---

## About This Document

This document describes how to use GeminiDB APIs to perform operations on GeminiDB instances, such as creating, deleting, and querying the instances. For details about all supported operations, see [API Overview](#).

Before calling the APIs, ensure that you are familiar with GeminiDB concepts. For details, see *GeminiDB User Guide*.

## Calling Method

GeminiDB provides Representational State Transfer (REST) APIs. You can call the APIs over HTTPS. For details, see [Calling APIs](#).

## Endpoint

An endpoint receives API calls and sends responses. Endpoints vary depending on services and regions. For the endpoints of all services, contact the enterprise administrator.

## Constraints

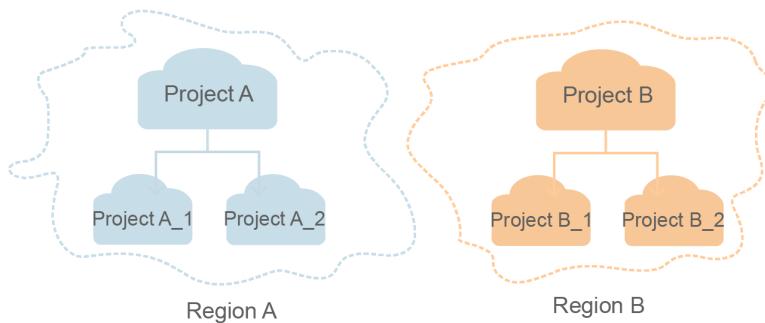

For more constraints, see the description of each API.

## Concepts

- Domain  
A domain has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and assign user permissions. The domain is a payment entity and should not be used directly to perform routine management. For security purposes, create users and grant them permissions for routine management.
- IAM User  
A user is created using a domain to use cloud services. Each user has its own identity credentials (password and access keys).  
API authentication requires information such as the domain, username, and password.

- Region  
A region is a geographic area in which cloud resources are deployed. Availability zones (AZs) in the same region can communicate with each other over an intranet, while AZs in different regions are isolated from each other. Deploying cloud resources in different regions can better suit certain user requirements or comply with local laws or regulations.
- AZ  
An AZ contains one or more physical data centers. Each AZ has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. Within an AZ, computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are connected using high-speed optical fibers to support cross-AZ high-availability systems.
- Project  
A project corresponds to a region. Default projects are defined to group and physically isolate resources (including compute, storage, and network resources) between different regions. Users can be granted permissions in a default project to access all resources under their domains in the region associated with the project. If you need more refined access control, create subprojects under a default project and purchase resources in the subprojects. Then you can assign users the permissions required to access only the resources in specific subprojects.

**Figure 1-1** Project isolating model

- Enterprise Project  
Enterprise projects group and manage resources across regions. Resources in enterprise projects are logically isolated. An enterprise project can contain resources of multiple regions, and resources can be added to or removed from the enterprise project.

# 2 API Overview

GeminiDB provides extended APIs. These APIs enable you to use some functions of GeminiDB.

**Table 2-1** API description

Type	Description
API Version Queries	<ul style="list-style-type: none"><li>Query API versions.</li><li>Query version information of a specific API.</li></ul>
DB Version Queries	Query version information of a specified type of instances.
Instance Specifications Queries	Query all instance specifications under a specified condition.
Instance Management	Create, delete, and query instances, scale up or down the instance storage space, add or delete cluster instance nodes, change instance specifications, and change the instance administrator password, instance name, and instance security group.
Backup and Restoration	Query and set automated backup policies.
Parameter Management	Obtain parameter templates, create a parameter template, modify parameters in a parameter template, apply a parameter template, modify or obtain parameters of a specified instance, obtain parameters of a specified parameter template, and delete a parameter template.
Tag Management	Query resources by tag, batch add and delete tags, and query resource tags.
Quota Management	Query quotas.

Type	Description
Disaster Recovery (DR) Management	Checking whether a DR relationship can be created for one instance with a specified one or deleted, creating a DR relationship between one instance and a specified instance, and deleting a DR relationship between two them.

# 3 Calling APIs

## 3.1 Making an API Request

This section describes the structure of a REST API, and uses the IAM API for [obtaining a user token](#) as an example to describe how to call an API. The obtained token is used to authenticate other APIs.

### Request URI

A request URI consists of the following:

**{URI-scheme}://{Endpoint}/{resource-path}?{query-string}**

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be separately transmitted, rather than being conveyed in a request message separately.

**Table 3-1** URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of a server where a REST service endpoint is hosted. The endpoint varies depending on services and regions. It can be obtained from the administrator. For example, the endpoint of IAM in the EU-Dublin region is <b>iam.eu-west-101.myhuaweicloud.eu</b> .
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of the API. For example, the <b>resource-path</b> of the API for obtaining a user token is <b>/v3/auth/tokens</b> .

Parameter	Description
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of "Parameter name=Parameter value". For example, ? <b>limit=10</b> indicates that up to 10 data records will be displayed.

## Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server:

**Table 3-2** HTTP methods

Method	Description
GET	Requests a server to return specified resources.
PUT	Requests a server to update specified resources.
POST	Requests a server to add a resource or perform a special operation.
DELETE	Requests a server to delete a specified resource (for example, an object).

For example, in the URI for [obtaining a user token](#), the request method is POST. The request is as follows:

```
POST https://iam.eu-west-101.myhuaweicloud.eu/v3/auth/tokens
```

## Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, add **Content-Type** that defines a request body type to request for authentication information.

[Table 3-3](#) lists common request header fields.

**Table 3-3** Common request headers

Parameter	Description	Mandatory	Example Value
Content-Type	MIME type of the request body. Use the default value <b>application/json</b> . For APIs used to upload objects or images, the value varies depending on the flow type.	This field is optional for GET requests and mandatory for other requests.	application/json
Content-Length	Length of the request body. The unit is byte.	This field is optional for POST requests, but must be left blank for GET requests.	3495
X-Project-Id	Project ID. To obtain the project ID, see <a href="#">Obtaining a Project ID</a> .	No	e9993fc787d94b6c886cb aa340f9c0f4
X-Auth-Token	User token. After a request is processed, the value of <b>X-Subject-Token</b> in the header is the token value.	Yes	The following is part of an example token: MIIPAgYJKoZIhvcNAQc-Co...ggg1BBIINPXsidG9rZ

The API used to [obtain a user token](#) does not require authentication. Therefore, this API only requires adding the **Content-Type** field. The following is an example request:

```
POST https://iam.eu-west-101.myhuaweicloud.eu/v3/auth/tokens
Content-Type: application/json
```

## (Optional) Request Body

This part is optional. The request body is often sent in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. If the request body contains full-width characters, these characters must be coded in UTF-8.

Request bodies vary depending on APIs. Some APIs do not require a request body, such as the APIs requested using the GET and DELETE methods.

For the API of [obtaining a user token](#), request parameters and parameter description can be obtained from the API request. The following is an example

request with a body included. Replace *username*, *domainname*, \*\*\*\*\* (login password), and xxxxxxxxxxxxxxxx (project name) with required values. You can obtain the values from the administrator.

#### NOTE

The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For details, see [Obtaining a User Token](#).

```
POST https://iam.eu-west-101.myhuaweicloud.eu/v3/auth/tokens
Content-Type: application/json
```

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxxxxxxxxxxxxx"
      }
    }
  }
}
```

If all data required for the API request is available, you can send a request to call an API through [curl](#), [Postman](#), or coding. For the API of obtaining a user token, **x-subject-token** in the response header is the required user token. Then, this token can be used to authenticate the calling of other APIs.

## 3.2 Authentication

GeminiDB supports token-based authentication.

#### NOTE

The validity period of a token is 24 hours. If a token is required, the system caches the token to avoid frequent calling.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to a request to get permissions for calling the API.

If you want to use a token for authentication, you need to obtain the user's token and add **X-Auth-Token** to the request header of the service API to make an API call.

When you [call an API to obtain a user token](#), set **auth.scope** in the request body to **project**.

```
{  
    "auth": {  
        "identity": {  
            "methods": [  
                "password"  
            ],  
            "password": {  
                "user": {  
                    "name": "username",  
                    "password": "password",  
                    "domain": {  
                        "name": "domainname"  
                    }  
                }  
            }  
        },  
        "scope": {  
            "project": {  
                "name": "xxxxxxxx"  
            }  
        }  
    }  
}
```

After a token is obtained, add field **X-Auth-Token** to the request header to specify the token when other APIs are called. For example, if the token is **ABCDEFG....**, add **X-Auth-Token: ABCDEFG....** to a request as follows:

```
GET https://iam.eu-west-101.myhuaweicloud.eu/v3/auth/projects  
Content-Type: application/json  
X-Auth-Token: ABCDEFG....
```

## 3.3 Returned Values

### Status Code

After you send a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits ranging from 1xx to 5xx. It indicates the status of a response. For more information, see [Status Codes](#).

If status code 201 is returned for calling the API used to [obtain a user token](#), the request is successful.

### Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

[Figure 3-1](#) shows the response header for the API used to [obtain a user token](#), in which **x-subject-token** is the required user token. Then, this token can be used to authenticate the calling of other APIs.

**Figure 3-1** Response header for the API used to obtain a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopener
x-frame-options → SAMEORIGIN
x-iam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5
x-subject-token → MIIYXQVJKoZhvNAQcColYTjCCGEoCAQEExDTALBglghkgBZQMEAqEwgharBgkqhkiG9w0BBwGgg hacBIIWmHsidG9rZW4iOnsiZXhwaXJlc19hdCI6ljlwMTktMDItMTNUMDfj3KUs6YgJknvNRbW2eZ5eb78SZOkqjACgkIqO1wi4JlGzrp d18LGXK5bxldfq4lqHCYb8P4NaY0NYejcAgzJveFIYtLWT1GSO0zxkZmlQHQj82H8qHdg lZO9fuEbL5dMhdavj+33wElxHRC9187o+k9-j+CMZSEB7bUGd5Uj6eRASX1jipPEGA270g1Fr uoL6jqglFkNPQuFSOU8+uSsttVwRtNfsC+qTp22Rkd5MCqFGQ8LcuUxC3a+9CMBnOintWW7oeRUvhVpxk8pxiX1wTEboXRzT6MUbpvGw-oPNFYxJECKn oH3Rozv0vN--n5d6Nb xg ==
x-xss-protection → 1; mode=block;
```

## (Optional) Response Body

This part is optional. A response body is generally returned in a structured format (for example, JSON or XML), corresponding to **Content-Type** in the response header, and is used to transfer content other than the response header.

If the following information is returned for calling the API used to [obtain a user token](#), the request is successful. The following describes part of the request body.

```
{
  "token": {
    "expires_at": "2019-02-13T06:52:13.855000Z",
    "methods": [
      "password"
    ],
    "catalog": [
      {
        "endpoints": [
          {
            "region_id": "aaa",
            ....
        }
      ]
    ]
  }
}
```

If an error occurs during API calling, an error code and error message will be displayed. The following is an error response body:

```
{
  "error_msg": "Parameter error",
  "error_code": "DBS.200001"
}
```

In the response, **error\_code** indicates an error code, and **error\_msg** describes the error.

# 4 Quick Start

This chapter describes how to create a GeminiDB Cassandra instance by calling an API.

## NOTE

The token obtained from IAM is valid for only 24 hours. If you want to use a token for authentication, you can cache it to avoid frequently obtaining the token.

## Involved APIs

If you use a token for authentication, you must obtain the user's token and add **X-Auth-Token** to the request message header of the service API when making an API call.

- API for obtaining tokens from IAM
- API for creating a GeminiDB Cassandra instance

## Procedure

1. Use a token for authentication by referring to [Authentication](#).
2. Send **POST https://{{Endpoint}}/v3/{{project\_id}}/instances**.
3. Add **X-Auth-Token** to the request header.
4. Transfer the following parameters in the request body:

## NOTE

Values of **region** and **availability\_zone** are only for reference.

For details about the API for creating instances, see [Creating an Instance](#).

```
{  
    "name": "test-cassandra-01", //Instance name  
    "datastore": {  
        "type": "cassandra", //Database type  
        "version": "3.11", //DB engine version  
        "storage_engine": "rocksDB" //Storage engine  
    },  
    "region": "aaa", //Region  
    "availability_zone": "bbb", //AZ  
    "vpc_id": "674e9b42-cd8d-4d25-a2e6-5abcc565b961", //VPC ID  
    "subnet_id": "f1df08c5-71d1-406a-aff0-de435a51007b", //Subnet ID
```

```
"security_group_id": "7aa51dbf-5b63-40db-9724-dad3c4828b58", //Security group ID
"password": "xxxx", //Administrator password
"mode": "Cluster", //Instance type
"flavor": [
    {
        "num": 3, //Nodes
        "size": 500, //Storage space
        "storage": "ULTRAHIGH", //Disk type
        "spec_code": "geminidb.cassandra.4xlarge.4" //Resource specification code
    }
],
"backup_strategy": {
    "start_time": "08:00-09:00", //Backup time window
    "keep_days": "8" //Retention period of backup files
},
"enterprise_project_id": "0" //Enterprise project ID
}
```

If the following information is displayed, the request is successful:

```
{
    "id": "39b6a1a278844ac48119d86512e0000bin06",
    "name": "test-cassandra-01",
    "datastore": {
        "type": "cassandra",
        "version": "3.11",
        "storage_engine": "rocksDB"
    },
    "created": "2019-10-28 14:10:54",
    "status": "creating",
    "region": "aaa",
    "availability_zone": "bbb",
    "vpc_id": "674e9b42-cd8d-4d25-a2e6-5abcc565b961",
    "subnet_id": "f1df08c5-71d1-406a-aff0-de435a51007b",
    "security_group_id": "7aa51dbf-5b63-40db-9724-dad3c4828b58",
    "mode": "Cluster",
    "flavor": [
        {
            "num": 3,
            "size": 500,
            "storage": "ULTRAHIGH",
            "spec_code": "geminidb.cassandra.4xlarge.4"
        }
    ],
    "backup_strategy": {
        "start_time": "08:00-09:00",
        "keep_days": "8"
    },
    "job_id": "c010abd0-48cf-4fa8-8cbc-090f093eaa2f",
    "enterprise_project_id": "0"
}
```

If the request fails, an error code and error information are returned. For details, see [Error Codes](#).

# 5 APIs v3.1

## 5.1 API Versions and Specifications

### 5.1.1 Querying Instance Specifications

#### Function

This API is used to query all instance specifications under a specified condition.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

#### URI

GET /v3.1/{project\_id}/flavors

**Table 5-1** URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .

**Table 5-2** Query parameters

Parameter	Mandatory	Type	Description
engine_name	No	String	<p>Database type. The value can be:</p> <ul style="list-style-type: none"><li>• <b>cassandra</b>, indicating that the instances are of the GeminiDB Cassandra type.</li><li>• <b>influxdb</b>, indicating that the instances are of the GeminiDB Influx type.</li><li>• <b>redis</b>, indicating that the instances are of the GeminiDB Redis type.</li><li>• If this parameter is not transferred, the default value is <b>cassandra</b>.</li></ul>
offset	No	Integer	<p>Index offset.</p> <ul style="list-style-type: none"><li>• If <b>offset</b> is set to <i>N</i>, the query starts from the <i>N+1</i> piece of data. The default value is <b>0</b>, which indicates that the query starts from the first piece of data.</li><li>• The value must be a non-negative number.</li></ul>
limit	No	Integer	<p>Maximum of specifications that can be queried</p> <ul style="list-style-type: none"><li>• The value ranges from <b>1</b> to <b>100</b>.</li><li>• If this parameter is not transferred, the first 100 pieces of specification information is queried by default.</li></ul>

## Request Parameters

**Table 5-3** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

## Response Parameters

Status code: 200

**Table 5-4** Response body parameters

Parameter	Type	Description
total_count	Integer	Total number of records
flavors	Array of <b>Flavors</b> objects	Instance specifications

**Table 5-5** Flavors

Parameter	Type	Description
engine_name	String	API name.
engine_version	String	API version.
vcpus	String	CPU cores
ram	String	Memory size (MB)
spec_code	String	Resource specification code. <b>Example:</b> <b>geminidb.cassandra.8xlarge.4</b> <b>NOTE</b> <ul style="list-style-type: none"><li>• <b>geminidb.cassandra</b> indicates the instance is a GeminiDB Cassandra instance.</li><li>• <b>8xlarge.4</b> indicates node specifications.</li></ul>
availability_zone	Array of strings	ID of the AZ that supports the specifications <b>NOTE</b> This parameter has been discarded. Do not use it.
az_status	Object	Status of specifications in an AZ.

## Example Request

URI example

## 5.2 Backup and Restoration

## 5.2.1 Querying Backups

### Function

This API is used to query backups based on specified conditions.

### URI

GET /v3.1/{project\_id}/backups

**Table 5-6** URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .

**Table 5-7** Query parameters

Parameter	Mandatory	Type	Description
instance_id	No	String	Instance ID, which can be obtained by calling the API for querying instances. If there are no instances available, create one by calling the API used for creating an instance.
datastore_type	No	String	Database type. The value can be: <ul style="list-style-type: none"><li>• <b>redis</b></li><li>• <b>influxdb</b></li></ul>
backup_id	No	String	Backup ID.
backup_type	No	String	Backup type, which is case sensitive. The value can be: <ul style="list-style-type: none"><li>• <b>Auto</b>, indicating that this backup is an automatic full backup.</li><li>• <b>Manual</b>, indicating that this backup is a manual full backup.</li><li>• If this parameter is not transferred, all automated and manual backups (including database- and table-level backups) are queried by default.</li></ul>

Parameter	Mandatory	Type	Description
type	No	String	<p>Backup policy type. The value can be:</p> <ul style="list-style-type: none"><li>• <b>Instance</b>: An instance backup is queried.</li><li>• <b>DatabaseTable</b>: A database or table backup is queried.</li><li>• The default value is <b>Instance</b>.</li></ul>
limit	No	Integer	<p>Maximum backup records to be queried. The value ranges from <b>1</b> to <b>100</b>. If this parameter is not transferred, the first 100 instances are queried by default.</p> <p>Minimum value: <b>1</b></p> <p>Maximum value: <b>100</b></p>
offset	No	Integer	<p>Index position. The query starts from the next backup creation time indexed by this parameter under a specified project. If offset is set to <i>N</i>, the resource query starts from the <i>N+1</i> piece of data. The value must be no less than <b>0</b>. If this parameter is not transferred, the index offset is <b>0</b> by default, indicating that the query starts from the latest created instance.</p> <p>Minimum value: <b>0</b></p>
begin_time	No	String	<p>Start time of the backup query. The time point is in the <code>yyyy-mm-ddThh:mm:ssZ</code> format. <b>T</b> indicates the start time. <b>Z</b> indicates the time zone offset and the default value is left blank by default.</p> <ul style="list-style-type: none"><li>• When <b>end_time</b> is not empty, <b>begin_time</b> is mandatory.</li></ul>

Parameter	Mandatory	Type	Description
end_time	No	String	<p>End time of the backup query. The time point is in the yyyy-mm-ddThh:mm:ssZ format. T indicates the start time. Z indicates the time zone offset and the default value is left blank by default.</p> <ul style="list-style-type: none"><li>When <b>begin_time</b> is not empty, <b>end_time</b> is mandatory.</li></ul>

## Request Parameters

**Table 5-8** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

## Response Parameters

Status code: 200

**Table 5-9** Response body parameters

Parameter	Type	Description
total_count	Integer	Total backups.
backups	Array of objects	Backup details. For details, see <a href="#">Table 5-10</a> .

**Table 5-10** Backup

Parameter	Type	Description
id	String	Backup ID.
description	String	Backup description.
instance_id	String	ID of the instance that the backup is created for.
instance_name	String	Name of the instance that the backup is created for.

Parameter	Type	Description
datastore	object	DB version information. For details, see <a href="#">Table 5-11</a> .
name	String	Backup name.
type	String	<ul style="list-style-type: none"><li>• <b>Auto</b>: indicates that this backup is an automatic full backup.</li><li>• <b>Manual</b>: indicates that this backup is a manual full backup.</li></ul>
size	Double	Backup size, in KB.
status	String	Backup status. The value can be: <ul style="list-style-type: none"><li>• <b>BUILDING</b>, indicating that the backup is in progress.</li><li>• <b>COMPLETED</b>, indicating that the backup is completed.</li><li>• <b>FAILED</b>, indicating that the backup failed.</li></ul>
begin_time	String	Backup start time. The time point is in the yyyy-mm-ddThh:mm:ssZ format. <b>T</b> indicates the start time, and <b>Z</b> indicates the time zone offset.
end_time	String	Backup end time. The time point is in the yyyy-mm-ddThh:mm:ssZ format. <b>T</b> indicates the start time, and <b>Z</b> indicates the time zone offset.
database_tables	Array of objects	Database and table information in the backup. For details, see <a href="#">Table 5-12</a> . <ul style="list-style-type: none"><li>• Keep this parameter empty or ignore it when you query an instance backup.</li><li>• Specify this parameter when you query a database or table backup (if any).</li></ul>

**Table 5-11** Datastore

Parameter	Type	Description
type	String	Database type.
version	String	Database version.

