyphens (-), and periods (.) are allowed. PVC names must be unique in a namespace.                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | No        | String | PVC labels, in the format of key-value pairs. <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li>• <b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string.</li></ul> |

**Table 4-684 PersistentVolumeClaimSpec**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumelD  | Yes       | String | ID of an existing storage volume. <ul style="list-style-type: none"><li>• If an SFS, EVS, or SFS Turbo volume is used, set this parameter to the ID of the volume.</li><li>• If an OBS bucket is used, set this parameter to the OBS bucket name.</li></ul> |

| Parameter        | Mandatory | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 4-685 ResourceRequirements**

| Parameter | Mandatory | Type                | Description                                                 |
|-----------|-----------|---------------------|-------------------------------------------------------------|
| limits    | No        | Map<String, String> | Resource limits. This parameter is invalid during creation. |

| Parameter | Mandatory | Type                | Description                                                   |
|-----------|-----------|---------------------|---------------------------------------------------------------|
| requests  | No        | Map<String, String> | Resource requests. This parameter is invalid during creation. |

**Table 4-686 PersistentVolumeClaimStatus**

| Parameter   | Mandatory | Type             | Description                              |
|-------------|-----------|------------------|------------------------------------------|
| accessModes | No        | Array of strings | Access mode of the PV.                   |
| capacity    | No        | String           | Actual resources and capacity of the PV. |
| phase       | No        | String           | Current status of the PVC.               |

## Response Parameters

Status code: 201

**Table 4-687 Response body parameters**

| Parameter  | Type                                                 | Description                                                                                                      |
|------------|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| apiVersion | String                                               | API version. The value is fixed at <b>v1</b> .                                                                   |
| kind       | String                                               | API type. The value is fixed at <b>PersistentVolumeClaim</b> .                                                   |
| metadata   | <a href="#">PersistentVolumeClaimMetadata</a> object | Cluster object metadata, which is a collection of attributes.                                                    |
| spec       | <a href="#">PersistentVolumeClaimSpec</a> object     | Detailed description of the cluster object. CCE creates or updates objects by defining or updating <b>spec</b> . |
| status     | <a href="#">PersistentVolumeClaimStatus</a> object   | PVC status. The request to create a PVC does not need to carry this parameter.                                   |

**Table 4-688** PersistentVolumeClaimMetadata

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | PVC name. Enter 1 to 253 characters starting and ending with a letter or digit. Only lowercase letters, digits, hyphens (-), and periods (.) are allowed. PVC names must be unique in a namespace.                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | String | PVC labels, in the format of key-value pairs. <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li>• <b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string.</li></ul> |

**Table 4-689** PersistentVolumeClaimSpec

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                           |
|-------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumelD    | String | ID of an existing storage volume. <ul style="list-style-type: none"><li>• If an SFS, EVS, or SFS Turbo volume is used, set this parameter to the ID of the volume.</li><li>• If an OBS bucket is used, set this parameter to the OBS bucket name.</li></ul>                                                           |
| storageType | String | Cloud storage class. This parameter is used together with <b>volumelD</b> . That is, <b>volumelD</b> and <b>storageType</b> must be configured at the same time. <ul style="list-style-type: none"><li>• <b>bs:</b> EVS</li><li>• <b>nfs:</b> SFS</li><li>• <b>obs:</b> OBS</li><li>• <b>efs:</b> SFS Turbo</li></ul> |

| storageClassName | String                      | Storage class name of the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| volumeName       | String                      | Name of the PV bound to the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| resources        | ResourceRequirements object | Resource requests and limits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| volumeMode       | String                      | PV type specified by the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-690** ResourceRequirements

| Parameter | Type                | Description                                                   |
|-----------|---------------------|---------------------------------------------------------------|
| limits    | Map<String, String> | Resource limits. This parameter is invalid during creation.   |
| requests  | Map<String, String> | Resource requests. This parameter is invalid during creation. |

**Table 4-691** PersistentVolumeClaimStatus

| Parameter   | Type             | Description                              |
|-------------|------------------|------------------------------------------|
| accessModes | Array of strings | Access mode of the PV.                   |
| capacity    | String           | Actual resources and capacity of the PV. |
| phase       | String           | Current status of the PVC.               |

## Example Requests

Specifying an EVS volume ID and creating a PVC

```
POST /api/v1/namespaces/default/cloudpersistentvolumeclaims

{
  "apiVersion" : "v1",
  "kind" : "PersistentVolumeClaim",
  "metadata" : {
    "name" : "csmss-dev-create",
    "namespace" : "default"
  },
  "spec" : {
    "volumeID" : "86b29e16-23db-11e7-9c83-fa163ec08232",
    "storageType" : "bs",
    "accessModes" : [ "ReadWriteMany" ]
  }
}
```

## Example Responses

### Status code: 201

The job for creating a PVC is successfully delivered.

```
{
  "kind" : "PersistentVolumeClaim",
  "apiVersion" : "v1",
  "metadata" : {
    "name" : "csmss-dev-create",
    "namespace" : "default",
    "selfLink" : "/api/v1/namespaces/default/persistentvolumeclaims/db-mysql-0",
    "uid" : "86b29e16-23db-11e7-9c83-fa163ec08232",
    "resourceVersion" : "1793115",
    "creationTimestamp" : "2017-04-18T02:05:42Z"
  },
  "spec" : {
    "volumeName" : "csmss-dev-create",
    "accessModes" : [ "ReadWriteMany" ],
    "resources" : {
      "requests" : {
        "storage" : "1Gi"
      }
    },
    "status" : {
      "phase" : "Pending",
      "accessModes" : [ "ReadWriteMany" ]
    }
}
```

## Status Codes

| Status Code | Description                                           |
|-------------|-------------------------------------------------------|
| 201         | The job for creating a PVC is successfully delivered. |

## Error Codes

See [Error Codes](#).

## 4.5.2 Deleting a PVC (to be discarded)

### Function

This API is used to delete a PVC from a specified namespace. Using this API, you can determine whether to retain the cloud storage volume associated with the PVC. This API has been deprecated. Use the corresponding Kubernetes PV API instead.

#### NOTE

The URL for storage management is in the format of `https://{clusterid}.Endpoint/uri`. In the URL, `{clusterid}` indicates the cluster ID, and `uri` indicates the resource path, that is, the path for API access. If `https://Endpoint/uri` is used, the `X-Cluster-ID` parameter in the request header must be specified.

### URI

`DELETE /api/v1/namespaces/{namespace}/cloudpersistentvolumeclaims/{name}`

**Table 4-692** Path Parameters

| Parameter | Mandatory | Type   | Description                         |
|-----------|-----------|--------|-------------------------------------|
| name      | Yes       | String | Name of the PVC to be deleted.      |
| namespace | Yes       | String | Namespace where the PVC is located. |

**Table 4-693** Query Parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                    |
|--------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deleteVolume | No        | String | Whether to delete associated backend cloud storage volume after the PVC is deleted. The value can be <b>true</b> (delete) or <b>false</b> (not delete). The value defaults to <b>false</b> .                                                                                                                                                   |
| storageType  | No        | String | Cloud storage type. This parameter is used together with <code>deleteVolume</code> . That is, <code>deleteVolume</code> and <code>storageType</code> must be configured at the same time. <ul style="list-style-type: none"><li>• <b>bs:</b> EVS</li><li>• <b>nfs:</b> SFS</li><li>• <b>obs:</b> OBS</li><li>• <b>efs:</b> SFS Turbo</li></ul> |

## Request Parameters

**Table 4-694** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |
| X-Cluster-ID | No        | String | Cluster ID. This field is mandatory when the URL format <b>https://Endpoint/uri</b> is used. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .                                         |

## Response Parameters

Status code: 200

**Table 4-695** Response body parameters

| Parameter  | Type                                        | Description                                                                                                      |
|------------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| apiVersion | String                                      | API version. The value is fixed at <b>v1</b> .                                                                   |
| kind       | String                                      | API type. The value is fixed at <b>PersistentVolumeClaim</b> .                                                   |
| metadata   | <b>PersistentVolumeClaimMetadata</b> object | Cluster object metadata, which is a collection of attributes.                                                    |
| spec       | <b>PersistentVolumeClaimSpec</b> object     | Detailed description of the cluster object. CCE creates or updates objects by defining or updating <b>spec</b> . |
| status     | <b>PersistentVolumeClaimStatus</b> object   | PVC status. The request to create a PVC does not need to carry this parameter.                                   |

**Table 4-696** PersistentVolumeClaimMetadata

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | PVC name. Enter 1 to 253 characters starting and ending with a letter or digit. Only lowercase letters, digits, hyphens (-), and periods (.) are allowed. PVC names must be unique in a namespace.                                                                                                                                                                                                                                                                                                                                                                                                                |
| labels    | String | PVC labels, in the format of key-value pairs. <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. A DNS subdomain can be prefixed to a key and contain a maximum of 253 characters. Example DNS subdomain: example.com/my-key</li><li>• <b>Value:</b> The value can be left blank or contain 1 to 63 characters that start with a letter or digit. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed in the character string.</li></ul> |

**Table 4-697** PersistentVolumeClaimSpec

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                           |
|-------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volumelD    | String | ID of an existing storage volume. <ul style="list-style-type: none"><li>• If an SFS, EVS, or SFS Turbo volume is used, set this parameter to the ID of the volume.</li><li>• If an OBS bucket is used, set this parameter to the OBS bucket name.</li></ul>                                                           |
| storageType | String | Cloud storage class. This parameter is used together with <b>volumelD</b> . That is, <b>volumelD</b> and <b>storageType</b> must be configured at the same time. <ul style="list-style-type: none"><li>• <b>bs:</b> EVS</li><li>• <b>nfs:</b> SFS</li><li>• <b>obs:</b> OBS</li><li>• <b>efs:</b> SFS Turbo</li></ul> |

| Parameter        | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accessModes      | Array of strings            | <p>Access mode of the volume. Only the first value in all selected options is valid.</p> <ul style="list-style-type: none"><li>• <b>ReadWriteOnce</b>: The volume can be mounted as read-write by a single node.</li></ul> <p><b>NOTE</b><br/>This function is supported only when the cluster version is v1.13.10 and the storage-driver version is 1.0.19.</p> <ul style="list-style-type: none"><li>• <b>ReadOnlyMany</b> (default): The volume can be mounted as read-only by many nodes.</li><li>• <b>ReadWriteMany</b>: The volume can be mounted as read-write by many nodes.</li></ul> |
| storageClassName | String                      | Storage class name of the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| volumeName       | String                      | Name of the PV bound to the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| resources        | ResourceRequirements object | Resource requests and limits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| volumeMode       | String                      | PV type specified by the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-698** ResourceRequirements

| Parameter | Type                | Description                                                   |
|-----------|---------------------|---------------------------------------------------------------|
| limits    | Map<String, String> | Resource limits. This parameter is invalid during creation.   |
| requests  | Map<String, String> | Resource requests. This parameter is invalid during creation. |

**Table 4-699** PersistentVolumeClaimStatus

| Parameter   | Type             | Description                              |
|-------------|------------------|------------------------------------------|
| accessModes | Array of strings | Access mode of the PV.                   |
| capacity    | String           | Actual resources and capacity of the PV. |
| phase       | String           | Current status of the PVC.               |

## Example Requests

None

## Example Responses

None

## Status Codes

| Status Code | Description                                           |
|-------------|-------------------------------------------------------|
| 200         | The job for deleting a PVC is successfully delivered. |

## Error Codes

See [Error Codes](#).

## 4.6 Add-on Management

### 4.6.1 Installing an Add-on Instance

#### Function

This API is used to install an add-on instance by using an add-on template.

#### URI

POST /api/v3/addons

#### Request Parameters

**Table 4-700** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-701** Request body parameters

| Parameter  | Mandatory | Type                                       | Description                                                                                            |
|------------|-----------|--------------------------------------------|--------------------------------------------------------------------------------------------------------|
| kind       | Yes       | String                                     | API type. The value is fixed at <b>Addon</b> and cannot be changed. Any user-defined value is invalid. |
| apiVersion | Yes       | String                                     | API version. The value is fixed at <b>v3</b> and cannot be changed. Any user-defined value is invalid. |
| metadata   | Yes       | <a href="#">AddonMetadata object</a>       | Basic information about the object. Metadata is a collection of attributes.                            |
| spec       | Yes       | <a href="#">InstanceRequestSpec object</a> | Detailed description of add-on installation or upgrade.                                                |

**Table 4-702** AddonMetadata

| Parameter         | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                             |
|-------------------|-----------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | No        | String              | Unique ID                                                                                                                                                                                                                                                                                               |
| name              | No        | String              | Add-on name                                                                                                                                                                                                                                                                                             |
| alias             | No        | String              | Add-on alias                                                                                                                                                                                                                                                                                            |
| labels            | No        | Map<String, String> | Add-on labels in key-value pairs. This is a reserved field and does not take effect.                                                                                                                                                                                                                    |
| annotations       | No        | Map<String, String> | Add-on annotations in the format of key-value pairs. <ul style="list-style-type: none"><li>● For add-on installation, the value is fixed at <code>{"addon.install/type":"install"}</code>.</li><li>● For add-on upgrade, the value is fixed at <code>{"addon.upgrade/type":"upgrade"}</code>.</li></ul> |
| updateTimestamp   | No        | String              | Updated at                                                                                                                                                                                                                                                                                              |

| version            | No        | String              | <p>Version of the add-on to install or upgrade, for example, <b>1.0.0</b>.</p> <ul style="list-style-type: none"><li>• Installation: This parameter is optional. If not specified, the latest version supported by the cluster is used.</li><li>• Upgrade: This parameter is mandatory. The version number must be specified.</li></ul>                       |
| clusterID          | Yes       | String              | Cluster ID.                                                                                                                                                                                                                                                                                                                                                   |
| values             | Yes       | Map<String, Object> | Add-on template installation parameters (varying depending on the add-on). During the add-on upgrade, you need to specify all the installation parameters. If the parameters are not specified, the default values in the add-on template are used. The current add-on installation parameters can be obtained through the API for querying add-on instances. |
| addonTemplate Name | Yes       | String              | Name of the add-on template to be installed, for example, <b>coredns</b> .                                                                                                                                                                                                                                                                                    |

## Response Parameters

Status code: 201

**Table 4-704** Response body parameters

| Parameter  | Type                                 | Description                                                                 |
|------------|--------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                               | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                               | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata object</a> | Basic information about the object. Metadata is a collection of attributes. |

| Parameter | Type                                       | Description                                  |
|-----------|--------------------------------------------|----------------------------------------------|
| spec      | <a href="#">InstanceSpec</a> object        | Detailed description of the add-on instance. |
| status    | <a href="#">AddonInstanceStatus</a> object | Add-on instance status.                      |

**Table 4-705 AddonMetadata**

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | String              | Unique ID                                                                                                                                                                                                                                                                                                 |
| name              | String              | Add-on name                                                                                                                                                                                                                                                                                               |
| alias             | String              | Add-on alias                                                                                                                                                                                                                                                                                              |
| labels            | Map<String, String> | Add-on labels in key-value pairs. This is a reserved field and does not take effect.                                                                                                                                                                                                                      |
| annotations       | Map<String, String> | Add-on annotations in the format of key-value pairs. <ul style="list-style-type: none"><li>• For add-on installation, the value is fixed at <code>{"addon.install/type": "install"}</code>.</li><li>• For add-on upgrade, the value is fixed at <code>{"addon.upgrade/type": "upgrade"}</code>.</li></ul> |
| updateTimestamp   | String              | Updated at                                                                                                                                                                                                                                                                                                |
| creationTimestamp | String              | Created at                                                                                                                                                                                                                                                                                                |

**Table 4-706 InstanceSpec**

| Parameter          | Type   | Description                                          |
|--------------------|--------|------------------------------------------------------|
| clusterID          | String | Cluster ID.                                          |
| version            | String | Add-on template version, for example, <b>1.0.0</b> . |
| addonTemplate Name | String | Add-on template name, for example, <b>coredns</b> .  |
| addonTemplate Type | String | Add-on template type.                                |
| addonTemplate Logo | String | URL for obtaining the add-on template logo.          |

| Parameter           | Type                | Description                                                                                                |
|---------------------|---------------------|------------------------------------------------------------------------------------------------------------|
| addonTemplateLabels | Array of strings    | Labels of the add-on template.                                                                             |
| description         | String              | Add-on template description.                                                                               |
| values              | Map<String, Object> | Add-on template installation parameters (varying depending on the add-on). Set the parameters accordingly. |

**Table 4-707** AddonInstanceStatus

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | String | <p>Statuses of add-on instances. Options:</p> <ul style="list-style-type: none"><li>• <b>running</b>: All of the add-on instances are running and the add-on is running properly.</li><li>• <b>abnormal</b>: The add-on instances are abnormal and the add-on cannot be used. Click the add-on name to view exceptions.</li><li>• <b>installing</b>: The add-on is being installed.</li><li>• <b>installFailed</b>: Installing the add-on failed. In this case, uninstall the add-on and then reinstall it.</li><li>• <b>upgrading</b>: The add-on is being upgraded.</li><li>• <b>upgradeFailed</b>: Upgrading the add-on failed. In this case, upgrade the add-on again or uninstall the add-on and reinstall it.</li><li>• <b>deleting</b>: The add-on is being deleted.</li><li>• <b>deleteFailed</b>: Deleting the add-on failed. In this case, uninstall the add-on again.</li><li>• <b>deleteSuccess</b>: Deleting the add-on succeeded.</li><li>• <b>available</b>: Only some instances of the add-on are running. This indicates that some functions of the add-on are available.</li><li>• <b>rollbacking</b>: The add-on is being rolled back.</li><li>• <b>rollbackFailed</b>: Rolling back the add-on failed. In this case, roll back the add-on again or uninstall the add-on and reinstall it.</li><li>• <b>unknown</b>: The add-on chart instance does not exist.</li></ul> |
| Reason    | String | Cause of the add-on installation failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter       | Type                            | Description                                                          |
|-----------------|---------------------------------|----------------------------------------------------------------------|
| message         | String                          | Installation error details.                                          |
| targetVersions  | Array of strings                | Versions to which the current add-on version can be upgraded.        |
| currentVersion  | <a href="#">Versions</a> object | Information about the current add-on version.                        |
| isRollbackable  | Boolean                         | Whether the add-on version can be rolled back to the source version. |
| previousVersion | String                          | The add-on version before upgrade or rollback                        |

**Table 4-708** Versions

| Parameter         | Type                                             | Description                                     |
|-------------------|--------------------------------------------------|-------------------------------------------------|
| version           | String                                           | Add-on version.                                 |
| input             | Object                                           | Add-on installation parameters.                 |
| stable            | Boolean                                          | Whether the add-on version is a stable release. |
| translate         | Object                                           | Translation information used by the GUI.        |
| supportVersions   | Array of <a href="#">SupportVersions</a> objects | Cluster versions that support the add-on.       |
| creationTimestamp | String                                           | Creation time.                                  |
| updateTimestamp   | String                                           | Update time.                                    |

**Table 4-709** SupportVersions

| Parameter      | Type             | Description                                                                  |
|----------------|------------------|------------------------------------------------------------------------------|
| clusterType    | String           | Cluster type that supports the add-on.                                       |
| clusterVersion | Array of strings | Cluster versions that support the add-on. The value is a regular expression. |

## Example Requests

Install the coredns add-on of version 1.17.15. The add-on specification is 2500 QPS, and the number of add-on instances is 2.

## 4.6.2 Listing Add-on Templates

### Function

This API is used to query add-on templates.

### URI

GET /api/v3/addontemplates

**Table 4-710** Query Parameters

| Parameter           | Mandatory | Type   | Description                                                                                            |
|---------------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| addon_template_name | No        | String | Add-on name or alias for search. If this parameter is not specified, all the add-ons will be searched. |

### Request Parameters

**Table 4-711** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

### Response Parameters

Status code: 200

**Table 4-712** Response body parameters

| Parameter  | Type   | Description                                                         |
|------------|--------|---------------------------------------------------------------------|
| kind       | String | API type. The value is fixed at <b>Addon</b> and cannot be changed. |
| apiVersion | String | API version. The value is fixed at <b>v3</b> and cannot be changed. |

| Parameter | Type                                           | Description               |
|-----------|------------------------------------------------|---------------------------|
| items     | Array of <a href="#">AddonTemplate</a> objects | List of add-on templates. |

**Table 4-713** AddonTemplate

| Parameter  | Type                                 | Description                                                                 |
|------------|--------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                               | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                               | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata</a> object | Basic information about the object. Metadata is a collection of attributes. |
| spec       | <a href="#">TemplateSpec</a> object  | Detailed description of the add-on template.                                |

**Table 4-714** AddonMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.6.3 Updating an Add-on Instance

#### Function

This API is used to update an add-on instance.

