For more historical notices, see **Product Bulletin** and **Vulnerability Notices**.

2 Product Bulletin

2.1 Product Change Notices

Support for containerd

Released: Dec 16, 2022

Kubernetes community has removed dockershim from clusters of version 1.24, in which Docker runtime is no longer supported. Starting from version 1.23, CCE clusters allow you to use containerd as the runtime. CCE is still compatible with Docker by now, but will remove the support for Docker in clusters of version 1.27. You are advised to use containerd when creating a node and change the runtime of existing nodes to containerd.

For details about the differences between containerd and Docker, see **Container Engine**.

Service Account Token Security Improvement

Released: Nov 24, 2022

In Kubernetes clusters v1.21 or later, pods will not automatically mount permanent tokens. You can obtain tokens using **TokenRequest** API and mount them to the pod using the projected volume.

Such tokens are valid for a fixed period (one hour by default). Before expiration, kubelet refreshes the tokens to ensure that the pods always use valid tokens. This feature is enabled by default in Kubernetes clusters v1.21 and later. If you use a Kubernetes client of a to-be-outdated version, the certificate reloading may fail.

For details, see **Service Account Token Security Improvement**.

Upgrading Helm V2 to Helm V3

Released: Aug 30, 2022

The open source Helm on which the charts in the CCE console depend has upgraded from V2 to V3. From now on, CCE will automatically convert Helm V2

releases in your clusters to Helm V3 ones. Some Helm V2 functions have better implementations in Helm V3, but may be incompatible with the original ones. You need to check the differences between Helm V3 and Helm V2 and perform adaptation verification as described in **Differences Between Helm v2 and Helm v3 and Adaptation Solutions**.

If switching to Helm V3 is hard for now, you can manage and deploy Helm V2 releases through the Helm client in the background. For details, see **Deploying an Application Through the Helm v2 Client**. To better run your services deployed in CCE with sufficient O&M support, you are advised to switch to the Helm V3 before **December 30, 2022**.

Optimized Key Authentication of everest Add-On

Released: Feb 2, 2021

In **version 1.2.0** of the everest add-on, **key authentication** is optimized when OBS is used. After the everest add-on is upgraded from a version earlier than 1.2.0 to 1.2.0 or later, you need to restart all workloads that use OBS in the cluster. Otherwise, workloads may not be able to use OBS.

2.2 Release Notes for Cluster Version

End of Maintenance for Clusters of Version 1.19

Released: Aug 2, 2023

Huawei Cloud CCE clusters of version 1.19 will be end of maintenance (EOM) on September 30, 2023, 09:00 GMT+08:00. After the version EOM, Huawei Cloud does not support the creation of new clusters or provide technical support for the CCE clusters of version 1.19 and earlier versions. Upgrade your CCE clusters to the latest commercial version. For details about how to upgrade a cluster, see **Upgrade Overview**. For details about the CCE cluster versions, see **Kubernetes Version Policy**.

End of Maintenance for Clusters of Version 1.17

Released: Nov 29, 2022

According to **Kubernetes Version Policy**, CCE clusters of version 1.17 will be end of maintenance on **January 31, 2023**. You can still run clusters of version 1.17, but CCE will no longer provide support for this version, including release of new functions, community bug fixes, vulnerability management, and upgrade. You are advised to upgrade the cluster to the latest version before the version support is removed.

End of Maintenance for Clusters of Version 1.15

Released: Jun 22, 2022

According to **Kubernetes Version Policy**, CCE clusters of version 1.15 will be end of maintenance on **September 30, 2022**. You are advised to upgrade the cluster to the latest version.

End of Maintenance for Clusters of Version 1.13

Released: Mar 11, 2022

According to **Kubernetes Version Policy**, CCE clusters of version 1.13 will be end of maintenance on **March 11, 2022**. You are advised to upgrade the cluster to the latest version.

Removing Support for Creating CCE Clusters of Version 1.13 and Earlier

Released: Dec 8, 2020

According to **Kubernetes Version Policy**, CCE will not allow for creating clusters of version 1.13 or earlier from **March 1, 2021**, but will continue to maintain Kubernetes clusters of version 1.13.

Upgrading Kubernetes Clusters of Version 1.9

Released: Dec 7, 2020

According to **Kubernetes Version Policy**, CCE Kubernetes clusters of version 1.9 will be end of maintenance recently. If you are using clusters of version 1.9.7 or 1.9.10, you are advised to upgrade your clusters to a later version before **April 30, 2021**. If not, these clusters cannot be upgraded anymore.

3 Vulnerability Notices

3.1 Vulnerability Fixing Policies

Cluster Vulnerability Fixing SLA

- High-risk vulnerabilities:
  - CCE fixes vulnerabilities within one month after the Kubernetes community detects them and releases fixing solutions. The fixing policies are the same as those of the community.
  - Emergency vulnerabilities of the operating system are released according to the operating system fixing policies and procedure. Generally, a fixing solution is provided within one month, and you need to fix the vulnerabilities by yourself.
- Other vulnerabilities:

  Other vulnerabilities can be fixed through a normal upgrade.

Statement

To prevent customers from being exposed to unexpected risks, CCE does not provide other information about the vulnerability except the vulnerability background, details, technical analysis, affected functions/versions/scenarios, solutions, and reference information.

In addition, CCE provides the same information for all customers to protect all customers equally. CCE will not notify individual customers in advance.

CCE does not develop or release exploitable intrusive code (or code for verification) using the vulnerabilities in the product.

3.2 Notice on the Kubernetes Security Vulnerability (CVE-2022-3172)

Description

Kubernetes community detected a security issue in kube-apiserver. This issue allows the aggregated API server to redirect client traffic to any URL, which may cause the client to perform unexpected operations and forward the client's API server credentials to a third party.

Table 3-1 Vulnerability information

Type	CVE-ID	Severity	Discovered
SSRF	CVE-2022-3172	Medium	2022-09-09

Impact

Affected versions:

- kube-apiserver ≤ v1.23.10

CCE clusters of the preceding versions configured with the aggregated API server will be affected, especially for CCE clusters with logical multi-tenancy.

Identification Method

For CCE clusters and CCE Turbo clusters of version 1.23 or earlier, kubectl to connect to the clusters. Run the following command to check whether the aggregated API server is running:

```
kubectl get apiservices.apiregistration.k8s.io -o=jsonpath='{range .items[?(@.spec.service)]}{.metadata.name}{"\n"}{end}'
```

If the returned value is not empty, the aggregated API server exists.

Solution

Upgrades are the currently available solution. The cluster administrator must control permissions to prevent untrusted personnel from deploying and controlling the aggregated API server through the API service interface.

This vulnerability has been fixed in CCE clusters of v1.23.5-r0, v1.21.7-r0, and v1.19.16-r4.