**Table 5-12** QueryDatabaseTableInfo

Parameter	Type	Description
database_name	String	Database name.
table_names	Array of strings	Table names. <ul style="list-style-type: none"><li>● If this parameter is empty, database names are queried.</li><li>● If this parameter is not empty, table names are queried.</li></ul>

## 5.2.2 Querying an Automated Backup Policy

### Function

This API is used to query an automated backup policy, including GeminiDB Cassandra databases and tables.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

### URI

**Table 5-13** URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .
instance_id	Yes	String	Instance ID

## Request Parameters

**Table 5-14** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

## Response Parameters

Status code: 202

**Table 5-15** Response body parameter

Parameter	Type	Description
backup_policy	object	Backup policy objects, including the backup retention period (days) and start time. For details, see <a href="#">Table 5-16</a> .

**Table 5-16** ShowBackupPolicyResult

Parameter	Type	Description
keep_days	Integer	Backup retention days
start_time	String	Backup time window. Automated backup will be triggered during the backup time window.
period	String	Backup period. After a backup period is specified, data will be automatically backed up on the selected days every week.

## Example Request

URI example

GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fcd405ea4674276ce36dae8in02/backups/policy

## Example Response

Status code: 202

Success

Enabling an automated backup policy

{  
  "backup\_policy" : {

```
        "keep_days" : 7,  
        "start_time" : "19:00-20:00",  
        "period" : "1,2,4,5,6"  
    }  
}
```

Disabling an automated backup policy

```
{  
    "backup_policy" : {  
        "keep_days" : 0  
    }  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 5.3 Parameter Configuration

### 5.3.1 Obtaining Parameter Templates

#### Function

This API is used to obtain parameter templates, including all of the default and custom parameter templates.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

#### URI

GET /v3.1/{project\_id}/configurations

**Table 5-17** URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .

**Table 5-18** Query parameters

Parameter	Mandatory	Type	Description
offset	No	Integer	<p>Index offset.</p> <ul style="list-style-type: none"><li>If <b>offset</b> is set to <math>N</math>, the query starts from the <math>N+1</math> piece of data. The default value is <b>0</b>, which indicates that the query starts from the first piece of data.</li><li>The value must be a non-negative number.</li></ul>
limit	No	Integer	<p>Maximum number of instances that can be queried.</p> <ul style="list-style-type: none"><li>The value ranges from <b>1</b> to <b>100</b>.</li><li>If this parameter is not transferred, the first 100 records are queried by default.</li></ul>

## Request Parameters

**Table 5-19** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

## Response Parameters

Status code: 200

**Table 5-20** Response body parameters

Parameter	Type	Description
count	Integer	Total number of records.
quota	Integer	Maximum number of custom parameter templates that a user can create.
configurations	Array of <a href="#">ListConfigurations-Result</a> objects	Parameter templates.

**Table 5-21** ListConfigurationsResult

Parameter	Type	Description
id	String	Parameter template ID.
name	String	Parameter template name.
description	String	Parameter template description.
datastore_version_name	String	Database version name.
datastore_name	String	Database name.
created	String	Creation time in the yyyy-MM-ddTHH:mm:ssZ format. <b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset.
updated	String	Update time in the yyyy-MM-ddTHH:mm:ssZ format. <b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset.
mode	String	Instance type. The value can be: <b>Cluster</b> : GeminiDB Cassandra cluster instance <b>Cluster</b> : GeminiDB Influx cluster instance <b>InfluxdbSingle</b> : single-node GeminiDB Influx instance
user_defined	Boolean	Whether the parameter template is a custom template. The value can be: <ul style="list-style-type: none"><li>• <b>false</b>, indicating that the parameter template is a default parameter template.</li><li>• <b>true</b>, indicating that the parameter template is a custom template.</li></ul>

# 6 APIs v3

## 6.1 API Versions

### 6.1.1 Querying API Versions

#### Function

This API is used to query the supported API versions.

#### URI

GET /

#### Request Parameters

None

#### Response Parameters

Status code: 200

**Table 6-1** Response body parameter

Parameter	Type	Description
versions	Array of <a href="#">ApiVersionResponse</a> objects	API version information

**Table 6-2** ApiVersionResponse

Parameter	Type	Description
id	String	API version number
links	Array of <a href="#">Links</a> objects	API link information <b>NOTE</b> If the version is v3, the value is [].
status	String	Version status
version	String	Subversion information of the API version
min_version	String	Minimum API version number
updated	String	Version update time The format is yyyy-mm-dd Thh:mm:ssZ. <b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the UTC.

**Table 6-3** Links

Parameter	Type	Description
href	String	API URL. The value is "".
rel	String	The value is <b>self</b> , indicating that URL is a local link.

## Example Request

URI example

GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/

## Example Response

Status code: 200

Success

```
{  
  "versions": [ {  
    "id": "v3",  
    "links": [ ],  
    "status": "CURRENT",  
    "version": "",  
    "min_version": "",  
    "updated": "2019-10-30T17:34:02Z"  
  } ]  
}
```

## Status Codes

For details, see [Status Codes](#).

## Error Codes

For details, see [Error Codes](#).

### 6.1.2 Querying Version Information of an API

#### Function

This API is used to query version information of a specified API.

#### URI

GET /{versionId}

**Table 6-4** URI parameter

Parameter	Mandatory	Type	Description
versionId	Yes	String	API version

#### Request Parameters

None

#### Response Parameters

Status code: 200

**Table 6-5** Response body parameter

Parameter	Type	Description
version	<a href="#">ApiVersionResponse</a> object	API version information

**Table 6-6** ApiVersionResponse

Parameter	Type	Description
id	String	API version number
links	Array of <a href="#">Links</a> objects	API link information <b>NOTE</b> If the version is v3, the value is [].
status	String	Version status

Parameter	Type	Description
version	String	Subversion information of the API version
min_version	String	Minimum API version number
updated	String	Version update time The format is yyyy-mm-dd Thh:mm:ssZ. <b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the UTC.

**Table 6-7** Links

Parameter	Type	Description
href	String	API URL. The value is "".
rel	String	The value is <b>self</b> , indicating that URL is a local link.

## Example Request

URI example

GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3

## Example Response

Status code: 200

Success

```
{  
  "version": {  
    "id": "v3",  
    "links": [],  
    "status": "CURRENT",  
    "version": "",  
    "min_version": "",  
    "updated": "2019-10-30T17:34:02Z"  
  }  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.2 Versions and Specifications

### 6.2.1 Querying Version Information

#### Function

This API is used to query version information of a specified type of instances.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

#### URI

GET /v3/{project\_id}/datastores/{datastore\_name}/versions

**Table 6-8** URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .
datastore_name	Yes	String	Database type. The value can be: <ul style="list-style-type: none"><li>• <b>cassandra</b>, indicating that the instances are of the GeminiDB Cassandra type.</li><li>• <b>influxdb</b>, indicating that the instances are of the GeminiDB Influx type.</li><li>• <b>redis</b>, indicating that the instances are of the GeminiDB Redis type.</li></ul>

## Request Parameters

**Table 6-9** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

## Response Parameters

Status code: 200

**Table 6-10** Response body parameter

Parameter	Type	Description
versions	Array of strings	Database version. The supported versions are: <ul style="list-style-type: none"><li>• GeminiDB Cassandra instance 3.11</li><li>• GeminiDB Influx instance 1.7</li><li>• GeminiDB Redis instance 5.0</li></ul>

## Example Request

URI example

```
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/  
datastores/cassandra/versions
```

## Example Response

Status code: 200

Success

```
{  
  "versions" : [ "3.11" ]  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.3 Instances

## 6.3.1 Creating an Instance

### Function

- This API can be used to create an instance.
- The API can be used to create an instance when you restore data using a specific backup.
- The API can also be used to create an instance when you restore data of a specific instance to a specified point in time.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

This API supports both yearly/monthly and pay-per-use instances.

### URI

POST /v3/{project\_id}/instances

**Table 6-11** URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .

### Request Parameters

**Table 6-12** Request header parameter

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

**Table 6-13** Request body parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Instance name, which can be the same as an existing instance name. The name can contain 4 to 64 bytes and must start with a letter. It is case-sensitive and can contain only letters, digits, hyphens (-), and underscores (_).
datastore	Yes	Datastore object	Database information.
region	Yes	String	Region ID. The value cannot be empty. Obtain the parameter value from the enterprise administrator.
availability_zone	Yes	String	AZ ID. For details about the value, see <a href="#">az_status</a> returned in <a href="#">Querying Instance Specifications</a> . If an instance can be created across three AZs, separate multiple AZ IDs by commas (,).
vpc_id	Yes	String	VPC ID. You can obtain the value with either of the following methods: <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.</li><li>• Method 2: Query the VPC ID using the VPC API. For details, see <a href="#">Querying VPCs</a>.</li></ul>

Parameter	Mandatory	Type	Description
subnet_id	Yes	String	<p>Subnet ID. You can obtain the subnet ID with either of the following methods:</p> <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the network ID on the displayed page.</li><li>• Method 2: Query the subnet ID through the VPC API. For details, see <a href="#">Querying Subnets</a>.</li></ul>
security_group_id	Yes	String	<p>Security group ID. You can obtain the security group ID with either of the following methods:</p> <ul style="list-style-type: none"><li>• Method 1: Log in to the VPC console. Choose <b>Access Control &gt; Security Groups</b> in the navigation pane on the left. On the displayed page, click the target security group. You can view the security group ID on the displayed page.</li><li>• Method 2: Query the security group using the VPC API. For details, see <a href="#">Querying Security Groups</a>.</li></ul>
password	Yes	String	<p>Database password. The password can include 8 to 32 characters and contain uppercase letters, lowercase letters, digits, and the following special characters: ~!@#%^*-_=+? Enter a strong password against security risks such as brute force cracking.</p>

Parameter	Mandatory	Type	Description
mode	Yes	String	<p>Instance type. The value can be:</p> <ul style="list-style-type: none"><li>• <b>Cluster</b>, indicating that GeminiDB Cassandra supports the cluster type.</li><li>• <b>Cluster</b>, indicating that GeminiDB Influx supports the cluster type.</li><li>• <b>Cluster</b>, indicating that GeminiDB Redis supports the cluster type.</li><li>• <b>Replication</b>, indicating that GeminiDB Redis supports the primary/standby type.</li></ul>
flavor	Yes	Array of <a href="#">Flavor</a> objects	<p>Instance specifications. For details about the specifications, see parameter values under <b>flavors</b> in <a href="#">Querying Instance Specifications</a>.</p>
configuration_id	No	String	Parameter template ID.
backup_strategy	No	<a href="#">BackupStrategy</a> object	Advanced backup policy.
enterprise_project_id	No	String	<p>Enterprise project ID.</p> <ul style="list-style-type: none"><li>• Do not transfer this parameter if EPS is not enabled.</li><li>• If EPS is enabled but this parameter is not transferred, the default enterprise project is used. For the enterprise project ID, see the <b>id</b> value in the <b>enterprise_project field data structure</b> table in section "Querying the Enterprise Project List" of the <i>Enterprise Project Management Service API Reference</i>.</li></ul>

Parameter	Mandatory	Type	Description
ssl_option	No	String	<p>Whether SSL is enabled. The value can be:</p> <ul style="list-style-type: none"><li>• <b>0</b>, indicating that SSL is disabled by default.</li><li>• <b>1</b>, indicating that SSL is enabled by default.</li><li>• If this parameter is not transferred, SSL is disabled by default.</li></ul>
charge_info	No	<a href="#">ChargeInfo object</a>	Billing mode, which includes yearly/monthly and pay-per-use. The default billing mode is pay-per-use.
dedicated_resource_id	No	String	Dedicated resource ID. This parameter can be delivered only after the dedicated resource pool is enabled.
restore_info	No	<a href="#">RestoreInfo object</a>	<p>Backup information. You can restore data from a specific backup or instance to a specific point in time during the backup retention period.</p> <p>Only GeminiDB Cassandra and GeminiDB Influx allow you to restore data from a specific cluster instance to a specific point in time.</p>
port	No	String	<p>Port number for accessing the instance.</p> <p>You can specify a port number for accessing GeminiDB Redis instances. The port number ranges from 1024 to 65535, excluding 2180, 2887, 3887, 6377, 6378, 6380, 8018, 8079, 8091, 8479, 8484, 8999, 9864, 9866, 9867, 12017, 12333, and 50069.</p> <p>If you do not specify a port number, port 6379 is used by default when you create a GeminiDB Redis instance.</p> <p>If you want to use this instance for dual-active DR, set the port to 8635.</p>

**Table 6-14** Datastore

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Database type.</p> <ul style="list-style-type: none"><li>• GeminiDB Cassandra, GeminiDB Influx, and GeminiDB Redis instances are supported.</li><li>• If you set this parameter to <b>cassandra</b>, GeminiDB Cassandra instances will be created.</li><li>• If you set this parameter to <b>influxdb</b>, GeminiDB Influx instances will be created.</li><li>• If you set this parameter to <b>redis</b>, GeminiDB Redis instances will be created.</li></ul>
version	Yes	String	<p>Database version. The value can be:</p> <ul style="list-style-type: none"><li>• <b>3.11</b>: GeminiDB Cassandra instance 3.11</li><li>• <b>1.7</b>: GeminiDB Influx instance 1.7</li><li>• <b>5.0</b>: GeminiDB Redis instance 5.0</li></ul>
storage_engine	Yes	String	<p>Storage engine.</p> <ul style="list-style-type: none"><li>• <b>rocksDB</b>, indicating that the GeminiDB Cassandra instance supports the RocksDB storage engine.</li><li>• <b>rocksDB</b>, indicating that the GeminiDB Influx instance supports the RocksDB storage engine.</li><li>• <b>rocksDB</b>, indicating that the GeminiDB Redis instance supports the RocksDB storage engine.</li></ul>

**Table 6-15 Flavor**

Parameter	Mandatory	Type	Description
num	Yes	String	<p>Number of nodes.</p> <ul style="list-style-type: none"><li>• Each GeminiDB Cassandra instance can run on 3 to 60 nodes.</li><li>• Each GeminiDB Influx cluster instance can run on 3 to 16 nodes.</li><li>• Each GeminiDB Redis instance can run on 2 to 36 nodes.</li></ul>
size	Yes	String	<p>Storage space. It must be an integer, in GB.</p> <ul style="list-style-type: none"><li>• For details about GeminiDB Cassandra instances, see <a href="#">Instance Specifications</a>.</li><li>• For details about GeminiDB Influx instances, see <a href="#">Instance Specifications</a>.</li><li>• For details about GeminiDB Redis instances, see <a href="#">Instance Specifications</a>.</li></ul>
storage	Yes	String	<p>Disk type.</p> <p>If you set this parameter to <b>ULTRAHIGH</b>, SSD disks are used.</p>
spec_code	Yes	String	<p>Resource specification code.</p> <p>For the code, see the value of response parameter <b>spec_code</b> in <a href="#">Querying Instance Specifications</a>.</p>

**Table 6-16** BackupStrategy

Parameter	Mandatory	Type	Description
start_time	Yes	String	<p>Backup time window. Automated backup will be triggered during the backup time window.</p> <p>The value cannot be empty. It must be the UTC time in the hh:mm-HH:MM format.</p> <ul style="list-style-type: none"><li>• The <b>HH</b> value must be 1 greater than the <b>hh</b> value.</li><li>• The values of <b>mm</b> and <b>MM</b> must be the same and must be set to <b>00, 15, 30, or 45</b>.</li><li>• If this parameter is not transferred, the default backup time window is from 00:00 to 01:00.</li><li>• Example value: <b>23:00-00:00</b></li></ul>
keep_days	No	String	<p>Backup retention days.</p> <p>The value ranges from <b>0</b> to <b>35</b>.</p> <ul style="list-style-type: none"><li>• If this parameter is set to <b>0</b>, the automated backup policy is not set.</li><li>• If this parameter is not transferred, the automated backup policy is enabled by default. Backup files are stored for 7 days by default.</li></ul>

**Table 6-17** ChargeInfo

Parameter	Mandatory	Type	Description
charge_mode	Yes	String	<p>Billing mode.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• <b>prePaid</b>: indicates that the billing mode is yearly/monthly.</li><li>• <b>postPaid</b>: indicates that the billing mode is pay-per-use.</li></ul>

Parameter	Mandatory	Type	Description
period_type	No	String	<p>Subscription period type.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• <b>month</b>: indicates that the subscription unit is month.</li><li>• <b>year</b>: indicates that the subscription unit is year.</li></ul> <p><b>NOTE</b></p> <p>This parameter is valid and mandatory only when <b>charge_mode</b> is set to <b>prePaid</b>.</p>
period_num	No	String	<p>Subscription time period. This parameter is valid and mandatory only when <b>charge_mode</b> is set to <b>prePaid</b>.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• If <b>period_type</b> is set to <b>month</b>, the parameter value ranges from <b>1</b> to <b>9</b>.</li><li>• If <b>period_type</b> is set to <b>year</b>, the parameter value ranges from <b>1</b> to <b>3</b>.</li></ul>
is_auto_renew	No	String	<p>Whether automatic renewal is enabled for yearly/monthly instances. The renewal period is the same as the original period, and the order will be automatically paid during the renewal. The value can be:</p> <ul style="list-style-type: none"><li>• <b>true</b>, indicating that the subscription is automatically renewed.</li><li>• <b>false</b>, indicating that the subscription is not automatically renewed. The default value is <b>false</b>.</li></ul>

Parameter	Mandatory	Type	Description
is_auto_pay	No	String	<p>Payment method. When you create a yearly/monthly instance, you can specify whether the order is automatically paid from your account. This parameter does not affect the payment mode of automatic renewal. The value can be:</p> <ul style="list-style-type: none"><li>• <b>true</b>, indicating that the order is automatically paid from your account.</li><li>• <b>false</b>, indicating that the order needs to be manually paid from your account. This payment method is used by default.</li></ul>

**Table 6-18** RestoreInfo

Parameter	Mandatory	Type	Description
backup_id	No	String	<p>Backup file ID. This parameter cannot be left blank when you create an instance to restore data using a specific backup.</p>
source_instance_id	No	String	<p>ID of the specified instance that backup data is restored to. This parameter cannot be left blank when you restore data at a specific time point from a specific instance to a new instance.</p>
restore_time	No	Long	<p>Time point that backup data is restored to. This parameter cannot be left blank when you restore data at a specific point in time from a specific instance to a new instance. The value is a 13-digit number (in milliseconds, UTC time).</p>

## Response Parameters

Status code: 202

**Table 6-19** Response body parameters

Parameter	Type	Description
id	String	Instance ID.
name	String	Instance name. This parameter is the same as the corresponding request parameter.
datastore	Datastore object	Database information. This parameter is the same as the corresponding request parameter.
created	String	Creation time, which is in the yyyy-mm-dd hh:mm:ss format.
status	String	Instance status. The value is <b>creating</b> .
region	String	Region ID. This parameter is the same as the corresponding request parameter.
availability_zone	String	AZ ID. This parameter is the same as the corresponding request parameter.
vpc_id	String	VPC ID. This parameter is the same as the corresponding request parameter.
subnet_id	String	Subnet ID. This parameter is the same as the corresponding request parameter.
security_group_id	String	Security group ID. This parameter is the same as the corresponding request parameter.
mode	String	Instance type. This parameter is the same as the corresponding request parameter.
flavor	Array of Flavor objects	Instance specifications. This parameter is the same as the corresponding request parameter.
backup_strategy	BackupStrategy object	Advanced backup policy. This parameter is the same as the corresponding request parameter.
enterprise_project_id	String	Enterprise project ID. If you set this parameter to <b>0</b> , the resource belongs to the <b>default</b> enterprise project.

Parameter	Type	Description
ssl_option	String	Whether SSL is enabled. This parameter has the same effect as the corresponding request parameter.
job_id	String	ID of the workflow for creating an instance. This parameter is returned only when a pay-per-use instance is created.
order_id	String	ID of the order for creating an instance. This parameter is returned only when you create a yearly/monthly instance.
charge_info	<a href="#">ChargeInfo</a> object	Billing mode, which includes yearly/monthly and pay-per-use. The default billing mode is pay-per-use.
dedicated_resource_id	String	Dedicated resource ID. This parameter is returned only when the DB instance belongs to a dedicated resource pool.

**Table 6-20** Datastore

Parameter	Type	Description
type	String	Database type. <ul style="list-style-type: none"><li>• GeminiDB Cassandra, GeminiDB Influx, and GeminiDB Redis instances are supported.</li><li>• If you set this parameter to <b>cassandra</b>, GeminiDB Cassandra instances will be created.</li><li>• If you set this parameter to <b>influxdb</b>, GeminiDB Influx instances will be created.</li><li>• If you set this parameter to <b>redis</b>, GeminiDB Redis instances will be created.</li></ul>
version	String	Database version. The value can be: <ul style="list-style-type: none"><li>• <b>3.11</b>: GeminiDB Cassandra instance 3.11</li><li>• <b>1.7</b>: GeminiDB Influx instance 1.7</li><li>• <b>5.0</b>: GeminiDB Redis instance 5.0</li></ul>

Parameter	Type	Description
storage_engine	String	<p>Storage engine.</p> <ul style="list-style-type: none"><li>● <b>rocksDB</b>, indicating that the GeminiDB Cassandra instance supports the RocksDB storage engine.</li><li>● <b>rocksDB</b>, indicating that the GeminiDB Influx instance supports the RocksDB storage engine.</li><li>● <b>rocksDB</b>, indicating that the GeminiDB Redis instance supports the RocksDB storage engine.</li></ul>

**Table 6-21** Flavor

Parameter	Type	Description
num	String	<p>Number of nodes.</p> <ul style="list-style-type: none"><li>● Each GeminiDB Cassandra instance can run on 3 to 60 nodes.</li><li>● Each GeminiDB Influx instance can run on 3 to 16 nodes.</li><li>● Each GeminiDB Redis instance can run on 2 to 36 nodes.</li></ul>
size	String	<p>Storage space. It must be an integer, in GB.</p> <ul style="list-style-type: none"><li>● For details about GeminiDB Cassandra instances, see <a href="#">Instance Specifications</a>.</li><li>● For details about GeminiDB Influx instances, see <a href="#">Instance Specifications</a>.</li><li>● For details about GeminiDB Redis instances, see <a href="#">Instance Specifications</a>.</li></ul>
storage	String	<p>Disk type.</p> <p>If you set this parameter to <b>ULTRAHIGH</b>, SSD disks are used.</p>
spec_code	String	<p>Resource specification code.</p> <p>For the code, see the value of response parameter <b>spec_code</b> in <a href="#">Querying Instance Specifications</a>.</p>

**Table 6-22** BackupStrategy

Parameter	Type	Description
start_time	String	<p>Backup time window. Automated backup will be triggered during the backup time window.</p> <p>The value cannot be empty. It must be the UTC time in the hh:mm-HH:MM format.</p> <ul style="list-style-type: none"><li>• The <b>HH</b> value must be 1 greater than the <b>hh</b> value.</li><li>• The values of <b>mm</b> and <b>MM</b> must be the same and must be set to <b>00</b>, <b>15</b>, <b>30</b>, or <b>45</b>.</li><li>• If this parameter is not transferred, the default backup time window is from 00:00 to 01:00.</li><li>• Example value: <b>23:00-00:00</b></li></ul>
keep_days	String	<p>Backup retention days.</p> <p>The value ranges from <b>0</b> to <b>35</b>.</p> <ul style="list-style-type: none"><li>• If this parameter is set to <b>0</b>, the automated backup policy is not set.</li><li>• If this parameter is not transferred, the automated backup policy is enabled by default. Backup files are stored for 7 days by default.</li></ul>

**Table 6-23** ChargeInfo

Parameter	Type	Description
charge_mode	String	<p>Billing mode.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• <b>prePaid</b>: indicates that the billing mode is yearly/monthly.</li><li>• <b>postPaid</b>: indicates that the billing mode is pay-per-use.</li></ul>

Parameter	Type	Description
period_type	String	<p>Subscription period type.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• <b>month</b>: indicates that the subscription unit is month.</li><li>• <b>year</b>: indicates that the subscription unit is year.</li></ul> <p><b>NOTE</b> This parameter is valid and mandatory only when <b>charge_mode</b> is set to <b>prePaid</b>.</p>
period_num	String	<p>Subscription time period. This parameter is available and mandatory only when <b>charge_mode</b> is set to <b>prePaid</b>.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• If <b>period_type</b> is set to <b>month</b>, the parameter value ranges from <b>1</b> to <b>9</b>.</li><li>• If <b>period_type</b> is set to <b>year</b>, the parameter value ranges from <b>1</b> to <b>3</b>.</li></ul>
is_auto_renew	String	<p>Whether automatic renewal is enabled for yearly/monthly instances. The renewal period is the same as the original period, and the order will be automatically paid during the renewal. The value can be:</p> <ul style="list-style-type: none"><li>• <b>true</b>, indicating that the subscription is automatically renewed.</li><li>• <b>false</b>, indicating that the subscription is not automatically renewed. The default value is <b>false</b>.</li></ul>

Parameter	Type	Description
is_auto_pay	String	<p>Payment method. When you create a yearly/monthly instance, you can specify whether the order is automatically paid from your account. This parameter does not affect the payment mode of automatic renewal. The value can be:</p> <ul style="list-style-type: none"><li>• <b>true</b>, indicating that the order is automatically paid from your account.</li><li>• <b>false</b>, indicating that the order needs to be manually paid from your account. This payment method is used by default.</li></ul>

## Example Request

- **URI example**

POST <https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances>

-  **NOTE**

Values of **region** and **availability\_zone** in the request body are only examples. Set them based on service requirements.