#### URI

PUT /api/v3/addons/{id}

**Table 4-718** Path Parameters

| Parameter | Mandatory | Type   | Description         |
|-----------|-----------|--------|---------------------|
| id        | Yes       | String | Add-on instance ID. |

#### Request Parameters

**Table 4-719** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-720** Request body parameters

| Parameter | Mandatory | Type   | Description                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| kind      | Yes       | String | API type. The value is fixed at <b>Addon</b> and cannot be changed. Any user-defined value is invalid. |

| Parameter  | Mandatory | Type                              | Description                                                                                            |
|------------|-----------|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| apiVersion | Yes       | String                            | API version. The value is fixed at <b>v3</b> and cannot be changed. Any user-defined value is invalid. |
| metadata   | Yes       | <b>AddonMetadata</b> object       | Basic information about the object. Metadata is a collection of attributes.                            |
| spec       | Yes       | <b>InstanceRequestSpec</b> object | Detailed description of add-on installation or upgrade.                                                |

**Table 4-721** AddonMetadata

| Parameter         | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                             |
|-------------------|-----------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | No        | String              | Unique ID                                                                                                                                                                                                                                                                                               |
| name              | No        | String              | Add-on name                                                                                                                                                                                                                                                                                             |
| alias             | No        | String              | Add-on alias                                                                                                                                                                                                                                                                                            |
| labels            | No        | Map<String, String> | Add-on labels in key-value pairs. This is a reserved field and does not take effect.                                                                                                                                                                                                                    |
| annotations       | No        | Map<String, String> | Add-on annotations in the format of key-value pairs. <ul style="list-style-type: none"><li>• For add-on installation, the value is fixed at <code>{"addon.install/type":"install"}</code>.</li><li>• For add-on upgrade, the value is fixed at <code>{"addon.upgrade/type":"upgrade"}</code>.</li></ul> |
| updateTimestamp   | No        | String              | Updated at                                                                                                                                                                                                                                                                                              |
| creationTimestamp | No        | String              | Created at                                                                                                                                                                                                                                                                                              |

**Table 4-722** InstanceRequestSpec

| Parameter          | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version            | No        | String              | <p>Version of the add-on to install or upgrade, for example, <b>1.0.0</b>.</p> <ul style="list-style-type: none"><li>• Installation: This parameter is optional. If not specified, the latest version supported by the cluster is used.</li><li>• Upgrade: This parameter is mandatory. The version number must be specified.</li></ul>                       |
| clusterID          | Yes       | String              | Cluster ID.                                                                                                                                                                                                                                                                                                                                                   |
| values             | Yes       | Map<String, Object> | Add-on template installation parameters (varying depending on the add-on). During the add-on upgrade, you need to specify all the installation parameters. If the parameters are not specified, the default values in the add-on template are used. The current add-on installation parameters can be obtained through the API for querying add-on instances. |
| addonTemplate Name | Yes       | String              | Name of the add-on template to be installed, for example, <b>coredns</b> .                                                                                                                                                                                                                                                                                    |

## Response Parameters

Status code: 200

**Table 4-723** Response body parameters

| Parameter  | Type                                 | Description                                                                 |
|------------|--------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                               | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                               | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata object</a> | Basic information about the object. Metadata is a collection of attributes. |

| Parameter | Type                                       | Description                                  |
|-----------|--------------------------------------------|----------------------------------------------|
| spec      | <a href="#">InstanceSpec</a> object        | Detailed description of the add-on instance. |
| status    | <a href="#">AddonInstanceStatus</a> object | Add-on instance status.                      |

**Table 4-724 AddonMetadata**

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | String              | Unique ID                                                                                                                                                                                                                                                                                                 |

| status    | String | <p>Statuses of add-on instances. Options:</p> <ul style="list-style-type: none"><li>• <b>running</b>: All of the add-on instances are running and the add-on is running properly.</li><li>• <b>abnormal</b>: The add-on instances are abnormal and the add-on cannot be used. Click the add-on name to view exceptions.</li><li>• <b>installing</b>: The add-on is being installed.</li><li>• <b>installFailed</b>: Installing the add-on failed. In this case, uninstall the add-on and then reinstall it.</li><li>• <b>upgrading</b>: The add-on is being upgraded.</li><li>• <b>upgradeFailed</b>: Upgrading the add-on failed. In this case, upgrade the add-on again or uninstall the add-on and reinstall it.</li><li>• <b>deleting</b>: The add-on is being deleted.</li><li>• <b>deleteFailed</b>: Deleting the add-on failed. In this case, uninstall the add-on again.</li><li>• <b>deleteSuccess</b>: Deleting the add-on succeeded.</li><li>• <b>available</b>: Only some instances of the add-on are running. This indicates that some functions of the add-on are available.</li><li>• <b>rollbacking</b>: The add-on is being rolled back.</li><li>• <b>rollbackFailed</b>: Rolling back the add-on failed. In this case, roll back the add-on again or uninstall the add-on and reinstall it.</li><li>• <b>unknown</b>: The add-on chart instance does not exist.</li></ul> |
| Reason    | String | Cause of the add-on installation failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter       | Type                            | Description                                                          |
|-----------------|---------------------------------|----------------------------------------------------------------------|
| message         | String                          | Installation error details.                                          |
| targetVersions  | Array of strings                | Versions to which the current add-on version can be upgraded.        |
| currentVersion  | <a href="#">Versions</a> object | Information about the current add-on version.                        |
| isRollbackable  | Boolean                         | Whether the add-on version can be rolled back to the source version. |
| previousVersion | String                          | The add-on version before upgrade or rollback                        |

**Table 4-727 Versions**

| Parameter         | Type                                             | Description                                     |
|-------------------|--------------------------------------------------|-------------------------------------------------|
| version           | String                                           | Add-on version.                                 |
| input             | Object                                           | Add-on installation parameters.                 |
| stable            | Boolean                                          | Whether the add-on version is a stable release. |
| translate         | Object                                           | Translation information used by the GUI.        |
| supportVersions   | Array of <a href="#">SupportVersions</a> objects | Cluster versions that support the add-on.       |
| creationTimestamp | String                                           | Creation time.                                  |
| updateTimestamp   | String                                           | Update time.                                    |

**Table 4-728 SupportVersions**

| Parameter      | Type             | Description                                                                  |
|----------------|------------------|------------------------------------------------------------------------------|
| clusterType    | String           | Cluster type that supports the add-on.                                       |
| clusterVersion | Array of strings | Cluster versions that support the add-on. The value is a regular expression. |

## Example Requests

Update the everest add-on to version 2.1.30.

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

See [Error Codes](#).

### 4.6.4 Rolling Back an Add-on Instance

#### Function

Roll back the add-on instance version to the source version. Only when the **status.isRollbackable** parameter is set to **true**, and the add-on instance is in the **running**, **available**, **abnormal**, **upgradeFailed**, or **rollbackFailed** state, the version can be rolled back to the source version.

#### URI

POST /api/v3/addons/{id}/operation/rollback

**Table 4-729** Path Parameters

| Parameter | Mandatory | Type   | Description        |
|-----------|-----------|--------|--------------------|
| id        | Yes       | String | Add-on instance ID |

## Request Parameters

**Table 4-730** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-731** Request body parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| clusterID | Yes       | String | Cluster ID  |

## Response Parameters

Status code: 200

**Table 4-732** Response body parameters

| Parameter  | Type                                      | Description                                                                 |
|------------|-------------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                                    | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                                    | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata</a> object      | Basic information about the object. Metadata is a collection of attributes. |
| spec       | <a href="#">InstanceSpec</a> object       | Detailed description of the add-on instance.                                |
| status     | <a href="#">AddonInstanceState</a> object | Add-on instance status.                                                     |

**Table 4-733** AddonMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                             |

**Table 4-736 Versions**

| Parameter         | Type                                                | Description                                     |
|-------------------|-----------------------------------------------------|-------------------------------------------------|
| version           | String                                              | Add-on version.                                 |
| input             | Object                                              | Add-on installation parameters.                 |
| stable            | Boolean                                             | Whether the add-on version is a stable release. |
| translate         | Object                                              | Translation information used by the GUI.        |
| supportVersions   | Array of<br><a href="#">SupportVersions</a> objects | Cluster versions that support the add-on.       |
| creationTimestamp | String                                              | Creation time.                                  |
| updateTimestamp   | String                                              | Update time.                                    |

**Table 4-737 SupportVersions**

| Parameter      | Type                | Description                                                                  |
|----------------|---------------------|------------------------------------------------------------------------------|
| clusterType    | String              | Cluster type that supports the add-on.                                       |
| clusterVersion | Array of<br>strings | Cluster versions that support the add-on. The value is a regular expression. |

## Example Requests

```
{  
    "clusterID" : "*****"  
}
```

## Example Responses

**Status code: 200**

Add-on instance version is rolled back.

## Status Codes

| Status Code | Description                             |
|-------------|-----------------------------------------|
| 200         | Add-on instance version is rolled back. |

## Error Codes

See [Error Codes](#).

## 4.6.5 Deleting an Add-on Instance

### Function

This API is used to delete an add-on instance.

### URI

DELETE /api/v3/addons/{id}

**Table 4-738** Path Parameters

| Parameter | Mandatory | Type   | Description         |
|-----------|-----------|--------|---------------------|
| id        | Yes       | String | Add-on instance ID. |

**Table 4-739** Query Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                              |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id | No        | String | Cluster ID (deprecated). For details about how to obtain the cluster ID, see <a href="#">How Do I Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-740** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

### Response Parameters

None

## Example Requests

None

## Example Responses

**Status code: 200**

OK

success

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

See [Error Codes](#).

## 4.6.6 Querying an Add-on Instance

### Function

This API is used to obtain details about an add-on instance.

### URI

GET /api/v3/addons/{id}

**Table 4-741** Path Parameters

| Parameter | Mandatory | Type   | Description         |
|-----------|-----------|--------|---------------------|
| id        | Yes       | String | Add-on instance ID. |

**Table 4-742** Query Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                              |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id | No        | String | Cluster ID (deprecated). For details about how to obtain the cluster ID, see <a href="#">How Do I Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-743** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-744** Response body parameters

| Parameter  | Type                                      | Description                                                                 |
|------------|-------------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                                    | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                                    | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata</a> object      | Basic information about the object. Metadata is a collection of attributes. |
| spec       | <a href="#">InstanceSpec</a> object       | Detailed description of the add-on instance.                                |
| status     | <a href="#">AddonInstanceState</a> object | Add-on instance status.                                                     |

**Table 4-745** AddonMetadata

| Parameter | Type   | Description  |
|-----------|--------|--------------|
| uid       | String | Unique ID    |
| name      | String | Add-on name  |
| alias     | String | Add-on alias |

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| labels            | Map<String, String> | Add-on labels in key-value pairs. This is a reserved field and does not take effect.                                                                                                                                                                                                                    |
| annotations       | Map<String, String> | Add-on annotations in the format of key-value pairs. <ul style="list-style-type: none"><li>• For add-on installation, the value is fixed at <code>{"addon.install/type":"install"}</code>.</li><li>• For add-on upgrade, the value is fixed at <code>{"addon.upgrade/type":"upgrade"}</code>.</li></ul> |
| updateTimestamp   | String              | Updated at                                                                                                                                                                                                                                                                                              |
| creationTimestamp | String              | Created at                                                                                                                                                                                                                                                                                              |

**Table 4-746** InstanceSpec

| Parameter            | Type                | Description                                                                                                |
|----------------------|---------------------|------------------------------------------------------------------------------------------------------------|
| clusterID            | String              | Cluster ID.                                                                                                |
| version              | String              | Add-on template version, for example, <b>1.0.0</b> .                                                       |
| addonTemplate Name   | String              | Add-on template name, for example, <b>coredns</b> .                                                        |
| addonTemplate Type   | String              | Add-on template type.                                                                                      |
| addonTemplate Logo   | String              | URL for obtaining the add-on template logo.                                                                |
| addonTemplate Labels | Array of strings    | Labels of the add-on template.                                                                             |
| description          | String              | Add-on template description.                                                                               |
| values               | Map<String, Object> | Add-on template installation parameters (varying depending on the add-on). Set the parameters accordingly. |

**Table 4-747 AddonInstanceStatus**

| Parameter       | Type                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| targetVersions  | Array of strings                | Versions to which the current add-on version can be upgraded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| currentVersion  | <a href="#">Versions object</a> | Information about the current add-on version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| isRollbackable  | Boolean                         | Whether the add-on version can be rolled back to the source version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| previousVersion | String                          | The add-on version before upgrade or rollback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 4-748** Versions

| Parameter         | Type                                             | Description                                     |
|-------------------|--------------------------------------------------|-------------------------------------------------|
| version           | String                                           | Add-on version.                                 |
| input             | Object                                           | Add-on installation parameters.                 |
| stable            | Boolean                                          | Whether the add-on version is a stable release. |
| translate         | Object                                           | Translation information used by the GUI.        |
| supportVersions   | Array of <a href="#">SupportVersions</a> objects | Cluster versions that support the add-on.       |
| creationTimestamp | String                                           | Creation time.                                  |
| updateTimestamp   | String                                           | Update time.                                    |

**Table 4-749** SupportVersions

| Parameter      | Type             | Description                                                                  |
|----------------|------------------|------------------------------------------------------------------------------|
| clusterType    | String           | Cluster type that supports the add-on.                                       |
| clusterVersion | Array of strings | Cluster versions that support the add-on. The value is a regular expression. |

## 4.6.7 Listing Add-on Instances

### Function

This API is used to list all add-on instances in the cluster.

### URI

GET /api/v3 addons

**Table 4-750** Query Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                             |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain a cluster ID, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-751** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

### Response Parameters

Status code: 200

**Table 4-752** Response body parameters

| Parameter  | Type   | Description                                                         |
|------------|--------|---------------------------------------------------------------------|
| kind       | String | API type. The value is fixed at <b>Addon</b> and cannot be changed. |
| apiVersion | String | API version. The value is fixed at <b>v3</b> and cannot be changed. |

| Parameter | Type                                           | Description           |
|-----------|------------------------------------------------|-----------------------|
| items     | Array of <a href="#">AddonInstance</a> objects | Add-on instance list. |

**Table 4-753** AddonInstance

| Parameter  | Type                                      | Description                                                                 |
|------------|-------------------------------------------|-----------------------------------------------------------------------------|
| kind       | String                                    | API type. The value is fixed at <b>Addon</b> and cannot be changed.         |
| apiVersion | String                                    | API version. The value is fixed at <b>v3</b> and cannot be changed.         |
| metadata   | <a href="#">AddonMetadata</a> object      | Basic information about the object. Metadata is a collection of attributes. |
| spec       | <a href="#">InstanceSpec</a> object       | Detailed description of the add-on instance.                                |
| status     | <a href="#">AddonInstanceState</a> object | Add-on instance status.                                                     |

**Table 4-754** AddonMetadata

| Parameter         | Type                | Description                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid               | String              | Unique ID                                                                                                                                                                                                                                                                                                 |

| Parameter         | Type                                             | Description                                     |
|-------------------|--------------------------------------------------|-------------------------------------------------|
| version           | String                                           | Add-on version.                                 |
| input             | Object                                           | Add-on installation parameters.                 |
| stable            | Boolean                                          | Whether the add-on version is a stable release. |
| translate         | Object                                           | Translation information used by the GUI.        |
| supportVersions   | Array of <a href="#">SupportVersions</a> objects | Cluster versions that support the add-on.       |
| creationTimestamp | String                                           | Creation time.                                  |
| updateTimestamp   | String                                           | Update time.                                    |

**Table 4-758 SupportVersions**

| Parameter      | Type             | Description                                                                  |
|----------------|------------------|------------------------------------------------------------------------------|
| clusterType    | String           | Cluster type that supports the add-on.                                       |
| clusterVersion | Array of strings | Cluster versions that support the add-on. The value is a regular expression. |

# 4.7 Cluster Upgrade

## 4.7.1 Upgrading a Cluster

### Function

Cluster upgrade

#### NOTE

- Cluster upgrade involves many operations on components. You are advised to upgrade your cluster on the CCE console, a more interactive and intuitive way to reduce operational risks.
- Currently, cluster upgrade APIs are available only upon request.

### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgrade

**Table 4-759** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-760** Request body parameters

| Parameter | Mandatory | Type                                                 | Description       |
|-----------|-----------|------------------------------------------------------|-------------------|
| metadata  | Yes       | <a href="#">UpgradeClusterRequestMetadata</a> object | Upgrade metadata. |
| spec      | Yes       | <a href="#">UpgradeSpec</a> object                   | Upgrade settings. |

**Table 4-761** UpgradeClusterRequestMetadata

| Parameter  | Mandatory | Type   | Description                                     |
|------------|-----------|--------|-------------------------------------------------|
| apiVersion | Yes       | String | API version. Defaults to <b>v3</b> .            |
| kind       | Yes       | String | Resource type. Defaults to <b>UpgradeTask</b> . |

**Table 4-762** UpgradeSpec

| Parameter            | Mandatory | Type                                        | Description               |
|----------------------|-----------|---------------------------------------------|---------------------------|
| clusterUpgradeAction | No        | <a href="#">ClusterUpgradeAction</a> object | Cluster upgrade settings. |

**Table 4-763** ClusterUpgradeAction

| Parameter | Mandatory | Type                                                | Description                                                                                                                    |
|-----------|-----------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| addons    | No        | Array of <a href="#">UpgradeAddonConfig</a> objects | Add-on configuration list.                                                                                                     |
| nodeOrder | No        | Map<String, Array< <a href="#">NodePriority</a> >>  | Upgrade sequence of nodes in the node pool.<br><b>NOTE</b><br>key indicates the node pool ID. Defaults to <b>DefaultPool</b> . |

| Parameter     | Mandatory | Type                   | Description                                                                                                                                                                                                                                                                                                               |
|---------------|-----------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodePoolOrder | No        | Map<String, Integer>   | Upgrade sequence of a node pool, in key-value pairs.<br><b>NOTE</b><br><code>key</code> indicates the node pool ID. Defaults to <code>DefaultPool</code> . <code>value</code> means the priority of a node pool. Defaults to <code>0</code> , indicating the lowest priority. A larger value indicates a higher priority. |
| strategy      | Yes       | UpgradeStrategy object | Upgrade policy.                                                                                                                                                                                                                                                                                                           |
| targetVersion | Yes       | String                 | Target cluster version, for example, v1.23.                                                                                                                                                                                                                                                                               |

**Table 4-764** UpgradeAddonConfig

| Parameter         | Mandatory | Type   | Description                                                             |
|-------------------|-----------|--------|-------------------------------------------------------------------------|
| addonTemplateName | Yes       | String | Add-on name.                                                            |
| operation         | Yes       | String | Execution action. For current upgrades, the value can be <b>patch</b> . |
| version           | Yes       | String | Target add-on version.                                                  |
| values            | No        | Object | Add-on parameter list, in key-value pairs.                              |

**Table 4-765** NodePriority

| Parameter    | Mandatory | Type                | Description                                                                                                                               |
|--------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| nodeSelector | Yes       | NodeSelector object | Node label selector, which selects a batch of nodes.                                                                                      |
| priority     | Yes       | Integer             | Priority of this batch of nodes. Defaults to <code>0</code> , indicating the lowest priority. A larger value indicates a higher priority. |

**Table 4-766** NodeSelector

| Parameter | Mandatory | Type             | Description                  |
|-----------|-----------|------------------|------------------------------|
| key       | Yes       | String           | Label key.                   |
| value     | No        | Array of strings | Label value list.            |
| operator  | Yes       | String           | Logical operators of labels. |

**Table 4-767** UpgradeStrategy

| Parameter            | Mandatory | Type                        | Description                                                                              |
|----------------------|-----------|-----------------------------|------------------------------------------------------------------------------------------|
| type                 | Yes       | String                      | Upgrade policy type. Supports only inPlaceRollingUpdate.                                 |
| inPlaceRollingUpdate | No        | InPlaceRollingUpdate object | In-place upgrade settings. Mandatory when the in-place upgrade policy type is specified. |

**Table 4-768** InPlaceRollingUpdate

| Parameter       | Mandatory | Type    | Description                                       |
|-----------------|-----------|---------|---------------------------------------------------|
| userDefinedStep | No        | Integer | Node upgrade step, from 1 to 40. Recommended: 20. |

## Response Parameters

Status code: 200

**Table 4-769** Response body parameters

| Parameter | Type                                  | Description           |
|-----------|---------------------------------------|-----------------------|
| metadata  | UpgradeClusterResponseMetadata object | Upgrade task metadata |
| spec      | UpgradeResponseSpec object            | Upgrade settings      |

**Table 4-770** UpgradeCluserResponseMetadata

| Parameter | Type   | Description                                                                                                 |
|-----------|--------|-------------------------------------------------------------------------------------------------------------|
| uid       | String | Upgrade task ID. You can obtain the progress by calling the API for obtaining cluster upgrade task details. |

**Table 4-771** UpgradeResponseSpec

| Parameter             | Type                                                  | Description              |
|-----------------------|-------------------------------------------------------|--------------------------|
| clusterUpgrad eAction | <a href="#">ClusterUpgra deResponseA ction</a> object | Cluster upgrade settings |

**Table 4-772** ClusterUpgradeResponseAction

| Parameter              | Type                                    | Description                                                                                                          |
|------------------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| version                | String                                  | Current cluster version                                                                                              |
| targetVersion          | String                                  | Target cluster version, for example, v1.23.                                                                          |
| targetPlatfor mVersion | String                                  | Platform version of the target cluster, which is an internal version of the cluster version and cannot be specified. |
| strategy               | <a href="#">UpgradeStrat egy</a> object | Upgrade policies                                                                                                     |
| config                 | Object                                  | Cluster configuration specified during an upgrade                                                                    |

**Table 4-773** UpgradeStrategy

| Parameter             | Type                                         | Description                                                                              |
|-----------------------|----------------------------------------------|------------------------------------------------------------------------------------------|
| type                  | String                                       | Upgrade policy type. Supports only inPlaceRollingUpdate.                                 |
| inPlaceRolling Update | <a href="#">InPlaceRollin gUpdate</a> object | In-place upgrade settings. Mandatory when the in-place upgrade policy type is specified. |

**Table 4-774 InPlaceRollingUpdate**

| Parameter       | Type    | Description                                          |
|-----------------|---------|------------------------------------------------------|
| userDefinedStep | Integer | Node upgrade step, from 1 to 40.<br>Recommended: 20. |

## Example Requests

Upgrade the cluster to v1.23 and set the node upgrade step to 20.

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/upgrade
```

```
{  
  "metadata": {  
    "apiVersion": "v3",  
    "kind": "UpgradeTask"  
  },  
  "spec": {  
    "clusterUpgradeAction": {  
      "strategy": {  
        "type": "inPlaceRollingUpdate",  
        "inPlaceRollingUpdate": {  
          "userDefinedStep": 20  
        }  
      },  
      "targetVersion": "v1.23"  
    }  
  }  
}
```

## Example Responses

**Status code: 200**

Cluster upgrade requested.

```
{  
  "metadata": {  
    "uid": "976a33e2-f545-11ed-87af-0255ac1002c2"  
  },  
  "spec": {  
    "clusterUpgradeAction": {  
      "version": "v1.19.16-r20",

### 4.7.2 Obtaining Cluster Upgrade Task Details

#### Function

Upgrade task ID, obtained from the **uid** field in the response body after the cluster upgrade API is called.

#### NOTE

- Cluster upgrade involves many operations on components. You are advised to upgrade your cluster on the CCE console, a more interactive and intuitive way to reduce operational risks.
- Currently, cluster upgrade APIs are available only upon request.

#### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgrade/tasks/{task\_id}

**Table 4-775** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| task_id    | Yes       | String | Upgrade task ID, obtained from the <b>uid</b> field in the response body after the cluster upgrade API is called.    |

### 4.7.3 Retrying a Cluster Upgrade Task

#### Function

Execute the failed cluster upgrade task again.

- Cluster upgrade involves many operations on components. You are advised to upgrade your cluster on the CCE console, a more interactive and intuitive way to reduce operational risks.
- Currently, cluster upgrade APIs are available only upon request.

#### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgrade/retry

**Table 4-780** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

**Table 4-806** riskSource

| Parameter          | Type                                                | Description         |
|--------------------|-----------------------------------------------------|---------------------|
| configurationRisks | Array of <a href="#">configurationRisks</a> objects | Configuration risk  |
| deprecatedAPIRisks | Array of <a href="#">deprecatedAPIRisks</a> objects | Deprecated API risk |
| nodeRisks          | Array of <a href="#">nodeRisks</a> objects          | Node risk           |
| addonRisks         | Array of <a href="#">addonRisks</a> objects         | Add-on risk         |

**Table 4-807** configurationRisks

| Parameter     | Type   | Description               |
|---------------|--------|---------------------------|
| package       | String | Component                 |
| sourceFile    | String | How to Obtain             |
| nodeMsg       | String | Node information          |
| field         | String | Parameter Value           |
| operation     | String | Change an operation type. |
| originalValue | String | Original Value            |
| value         | String | Current Value             |

**Table 4-808** deprecatedAPIRisks

| Parameter | Type   | Description                                                                |
|-----------|--------|----------------------------------------------------------------------------|
| url       | String | Request path, for example, <b>/apis/policy/v1beta1/podsecuritypolicies</b> |
| userAgent | String | Client information                                                         |

**Table 4-809** nodeRisks

| Parameter | Type   | Description    |
|-----------|--------|----------------|
| NodeID    | String | Worker node ID |

**Table 4-810** addonRisks

| Parameter          | Type   | Description                 |
|--------------------|--------|-----------------------------|
| addonTemplate Name | String | Name of the add-on template |
| alias              | String | Add-on alias                |

## Example Requests

Request body for a cluster pre-upgrade check

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/precheck
{
  "kind" : "PreCheckTask",
  "apiVersion" : "v3",
  "spec" : {
    "clusterID" : "8978deaa-1743-11ee-8e46-0255ac10004c",
    "clusterVersion" : "v1.15.11-r1",
    "targetVersion" : "v1.19.16-r80",
    "skippedCheckItemList" : [ ]
  }
}
```

## Example Responses

**Status code: 200**

Cluster pre-upgrade check succeeded.

```
{
  "kind" : "PreCheckTask",
  "apiVersion" : "v3",
  "metadata" : {
    "uid" : "9991b45e-a2be-4b49-aca4-50a25fa6f81e"
  },
  "spec" : {
    "clusterID" : "8978deaa-1743-11ee-8e46-0255ac10004c",
    "clusterVersion" : "v1.15.11-r1",
    "targetVersion" : "v1.19.16-r80"
  },
  "status" : {
    "phase" : "Init",
    "clusterCheckStatus" : {
      "phase" : "Init"
    },
    "addonCheckStatus" : {
      "phase" : "Init"
    },
    "nodeCheckStatus" : {
      "phase" : "Init"
    }
  }
}
```

{}

## Status Codes

| Status Code | Description                          |
|-------------|--------------------------------------|
| 200         | Cluster pre-upgrade check succeeded. |

## Error Codes

See [Error Codes](#).

## 4.7.8 Obtaining Details About a Pre-upgrade Check Task of a Cluster

### Function

Obtain details about a pre-upgrade check task of a cluster. The task ID is obtained from the **uid** field in the response body after the cluster check API is called.

### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/precheck/tasks/{task\_id}

**Table 4-811** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| task_id    | Yes       | String | Upgrade task ID, obtained from the <b>uid</b> field in the response body after the cluster upgrade API is called.    |

### Request Parameters

None

## Response Parameters

Status code: 200

**Table 4-812** Response body parameters

| Parameter  | Type                               | Description                                          |
|------------|------------------------------------|------------------------------------------------------|
| apiVersion | String                             | API version, which defaults to <b>v3</b>             |
| kind       | String                             | Resource type, which defaults to <b>PreCheckTask</b> |
| metadata   | <b>PrecheckTaskMetadata</b> object | Metadata of a pre-upgrade check task                 |
| spec       | <b>PrecheckSpec</b> object         | Information of a pre-upgrade check task              |
| status     | <b>PrecheckStatus</b> object       | Status of a pre-upgrade check task                   |

**Table 4-813** PrecheckTaskMetadata

| Parameter         | Type   | Description                    |
|-------------------|--------|--------------------------------|
| uid               | String | Task ID                        |
| creationTimestamp | String | Time when the task was created |
| updateTimestamp   | String | Time when the task was updated |

**Table 4-814** PrecheckSpec

| Parameter            | Type                                         | Description         |
|----------------------|----------------------------------------------|---------------------|
| clusterID            | String                                       | Cluster ID          |
| clusterVersion       | String                                       | Cluster version     |
| targetVersion        | String                                       | Target Version      |
| skippedCheckItemList | Array of <b>skippedCheckItemList</b> objects | Skipped check items |

**Table 4-815** skippedCheckItemList

| Parameter        | Type                                    | Description                                                                                                        |
|------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| name             | String                                  | Names of the skipped check items                                                                                   |
| resourceSelector | <a href="#">resourceSelector object</a> | Resource tag selector. This parameter is available only for node check, but not for cluster check or add-on check. |

**Table 4-816** resourceSelector

| Parameter | Type             | Description                                                                                     |
|-----------|------------------|-------------------------------------------------------------------------------------------------|
| key       | String           | Tag key. Options: <ul style="list-style-type: none"><li>• <b>node.uid</b>: node UID</li></ul>   |
| values    | Array of strings | Tag values                                                                                      |
| operator  | String           | Logical operator of a tag. Options: <ul style="list-style-type: none"><li>• <b>In</b></li></ul> |

**Table 4-817** PrecheckStatus

| Parameter          | Type                                      | Description                                                                                                                                                                                   |
|--------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase              | String                                    | Status. Options: <ul style="list-style-type: none"><li>• <b>Init</b>: initializing</li><li>• <b>Running</b></li><li>• <b>Success</b></li><li>• <b>Failed</b></li><li>• <b>Error</b></li></ul> |
| expireTimeStamp    | String                                    | Check result expiration time                                                                                                                                                                  |
| message            | String                                    | Information, which typically indicates the log for execution errors                                                                                                                           |
| clusterCheckStatus | <a href="#">clusterCheckStatus object</a> | Status of a cluster restrictions check                                                                                                                                                        |
| addonCheckStatus   | <a href="#">addonCheckStatus object</a>   | Status of an add-on check                                                                                                                                                                     |
| nodeCheckStatus    | <a href="#">nodeCheckStatus object</a>    | Node check status                                                                                                                                                                             |

**Table 4-818** clusterCheckStatus

| Parameter   | Type                                                | Description                                                                                                                                                            |

**Table 4-821** NodeStageStatus

| Parameter   | Type                                                | Description                  |
|-------------|-----------------------------------------------------|------------------------------|
| nodeInfo    | <a href="#">NodeInfo</a> object                     | Node information             |
| itemsStatus | Array of <a href="#">PreCheckItemStatus</a> objects | Compliance set by check item |

**Table 4-822** NodeInfo

| Parameter | Type   | Description |
|-----------|--------|-------------|
| uid       | String | Node UID    |
| name      | String | Node name   |
| status    | String | Status      |
| nodeType  | String | Node type   |

**Table 4-823** PreCheckItemStatus

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                        |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Check item                                                                                                                                                                                                                                                                                                         |
| kind      | String | Check item type. Options: <ul style="list-style-type: none"><li>• <b>Exception:</b> exceptions that need to be resolved by you</li><li>• <b>Risk:</b> risks that can be skipped after you confirm them</li></ul>                                                                                                   |
| group     | String | Check item group. Options: <ul style="list-style-type: none"><li>• <b>LimitCheck:</b> cluster limit check</li><li>• <b>MasterCheck:</b> master node check</li><li>• <b>NodeCheck:</b> worker node check</li><li>• <b>AddonCheck:</b> add-on check</li><li>• <b>ExecuteException:</b> process error check</li></ul> |
| level     | String | Check item severity. Options: <ul style="list-style-type: none"><li>• <b>Info:</b> information</li><li>• <b>Warning</b></li><li>• <b>Fatal:</b> critical</li></ul>                                                                                                                                                 |

| Parameter  | Type                        | Description                                                                                                                                                            |
|------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase      | String                      | Status. Options: <ul style="list-style-type: none"><li>• <b>Init</b>: initializing</li><li>• <b>Running</b></li><li>• <b>Success</b></li><li>• <b>Failed</b></li></ul> |
| message    | String                      | Information                                                                                                                                                            |
| riskSource | <b>riskSource</b><br>object | Risk item                                                                                                                                                              |
| errorCodes | Array of<br>strings         | Error code set                                                                                                                                                         |

**Table 4-824** riskSource

| Parameter           | Type                                           | Description         |
|---------------------|------------------------------------------------|---------------------|
| configuration Risks | Array of<br><b>configuration Risks</b> objects | Configuration risk  |
| deprecatedAPIRisks  | Array of<br><b>deprecatedAPIRisks</b> objects  | Deprecated API risk |
| nodeRisks           | Array of<br><b>nodeRisks</b> objects           | Node risk           |
| addonRisks          | Array of<br><b>addonRisks</b> objects          | Add-on risk         |

**Table 4-825** configurationRisks

| Parameter  | Type   | Description               |
|------------|--------|---------------------------|
| package    | String | Component                 |
| sourceFile | String | How to Obtain             |
| nodeMsg    | String | Node information          |
| field      | String | Parameter Value           |
| operation  | String | Change an operation type. |

| Parameter     | Type   | Description    |
|---------------|--------|----------------|
| originalValue | String | Original Value |
| value         | String | Current Value  |

**Table 4-826** deprecatedAPIRisks

| Parameter | Type   | Description                                                                |
|-----------|--------|----------------------------------------------------------------------------|
| url       | String | Request path, for example, <b>/apis/policy/v1beta1/podsecuritypolicies</b> |
| userAgent | String | Client information                                                         |

**Table 4-827** nodeRisks

| Parameter | Type   | Description    |
|-----------|--------|----------------|
| NodeID    | String | Worker node ID |

**Table 4-828** addonRisks

| Parameter     | Type   | Description                 |
|---------------|--------|-----------------------------|
| addonTemplate | String | Name of the add-on template |
| alias         | String | Add-on alias                |

### Response Parameters

Status code: 200

**Table 4-830** Response body parameters

| Parameter  | Type                                                 | Description                                                                 |
|------------|------------------------------------------------------|-----------------------------------------------------------------------------|
| apiVersion | String                                               | API version, which defaults to v3                                           |
| kind       | String                                               | Type                                                                        |
| metadata   | <a href="#">Metadata object</a>                      | Basic information about the object. Metadata is a collection of attributes. |
| items      | Array of <a href="#">PrecheckClusterTask</a> objects | Cluster check tasks                                                         |

**Table 4-831** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-832** PrecheckClusterTask

| Parameter  | Type                                | Description                                          |
|------------|-------------------------------------|------------------------------------------------------|
| apiVersion | String                              | API version, which defaults to <b>v3</b>             |
| kind       | String                              | Resource type, which defaults to <b>PreCheckTask</b> |
| metadata   | <b>PrecheckTask Metadata</b> object | Metadata of a pre-upgrade check task                 |
| spec       | <b>PrecheckSpec</b> object          | Information of a pre-upgrade check task              |
| status     | <b>PrecheckStatus</b> object        | Status of a pre-upgrade check task                   |

**Table 4-833** PrecheckTaskMetadata

| Parameter         | Type   | Description                    |
|-------------------|--------|--------------------------------|
| uid               | String | Task ID                        |
| creationTimestamp | String | Time when the task was created |
| updateTimestamp   | String | Time when the task was updated |

**Table 4-834** PrecheckSpec

| Parameter            | Type                                                        | Description         |
|----------------------|-------------------------------------------------------------|---------------------|
| clusterID            | String                                                      | Cluster ID          |
| clusterVersion       | String                                                      | Cluster version     |
| targetVersion        | String                                                      | Target Version      |
| skippedCheckItemList | Array of<br><a href="#">skippedCheckItemList</a><br>objects | Skipped check items |

**Table 4-835** skippedCheckItemList

| Parameter        | Type                                    | Description                                                                                                        |
|------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| name             | String                                  | Names of the skipped check items                                                                                   |
| resourceSelector | <a href="#">resourceSelector</a> object | Resource tag selector. This parameter is available only for node check, but not for cluster check or add-on check. |

**Table 4-836** resourceSelector

| Parameter | Type             | Description                                                                                     |
|-----------|------------------|-------------------------------------------------------------------------------------------------|
| key       | String           | Tag key. Options: <ul style="list-style-type: none"><li>• <b>node.uid</b>: node UID</li></ul>   |
| values    | Array of strings | Tag values                                                                                      |
| operator  | String           | Logical operator of a tag. Options: <ul style="list-style-type: none"><li>• <b>In</b></li></ul> |

**Table 4-837** PrecheckStatus

| Parameter | Type   | Description                                                                                                                                                                                   |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase     | String | Status. Options: <ul style="list-style-type: none"><li>• <b>Init</b>: initializing</li><li>• <b>Running</b></li><li>• <b>Success</b></li><li>• <b>Failed</b></li><li>• <b>Error</b></li></ul> |

| Parameter          | Type                                      | Description                                                         |
|--------------------|-------------------------------------------|---------------------------------------------------------------------|
| expireTimeStamp    | String                                    | Check result expiration time                                        |
| message            | String                                    | Information, which typically indicates the log for execution errors |
| clusterCheckStatus | <a href="#">clusterCheckStatus object</a> | Status of a cluster restrictions check                              |
| addonCheckStatus   | <a href="#">addonCheckStatus object</a>   | Status of an add-on check                                           |

## Status Codes

| Status Code | Description                                                   |
|-------------|---------------------------------------------------------------|
| 200         | The list of pre-upgrade check tasks of a cluster is obtained. |

## Error Codes

See [Error Codes](#).

## 4.7.10 Post-upgrade Check

### Function

Post-upgrade check, which is used by the customer to check the cluster status after an upgrade and provide feedback after services are restored. Use this API with the console.

### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/postcheck

**Table 4-849** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-850** Request body parameters

| Parameter  | Mandatory | Type                                 | Description                                                         |
|------------|-----------|--------------------------------------|---------------------------------------------------------------------|
| apiVersion | Yes       | String                               | API version, which defaults to <b>v3</b>                            |
| kind       | Yes       | String                               | Resource type                                                       |
| spec       | Yes       | <a href="#">PostcheckSpec</a> object | <b>spec</b> indicates the configuration confirmed after an upgrade. |

**Table 4-851** PostcheckSpec

| Parameter      | Mandatory | Type   | Description            |
|----------------|-----------|--------|------------------------|
| clusterID      | No        | String | Cluster ID             |
| clusterVersion | No        | String | Source cluster version |
| targetVersion  | No        | String | Target cluster version |

## Response Parameters

Status code: 200

**Table 4-852** Response body parameters

| Parameter  | Type                                                     | Description                                     |
|------------|----------------------------------------------------------|-------------------------------------------------|
| apiVersion | String                                                   | API version                                     |
| kind       | String                                                   | Resource type                                   |
| metadata   | <a href="#">PostcheckClusterResponse Metadata object</a> | Post-upgrade check metadata                     |

## Example Requests

### Post-upgrade check

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/postcheck
{
  "kind" : "PostCheckTask",
  "apiVersion" : "v3",
  "spec" : {
    "clusterID" : "8978deaa-1743-11ee-8e46-0255ac10004c",
    "clusterVersion" : "v1.15.11-r1",
    "targetVersion" : "v1.19.16-r80"
  }
}
```

## Example Responses

### Status code: 200

Cluster post-upgrade check succeeded.

```
{
  "kind" : "PostCheckTask",
  "apiVersion" : "v3",
  "metadata" : {
    "uid" : "e99fedf8-348c-4084-b0fd-81bf187df4e0"
  },
  "spec" : {
    "clusterID" : "8978deaa-1743-11ee-8e46-0255ac10004c",
    "clusterVersion" : "v1.15.11-r1",
    "targetVersion" : "v1.19.16-r80"
  },
  "status" : {
    "phase" : "Success"
  }
}
```

## Status Codes

| Status Code | Description                           |
|-------------|---------------------------------------|
| 200         | Cluster post-upgrade check succeeded. |

## Error Codes

See [Error Codes](#).

## 4.7.11 Cluster Backup

### Function

Cluster backup

### URI

POST /api/v3.1/projects/{project\_id}/clusters/{cluster\_id}/operation/snapshot

**Table 4-856** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

None

### Response Parameters

Status code: 200

**Table 4-857** Response body parameters

| Parameter | Type                                                   | Description     |
|-----------|--------------------------------------------------------|-----------------|
| uid       | String                                                 | Task ID         |
| metadata  | <a href="#">SnapshotClusterResponseMetadata object</a> | Backup metadata |

| Parameter  | Type   | Description                                |
|------------|--------|--------------------------------------------|
| apiVersion | String | API version, which defaults to <b>v3.1</b> |
| kind       | String | Task type                                  |

## Example Requests

Example of a cluster upgrade backup request

```
POST /api/v3.1/projects/{project_id}/clusters/{cluster_id}/operation/snapshot
```

## Example Responses

**Status code: 200**

The cluster backup task is created.

```
{  
    "uid": "15376f1b-daa6-4e2d-96a6-e9d5d7caeaa2",  
    "metadata": {  
        "kind": "Snapshot",  
        "apiVersion": "v3.1"  
    }  
}
```

## Status Codes

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | The cluster backup task is created. |

## Error Codes

See [Error Codes](#).

## 4.7.12 Obtaining a List of Cluster Backup Task Details

### Function

Obtain a list of cluster backup task details.

### URI

```
GET /api/v3.1/projects/{project_id}/clusters/{cluster_id}/operation/snapshot/tasks
```

**Table 4-859** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

None

## Response Parameters

Status code: 200

## Status Codes

| Status Code | Description                                  |
|-------------|----------------------------------------------|
| 200         | The cluster upgrade information is obtained. |

## Error Codes

See [Error Codes](#).

### 4.7.14 Obtaining a Cluster Upgrade Path

#### Function

Obtain the cluster upgrade path.

#### URI

GET /api/v3/clusterupgradepaths

#### Request Parameters

**Table 4-874** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-875** Response body parameters

| Parameter    | Type                         | Description                                                                 |
|--------------|------------------------------|-----------------------------------------------------------------------------|
| apiVersion   | String                       | API version                                                                 |
| kind         | String                       | Resource type                                                               |
| metadata     | Metadata object              | Basic information about the object. Metadata is a collection of attributes. |
| upgradePaths | Array of UpgradePath objects | Upgrade paths                                                               |

**Table 4-876** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-877** UpgradePath

| Parameter       | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version         | String           | Cluster version. For example, v1.19.16-r20 for clusters of v1.19 or earlier, and v1.21 for clusters of v1.21 or later. For details, see CCE Cluster Versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| platformVersion | String           | CCE cluster platform version, which is an internal version under the cluster version ( <b>version</b> ). Platform versions are used to trace iterations in a major cluster version. They are unique within a major cluster version and recounted when the major cluster version changes. The format of <b>platformVersion</b> is <b>cce.X.Y</b> .- X: an internal feature version. When features or OSs in a cluster version are modified or patches are released in the cluster, the value of this parameter increases monotonically from 1.- Y: a patch version of an internal feature version. This parameter is only used for updating a software package for a released feature version. The value of this parameter increases monotonically from 0. |
| targetVersions  | Array of strings | Target versions that can be upgraded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example Requests

None

## Example Responses

### Status code: 200

The cluster upgrade path is obtained.

```

## Example Requests

None

## Example Responses

**Status code: 200**

The cluster upgrade path is obtained.

```
{  
    "kind" : "ClusterUpgradeFeatureGates",  
    "apiVersion" : "v3",  
    "metadata" : { },  
    "upgradeFeatureGates" : {  
        "DisplayPreCheckDetail" : "Support",  
        "EvsSnapshot" : "Support",  
        "LabelForSkippedNode" : "Support",  
        "UpgradeStrategy" : "Support"  
    }  
}
```

## Status Codes

| Status Code | Description                           |
|-------------|---------------------------------------|
| 200         | The cluster upgrade path is obtained. |

## Error Codes

See [Error Codes](#).

## 4.7.16 Enabling the Cluster Upgrade Process Booting Task

### Function

This API is used to create a cluster upgrade booting task. After the booting task is created by calling this API, start the check through the cluster pre-upgrade check. The upgrade process task is used to control the execution process of the cluster upgrade task. The execution process is as follows: Pre-upgrade check -> Cluster upgrade -> Post-upgrade check.

### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgradeworkflows

**Table 4-881** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-882** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-883** Request body parameters

| Parameter  | Mandatory | Type                       | Description                                                                |
|------------|-----------|----------------------------|----------------------------------------------------------------------------|
| kind       | Yes       | String                     | API type. The value is fixed at <b>WorkFlowTask</b> and cannot be changed. |
| apiVersion | Yes       | String                     | API version. The value is fixed at <b>v3</b> and cannot be changed.        |
| spec       | Yes       | <b>WorkFlowSpec</b> object |                                                                            |

**Table 4-884** WorkFlowSpec

| Parameter      | Mandatory | Type   | Description                                                                                                                                              |
|----------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterID      | No        | String | Cluster ID, which uniquely identifies a resource. The value is automatically generated after the object is created. A custom value will not take effect. |
| clusterVersion | No        | String | Current version of the cluster to be upgraded                                                                                                            |
| targetVersion  | Yes       | String | Target version of the cluster                                                                                                                            |

## Response Parameters

Status code: 201

**Table 4-885** Response body parameters

| Parameter  | Type                         | Description                                                                                                                                                                                     |
|------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                       | API type. The value is fixed at <b>WorkFlowTask</b> and cannot be changed.                                                                                                                      |
| apiVersion | String                       | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                                                                                             |
| metadata   | <b>Metadata</b> object       | Upgrade process metadata                                                                                                                                                                        |
| spec       | <b>WorkFlowSpec</b> object   | Element type of the collection class. The main body of the cluster upgrade process is provided in <b>spec</b> . CCE creates or updates objects by defining or updating <b>spec</b> .            |
| status     | <b>WorkFlowStatus</b> object | Element type of the collection class, which is used to record the current status of the cluster upgrade process, including the execution status of each process in the cluster upgrade process. |

**Table 4-886** Metadata

**Table 4-889** PointStatus

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                     |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskType        | String | Cluster upgrade task type. Options: <b>Cluster</b> : a cluster upgrade task <b>PreCheck</b> : a cluster pre-upgrade check task <b>Rollback</b> : a cluster rollback task <b>Snapshot</b> : a cluster upgrade snapshot task <b>PostCheck</b> : a cluster post-upgrade check task |
| taskID          | String | Upgrade task ID                                                                                                                                                                                                                                                                 |
| status          | String | Cluster upgrade status. Options: <b>Init</b> : The task is in the initial state. <b>Queuing</b> : The task is in the execution queue. <b>Running</b> : The task is being executed. <b>Success</b> : The task has been executed. <b>Failed</b> : Executing the task failed.      |
| startTimeStamp  | String | Start time of the upgrade task                                                                                                                                                                                                                                                  |
| endTimeStamp    | String | End time of the upgrade task                                                                                                                                                                                                                                                    |
| expireTimeStamp | String | Expiration time of the upgrade task (only for pre-upgrade check tasks)                                                                                                                                                                                                          |

**Table 4-890 LineStatus**

| Parameter  | Type   | Description                                                                               |
|------------|--------|-------------------------------------------------------------------------------------------|
| startPoint | String | Path startpoint                                                                           |
| endPoint   | String | Path endpoint                                                                             |
| critical   | String | Whether it is a key path. An upgrade can be canceled only after the key path is executed. |

## Example Requests

Enable the process of upgrading a cluster to v1.23.