Helpful Links

https://github.com/kubernetes/kubernetes/issues/112513

3.3 Privilege Escalation Vulnerability in Linux Kernel openvswitch Module (CVE-2022-2639)

Description

Details about the privilege escalation vulnerability in the Linux Kernel openvswitch module (CVE-2022-2639) are disclosed. The **reserve_sfa_size()** function in this module has a defect. As a result, a local user can exploit this vulnerability to escalate their privileges on the system. The POC of this vulnerability has been disclosed, and the risk is high.

Table 3-2 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2022-2639	High	2022-09-01

Impact

1. CCE clusters that use the container tunnel network model; node OS images that use EulerOS 2.9;

2. Node OS images that use Ubuntu

Cluster nodes running EulerOS 2.5 and CentOS 7.6 **are not affected by this vulnerability**.

Solution

1. If a process in a container is started by a non-root user, you can configure seccomp, the security computing mode, for the workload. You are advised to use the RuntimeDefault mode or disable system calls such as unshare. For details about the configuration, see **Restrict a Container's Syscalls with seccomp**.
2. Ubuntu images are embedded with the openvswitch kernel module. You can disable the loading of this module to avoid this problem. The procedure is as follows:
   ```
   echo "blacklist openvswitch" >>/etc/modprobe.d/blacklist.conf
   ```
   Then, restart the node for the settings to take effect.

https://github.com/torvalds/linux/commit/cefa91b2332d7009bc0be5d951d6cbbf349f90f8

3.4 Notice on nginx-ingress Add-On Security Vulnerability (CVE-2021-25748)

Description

The Kubernetes community disclosed an ingress-nginx vulnerability. Users can obtain the credentials used by ingress-controller through the **spec.rules[].http.paths[].path** field of the ingress object. The credentials can be used to obtain the secrets of all namespaces in the cluster. This vulnerability has been assigned CVE-2021-25748.

Table 3-3 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2021-25748	Medium	2022-06-10

Impact

Users who have the permissions to create or update the **spec.rules[].http.paths[].path** field in the ingress can use a newline character to bypass the sanitization of the field to obtain the credentials of the ingress controller, with which the users can access the secrets of all namespaces in the cluster.

Identification Method

For CCE clusters of version 1.23 or earlier:

1. If you install your own nginx-ingress, check whether its image tag is earlier than 1.2.1.

2. If you use the nginx-ingress add-on provided by CCE, check whether the version is earlier than or equal to 2.1.0.

Solution

1. Upgrade ingress-nginx to version 1.2.1.

2. If you are running the "chrooted" ingress-nginx controller introduced in version 1.2.0 (gcr.io/Kubernetes-staging-ingress-nginx/controller-chroot), no action is required.

Helpful Links

1. CVE-2021-25748: **https://github.com/kubernetes/ingress-nginx/issues/8686**
2. Fixed version released by the community: **https://github.com/kubernetes/ingress-nginx/releases/tag/controller-v1.2.1**

3.5 Notice on nginx-ingress Security Vulnerabilities (CVE-2021-25745 and CVE-2021-25746)

Description

The Kubernetes open source community has disclosed two nginx-ingress vulnerabilities:

1. CVE-2021-25745: When creating or updating an ingress, a user who has permissions can use the **spec.rules[].http.paths[].path** field to obtain the credentials of the ingress controller. The credentials can be used to obtain the secrets of all namespaces in the cluster.

2. CVE-2021-25746: When creating or updating an ingress, a user who has permissions can use the **.metadata.annotations** field to obtain the credentials used by the ingress controller. The credentials can be used to obtain the secrets of all namespaces in the cluster.

Table 3-4 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2021-25745	Medium	2022-04-16
Privilege escalation	CVE-2021-25746	Medium	2022-04-16

Impact

These vulnerabilities affect multi-tenant CCE clusters where common users have permissions to create ingresses.

Identification Method

For CCE clusters of version 1.23 or earlier:

1. If you install your own nginx-ingress, check whether its image tag is earlier than 1.2.0.

2. If you use the nginx-ingress add-on provided by CCE, check whether the version is earlier than 2.1.0.

Solution

1. For CVE-2021-25745: Implement an admission policy to restrict the **spec.rules[].http.paths[].path** field in **networking.k8s.io/Ingress** to known safe characters (see the latest **rules** in the Kubernetes community or use the suggested value in **annotation-value-word-blocklist**).

2. For CVE-2021-25746: Implement an admission policy to restrict the **metadata.annotations** values to known safe characters (see the latest **rules** in

the Kubernetes community or use the suggested value in **annotation-value-word-blocklist**).

Helpful Links

1. CVE-2021-25745: **https://github.com/kubernetes/ingress-nginx/issues/8502**
2. CVE-2021-25746: **https://github.com/kubernetes/ingress-nginx/issues/8503**
3. Fixed version released by the community: **https://github.com/kubernetes/ingress-nginx/releases/tag/controller-v1.2.0**

3.6 Notice on the containerd Process Privilege Escalation Vulnerability (CVE-2022-24769)

Description

A security vulnerability has been disclosed in the containerd open source community. When non-root containers were started incorrectly with non-empty inheritable capabilities, attacker may gain access to programs with inheritable file capabilities to elevate those capabilities to the permitted set during execve. This vulnerability has been assigned CVE-2022-24769.

Table 3-5 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2022-24769	Low	2022-03-24

Impact

When a container is created using containerd, Linux process capabilities are included in the inheritable set by default. As a result, when execve() runs in a process in the container by a non-root user, the intersection of the process inheritable capabilities and the file inheritable capabilities is added to the permitted set of the process after execution, causing unexpected privilege escalation. It should be noted that the privilege escalation does not break through the process permission before execve, but only inherits the previous capabilities.

Clusters that use the following containerd versions are affected:

1. CCE Turbo clusters that use the containerd of a version earlier than 1.4.1-98 as the Kubernetes CRI runtime

2. CCE clusters that use the containerd of a version earlier than 1.5.11

Identification Method

View the containerd version by running the **containerd --version** command on a worker node as the root user.

Solution

The entry point of a container can be modified to use the capsh utility to remove inheritable capabilities.

Helpful Links

Community announcement: **https://github.com/containerd/containerd/security/advisories/GHSA-c9cp-9c75-9v8c**

3.7 Notice on CRI-O Container Runtime Engine Arbitrary Code Execution Vulnerability (CVE-2022-0811)

Description

A security vulnerability in CRI-O 1.19 was found by the crowdstrike security team. Attackers can exploit this vulnerability to bypass protection and set arbitrary kernel parameters on the host. As a result, any user with permissions to deploy a pod on a Kubernetes cluster that uses CRI-O runtime can abuse the **kernel.core_pattern** kernel parameter to achieve container escape and arbitrary code execution as root on any node in the cluster.

This vulnerability has been assigned CVE-2022-0811.

Table 3-6 Vulnerability information

Type	CVE-ID	Severity	Discovered
Container escape	CVE-2022-0811	High	2021-03-16

Impact

This vulnerability affects Kubernetes clusters that use CRI-O of versions later than 1.19. The involved patch versions include 1.19.6, 1.20.7, 1.21.6, 1.22.3, 1.23.2, and 1.24.0.