```
{  
    "name" : "test-cassandra-01",  
    "datastore" : {  
        "type" : "cassandra",  
        "version" : "3.11",  
        "storage_engine" : "rocksDB"  
    },  
    "region" : "aaa",  
    "availability_zone" : "bbb",  
    "vpc_id" : "674e9b42-cd8d-4d25-a2e6-5abcc565b961",  
    "subnet_id" : "f1df08c5-71d1-406a-aff0-de435a51007",  
    "security_group_id" : "7aa51dbf-5b63-40db-9724-dad3c4828b58",  
    "password" : "*****",  
    "mode" : "Cluster",  
    "flavor" : [ {  
        "num" : 3,  
        "storage" : "ULTRAHIGH",  
        "size" : 500,  
        "spec_code" : "geminidb.cassandra.4xlarge.4"  
    } ],  
    "backup_strategy" : {  
        "start_time" : "08:15-09:15",  
        "keep_days" : 8  
    },  
    "ssl_option" : 1  
}
```

- Creating a yearly/monthly 3-node GeminiDB Cassandra instance with 16 vCPUs and 64 GB of memory

### NOTE

Values of **region** and **availability\_zone** in the request body are only examples. Set them based on service requirements.

```
{  
    "name" : "test-cassandra-01",  
    "datastore": {  
        "type" : "cassandra",  
        "version" : "3.11",  
        "storage_engine" : "rocksDB"  
    },  
    "region" : "aaa",  
    "availability_zone" : "bbb",  
    "vpc_id" : "674e9b42-cd8d-4d25-a2e6-5abcc565b961",  
    "subnet_id" : "f1df08c5-71d1-406a-aff0-de435a51007",  
    "security_group_id" : "7aa51dbf-5b63-40db-9724-dad3c4828b58",  
    "password" : "*****",  
    "mode" : "Cluster",  
    "flavor" : [ {  
        "num" : 3,  
        "storage" : "ULTRAHIGH",  
        "size" : 500,  
        "spec_code" : "geminidb.cassandra.4xlarge.4"  
    } ],  
    "backup_strategy" : {  
        "start_time" : "08:15-09:15",  
        "keep_days" : 8  
    },  
    "ssl_option" : 1,  
    "charge_info" : {  
        "charge_mode" : "prePaid",  
        "period_type" : "year",

### 6.3.2 Deleting an Instance

#### Function

This API is used to delete an instance. Only pay-per-use instances can be deleted. Yearly/Monthly instances need to be unsubscribed from if they are no longer needed.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

#### URI

DELETE /v3/{project\_id}/instances/{instance\_id}

**Table 6-24** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

#### Request Parameters

**Table 6-25** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

#### Response Parameters

Status code: 202

**Table 6-26** Response body parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| job_id    | String | Task ID.    |

## Example Request

URI example

```
DELETE https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in02
```

## Example Response

Status code: 202

Accepted

```
{  
    "job_id" : "04efe8e2-9255-44ae-a98b-d87cae411890"  
}
```

### 6.3.3 Querying Instances and Details

#### Function

This API is used to query instances and details based on specified conditions.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

#### URI

GET /v3/{project\_id}/instances

**Table 6-27** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

**Table 6-28** Query parameters

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | No        | String | Instance ID.<br>If you enter an instance ID starting with an asterisk (*), fuzzy search results are returned. If you enter a valid instance ID, an exact result is returned.                                                                                                                                                                      |
| name           | No        | String | Instance name.<br>If you enter an instance name starting with an asterisk (*), fuzzy search results are returned. If you enter a valid instance name, an exact result is returned.                                                                                                                                                                |
| datastore_type | No        | String | Database type. The value can be:<br><b>cassandra</b> , indicating that GeminiDB Cassandra instances are queried.<br><b>influxdb</b> , indicating that GeminiDB Influx instances are queried.<br><b>redis</b> , indicating that GeminiDB Redis instances are queried.<br>If this parameter is not transferred, all database instances are queried. |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mode      | No        | String  | <p>Instance type. The value can be:</p> <p><b>Cluster</b>: GeminiDB Cassandra, GeminiDB Influx, or GeminiDB Redis replica set instance</p> <p>The system ignores this parameter if parameter <b>datastore_type</b> is not transferred.</p>                                                                                                                                                                       |
| vpc_id    | No        | String  | <p>VPC ID. You can obtain the value with either of the following methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.</li><li>Method 2: Query the VPC ID using the VPC API. For details, see <a href="#">Querying VPCs</a>.</li></ul>                                                                                             |
| subnet_id | No        | String  | <p>Subnet ID. You can obtain the subnet ID with either of the following methods:</p> <ul style="list-style-type: none"><li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the network ID on the displayed page.</li><li>Method 2: Query the network ID using the VPC API. For details, see <a href="#">Querying Subnets</a>.</li></ul>                 |
| offset    | No        | Integer | <p>Index position. The query starts from the next instance creation time indexed by this parameter under a specified project. If offset is set to N, the resource query starts from the N+1 piece of data.</p> <p>The value must be no less than <b>0</b>. If this parameter is not transferred, the index offset is <b>0</b> by default, indicating that the query starts from the latest created instance.</p> |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                           |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit     | No        | Integer | Maximum number of instances that can be queried. The value ranges from <b>1</b> to <b>100</b> . If this parameter is not transferred, the first 100 instances are queried by default. |

## Request Parameters

**Table 6-29** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

Status code: 200

**Table 6-30** Response body parameters

| Parameter   | Type                                                 | Description              |
|-------------|------------------------------------------------------|--------------------------|
| instances   | Array of <a href="#">ListInstancesResult</a> objects | Instance information.    |
| total_count | Integer                                              | Total number of records. |

**Table 6-31** ListInstancesResult

| Parameter | Type   | Description    |
|-----------|--------|----------------|
| id        | String | Instance ID.   |

| groups                | Array of <a href="#">ListInstancesGroupResult</a> objects | Group information.                                                                                                                                                                                                          |
| enterprise_project_id | String                                                    | Enterprise project ID.<br>If you set this parameter to <b>0</b> , the resource belongs to the <b>default</b> enterprise project.                                                                                            |
| time_zone             | String                                                    | Time zone.                                                                                                                                                                                                                  |
| actions               | Array of strings                                          | Operation that is executed on the instance. Example values: <ul style="list-style-type: none"><li>• <b>CREATE</b></li><li>• <b>REBOOT</b></li><li>• <b>RESTORE</b></li></ul>                                                |
| dedicated_resource_id | String                                                    | Dedicated resource ID. This parameter is returned only when the instance belongs to a dedicated resource pool.                                                                                                              |
| lb_ip_address         | String                                                    | IP address bound to the load balancer. This parameter is returned only when an IP address is specified for the load balancer.                                                                                               |
| lb_port               | String                                                    | Load balancing port number. This parameter is returned only when there is a load balancer address.                                                                                                                          |

**Table 6-32** ListInstancesDatastoreResult

| Parameter       | Type    | Description                                                                                                                   |
|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------|
| type            | String  | DB API.                                                                                                                       |
| version         | String  | DB version number.                                                                                                            |
| patch_available | Boolean | Whether there is an available patch for upgrade. If <b>true</b> is returned, you can install a patch to upgrade the instance. |

| Parameter     | Type   | Description                                                                                  |
|---------------|--------|----------------------------------------------------------------------------------------------|
| whole_version | String | Complete database version number.<br>This parameter is available only to GeminiDB Cassandra. |

**Table 6-33** ListInstancesBackupStrategyResult

| Parameter  | Type    | Description                                                                                                             |
|------------|---------|-------------------------------------------------------------------------------------------------------------------------|
| start_time | String  | Backup time window. Automated backup will be triggered during the backup time window. The current time is the UTC time. |
| keep_days  | Integer | Backup retention days. The value ranges from <b>0</b> to <b>35</b> .                                                    |

**Table 6-34** ListInstancesGroupResult

| Parameter | Type                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| name       | String | Node name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| status     | String | Node status.<br>The value can be: <ul style="list-style-type: none"><li>• <b>normal</b>, indicating that the node is running normally.</li><li>• <b>abnormal</b>, indicating that the node is abnormal.</li><li>• <b>creating</b>, indicating that the node is being created.</li><li>• <b>createfail</b>, indicating that the node failed to be created.</li><li>• <b>deleted</b>, indicating that the node has been deleted.</li><li>• <b>resizefailed</b>: indicating that the node specifications failed to be changed.</li><li>• <b>enlargefail</b>: indicating nodes failed to be added.</li></ul> |
| subnet_id  | String | ID of the subnet where the instance node is deployed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| private_ip | String | Private IP address of the node. This parameter value is available after an ECS is created. Otherwise, the value is "".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| public_ip  | String | Bound EIP. This parameter is valid only for nodes bound with EIPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| spec_code  | String | Resource specification code. For the code, see the value of parameter <b>flavors.spec_code</b> in <a href="#">Querying Instance Specifications</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter         | Type    | Description                                                                                                                                                                                                                                      |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | String  | AZ.                                                                                                                                                                                                                                              |
| support_reduce    | Boolean | Whether instance nodes can be deleted. The value can be: <ul style="list-style-type: none"><li>• <b>true</b>, indicating that instance nodes can be deleted.</li><li>• <b>false</b>, indicating that instance nodes cannot be deleted.</li></ul> |

## Example Request

- URI example

Querying all instances and details

```
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/0483b6b16e954cb88930a360d2c4e663/instances
```

- URI example

Querying instances and details based on specified conditions

```
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/0483b6b16e954cb88930a360d2c4e663/instances?offset=0&limit=10&id=ed7cc6166ec24360a5ed5c5c9c2ed726in06&name=hy&mode=Cluster&datastore_type=cassandra&vpc_id=19e5d45d-70fd-4a91-87e9-b27e71c9891f&subnet_id=bd51fb45-2dcb-4296-8783-8623bfe89bb7
```

## Example Response

### 6.3.4 Scaling Up Storage Space of an Instance

#### Function

This API is used to scale up storage space of an instance.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

This API supports both yearly/monthly and pay-per-use instances.

#### URI

POST /v3/{project\_id}/instances/{instance\_id}/extend-volume

**Table 6-37** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-38** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-39** Request body parameters

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| size        | Yes       | Integer | <p>Requested storage space. It must be an integer greater than the current storage space.</p> <p>The maximum storage space depends on the API type and specifications.</p> <ul style="list-style-type: none"><li>For details about GeminiDB Cassandra instances, see <a href="#">Instance Specifications</a>.</li><li>For details about GeminiDB Influx instances, see <a href="#">Instance Specifications</a>.</li><li>For details about GeminiDB Redis instances, see <a href="#">Instance Specifications</a>.</li></ul> |
| is_auto_pay | No        | String  | <p>Whether the order will be automatically paid after a yearly/monthly instance is created. This parameter does not affect the payment mode of automatic renewal.</p> <ul style="list-style-type: none"><li><b>true</b>: indicates that the order is automatically paid from the account.</li><li><b>false</b>: indicates that the order is manually paid from the account. The default value is <b>false</b>.</li></ul>                                                                                                   |

## Response Parameters

Status code: 202

**Table 6-40** Response body parameters

| Parameter | Type   | Description                                                                          |
|-----------|--------|--------------------------------------------------------------------------------------|
| job_id    | String | Task ID. This parameter is returned only for pay-per-use instances.                  |
| order_id  | String | Order ID. This parameter is returned only when a yearly/monthly instance is created. |

## Example Request

- URI example  
POST https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fcda405ea4674276ce36dae8in06/extend-volume
- Scaling up storage space of an instance to 550 GB  
{  
    "size" : 550  
}

## Example Response

Status code: 202

Accepted

Example response for a pay-per-use instance:

```
{  
    "job_id" : "04efe8e2-9255-44ae-a98b-d87cae411890"  
}
```

Example response for a yearly/monthly instance:

```
{  
    "order_id" : "CS20070721568OVO9"  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.3.5 Adding Nodes for an Instance

#### Function

This API is used to add nodes for a specified instance.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

## URI

POST /v3/{project\_id}/instances/{instance\_id}/enlarge-node

**Table 6-41** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-42** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-43** Request body parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| num       | Yes       | Integer | Number of new nodes.                                                                                                                                                                                                                                                                                                                                                                                                            |
| subnet_id | No        | String  | ID of the subnet where the new node is deployed. <ul style="list-style-type: none"><li>• This parameter can be transferred when nodes are added for GeminiDB Cassandra instances.</li><li>• The transferred subnet ID must belong to the VPC where the current instance is deployed.</li><li>• If this parameter is not transferred, the system will allocate a subnet with sufficient IP addresses for the new node.</li></ul> |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_auto_pay | No        | String | <p>Whether the order will be automatically paid after a yearly/monthly instance is created. This parameter does not affect the payment mode of automatic renewal.</p> <ul style="list-style-type: none"><li>• <b>true</b>: indicates that the order is automatically paid from the account.</li><li>• <b>false</b>: indicates that the order is manually paid from the account. The default value is <b>false</b>.</li></ul> |

## Response Parameters

Status code: 202

**Table 6-44** Response body parameters

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| job_id    | String | Task ID. This parameter is returned only for pay-per-use instances.     |
| order_id  | String | Order ID. This parameter is returned only for yearly/monthly instances. |

## Example Request

- **URI example**  
POST https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in06/enlarge-node
- **Adding a node**  
{  
    "num" : 1  
}

## Example Response

Status code: 202

Accepted

Example response for a pay-per-use instance:

```
{  
    "job_id" : "3711e2ad-5787-49bc-a47f-3f0b066af9f5"  
}
```

Example response for a yearly/monthly instance:

```
{  
    "order_id" : "CS20070721568OVO9"  
}
```

### 6.3.6 Deleting Instance Nodes

#### Function

This API is used to delete instance nodes.

#### Constraints

This API supports the following instance types:

- Yearly/Monthly and pay-per-use GeminiDB Cassandra instances
- Yearly/Monthly and pay-per-use GeminiDB Redis instances

#### URI

POST /v3/{project\_id}/instances/{instance\_id}/reduce-node

**Table 6-45** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

#### Request Parameters

**Table 6-46** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-47** Request body parameters

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| num       | No        | Integer          | <p>Number of nodes to be deleted randomly.</p> <p><b>NOTE</b><br/>If the client is directly connected to a node, random scale-in is not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| node_list | No        | Array of strings | <p>ID of the node to be deleted. Make sure that the node can be deleted. If this parameter is not transferred, the number of nodes to be deleted is specified based on the internal system policy.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Either <b>num</b> or <b>node_list</b> must be set.<ul style="list-style-type: none"><li>• If <b>num</b> and <b>node_list</b> are both transferred, the value of <b>node_list</b> takes effect.</li><li>• If <b>node_list</b> is empty, instance nodes are deleted randomly. If <b>node_list</b> is not empty, only the node with a specified ID is deleted.</li><li>• Before a node is deleted, do not connect to the node directly to avoid service interruptions.</li></ul></li></ul> |

## Response Parameters

Status code: 202

**Table 6-48** Response body parameters

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| job_id    | String | Task ID. This parameter is returned only for pay-per-use instances.     |
| order_id  | String | Order ID. This parameter is returned only for yearly/monthly instances. |

## Example Request

- URI example

```
POST https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in06/reduce-node
```

- Deleting a node

```
{  
    "num": 1,  
    "node_list": ["116ba14da34a42d28ecd83a38c218907no12"]  
}
```

## Example Response

Status code: 202

Accepted

Example response for a pay-per-use instance:

```
{  
    "job_id": "04efe8e2-9255-44ae-a98b-d87cae411890"  
}
```

Example response for a yearly/monthly instance:

```
{  
    "order_id": "CS20070721568OVO9"  
}
```

### 6.3.7 Obtaining Sessions of a Node

#### Function

This API is used to obtain all sessions of a node.

#### Constraints

This API supports GeminiDB Redis instances.

#### URI

GET /v3/{project\_id}/redis/nodes/{node\_id}/sessions

**Table 6-49** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| node_id    | Yes       | String | Node ID.                                                                                               |

**Table 6-50** Query parameters

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                   |
|-------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset      | No        | Integer | Index offset. The value must be no less than <b>0</b> . If this parameter is not transferred, the index offset is <b>0</b> by default, indicating that the query starts from the latest created session to the instance node. |
| limit       | No        | Integer | Number of pages in a pagination query. If this parameter is not transferred, 50 sessions are displayed on each page by default. A maximum of 100 sessions can be displayed.                                                   |
| addr_prefix | No        | String  | Prefix of the address on the user side. It is a character string consisting of an IP address and port number. If this parameter is not transferred, all prefixes of addresses on the user side are queried by default.        |

## Request Parameters

**Table 6-51** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |
| X-Language   | No        | String | Language    |

## Response Parameters

Status code: 200

**Table 6-52** Response body parameters

| Parameter | Type             | Description                                                      |
|-----------|------------------|------------------------------------------------------------------|
| sessions  | Array of objects | Instance sessions. For details, see <a href="#">Table 6-53</a> . |

| Parameter   | Type    | Description                               |
|-------------|---------|-------------------------------------------|
| total_count | Integer | Total sessions that meet search criteria. |

**Table 6-53** InstanceSession

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| addr      | String | IP address and port number of the client.                          |
| id        | String | Client ID.                                                         |
| name      | String | Client name, which is specified by running <b>CLIENT SETNAME</b> . |
| cmd       | String | Last executed command.                                             |
| age       | String | Setup duration of the client connection, in seconds.               |
| idle      | String | Idle duration of the client connection, in seconds.                |
| db        | String | ID of the currently accessed database.                             |
| fd        | String | File descriptor for sockets.                                       |
| sub       | String | Number of subscribed channels (Pub/Sub).                           |
| psub      | String | Number of subscribed channels (Pub/Sub) in batches.                |
| multi     | String | Number of commands contained in a MULTI or EXEC transaction.       |

## Example Request

```
GET https://[Endpoint]/v3/619d3e78f61b4be68bc5aa0b59edcf7b/redis/nodes/784b3fb7bac14bc490659950dd4f022fno12/sessions?offset=0&limit=20&addr_prefix=192.0.0.1:80
```

## Example Response

Status code: 200

Success

```
{  
    "total_count": 100,  
    "sessions": [ {  
        "addr": "127.0.0.1:8080",  
        "id": "254487",  
        "name": "cli",  
        "cmd": "get",  
        "age": "8888581",  
        "idle": "8888581",  
        "db": "0",  
        "fd": "1311",  
        "sub": 0,  
        "psub": 0,  
        "multi": 0  
    } ]  
}
```

```
    "sub" : "0",
    "psub" : "0",
    "multi" : "-1"
  ]
}
```

## 6.3.8 Querying Session Statistics of an Instance Node

### Function

This API is used to query session statistics of an instance node.

### Constraints

This API supports GeminiDB Redis instances.

### URI

GET /v3/{project\_id}/redis/nodes/{node\_id}/session-statistics

**Table 6-54** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| node_id    | Yes       | String | Node ID.                                                                                               |

### Request Parameters

**Table 6-55** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

### Response Parameters

Status code: 200

**Table 6-56** Response body parameters

| Parameter               | Type             | Description                                                                                                                                                                            |
|-------------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| total_connection_count  | Integer          | Total client connections.                                                                                                                                                              |
| active_connection_count | Integer          | Number of active client connections.                                                                                                                                                   |
| top_source_ips          | Array of objects | Top ten clients with the most connections. Total connected clients and their IP addresses are displayed and ordered based on sessions. For details, see <a href="#">Table 6-57</a> .   |
| top_dbs                 | Array of objects | Top ten databases with the most connections. Total connected clients and their IP addresses are displayed and ordered based on sessions. For details, see <a href="#">Table 6-58</a> . |

**Table 6-57** SourceTopConnection

| Parameter        | Type    | Description                   |
|------------------|---------|-------------------------------|
| client_ip        | String  | Client IP address.            |
| connection_count | Integer | Number of client connections. |

**Table 6-58** TopDbConnection

| Parameter        | Type    | Description                   |
|------------------|---------|-------------------------------|
| db               | String  | GeminiDB Redis database ID.   |
| connection_count | Integer | Number of client connections. |

## Example Request

```
GET https://[Endpoint]/v3/619d3e78f61b4be68bc5aa0b59edcf7b/redis/nodes/784b3fb7bac14bc490659950dd4f022fno12/session-statistics
```

## Example Response

Status code: 200

Success

```
{  
    "total_connection_count": 10,  
    "active_connection_count": 5,  
    "top_source_ips": [ {
```

```

### 6.3.9 Closing Sessions of an Instance Node

#### Function

This API is used to close sessions of an instance node.

#### Constraints

This API supports GeminiDB Redis instances and can be used to close inactive sessions of an instance node.

#### URI

DELETE /v3/{project\_id}/redis/nodes/{node\_id}/sessions

**Table 6-59** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| node_id    | Yes       | String | Node ID.                                                                                               |

## Request Parameters

**Table 6-60** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-61** Request body parameters

| Parameter   | Mandatory | Type             | Description                                                                                                            |
|-------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------|
| is_all      | Yes       | Boolean          | Whether all sessions are closed.                                                                                       |
| session_ids | No        | Array of strings | ID of the session to be closed. When the value of <b>is_all</b> is <b>false</b> , this parameter cannot be left empty. |

## Response Parameters

Status code: 200

No response parameters

## Example Request

- URI example

```
DELETE https://{Endpoint}/v3/619d3e78f61b4be68bc5aa0b59edcf7b/redis/nodes/784b3fb7bac14bc490659950dd4f022fno12/sessions
```

- Deleting sessions **1131** and **2323**

```
{  
    "is_all": false,  
    "session_ids": [ "1131", "2323" ]  
}
```

## Example Response

Status code: 200

Success

```
{ }
```

## Status Codes

## 6.3.10 Changing Specifications of an Instance

### Function

This API is used to change specifications of an instance.

 NOTE

Services will be interrupted for 5 to 10 minutes when you change specifications of an instance. Exercise caution when performing this operation.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Redis

This API can be used to change instance specifications.

The new specifications cannot be the same as the original specifications.

Specifications can be modified only when the instance status is **normal**.

If specifications cannot meet the requirements for running the instance, the specifications cannot be changed.

### URI

PUT /v3/{project\_id}/instances/{instance\_id}/resize

**Table 6-62** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

### Request Parameters

**Table 6-63** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-64** Request body parameters

| Parameter   | Mandatory | Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|-----------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resize      | Yes       | <a href="#">ResizeInstanceOption object</a> | Target specification information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| is_auto_pay | No        | String                                      | <p>Whether the order will be automatically paid after a yearly/monthly instance is created. This parameter does not affect the payment mode of automatic renewal.</p> <ul style="list-style-type: none"><li>• This parameter is invalid when the instance specifications are scaled down.</li><li>• When the specifications are scaled up, this parameter can be set to:<ul style="list-style-type: none"><li>- <b>true</b>, indicating that the order is automatically paid from the account.</li><li>- <b>false</b>, indicating that the order is manually paid from the account. The default value is <b>false</b>.</li></ul></li></ul> |

**Table 6-65** ResizeInstanceOption

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| target_spec_code | Yes       | String | <p>Target resource specification code.</p> <p>For the code, see the value of response parameter <a href="#">flavors.spec_code</a> in <a href="#">Querying Instance Specifications</a>.</p> |

## Response Parameters

Status code: 202

**Table 6-66** Response body parameters

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| job_id    | String | Task ID. This parameter is returned only for pay-per-use instances.     |
| order_id  | String | Order ID. This parameter is returned only for yearly/monthly instances. |

## Example Request

- **URI example**  
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in06/resize
- **Changing instance specifications to 16 vCPUs and 64 GB**  
{  
  "resize" : {  
    "target\_spec\_code" : "geminidb.cassandra.4xlarge.4"  
  }  
}

## Example Response

Status code: 202

Accepted

Example response for a pay-per-use instance:

```
{  
  "job_id" : "3711e2ad-5787-49bc-a47f-3f0b066af9f5"  
}
```

Example response for a yearly/monthly instance:

```
{  
  "order_id" : "CS20070721568OVO9"  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.3.11 Resetting the Administrator Password of an Instance

### Function

This API is used to reset the administrator password of an instance.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

Abnormal instances do not support this operation.

Only the password of user **rwuser** can be reset.

## URI

PUT /v3/{project\_id}/instances/{instance\_id}/password

**Table 6-67** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-68** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-69** Request body parameter

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password  | Yes       | String | <p>Database password.<br/>The password can include 8 to 32 characters and contain uppercase letters, lowercase letters, digits, and a combination of any two of the following special characters: ~!@#%^*-_=+?<br/>Enter a strong password against security risks such as brute force cracking.</p> |

## Response Parameters

## 6.3.12 Editing the Name of an Instance

### Function

This API is used to edit the name of an instance.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

The name of the instance that is being created or fails to be created cannot be edited.

### URI

PUT /v3/{project\_id}/instances/{instance\_id}/name

**Table 6-70** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-71** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-72** Request body parameter

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                     |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | New instance name.<br>The name:<br>Must start with a letter and can include 4 to 64 characters.<br>It is case-sensitive and can contain only letters, digits, hyphens (-), and underscores (_). |

## Response Parameters

Status code: 204

No response parameters

## Example Request

- URI example  
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fcd405ea4674276ce36dae8in06/name
- Changing the instance name to **myNewName**

```
{  
    "name" : "myNewName"  
}
```

## Example Response

None

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.3.13 Changing the Security Group of an Instance

#### Function

This API is used to change the security group associated with an instance.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

Abnormal instances do not support this operation.

Please confirm the modified security group rule. This policy may affect connections to the current instance, interrupting services.

#### URI

PUT /v3/{project\_id}/instances/{instance\_id}/security-group

**Table 6-73** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

#### Request Parameters

**Table 6-74** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-75** Request body parameter

| Parameter         | Mandatory | Type   | Description                   |
|-------------------|-----------|--------|-------------------------------|
| security_group_id | Yes       | String | ID of the new security group. |

## Response Parameters

Status code: 202

**Table 6-76** Response body parameter

| Parameter | Type   | Description |
|-----------|--------|-------------|
| job_id    | String | Task ID.    |

## Example Request

- URI example  
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in02/security-group

## 6.3.14 Upgrading Minor Version

### Function

This API is used to upgrade the minor version of an instance.

## Constraints

- This API supports the following types of instances:
  - GeminiDB Cassandra
- This API is not available to frozen or abnormal instances.
- This API is not available if there are abnormal instance nodes.
- View field **patch\_available** in the result returned by the API for querying instance details and check whether a minor version upgrade is supported.
- Perform an upgrade during off-peak hours.

## URI

POST /v3/{project\_id}/instances/{instance\_id}/db-upgrade

**Table 6-77** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-78** Request header parameter

| Parameter    | Mandatory | Type   | Description |

## 6.3.15 Changing a Database Port

### Function

This API is used to change the database port of an instance.

### Constraints

This API supports the following types of instances:

- GeminiDB Cassandra
- GeminiDB Redis

GeminiDB Redis and GeminiDB Cassandra do not allow you to change the database port of a DR instance. To change the database port, you have to change the port of the primary instance first. The load balancer port of a GeminiDB Redis instance is changed accordingly.

The instance must be restarted to make changes take effect. Exercise caution when modifying the database port.

### URI

PUT /v3/{project\_id}/instances/{instance\_id}/port

**Table 6-80** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                            |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | String | Instance ID, which can be obtained by calling the API described in <a href="#">Querying Instances and Details</a> . If there are no instances available, call the API described in <a href="#">Creating an Instance</a> to create one. |

## Request Parameters

**Table 6-81** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-82** Request body parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port      | Yes       | Integer | New database port number.<br>The database port number of replica sets 4.0 ranges from 2100 to 9500, except 8636, 8637, and 8638.<br>The database port number of GeminiDB Cassandra instances ranges from 2100 to 9500, except 7000, 7001, 7199, 8636, 8479, 8484, 8999, 8018, 2180, 2887, 3887, 8079, 8091, and 8092.<br>The port number of the GeminiDB Redis instance ranges from 1024 to 65535, except 2180, 2887, 3887, 6377, 6378, 6380, 8018, 8079, 8091, 8479, 8484, 8999, 9864, 9866, 9867, 12017, 12333 and 50069. |

## Response Parameters

Status code: 202

**Table 6-83** Response body parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| job_id    | String | Task ID.    |

## Example Request

- Changing the database port number to 8888

```
{ "port": 8888 }
```

## Example Response

Status code: 202

Accepted

```
{ "job_id": "89638f5e-0780-497c-b3c0-4d0968383e19" }
```

## 6.3.16 Modifying High-Risk Commands

### Function

This API is used to modify high-risk commands supported by a GeminiDB Redis instance in batches.

### Constraints

This API supports only proxy-based general-purpose GeminiDB Redis instances.

### URI

PUT /v3/{project\_id}/instances/{instance\_id}/high-risk-commands

**Table 6-84** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Mandatory | Type   | Description  |
|-------------|-----------|--------|--------------|
| instance_id | Yes       | String | Instance ID. |

## Request Parameters

**Table 6-85** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-86** Request body parameters

| Parameter | Mandatory | Type             | Description                                                                                                |
|-----------|-----------|------------------|------------------------------------------------------------------------------------------------------------|
| commands  | Yes       | Array of objects | High-risk commands and their corresponding renamed commands. For details, see <a href="#">Table 6-87</a> . |

**Table 6-87** CommandInfo

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| origin_name | Yes       | String | Original high-risk commands. The following commands are supported: KEYS, FLUSHDB, FLUSHALL, HGETALL, HKEYS, HVALS, and SMEMBERS.                                                                                                                                           |
| name        | Yes       | String | Name of the command that takes effect. If this parameter is left blank, the command is disabled. The value can include 0 to 30 characters, including digits, uppercase letters, lowercase letters, and underscores (_).<br>Minimum characters: 0<br>Maximum characters: 30 |

## Response Parameters

Status code: 200

No response parameters

## Example Request

## 6.3.17 Setting the Maintenance Period of an Instance

### Function

This API is used to set the maintenance period of a specified instance.

### Constraints

This API supports the following types of instances:

- GeminiDB Influx

- GeminiDB Redis
- GeminiDB Cassandra

## URI

PUT /v3/{project\_id}/instances/{instance\_id}/maintenance-window

**Table 6-88** Path parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID                                                                                            |

## Request Parameters

**Table 6-89** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 6-90** Request body parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | Yes       | String | Start time. The value must be a valid value in the "HH:MM" format. The current time is the UTC time and must be on the hour. By default, the interval between the end time and the start time is four hours. |

## Response Parameters

**Status code: 204**

None

## Example Request

Set the maintenance window of an instance to 02:00-06:00.

```
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/0549b4a43100d4f32f51c01c2fe4acdb/instances/
```

```
b0965c9010f44ffca9af4ee00746aa8din12/maintenance-window
{
    "start_time" : "02:00"
}
```

## Example Response

None

## 6.4.2 Querying an Automated Backup Policy

### Function

This API is used to query an automated backup policy, including GeminiDB Cassandra databases and tables.

## Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

## URI

GET /v3/{project\_id}/instances/{instance\_id}/backups/policy

**Table 6-97** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID                                                                                            |

## Request Parameters

**Table 6-98** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

## Response Parameters

Status code: 202

**Table 6-99** Response body parameter

| Parameter     | Type   | Description                                                                                                                        |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------|
| backup_policy | object | Backup policy objects, including the backup retention period (days) and start time. For details, see <a href="#">Table 6-100</a> . |

**Table 6-100** ShowBackupPolicyResult

| Parameter  | Type    | Description                                                                                                              |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------|
| keep_days  | Integer | Backup retention days                                                                                                    |
| start_time | String  | Backup time window. Automated backup will be triggered during the backup time window.                                    |
| period     | String  | Backup period. After a backup period is specified, data will be automatically backed up on the selected days every week. |

## Example Request

URI example

```
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in02/backups/policy
```

## Example Response

Status code: 202

Success

Enabling an automated backup policy

```
{  
  "backup_policy": {  
    "keep_days": 7,  
    "start_time": "19:00-20:00",  
    "period": "1,2,4,5,6"  
  }  
}
```

Disabling an automated backup policy

```
{  
  "backup_policy": {  
    "keep_days": 0  
  }  
}
```

| start_time | No        | String | <p>Backup time window. Automated backup will be triggered during the backup time window. This parameter is mandatory if the automated backup policy is enabled. If the policy is disabled, you do not need to transfer this parameter.</p> <p>The value must be the UTC time in the hh:mm-HH:MM format.</p> <ul style="list-style-type: none"><li>• The <b>HH</b> value must be 1 greater than the <b>hh</b> value.</li><li>• The values of <b>mm</b> and <b>MM</b> must be the same and must be set to <b>00, 15, 30, or 45</b>.</li><li>• Example value: <b>23:00-00:00</b></li></ul>                                                                                                                                                                                                                                            |
| period     | No        | String | <p>Backup period. After a backup period is specified, data will be automatically backed up on the selected days every week. This parameter is mandatory if the automated backup policy is enabled. If the policy is disabled, you do not need to transfer this parameter.</p> <p>The value is a list of digits separated by commas (,). Each digit indicates a day of the week. The restrictions on the backup period are as follows:</p> <ul style="list-style-type: none"><li>• If you set <b>keep_days</b> to <b>0</b>, this parameter is not transferred.</li><li>• If you set <b>keep_days</b> to <b>1 to 6</b>, set this parameter to <b>1, 2, 3, 4, 5, 6, 7</b>.</li><li>• If you set <b>keep_days</b> to <b>7 to 35</b>, select at least one day of the week for the backup cycle. Example value: <b>1,2,3,4</b></li></ul> |

## Response Parameters

Status code: 204

No response parameters

## Example Request

- URI example

```
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in02/backups/policy
```

- Example request body

Enabling or modifying the automated backup policy (Set **period** to **1, 2, 3, 4, 5**, and **6**, **start\_time** to **01:00-02:00**, and **keep\_days** to **7**.)

```
{  
    "backup_policy" : {  
        "period" : "1,2,3,4,5,6",  
        "start_time" : "01:00-02:00",  
        "keep_days" : 7  
    }  
}
```

Disabling automated backup

```
{  
    "backup_policy" : {  
        "keep_days" : 0  
    }  
}
```

## Example Response

Status code: 204

No Content

```
{ }
```

## Status Codes

## Error Codes

See [Error Codes](#).

## 6.4.4 Querying the Time Window When a Backup Can Be Restored

### Function

This API is used to query the time window when a backup can be restored.

### Constraints

This API supports the following types of instances:

- GeminiDB Cassandra
- GeminiDB Influx

This API does not support single-node GeminiDB Influx instances.

Make sure that full backup, incremental backup, and automated backup have been enabled. To enable incremental backup, contact customer service. This function can be used only when the next automated backup is performed.

This API can be used to query the time point that a backup can be restored to, so values of **start\_time** and **end\_time** are the same.

## URI

GET /v3/{project\_id}/instances/{instance\_id}/backups/restorable-time-periods

**Table 6-105** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                            |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a user in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                   |
| instance_id | Yes       | String | Instance ID, which can be obtained by calling the API described in <a href="#">Querying Instances and Details</a> . If there are no instances available, call the API described in <a href="#">Creating an Instance</a> to create one. |

**Table 6-106** Query parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | No        | String | Start time point that the backup can be restored to. The time point is in the yyyy-mm-ddThh:mm:ssZ format. <b>T</b> indicates the start time, and <b>Z</b> indicates the time zone offset. |
| end_time   | No        | String | End time point that the backup can be restored to. The time point is in the yyyy-mm-ddThh:mm:ssZ format. <b>T</b> indicates the start time, and <b>Z</b> indicates the time zone offset.   |

| Parameter | Mandatory | Type    | Description                                                                                                                          |
|-----------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | Integer | Offset. The records after this offset will be queried. The default value is <b>0</b> .                                               |
| limit     | No        | Integer | Maximum number of records displayed on each page. The value ranges from <b>0</b> to <b>1000</b> . The default value is <b>1000</b> . |

## Request Parameters

**Table 6-107** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

Status code: 200

**Table 6-108** Response body parameters

| Parameter               | Type                                   | Description                                       |
|-------------------------|----------------------------------------|---------------------------------------------------|
| total_count             | Integer                                | Total time windows when a backup can be restored. |
| restorable_time_periods | Array of <b>restorableTime</b> objects | Time windows when a backup can be restored.       |

**Table 6-109** restorableTime

| Parameter  | Type | Description                                                                                                              |
|------------|------|--------------------------------------------------------------------------------------------------------------------------|
| start_time | Long | Start time of the restoration time range in the UNIX timestamp format. The start time is the UTC time in milliseconds.   |
| end_time   | Long | End time point of the restoration time range in the UNIX timestamp format. The end time is the UTC time in milliseconds. |

## Example Request

- URI example

```
GET https://[Endpoint]/v3/054e292c9880d4992f02c0196d3ea468/instances/  
a4d8ea2584e047439a667703c0684119in06/backups/restorable-time-periods?  
start_time=2022-06-01T18:50:20+0800&end_time=2022-06-01T19:50:20+0800&offset=0&limit=1000
```

## Example Response

Status code: 200

Success

```
{  
    "total_count": 1,  
    "restorable_time_periods": [  
        {  
            "start_time": 1607731200000,  
            "end_time": 1607731200000  
        }  
    ]  
}
```

## 6.4.5 Querying the Recycling Policy

### Function

This API is used to query the recycling policy.

### URI

GET /v3/{project\_id}/instances/recycle-policy

**Table 6-110** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                          |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a user in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

**Table 6-111** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

Status code: 200

**Table 6-112** Response body parameters

| Parameter      | Type   | Description                                                      |
|----------------|--------|------------------------------------------------------------------|
| recycle_policy | object | Recycling policy. For details, see <a href="#">Table 6-113</a> . |

**Table 6-113** RecyclePolicy

| Parameter                | Type    | Description                                                                                       |
|--------------------------|---------|---------------------------------------------------------------------------------------------------|
| retention_period_in_days | Integer | Policy retention duration (1 to 7 days). The value is a positive integer. The default value is 7. |

## Example Request

- URI example  
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/054e292c9880d4992f02c0196d3ea468/instances/recycle-policy
- Example request body  
None

## Example Response

Status code: 200

Success

```
{  
  "recycle_policy": {  
    "retention_period_in_days": 7  
  }  
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.4.6 Modifying the Recycling Policy

### Function

This API is used to change a retention period for deleted instances. The new retention period is available to only those instances deleted after the change, but not to the instances already moved to the recycle bin before the change.