```
POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/upgradeworkflows

{
  "kind" : "WorkFlowTask",
  "apiVersion" : "v3",
  "spec" : {
    "targetVersion" : "v1.23"
  }
}
```

## Example Responses

**Status code: 201**

The upgrade process is created in the specified cluster.

```
{
  "kind" : "WorkFlowTask",
  "apiVersion" : "v3",
  "metadata" : {
    "uid" : "5ddffddfe-87db-11ec-b5e5-0255ac111914"
  },
  "spec" : {
    "clusterID" : "b4b9e60f-8aa2-11ee-af09-0255ac10004f",
    "clusterVersion" : "v1.17.17-r0",
    "targetVersion" : "v1.19.16-r80"
  },
  "status" : {
    "pointStatuses" : [ {

## Status Codes

| Status Code | Description                                              |
|-------------|----------------------------------------------------------|
| 201         | The upgrade process is created in the specified cluster. |

## Error Codes

See [Error Codes](#).

### 4.7.17 Obtaining a List of Upgrade Workflows

#### Function

Obtain a list of historical cluster upgrade booting tasks.

#### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgradeworkflows

**Table 4-891** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-892** Request header parameters

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| Content-Type | Yes       | String | Message body type (format). |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-893** Response body parameters

| Parameter  | Type                                   | Description                                                         |
|------------|----------------------------------------|---------------------------------------------------------------------|
| kind       | String                                 | API type. The value is fixed at <b>List</b> and cannot be changed.  |
| apiVersion | String                                 | API version. The value is fixed at <b>v3</b> and cannot be changed. |
| items      | <a href="#">UpgradeWorkFlow</a> object |                                                                     |

**Table 4-894** UpgradeWorkFlow

| Parameter  | Type                                  | Description                                                                                                                                                                                     |
|------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                                | API type. The value is fixed at <b>WorkFlowTask</b> and cannot be changed.                                                                                                                      |
| apiVersion | String                                | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                                                                                             |
| metadata   | <a href="#">Metadata</a> object       | Upgrade process metadata                                                                                                                                                                        |
| spec       | <a href="#">WorkFlowSpec</a> object   | Element type of the collection class. The main body of the cluster upgrade process is provided in <b>spec</b> . CCE creates or updates objects by defining or updating <b>spec</b> .            |
| status     | <a href="#">WorkFlowStatus</a> object | Element type of the collection class, which is used to record the current status of the cluster upgrade process, including the execution status of each process in the cluster upgrade process. |

**Table 4-895** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-896** WorkFlowSpec

| Parameter      | Type   | Description                                                                                                                                              |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterID      | String | Cluster ID, which uniquely identifies a resource. The value is automatically generated after the object is created. A custom value will not take effect. |
| clusterVersion | String | Current version of the cluster to be upgraded                                                                                                            |
| targetVersion  | String | Target version of the cluster                                                                                                                            |

**Table 4-897** WorkFlowStatus

| Parameter     | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                              | Execution status of the cluster upgrade process. Options: <b>Init</b> : No task is running in the upgrade process. <b>Running</b> : Some tasks in the upgrade process are being executed. <b>Pending</b> : A task in the upgrade process fails to be executed. <b>Success</b> : All tasks in the upgrade process have been executed. <b>Cancel</b> : The upgrade process has been canceled. |
| pointStatuses | Array of <b>PointStatus</b> objects | Execution status of each task in the upgrade process                                                                                                                                                                                                                                                                                                                                        |
| lineStatuses  | Array of <b>LineStatus</b> objects  | Task execution path of the upgrade process                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-898** PointStatus

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                     |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskType        | String | Cluster upgrade task type. Options: <b>Cluster</b> : a cluster upgrade task <b>PreCheck</b> : a cluster pre-upgrade check task <b>Rollback</b> : a cluster rollback task <b>Snapshot</b> : a cluster upgrade snapshot task <b>PostCheck</b> : a cluster post-upgrade check task |
| taskID          | String | Upgrade task ID                                                                                                                                                                                                                                                                 |
| status          | String | Cluster upgrade status. Options: <b>Init</b> : The task is in the initial state. <b>Queuing</b> : The task is in the execution queue. <b>Running</b> : The task is being executed. <b>Success</b> : The task has been executed. <b>Failed</b> : Executing the task failed.      |
| startTimeStamp  | String | Start time of the upgrade task                                                                                                                                                                                                                                                  |
| endTimeStamp    | String | End time of the upgrade task                                                                                                                                                                                                                                                    |
| expireTimeStamp | String | Expiration time of the upgrade task (only for pre-upgrade check tasks)                                                                                                                                                                                                          |

**Table 4-899** LineStatus

| Parameter  | Type   | Description                                                                               |
|------------|--------|-------------------------------------------------------------------------------------------|
| startPoint | String | Path startpoint                                                                           |
| endPoint   | String | Path endpoint                                                                             |
| critical   | String | Whether it is a key path. An upgrade can be canceled only after the key path is executed. |

## Example Requests

None

## Example Responses

### Status code: 200

The list of historical cluster upgrade booting tasks is obtained.

## 4.7.18 Obtaining Details About a Specified Cluster Upgrade Task

### Function

This API is used to obtain details about an upgrade booting task based on the task ID.

## URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgradeworkflows/{upgrade\_workflow\_id}

**Table 4-900** Path Parameters

| Parameter           | Mandatory | Type   | Description                                                                                                                              |
|---------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| project_id          | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .                     |
| cluster_id          | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> .                     |
| upgrade_workflow_id | Yes       | String | Booting process ID of a cluster upgrade task. For details about how to obtain the ID, see <a href="#">Obtaining API URI Parameters</a> . |

## Request Parameters

**Table 4-901** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

**Status code: 200**

**Table 4-902** Response body parameters

| Parameter  | Type                         | Description                                                                                                                                                                                     |
|------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                       | API type. The value is fixed at <b>WorkFlowTask</b> and cannot be changed.                                                                                                                      |
| apiVersion | String                       | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                                                                                             |
| metadata   | <b>Metadata</b> object       | Upgrade process metadata                                                                                                                                                                        |
| spec       | <b>WorkFlowSpec</b> object   | Element type of the collection class. The main body of the cluster upgrade process is provided in <b>spec</b> . CCE creates or updates objects by defining or updating <b>spec</b> .            |
| status     | <b>WorkFlowStatus</b> object | Element type of the collection class, which is used to record the current status of the cluster upgrade process, including the execution status of each process in the cluster upgrade process. |

**Table 4-903** Metadata

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| uid               | String              | Unique ID.                                                                             |
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-904** WorkFlowSpec

| Parameter      | Type   | Description                                                                                                                                              |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterID      | String | Cluster ID, which uniquely identifies a resource. The value is automatically generated after the object is created. A custom value will not take effect. |
| clusterVersion | String | Current version of the cluster to be upgraded                                                                                                            |

| Parameter     | Type   | Description                   |
|---------------|--------|-------------------------------|
| targetVersion | String | Target version of the cluster |

**Table 4-905** WorkFlowStatus

| Parameter     | Type                                         | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                                       | Execution status of the cluster upgrade process. Options: <b>Init</b> : No task is running in the upgrade process. <b>Running</b> : Some tasks in the upgrade process are being executed. <b>Pending</b> : A task in the upgrade process fails to be executed. <b>Success</b> : All tasks in the upgrade process have been executed. <b>Cancel</b> : The upgrade process has been canceled. |
| pointStatuses | Array of <a href="#">PointStatus</a> objects | Execution status of each task in the upgrade process                                                                                                                                                                                                                                                                                                                                        |
| lineStatuses  | Array of <a href="#">LineStatus</a> objects  | Task execution path of the upgrade process                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-906** PointStatus

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                     |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskType        | String | Cluster upgrade task type. Options: <b>Cluster</b> : a cluster upgrade task <b>PreCheck</b> : a cluster pre-upgrade check task <b>Rollback</b> : a cluster rollback task <b>Snapshot</b> : a cluster upgrade snapshot task <b>PostCheck</b> : a cluster post-upgrade check task |
| taskID          | String | Upgrade task ID                                                                                                                                                                                                                                                                 |
| status          | String | Cluster upgrade status. Options: <b>Init</b> : The task is in the initial state. <b>Queuing</b> : The task is in the execution queue. <b>Running</b> : The task is being executed. <b>Success</b> : The task has been executed. <b>Failed</b> : Executing the task failed.      |
| startTimeStamp  | String | Start time of the upgrade task                                                                                                                                                                                                                                                  |
| endTimeStamp    | String | End time of the upgrade task                                                                                                                                                                                                                                                    |
| expireTimeStamp | String | Expiration time of the upgrade task (only for pre-upgrade check tasks)                                                                                                                                                                                                          |

**Table 4-907 LineStatus**

| Parameter  | Type   | Description                                                                               |
|------------|--------|-------------------------------------------------------------------------------------------|
| startPoint | String | Path startpoint                                                                           |
| endPoint   | String | Path endpoint                                                                             |
| critical   | String | Whether it is a key path. An upgrade can be canceled only after the key path is executed. |

## Example Requests

None

## Example Responses

### Status code: 200

Details about the cluster upgrade task are obtained.

See [Error Codes](#).

## 4.7.19 Updating the Status of a Specified Cluster Upgrade Booting Task

### Function

This API is used to update the status of a specified cluster upgrade booting task. This API applies only to the upgrade cancellation process. When this API is called, the status of the upgrade process booting task cannot be **running**, **success**, or **cancel**, and the status of the upgrade subtask cannot be **running**, **init**, **pause**, or **queue**.

### URI

PATCH /api/v3/projects/{project\_id}/clusters/{cluster\_id}/operation/upgradeworkflows/{upgrade\_workflow\_id}

**Table 4-908** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

| Parameter           | Mandatory | Type   | Description                                                                                                                              |
|---------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| upgrade_workflow_id | Yes       | String | Booting process ID of a cluster upgrade task. For details about how to obtain the ID, see <a href="#">Obtaining API URI Parameters</a> . |

## Request Parameters

**Table 4-909** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-910** Request body parameters

| Parameter | Mandatory | Type                          | Description                                                    |
|-----------|-----------|-------------------------------|----------------------------------------------------------------|
| status    | No        | <a href="#">status</a> object | Updated workflow status.<br>(Only <b>Cancel</b> is supported.) |

**Table 4-911** status

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase     | No        | String | Execution status of the cluster upgrade process. Options: <b>Init</b> : No task is running in the upgrade process. <b>Running</b> : Some tasks in the upgrade process are being executed. <b>Pending</b> : A task in the upgrade process fails to be executed. <b>Success</b> : All tasks in the upgrade process have been executed. <b>Cancel</b> : The upgrade process has been canceled. |

## Response Parameters

Status code: 200

**Table 4-912** Response body parameters

| Parameter  | Type                                  | Description                                                                                                                                                                                     |
|------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind       | String                                | API type. The value is fixed at <b>WorkFlowTask</b> and cannot be changed.                                                                                                                      |
| apiVersion | String                                | API version. The value is fixed at <b>v3</b> and cannot be changed.                                                                                                                             |
| metadata   | <a href="#">Metadata object</a>       | Upgrade process metadata                                                                                                                                                                        |
| spec       | <a href="#">WorkFlowSpec object</a>   | Element type of the collection class. The main body of the cluster upgrade process is provided in <b>spec</b> . CCE creates or updates objects by defining or updating <b>spec</b> .            |
| status     | <a href="#">WorkFlowStatus object</a> | Element type of the collection class, which is used to record the current status of the cluster upgrade process, including the execution status of each process in the cluster upgrade process. |

**Table 4-913** Metadata

| Parameter | Type   | Description |
|-----------|--------|-------------|
| uid       | String | Unique ID.  |

| Parameter         | Type                | Description                                                                            |
|-------------------|---------------------|----------------------------------------------------------------------------------------|
| name              | String              | Resource name                                                                          |
| labels            | Map<String, String> | Resource labels in key-value pairs. This is a reserved field and does not take effect. |
| annotations       | Map<String, String> | Resource annotations in the format of key-value pairs.                                 |
| updateTimestamp   | String              | Update time.                                                                           |
| creationTimestamp | String              | Creation time.                                                                         |

**Table 4-914** WorkFlowSpec

| Parameter      | Type   | Description                                                                                                                                              |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterID      | String | Cluster ID, which uniquely identifies a resource. The value is automatically generated after the object is created. A custom value will not take effect. |
| clusterVersion | String | Current version of the cluster to be upgraded                                                                                                            |
| targetVersion  | String | Target version of the cluster                                                                                                                            |

**Table 4-915** WorkFlowStatus

| Parameter     | Type                                         | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phase         | String                                       | Execution status of the cluster upgrade process. Options: <b>Init</b> : No task is running in the upgrade process. <b>Running</b> : Some tasks in the upgrade process are being executed. <b>Pending</b> : A task in the upgrade process fails to be executed. <b>Success</b> : All tasks in the upgrade process have been executed. <b>Cancel</b> : The upgrade process has been canceled. |
| pointStatuses | Array of <a href="#">PointStatus</a> objects | Execution status of each task in the upgrade process                                                                                                                                                                                                                                                                                                                                        |
| lineStatuses  | Array of <a href="#">LineStatus</a> objects  | Task execution path of the upgrade process                                                                                                                                                                                                                                                                                                                                                  |

**Table 4-916 PointStatus**

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                     |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskType        | String | Cluster upgrade task type. Options: <b>Cluster</b> : a cluster upgrade task <b>PreCheck</b> : a cluster pre-upgrade check task <b>Rollback</b> : a cluster rollback task <b>Snapshot</b> : a cluster upgrade snapshot task <b>PostCheck</b> : a cluster post-upgrade check task |
| taskID          | String | Upgrade task ID                                                                                                                                                                                                                                                                 |
| status          | String | Cluster upgrade status. Options: <b>Init</b> : The task is in the initial state. <b>Queuing</b> : The task is in the execution queue. <b>Running</b> : The task is being executed. <b>Success</b> : The task has been executed. <b>Failed</b> : Executing the task failed.      |
| startTimeStamp  | String | Start time of the upgrade task                                                                                                                                                                                                                                                  |
| endTimeStamp    | String | End time of the upgrade task                                                                                                                                                                                                                                                    |
| expireTimeStamp | String | Expiration time of the upgrade task (only for pre-upgrade check tasks)                                                                                                                                                                                                          |

**Table 4-917 LineStatus**

| Parameter  | Type   | Description                                                                               |
|------------|--------|-------------------------------------------------------------------------------------------|
| startPoint | String | Path startpoint                                                                           |
| endPoint   | String | Path endpoint                                                                             |
| critical   | String | Whether it is a key path. An upgrade can be canceled only after the key path is executed. |

## Example Requests

Cancel the upgrade process.

```
PATCH /api/v3/projects/47eb1d64cbeb45cfa01ae20af4f4b563/clusters/  
f9960c6b-8e60-11ee-9754-0255ac100b05/operation/upgradeworkflows/

|-------------|------------------------------------------------------------|
| 200         | The status of the cluster upgrade booting task is updated. |

## Error Codes

See [Error Codes](#).

## 4.8 Quota Management

### 4.8.1 Querying Resource Quotas

#### Function

This API is used to query CCE resource quotas.

#### URI

GET /api/v3/projects/{project\_id}/quotas

**Table 4-918** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-919** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

#### Response Parameters

**Status code:** 200

**Table 4-920** Response body parameters

| Parameter | Type                                              | Description |
|-----------|---------------------------------------------------|-------------|
| quotas    | Array of<br><a href="#">QuotaResource</a> objects | Resources   |

**Table 4-921** QuotaResource

| Parameter          | Type    | Description                                                |
|--------------------|---------|------------------------------------------------------------|
| quotaKey           | String  | Resource type                                              |
| quotaLimit         | Integer | Quota                                                      |
| used               | Integer | Number of created resources                                |
| unit               | String  | Unit                                                       |
| regionId           | String  | Region ID. This parameter is not returned if not involved. |
| availabilityZoneId | String  | AZ ID. This parameter is not returned if not involved.     |

## Example Requests

None

## Example Responses

### Status code: 200

The resource quotas are obtained successfully.

```
{  
    "quotas": [ {  
        "quotaKey": "cluster",  
        "quotaLimit": 20,  
        "used": 13,  
        "unit": "count"  
    } ]  
}
```

## Status Codes

| Status Code | Description                                    |
|-------------|------------------------------------------------|
| 200         | The resource quotas are obtained successfully. |

# 4.9 API Versions

## 4.9.1 Obtaining API Versions

### Function

This API is used to query the list of API versions supported by CCE.

### URI

GET /

### Request Parameters

None

### Response Parameters

Status code: 200

**Table 4-922** Response body parameters

| Parameter | Type                                              | Description       |
|-----------|---------------------------------------------------|-------------------|
| versions  | Array of <a href="#">APIVersionDetail</a> objects | API version list. |

**Table 4-923** APIVersionDetail

| Parameter   | Type                                            | Description                                                                                                                                                                             |
|-------------|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id          | String                                          | API version ID. Example: v3                                                                                                                                                             |
| links       | Array of <a href="#">APIVersionLink</a> objects | URL of the API version.                                                                                                                                                                 |
| min_version | String                                          | Microversion. If the APIs of this version support microversions, set this parameter to the supported minimum microversion. If no microversion is supported, leave this parameter blank. |

| Parameter | Type   | Description                                                                                                                                                                                                                                                              |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | String | API version status. Possible values: <ul style="list-style-type: none"><li>• <b>CURRENT</b>: preferred API version</li><li>• <b>SUPPORTED</b>: old API version that is still supported</li><li>• <b>DEPRECATED</b>: discarded API version that will be deleted</li></ul> |
| updated   | String | Time when the API was released (UTC). For example, if the API version is v3, the value is '2018-09-15 00:00:00Z'.                                                                                                                                                        |
| version   | String | Microversion. If the APIs of this version support microversions, set this parameter to the supported maximum microversion. If no microversion is supported, leave this parameter blank.                                                                                  |

**Table 4-924 APIVersionLink**

| Parameter | Type   | Description                                                                                                                      |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------|
| href      | String | URL of the API version.                                                                                                          |
| rel       | String | Link attributes. <b>self</b> : A self link contains a versioned link to the resource. Use these links immediately after linking. |

## Example Requests

None

## Example Responses

### Status code: 200

The API version list is queried successfully.

```
{  
  "versions" : [ {  
    "id" : "v3",  
    "links" : [ {  
      "href" : "https://cce.region.***.com/v3",  
      "rel" : "self"  
    } ],  
    "min_version" : "",  
    "status" : "CURRENT",  
    "updated" : "2018-09-15 00:00:00Z",  
    "version" : ""  
  } ]  
}
```

## Status Codes

# 4.10 Tag Management

## 4.10.1 Adding Resource Tags to a Specified Cluster in Batches

### Function

This API is used to add resource tags for a specified cluster in batches.

#### NOTE

- Each cluster supports a maximum of 20 resource tags.
- This API is idempotent. If the to-be-added tag has the same tag key and tag value as an existing tag, the tag will be added. If the to-be-added tag has the same key but different value as an existing tag, the tag will overwrite the existing one.

### URI

POST /api/v3/projects/{project\_id}/clusters/{cluster\_id}/tags/create

**Table 4-925** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-926** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-927** Request body parameters

| Parameter | Mandatory | Type                                         | Description                                                                                       |
|-----------|-----------|----------------------------------------------|---------------------------------------------------------------------------------------------------|
| tags      | Yes       | Array of <a href="#">ResourceTag</a> objects | List of cluster resource tags to be created. Each cluster supports a maximum of 20 resource tags. |

## 4.11 Configuration Management

### 4.11.1 Obtaining the Parameters That Can Be Configured for a Node Pool

#### Function

This API is used to obtain the parameters that can be configured in a specified CCE node pool.

#### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodepools/{nodepool\_id}/configuration/detail

**Table 4-933** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                          |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id  | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| nodepool_id | Yes       | String | Node pool ID.                                                                                                        |

#### Request Parameters

**Table 4-934** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-935** Response body parameters

| Parameter          | Type                                            | Description                                               |
|--------------------|-------------------------------------------------|-----------------------------------------------------------|
| kube-apiserver     | Array of <a href="#">PackageOptions</a> objects | Configuration parameter, which consists of key and value. |
| {User defined key} | map<string, array>                              |                                                           |

**Table 4-936** PackageOptions

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                   |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String  | Parameter name                                                                                                                                                                                                                                                                                                                |
| default   | String  | Default parameter value. If this parameter is not specified, the default value will take effect. The returned parameter can be of integer, string, or Boolean type.                                                                                                                                                           |
| validAt   | String  | How the parameter takes effect. Options: <ul style="list-style-type: none"><li>• <b>static</b>: The parameter takes effect when a node is created and cannot be modified later.</li><li>• <b>immediately</b>: The parameter can be modified when a node is running and takes effect immediately after modification.</li></ul> |
| empty     | Boolean | Whether the configuration item can be empty. Options: <ul style="list-style-type: none"><li>• <b>true</b>: If this parameter is set to <b>true</b>, no value will take effect.</li><li>• <b>false</b>: If this parameter is set to <b>false</b>, the default value will take effect.</li></ul>                                |
| schema    | String  | Parameter category                                                                                                                                                                                                                                                                                                            |
| type      | String  | Parameter type                                                                                                                                                                                                                                                                                                                |

## 4.11.2 Obtaining the List of Parameters That Can Be Configured for a Cluster

### Function

This API is used to obtain the list of parameters that can be configured for a CCE cluster.

### URI

GET /api/v3/projects/{project\_id}/clusters/{cluster\_id}/configuration/detail

**Table 4-937** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-938** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-939** Response body parameters

| Parameter          | Type                                            | Description                                               |
|--------------------|-------------------------------------------------|-----------------------------------------------------------|
| kube-apiserver     | Array of <a href="#">PackageOptions</a> objects | Configuration parameter, which consists of key and value. |
| {User defined key} | map<string, array>                              |                                                           |

**Table 4-940** PackageOptions

| Parameter | Type   | Description    |
|-----------|--------|----------------|
| name      | String | Parameter name |

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                   |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default   | String  | Default parameter value. If this parameter is not specified, the default value will take effect. The returned parameter can be of integer, string, or Boolean type.                                                                                                                                                           |
| validAt   | String  | How the parameter takes effect. ## 4.11.4 Changing the Values of Configuration Parameters of a Node Pool

### Function

This API is used to change the values of parameter configurations of a node pool in the CCE cluster.

### URI

PUT /api/v3/projects/{project\_id}/clusters/{cluster\_id}/nodepools/{nodepool\_id}/configuration

**Table 4-948** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                          |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| cluster_id  | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |
| nodepool_id | Yes       | String | Node pool ID.                                                                                                        |

## Request Parameters

**Table 4-949** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-950** Request body parameters

| Parameter  | Mandatory | Type                                             | Description                                            |
|------------|-----------|--------------------------------------------------|--------------------------------------------------------|
| apiVersion | Yes       | String                                           | API version. The value is fixed at <b>v3</b> .         |
| kind       | Yes       | String                                           | API type. The value is fixed at <b>Configuration</b> . |
| metadata   | Yes       | <a href="#">ConfigurationMetadata object</a>     | Configuration metadata                                 |
| spec       | Yes       | <a href="#">ClusterConfigurationsSpec object</a> | Configuration specifications                           |

**Table 4-951** ConfigurationMetadata

| Parameter | Mandatory | Type   | Description        |
|-----------|-----------|--------|--------------------|
| name      | Yes       | String | Configuration name |

| Parameter | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| labels    | No        | Map<String, String> | A configuration label in a key-value pair. <ul style="list-style-type: none"><li>• <b>Key:</b> Enter 1 to 63 characters, starting with a letter or digit. ## Example Requests

The following example describes how to update the **system-reserved-mem** and **kube-reserved-mem** parameters in kubelet.