CCE clusters are not affected by this vulnerability because they do not use CRI-O.

Solution

1. For CRI-O v1.19 and v1.20, set **manage_ns_lifecycle** to **false**, and use Open Container Initiative (OCI) runtimes to configure sysctls.
2. Create a PodSecurityPolicy and set all sysctls to **false**.
3. Upgrade the CRI-O version in a timely manner.

Helpful Links

1. Red Hat community vulnerability notice: **https://access.redhat.com/security/cve/cve-2022-0811**

2. cr8escape: New Vulnerability in CRI-O Container Engine Discovered by CrowdStrike: **https://www.crowdstrike.com/blog/cr8escape-new-vulnerability-discovered-in-cri-o-container-engine-cve-2022-0811/**

3.8 Notice on the Container Escape Vulnerability Caused by the Linux Kernel (CVE-2022-0492)

Description

In some scenarios, the release_agent feature of the Linux kernel's cgroup v1 can be used to escape from the container to OS. This vulnerability has been assigned CVE-2022-0492.

Table 3-7 Vulnerability information

Type	CVE-ID	Severity	Discovered
Container escape	CVE-2022-0492	High	2021-02-07

Impact

The Linux kernel does not check whether the process is authorized to configure the **release_agent** file. On an affected node, workload processes are executed as user **root** (or the user with the **CAP_SYS_ADMIN** permission), and **seccomp** is not configured.

CCE clusters are affected by this vulnerability in the following aspects:

1. For x86 nodes, EulerOS 2.5 and CentOS images are not affected by this vulnerability.
2. EulerOS (Arm) whose kernel version is earlier than 4.19.36-vhulk1907.1.0.h962.eulerosv2r8.aarch64 is affected by this vulnerability.
3. EulerOS (x86) whose kernel version is earlier than 4.18.0-147.5.1.6.h541.eulerosv2r9.x86_64 is affected by this vulnerability.
4. Ubuntu nodes whose kernel version is 4.15.0-136-generic or earlier is affected by this vulnerability.

Solution

1. A fix version has been provided for EulerOS 2.9 images. Migrate to the 4.18.0-147.5.1.6.h541.eulerosv2r9.x86_64 nodes as soon as possible.
2. Configure **seccomp** for workloads to restrict unshare system calls. For details, see **Kubernetes documentation**.
3. Restrict the process permissions in a container and minimize the process permissions in the container. For example, use a non-root user to start processes and use the **capability** mechanism to refine the process permissions.

Helpful Links

1. Kernel repair commit: **https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/commit/?id=24f6008564183aa120d07c03d9289519c2fe02af**
2. Red Hat community vulnerability notice: **https://access.redhat.com/security/cve/cve-2022-0492**

3.9 Notice on the Non-Security Handling Vulnerability of containerd Image Volumes (CVE-2022-23648)

Description

A vulnerability has been disclosed in the containerd open source community. If an image has malicious attributes, processes in the container may access read-only copies of arbitrary files and directories on the host, causing sensitive information leakage on the host.

Table 3-8 Vulnerability information

Type	CVE-ID	Severity	Discovered
Container escape	CVE-2022-23648	Medium	2022-02-28

Impact

Containers launched with a specially-crafted image configuration could gain access to read-only copies of arbitrary files and directories on the host. This may expose potentially sensitive information.

The impact of this vulnerability is as follows:

1. containerd is used as the Kubernetes CRI runtime, and malicious images from unknown sources are used. This vulnerability is not involved when Docker is used as CRI.
2. The containerd version is earlier than 1.4.1-96.

Identification Method

On the new CCE console, check the value of **Runtime Version** on the **Nodes** page of the CCE Turbo cluster. If the containerd runtime is used and its version is earlier than 1.4.1-96, the vulnerability is involved.

Solution

1. Use trusted images, not third-party images from unknown sources. SoftWare Repository for Container (SWR) is recommended.
2. Migrate pods to nodes running a containerd version later than 1.4.1-96 (already available on the CCE console)

Helpful Links

A patch has been released in the community. For details, see **https://github.com/containerd/containerd/security/advisories/GHSA-crp2-qrr5-8pq7**

3.10 Linux Kernel Integer Overflow Vulnerability (CVE-2022-0185)

Description

William Liu and Jamie Hill-Daniel discovered an integer underflow vulnerability in the Linux kernel, which may lead to out-of-bounds writes. A local attacker can use this vulnerability to cause a denial of service (system crash) or execute arbitrary code. In a container scenario, a user with the CAP_SYS_ADMIN permission can escape from the container to the host machine. The vulnerability POC already exists, but no disclosed exploit code is found.

Table 3-9 Vulnerability information

Type	CVE-ID	Severity	Discovered
Resource management flaw	CVE-2022-0185	High	2022-01-27

Impact

In a container scenario, users have the CAP_SYS_ADMIN permission, and the kernel version is 5.1 or later. In a standard Docker environment, the Docker seccomp filter is used. Therefore, the system is not affected by this vulnerability by default. In the Kubernetes scenario, the seccomp filter is disabled by default. The system is affected by this vulnerability if the kernel and permission conditions are met.

The CCE is not affected by this vulnerability.

Identification Method

Run the **uname -a** command to view the kernel version.

Workarounds and Mitigation Measures

CCE clusters are not affected by this vulnerability. For a Kubernetes cluster, you are advised to:

1. Run containers with the least privilege.
2. Configure **seccomp** based on the configuration method provided by Kubernetes.

https://www.openwall.com/lists/oss-security/2022/01/18/7

3.11 Linux Polkit Privilege Escalation Vulnerability (CVE-2021-4034)

Description

A security research team disclosed a privilege escalation vulnerability (CVE-2021-4034, also dubbed PwnKit) in PolKit's pkexec. Unprivileged users can gain full root privileges on a vulnerable host by exploiting this vulnerability in its default configuration. Currently, the POC/EXP of this vulnerability has been disclosed, and the risk is high.

Polkit (formerly PolicyKit) is a component for controlling system-wide privileges in Unix-like operating systems. pkexec is a part of the Polkit framework. It executes commands with elevated permissions and is an alternative to Sudo. If you are a Polkit user, check your Polkit version and implement timely security hardening.

Reference: **https://www.qualys.com/2022/01/25/cve-2021-4034/pwnkit.txt**

Table 3-10 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2021-4034	High	2022-01-28

Impact

Affected versions: all mainstream Linux versions

Secure versions: View the security bulletins of Linux vendors.

Solution

1. Linux vendors, such as Red Hat, Ubuntu, Debian, and SUSE, have released patches to fix this vulnerability. Upgrade your Linux OS to a secure version. If you are unable to update it in a timely manner, you can mitigate the risk by referring to the official suggestions provided by these vendors.

   RedHat, Ubuntu: **USN-5252-1**, **USN-5252-2**; **Debian**, **SUSE**
2. EulerOS has released a patch. You only need to upgrade the polkit package (.rpm).