### Constraints

The retention period for deleted instances can be 1 to 7 days.

### URI

PUT /v3/{project\_id}/instances/recycle-policy

**Table 6-114** Path parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

**Table 6-115** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-116** Request body parameters

| Parameter      | Mandatory | Type   | Description                                                      |
|----------------|-----------|--------|------------------------------------------------------------------|
| recycle_policy | Yes       | object | Recycling policy. For details, see <a href="#">Table 6-117</a> . |

**Table 6-117** RecyclePolicy

| Parameter                | Mandatory | Type    | Description                                                                                       |
|--------------------------|-----------|---------|---------------------------------------------------------------------------------------------------|
| retention_period_in_days | No        | Integer | Policy retention duration (1 to 7 days). The value is a positive integer. The default value is 7. |

## Response Parameters

**Status code: 200**

No response parameters

## Example Request

- **URI example**  
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/619d3e78f61b4be68bc5aa0b59edcf7b/instances/recycle-policy
- **Setting the retention period of instances in the recycle bin to 3 days**  
{  
    "recycle\_policy": {  
        "retention\_period\_in\_days": 3  
    }  
}

## Example Response

None

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.4.7 Querying Instances in the Recycle Bin

### Function

This API is used to query all instances in the recycle bin.

### URI

GET /v3/{project\_id}/recycle-instances

**Table 6-118** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

**Table 6-119** Query parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | Integer | <p>Index offset.</p> <ul style="list-style-type: none"><li>If <b>offset</b> is set to <math>N</math>, the query starts from the <math>N+1</math> piece of data. The default value is <b>0</b>, which indicates that the query starts from the first piece of data.</li><li>The value must be a non-negative number.</li></ul> |
| limit     | No        | Integer | <p>Maximum records to be queried.</p> <ul style="list-style-type: none"><li>The value ranges from <b>1</b> to <b>100</b>.</li><li>If this parameter is not transferred, the first 100 records are queried by default.</li></ul>                                                                                               |

## Request Parameters

**Table 6-120** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

Status code: 200

**Table 6-121** Response body parameters

| Parameter   | Type             | Description                                                          |
|-------------|------------------|----------------------------------------------------------------------|
| total_count | Integer          | Total number of records.                                             |
| instances   | Array of objects | Instance information. For details, see <a href="#">Table 6-122</a> . |

**Table 6-122** RecycleInstance

| Parameter             | Type   | Description                                                                                                                                                                                                            |
|-----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                    | String | Instance ID.                                                                                                                                                                                                           |
| name                  | String | Instance name.                                                                                                                                                                                                         |
| mode                  | String | Instance type. The value can be: <ul style="list-style-type: none"><li>• <b>Cluster</b>, indicating that the instance is a GeminiDB Cassandra, GeminiDB Influx, or GeminiDB Redis replica set instance.</li></ul>      |
| datastore             | object | Database information For details, see <a href="#">Table 6-123</a> .                                                                                                                                                    |
| charge_mode           | String | Billing mode. Options: <ul style="list-style-type: none"><li>• <b>prePaid</b>: indicates that the billing mode is yearly/monthly.</li><li>• <b>postPaid</b>: indicates that the billing mode is pay-per-use.</li></ul> |
| enterprise_project_id | String | Enterprise project ID. The value <b>0</b> indicates that the default enterprise project is used.                                                                                                                       |
| backup_id             | String | Backup ID.                                                                                                                                                                                                             |
| created_at            | String | Instance creation time.                                                                                                                                                                                                |
| deleted_at            | String | Instance deletion time.                                                                                                                                                                                                |
| retained_until        | String | Retention end time.                                                                                                                                                                                                    |

**Table 6-123** RecycleDatastore

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.5 Parameter Configuration

### 6.5.1 Creating a Parameter Template

#### Function

This API is used to create a parameter template and configure the name, description, DB engine version, and parameter values in the parameter template.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

The new parameter template cannot have the same name as any existing parameter template.

For configuration item **values**, you can enter system-defined parameters that allow for modification.

## URI

POST /v3/{project\_id}/configurations

**Table 6-124** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 6-125** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-126** Request body parameters

| Parameter   | Mandatory | Type                | Description                                                                                                                                                                         |
|-------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | Yes       | String              | Parameter template name. It can include a maximum of 64 characters and can contain only uppercase letters, lowercase letters, digits, hyphens (-), underscores (_), and periods (.) |
| description | No        | String              | Parameter template description. It can contain a maximum of 256 characters except the following special characters: >!<"&'=. The value is left blank by default.                    |
| values      | No        | Map<String, String> | Parameter values defined by users based on a default parameter template. Keep the parameter values unchanged by default.                                                            |

| Parameter | Mandatory | Type                                                | Description      |
|-----------|-----------|-----------------------------------------------------|------------------|
| datastore | Yes       | <a href="#">ConfigurationDatastoreOption object</a> | Database object. |

**Table 6-127 ConfigurationDatastoreOption**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | Database type. The value can be:<br><b>cassandra</b> : GeminiDB Cassandra instance<br><b>influxdb</b> : GeminiDB Influx instance                                                                                                                                                                                             |
| version   | Yes       | String | Database version. The value can be:<br><b>3.11</b> : GeminiDB Cassandra instance 3.11<br><b>1.7</b> , indicating that GeminiDB Influx 1.7 is supported.                                                                                                                                                                      |
| mode      | No        | String | Instance type. This parameter is mandatory when you create a GeminiDB Cassandra instance with cloud native storage. <ul style="list-style-type: none"><li>• <b>InfluxdbSingle</b>: single-node GeminiDB Influx instance</li><li>• <b>CloudNativeCluster</b>: GeminiDB Cassandra instance with cloud native storage</li></ul> |

## Response Parameters

Status code: 200

**Table 6-128 Response body parameter**

| Parameter     | Type                                       | Description                     |
|---------------|--------------------------------------------|---------------------------------|
| configuration | <a href="#">ConfigurationResult object</a> | Parameter template information. |

**Table 6-129 ConfigurationResult**

| Parameter              | Type   | Description                                       |
|------------------------|--------|---------------------------------------------------|
| id                     | String | Parameter template ID.                            |
| name                   | String | Parameter template name.                          |
| datastore_version_name | String | Database version name.                            |
| datastore_name         | String | Database name.                                    |
| description            | String | Parameter template description                    |
| created                | String | Creation time in the yyyy-MM-ddTHH:mm:ssZ format. |
| updated                | String | Update time in the yyyy-MM-ddTHH:mm:ssZ format.   |

## Example Request

- URI example  
POST https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/configurations
- Creating a parameter template for GeminiDB Cassandra instances

```
{  
    "name" : "configuration_test",  
    "description" : "configuration_test",  
    "values" : {  
        "max_connections" : "10",  
        "autocommit" : "OFF"  
    },  
    "datastore" : {  
        "type" : "cassandra",  
        "version" : "3.11"  
    }  
}
```

## Example Response

Status code: 200

Success

```
{  
    "configuration" : {  
        "id" : "463b4b58d0e84e2b95605dea4552fdpr06",  
        "name" : "configuration_test",  
        "datastore_version_name" : "3.11",  
        "datastore_name" : "cassandra",  
        "description" : "configuration_test",  
        "created" : "2020-03-09T08:27:56+0800",  
        "updated" : "2020-03-09T08:27:56+0800"  
    }  
}
```

## 6.5.2 Modifying Parameters in a Parameter Template

### Function

This API is used to modify parameters in a specified parameter template, including parameter names, descriptions, and values.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

The modified parameter template name must be different from the name of any existing or default parameter template.

Default parameter templates cannot be modified.

For configuration item **values**, you can enter system-defined parameters that allow for modification.

### URI

PUT /v3/{project\_id}/configurations/{config\_id}

**Table 6-130** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| config_id  | Yes       | String | Parameter template ID.                                                                                 |

### Request Parameters

**Table 6-131** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-132 Request body parameters**

| Parameter   | Mandatory | Type                | Description                                                                                                                                                                          |
|-------------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | No        | String              | Parameter template name. It can include a maximum of 64 characters and can contain only uppercase letters, lowercase letters, digits, hyphens (-), underscores (_), and periods (.). |
| description | No        | String              | Parameter template description. It can include a maximum of 256 characters and cannot contain the following special characters: >!<"&=' The value is left blank by default.          |
| values      | No        | Map<String, String> | Parameter values defined by users based on a default parameter template. If this parameter is not specified, no parameter values are to be changed.                                  |

## Response Parameters

Status code: 200

No response parameters

## Example Request

- URI example  
PUT https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/configurations/e02e76567ae04662a2753492b77f965bpr06
- Modifying Parameters in a Parameter Template

### NOTE

At least one parameter in the request body must be specified. Otherwise, the request cannot be delivered.

```
{  
  "name" : "configuration_test",  
  "description" : "configuration_test",  
  "values" : {  
    "concurrent_reads" : "64"  
  }  
}
```

### 6.5.3 Applying a Parameter Template

#### Function

This API is used to apply a parameter template to one or more instances.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

This API is an asynchronous API. A successful response does not indicate that the parameter template is successfully applied.

#### URI

PUT /v3/{project\_id}/configurations/{config\_id}/apply

**Table 6-133** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| config_id  | Yes       | String | Parameter template ID                                                                                  |

#### Request Parameters

**Table 6-134** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 6-135** Request body parameter

| Parameter    | Mandatory | Type             | Description  |
|--------------|-----------|------------------|--------------|
| instance_ids | Yes       | Array of strings | Instance IDs |

## Response Parameters

Status code: 200

**Table 6-136** Response body parameters

| Parameter | Type    | Description                                                                                                                                                                                                                                                   |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_id    | String  | ID of an asynchronous task that applies the parameter template                                                                                                                                                                                                |
| success   | Boolean | Whether the task for applying the parameter template is successfully submitted. The value can be: <ul style="list-style-type: none"><li>• <b>true</b>: The task is successfully submitted.</li><li>• <b>false</b>: The task failed to be submitted.</li></ul> |

## Example Request

- URI example

## 6.5.5 Querying Instance Parameter Settings

### Function

This API is used to query instance parameter settings.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

### URI

GET /v3/{project\_id}/instances/{instance\_id}/configurations

**Table 6-141** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

### Request Parameters

**Table 6-142** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

### Response Parameters

Status code: 200

**Table 6-143** Response body parameter

| Parameter              | Type   | Description            |
|------------------------|--------|------------------------|
| datastore_version_name | String | Database version name. |

| Parameter                | Type                                                          | Description                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datastore_name           | String                                                        | Database name.                                                                                                                                                                                                        |
| created                  | String                                                        | Creation time in the yyyy-MM-ddTHH:mm:ssZ format.<br><b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset.                                                 |
| updated                  | String                                                        | Update time in the yyyy-MM-ddTHH:mm:ssZ format.<br><b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset.                                                   |
| id                       | String                                                        | Parameter template ID.                                                                                                                                                                                                |
| mode                     | String                                                        | Instance type. The value can be:<br><b>Cluster</b> , indicating that the instance is of the GeminiDB Cassandra cluster type.<br><b>Cluster</b> , indicating that the instance is of the GeminiDB Influx cluster type. |
| configuration parameters | Array of <a href="#">ConfigurationParameterResult</a> objects | Parameters defined by users based on a default parameter template.                                                                                                                                                    |

**Table 6-144 ConfigurationParameterResult**

| Parameter        | Type    | Description                                                                                                                                                                                                                                                          |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | String  | Parameter name.                                                                                                                                                                                                                                                      |
| value            | String  | Parameter value.                                                                                                                                                                                                                                                     |
| restart_required | Boolean | Whether the instance needs to be restarted. The value can be: <ul style="list-style-type: none"><li>• <b>false</b>, indicating that the instance does not need to be restarted.</li><li>• <b>true</b>, indicating that the instance needs to be restarted.</li></ul> |
| readonly         | Boolean | Whether the parameter is read-only. The value can be: <ul style="list-style-type: none"><li>• <b>false</b>, indicating that the parameter is not read-only.</li><li>• <b>true</b>, indicating that the parameter is read-only.</li></ul>                             |

| Parameter   | Type   | Description                                                                                                                                                   |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_range | String | Value range. For example, the value of the Integer type ranges from <b>0</b> to <b>1</b> , and the value of the Boolean type is <b>true</b> or <b>false</b> . |
| type        | String | Parameter type. The value can be <b>string</b> , <b>integer</b> , <b>boolean</b> , <b>list</b> , or <b>float</b> .                                            |
| description | String | Parameter description.                                                                                                                                        |

## 6.5.6 Obtaining Parameters of a Specified Parameter Template

### Function

This API is used to obtain information about parameters of a specified parameter template.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

### URI

GET /v3/{project\_id}/configurations/{config\_id}

**Table 6-145** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| config_id  | Yes       | String | Parameter template ID.                                                                                 |

### Request Parameters

**Table 6-146** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

### Response Parameters

Status code: 200

**Table 6-147** Response body parameters

| Parameter | Type   | Description              |
|-----------|--------|--------------------------|
| id        | String | Parameter template ID.   |
| name      | String | Parameter template name. |

| Parameter                | Type                                                             | Description                                                                                                                                                           |
|--------------------------|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description              | String                                                           | Parameter template description.                                                                                                                                       |
| datastore_version_name   | String                                                           | Database version name.                                                                                                                                                |
| datastore_name           | String                                                           | Database name.                                                                                                                                                        |
| created                  | String                                                           | Creation time in the yyyy-MM-ddTHH:mm:ssZ format.<br><b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset. |
| updated                  | String                                                           | Update time in the yyyy-MM-ddTHH:mm:ssZ format.<br><b>T</b> is the separator between calendar and hourly notation of time. <b>Z</b> indicates the time zone offset.   |
| configuration_parameters | Array of<br><a href="#">ConfigurationParameterResult</a> objects | Parameters defined by users based on a default parameter template.                                                                                                    |

**Table 6-148 ConfigurationParameterResult**

| Parameter        | Type    | Description                                                                                                                                                                                                                                                          |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | String  | Parameter name.                                                                                                                                                                                                                                                      |
| value            | String  | Parameter value.                                                                                                                                                                                                                                                     |
| restart_required | Boolean | Whether the instance needs to be restarted. The value can be: <ul style="list-style-type: none"><li>• <b>false</b>, indicating that the instance does not need to be restarted.</li><li>• <b>true</b>, indicating that the instance needs to be restarted.</li></ul> |
| readonly         | Boolean | Whether the parameter is read-only. The value can be: <ul style="list-style-type: none"><li>• <b>false</b>, indicating that the parameter is not read-only.</li><li>• <b>true</b>, indicating that the parameter is read-only.</li></ul>                             |
| value_range      | String  | Value range. For example, the value of the Integer type ranges from <b>0</b> to <b>1</b> , and the value of the Boolean type is <b>true</b> or <b>false</b> .                                                                                                        |

| Parameter   | Type   | Description                                                                                                        |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------|
| type        | String | Parameter type. The value can be <b>string</b> , <b>integer</b> , <b>boolean</b> , <b>list</b> , or <b>float</b> . |
| description | String | Parameter description.                                                                                             |

## 6.5.7 Deleting a Parameter Template

### Function

This API is used to delete a specified parameter template.

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

## URI

DELETE /v3/{project\_id}/configurations/{config\_id}

**Table 6-149** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| config_id  | Yes       | String | Parameter template ID.                                                                                 |

## Request Parameters

**Table 6-150** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

**Status code: 200**

No response parameters

## Example Request

URI example

```
DELETE https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/configurations/e02e76567ae04662a2753492b77f965bpr06
```

## Example Response

None

## 6.6 Tags

### 6.6.1 Querying an Instance by Tag

#### Function

This API is used to query a specified instance by tag.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

A maximum of 20 tags can be added to a DB instance. The tag key must be unique.

#### URI

POST /v3/{project\_id}/instances/resource-instances/action

**Table 6-151** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

#### Request Parameters

**Table 6-152** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-153** Request body parameters

| Parameter | Mandatory | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | String                              | <p>Index offset. The query starts from the next piece of data indexed by this parameter.</p> <ul style="list-style-type: none"><li>• If <b>action</b> is set to <b>count</b>, this parameter does not need to be transferred.</li><li>• If <b>action</b> is set to <b>filter</b>, the value must be a non-negative number. The default value is <b>0</b>, indicating that the query starts from the first piece of data.'</li></ul> |

| key       | Yes       | String           | <p>Tag key. It can contain a maximum of 36 Unicode characters. The <b>key</b> value cannot be null, an empty string, or spaces. Before using <b>key</b>, delete spaces before and after the value.</p> <p><b>NOTE</b><br/>The character set of this parameter is not verified during search.</p>           |
| values    | Yes       | Array of strings | <p>Tag values. Each tag value can contain a maximum of 43 Unicode characters and cannot contain spaces. Before using <b>values</b>, delete spaces before and after the value.</p> <p>If the <b>values</b> is not specified, any parameter value can be queried. All values are in the OR relationship.</p> |

## Response Parameters

Status code: 200

**Table 6-156** Response body parameters

| Parameter   | Type                                         | Description              |
|-------------|----------------------------------------------|--------------------------|
| instances   | Array of<br><b>InstanceResult</b><br>objects | All instances.           |
| total_count | Integer                                      | Total number of records. |

**Table 6-157** InstanceResult

| Parameter     | Type                                            | Description                                                                        |
|---------------|-------------------------------------------------|------------------------------------------------------------------------------------|
| instance_id   | String                                          | Instance ID.                                                                       |
| instance_name | String                                          | Instance name.                                                                     |
| tags          | Array of<br><b>InstanceTagResult</b><br>objects | All tags. If there are no tags, <b>tags</b> is taken as an empty array by default. |

**Table 6-158** InstanceTagResult

| Parameter | Type   | Description                                                                                                                                                                                                 |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Tag key. The tag key must be specified and can include a maximum of 36 Unicode characters.<br>It is case-sensitive and can contain digits, letters, underscores (_), and hyphens (-).                       |
| value     | String | Tag value. The tag value can contain a maximum of 43 Unicode characters and can be an empty string.<br>It is case-sensitive and can contain digits, letters, underscores (_), periods (.), and hyphens (-). |

## Example Request

- URI example  
POST https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/resource-instances/action
- Example request body  
Querying an instance by name (Set **offset** to 100 and **limit** to 100.)

```
{  
  "offset": 100,  
  "limit": 100,  
  "action": "filter",  
}
```

```
"matches" : [ {  
    "key" : "instance_name",  
    "value" : "test-single"  
},  
    "tags" : [ {  
        "key" : "key1",  
        "values" : [ "value1", "value2" ]  
    }]  
}
```

### Querying total records

```
{  
    "action" : "count",  
    "tags" : [ {  
        "key" : "key1",  
        "values" : [ "value1", "value2" ]  
    }, {  
        "key" : "key2",  
        "values" : [ "value1", "value2" ]  
    } ],  
    "matches" : [ {  
        "key" : "instance_name",  
        "value" : "test-single"  
    }, {  
        "key" : "instance_id",  
        "value" : "958693039f284d6ebfb177375711072ein06"  
    } ]  
}
```

## Example Response

Status code: 200

Success

```
{  
    "total_count": 1,  
    "instances" : [ {  
        "instance_id" : "2acbf2223caf3bac3c33c6153423c3ccin06",  
        "instance_name" : "test-single",  
        "tags" : [ {  
            "key" : "key1",  
            "value" : "value1"  
        }, {  
            "key" : "key2",  
            "value" : "value1"  
        } ]  
    } ]  
}
```

## 6.6.2 Adding or Deleting Resource Tags in Batches

### Function

This API is used to add tags to or delete tags from a specified DB instance in batches.

## Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

A maximum of tags can be added to an instance. The tag key must be unique.

If the request body contains duplicated keys, an error message will be reported when the API is called.

If the key in the request body is the same as an existing key in a specified instance, the value of the **value** parameter that corresponds to the existing key is overwritten.