```
/api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}/configuration

{
  "kind": "Configuration",
  "apiVersion": "v3",
  "metadata": {
    "name": "configuration"
  },
  "spec": {
    "packages": [
      {
        "name": "kubelet",
        "configurations": [
          {
            "name": "system-reserved-mem",
            "value": 600
          },
          {
            "name": "kube-reserved-mem",
            "value": 800
          }
        ]
      }
    ]
  }
}
```

## Example Responses

**Status code: 200**

The parameter configurations of the node pool are updated successfully.

# 4.12 Chart Management

## 4.12.1 Uploading a Chart

### Function

This API is used to upload a chart.

### URI

POST /v2/charts

### Request Parameters

**Table 4-960** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-961** FormData parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameters | No        | String | Parameter configurations for uploading a chart. The following is an example:<br>{"override":true,"skip_lint":true,"source":"package"}<br>• skip_lint: whether lint uploaded chart - override: whether override existed chart - visible: update chart visible |
| content    | Yes       | File   | Chart package file                                                                                                                                                                                                                                           |

## Response Parameters

Status code: 201

**Table 4-962** Response body parameters

| Parameter   | Type    | Description                 |
|-------------|---------|-----------------------------|
| id          | String  | Chart ID                    |
| name        | String  | Chart name                  |
| values      | String  | Chart value                 |
| translate   | String  | Chart translation resources |
| instruction | String  | Chart description           |
| version     | String  | Chart version               |
| description | String  | Chart description           |
| source      | String  | Chart source                |
| icon_url    | String  | URL to chart icons          |
| public      | Boolean | Whether the chart is public |
| chart_url   | String  | URL to the chart            |
| create_at   | String  | Created at                  |
| update_at   | String  | Updated at                  |

## Example Requests

POST /v2/charts

```
{  
  "parameters": "{\"override\":true,\"skip_lint\":true,\"source\":\"package\"}",  
  "content": "chart-file.tgz"  
}
```

## 4.12.5 Creating a Release

### Function

This API is used to create a release.

### URI

POST /cce/cam/v3/clusters/{cluster\_id}/releases

**Table 4-975** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-976** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-977** Request body parameters

| Parameter   | Mandatory | Type                                        | Description                                |
|-------------|-----------|---------------------------------------------|--------------------------------------------|
| chart_id    | Yes       | String                                      | Chart ID                                   |
| description | No        | String                                      | Release description                        |
| name        | Yes       | String                                      | Release name                               |
| namespace   | Yes       | String                                      | Namespace to which a chart release belongs |
| version     | Yes       | String                                      | Release version                            |
| parameters  | No        | <a href="#">ReleaseReqBodyParams object</a> | Release parameters                         |
| values      | Yes       | <a href="#">values object</a>               | Release value                              |

**Table 4-978** ReleaseReqBodyParams

| Parameter       | Mandatory | Type    | Description                                                                                            |
|-----------------|-----------|---------|--------------------------------------------------------------------------------------------------------|
| dry_run         | No        | Boolean | After this function is enabled, only chart parameters are verified, and installation is not performed. |
| name_template   | No        | String  | Release name template                                                                                  |
| no_hooks        | No        | Boolean | Whether to disable hooks during installation                                                           |
| replace         | No        | Boolean | Whether to replace the release with the same name                                                      |
| recreate        | No        | Boolean | Whether to rebuild the release                                                                         |
| reset_values    | No        | Boolean | Whether to reset values during an update                                                               |
| release_version | No        | Integer | Version of the rollback release                                                                        |
| include_hooks   | No        | Boolean | Enable hooks during an update or deletion.                                                             |

**Table 4-979** values

| Parameter       | Mandatory | Type   | Description       |
|-----------------|-----------|--------|-------------------|
| imagePullPolicy | No        | String | Image pull policy |
| imageTag        | No        | String | Image tag         |

## Response Parameters

Status code: 201

**Table 4-980** Response body parameters

| Parameter          | Type    | Description                                |
|--------------------|---------|--------------------------------------------|
| chart_name         | String  | Chart name                                 |
| chart_public       | Boolean | Whether the chart is public                |
| chart_version      | String  | Chart version                              |
| cluster_id         | String  | Cluster ID                                 |
| cluster_name       | String  | Current name                               |
| create_at          | String  | Created at                                 |
| description        | String  | Release description                        |
| name               | String  | Release name                               |
| namespace          | String  | Namespace to which a chart release belongs |
| parameters         | String  | Release parameters                         |
| resources          | String  | Resources required by the release          |
| status             | String  | Release status                             |
| status_description | String  | Release status description                 |
| update_at          | String  | Updated at                                 |
| values             | String  | Release value                              |
| version            | Integer | Release version                            |

## Example Requests

```
POST /cce/cam/v3/clusters/{cluster_id}/releases
```

```
{  
    "name" : "nino21",  
    "namespace" : "project01",  
}

### 4.12.7 Updating a Release

#### Function

This API is used to update a release.

#### URI

PUT /cce/cam/v3/clusters/{cluster\_id}/namespace/{namespace}/releases/{name}

**Table 4-983** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| name       | Yes       | String | Release name                                                                                                         |
| namespace  | Yes       | String | Namespace of the chart                                                                                               |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

#### Request Parameters

**Table 4-984** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

**Table 4-985** Request body parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| chart_id  | Yes       | String | Chart ID    |

| Parameter  | Mandatory | Type                                        | Description                                                      |
|------------|-----------|---------------------------------------------|------------------------------------------------------------------|
| action     | Yes       | String                                      | <b>upgrade</b> for an upgrade and <b>rollback</b> for a rollback |
| parameters | Yes       | <a href="#">ReleaseReqBodyParams object</a> | Release parameters                                               |
| values     | Yes       | <a href="#">values object</a>               | Release value                                                    |

**Table 4-986 ReleaseReqBodyParams**

| Parameter       | Mandatory | Type    | Description                                                                                            |
|-----------------|-----------|---------|--------------------------------------------------------------------------------------------------------|
| dry_run         | No        | Boolean | After this function is enabled, only chart parameters are verified, and installation is not performed. |
| name_template   | No        | String  | Release name template                                                                                  |
| no_hooks        | No        | Boolean | Whether to disable hooks during installation                                                           |
| replace         | No        | Boolean | Whether to replace the release with the same name                                                      |
| recreate        | No        | Boolean | Whether to rebuild the release                                                                         |
| reset_values    | No        | Boolean | Whether to reset values during an update                                                               |
| release_version | No        | Integer | Version of the rollback release                                                                        |
| include_hooks   | No        | Boolean | Enable hooks during an update or deletion.                                                             |

**Table 4-987 values**

| Parameter       | Mandatory | Type   | Description       |
|-----------------|-----------|--------|-------------------|
| imagePullPolicy | No        | String | Image pull policy |
| imageTag        | No        | String | Image tag         |

## Response Parameters

**Table 4-988** Response body parameters

| Parameter          | Type    | Description                                |
|--------------------|---------|--------------------------------------------|
| chart_name         | String  | Chart name                                 |
| chart_public       | Boolean | Whether the chart is public                |
| chart_version      | String  | Chart version                              |
| cluster_id         | String  | Cluster ID                                 |
| cluster_name       | String  | Current name                               |
| create_at          | String  | Created at                                 |
| description        | String  | Release description                        |
| name               | String  | Release name                               |
| namespace          | String  | Namespace to which a chart release belongs |
| parameters         | String  | Release parameters                         |
| resources          | String  | Resources required by the release          |
| status             | String  | Release status                             |
| status_description | String  | Release status description                 |
| update_at          | String  | Updated at                                 |
| values             | String  | Release value                              |
| version            | Integer | Release version                            |

## Example Requests

```
PUT /cce/cam/v3/clusters/{cluster_id}/namespace/{namespace}/releases/{name}

### 4.12.8 Obtaining a Chart

#### Function

This API is used to obtain a chart.

#### URI

GET /v2/charts/{chart\_id}

**Table 4-989** Path Parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| chart_id  | Yes       | String | Chart ID    |

## Request Parameters

**Table 4-990** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-991** Response body parameters

| Parameter   | Type    | Description                 |
|-------------|---------|-----------------------------|
| id          | String  | Chart ID                    |
| name        | String  | Chart name                  |
| values      | String  | Chart value                 |
| translate   | String  | Chart translation resources |
| instruction | String  | Chart description           |
| version     | String  | Chart version               |
| description | String  | Chart description           |
| source      | String  | Chart source                |
| icon_url    | String  | URL to chart icons          |
| public      | Boolean | Whether the chart is public |
| chart_url   | String  | URL to the chart            |

| Parameter | Type   | Description |
|-----------|--------|-------------|
| create_at | String | Created at  |
| update_at | String | Updated at  |

## 4.12.12 Obtaining Chart Values

### Function

This API is used to obtain chart values.

## URI

GET /v2/charts/{chart\_id}/values

**Table 4-1000** Path Parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| chart_id  | Yes       | String | Chart ID    |

## Request Parameters

**Table 4-1001** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

Status code: 200

**Table 4-1002** Response body parameters

| Parameter | Type                | Description                                                           |
|-----------|---------------------|-----------------------------------------------------------------------|
| values    | Map<String, Object> | Data in <b>values.yaml</b> . The data structure depends on the chart. |

## Example Requests

None

## Example Responses

Status code: 200

### 4.12.13 Obtaining Historical Records of a Release

#### Function

This API is used to obtain historical records of a release.

#### URI

GET /cce/cam/v3/clusters/{cluster\_id}/namespace/{namespace}/releases/{name}/history

**Table 4-1003 Path Parameters**

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| name       | Yes       | String | Release name                                                                                                         |
| namespace  | Yes       | String | Namespace of the chart                                                                                               |
| cluster_id | Yes       | String | Cluster ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

## Request Parameters

**Table 4-1004** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

## Response Parameters

**Status code: 200**

**Table 4-1005** Response body parameters

| Parameter | Type                                         | Description |
|-----------|----------------------------------------------|-------------|
| [items]   | Array of <a href="#">ReleaseResp</a> objects | OK          |

**Table 4-1006** ReleaseResp

| Parameter     | Type    | Description                                |
|---------------|---------|--------------------------------------------|
| chart_name    | String  | Chart name                                 |
| chart_public  | Boolean | Whether the chart is public                |
| chart_version | String  | Chart version                              |
| cluster_id    | String  | Cluster ID                                 |
| cluster_name  | String  | Current name                               |
| create_at     | String  | Created at                                 |
| description   | String  | Release description                        |
| name          | String  | Release name                               |
| namespace     | String  | Namespace to which a chart release belongs |
| parameters    | String  | Release parameters                         |

| Parameter          | Type    | Description                       |
|--------------------|---------|-----------------------------------|
| resources          | String  | Resources required by the release |
| status             | String  | Release status                    |
| status_description | String  | Release status description        |
| update_at          | String  | Updated at                        |
| values             | String  | Release value                     |
| version            | Integer | Release version                   |

## 4.12.14 Obtaining the Quota of a User Chart

### Function

This API is used to obtain the quota of a user chart.

### URI

GET /v2/charts/{project\_id}/quotas

**Table 4-1007** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the value, see <a href="#">How to Obtain Parameters in the API URI</a> . |

### Request Parameters

**Table 4-1008** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|--------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format).                                                                                                                                                                                                                   |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a User Token</a> . |

### Response Parameters

Status code: 200

**Table 4-1009** Response body parameters

| Parameter | Type                          | Description |
|-----------|-------------------------------|-------------|
| quotas    | <a href="#">quotas</a> object | Chart quota |

**Table 4-1010** quotas

| Parameter | Type                                    | Description |
|-----------|-----------------------------------------|-------------|
| resources | Array of<br><b>resources</b><br>objects | Resources   |

**Table 4-1011** resources

| Parameter | Type    | Description    |
|-----------|---------|----------------|
| type      | String  | Resource type  |
| quota     | Integer | Resource quota |
| used      | Integer | Used resources |

# 5 Kubernetes APIs

## Description

Kubernetes APIs are resource-based (RESTful) programming interfaces provided through HTTP. It supports query, creation, update, and deletion of various cluster resources using standard HTTP request methods (POST, PUT, PATCH, DELETE, and GET).

CCE allows you to use native [Kubernetes APIs](#) in the following ways:

- [Calling Kubernetes APIs Through the Cluster API Server](#). It is suitable for API calls on scale thanks to its direct connection to the API Server. This is a recommended option.
- [Calling Kubernetes APIs Through API Gateway](#). It applies to small-scale API calls. API gateway flow control may be triggered when APIs are called on scale.

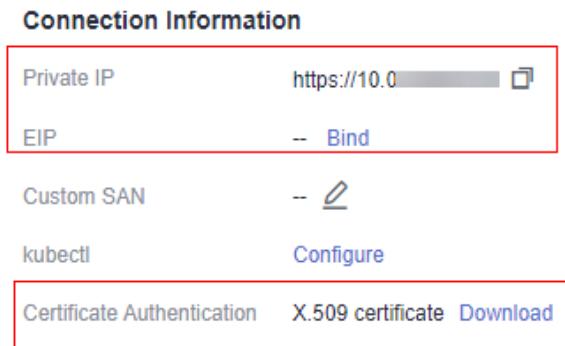

## Calling Kubernetes APIs Through the Cluster API Server

You can use the API server of a Kubernetes cluster to call Kubernetes-native APIs.

### Step 1 Obtain the cluster certificate and API server.

- Method 1: Obtain the certificate by calling the API for [obtaining the cluster certificate](#), save the returned information to the `kubeconfig.json` file, and extract the certificate, private key, and API server information. The commands are as follows:

```
# Obtain the certificate and save it as client.crt.  
cat ./kubeconfig.json |grep client-certificate-data | awk -F ""'{print $4}' | base64 -d > ./client.crt  
# Obtain the private key and save it as client.key.  
cat ./kubeconfig.json |grep client-key-data | awk -F ""'{print $4}' | base64 -d > ./client.key  
# Obtain the API server.  
cat ./kubeconfig.json |grep server | awk -F ""'{print $4}'
```
- Method 2: Query the API server address (private or public network address) on the [Cluster Information](#) page of the CCE console and download the certificate (`client.crt` and `client.key` files).

**Step 2** Call Kubernetes-native APIs using the cluster certificate.

For example, run the curl command to call an API to view pod information. In the following example, `192.168.0.198:5443` is the IP address of the cluster API server.

```
curl --cacert ./ca.crt --cert ./client.crt --key ./client.key https://192.168.0.198:5443/api/v1/namespaces/default/pods/
```

For more cluster APIs, see [Kubernetes APIs](#).

----End

## Calling Kubernetes APIs Through API Gateway

You can call Kubernetes-native APIs through API Gateway using the URL in the format of `https://{clusterid}.Endpoint/uri`. In the URL, `{clusterid}` indicates the cluster ID, and `uri` indicates the resource path, that is, the path for API access.

**Table 5-1** URL parameters

| Parameter   | Description                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| {clusterid} | Cluster ID. After a cluster is created, call the <a href="#">API for obtaining a cluster in a specified project</a> to obtain the cluster ID. |
| Endpoint    | Entry (URL) for a web service, which can be obtained from Endpoints.                                                                          |
| uri         | Access path of an API for performing an operation. Obtain the value from the URI of the API. For details, see Kubernetes API.                 |

**Step 1** Obtain the token of the region where the cluster is located. For details about how to obtain the token, see [Obtaining a Token](#).**Step 2** Obtain the cluster ID using either of the following methods:

- Method 1: Use the API for obtaining cluster information to query the cluster UID.
- Method 2: Query the cluster on the **Cluster Information** page of the CCE console.

| Basic Info         |                                              |
|--------------------|----------------------------------------------|
| Name               | cce-test                                     |
| Cluster ID         | [REDACTED]                                   |
| Type               | CCE cluster                                  |
| Cluster Version    | v1.23                                        |
| Patch Version      | v1.23.5-r0                                   |
| Status             | <span style="color: green;">●</span> Running |
| Cluster Scale      | Nodes: 50                                    |
| Created            | Jan 29, 2023 14:35:38 GMT+08:00              |
| Enterprise Project | default                                      |

**Step 3** Determine the requested URL based on the URL format **https://*{clusterid}*.Endpoint/uri**.

- **{clusterid}**: Obtain the value by using [Step 2](#).
- Endpoint: Obtaining the endpoint from the administrator.  
For example, the endpoint of CCE in the **Dublin** region is **cce.myhuaweicloud.eu**.
- **uri**: Set this parameter based on the API to be called. For example, if you want to create a Deployment, the request method is POST and the API URI is **/apis/apps/v1/namespaces/{namespace}/deployments**, where **{namespace}** indicates the cluster namespace name. In this example, the value is **default**.

For more APIs, see [Kubernetes APIs](#).

Combine the preceding parameters following the URL format **https://*{clusterid}*.Endpoint/uri**.

The following is an example of the URL for calling the API to view information about all pods:

`https://07da5****.cce.ap-southeast-3.myhuaweicloud.com/apis/apps/v1/namespaces/default/deployments`

**Step 4** Use the request method specified by the API and set the request header parameters. If parameters in the body need to be added, add the structure corresponding to the API by referring to [Kubernetes APIs](#).

Example curl command to call the API for creating a Deployment using POST and adding the corresponding body:

In this example, the **nginx.json** file is used to create a Deployment named **nginx**. The Deployment uses the **nginx:latest** image and contains two pods. Each pod occupies 100m CPU and 200 MiB memory.

```
curl --location --request POST 'https://07da5****.cce.ap-southeast-3.myhuaweicloud.com/apis/apps/v1/namespaces/default/deployments' \
--header 'Content-Type: application/json' \
--header 'X-Auth-Token: MIIWVw****' \
--data @nginx.json
```

Header parameters contained in the request are as follows:

**Table 5-2** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                              |
|--------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type | Yes       | String | Message body type (format), for example, application/json.                                                                                                                                                                               |
| X-Auth-Token | Yes       | String | Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see <a href="#">Obtaining a Token</a> . |

The content of the **nginx.json** file is as follows:

```
{  
    "apiVersion": "apps/v1",  
    "kind": "Deployment",  
    "metadata": {  
        "name": "nginx"  
    },  
    "spec": {  
        "replicas": 2,  
        "selector": {  
            "matchLabels": {  
                "app": "nginx"  
            }  
        },  
        "template": {  
            "metadata": {  
                "labels": {  
                    "app": "nginx"  
                }  
            },  
            "spec": {  
                "containers": [  
                    {  
                        "image": "nginx:latest",

# Permissions and Supported Actions

You can use Identity and Access Management (IAM) for fine-grained permissions management of your CCE clusters. If your account does not need individual IAM users, you can skip this section.

New IAM users do not have any permissions assigned by default. You need to first add them to one or more groups and attach policies or roles to these groups. Users inherit permissions from the groups to which they are added and can perform specific operations on cloud services based on the assigned permissions.

You can grant users permissions by using . Roles are provided by IAM to define service-based permissions that match users' job responsibilities. Policies define API-based permissions for operations on specific resources under certain conditions, allowing for more fine-grained, secure access control of cloud resources.

## NOTE

If you want to allow or deny the access to an API, fine-grained authorization is a good choice.

An account has all of the permissions required to call all APIs, but IAM users must have the required permissions specifically assigned. The required permissions are determined by the actions supported by the API. Only users with the permissions allowing for those actions can call the API successfully. For example, if an IAM user wants to query ECSs using an API, the user must have been granted permissions that allow the **ecs:servers:list** action.

## Supported Actions

CCE provides system-defined policies that can be directly used in IAM. You can also create custom policies to supplement system-defined policies for more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- Permissions: statements in a policy that allow or deny certain operations.
- APIs: REST APIs that can be called by a user who has been granted specific permissions.
- Actions: specific operations that are allowed or denied in a custom policy.

- Dependencies: actions which a specific action depends on. When allowing an action for a user, you also need to allow any existing action dependencies for that user.
- IAM projects/Enterprise projects: the authorization scope of a custom policy. A custom policy can be applied to IAM projects or enterprise projects or both. Policies that contain actions for both IAM and enterprise projects can be used and applied for both IAM and Enterprise Management. Policies that contain actions only for IAM projects can be used and applied to IAM only.

 NOTE

The check mark (✓) and cross symbol (✗) respectively indicate that an action takes effect or does not take effect for the corresponding type of projects.

CCE supports the following actions in custom policies.