The upgrade method is as follows:

a. yum clean all
b. yum makecache
c. yum update polkit
d. rpm -qa | grep polkit

Check whether the OS has been upgraded to the corresponding version.

- EulerOS 2.10: polkit-0.116-6.h4
- EulerOS 2.9: polkit-0.116-5.h7
- EulerOS 2.8: polkit-0.115-2.h14
- EulerOS 2.5: polkit-0.112-14.h15

3. If no patch is available in your system, run the **# chmod 0755 /usr/bin/pkexec** command to delete SUID-bit from pkexec.

Before fixing vulnerabilities, back up your files and conduct a thorough test.

3.12 Notice on the Vulnerability of Kubernetes subPath Symlink Exchange (CVE-2021-25741)

Description

A security issue was spotted in Kubernetes where a user may be able to create a container with a subPath volume mounted to access files and directories outside of the volume, including those on the host file system.

When a container uses subPath to mount some files or directories, attackers may use Symlink Exchange to access directories other than the mount directory or files on the host, causing unauthorized operations.

Table 3-11 Vulnerability information

Type	CVE-ID	Severity	Discovered
Resource management flaw	CVE-2021-25741	Medium	2021-09-15

Impact

This vulnerability affects the scenario where VolumeSubpath is enabled (enabled by default). It may have the following impacts:

- If a malicious user creates a container with a subPath volume mounted, the user can access files and directories outside the volume, including those on the host file system.
- Clusters for which the cluster administrator has restricted the ability to create hostPath mounts are most severely affected. An attacker can exploit this

vulnerability to perform access similar to hostPath without using the hostPath function, thereby bypassing the restriction.

- In the default Kubernetes environment, vulnerability exploitation can be used to mask the abuse of granted privileges.

Identification Method

All clusters are affected by this vulnerability.

Log in to the node and run the following command to check BuildDate. If BuildDate is later than August 20, 2021, the vulnerability has been fixed and the system is not affected by the vulnerability.

```
[root@prometheus-38892-wsb84 ~]# kubelet --version=raw
version.Info{Major:"1", Minor:"19+", GitVersion:"v1.19.10-r1.0.0-source-121-gb9675686c54267", GitCommit:"b9675686
c54267276a35579d4921c91be3d226f2", GitTreeState:"clean", BuildDate:"2021-09-03T09:35:06Z", GoVersion:"go1.15.7",
Compiler:"gc", Platform:"linux/amd64"}
```

Solution

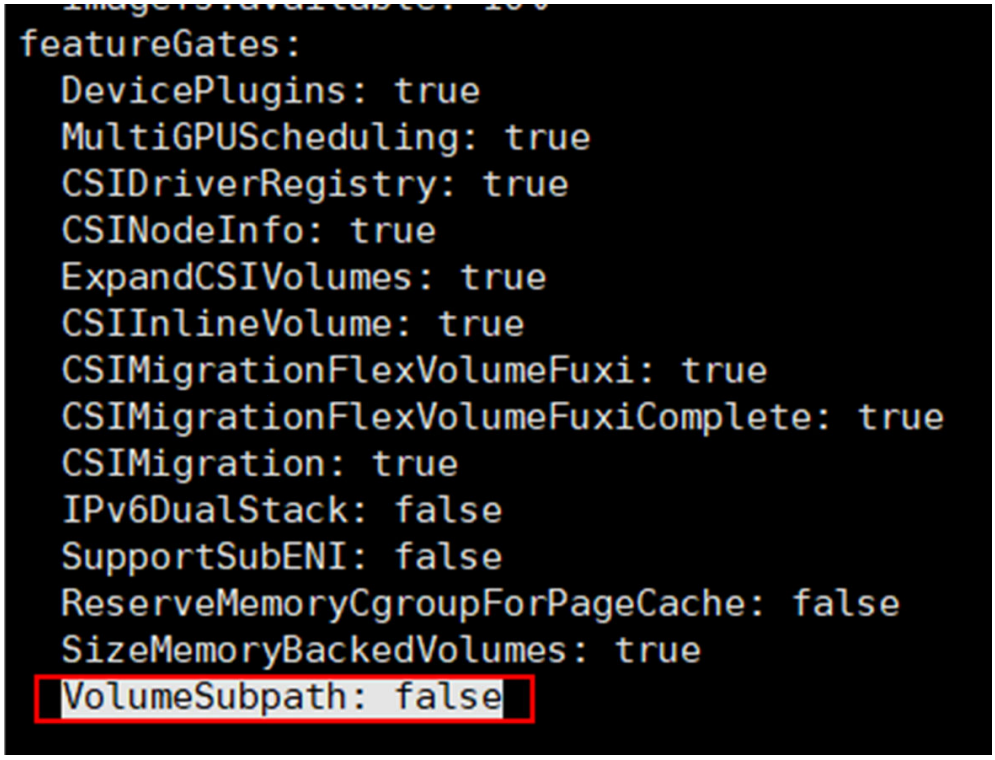
You can disable VolumeSubpath feature gate on kubelet and delete any existing pods that use the subPath function.

Step 1 Log in to each CCE node as user **root**.

Step 2 Modify the kubelet configuration parameter to disable the VolumeSubpath feature.

vi /opt/cloud/cce/kubernetes/kubelet/kubelet_config.yaml

Add the **VolumeSubpath: false** field.



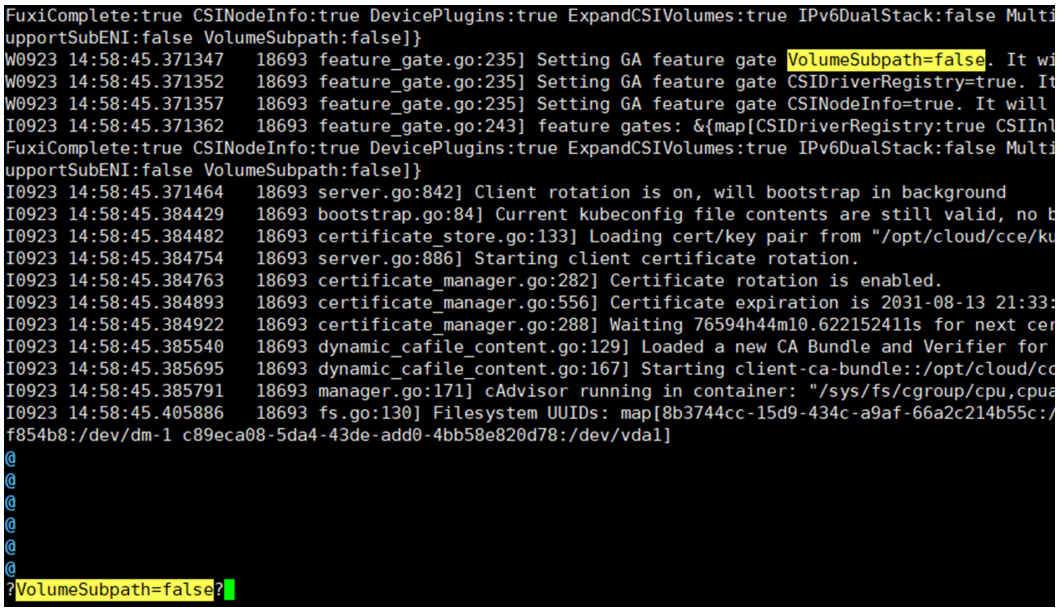
Step 3 Restart kubelet.

systemctl restart kubelet

Step 4 Ensure that the new kubelet process is started and VolumeSubpath is disabled.

vi /var/paas/sys/log/kubernetes/kubelet.log

Search for **VolumeSubpath=false**. If it can be found, the function is successfully disabled.