If the tag to be deleted does not exist, the operation is considered successful by default. The character set of the tag is not verified during the deletion.

## URI

POST /v3/{project\_id}/instances/{instance\_id}/tags/action

**Table 6-159** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-160** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

**Table 6-161** Request body parameters

| Parameter | Mandatory | Type                                                     | Description                                                                                                                                                                                         |
|-----------|-----------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action    | Yes       | String                                                   | Operation identifier. The value can be: <ul style="list-style-type: none"><li>• <b>create</b>, indicating that tags are added.</li><li>• <b>delete</b>, indicating that tags are deleted.</li></ul> |
| tags      | Yes       | Array of <a href="#">BatchTagActionTagOption</a> objects | All tags.                                                                                                                                                                                           |

**Table 6-162** BatchTagActionTagOption

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Tag key. It can contain a maximum of 128 Unicode characters. The <b>key</b> value cannot be <b>null</b> , an empty string, or spaces. Before using <b>key</b> , delete spaces before and after the value.<br>It is case-sensitive and can contain digits, letters, underscores (_), and hyphens (-).                                                                                                                                                                                                                                                                     |
| value     | No        | String | Tag value. The tag value can contain a maximum of 255 Unicode characters and can be an empty string.<br>It is case-sensitive and can contain digits, letters, underscores (_), periods (.), and hyphens (-). <ul style="list-style-type: none"><li>• If <b>action</b> is set to <b>create</b>, this parameter is mandatory.</li><li>• If <b>action</b> is set to <b>delete</b>, this parameter is optional.</li></ul> <p><b>NOTE</b><br/>If <b>value</b> is specified, tags are deleted by key and value. If <b>value</b> is not specified, tags are deleted by key.</p> |

### 6.6.3 Querying Tags of an Instance

#### Function

This API is used to query tags of a specified instance.

#### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

A maximum of 20 tags can be added to a DB instance. The tag key must be unique.

## URI

GET /v3/{project\_id}/instances/{instance\_id}/tags

**Table 6-163** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | String | Instance ID.                                                                                           |

## Request Parameters

**Table 6-164** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

## Response Parameters

Status code: 200

**Table 6-165** Response body parameter

| Parameter | Type                                                    | Description           |
|-----------|---------------------------------------------------------|-----------------------|
| tags      | Array of <a href="#">ListInstanceTagsResult</a> objects | Tags of the instance. |

**Table 6-166** ListInstanceTagsResult

| Parameter | Type   | Description                                                                                                                                                                                                 |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Tag key. The tag key can contain a maximum of 36 Unicode characters and must be specified.<br>It is case-sensitive and can contain digits, letters, underscores (_), and hyphens (-).                       |
| value     | String | Tag value. The tag value can contain a maximum of 43 Unicode characters and can be an empty string.<br>It is case-sensitive and can contain digits, letters, underscores (_), periods (.), and hyphens (-). |

## Example Request

URI example

```
GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/9136fd2a9fc405ea4674276ce36dae8in02/tags
```

## Example Response

Status code: 200

Success

```
{  
  "tags": [ {  
    "key": "key1",  
    "value": "value1"  
  }, {  
    "key": "key2",  
    "value": "value2"  
  } ]  
}
```

## 6.7 Quotas

## 6.7.1 Querying Quota

### Function

This API is used to query GeminiDB resource quotas of a tenant.

### URI

GET /v3/{project\_id}/quotas

**Table 6-167** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

**Table 6-168** Request header parameter

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token. |

### Response Parameters

Status code: 200

**Table 6-169** Response body parameter

| Parameter | Type                                                 | Description        |
|-----------|------------------------------------------------------|--------------------|
| quotas    | <a href="#">ShowResourcesListResponseBody</a> object | Quota information. |

**Table 6-170** ShowResourcesListResponseBody

| Parameter | Type                                                             | Description    |
|-----------|------------------------------------------------------------------|----------------|
| resources | Array of <a href="#">ShowResourcesDetailResponseBody</a> objects | All resources. |

**Table 6-171 ShowResourcesDetailResponseBody**

| Parameter | Type    | Description                                                                                      |
|-----------|---------|--------------------------------------------------------------------------------------------------|
| type      | String  | Quota resource type. Only the instance type is supported.                                        |
| quota     | Integer | Current quota.<br>If this parameter is set to <b>0</b> , no quantity limit is set for resources. |
| used      | Integer | Number of used resources.                                                                        |

## Example Request

URI example

GET https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/0549b4a43100d4f32f51c01c2fe4acdb/quotas

## Example Response

Status code: 200

Success

```
{  
  "quotas" : {  
    "resources" : [ {  
      "type" : "instance",  
      "quota" : 200,  
      "used" : 58  
    } ]  
  }  
}
```

# 7 Historical APIs

## 7.1 Instance Specifications

### Function

This API is used to query all instance specifications under a specified condition.

#### NOTICE

This API will be unavailable. You are advised to use the new API described in [Querying Instance Specifications](#).

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis

### URI

- URI format  
GET /v3/{project\_id}/flavors
- URI example  
`https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/flavors?region=eu-west-101&engine_name=cassandra`
- Parameter description

**Table 7-1** Parameter description

| Parameter   | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain this value, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                                                                                                                                                                                       |
| region      | No        | Region where an instance is deployed.<br>The value:<br>Must be specified. Obtain the parameter value from the enterprise administrator.                                                                                                                                                                                                                                                                         |
| engine_name | No        | Database type. The value can be: <ul style="list-style-type: none"><li>• <b>cassandra</b>: GeminiDB Cassandra instance specifications are queried.</li><li>• <b>influxdb</b>: GeminiDB Influx instance specifications are queried.</li><li>• <b>redis</b>: GeminiDB Redis instance specifications are queried.</li><li>• If this parameter is not transferred, the default value is <b>cassandra</b>.</li></ul> |

## Request Parameters

# 7.2 Parameter Templates

## 7.2.1 Obtaining Parameter Templates

### Function

This API is used to obtain parameter templates, including default and custom parameter templates of all instances.

#### NOTICE

This API will be unavailable. You are advised to use the new API described in [Obtaining Parameter Templates](#).

### Constraints

This API supports the following instance types:

- GeminiDB Cassandra
- GeminiDB Influx

### URI

- URI format  
GET /v3/{project\_id}/configurations
- URI example  
`https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/configurations`
- Required parameters

**Table 7-4** Parameter description

| Parameter  | Mandatory | Description                                                                                               |
|------------|-----------|-----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region.<br>To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

None

## Response Parameters

## 7.3 Tags

### 7.3.1 Querying an Instance by Tag

#### Function

This API is used to query a specified instance by tag.

---

#### NOTICE

This API will be unavailable. You are advised to use the new API described in [Querying an Instance by Tag](#).

---

#### Constraints

- This API supports the following types of instances:

- GeminiDB Cassandra
- GeminiDB Influx
- GeminiDB Redis
- A maximum of 20 tags can be added to a DB instance. The tag key must be unique.

## URI

- URI format

POST /v3/{project\_id}/instances/resource\_instances/action

- URI example

[https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/resource\\_instances/action](https://gaussdb-nosql.eu-west-101.myhuaweicloud.eu/v3/375d8d8fad1f43039e23d3b6c0f60a19/instances/resource_instances/action)

- Required parameters

**Table 7-7** Parameter description

| Parameter  | Mandatory | Description                                                                                            |
|------------|-----------|--------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region. To obtain this value, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

- Required parameters

**Table 7-8** Parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | String | <p>Index position. **Table 7-9** Data structure description of parameter **tags**

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                           |
|-----------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String           | Tag key. It can contain a maximum of 36 Unicode characters. The <b>key</b> value cannot be null, an empty string, or spaces. Before using <b>key</b> , delete spaces before and after the value.<br><b>NOTE</b><br>The character set of this parameter is not verified during search. |
| values    | Yes       | Array of strings | Tag values. Each tag value can contain a maximum of 43 Unicode characters and cannot contain spaces. Before using <b>values</b> , delete spaces before and after the value.<br>If <b>values</b> is not specified, any value can be queried. All values are in the OR relationship.    |

**Table 7-10** Data structure description of parameter **matches**

| Parameter | Mandatory | Type   | Description                                                                                                                                           |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Query criteria. The value can be <b>instance_name</b> or <b>instance_id</b> , indicating that the query is based on the instance name or instance ID. |
| value     | Yes       | String | Name or ID of the instance to be queried                                                                                                              |

- Example request body

Querying an instance by tag:

```
{  
    "offset": "100",  
    "limit": "100",  
    "action": "filter",  
    "matches": [  
        {  
            "key": "instance_name",  
            "value": "test-af07"  
        }  
    ],
```

```
"tags": [
  {
    "key": "key1",
    "values": [
      "value1",
      "value2"
    ]
  }
]
```

Querying the total number of records:

```
{
  "action": "count",
  "tags": [
    {
      "key": "key1",
      "values": [
        "value1",
        "value2"
      ]
    },
    {
      "key": "key2",
      "values": [
        "value1",
        "value2"
      ]
    }
  ],
  "matches": [
    {
      "key": "instance_name",
      "value": "test-af07"
    },
    {
      "key": "instance_id",
      "value": "958693039f284d6ebfb177375711072ein06"
    }
  ]
}
```

## Response Parameters

- Normal response

**Table 7-11** Parameter description

| Parameter   | Type             | Description             |
|-------------|------------------|-------------------------|
| instances   | Array of objects | All instances           |
| total_count | Integer          | Total number of records |

**Table 7-12** Data structure description of parameter **instance**

| Parameter     | Type             | Description                                                                                                                               |
|---------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id   | String           | Instance ID                                                                                                                               |
| instance_name | String           | Instance name                                                                                                                             |
| tags          | Array of objects | All tags. If there are no tags, <b>tags</b> is taken as an empty array by default. For more information, see <a href="#">Table 7-13</a> . |

**Table 7-13** Data structure description of parameter **tags**

| Parameter | Type   | Description                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Tag key. The tag key can contain a maximum of 36 Unicode characters and must be specified. It is case-sensitive and can contain digits, letters, underscores (_), and hyphens (-). |
| value     | String | Tag value. The tag value can contain a maximum of 43 Unicode characters and can be an empty string. Letters, digits, underscores (_), periods (.), and hyphens (-)                 |

- Example normal response

Returning a specified instance by tag:

```
{  
  "instances": [  
    {  
      "instance_id": "2acbf2223caf3bac3c33c6153423c3ccin06",  
      "instance_name": "test-single",  
      "tags": [  
        {  
          "key": "key1",  
          "value": "value1"  
        },  
        {  
          "key": "key2",  
          "value": "value1"  
        }  
      ]  
    }  
  ]  
}
```

Returning total records:

```
{  
    "total_count": 4  
}
```

- Abnormal response

# 8 Permission Policies and Supported Actions

## 8.1 Introduction

You can use Identity and Access Management (IAM) for fine-grained management of the permissions for your GeminiDB databases. If your account does not need individual IAM users, then you may skip over this section.

By default, new IAM users do not have permissions assigned. You need to add a user to one or more groups, and attach permission policies or roles to these groups. Users inherit permissions from the groups that they are added to and can perform specified operations on cloud services based on the permissions.

You can grant users permissions by using **roles** and **policies**. Roles are a type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. Policies define API-based permissions for operations on specific resources under certain conditions, allowing for more fine-grained, secure access control of cloud resources.

### NOTE

Policy-based authorization is useful if you want to allow or deny the access to an API.

An account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user queries GeminiDB Cassandra instances using an API, the user must have been granted the permissions that allow the **nosql:instance:list** action.

## Supported Actions

GeminiDB provides system-defined policies that can be directly used in IAM. You can also create custom policies and use them to supplement system-defined policies, implementing more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- Permissions: Statements in a policy that allow or deny certain operations.
- APIs: REST APIs that can be called in a custom policy
- Actions: Added to a custom policy to control permissions for specific operations.
- IAM or enterprise projects: Type of projects for which an action will take effect. Policies that contain actions for both IAM and enterprise projects can be used and take effect for both IAM and Enterprise Management. Policies that only contain actions for IAM projects can be used and only take effect for IAM. For the differences between IAM and enterprise projects, see [Differences Between IAM and Enterprise Management](#).

For details about the custom actions supported by GeminiDB, see [GeminiDB Actions](#).

## 8.2 GeminiDB Actions

**Table 8-1** Instance management actions

| Permission                              | API                                                                                                                                                                 | Action                           | IAM Project | Enterprise Project |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------|--------------------|
| Creating a DB instance                  | POST /v3/{project_id}/instances                                                                                                                                     | nosql:instance:create            | ✓           | ✓                  |
| Deleting a DB instance                  | DELETE /v3/{project_id}/instances/{instance_id}                                                                                                                     | nosql:instance:delete            | ✓           | ✓                  |
| Querying DB instances                   | GET /v3/{project_id}/instances? id={id}&name={name}&mode={mode}&datastore_type={datastore_type}&vpc_id={vpc_id}&subnet_id={subnet_id}&offset={offset}&limit={limit} | nosql:instance:list              | ✓           | ✓                  |
| Scaling up storage space of an instance | POST /v3/{project_id}/instances/{instance_id}/extend-volume                                                                                                         | nosql:instance:modifyStorageSize | ✓           | ✓                  |

| Permission                                 | API                                                         | Action                                     | IAM Project | Enterprise Project |
|--------------------------------------------|-------------------------------------------------------------|--------------------------------------------|-------------|--------------------|
| Adding nodes for a cluster instance        | POST /v3/{project_id}/instances/{instance_id}/enlarge-node  | nosql:instance:extendNode                  | ✓           | ✓                  |
| Deleting nodes from a cluster instance     | POST /v3/{project_id}/instances/{instance_id}/reduce-node   | nosql:instance:reduceNode                  | ✓           | ✓                  |
| Changing specifications of an instance     | PUT /v3/{project_id}/instances/{instance_id}/resize         | nosql:instance:modifySpecification         | ✓           | ✓                  |
| Changing the administrator password        | PUT /v3/{project_id}/instances/{instance_id}/password       | nosql:instance:modifyPasswd                | ✓           | ✓                  |
| Editing the name of an instance            | PUT /v3/{project_id}/instances/{instance_id}/name           | nosql:instance:rename                      | ✓           | ✓                  |
| Changing the security group of an instance | PUT /v3/{project_id}/instances/{instance_id}/security-group | nosql:instance:modifySecurityGroup         | ✓           | ✓                  |
| Upgrading minor version                    | POST /v3/{project_id}/instances/{instance_id}/db-upgrade    | nosql:instance:upgradeDatabaseVersion      | ✓           | ✓                  |
| Patching databases in batches              | /v3/{projectId}/instances/db-upgrade                        | nosql:instance:batchUpgradeDatabaseVersion | ✓           | ✓                  |

| Permission                                         | API                                                                     | Action                                 | IAM Project | Enterprise Project |
|----------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------|-------------|--------------------|
| Creating cold storage                              | POST /v3/{project_id}/instances/{instance_id}/cold-volume               | nosql:instance:modifyStorageSize       | ✓           | ✓                  |
| Scaling up cold storage                            | PUT /v3/{project_id}/instances/{instance_id}/cold-volume                | nosql:instance:modifyStorageSize       | ✓           | ✓                  |
| Binding or unbinding an EIP                        | POST /v3/{project_id}/instances/{instance_id}/nodes/{node_id}/public-ip | nosql:instance:bindPublicIp            | ✓           | ✓                  |
| Enabling or disabling SSL                          | POST /v3/{project_id}/instances/{instance_id}/ssl-option                | nosql:instance:switchSSL               | ✓           | ✓                  |
| Restarting a DB instance                           | POST /v3/{project_id}/instances/{instance_id}/restart                   | nosql:instance:restart                 | ✓           | ✓                  |
| Configuring autoscaling policies for storage space | PUT /v3/{project_id}/instances/disk-auto-expansion                      | nosql:instance:modifyStorageSize       | ✓           | ✓                  |
| Setting the maintenance period of an instance      | PUT /v3/{project_id}/instances/{instance_id}/maintenance-window         | nosql:instance:modifyMaintenanceWindow | ✓           | ✓                  |

**Table 8-2** Actions for backups and restorations

| Permission                                             | API                                                                          | Action                                 | IAM Project | Enterprise Project |
|--------------------------------------------------------|------------------------------------------------------------------------------|----------------------------------------|-------------|--------------------|
| Querying an automated backup policy                    | GET /v3.1/{project_id}/instances/{instance_id}/backups/policy                | nosql:backup:list                      | ✓           | ✓                  |
| Configuring an automated backup policy                 | PUT /v3/{project_id}/instances/{instance_id}/backups/policy                  | nosql:instance:modifyBackupPolicy      | ✓           | ✓                  |
| Querying instances that can be restored                | GET /v3/{project_id}/backups/{backup_id}/restorable-instances                | nosql:instance:list                    | ✓           | ✓                  |
| Querying the time window when a backup can be restored | GET /v3/{project_id}/instances/{instance_id}/backups/restorable-time-periods | nosql:backup:list                      | ✓           | ✓                  |
| Creating a manual backup                               | POST /v3/{project_id}/instances/{instance_id}/backups                        | nosql:backup:create                    | ✓           | ✓                  |
| Deleting a manual backup                               | DELETE /v3/{project_id}/backups/{backup_id}                                  | nosql:backup:delete                    | ✓           | ✓                  |
| Restoring data to an existing instance                 | POST /v3/{project_id}/instances/{instance_id}/recovery                       | nosql:backup:refreshInstanceFromBackup | ✓           | ✓                  |

**Table 8-3** Parameter template management actions

| Permission                                             | API                                                           | Action                         | IAM Project | Enterprise Project |
|--------------------------------------------------------|---------------------------------------------------------------|--------------------------------|-------------|--------------------|
| Obtaining parameter templates                          | GET /v3/{project_id}/configurations                           | nosql:param:list               | ✓           | ✓                  |
| Creating a parameter template                          | POST /v3/{project_id}/configurations                          | nosql:param:create             | ✓           | ✓                  |
| Modifying parameters in a parameter template           | PUT /v3.1/{project_id}/instances/{instance_id}/configurations | nosql:param:modify             | ✓           | ✓                  |
| Applying a parameter template                          | PUT /v3.1/{project_id}/configurations/{config_id}/apply       | nosql:instance:modifyParameter | ✓           | ✓                  |
| Modifying parameters of a specified instance           | PUT /v3/{project_id}/instances/{instance_id}/configurations   | nosql:instance:modifyParameter | ✓           | ✓                  |
| Obtaining parameters of a specified instance           | GET /v3/{project_id}/instances/{instance_id}/configurations   | nosql:param:list               | ✓           | ✓                  |
| Obtaining parameters of a specified parameter template | GET /v3/{project_id}/configurations/{config_id}               | nosql:param:list               | ✓           | ✓                  |
| Deleting a parameter template                          | DELETE /v3/{project_id}/configurations/{config_id}            | nosql:param:delete             | ✓           | ✓                  |

**Table 8-4** Tag management actions

| Permission                                  | API                                                       | Action                                                                                        | IAM Project | Enterprise Project |
|---------------------------------------------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------|-------------|--------------------|
| Querying an instance by tag                 | POST /v3/{project_id}/instances/resource_instances/action | <ul style="list-style-type: none"> <li>nosql:instance:list</li> <li>nosql:tag:list</li> </ul> | ✓           | ✓                  |
| Adding or deleting resource tags in batches | POST /v3/{project_id}/instances/{instance_id}/tags/action | nosql:instance:tag                                                                            | ✓           | ✓                  |
| Querying tags of an instance                | GET /v3/{project_id}/instances/{instance_id}/tags         | <ul style="list-style-type: none"> <li>nosql:instance:list</li> <li>nosql:tag:list</li> </ul> | ✓           | ✓                  |

**Table 8-5** Quota management actions

| Permission               | API                         | Action              | IAM Project | Enterprise Project |
|--------------------------|-----------------------------|---------------------|-------------|--------------------|
| Querying resource quotas | GET /v3/{project_id}/quotas | nosql:instance:list | ✓           | ✓                  |

**Table 8-6** Actions for disaster recovery management

| Permission                    | API                                                                   | Action            | IAM Project | Enterprise Project |
|-------------------------------|-----------------------------------------------------------------------|-------------------|-------------|--------------------|
| Performing a pre-check for DR | POST /v3/{projectId}/instance/{instanceId}/disaster-recovery/precheck | nosql:dr:precheck | ✓           | ✓                  |

| Permission                                                                         | API                                                                                  | Action                                        | IAM Project | Enterprise Project |
|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|-----------------------------------------------|-------------|--------------------|
| Creating a DR relationship                                                         | POST /v3/{projectId}/instance/{instanceId}/disaster-recovery/construction            | nosql:dr:construct                            | ✓           | ✓                  |
| Deleting a DR relationship                                                         | POST /v3/{projectId}/instance/{instanceId}/disaster-recovery/deconstruction          | nosql:dr:deconstruct                          | ✓           | ✓                  |
| Obtaining role information of a DR instance                                        | POST /v3/{project_id}/instances/{instance_id}/instance-role                          | nosql:instance:switchoverDisasterRecovery     | ✓           | ✓                  |
| Promoting a DR instance from standby to primary                                    | POST /v3/{project_id}/instances/{instance_id}/switchover-master                      | nosql:instance:switchoverFromDisasterToMaster | ✓           | ✓                  |
| Demoting a DR instance from primary to standby                                     | POST /v3/{project_id}/instances/{instance_id}/switchover-slave                       | nosql:instance:switchoverFromMasterToDisaster | ✓           | ✓                  |
| Pausing/Resuming data synchronization between two instances with a DR relationship | POST /v3/{project_id}/instances/{instance_id}/disaster-recovery/data-synchronization | nosql:dr:operateDataSync                      | ✓           | ✓                  |

**Table 8-7** Task management

| Permission                                     | API                                                     | Action                           | IAM Project | Enterprise Project |
|------------------------------------------------|---------------------------------------------------------|----------------------------------|-------------|--------------------|
| Querying the maintenance period of an instance | GET /v3/{project_id}/instances/{instance_id}/ops-window | nosql:instance:maintenanceWindow | √           | √                  |
| Cancelling a scheduled task                    | DELETE /v3/{project_id}/scheduled-jobs/{job_id}         | nosql:instance:cancleScheduleJob | √           | √                  |
| Querying scheduled tasks                       | GET /v3/{projectId}/scheduled-jobs                      | nosql:task:list                  | √           | √                  |

 **NOTE**

The check mark (√) indicates that the action takes effect. The cross mark (✗) indicates that the action does not take effect.