**Table 6-1** Cluster management actions

| Permission                      | API                                                                          | Action              | IAM Project | Enterprise Project |
|---------------------------------|------------------------------------------------------------------------------|---------------------|-------------|--------------------|
| Obtaining clusters in a project | GET /api/v3/projects/{project_id}/clusters                                   | cce:cluster:list    | ✓           | ✓                  |
| Obtaining a cluster             | GET /api/v3/projects/{project_id}/clusters/{cluster_id}                      | cce:cluster:get     | ✓           | ✓                  |
| Creating a cluster              | POST /api/v3/projects/{project_id}/clusters                                  | cce:cluster:create  | ✓           | ✓                  |
| Updating a cluster              | PUT /api/v3/projects/{project_id}/clusters/{cluster_id}                      | cce:cluster:update  | ✓           | ✓                  |
| Deleting a cluster              | DELETE /api/v3/projects/{project_id}/clusters/{cluster_id}                   | cce:cluster:delete  | ✓           | ✓                  |
| Upgrading a cluster             | POST /api/v2/projects/:projectid/clusters/:clusterid/upgrade                 | cce:cluster:upgrade | ✓           | ✓                  |
| Waking up a cluster             | POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/awake     | cce:cluster:start   | ✓           | ✓                  |
| Hibernating a cluster           | POST /api/v3/projects/{project_id}/clusters/{cluster_id}/operation/hibernate | cce:cluster:stop    | ✓           | ✓                  |

| Permission                               | API                                                                  | Action             | IAM Project | Enterprise Project |
|------------------------------------------|----------------------------------------------------------------------|--------------------|-------------|--------------------|
| Changing the specifications of a cluster | POST /api/v2/projects/{project_id}/clusters/:clusterid/resize        | cce:cluster:resize | ✓           | ✓                  |
| Obtaining the certificate of a cluster   | POST /api/v3/projects/{project_id}/clusters/{cluster_id}/clustercert | cce:cluster:get    | ✓           | ✓                  |

**Table 6-2** Node management actions

| Permission                       | API                                                                        | Action          | IAM Project | Enterprise Project                                                                                                                           |
|----------------------------------|----------------------------------------------------------------------------|-----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Obtaining all nodes in a cluster | GET /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes              | cce:node:list   | ✓           | ✓                                                                                                                                            |
| Obtaining a node                 | GET /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/{node_id}    | cce:node:get    | ✓           | ✓                                                                                                                                            |
| Creating a node                  | POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes             | cce:node:create | ✓           | <b>NOTE</b><br>If you use enterprise project authorization to create a node, you need to add the global permission of <b>evs:quota:get</b> . |
| Updating a node                  | PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/{node_id}    | cce:node:update | ✓           | ✓                                                                                                                                            |
| Deleting a node                  | DELETE /api/v3/projects/{project_id}/clusters/{cluster_id}/nodes/{node_id} | cce:node:delete | ✓           | ✓                                                                                                                                            |

**Table 6-3** Job management actions

| Permission                        | API                                                                                             | Action         | IAM Project | Enterprise Project |
|-----------------------------------|-------------------------------------------------------------------------------------------------|----------------|-------------|--------------------|
| Obtaining information about a job | GET /api/v3/projects/{project_id}/jobs/{job_id}                                                 | cce:job:get    | ✓           | ✓                  |
| Listing all jobs                  | GET /api/v2/projects/{project_id}/jobs                                                          | cce:job:list   | ✓           | ✓                  |
| Deleting one or all jobs          | DELETE /api/v2/projects/{project_id}/jobs<br>DELETE /api/v2/projects/{project_id}/jobs/{job_id} | cce:job:delete | ✓           | ✓                  |

**Table 6-4** Node pool management actions

| Permission                            | API                                                                                | Action              | IAM Project | Enterprise Project |
|---------------------------------------|------------------------------------------------------------------------------------|---------------------|-------------|--------------------|
| Obtaining all node pools in a cluster | GET /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools                  | cce:nodepool:list   | ✓           | ✓                  |
| Obtaining a node pool                 | GET /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}    | cce:nodepool:get    | ✓           | ✓                  |
| Creating a node pool                  | POST /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools                 | cce:nodepool:create | ✓           | ✓                  |
| Updating a node pool                  | PUT /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id}    | cce:nodepool:update | ✓           | ✓                  |
| Deleting a node pool                  | DELETE /api/v3/projects/{project_id}/clusters/{cluster_id}/nodepools/{nodepool_id} | cce:nodepool:delete | ✓           | ✓                  |

**Table 6-5** Chart management actions

| Permission                          | API                    | Action           | IAM Project | Enterprise Project |
|-------------------------------------|------------------------|------------------|-------------|--------------------|
| Updating a chart                    | PUT /v2/charts/{id}    | cce:chart:update | ✓           | x                  |
| Uploading a chart                   | POST /v2/charts        | cce:chart:upload | ✓           | x                  |
| Listing all charts                  | GET /v2/charts         | cce:chart:list   | ✓           | x                  |

|----------------------------------|---------------------------------------------------------------------------|--------------------|-------------|--------------------|
| Creating a PersistentVolumeClaim | POST /api/v1/namespaces/{namespace}/cloudpersistentvolume-claims          | cce:storage:create | √           | √                  |
| Deleting a PersistentVolumeClaim | DELETE /api/v1/namespaces/{namespace}/cloudpersistentvolume-claims/{name} | cce:storage:delete | √           | √                  |
| Listing all volumes              | GET /storage/api/v1/namespaces/{namespace}/listvolumes                    | cce:storage:list   | √           | √                  |

**Table 6-8** Add-on management actions

| Permission                   | API                                                | Action                   | IAM Project | Enterprise Project |
|------------------------------|----------------------------------------------------|--------------------------|-------------|--------------------|
| Creating an add-on instance  | POST /api/v3/addons                                | cce:addonInstance:create | √           | √                  |
| Obtaining an add-on instance | GET /api/v3/addons/{id}?cluster_id={cluster_id}    | cce:addonInstance:get    | √           | √                  |
| Listing all add-on instances | GET /api/v3/addons?cluster_id={cluster_id}         | cce:addonInstance:list   | √           | √                  |
| Deleting an add-on instance  | DELETE /api/v3/addons/{id}?cluster_id={cluster_id} | cce:addonInstance:delete | √           | √                  |
| Updating an add-on instance  | PUT /api/v3/addons/{id}                            | cce:addonInstance:update | √           | √                  |

**Table 6-9** Quota management actions

| Permission              | API                                      | Action        | IAM Project | Enterprise Project |
|-------------------------|------------------------------------------|---------------|-------------|--------------------|
| Obtaining quota details | GET /api/v3/projects/{project_id}/quotas | cce:quota:get | ✓           | ✓                  |

# 7 Appendix

## 7.1 Status Code

**Table 7-1** describes the status codes.

**Table 7-1** Status code

| Status Code | Code                          | Description                                                                                                                                                                                                                                      |
|-------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100         | Continue                      | The server has received the initial part of the request and the client should continue to send the remaining part.<br>It is issued on a provisional basis while request processing continues. It alerts the client to wait for a final response. |
| 101         | Switching Protocols           | The requester has asked the server to switch protocols and the server has agreed to do so. The target protocol must be more advanced than the source protocol.<br>For example, the current HTTP protocol is switched to a later version of HTTP. |
| 201         | Created                       | The request has been fulfilled, resulting in the creation of a new resource.                                                                                                                                                                     |
| 202         | Accepted                      | The request has been accepted for processing, but the processing has not been completed.                                                                                                                                                         |
| 203         | Non-Authoritative Information | The server successfully processed the request, but is returning information that may be from another source.                                                                                                                                     |

| Status Code | Code              | Description                                                                                                                                                                                                 |
|-------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 204         | NoContent         | The server has successfully processed the request, but does not return any content.<br>The status code is returned in response to an HTTP OPTIONS request.                                                  |
| 205         | Reset Content     | The server successfully processed the request, but is not returning any content.                                                                                                                            |
| 206         | Partial Content   | The server has successfully processed a part of the GET request.                                                                                                                                            |
| 300         | Multiple Choices  | There are multiple options for the requested resource. For example, this code could be used to present a list of resource characteristics and addresses from which the client such as a browser may choose. |
| 301         | Moved Permanently | This and all future requests should be permanently directed to the given URI indicated in this response.                                                                                                    |
| 302         | Found             | The requested resource was temporarily moved.                                                                                                                                                               |
| 303         | See Other         | The response to the request can be found under a different URI, and should be retrieved using a GET or POST method.                                                                                         |
| 304         | Not Modified      | The requested resource has not been modified. In such case, there is no need to retransmit the resource since the client still has a previously-downloaded copy.                                            |
| 305         | Use Proxy         | The requested resource is available only through a proxy.                                                                                                                                                   |
| 306         | Unused            | This HTTP status code is no longer used.                                                                                                                                                                    |
| 400         | BadRequest        | The request is invalid.<br>The client should modify the request instead of re-initiating it.                                                                                                                |
| 401         | Unauthorized      | The authorization information provided by the client is incorrect or invalid.                                                                                                                               |
| 402         | Payment Required  | This status code is reserved for future use.                                                                                                                                                                |

| Stat<br>us<br>Cod<br>e | Code                          | Description                                                                                                                                                                                                                                          |

| 403                    | Forbidden                     | <p>The server has received the request and understood it, but the server is refusing to respond to it.</p> <p>The client should modify the request instead of re-initiating it.</p>                                                                  |
| 404                    | NotFound                      | <p>The requested resource cannot be found.</p> <p>The client should modify the request instead of re-initiating it.</p>                                                                                                                              |
| 405                    | MethodNotAllowed              | <p>A request method is not supported for the requested resource.</p> <p>The client should modify the request instead of re-initiating it.</p>                                                                                                        |
| 406                    | Not Acceptable                | <p>The server cannot fulfill the request based on the content characteristics of the request.</p>                                                                                                                                                    |
| 407                    | Proxy Authentication Required | <p>This code is similar to 401, but indicates that the client must first authenticate itself with the proxy.</p>                                                                                                                                     |
| 408                    | Request Time-out              | <p>The server timed out waiting for the request.</p> <p>The client may re-initiate the request without modifications at any later time.</p>                                                                                                          |
| 409                    | Conflict                      | <p>The request cannot be processed due to a conflict.</p> <p>This status code indicates that the resource that the client attempts to create already exists, or the request fails to be processed because of the update of the conflict request.</p> |
| 410                    | Gone                          | <p>The requested resource cannot be found.</p> <p>The status code indicates that the requested resource has been deleted permanently.</p>                                                                                                            |
| 411                    | Length Required               | <p>The server refused to process the request because the request does not specify the length of its content.</p>                                                                                                                                     |
| 412                    | Precondition Failed           | <p>The server does not meet one of the preconditions that the requester puts on the request.</p>                                                                                                                                                     |

| Status Code | Code                            | Description                                                                                                                                                                                                                                                                                                                                                      |
|-------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 413         | Request Entity Too Large        | The server refuses to process a request because the request entity is too large. The server may disable the connection to prevent the client from sending requests consecutively. If the server temporarily cannot process the request, the response will contain a Retry-After header field.                                                                    |
| 414         | Request-URI Too Large           | The URI provided was too long for the server to process.                                                                                                                                                                                                                                                                                                         |
| 415         | Unsupported Media Type          | The server does not support the media type in the request.                                                                                                                                                                                                                                                                                                       |
| 416         | Requested range not satisfiable | The requested range is invalid.                                                                                                                                                                                                                                                                                                                                  |
| 417         | Expectation Failed              | The server fails to meet the requirements of the Expect request-header field.                                                                                                                                                                                                                                                                                    |
| 422         | UnprocessableEntity             | The request is well-formed but is unable to be processed due to semantic errors.                                                                                                                                                                                                                                                                                 |
| 429         | TooManyRequests                 | The client sends excessive requests to the server within a given time (exceeding the limit on the access frequency of the client), or the server receives excessive requests within a given time (beyond its processing capability). In this case, the client should repeat requests after the time specified in the Retry-After header of the response expires. |
| 500         | InternalServerError             | The server is able to receive the request but it could not understand the request.                                                                                                                                                                                                                                                                               |
| 501         | Not Implemented                 | The server does not support the requested function.                                                                                                                                                                                                                                                                                                              |
| 502         | Bad Gateway                     | The server acting as a gateway or proxy receives an invalid response from a remote server.                                                                                                                                                                                                                                                                       |

| 505                    | HTTP Version not supported | The server does not support the HTTP protocol version used in the request. |

## 7.2 Error Codes

If an error occurs in API calling, no result is returned. Identify the cause based on the error code of each API. If an error occurs in API calling, HTTP status code 4xx or 5xx is returned. The response body contains the specific error code and information. If you fail to locate the cause of an error, contact customer service and provide the error code, so that we can help you solve the problem as soon as possible.

### Format of an Error Response Body

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{  
    "errorMessage": "The format of message is error",  
    "errorCode": "CCE.01400001"  
}
```

In the preceding information, **errorCode** is an error code, and **errorMessage** describes the error.

### Error Code Description

| Status<br>Code | Error Code   | Error<br>Message             | Description                    | Troubleshooting                                                                                                    |
|----------------|--------------|------------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------|
| 400            | CCE.01400001 | Invalid request.             | Invalid request body.          | Modify the request body based on the returned message and the CCE API documentation, or contact technical support. |
| 400            | CCE.01400002 | Subnet not found in the VPC. | No subnet is found in the VPC. | Check whether the subnet in the request body is in the corresponding VPC.                                          |

| Status Code | Error Code   | Error Message                           | Description                                               | Troubleshooting                                                           |
|-------------|--------------|-----------------------------------------|-----------------------------------------------------------|---------------------------------------------------------------------------|
| 400         | CCE.01400003 | IPv6 not supported for the subnet.      | The subnet does not support IPv6.                         | Use a subnet that supports IPv6.                                          |
| 400         | CCE.01400004 | No available flavors for master nodes.  | There is no available flavor for the master node.         | Change to another available cluster flavor or contact technical support.  |
| 400         | CCE.01400005 | Container network CIDR blocks conflict. | The container CIDR block conflicts with the existing one. | Check the container CIDR block based on the returned message.             |
| 400         | CCE.01400006 | Content type not supported.             | The content type is invalid.                              | Use the supported content type by referring to the CCE API documentation. |
| 400         | CCE.01400007 | Insufficient cluster quota.             | Insufficient cluster quota.                               | Submit a service ticket to increase the cluster quota.                    |
| 400         | CCE.01400008 | Insufficient server quota               | Insufficient ECS quota.                                   | Submit a service ticket to increase the ECS quota.                        |
| 400         | CCE.01400009 | Insufficient CPU quota.                 | Insufficient ECS CPU quota.                               | Submit a service ticket to increase the ECS CPU quota.                    |
| 400         | CCE.01400010 | Insufficient memory quota.              | Insufficient ECS memory quota.                            | Submit a service ticket to increase the ECS memory quota.                 |
| 400         | CCE.01400011 | Insufficient security group quota.      | Insufficient security group quota.                        | Submit a service ticket to increase the security group quota.             |
| 400         | CCE.01400012 | Insufficient EIP quota.                 | Insufficient EIP quota.                                   | Submit a service ticket to increase the EIP quota.                        |

| Status Code | Error Code   | Error Message                                           | Description                                                 | Troubleshooting                                                                   |
|-------------|--------------|---------------------------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------------------------|
| 400         | CCE.01400013 | Insufficient volume quota.                              | Insufficient disk quota.                                    | Submit a service ticket to increase the disk quota based on the returned message. |
| 400         | CCE.01400014 | Excessive nodes in the cluster.                         | The number of nodes exceeds the cluster scale.              | Submit a service ticket to change the cluster flavor.                             |
| 400         | CCE.01400015 | Version not supported.                                  | The cluster version is not supported.                       | Create a cluster of the supported version based on the returned message.          |
| 400         | CCE.01400016 | Current cluster type does not support this node flavor. | The current cluster type does not support this node flavor. | Use the correct node flavor based on the returned message.                        |
| 400         | CCE.01400017 | No available container CIDR block found.                | No available container CIDR block is found.                 | Use a correct container CIDR block based on the returned message.                 |
| 400         | CCE.01400018 | This type of OS cannot be created in this CCE version.  | The current CCE version does not support this type of OS.   | Use a supported OS based on the returned message.                                 |
| 400         | CCE.01400019 | Insufficient resource tenant quota.                     | The quota of the resource tenant is insufficient.           | Rectify the fault based on the returned message or contact technical support.     |
| 400         | CCE.01400020 | Insufficient VPC quota.                                 | Insufficient VPC quota.                                     | Rectify the fault based on the returned message or contact technical support.     |
| 400         | CCE.01400021 | No available flavors for nodes.                         | There is no available flavor for the node.                  | Change to another available node flavor or contact technical support.             |

| Status Code | Error Code   | Error Message                        | Description                                         | Troubleshooting                                                                                                    |
|-------------|--------------|--------------------------------------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| 400         | CCE.01400022 | No available node volumes for nodes. | There is no available EVS disk flavor for the node. | Change to another available EVS disk flavor or contact technical support.                                          |
| 400         | CCE.02400001 | Invalid request.                     | Invalid request body.                               | Modify the request body based on the returned message and the CCE API documentation, or contact technical support. |
| 400         | CCE.03400001 | Invalid request.                     | Invalid request body.                               | Modify the request body based on the returned message and the CCE API documentation, or contact technical support. |
| 400         | CCE.03400002 | Missing access key.                  | The access key is missing.                          | Ensure that the version of the installed or upgraded storage add-on is correct, or contact technical support.      |
| 401         | CCE.01401001 | Authorization failed.                | Authentication failed.                              | Rectify the fault based on the returned message or contact technical support.                                      |
| 401         | CCE.02401001 | Authorization failed.                | Authentication failed.                              | Rectify the fault based on the returned message or contact technical support.                                      |
| 401         | CCE.03401001 | Authorization failed.                | Authentication failed.                              | Rectify the fault based on the returned message or contact technical support.                                      |

| Status Code | Error Code   | Error Message                              | Description                                                   | Troubleshooting                                                                         |

| 403         | CCE.01403001 | Forbidden.                                 | Access denied.                                                | Rectify the fault based on the returned message or contact technical support.           |
| 403         | CCE.02403001 | Forbidden.                                 | Access denied.                                                | Rectify the fault based on the returned message or contact technical support.           |
| 403         | CCE.03403001 | Forbidden.                                 | Access denied.                                                | Rectify the fault based on the returned message or contact technical support.           |
| 404         | CCE.01404001 | Resource not found.                        | Resources not found.                                          | Check whether the resource to be accessed has been deleted.                             |
| 404         | CCE.02404001 | Resource not found.                        | Resources not found.                                          | Check whether the resource to be accessed has been deleted.                             |
| 404         | CCE.03404001 | Resource not found.                        | Resources not found.                                          | Check whether the resource to be accessed has been deleted.                             |
| 409         | CCE.01409001 | The resource already exists.               | The resource already exists.                                  | Delete the resource and try again.                                                      |
| 409         | CCE.01409002 | Resource updated with out-of-date version. | An out-of-date version is used to update the target resource. | Ensure that the target resource version is the latest one or contact technical support. |
| 409         | CCE.02409001 | The resource already exists.               | The resource already exists.                                  | Delete the resource and try again.                                                      |
| 409         | CCE.03409001 | Addon instance has installed.              | The add-on instance has been installed.                       | Delete the add-on instance and install it again.                                        |

| Status Code | Error Code   | Error Message                              | Description                                      | Troubleshooting                                                               |
|-------------|--------------|--------------------------------------------|--------------------------------------------------|-------------------------------------------------------------------------------|
| 429         | CCE.01429002 | Resource locked by other requests.         | The resource is locked by another request.       | Rectify the fault based on the returned message or contact technical support. |
| 429         | CCE.02429001 | The throttling threshold has been reached. | The maximum number of requests has been reached. | Reduce the frequency of sending requests or contact technical support.        |
| 500         | CCE.01500001 | Internal error.                            | Internal error.                                  | Rectify the fault based on the returned message or contact technical support. |
| 500         | CCE.02500001 | Internal error.                            | Internal error.                                  | Rectify the fault based on the returned message or contact technical support. |
| 500         | CCE.03500001 | Internal error.                            | Internal error.                                  | Rectify the fault based on the returned message or contact technical support. |

## 7.3 Obtaining a Project ID

### Scenarios

A project ID is required for some URLs when APIs are called. Therefore, obtain a project ID in advance. Two methods are available:

- [Call an API](#)
- [Use the console](#)

### Obtaining the Project ID by Calling an API

You can obtain the project ID by calling the IAM API used to query project information based on the specified criteria.

The API for obtaining a project ID is **GET <https://{{Endpoint}}/v3/projects>**. {{Endpoint}} indicates the endpoint of IAM, which can be obtained from [Endpoints](#). For details about API authentication, see [Authentication](#).

The following is an example response. The value of **id** is the project ID.

```
{  
  "projects": [  
    {  
      "domain_id": "65382450e8f64ac0870cd180d14e684b",  
      "is_domain": false,

## Obtaining a Project ID from the Console

To obtain a project ID from the console, perform the following operations:

1. Log in to the management console.
2. Hover over the username in the upper right corner and select **My Credentials** from the drop-down list.

On the **API Credentials** page, view the project ID in the project list.

## 7.4 Obtaining an Account ID

An account ID (domain-id) is required for some URLs when an API is called. To obtain an account ID, perform the following operations:

1. Sign up and log in to the management console.
2. Click the username in the upper right corner and choose **My Credentials** from the drop-down list.

On the **API Credentials** page, view the account ID.

## 7.5 Specifying Add-ons to Be Installed During Cluster Creation

When creating a cluster, you can add a key-value pair to **annotations** of the **metadata** field in the request body to install an add-on in the cluster. The key is **cluster.install.addons/install**, and the value is a JSON array of **AddonTemplate**.