Step 5 Delete any pod that uses the subPath function.

----End

Enabling or Rolling Back the VolumeSubpath Feature

Step 1 Modify the kubelet configuration file and delete the **VolumeSubpath** field.

vi /opt/cloud/cce/kubernetes/kubelet/kubelet_config.yaml

Step 2 Restart kubelet.

systemctl restart kubelet

Step 3 Check that the new kubelet process is started and the **kubelet.log** file does not contain **VolumeSubpath=false**.

----End

3.13 Notice on runC Vulnerability that Allows a Container Filesystem Breakout via Directory Traversal (CVE-2021-30465)

Description

runC is vulnerable to a symlink exchange attack whereby an attacker can request a seemingly-innocuous pod configuration that actually results in the host filesystem being bind-mounted into the container (allowing for a container escape). CVE-2021-30465 has been assigned for this vulnerability. The details and POC of this vulnerability have been disclosed and the risk is high.

Table 3-12 Vulnerability information

Type	CVE-ID	Severity	Discovered
Container escape	CVE-2021-30465	High	2021-05-31

Impact

An attacker can create a malicious pod, mount the host directory to the container, and exploit a runC symlink and race condition vulnerability, allowing container escape and host filesystem access.

CCE clusters earlier than v1.17 (excluding 1.17) involve this vulnerability. For existing CCE clusters of v1.17, v1.19, and v1.21, check the runC version on the node.

Solution

- Restrict untrusted users from creating workloads, especially configuring volume mounting parameters.
- Restrict the permissions of the container.
  - Use a non-root user.
  - Use capabilities to restrict the privileges of containers, such as CAP_DAC_OVERRIDE, CAP_DAC_READ_SEARCH, and CAP_SYS_ADMIN.
  - Use seccomp to restrict the attacker's system call permissions on the host kernel. For details, see **Restrict a Container's Syscalls with Seccomp**.

This vulnerability has been fixed for new nodes in CCE.

You can create a node and set the old node to be unschedulable. After all pods on the old node are scheduled to the new node, delete or reset the old node.

3.14 Notice on the Docker Resource Management Vulnerability (CVE-2021-21285)

Description

Docker is an open source application container engine. It allows you to create containers (lightweight VMs) on Linux and use configuration files for automatic installation, deployment, running, and upgrade of applications. Docker versions earlier than 19.03.15 and 20.10.3 have a resource management error that may be exploited by attackers to crash the Docker daemon (dockerd).

Table 3-13 Vulnerability information

Type	CVE-ID	Severity	Discovered
Resource management flaw	CVE-2021-21285	Medium	2021-02-02

Impact

The Docker daemon does not verify the digest at the image layer during image pull.

This vulnerability may be triggered in the following scenarios:

- Manually run **docker pull** on a node in the cluster to pull a maliciously damaged image.
- kubelet automatically pulls a maliciously damaged image defined in the workload template during workload deployment.

The impact of this vulnerability is as follows:

- If an image is maliciously damaged, pulling it may crash the docker daemon.
- If you use Huawei Cloud SWR and your images are obtained from SWR, digest verification will be performed on the image uploaded to the image repository, and the Docker daemon will not be affected.
- This vulnerability does not affect the running containers.

Identification Method

1. For EulerOS or CentOS nodes, run the following command to check the security package version:
   ```
   rpm -qa |grep docker
   ```
2. For a node running on EulerOS or CentOS, if the Docker version is earlier than **18.09.0.100.51.h10.51.h3-1.h15.eulerosv2r7**, the Docker package will be affected by this vulnerability.
3. For nodes that use other OSs, such as Ubuntu, you can run the **docker version** command to view the Docker version. If the version is earlier than 19.03.15 and 20.10.3, this vulnerability is involved.

Solution

Do not use images from unknown sources. You are advised to use SoftWare Repository for Container (SWR).

Helpful Links

The vendors have released an upgrade patch to fix the vulnerability. To obtain the patch, visit **https://github.com/moby/moby/commit/8d3179546e79065adefa67cc697c09d0ab137d30**

3.15 Notice on the NVIDIA GPU Driver Vulnerability (CVE-2021-1056)

Description

NVIDIA detected a vulnerability (assigned CVE-2021-1056), which exists in the NVIDIA GPU drivers and is related to device isolation. When a container is started in the non-privileged mode, an attacker can exploit this vulnerability to create a special character device file in the container to obtain the access permission of all GPU devices on the host machine.

For more information about this vulnerability, see **CVE-2021-1056**.

According to the official NVIDIA announcement, if your CCE cluster has a GPU-enabled node (ECS) and uses the recommended NVIDIA GPU driver (Tesla 396.37), your NVIDIA driver is not affected by this vulnerability. If you have installed or updated the NVIDIA GPU driver on your node, this vulnerability may be involved.

Table 3-14 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2021-1056	Medium	2021-01-07

Impact

According to the vulnerability notice provided by NVIDIA, the affected NVIDIA GPU driver versions are as follows:

CVE IDs Addressed	Software Product	Operating System	Driver Branch	Affected Versions	Updated Driver Version
CVE-2021-1052 CVE-2021-1053	GeForce	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	NVIDIA RTX/Quadro, NVS	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	Tesla	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
CVE-2021-1056	GeForce	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	NVIDIA RTX/Quadro, NVS	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
			R390	All version prior to 390.141	390.141
	Tesla	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
			R418	All versions prior to 418.181.07	418.181.07

For more information, see the **official NVIDIA website**.

Note:

- The NVIDIA GPU driver version recommended for CCE clusters and the gpu-beta add-on has not yet been listed in the affected versions disclosed on the NVIDIA official website. If there are official updates, you will be notified and provided possible solutions to fix this vulnerability.
- If you have selected a custom NVIDIA GPU driver version or updated the GPU driver on the node, check whether your GPU driver is affected by this vulnerability by referring to the preceding table.