# 9 Appendixes

## 9.1 Abnormal Request Results

- Abnormal Response

**Table 9-1** Parameter description

| Parameter  | Mandatory | Type   | Description                                                         |
|------------|-----------|--------|---------------------------------------------------------------------|
| error_code | Yes       | String | Error code returned when a task submission exception occurs.        |
| error_msg  | Yes       | String | Error description returned when a task submission exception occurs. |

- Example abnormal response

```
{  
    "error_code": "DBS.200001",  
    "error_msg": "Parameter error"  
}
```

## 9.2 Status Codes

- Normal

| Status Code | Encoding   | State Description                               |
|-------------|------------|-------------------------------------------------|
| 200         | OK         | Request succeeded.                              |
| 204         | No Content | Request succeeded, but no response is returned. |
| 202         | Accepted   | Asynchronous request submitted successfully.    |

- Abnormal

|-------------|-----------------------|----------------------------------------------------------------------------------------|
| 500         | Internal Server Error | The server is able to receive the request but unable to understand the request.        |
| 501         | Not Implemented       | The server does not support the requested function.                                    |
| 503         | Service Unavailable   | The requested service is unavailable.<br>Do not retry the request before modification. |

## 9.3 Error Codes

If an error occurs during API calling, no results will be returned. You can locate the error cause based on error codes of each API. If an error occurs, an HTTP status code is returned. The returned message body contains a specific error code and error message.

### Error Code Description

If an error code starting with **APIGW** is returned after you call an API, rectify the fault by referring to [Error Codes](#).

**Table 9-2** Error code description

| HTTP Status Code | Error Code | Error Message                   | Description            | Handling Measure                                                                   |
|------------------|------------|---------------------------------|------------------------|------------------------------------------------------------------------------------|
| 400              | DBS.200001 | Parameter error.                | Parameter error.       | Check whether transferred parameters or URLs are correct.                          |
| 404              | DBS.200002 | The DB instance does not exist. | Instance not found.    | Check whether the instance and its ID are correct and whether the instance exists. |
| 400              | DBS.200010 | Authentication failed.          | Authentication failed. | Check whether the tenant and instance match.                                       |

| HTTP Status Code | Error Code | Error Message                                                                                 | Description                                                     | Handling Measure                                                                                       |
|------------------|------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| 403              | DBS.200011 | This instance {0} status makes it not be allowed to do this {1} operation now.                | Operation cannot be performed in current state of the instance. | Check whether the instance status or the ongoing operation on the instance conflicts with the request. |
| 404              | DBS.200013 | This node does not exist.                                                                     | Node not found.                                                 | Check whether the node ID or group ID is correct.                                                      |
| 403              | DBS.200018 | This instance's status or its node's status makes it not be allowed to do this operation now. | Unavailable instance.                                           | Check whether the instance status or the ongoing operation on the instance conflicts with the request. |
| 403              | DBS.200019 | Another operation is being performed on the DB instance or the DB instance is faulty.         | Operation cannot be performed in current state of the instance. | Check whether the instance status or the ongoing operation on the instance conflicts with the request. |
| 400              | DBS.200022 | The DB instance name {0} already exists.                                                      | Instance name already exists.                                   | Check whether the instance name exists.                                                                |
| 400              | DBS.200024 | The region is unavailable.                                                                    | Unavailable region.                                             | Check whether the region name is correct and whether the region is available.                          |

| HTTP Status Code | Error Code | Error Message                                                             | Description                                                            | Handling Measure                                                                                             |
|------------------|------------|---------------------------------------------------------------------------|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| 400              | DBS.200025 | Invalid AZ.                                                               | Invalid AZ.                                                            | Check whether the AZ name is correct and whether the AZ is available.                                        |
| 403              | DBS.200028 | Volume size reach limit.                                                  | Maximum storage space has been reached.                                | Check whether the storage space exceeds the upper limit.                                                     |
| 400              | DBS.200029 | Invalid username and password.                                            | Invalid username and password.                                         | Check whether the username and password match and whether the password meets password strength requirements. |
| 400              | DBS.200041 | Invalid datastore version.                                                | Invalid database version.                                              | Check whether the database version is supported.                                                             |
| 404              | DBS.200042 | Invalid database engine.                                                  | Invalid database API.                                                  | Check whether the database API is supported by GeminiDB.                                                     |
| 400              | DBS.200047 | Operation cannot be executed in current state of the DB instance or node. | Operation cannot be executed in current state of the instance or node. | Check whether the instance status or the ongoing operation on the instance conflicts with the request.       |

| HTTP Status Code | Error Code | Error Message                                | Description                        | Handling Measure                                                                                             |
|------------------|------------|----------------------------------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------|
| 400              | DBS.200048 | Invalid VPC.                                 | Invalid VPC.                       | Check whether the VPC ID and name are correct and meet the requirements.                                     |
| 400              | DBS.200049 | Invalid subnet.                              | Invalid subnet.                    | Check whether the subnet ID and name are correct and meet the requirements.                                  |
| 400              | DBS.200050 | Invalid security group.                      | Invalid security group.            | Check whether the security group ID and name are correct and meet the requirements.                          |
| 400              | DBS.200052 | Invalid password.                            | Invalid password.                  | Check whether the username and password match and whether the password meets password strength requirements. |
| 400              | DBS.200053 | The DB instance specifications do not exist. | Instance specifications not found. | Check whether the specifications are correct and supported in the current AZ.                                |

| HTTP Status Code | Error Code | Error Message                                           | Description                                  | Handling Measure                                                              |
|------------------|------------|---------------------------------------------------------|----------------------------------------------|-------------------------------------------------------------------------------|
| 400              | DBS.200054 | Invalid DB instance specifications.                     | Invalid instance specifications.             | Check whether the specifications are correct and supported in the current AZ. |
| 400              | DBS.200057 | Invalid parameter group ID.                             | Invalid parameter template.                  | Check whether the parameter template is supported by the GeminiDB API.        |
| 404              | DBS.200058 | Parameter template does not exist.                      | Parameter template not found.                | Check whether the parameter template exists.                                  |
| 400              | DBS.200059 | Invalid database port.                                  | Invalid database port.                       | Check whether the database port is missing or valid.                          |
| 400              | DBS.200060 | The database port number is out of the specified range. | Database port is not in the specified range. | Check whether the database port is valid.                                     |
| 400              | DBS.200063 | Invalid DB instance type.                               | Invalid instance type.                       | Check whether the instance type is valid.                                     |
| 400              | DBS.200068 | Weak password.                                          | Weak password.                               | Password is too easy to guess. Change it to a strong password.                |
| 400              | DBS.200072 | Invalid storage space.                                  | Invalid storage space.                       | Check whether the storage space exceeds the upper limit.                      |

| HTTP Status Code | Error Code | Error Message                                                     | Description                                                     | Handling Measure                                                                                       |
|------------------|------------|-------------------------------------------------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| 400              | DBS.200075 | Invalid node role.                                                | Invalid node role.                                              | Check whether the role of the node meets the requirements and whether the instance is normal.          |
| 403              | DBS.200076 | Operation cannot be executed in current state of the DB instance. | Operation cannot be performed in current state of the instance. | Check whether the instance status or the ongoing operation on the instance conflicts with the request. |
| 400              | DBS.200077 | Failed to change the password.                                    | Updating password failed.                                       | Check whether the username is correct.                                                                 |
| 400              | DBS.200091 | Invalid IP address.                                               | Invalid IP address.                                             | Check whether the required IP address is missing or whether the input IP address is valid.             |

| 400              | DBS.301040 | The target security group is same as current.                | Target security group is the same as current security group.  | Check whether the target security group is the same as the current security group.  |
| 400              | DBS.301071 | Invalid session id.                                          | Invalid session ID.                                           | Check whether the session ID is correct and meets the requirements.                 |

| HTTP Status Code | Error Code   | Error Message                                     | Description                                   | Handling Measure                                                        |
|------------------|--------------|---------------------------------------------------|-----------------------------------------------|-------------------------------------------------------------------------|
| 400              | DBS.301072   | Invalid plan summary.                             | Invalid execution plan.                       | Check whether the execution plan is correct and meets the requirements. |
| 400              | DBS.301073   | Invalid operation type.                           | Invalid operation type.                       | Check whether the operation type is correct and meets the requirements. |
| 400              | DBS.301074   | Invalid namespace.                                | Invalid namespace.                            | Check whether the namespace is correct and meets the requirements.      |
| 400              | DBS.301075   | Invalid cost time.                                | Invalid execution time.                       | Check whether the execution time is correct and meets the requirements. |
| 400              | DBS.301076   | Query session failed.                             | Querying session failed.                      | Contact customer service to check the instance status.                  |
| 400              | DBS.301077   | Kill session failed.                              | Killing session failed.                       | Contact customer service to check the instance status.                  |
| 400              | DBS.03000001 | The instance has not build biactive relationship. | Instance has no dual-active DR relationships. | Check whether the instance has a dual-active DR relationship.           |

| HTTP Status Code | Error Code   | Error Message          | Description                             | Handling Measure                                                   |
|------------------|--------------|------------------------|-----------------------------------------|--------------------------------------------------------------------|
| 400              | DBS.03000002 | Invalid threshold.     | Incorrect input threshold.              | Check whether the input threshold meets the requirements.          |
| 400              | DBS.03000003 | Invalid step.          | Inputting autoscaling increment failed. | Check whether the input increase step meets the requirements.      |
| 400              | DBS.03000004 | Invalid switch option. | Invalid parameter settings.             | Check whether the input switch option is <b>on</b> or <b>off</b> . |

## 9.4 Obtaining a Project ID

### Scenarios

When calling APIs, you need to specify the project ID in some URLs. To do so, you need to obtain the project ID first.

You can obtain the required project ID with either of the following methods:

- [Obtaining the Project ID by Calling an API](#)
- [Obtaining a Project ID from the Console](#)

### Obtaining the Project ID by Calling an API

You can obtain the project ID by calling the IAM API used to query project information based on specified criteria.

The API used to obtain a project ID is **GET https://{Endpoint}/v3/projects/**. **{Endpoint}** is the IAM endpoint and can be obtained from the administrator. For details about API authentication, see [Authentication](#).

The following is an example response. The value of **id** is the project ID.

```
{  
  "projects": [  
    {  
      "domain_id": "65382450e8f64ac0870cd180d14e684b",  
      "is_domain": false,  
      "parent_id": "65382450e8f64ac0870cd180d14e684b",  
      "name": "project_name",  
      "description": "",  
    }  
  ]  
}
```

```
        "links": {
          "next": null,
          "previous": null,
          "self": "https://www.example.com/v3/projects/a4a5d4098fb4474fa22cd05f897d6b99"
        },
        "id": "a4a5d4098fb4474fa22cd05f897d6b99",
        "enabled": true
      },
      "links": {
        "next": null,
        "previous": null,
        "self": "https://www.example.com/v3/projects"
      }
    }
```

## Obtaining a Project ID from the Console

1. Sign up and log in to the management console.
2. Move your pointer over the username and select **My Credentials** in the displayed drop-down list.  
On the **API Credentials** page, view the project ID in the project list.

**Figure 9-1** Viewing project IDs

The screenshot shows the 'API Credentials' page under the 'My Credentials' section. It displays IAM User Name and Account Name, followed by a table of projects. The table has columns for Project ID, Project Name, and Region. The data in the table is as follows:

| Project ID     | Project Name   | Region         |
|----------------|----------------|----------------|
| ap-southeast-1 | ap-southeast-1 | ap-southeast-1 |
| ap-southeast-3 | ap-southeast-3 | ap-southeast-3 |
| cn-east-3      | cn-east-3      | cn-east-3      |
| sa-brazil-1    | sa-brazil-1    | sa-brazil-1    |
| eu-west-101    | eu-west-101    | EU-Dublin      |

## 9.5 Metrics

### Function

This section describes GeminiDB metrics reported to Cloud Eye as well as their namespaces and dimensions. You can use APIs provided by Cloud Eye to query metrics of monitored objects and alarms generated for GeminiDB.

### Namespace

SYS.NoSQL

## GeminiDB Redis Metrics

**Table 9-3** GeminiDB Redis API metrics

| Metric ID                  | Metric Name                     | Description                                            | Value Range  | Monitored Object              | Monitoring Period (Raw Data) |
|----------------------------|---------------------------------|--------------------------------------------------------|--------------|-------------------------------|------------------------------|
| nosql001_cpu_usage         | CPU Usage                       | CPU usage of the monitored system                      | 0–100%       | GeminiDB Redis instance nodes | 1 minute                     |
| nosql002_mem_usage         | Memory Usage                    | Memory usage of the monitored system                   | 0–100%       | GeminiDB Redis instance nodes | 1 minute                     |
| nosql005_disk_usage        | Storage Space Usage             | Disk usage of the monitored container                  | 0–100%       | GeminiDB Redis instances      | 1 minute                     |
| nosql006_disk_total_size   | Total Disk Size                 | Total disk capacity of the monitored container         | ≥ 0 GB       | GeminiDB Redis instances      | 1 minute                     |
| nosql007_disk_used_size    | Used Storage Space              | Used disk space of the monitored container             | ≥ 0 GB       | GeminiDB Redis instances      | 1 minute                     |
| redis017_proxy_accept      | Total Clients Received by Proxy | Total number of clients received by the proxy          | ≥ 0 counts   | GeminiDB Redis instance nodes | 1 minute                     |
| redis018_proxy_request_ps  | Request Acceptance Rate         | Rate at which the proxy receives client requests       | ≥ 0 counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis019_proxy_response_ps | Proxy Response Rate             | Rate at which the proxy returns requests to the client | ≥ 0 counts/s | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID                      | Metric Name                             | Description                                                                 | Value Range  | Monitored Object              | Monitoring Period (Raw Data) |
|--------------------------------|-----------------------------------------|-----------------------------------------------------------------------------|--------------|-------------------------------|------------------------------|
| redis020_proxy_recv_client_bps | Proxy Byte Stream Acceptance Rate       | Rate at which the proxy receives byte streams from the client /s            | ≥ 0 bytes/s  | GeminiDB Redis instance nodes | 1 minute                     |
| redis021_proxy_send_client_bps | Proxy Byte Stream Send Rate             | Rate at which the proxy sends byte streams to the client /s                 | ≥ 0 bytes/s  | GeminiDB Redis instance nodes | 1 minute                     |
| redis032_shard_qps             | Shard QPS                               | QPS of the shard<br>Unit: count                                             | ≥ 0 counts   | GeminiDB Redis instance nodes | 1 minute                     |
| redis036_exists_avg_usec       | Average Proxy Latency of exists Command | Average latency when the proxy executes the exists command<br>Unit: $\mu$ s | ≥ 0 $\mu$ s  | GeminiDB Redis instance nodes | 1 minute                     |
| redis037_exists_max_usec       | Maximum Proxy Latency of exists Command | Maximum latency when the proxy executes the exists command<br>Unit: $\mu$ s | ≥ 0 $\mu$ s  | GeminiDB Redis instance nodes | 1 minute                     |
| redis038_exists_p99            | Proxy P99 Latency of exists Command     | P99 latency when the proxy executes the exists command<br>Unit: $\mu$ s     | ≥ 0 $\mu$ s  | GeminiDB Redis instance nodes | 1 minute                     |
| redis039_exists_qps            | Proxy exists Command Rate               | Rate at which the proxy executes the exists command                         | ≥ 0 counts/s | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID                | Metric Name                             | Description                                                                 | Value Range       | Monitored Object              | Monitoring Period (Raw Data) |
|--------------------------|-----------------------------------------|-----------------------------------------------------------------------------|-------------------|-------------------------------|------------------------------|
| redis040_expire_avg_usec | Average Proxy Latency of expire Command | Average latency when the proxy executes the expire command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis041_expire_max_usec | Maximum Proxy Latency of expire Command | Maximum latency when the proxy executes the expire command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis042_expire_p99      | Proxy P99 Latency of expire Command     | P99 latency when the proxy executes the expire command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis043_expire_qps      | Proxy expire Command Rate               | Rate at which the proxy executes the expire command                         | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis044_del_avg_usec    | Average Proxy Latency of del Command    | Average latency when the proxy executes the del command<br>Unit: $\mu$ s    | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis045_del_max_usec    | Maximum Proxy Latency of del Command    | Maximum latency when the proxy executes the del command<br>Unit: $\mu$ s    | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID                 | Metric Name                              | Description                                                                  | Value Range       | Monitored Object              | Monitoring Period (Raw Data) |
|---------------------------|------------------------------------------|------------------------------------------------------------------------------|-------------------|-------------------------------|------------------------------|
| redis046_del_p99          | Proxy P99 Latency of del Command         | P99 latency when the proxy executes the del command<br>Unit: $\mu$ s         | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis047_del_qps          | Proxy del Command Rate                   | Rate at which the proxy executes the del command                             | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis048_ttl_avg_usec     | Average Proxy Latency of ttl Command     | Average latency when the proxy executes the ttl command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis049_ttl_max_usec     | Maximum Proxy Latency of ttl Command     | Maximum latency when the proxy executes the ttl command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis050_ttl_p99          | Proxy P99 Latency of ttl Command         | P99 latency when the proxy executes the ttl command<br>Unit: $\mu$ s         | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis051_ttl_qps          | Proxy ttl Command Rate                   | Rate at which the proxy executes the ttl command                             | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis052_persist_avg_usec | Average Proxy Latency of persist Command | Average latency when the proxy executes the persist command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID                 | Metric Name                              | Description                                                                  | Value Range       | Monitored Object              | Monitoring Period (Raw Data) |
|---------------------------|------------------------------------------|------------------------------------------------------------------------------|-------------------|-------------------------------|------------------------------|
| redis053_persist_max_usec | Maximum Proxy Latency of persist Command | Maximum latency when the proxy executes the persist command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis054_persist_p99      | Proxy P99 Latency of persist Command     | P99 latency when the proxy executes the persist command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis055_persist_qps      | Proxy persist Command Rate               | Rate at which the proxy executes the persist command                         | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis056_scan_avg_usec    | Average Proxy Latency of scan Command    | Average latency when the proxy executes the scan command<br>Unit: $\mu$ s    | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis057_scan_max_usec    | Maximum Proxy Latency of scan Command    | Maximum latency when the proxy executes the scan command<br>Unit: $\mu$ s    | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis058_scan_p99         | Proxy P99 Latency of scan Command        | P99 latency when the proxy executes the scan command<br>Unit: $\mu$ s        | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis059_scan_qps         | Proxy scan Command Rate                  | Rate at which the proxy executes the scan command                            | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID             | Metric Name                          | Description                                                              | Value Range       | Monitored Object              | Monitoring Period (Raw Data) |
|-----------------------|--------------------------------------|--------------------------------------------------------------------------|-------------------|-------------------------------|------------------------------|
| redis060_set_avg_usec | Average Proxy Latency of set Command | Average latency when the proxy executes the set command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis061_set_max_usec | Maximum Proxy Latency of set Command | Maximum latency when the proxy executes the set command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis062_set_p99      | Proxy P99 Latency of set Command     | P99 latency when the proxy executes the set command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis063_set_qps      | Proxy set Command Rate               | Rate at which the proxy executes the set command                         | $\geq 0$ counts/s | GeminiDB Redis instance nodes | 1 minute                     |
| redis064_get_avg_usec | Average Proxy Latency of get Command | Average latency when the proxy executes the get command<br>Unit: $\mu$ s | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |
| redis066_get_p99      | Proxy P99 Latency of get Command     | P99 latency when the proxy executes the get command<br>Unit: $\mu$ s     | $\geq 0 \mu$ s    | GeminiDB Redis instance nodes | 1 minute                     |

| Metric ID                    | Metric Name       | Description                                                                        | Value Range    | Monitored Object              | Monitoring Period (Raw Data) |
|------------------------------|-------------------|------------------------------------------------------------------------------------|----------------|-------------------------------|------------------------------|
| redis665_rsync_max_push_cost | Maximum Push Time | Maximum time required for a push operation in a collection period<br>Unit: $\mu$ s | $\geq 0 \mu$ s | GeminiDB Redis instance nodes | 1 minute                     |
| redis666_rsync_max_send_cost | Maximum Send Time | Maximum time required for a send operation in a collection period<br>Unit: $\mu$ s | $\geq 0 \mu$ s | GeminiDB Redis instance nodes | 1 minute                     |