**Table 7-2** Value data structure

| Parameter | Mandatory | Type                               | Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value     | Yes       | JSON array of AddonTemplate string | Add-on to be installed in the cluster. If this parameter is not specified, the coredns and storage-driver add-ons are installed by default for clusters of Kubernetes 1.13 and earlier versions, and the coredns, everest, and npd add-ons are installed by default for clusters of Kubernetes 1.15 and later versions. For details, see <a href="#">Table 7-3</a> . |

**Table 7-3** Data structure of the AddonTemplate field

| Parameter         | Mandatory | Type     | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| addonTemplateName | Yes       | String   | Add-on name.<br>The value can be <b>coredns</b> , <b>autoscaler</b> , <b>gpu-beta</b> , or <b>storage-driver</b> .                                                                                                                                                                                                                                                                       |
| version           | No        | String   | Add-on version.<br>To view the add-on version information, log in to the CCE console, click <b>Add-ons</b> in the navigation pane. Click the target add-on name. On the <b>Version History</b> tab page, you can view the versions of the add-on. If this parameter is left blank, the latest version is used by default.                                                                |
| values            | No        | Json Map | Parameters to be set for installing an add-on. <ul style="list-style-type: none"><li>• coredns: For details, see <a href="#">Table 7-4</a>.</li><li>• autoscaler: For details, see <a href="#">Table 7-8</a>.</li><li>• gpu-beta: For details, see <a href="#">Table 7-10</a>.</li></ul> <b>NOTE</b><br>You do not need to set this parameter when installing the storage-driver add-on. |

**Table 7-4** Special key-value pairs of the coredns values parameters

| Parameter | Mandatory | Type          | Description                |
|-----------|-----------|---------------|----------------------------|
| flavor    | Yes       | flavor object | Add-on specifications.     |
| custom    | Yes       | custom object | Custom coredns parameters. |

**Table 7-5** Data structure of the flavor field

| Parameter   | Mandatory | Type            | Description                |
|-------------|-----------|-----------------|----------------------------|
| description | Yes       | String          | Specification description. |
| name        | Yes       | String          | Flavor name.               |
| replicas    | Yes       | Integer         | Number of pods.            |
| resources   | Yes       | resource object | Add-on resources.          |

**Table 7-6** Data structure of the resource field

| Parameter   | Mandatory | Type   | Description         |
|-------------|-----------|--------|---------------------|
| name        | Yes       | String | Resource name.      |
| limitsCpu   | Yes       | String | CPU quota limit.    |
| limitsMem   | Yes       | String | Memory quota limit. |
| requestsCpu | Yes       | String | Requested CPU.      |
| requestsMem | Yes       | String | Requested memory.   |

**Table 7-7** Data structure of the custom field

| Parameter    | Mandatory | Type     | Description                                                                                                                |
|--------------|-----------|----------|----------------------------------------------------------------------------------------------------------------------------|
| stub_domains | No        | Json Map | JSON map that uses the DNS suffix key (such as acme.local) and the value composed of the JSON array of the DNS IP address. |

| Parameter            | Mandatory | Type       | Description                                                                                                                                                                                      |
|----------------------|-----------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| upstream_nameservers | No        | Json Array | The value of this parameter replaces the name server value obtained from <b>/etc/resolv.conf</b> of the node by default. Restriction: A maximum of three upstream name servers can be specified. |
| tenant_id            | Yes       | String     | Project ID.                                                                                                                                                                                      |

**Table 7-8** Special key-value pairs of the autoscaler values parameters

| Parameter | Mandatory | Type                 | Description                   |
|-----------|-----------|----------------------|-------------------------------|
| flavor    | Yes       | <b>flavor</b> Object | Add-on specifications.        |
| custom    | Yes       | <b>custom</b> object | Custom autoscaler parameters. |

**Table 7-9** Data structure of the custom field

| Parameter              | Mandatory | Type    | Description                                                                                                                                                        |
|------------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| coresTotal             | Yes       | Integer | Maximum and minimum number of cores of a cluster. The format is <b>&lt;min&gt;:&lt;max&gt;</b> . The autoscaler add-on performs cluster scaling within this range. |
| maxEmptyBulkDeleteFlag | Yes       | Integer | Maximum number of empty nodes that can be deleted at a time.                                                                                                       |
| maxNodesTotal          | Yes       | Integer | Maximum number of nodes in all node groups. The autoscaler add-on performs cluster scaling within this range.                                                      |
| memoryTotal            | Yes       | Integer | Maximum and minimum size of memory of a cluster. The format is <b>&lt;min&gt;:&lt;max&gt;</b> . The autoscaler add-on performs cluster scaling within this range.  |
| scaleDownDelayAfterAdd | Yes       | Integer | Interval for performing scale-down evaluation after a scale-up.                                                                                                    |

| Parameter                      | Mandatory | Type    | Description                                                                                                                                                                                                               |
|--------------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scaleDownDelayAfterDelete      | Yes       | Integer | Interval for performing scale-down evaluation after nodes are deleted. The default value is <b>scanInterval</b> .                                                                                                         |
| scaleDownDelayAfterFailure     | Yes       | Integer | Interval for performing scale-down evaluation after a scale-down failure.                                                                                                                                                 |
| scaleDownEnabled               | Yes       | Boolean | Whether to enable cluster scaling down.                                                                                                                                                                                   |
| scaleDownUnneededTime          | Yes       | Integer | Time waited to start a scale-down after a node has reached the scale-down threshold.                                                                                                                                      |
| scaleDownUtilizationThreshold  | Yes       | Float   | Threshold percentage of the total CPU or memory occupied by all pods running on the node to the allocatable resources on the node. When the actual percentage is lower than this threshold, node scale-down is triggered. |
| scaleUpCpuUtilizationThreshold | Yes       | Float   | CPU usage threshold for triggering scale-up.                                                                                                                                                                              |
| scaleUpMemUtilizationThreshold | Yes       | Float   | Memory usage threshold for triggering scale-up.                                                                                                                                                                           |
| scaleUpUnscheduledPodEnabled   | Yes       | Boolean | Scale-up is triggered when there are unscheduled pods.                                                                                                                                                                    |
| scaleUpUtilizationEnabled      | Yes       | Boolean | Scale-up is triggered when the resource usage reaches the threshold.                                                                                                                                                      |
| tenant_id                      | Yes       | String  | Project ID.                                                                                                                                                                                                               |
| unremovableNodeRecheckTimeout  | Yes       | Integer | Interval for checking whether a node can be removed.                                                                                                                                                                      |

**Table 7-10** Special Key-Value in values of AddonTemplate (GPU-beta)

| Parameter | Mandatory | Type          | Description                      |
|-----------|-----------|---------------|----------------------------------|
| custom    | Yes       | custom object | Customer parameters of gpu-beta. |

**Table 7-11** Data structure of the custom field

| Parameter                  | Mandatory | Type    | Description                                                              |
|----------------------------|-----------|---------|--------------------------------------------------------------------------|
| is_driver_from_nvidia      | Yes       | Boolean | Whether to use the NVIDIA driver.<br>Set this parameter to <b>true</b> . |
| nvidia_driver_download_url | Yes       | String  | Driver downloading URL.                                                  |

**Table 7-12** Data structure of the spec field

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | Cluster type. Possible values: <ul style="list-style-type: none"><li>● <b>VirtualMachine</b>: The cluster is a hybrid cluster.<br/>A hybrid cluster manages a group of node resources based on Kubernetes. It can manage VMs, bare-metal machines, or a combination of both. Kubernetes automatically schedules containers onto available nodes. Before creating a containerized workload, you must have an available cluster.</li><li>● <b>ARM64</b>: The cluster is a Kunpeng cluster.<br/>Containers in CCE's Kunpeng clusters can run on Kunpeng servers that use ARM architecture and Kunpeng processors. Kunpeng-accelerated cloud servers are easy to deploy and provide comparable scaling and scheduling performance as x86-based cloud servers.</li></ul> |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor    | Yes       | String | <p>Cluster flavor, which cannot be changed after the cluster is created.</p> <ul style="list-style-type: none"><li>• <b>cce.s1.small</b>: a small-scale CCE cluster with one master node and a maximum of 50 worker nodes</li><li>• <b>cce.s1.medium</b>: a medium-scale CCE cluster with one master node and a maximum of 200 worker nodes</li><li>• <b>cce.s2.small</b>: a small-scale, HA CCE cluster with three master nodes and a maximum of 50 worker nodes</li><li>• <b>cce.s2.medium</b>: a medium-scale, HA CCE cluster with three master nodes and a maximum of 200 worker nodes</li><li>• <b>cce.s2.large</b>: a large-scale, HA CCE cluster with three master nodes and a maximum of 1,000 worker nodes</li><li>• <b>cce.s2.xlarge</b>: an ultra-large-scale, HA CCE cluster with three master nodes and a maximum of 2,000 worker nodes</li></ul> |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |           |        | <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• <b>s1</b>: indicates a cluster with one master node. If the master node is faulty, the cluster is unavailable, but running workloads are not affected.</li><li>• <b>s2</b>: indicates a cluster with three master nodes. This is an HA cluster. If one of the master nodes is faulty, the cluster is still available.</li><li>• <b>dec</b>: dedicated hybrid cluster specifications. For example, <b>cce.dec.s1.small</b> is a small-scale, single-master, dedicated hybrid cluster (<math>\leq 50</math> nodes).</li><li>• For example, <b><math>\leq 50</math> nodes</b> indicates that the maximum number of nodes that can be managed by the cluster is 50.</li><li>• A single-master cluster has only one master node. If the master node is down, the cluster will become unavailable and stop serving new workloads. However, existing workloads in the cluster are not affected.</li><li>• An HA cluster has multiple master nodes. Faults in a single master node will not take the cluster down.</li></ul> |
| version   | No        | String | <p>Cluster's baseline Kubernetes version. The latest version is recommended.</p> <ul style="list-style-type: none"><li>• You can create clusters of two latest versions on the CCE console. To learn which cluster versions are available, choose <b>Clusters</b> in the navigation pane, click <b>Buy Cluster</b>, and view the supported cluster versions.</li><li>• You can call APIs to create clusters of other versions. However, these clusters will be gradually brought offline. For details about the offline policy, see the official CCE announcement.</li></ul> <p><b>NOTE</b><br/>If this parameter is left blank, the cluster of the latest version is created by default.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter            | Mandatory | Type                                    | Description                                                                                                                                                                                                                                                                                                                           |
|----------------------|-----------|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description          | No        | String                                  | Cluster description, for example, which purpose the cluster is intended to serve. By default, this parameter is left unspecified. To modify cluster description after the cluster is created, call the <a href="#">API used to update information about a specified cluster</a> or go to the cluster details page on the CCE console. |
| ipv6enable           | No        | Boolean                                 | Whether the cluster supports IPv6. Clusters of version 1.15 and later support IPv6.                                                                                                                                                                                                                                                   |
| hostNetwork          | Yes       | <a href="#">HostNetwork</a> object      | Node networking parameters, including VPC and subnet ID. <b>hostNetwork</b> is mandatory because nodes in a cluster communicate with each other by using a VPC.                                                                                                                                                                       |
| containerNetwork     | Yes       | <a href="#">ContainerNetwork</a> object | Container networking parameters, including the container network model and container CIDR block.                                                                                                                                                                                                                                      |
| authentication       | No        | <a href="#">Authentication</a> object   | Configurations of the cluster authentication mode.                                                                                                                                                                                                                                                                                    |
| kubernetesSvcIpRange | No        | String                                  | Service CIDR block or the IP address range which the <b>kubernetes clusterIP</b> must fall within. This parameter is available only for clusters of v1.11.7 and later.                                                                                                                                                                |
| billingMode          | No        | Integer                                 | Billing mode of a cluster. Currently, only <b>pay-per-use</b> clusters can be created.<br>Value <b>0</b> indicates pay-per-use. If this parameter is left unspecified, the default value <b>0</b> is used.                                                                                                                            |
| masters              | No        | <a href="#">MasterSpec</a> object       | Advanced configurations of the master node                                                                                                                                                                                                                                                                                            |
| extendParam          | No        | Map<String, String>                     | Extended fields in the format of key-value pairs.<br>You can configure multi-AZ clusters and dedicated hybrid clusters, and create clusters in specific enterprise projects.                                                                                                                                                          |

## Request Example

```

```

## 7.6 How to Obtain Parameters in the API URI

### project\_id

**project\_id** indicates the project ID, which can be obtained from the console or APIs. For details, see [Obtaining a Project ID](#).

### cluster\_id

**Step 1** Log in to the CCE console. In the navigation pane, choose **Clusters**.

**Step 2** Click the name of the created cluster. The cluster details page is displayed. Obtain the cluster ID.

----End

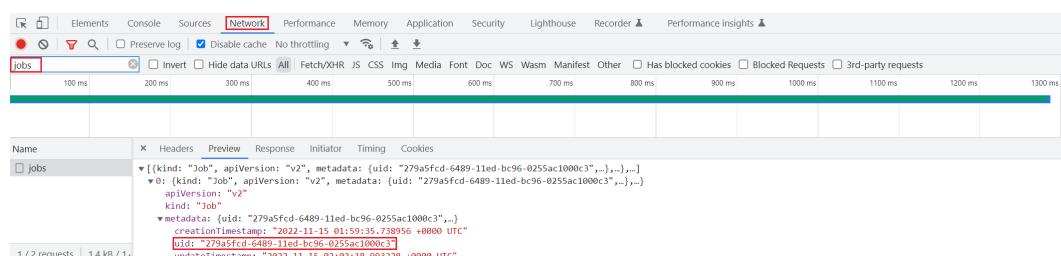

## node\_id

- Step 1** Log in to the CCE console. In the navigation pane, choose **Clusters**.
- Step 2** Click the name of the created cluster, select **Nodes** on the left, and move the cursor to the node name to view the node ID.
- End

## job\_id

- Step 1** Log in to the CCE console. In the navigation pane, choose **Clusters**. The following uses cluster management as an example to describe how to obtain the **job\_id** of the cluster that is being created.
- Step 2** Obtain the job ID.
1. If you are using Google Chrome, press **F12**. On the pane displayed on the right, click the **Network** tab.
  2. Click **Operation Records** on the CCE console to view details about cluster operation records.
  3. Enter **jobs** in the **Filter** text box to filter out the jobs. Select a job from the list on the left and click **Preview**. The **uid** field indicates the job UID.

Figure 7-1 Obtaining the job ID

----End

## 7.7 Creating a VPC and Subnet

### Context

To provide a secure and isolated network environment for CCE, create a VPC before creating a cluster.

If you have already created a VPC, you do not need to create it again.

### Creating a VPC

- Step 1** On the management console, click **Service List**, and choose **Network > Virtual Private Cloud** to launch the VPC console.
- Step 2** On the VPC console, click **Create VPC** to create a VPC.

**Step 3** The created VPC is displayed in the list. Click its name and obtain the VPC ID, which will be required in [cluster creation](#).

----End

## Creating a Subnet

**Step 1** On the management console, click **Service List**, and choose **Network > Virtual Private Cloud** to launch the VPC console.

**Step 2** On the **VPC** console, choose **Virtual Private Cloud > Subnets** in the navigation pane, and click **Create Subnet** in the upper right corner.

**Step 3** Create a subnet as prompted and click its name to obtain the network ID, which will be required in [cluster creation](#).

----End

## 7.8 Creating a Key Pair

### Context

Create a key pair before you create a container cluster. Key pairs are used for user identity authentication upon login to a worker node.

If you have already created a key pair, you do not need to create it again.

### Procedure

**Step 1** On the management console, click **Service List**, and choose **Compute > Elastic Cloud Server** to go to the ECS console.

**Step 2** In the navigation pane, choose **Key Pair**.

**Step 3** Click **Create Key Pair** and create a key pair as prompted.

**Step 4** After the creation is complete, a key file in the **.pem** format is generated and automatically saved to the default directory on your local computer.

----End

## 7.9 Node Flavor Description

### NOTE

Different regions support different node flavors, and node flavors may be changed or sold out. You are advised to log in to the CCE console and check whether the required node flavors are supported on the page for creating nodes.

- **CCE cluster**

You need to enter the specific flavor name, for example, **c6.large.2**.

## 7.10 Adding a Salt in the password Field When Creating a Node

When a node is created through the API, you need to add a salt to the **password** field to safeguard the password. The procedure is as follows:

### NOTE

The salt must be set based on the password complexity requirements:

- A string of 8–26 characters.
- Contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters !@#\$%^\_=+[{}];./?
- Cannot contain the username or the username spelled backwards.
- Cannot contain the username, the username spelled backwards, or more than two consecutive characters in the username (for Windows ECSSs).

## Python

**To salt a password in the Python 3.7.7 environment, perform the following steps:**

### NOTE

The **python crypt** package has compatibility issues in macOS. If the package cannot be executed, run it in Linux.

1. Add \ before \$ in the salt. Generate a ciphertext password based on the updated salt.  

```
python3 -c "import crypt;print(crypt.crypt('*****', crypt.mksalt()))"
```
2. Encode the value of the **password** field using Base64.  

```
echo -n '*****' | base64 | tr '\n' ' ' | sed s/[[:space:]]//g
```

## Java

**To salt a password in the Java environment, perform the following steps:**

1. Obtain a random number as the salt.

```
private static String getCharAndNumr(int length) {  
    String val = "";  
    Random random = new SecureRandom();  
    for (int i = 0; i < length; i++) {  
        // Indicates whether to output letters or digits.  
        String charOrNum = random.nextInt(2) % 2 == 0 ? "char" : "num";  
        // Character string  
        if ("char".equalsIgnoreCase(charOrNum)) {  
            // Indicates whether an upper-case or lower-case letter is obtained.  
            int choice = random.nextInt(2) % 2 == 0 ? 65 : 97;  
            val += (char) (choice + random.nextInt(26));  
        } else if ("num".equalsIgnoreCase(charOrNum)) { // Digit  
            val += String.valueOf(random.nextInt(10));  
        }  
    }  
    return val;  
}
```

2. Generate a salt.

```
private static String generateSalt() {  
    String salt;
```

```

try {
    salt = "$6$" + getCharAndNumr(16);
}catch (Exception e){
    salt = defaultSalt;
}

return salt;
}

```

3. Generate a ciphertext password based on the salt.

```

public static String getSaltPassword(String password) {
    if(StringUtils.isBlank(password)) {
        throw new BizException("password is empty");
    }

    String salt = generateSalt();

    Crypt crypt = new Crypt();
    return crypt.crypt(password, salt);
}

```

4. Encode the value of the **password** field using Base64.

```
(Base64.getEncoder().encodeToString(AddSaltPasswordUtil.getSaltPassword(cceNodeCreateVo.getPassword()).getBytes()))
```

5. A complete example is as follows:

```

import java.util.Base64;
import java.util.Random;
import java.security.SecureRandom;

import org.apache.commons.codec.digest.Crypt;
import org.apache.commons.lang.StringUtils;

public class PassWord {

    static String defaultSalt = null;

    public static void main(String[] args) throws Exception {
        System.out.println(Base64.getEncoder().encodeToString(PassWord.getSaltPassword("Custom
password").getBytes()));
    }

    //Generate a ciphertext password based on the salt.
    public static String getSaltPassword(String password) throws Exception {
        if(StringUtils.isBlank(password)) {
            throw new Exception("password is empty");
        }
        String salt = generateSalt();
        return Crypt.crypt(password, salt);
    }

    //Generate a salt.
    private static String generateSalt() {
        String salt;
        try {
            salt = "$6$" + getCharAndNumr(16);
        }catch (Exception e){
            salt = defaultSalt;
        }
        return salt;
    }

    //Obtain a random number as the salt.
    private static String getCharAndNumr(int length) {
        String val = "";
        Random random = new SecureRandom();
        for (int i = 0; i < length; i++) {
            // Indicates whether to output letters or digits.
            String charOrNum = random.nextInt(2) % 2 == 0 ? "char" : "num";
            // Character string
        }
    }
}

```

```
        if ("char".equalsIgnoreCase(charOrNum)) {
            // Indicates whether an upper-case or lower-case letter is obtained.
            int choice = random.nextInt(2) % 2 == 0 ? 65 : 97;
            val += (char) (choice + random.nextInt(26));
        } else if ("num".equalsIgnoreCase(charOrNum)) { // Digit
            val += String.valueOf(random.nextInt(10));
        }
    }
    return val;
}
```

## Go

You can use either of the following methods to salt passwords for the Go language:

- <https://github.com/amoghe/go-crypt>
- <https://github.com/GehirnInc/crypt>

## 7.11 Maximum Number of Pods That Can Be Created on a Node

### Calculation of the Maximum Number of Pods on a Node

The maximum number of pods that can be created on a node is calculated based on the cluster type:

- For a cluster using the container tunnel network model, the value depends only on [the maximum number of pods on a node](#).
- For clusters using the VPC network model, the value depends on [the maximum number of pods on a node](#) and [the minimum number of container IP addresses that can be allocated to a node](#). It is recommended that the maximum number of pods on a node be less than or equal to the number of container IP addresses that can be allocated to the node. Otherwise, pods may fail to be scheduled.
- For CCE Turbo clusters using the Cloud Native Network 2.0 model, the value depends on [the maximum number of pods on a node](#) and [the minimum number of ENIs on a CCE Turbo cluster node](#). It is recommended that the maximum number of pods on a node be less than or equal to the number of ENIs on the node. Otherwise, pods may fail to be scheduled.

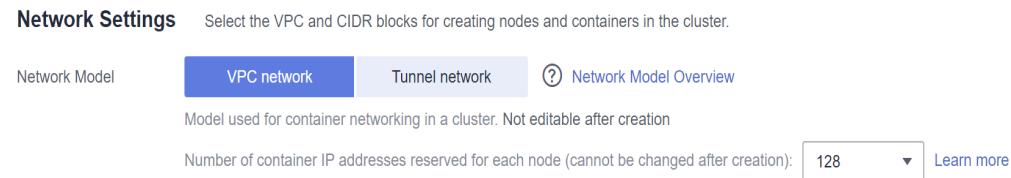

### Number of Container IP Addresses That Can Be Allocated on a Node

If you select **VPC network** for **Network Model** when creating a CCE cluster, you also need to set the number of container IP addresses that can be allocated to each node (`alpha.cce/fixPoolMask`). If the pod uses the host network (`hostNetwork: true`), the pod does not occupy the IP address of the allocatable container network. For details, see [Container Network vs. Host Network](#).

This parameter affects the maximum number of pods that can be created on a node. Each pod occupies an IP address (when the **container network** is used). If the number of available IP addresses is insufficient, pods cannot be created. If the

pod uses the host network (**hostNetwork: true**), the pod does not occupy the IP address of the allocatable container network.

**Figure 7-2** Specifying the number of allocatable container IP addresses on a node in the VPC network model

By default, a node occupies three container IP addresses (network address, gateway address, and broadcast address). Therefore, the number of container IP addresses that can be allocated to a node equals the number of selected container IP addresses minus 3. For example, in the preceding figure, the number of container IP addresses that can be allocated to a node is 125 (128 – 3).

## Maximum Number of Pods on a Node

When creating a node, you can configure the maximum number of pods (**maxPods**) that can be created on the node. This parameter is a configuration item of kubelet and determines the maximum number of pods that can be created by kubelet.

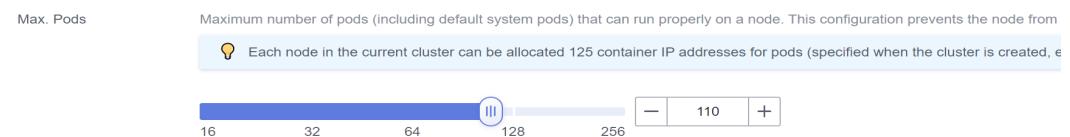

### NOTICE

For nodes in the default node pool (**DefaultPool**), the maximum number of pods cannot be changed after the nodes are created.

After a node in a custom node pool is created, you can modify the **max-pods** parameter in the node pool configuration to change the maximum number of pods on the node.

By default, the maximum number of pods on a node can be adjusted to 256. To increase the deployment density on a node, submit a [service ticket](#) to increase the maximum number of pods on a node, which can be 512.

**Figure 7-3** Specifying the maximum number of pods on a node

[Table 7-13](#) lists the default maximum number of pods on a node based on node specifications.

**Table 7-13** Default maximum number of pods on a node

| Memory         | Max. Pods |
|----------------|-----------|
| 4 GB           | 20        |
| 8 GB           | 40        |
| 16 GB          | 60        |
| 32 GB          | 80        |
| 64 GB or above | 110       |

## Number of Node ENIs (CCE Turbo Clusters)

In a CCE Turbo cluster, ECS nodes use sub-ENIs. The maximum number of pods that can be created on a node depends on the number of ENIs that can be used by the node.

**Figure 7-4** Node ENIs

The screenshot shows a table of ECS node flavors. The columns include Node Type (Elastic Cloud Server (VM)), vCPUs, Memory, Flavor, Assured/Maximum Bandwidth, Packets Per Second (PPS), and Max. Pods. The 'Max. Pods' column is highlighted with a red box. The data is as follows:

| Node Type                 | vCPUs | Memory | Flavor      | Assured/Maximum Bandwidth | Packets Per Second (PPS) | Max. Pods   |    |
|---------------------------|-------|--------|-------------|---------------------------|--------------------------|-------------|----|
| Elastic Cloud Server (VM) | All   | All    | c7 large 2  | 2cores   4GB              | 0.84.0 Gbit/s            | 400,000 pps | 16 |
|                           |       |        | c7 large 4  | 2cores   8GB              | 0.84.0 Gbit/s            | 400,000 pps | 16 |
|                           |       |        | c7.xlarge 2 | 4cores   8GB              | 1.68.0 Gbit/s            | 800,000 pps | 32 |

## Container Network vs. Host Network

When creating a pod, you can select the container network or host network for the pod.