Querying the NVIDIA Driver Version of a GPU Node

Log in to your GPU node and run the following command to view the driver version.

```
[root@XXX36 bin]# ./nvidia-smi
Fri Apr 16 10:28:28 2021
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 460.32.03    Driver Version: 460.32.03    CUDA Version: 11.2     |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |
| Fan  Temp  Perf  Pwr:Usage/Cap|         Memory-Usage | GPU-Util  Compute M. |
|                               |                      |               MIG M. |
|===============================+======================+======================|
|   0  Tesla T4            Off  | 00000000:21:01.0 Off |                    0 |
| N/A   68C    P0    31W /  70W |      0MiB / 15109MiB |      0%      Default |
|                               |                      |                  N/A |
+-------------------------------+----------------------+----------------------+

+-----------------------------------------------------------------------------+
| Processes:                                                                  |
|  GPU   GI   CI        PID   Type   Process name                  GPU Memory |
|        ID   ID                                                   Usage      |
|=============================================================================|
|  No running processes found                                                 |
+-----------------------------------------------------------------------------+
```

The preceding command output indicates that the GPU driver version of the node is 460.32.03.

Solution

Upgrade the node to the target driver version based on the **Impact**.

NOTE

After upgrading your NVIDIA GPU driver, you need to restart the GPU node, which will temporarily affect your services.

- If your node driver version belongs to 418 series, upgrade it to 418.181.07.
- If your node driver version belongs to 450 series, upgrade it to 450.102.04.
- If your node driver version belongs to 460 series, upgrade it to 460.32.03.

If you upgrade the GPU driver of a CCE cluster node, upgrade or reinstall the gpu-beta add-on, and enter the download address of the repaired NVIDIA GPU driver when installing the add-on.

3.16 Notice on the Sudo Buffer Vulnerability (CVE-2021-3156)

Description

A security team disclosed the heap-based buffer overflow vulnerability in sudo (CVE-2021-3156), a near-ubiquitous utility available on major Unix-like operating systems. All legacy versions from 1.8.2 to 1.8.31p2 and all stable versions from 1.9.0 to 1.9.5p1 are affected. Any unprivileged user can gain root privileges on a vulnerable host using a default sudo configuration by exploiting this vulnerability.

sudo is a powerful utility included in most if not all Unix- and Linux-based OSs. It allows users to run programs with the security privileges of another user.

Table 3-15 Vulnerability information

Type	CVE-ID	Severity	Discovered
Privilege escalation	CVE-2021-3156	High	2021-01-26

Impact

- All legacy versions from 1.8.2 to 1.8.31p2 (default configuration)
- All stable versions from 1.9.0 to 1.9.5p1 (default configuration)

Identification Method

1. Log in to the system as a non-root user.
2. Run the **sudoedit -s /** command to scan the vulnerability.
   - If the system is vulnerable, it will respond with an error that starts with **sudoedit:**.
   - If the system is patched, it will respond with an error that starts with **usage:**.

Solution

Upgrade sudo to a secure version and perform a self-check before the upgrade.

- For CentOS: upgrade to sudo 1.9.5p2 or later

  For more versions of sudo, see **https://www.sudo.ws/download.html**.
- For EulerOS: obtain the sudo patch package
  - EulerOS 2.2: **https://mirrors.huaweicloud.com/euler/2.2/os/x86_64/updates/sudo-1.8.6p7-23.h9.x86_64.rpm**
  - EulerOS 2.5: **https://mirrors.huaweicloud.com/euler/2.5/os/x86_64/updates/sudo-1.8.19p2-14.h9.eulerosv2r7.x86_64.rpm**
  - EulerOS 2.8: **https://mirrors.huaweicloud.com/euler/2.8/os/aarch64/updates/sudo-1.8.23-3.h18.eulerosv2r8.aarch64.rpm**

3.17 Notice on the Kubernetes Security Vulnerability (CVE-2020-8554)

Description

CVE-2020-8554 is a man-in-the-middle (MITM) vulnerability that exists in every version of Kubernetes with the most significant impact on multi-tenant clusters. A potential attacker who has the permissions to create and update Services and pods is able to intercept traffic from other pods or nodes in the cluster. By setting the **spec.externalIPs** field of a Service, a potential attacker can intercept the traffic of other pods or nodes that access this externalIP (for example, a well-known public IP address) and forward the traffic to a malicious pod created by the attacker, causing a man-in-the-middle attack. For Services, attackers can initiate MITM attacks by modifying the **status.loadBalancer.ingress.ip** field.

Table 3-16 Vulnerability information

Type	CVE-ID	Severity	Discovered
Traffic interception	CVE-2020-8554	Medium	2020-12-07

Impact

Multi-tenant clusters;

Clusters of all Kubernetes versions

Solution

You are advised to check all Services that use externalIP and loadBalancerIP to determine whether there are vulnerable Services.

This bug is caused by a design defect in Kubernetes. You can take precautionary measures as follows:

- **Restrict the use of externalIP**
  - Method 1: Use the Admission Webhook container (k8s.gcr.io/multitenancy/externalip-webhook:v1.0.0). The source code and deployment description are released at **https://github.com/kubernetes-sigs/externalip-webhook**.
  - Method 2: Use the open source OPA Gatekeeper. The example constraint template and constraints are released at **https://github.com/open-policy-agent/gatekeeper-library/tree/master/library/general/externalip**.
- **Restrict the use of loadBalancerIP**

  The Kubernetes community does not recommend that the cluster administrator assign the patch permissions of the Service and status objects to users in the cluster. Therefore, the community does not provide preventive measures for loadBalancerIP. If you need to restrict the use of loadBalancerIP, you can refer to the preventive measures for externalIP.

Helpful Links

https://github.com/kubernetes/kubernetes/issues/97076

3.18 Notice on the Apache containerd Security Vulnerability (CVE-2020-15257)

Description

CVE-2020-15257 is a Docker container escape vulnerability officially released by containerd. containerd is a container runtime underpinning Docker and common Kubernetes configurations. It handles abstractions related to containerization and provides APIs to manage container lifecycles. Attackers, under certain circumstances, can access the containerd-shim API to implement Docker container escape.

Table 3-17 Vulnerability information

Type	CVE-ID	Severity	Discovered
Docker container escape	CVE-2020-15257	Medium	2020-11-30

Impact

CCE clusters from v1.9 to v1.17.9.

If the host network is not used and the processes in a container are not run by user **root** (UID is 0), this vulnerability is not involved.

Solution

You are advised to run containers with least privilege and impose the following restrictions on untrusted containers:

1. Host network cannot be used.
2. Processes in a container cannot be run by user **root**.

Helpful Links

containerd-shim API exposed to host network containers

3.19 Notice on the Docker Engine Input Verification Vulnerability (CVE-2020-13401)

Description

IPv6 address dynamic allocation can be implemented through Dynamic Host Configuration Protocol (DHCP) or Router Advertisement. This causes the CVE-2020-13401 vulnerability. Router Advertisement allows the router to periodically notify nodes of the network status, including routing records. The client configures the network through Neighbor Discovery Protocol (NDP). This section describes the impacts of the vulnerability.