## GeminiDB Influx Metrics

**Table 9-4** GeminiDB Influx API metrics

| Metric ID            | Metric Name               | Description                          | Value Range | Unit    | Number System | Monitored Object               | Monitoring Period (Raw Data) |
|----------------------|---------------------------|--------------------------------------|-------------|---------|---------------|--------------------------------|------------------------------|
| gemini00_1_cpu_usage | CPU Usage                 | CPU usage of the monitored system    | 0–100       | %       | N/A           | GeminiDB Influx instance node  | 1 minute                     |
| gemini00_2_mem_usage | Memory Usage              | Memory usage of the monitored system | 0–100       | %       | N/A           | GeminiDB Influx instance node  | 1 minute                     |
| gemini00_3_bytes_out | Network Output Throughput | Outgoing traffic in bytes per second | $\geq 0$    | Bytes/s | 1024(IEC)     | GeminiDB Influx instance nodes | 1 minute                     |

| Metric ID                   | Metric Name               | Description                                  | Value Range | Unit     | Number System | Monitored Object               | Monitoring Period (Raw Data) |
|-----------------------------|---------------------------|----------------------------------------------|-------------|----------|---------------|--------------------------------|------------------------------|
| gemini004_bytes_in          | Network Input Throughput  | Incoming traffic in bytes per second         | $\geq 0$    | Bytes/s  | 1024(IEC)     | GeminiDB Influx instance nodes | 1 minute                     |
| nosql005_disk_usage         | Storage Space Usage       | Storage space usage of the monitored object. | 0–100       | %        | N/A           | GeminiDB Influx instances      | 1 minute                     |
| nosql006_disk_total_size    | Total Storage Space       | Total storage space of the monitored object. | $\geq 0$    | GB       | 1024(IEC)     | GeminiDB Influx instances      | 1 minute                     |
| nosql007_disk_used_size     | Used Storage Space        | Used storage space of the monitored object.  | $\geq 0$    | GB       | 1024(IEC)     | GeminiDB Influx instances      | 1 minute                     |
| influxdb001_series_num      | Time Series               | Total number of time series                  | $\geq 0$    | Counts   | N/A           | GeminiDB Influx instance nodes | 1 minute                     |
| influxdb002_query_req_ps    | Query Requests Per Second | Number of query requests per second          | $\geq 0$    | Counts/s | N/A           | GeminiDB Influx instance nodes | 1 minute                     |
| influxdb003_write_req_ps    | Write Requests Per Second | Number of write requests per second          | $\geq 0$    | Counts/s | N/A           | GeminiDB Influx instance nodes | 1 minute                     |
| influxdb004_write_points_ps | Write Points              | Number of write points per second            | $\geq 0$    | Counts/s | N/A           | GeminiDB Influx instance nodes | 1 minute                     |

| Metric ID                         | Metric Name               | Description                         | Value Range | Unit   | Number System | Monitored Object               | Monitoring Period (Raw Data) |
|-----------------------------------|---------------------------|-------------------------------------|-------------|--------|---------------|--------------------------------|------------------------------|
| influxdb0_05_write_concurrency    | Concurrent Write Requests | Number of concurrent write requests | $\geq 0$    | Counts | N/A           | GeminiDB Influx instance nodes | 1 minute                     |
| influxdb0_06_query_concurrency    | Concurrent Queries        | Number of concurrent query requests | $\geq 0$    | Counts | N/A           | GeminiDB Influx instance nodes | 1 minute                     |
| influxdb0_10_cold_disk_usage      | Cold Storage Space Usage  | Cold storage usage of an instance   | 0–100       | %      | N/A           | GeminiDB Influx instances      | 1 minute                     |
| influxdb0_11_cold_disk_total_size | Total Cold Storage Space  | Total cold storage of an instance   | $\geq 0$    | GB     | 1024(IEC)     | GeminiDB Influx instances      | 1 minute                     |
| influxdb0_12_cold_disk_used_size  | Cold Storage Space Usage  | Used cold storage of an instance    | $\geq 0$    | GB     | 1024(IEC)     | GeminiDB Influx instances      | 1 minute                     |

## GeminiDB Cassandra Metrics

**Table 9-5** GeminiDB Cassandra API metrics

| Metric ID                 | Name                      | Description                                                                  | Value Range  | Unit     | Number System | Monitored Object                  | Monitoring Period (Raw Data) |
|---------------------------|---------------------------|------------------------------------------------------------------------------|--------------|----------|---------------|-----------------------------------|------------------------------|
| nosql005_disk_usage       | Storage Space Usage       | Storage space usage of the monitored object.                                 | 0–100        | %        | N/A           | GeminiDB Cassandra instances      | 1 minute                     |
| nosql006_disk_total_size  | Total Storage Space       | Total storage space of the monitored object.                                 | ≥ 0          | GB       | 1024(I EC)    | GeminiDB Cassandra instances      | 1 minute                     |
| nosql007_disk_used_size   | Used Storage Space        | Used storage space of the monitored object.                                  | ≥ 0          | GB       | 1024(I EC)    | GeminiDB Cassandra instances      | 1 minute                     |
| nosql009_dfv_write_delay  | Storage Write Latency     | Average delay of writing data to the storage layer in a specified period     | ≥ 0          | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| nosql010_dfv_read_delay   | Storage Read Latency      | Average latency of reading data from the storage layer in a specified period | ≥ 0          | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra001_cpu_usage    | CPU Usage                 | CPU usage of an instance                                                     | 0–100        | %        | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra002_memory_usage | Memory Usage              | Memory usage of the instance                                                 | 0–100        | %        | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra003_bytes_out    | Network Output Throughput | Outgoing traffic in bytes per second                                         | ≥ 0 Bytes /s | Bytes /s | 1024(I EC)    | GeminiDB Cassandra instance nodes | 1 minute                     |

| Metric ID                        | Name                     | Description                                                                   | Value Range | Unit     | Number System | Monitored Object                  | Monitoring Period (Raw Data) |
|----------------------------------|--------------------------|-------------------------------------------------------------------------------|-------------|----------|---------------|-----------------------------------|------------------------------|
| cassandra004_bytes_in            | Network Input Throughput | Incoming traffic in bytes per second                                          | $\geq 0$    | Bytes /s | 1024(I EC)    | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra014_connections         | Active Node Connections  | Total number of connections attempting to connect to Cassandra instance nodes | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra015_read_latency        | Average Read Latency     | Average amount of time consumed by read requests                              | $\geq 0$    | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra016_write_latency       | Average Write Latency    | Average amount of time consumed by write requests                             | $\geq 0$    | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra037_pending_write       | Suspended Write Tasks    | Number of write tasks waiting in the queue                                    | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra038_pending_read        | Suspended Read Tasks     | Number of read tasks waiting in the queue.                                    | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra044_range_slice_latency | Scan Duration            | Average time consumed by scan operations                                      | $\geq 0$    | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra049_dropped_mutation    | Dropped Writes           | Average number of dropped writes                                              | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra052_dropped_read        | Dropped Reads            | Average number of dropped reads                                               | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |

| Metric ID                        | Name                                  | Description                                  | Value Range | Unit     | Number System | Monitored Object                  | Monitoring Period (Raw Data) |
|----------------------------------|---------------------------------------|----------------------------------------------|-------------|----------|---------------|-----------------------------------|------------------------------|
| cassandra092_load_info           | Data Volume on a Node                 | Data volume on a node                        | $\geq 0$    | Byte     | 1024(1EC)     | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra093_write_count_latency | Accumulated Write Requests            | Number of write requests initiated by a node | $\geq 0$    | Counts   | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra094_write_1min_rate     | Average Write Rate in the Last Minute | Average write rate in the last minute        | $\geq 0$    | Counts/s | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra095_write_p75_latency   | p75 Write Latency                     | p75 write latency                            | $\geq 0$    | ms       | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |

| cassandra164_read_p999_latency        | p999 Read Latency                     | p999 read latency                                     | $\geq 0$       | ms     | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra165_large_partition_num      | Big Keys                              | Number of big keys on the current node                | $\geq 0$       | Counts | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra166_write_max_latency        | Maximum Write Latency                 | Maximum write latency                                 | $\geq 0$       | ms     | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra167_read_max_latency         | Maximum Read Latency                  | Maximum read latency                                  | $\geq 0$       | ms     | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra168_imbalance_table_num      | Tables with Uneven Data Distribution  | Number of tables whose data is not evenly distributed | $\geq 0$       | Counts | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra169_modify_request_size_mean | Average Write Request Size            | Average write request size                            | $\geq 0$       | Bytes  | 1024(I EC)    | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra170_query_response_size_mean | Average Query Response Size           | Average size of query requests                        | $\geq 0$ Bytes | Bytes  | 1024(I EC)    | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra173_limit_diff_count_mean    | Mean of limit Value and Returned Rows | Mean of limit difference                              | $\geq 0$       | -      | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |

| Metric ID                           | Name                                | Description                           | Value Range | Unit     | Number System | Monitored Object                  | Monitoring Period (Raw Data) |
|-------------------------------------|-------------------------------------|---------------------------------------|-------------|----------|---------------|-----------------------------------|------------------------------|
| cassandra_a174_tombstone_query_rate | Tombstone Query Requests per Second | Rate of tombstone query requests      | ≥ 0         | Counts/s | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra_a175_single_delete_rate   | Row Delete Requests per Second      | Rate at which a single row is deleted | ≥ 0         | Counts/s | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra_a176_range_delete_rate    | Range Delete Requests per Second    | Range deletion rate                   | ≥ 0         | Counts/s | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |
| cassandra_a177_large_row_count      | Large Rows per Second               | Number of large rows                  | ≥ 0         | Counts/s | N/A           | GeminiDB Cassandra instance nodes | 1 minute                     |

## Dimensions

| Key                                    | Value                                                    |
|----------------------------------------|----------------------------------------------------------|
| cassandra_cluster_id,cassandra_node_id | Cluster ID or node ID of the GeminiDB Cassandra instance |
| redis_cluster_id,redis_node_id         | Cluster ID or node ID of the GeminiDB Redis instance     |
| influxdb_cluster_id,influxdb_node_id   | Cluster ID or node ID of the GeminiDB Influx instance    |

## 9.6 Events Supported by Event Monitoring

**Table 9-6** Events Supported by Event Monitoring for GeminiDB

| Event Source | Event Name                    | Event ID                    | Event Severity | Description                                                  | Solution                                                                                                                          | Impact                        |
|--------------|-------------------------------|-----------------------------|----------------|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| NoSQL        | Instance creation failure     | NoSQL CreateInstance Failed | Major          | The instance quota or underlying resources are insufficient. | Release the instances that are no longer used and try to provision them again, or submit a service ticket to adjust the quota.    | Instances fail to be created. |
|              | Specifications change failure | NoSQL ResizeInstance Failed | Major          | The underlying resources are insufficient.                   | Submit a service ticket to ask O&M personnel to coordinate resources, and then try again.                                         | Services are interrupted.     |
|              | Node adding failure           | NoSQL AddNodesFailed        | Major          | The underlying resources are insufficient.                   | Submit a service ticket to ask O&M personnel to coordinate resources, delete the node that failed to be added, and add a new one. | None                          |
|              | Node deletion failure         | NoSQL DeleteNodesFailed     | Major          | Releasing underlying resources failed.                       | Delete the node again.                                                                                                            | None                          |

| Event Source | Event Name                          | Event ID                             | Event Severity | Description                                                                                                       | Solution                                                                                  | Impact                                   |
|--------------|-------------------------------------|--------------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|------------------------------------------|
|              | Storage space scale-up failure      | NoSQL ScaleUpStorageFailed           | Major          | The underlying resources are insufficient.                                                                        | Submit a service ticket to ask O&M personnel to coordinate resources, and then try again. | Services may be interrupted.             |
|              | Password resetting failure          | NoSQL ResetPasswordFailed            | Major          | Resetting the password times out.                                                                                 | Reset the password again.                                                                 | None                                     |
|              | Parameter template change failure   | NoSQL UpdateInstanceParamGroupFailed | Major          | Changing a parameter template times out.                                                                          | Change the parameter template again.                                                      | None                                     |
|              | Backup policy configuration failure | NoSQL SetBackupPolicyFailed          | Major          | The database connection is abnormal.                                                                              | Configure the backup policy again.                                                        | None                                     |
|              | Manual backup creation failure      | NoSQL CreateManualBackupFailed       | Major          | The backup files fail to be exported or uploaded.                                                                 | Submit a service ticket to O&M personnel.                                                 | Data cannot be backed up.                |
|              | Automated backup creation failure   | NoSQL CreateAutomatedBackupFailed    | Major          | The backup files fail to be exported or uploaded.                                                                 | Submit a service ticket to O&M personnel.                                                 | Data cannot be backed up.                |
|              | Instance status abnormal            | NoSQL FaultyDBInstance               | Major          | This event is a key alarm event and is reported when an instance is faulty due to a disaster or a server failure. | Submit a service ticket.                                                                  | The database service may be unavailable. |

| Event Source | Event Name                             | Event ID                     | Event Severity | Description                                                                                                                                           | Solution                                                                     | Impact                                   |
|--------------|----------------------------------------|------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|------------------------------------------|
|              | Instance status recovery               | NoSQL DBInstanceRecovered    | Major          | If a disaster occurs, NoSQL provides an HA tool to automatically or manually rectify the fault. After the fault is rectified, this event is reported. | No further action is required.                                               | None                                     |
|              | Node status abnormal                   | NoSQL FaultyDBNode           | Major          | This event is a key alarm event and is reported when a database node is faulty due to a disaster or a server failure.                                 | Check whether the database service is available and submit a service ticket. | The database service may be unavailable. |
|              | Node status recovery                   | NoSQL DBNodeRecovered        | Major          | If a disaster occurs, NoSQL provides an HA tool to automatically or manually rectify the fault. After the fault is rectified, this event is reported. | No further action is required.                                               | None                                     |
|              | Primary/standby switchover or failover | NoSQL PrimaryStandbySwitched | Major          | This event is reported when a primary/secondary switchover or failover is triggered.                                                                  | No further action is required.                                               | None                                     |

| Event Source | Event Name                              | Event ID      | Event Severity | Description                                                                                                                                                  | Solution                                                                                                                       | Impact                                                                                                |
|--------------|-----------------------------------------|---------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
|              | Occurrence of hotspot partitioning keys | HotKey Occurs | Major          | Hotspot data is stored in one partition because the primary key is improper. Improper application design causes frequent read and write operations on a key. | 1. Choose a proper partition key.<br>2. Add service cache so that service applications read hotspot data from the cache first. | The service request success rate is affected, and the cluster performance and stability deteriorates. |
|              | BigKey occurrence                       | BigKey Occurs | Major          | The primary key design is improper. There are too many records or too much data in a single partition, causing load imbalance on nodes.                      | 1. Choose a proper partition key.<br>2. Add a new partition key for hashing data.                                              | As more and more data is stored in the partition, cluster stability deteriorates.                     |

| Event Source | Event Name                            | Event ID                     | Event Severity | Description                                                                                                                                                                                                                       | Solution                                                                                                                                                          | Impact                                                                                 |
|--------------|---------------------------------------|------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
|              | Insufficient storage space            | NoSQL RiskyDataDiskUsage     | Major          | The storage space is insufficient.                                                                                                                                                                                                | Scale up storage space. For details, see section "Scaling Up Storage Space" in the user guide of GeminiDB.                                                        | The instance is set to read-only and data cannot be written to the instance.           |
|              | Data disk expanded and being writable | NoSQL DataDiskUsageRecovered | Major          | The data disk has been expanded and becomes writable.                                                                                                                                                                             | No further action is required.                                                                                                                                    | None                                                                                   |
|              | Index creation failure                | NoSQL CreateIndexFailed      | Major          | The service load exceeds what the instance specifications can take. In this case, creating indexes consumes more instance resources. As a result, the response is slow or even frame freezing occurs, and the creation times out. | Select matched instance specifications based on service load. Create indexes during off-peak hours. Create indexes in the background. Select indexes as required. | The index fails to be created or is incomplete. Delete the index and create a new one. |

| Event Source | Event Name               | Event ID               | Event Severity | Description                                                                                                                                                                                                       | Solution                                                                                                                                          | Impact                                            |
|--------------|--------------------------|------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
|              | Write speed decrease     | NoSQL Stalling Occurs  | Major          | The write speed is close to the maximum write speed allowed by the cluster scale and instance specifications. As a result, the database flow control mechanism is triggered, and requests may fail.               | 1. Adjust the cluster scale or node specifications based on the maximum write rate of services.<br>2. Measure the maximum write rate of services. | The success rate of service requests is affected. |
|              | Data write stopped       | NoSQL StoppingOccurs   | Major          | The data write is too fast, reaching the maximum write capability allowed by the cluster scale and instance specifications. As a result, the database flow control mechanism is triggered, and requests may fail. | 1. Change the cluster scale or node specifications based on the maximum write rate of services.<br>2. Measure the maximum write rate of services. | The success rate of service requests is affected. |
|              | Database restart failure | NoSQL Restart DBFailed | Major          | The instance status is abnormal.                                                                                                                                                                                  | Submit a service ticket to O&M personnel.                                                                                                         | The instance status may be abnormal.              |

| Event Source | Event Name                                      | Event ID                             | Event Severity | Description                                         | Solution                                                                                                                                                                 | Impact                                     |
|--------------|-------------------------------------------------|--------------------------------------|----------------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
|              | Restoration to new instance failure             | NoSQL Restore ToNewInstance Failed   | Major          | The underlying resources are insufficient.          | Submit a service ticket to ask O&M personnel to coordinate resources, and then add new nodes.                                                                            | Data cannot be restored to a new instance. |
|              | Restoration to existing instance failure        | NoSQL Restore ToExistInstance Failed | Major          | The backup file fails to be downloaded or restored. | Submit a service ticket to O&M personnel.                                                                                                                                | The current instance may be unavailable.   |
|              | Backup file deletion failure                    | NoSQL DeleteBackupFailed             | Major          | The backup files fail to be deleted from OBS.       | Delete the backup files again.                                                                                                                                           | None                                       |
|              | Failure to display slow query logs in plaintext | NoSQL SwitchSlowlog PlainTextFailed  | Major          | The DB API does not support this function.          | Refer to the <i>GeminiDB User Guide</i> to check whether that the DB API supports the display of slow query logs in plaintext. Submit a service ticket to O&M personnel. | None                                       |

| Event Source | Event Name                             | Event ID                        | Event Severity | Description                                                                                        | Solution                                                                                                  | Impact                                                 |
|--------------|----------------------------------------|---------------------------------|----------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
|              | EIP binding failure                    | NoSQL BindEip Failed            | Major          | The node status is abnormal, an EIP has been bound to the node, or the EIP to be bound is invalid. | Check whether the node is normal and whether the EIP is valid.                                            | The instance cannot be accessed from a public network. |
|              | EIP unbinding failure                  | NoSQL Unbind EipFailed          | Major          | The node status is abnormal or the EIP has been unbound from the node.                             | Check whether the node and EIP status are normal.                                                         | None                                                   |
|              | Parameter modification failure         | NoSQL Modify ParameterFailed    | Major          | The parameter value is invalid.                                                                    | Check whether the parameter value is within the valid range and submit a service ticket to O&M personnel. | None                                                   |
|              | Parameter template application failure | NoSQL ApplyParameterGroupFailed | Major          | The instance status is abnormal. So, the parameter template cannot be applied.                     | Submit a service ticket to O&M personnel.                                                                 | None                                                   |
|              | Enabling or disabling SSL failure      | NoSQL SwitchSSLFailed           | Major          | Enabling or disabling SSL times out.                                                               | Try again or submit a service ticket. Do not change the connection mode.                                  | The SSL connection mode cannot be changed.             |

| Event Source | Event Name                    | Event ID       | Event Severity | Description                                                                                     | Solution                                                                                                                                                                                                         | Impact                                                                                                          |
|--------------|-------------------------------|----------------|----------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
|              | Too much data in a single row | LargeRowOccurs | Major          | If there is too much data in a single row, queries may time out, causing faults like OOM error. | 1. Limit the write length of each column and row so that the key and value length of each row does not exceed the preset threshold.<br>2. Check whether there are abnormal writes or coding, causing large rows. | If there are too many records in a single row, cluster stability will deteriorate as the data volume increases. |

# A Change History

| Released On | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