- Container network (default): **Each pod is assigned an IP address by the cluster networking add-ons, which occupies the IP addresses of the container network.**
- Host network: The pod uses the host network (**hostNetwork: true** needs to be configured for the pod) and occupies the host port. The pod IP address is the host IP address. The pod does not occupy the IP addresses of the container network. To use the host network, you must confirm whether the container ports conflict with the host ports. Do not use the host network unless you know exactly which host port is used by which container.

## 7.12 Node OS

### Mappings Between Cluster Versions and OS Versions

The following table lists the mappings between released cluster versions and OS versions.

**Table 7-14** ECS (VM) OS

| OS                        | Cluster Version | CCE Standard Cluster |                | CCE Turbo Cluster        | Latest Kernel                                  |
|---------------------------|-----------------|----------------------|----------------|--------------------------|------------------------------------------------|

## 7.13 Data Disk Space Allocation

This section describes how to allocate data disk space to nodes so that you can configure the data disk space accordingly.

### Allocating Data Disk Space

When creating a node, configure data disks for the node. You can also click **Expand** and customize the data disk space allocation for the node.

**Figure 7-5 Allocating data disk space**

- **Space Allocation for Container Engines**

- Specified disk space: CCE divides the data disk space for two parts by default. One part is used to store the Docker/containerd working directories, container images, and image metadata. The other is reserved for kubelet and emptyDir volumes. The available container engine space affects image pulls and container startup and running.
  - Container engine and container image space (90% by default): stores the container runtime working directories, container image data, and image metadata.
  - kubelet and emptyDir space (10% by default): stores pod configuration files, secrets, and mounted storage such as emptyDir volumes.
- Shared disk space: In clusters of v1.21.10-r0, v1.23.8-r0, v1.25.3-r0, or later versions, CCE allows **a container engine (Docker/containerd) and kubelet components to share data disk space**.
- **Space Allocation for Pods:** indicates the basesize of a pod. You can set an upper limit for the disk space occupied by each workload pod (including the space occupied by container images). This setting prevents the pods from taking all the disk space available, which may cause service exceptions. It is recommended that the value is less than or equal to 80% of the container engine space. This parameter is related to the node OS and container storage rootfs and is not supported in some scenarios. For details, see **Mapping Between OS and Container Storage Rootfs**.
- Write Mode
  - **Linear:** A linear logical volume integrates one or more physical volumes. Data is written to the next physical volume when the previous one is used up.
  - **Striped:** available only if there are at least two data disks. A striped logical volume stripes data into blocks of the same size and stores them in multiple physical volumes in sequence. This allows data to be concurrently read and written. A storage pool consisting of striped volumes cannot be scaled-out.

## Space Allocation for Container Engines

For a node using a non-shared data disk (100 GiB for example), the division of the disk space varies depending on the container storage Rootfs type **Device Mapper** or **OverlayFS**. For details about the container storage Rootfs corresponding to different OSs, see **Mapping Between OS and Container Storage Rootfs**.

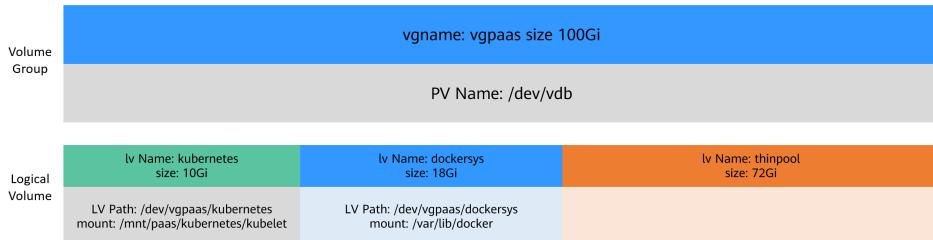

### ● **Rootfs (Device Mapper)**

By default, the container engine and image space, occupying 90% of the data disk, can be divided into the following two parts:

- The **/var/lib/docker** directory is used as the Docker working directory and occupies 20% of the container engine and container image space by default. (Space size of the **/var/lib/docker** directory = **Data disk space x 90% x 20%**)
- The thin pool is used to store container image data, image metadata, and container data, and occupies 80% of the container engine and container image space by default. (Thin pool space = **Data disk space x 90% x 80%**)

The thin pool is dynamically mounted. You can view it by running the **lsblk** command on a node, but not the **df -h** command.

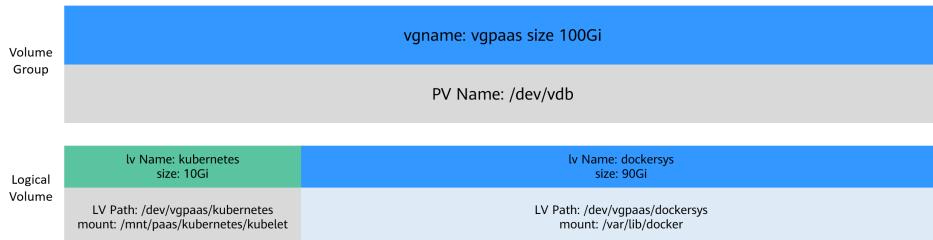

**Figure 7-6** Space allocation for container engines of Device Mapper

- **Rootfs (OverlayFS)**

No separate thin pool. The entire container engine and container image space (90% of the data disk by default) are in the **/var/lib/docker** directory.

**Figure 7-7** Space allocation for container engines of OverlayFS

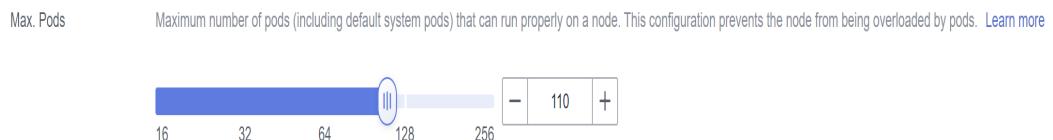

## Space Allocation for Pods

The customized pod container space (**basesize**) is related to the node OS and container storage Rootfs. For details about the container storage Rootfs, see [Mapping Between OS and Container Storage Rootfs](#).

- Device Mapper supports custom pod basesize. The default value is 10 GiB.
- In OverlayFS mode, the pod container space is not limited by default.

When configuring **basesize**, consider the maximum number of pods on a node. The container engine space should be greater than the total disk space used by containers. Formula: **the container engine space and container image space (90% by default) > Number of containers x basesize**. Otherwise, the container engine space allocated to the node may be insufficient and the container cannot be started.

**Figure 7-8** Maximum number of pods

For nodes that support **basesize**, when Device Mapper is used, although you can limit the size of the **/home** directory of a single container (to 10 GB by default),

all containers on the node still share the thin pool of the node for storage. They are not completely isolated. When the sum of the thin pool space used by certain containers reaches the upper limit, other containers cannot run properly.

In addition, after a file is deleted in the `/home` directory of the container, the thin pool space occupied by the file is not released immediately. Therefore, even if **basesize** is set to 10 GB, the thin pool space occupied by files keeps increasing until 10 GB when files are created in the container. The space released after file deletion will be reused but after a while. If **the number of containers on the node multiplied by basesize** is greater than the thin pool space size of the node, there is a possibility that the thin pool space has been used up.

## Mapping Between OS and Container Storage Roots

**Table 7-17** Node OSs and container engines in CCE clusters

| OS          | Container Storage Rootsfs                                                                            | Customized Basesize                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CentOS 7.x  | Clusters of v1.19.16 and earlier use Device Mapper.<br>Clusters of v1.19.16 and later use OverlayFS. | Supported when Rootsfs is set to Device Mapper and the container engine is Docker. The default value is 10 GiB.<br>Not supported when Rootsfs is set to OverlayFS.                           |
| EulerOS 2.5 | Device Mapper                                                                                        | Supported only when the container engine is Docker. The default value is 10 GiB.                                                                                                             |
| EulerOS 2.9 | OverlayFS                                                                                            | Supported only by clusters of v1.19.16, v1.21.3, v1.23.3, or later. There are no limits by default.<br>Not supported if the cluster versions are earlier than v1.19.16, v1.21.3, or v1.23.3. |

**Table 7-18** Node OSs and container engines in CCE Turbo clusters

| OS         | Container Storage Rootsfs | Customized Basesize |
|------------|---------------------------|---------------------|
| CentOS 7.x | OverlayFS                 | Not supported.      |

| OS          | Container Storage Rootfs                             | Customized Basesize                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EulerOS 2.9 | ECS VMs use OverlayFS.<br>ECS PMs use Device Mapper. | Supported only when Rootfs is set to OverlayFS and the container engine is Docker. The container basesize is not limited by default.<br>Supported when Rootfs is set to Device Mapper and the container engine is Docker. The default value is 10 GiB. |

## Garbage Collection Policies for Container Images

When the container engine space is insufficient, image garbage collection is triggered.

The policy for garbage collecting images takes two factors into consideration: **HighThresholdPercent** and **LowThresholdPercent**. Disk usage exceeding the high threshold (default: 80%) will trigger garbage collection. The garbage collection will delete least recently used images until the low threshold (default: 70%) is met.

## Recommended Configuration for the Container Engine Space

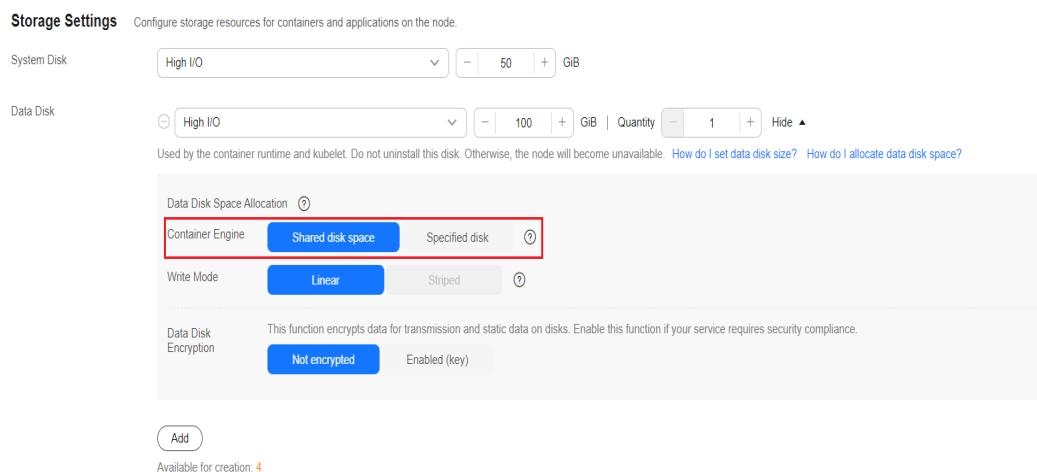

- The container engine space should be greater than the total disk space used by containers. Formula: **Container engine space > Number of containers x basesize**
- You are advised to create and delete files of containerized services in local storage volumes (such as emptyDir and hostPath volumes) or cloud storage directories mounted to the containers. In this way, the thin pool space is not occupied. emptyDir volumes occupy the kubelet space. Therefore, properly plan the size of the kubelet space.
- You can deploy services on nodes that use the OverlayFS (for details, see [Mapping Between OS and Container Storage Rootfs](#)) so that the disk space occupied by files created or deleted in containers can be released immediately.

## Data Disk Shared Between a Container Engine and kubelet Components

Docker/containerd and kubelet components share the space of a data disk.

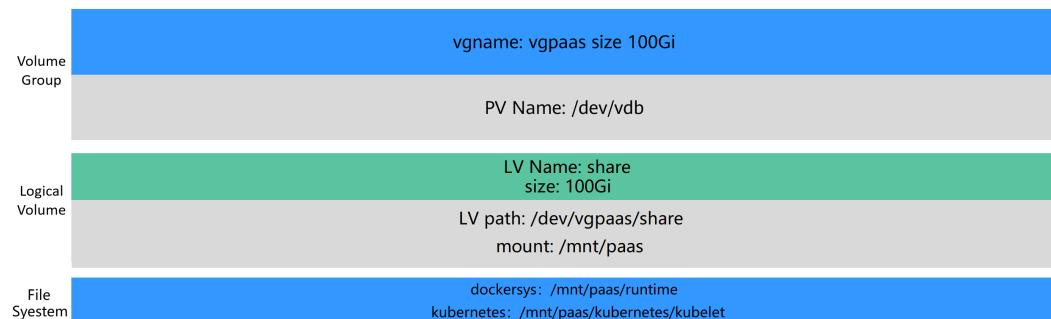

**NOTICE**

- This function is available only to clusters of v1.21.10-r0, v1.23.8-r0, v1.25.3-r0, or later versions.
- If Rootfs is set to OverlayFS, shared data disks are supported. If Rootfs is set to Device Mapper, shared data disks are not supported.
- If you have installed an NPD add-on in the cluster, upgrade the add-on to v1.18.10 or later. Otherwise, false alarms will be generated.
- If you have installed a log-agent add-on in the cluster, upgrade the add-on to v1.3.0 or later. Otherwise, log collection will be affected.
- If you have installed ICAgent in the cluster, upgrade it to v5.12.140 or later. Otherwise, log collection will be affected.

**Figure 7-9 Configuration for sharing disk space**

For nodes using a shared data disk, the container storage Rootfs is of the **OverlayFS** type. After such a node is created, the data disk space (for example, 100 GiB) will not be divided for the container engines, container images, and kubelet components. The data disk is mounted to **/mnt/paas**, and the storage space is divided using two file systems.

- dockersys: /mnt/paas/runtime
- Kubernetes: /mnt/paas/kubernetes/kubelet

**Figure 7-10 Allocating the storage space of a shared data disk**

## 7.14 Attaching Disks to a Node

### Challenges

In disk planning and striped logical disk creation, it is difficult for users to flexibly attach and partition disks when creating a node.

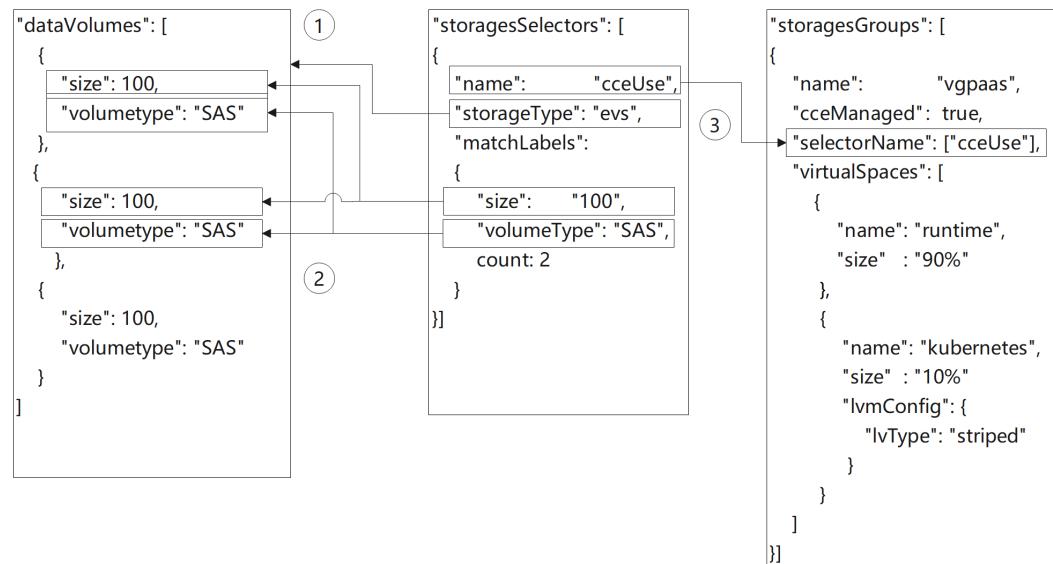

During node creation, the **storage** field selects a data disk based on parameters, such as the disk size and disk type, to prevent failures in node creation, resetting, migration, and management caused by drive letter matching failures.

### Solution

This section provides details about the **storage** field used in node creation so that you can implement complex disk selection and partitioning by calling the node creation API.

The **storage** field consists of **storageSelectors** and **storageGroups**. The **storageSelectors** field is responsible for disk selection, and the **storageGroups** field is responsible for disk processing.

The basic logic for field matching is as follows:

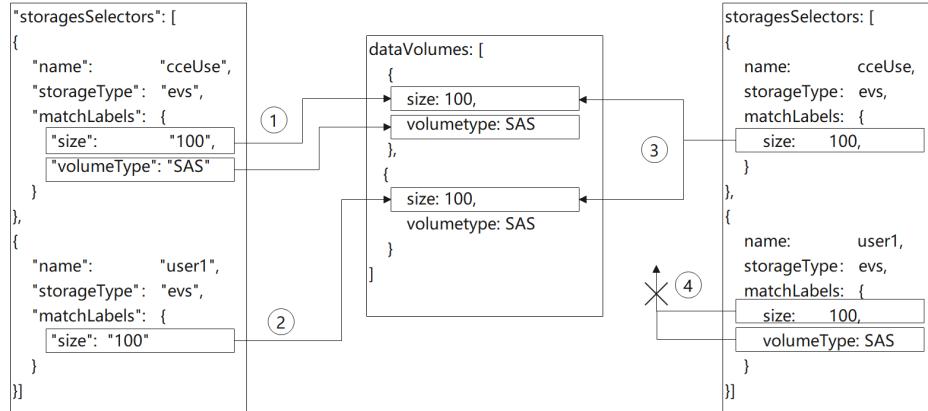

1. **storageSelectors** selects an EVS disk or a local disk based on the value of **storageType**.
  - a. Local disks do not support exact match. All local disks will be selected as data disks.

If some local disks need to be reserved, occupy the disks in the pre-installation script. The script is similar to the following:

```
# prepare
vgName=vg-test
storageDevice=/dev/vdb
# vgcreate
vgcreate ${vgName} ${storageDevice}
```

- b. EVS disks match the disks created in **dataVolumes** based on the settings of **matchLabels**.
- 2. Policies have priorities to match **matchLabels**. The **matchLabels** policy nearest to **storageSelectors** has a higher priority and the disk nearest to **dataVolumes** will be preferentially matches. As **matchLabels** uses loose matching, you are advised to place the **matchLabels** policy with a small matching range on the top. For example:

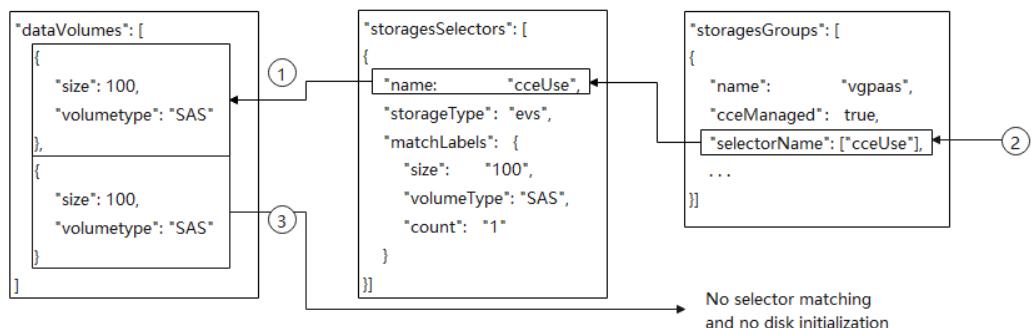

- a. In step 1, the first disk in **dataVolumes** is matched by the EVS disk whose size is 100 GiB and storage class is SAS. In step 2, the second disk in **dataVolumes** is matched by the EVS disk whose size is 100 GiB because the first disk has been selected.
- b. In step 3, two disks in **dataVolumes** can be matched because **volumeType** or **count** is not specified in **matchLabels**. In this case, no disk is available for matching in step 4.
- 3. **storageGroups** associates with **storageSelectors** based on **selectorName**. Finally, two 100 GiB disks are selected. The CCE backend groups the two PVs into a volume group (VG) and divides the VG into two logical volumes (LVs) in the ratio of 9:1. 10% of Kubernetes LVs are partitioned in striped mode. 90% runtime LVs are partitioned in linear mode by default because **runtimeConfig** is not configured.

## Creating a Raw Disk

During node creation on the CCE console, click **Add Data Disk**. Then, click **Expand** next to the newly added data disk and select **Default**. The created disk is a raw disk.

The following figure shows the API calling logic.

1. The **cceUse** selector matches a 100 GiB data disk.
2. The selected disk is managed by CCE and used as a data disk.
3. The other 100 GiB data disk created in **dataVolumes** is not selected by any selector and is managed by storageGroups. Therefore, this EVS disk will be attached to the node as a raw disk and will not be initialized.

After the node is created, log in to the node and check whether a 100 GiB disk has been attached but not initialized.

```

## Attaching a Disk to a Specified Path

During node creation on the CCE console, click **Add Data Disk**. Then, click **Expand** next to the newly added data disk, select **Mount Disk**, and set the mount path. In this case, CCE initializes and attaches the disk by default.

The following figure shows the API calling logic.

1. The **user1** selector selects a 100 GiB data disk.
  2. Create a VG named **vguser1** using LVM.
  3. Strip all the space of **vguser1** into an LV named **user** and format the disk in ext4 format. Finally, attach the disk to the **/tmp2** directory.

After the node is created, log in to the node and check whether a 100 GiB disk has been attached and managed by LVM.

```

```

## Creating Striped LVs to Improve Disk Performance

Currently, the striped LV function is supported only by calling an API. The following is an example:

1. **storageSelectors** matches all EVS disks in **dataVolumes** because **matchLabels** is not contained in **storageSelectors**.
2. Create a VG named **vgpaas** using LVM.
3. Strip 90% of the **vgpaas** space into runtime LVs.
4. Strip 10% of the **vgpaas** space into Kubernetes LVs.

 NOTE

- Two or more data disks are required for striping.
- When creating a striped LV, ensure that the types and sizes of the PVs added to the VG are the same. Otherwise, the creation will fail.
- When creating a striped LV, use the striping configuration for both the runtime LV and Kubernetes LV. Otherwise, the creation will fail.

Log in to the node and run the following command to view the striping result:

```
[root@test-83773 ~]# lvdisplay -m | grep -C 10 striped
  LV Size           36.00 GiB
  Current LE        9216
  Segments          1
  Allocation        inherit
  Read ahead sectors    auto
  - currently set to   512
  Block device       253:0

  --- Segments ---
  Logical extents 0 to 9215:
    Type            striped
    Stripes         2
    Stripe size     64.00 KiB
    Stripe 0:
      Physical volume  /dev/sdb
      Physical extents 0 to 4607
    Stripe 1:
      Physical volume  /dev/sdc
      Physical extents 0 to 4607

  --
  LV Size           20.00 GiB
  Current LE        5120
  Segments          1
  Allocation        inherit
  Read ahead sectors    auto
  - currently set to   8192
  Block device       253:4

  --- Segments ---
  Logical extents 0 to 5119:
    Type            striped
    Stripes         2
    Stripe size     64.00 KiB
    Stripe 0:
      Physical volume  /dev/sdb
```