Table 3-18 Vulnerability information

Type	CVE-ID	Severity	Discovered
Input validation flaw	CVE-2020-13401	Medium	2020-06-01

Impact

Nodes on which IPv6 is enabled and the Container Network Interface (CNI) plug-in version is earlier than v0.8.6

A malicious attacker can tamper with the IPv6 routing records of other containers on the host or the host itself to initiate a man-in-the-middle attack. Even if there was no IPv6 traffic before, if the DNS returns A (IPv4) and AAAA (IPv6) records, many HTTP libraries will try to use the IPv6 record for connections first then fall back to the IPv4 record, giving an opportunity to the attacker to respond. This vulnerability received a CVSS rating of 6.0 (Medium).

Kubernetes is not affected by this vulnerability. However, the CNI plug-in (see **https://github.com/containernetworking/plugins/pull/484** for details) used by Kubernetes is affected. The following kubelet versions involve the affected CNI plug-in:

- kubelet v1.18.0 to v1.18.3
- kubelet v1.17.0 to v1.17.6

- kubelet < v1.16.11

Solution

- Change the value of the host kernel parameter **net.ipv6.conf.all.accept_ra** to **0** to reject IPv6 route advertisements.
- Use service containers together with TLS and proper certificate verification to prevent man-in-the-middle spoofing.
- Do not set the CAP_NET_RAW capability in pods to prevent malicious containers from tampering with IPv6 routes.

```
securityContext:
    capabilities:
      drop: ["NET_RAW"]
```

3.20 Notice on the Kubernetes kube-apiserver Input Verification Vulnerability (CVE-2020-8559)

Description

Kubernetes disclosed a security vulnerability in kube-apiserver. An attacker can intercept certain upgrade requests sent to kubelet of a node and forward the requests to other target nodes using the original access credentials in the requests. This can lead permission escalation. This section describes the affected versions, impact, and preventive measures of the vulnerability.

Table 3-19 Vulnerability information

Type	CVE-ID	Severity	Discovered
Others	CVE-2020-8559	Medium	2020-07-15

Impact

The kube-apiserver component allows the proxied backends to send upgrade requests back to the original client. An attacker can intercept certain upgrade requests sent to kubelet of a node and forward the requests to other target nodes using the original access credentials in the requests. This can lead permission escalation. This vulnerability received a CVSS rating of 6.4 (Medium).

If multiple clusters share the same CA and authentication credential, this vulnerability may allow an attacker to attack other clusters. In this case, this vulnerability should be considered **High** severity.

In the cross-cluster scenarios, each CCE cluster uses an independently issued CA and authentication credentials of different clusters are isolated from each other. The cross-cluster scenarios are not affected by this vulnerability.

All kube-apiserver components from v1.6.0 to the following fixed versions are affected by this vulnerability:

- kube-apiserver v1.18.6

- kube-apiserver v1.17.9
- kube-apiserver v1.16.13

The following application scenarios are also affected by this vulnerability:

- A cluster is shared by multiple tenants and nodes are used as security boundaries for tenant isolation.
- Clusters share certificate authorities (CAs) and authentication credentials.

Solution

You are advised to take the following security measures to prevent cross-node attacks in a cluster:

- Keep authentication credentials secure.
- Follow the principle of the least privilege when granting permissions to IAM users. Use RBAC policies to restrict the access to the pods/exec, pods/attach, pods/portforward, and proxy resources.

3.21 Notice on the Kubernetes kubelet Resource Management Vulnerability (CVE-2020-8557)

Description

The eviction manager of kubelet does not manage the temporary storage usage of the **/etc/hosts** file mounted to pods. For this vulnerability, if a pod writes a large amount of data to its mounted **/etc/hosts** file to occupy the storage space of a node, a denial of service occurs on the node.

Table 3-20 Vulnerability information

Type	CVE-ID	Severity	Discovered
Resource management flaw	CVE-2020-8557	Medium	2020-07-15

Impact

The eviction manager of kubelet does not manage the temporary storage usage of the **/etc/hosts** file mounted to pods. For this vulnerability, if a pod writes a large amount of data to its mounted **/etc/hosts** file to occupy the storage space of a node, a denial of service occurs on the node. This vulnerability received a CVSS rating of 5.5 (Medium).

Clusters running pods with sufficient privileges to write to their own **/etc/hosts** files are affected. The following pods are included:

- Containers running with CAP_DAC_OVERRIDE (which is granted by default)
- Containers running as the **root** user (with **UID** set to **0**),or containers running with security context that have the flag **allowPrivilegeEscalation** set to **true**

(which is the default behavior when **Privileged Container** is **On** or the pods have the CAP_SYS_ADMIN permission).

The following kubelet versions are affected by this vulnerability:

- kubelet v1.18.0 to v1.18.5
- kubelet v1.17.0 to v1.17.8
- kubelet < v1.16.13

Solution

You are advised to take the following security measures:

- Set the cluster pod security policy or the admission mechanism to force pods to delete the CAP_DAC_OVERRIDE system permission.
```
securityContext:
    capabilities:
      drop: ["DAC_OVERRIDE"]
```
- Set the cluster pod security policy or other admission mechanisms to prevent the **root** user from starting containers, or set the **allowPrivilegeEscalation** parameter to **false**.
```
securityContext:
    allowPrivilegeEscalation: false
```
- Run the following command to monitor the **/etc/hosts** file in containers. If the file size is abnormal, enable the system to report an alarm or take corresponding container isolation measures.
```
find /var/lib/kubelet/pods/*/etc-hosts -size +1M
```

3.22 Notice on the Kubernetes kubelet and kube-proxy Authorization Vulnerability (CVE-2020-8558)

Description

Kubernetes officially released a security notice that the core component kube-proxy has a host boundary bypass vulnerability (CVE-2020-8558). With this vulnerability, attackers, through containers in the same LAN, can reach TCP and UDP services bound to 127.0.0.1 running on the node or in the node's network namespace, to obtain interface information. If a service on the port requires no additional authentication, the service is vulnerable to attacks. For example, if a cluster administrator runs a TCP service on a node that listens on 127.0.0.1:1234, because of this security vulnerability, the TCP service may be accessed by other hosts in the same LAN as the node or by containers running on the same node as the service. If the TCP service on port 1234 did not require additional authentication (because it assumed that only other localhost processes could reach it), the service could be vulnerable to attacks that use this security vulnerability.

Therefore, we kindly remind kube-proxy users to arrange self-check and implement timely security hardening.

For details, see **https://github.com/kubernetes/kubernetes/issues/92315**.

Table 3-21 Vulnerability information

Type	CVE-ID	Severity	Discovered
Code injection	CVE-2020-8558	High	2020-07-08

Impact

If an attacker can configure the host network or runs containers with CAP_NET_RAW, the attacker can obtain the socket information of the service that listens on 127.0.0.1 on the target host. If the target host runs an exposed service that can be accessed from 127.0.0.1 without any further authentication, the service information can be obtained by the attacker. For details, see **Placeholder issue**.

Possible attackers can be:

- Other pods sharing a host in the same switch
- Running container of the local host

The following kube-proxy versions are affected by this vulnerability:

- kube-proxy v1.18.0 to v1.18.3
- kube-proxy v1.17.0 to v1.17.6
- kube-proxy < v1.16.10

The CCE cluster control plane is protected by security groups, and CCE clusters can be accessed from tenant nodes or adjacent nodes through secure ports.

System components on cluster nodes listen on the port mapping to 127.0.0.1. This port is only used for health check and monitoring information query, which will not cause information leakage.

In conclusion, this vulnerability has little impact on CCE clusters.

Solution

Secure versions have been provided with this vulnerability fixed. If your service version falls into the affected range, upgrade it to a secure version. For details, see the official documentation:

- kubelet/kube-proxy v1.18.4+
- kubelet/kube-proxy v1.17.7+
- kubelet/kube-proxy v1.16.11+

You are advised to take the following security measures:

- If your service container needs to use the host network mode and listen on an insecure port, you can manually add an iptables rule on nodes.

  Run the following command to configure an iptables rule in clusters to reject traffic to 127.0.0.1 which does not originate on the nodes.

  ```
  iptables -I INPUT --dst 127.0.0.0/8 ! --src 127.0.0.0/8 -m conntrack ! --ctstate RELATED,ESTABLISHED,DNAT -j DROP
  ```

If your cluster needs not to enable the API Server insecure port, add the **--insecure-port=0** flag to your Kubernetes API Server command line to disable the insecure port.

- If your cluster runs an untrusted container, run the following command to disable CAP_NET_RAW in the manifest file:

```
securityContext:
    capabilities:
      drop: ["NET_RAW"]
```

CAUTION

Before fixing vulnerabilities, back up your files and conduct a thorough test.

3.23 Notice on Fixing Kubernetes HTTP/2 Vulnerability

Description

The Kubernetes community has released Go-related vulnerabilities: CVE-2019-9512 and CVE-2019-9514. The security issue has been found in the net/http library of the Go language that affects all versions and all components of Kubernetes. These vulnerabilities may cause DoS attacks to all processes that process HTTP or HTTPS Listener.

Go has released versions Go 1.12.9 and Go 1.11.13.

Kubernetes has released v1.13.10 - go1.11.13 using patched versions of Go.

CCE has released the latest Kubernetes clusters of v1.13.10 to fix the vulnerability. For Kubernetes clusters of v1.13, a patch will be provided at the end of September 2019 to fix the bug. For Kubernetes clusters earlier than v1.13, upgrade them to v1.13.10.

Table 3-22 Vulnerability information

Type	CVE-ID	Severity	Discovered
DoS attack	CVE-2019-9512	High	2019-08-13
Resource management flaw	CVE-2019-9514	High	2019-08-13

Impact

Default clusters are protected by VPCs and security groups and therefore not vulnerable.

If cluster APIs are exposed to Internet users, the cluster control plane may be vulnerable.

Solution

- The latest Kubernetes v1.13.10 has been released to fix the vulnerability.
- If the Kubernetes cluster is earlier than v1.13, upgrade the cluster version.

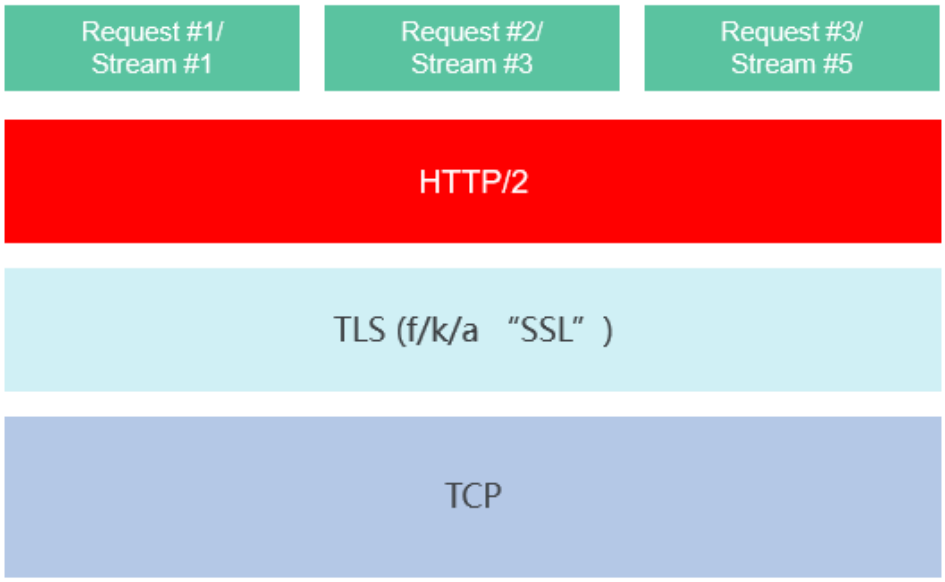
https://github.com/kubernetes/kubernetes/pull/81522

Technical Details

Most of these attacks occur at the HTTP/2 layer between request streams and TLS transmission. In fact, many attacks involve zero or one request.



Since the early hypertext transfer protocol, middleware services are request-oriented: logs are separated by requests instead of connections; rate limiting occurs at the request level; throttling is triggered when the number of requests reaches a specified limit.

Few tools can perform logging, rate limiting, and rate modification based on the client behavior at the HTTP/2 layer. Without tools, middleware services may find it even more difficult to detect and block malicious HTTP/2 connections.

The vulnerabilities allow remote attackers to consume excess system resources. Some attacks are very efficient, allowing a single terminal system to cause severe

impacts on multiple servers. These impacts include server shutdown, crash of core processes, and suspension. Attacks that are less efficient may cause lead to challenging issues. They only slow down servers and the slowdown may occur intermittently, making it more difficult to detect and prevent attacks.

3.24 Notice on Fixing Linux Kernel SACK Vulnerabilities

Description

On June 18, 2019, Red Hat released a security notice, stating that three security vulnerabilities (CVE-2019-11477, CVE-2019-11478, and CVE-2019-11479) were found on the TCP SACK module of the Linux kernel. These vulnerabilities are related to the maximum segment size (MSS) and TCP selective acknowledgment (SACK) packets. Remote attackers can exploit these vulnerabilities to trigger a denial of service (DoS), resulting in server unavailability or breakdown.

The Linux Kernel SACK vulnerabilities have been fixed for Huawei Cloud CCE using the following solution.

Table 3-23 Vulnerability information

Type	CVE-ID	Severity	Discovered	Fixed by Huawei Cloud
Input validation flaw	CVE-2019-11477	High	2019-06-17	2019-07-06
Resource management flaw	CVE-2019-11478	High	2019-06-17	2019-07-06
Resource management flaw	CVE-2019-11479	High	2019-06-17	2019-07-06

Impact

Linux kernel version 2.6.29 and later

Solution

These issues have been resolved in stable kernel versions of 4.4.182, 4.9.182, 4.14.127, 4.19.52, and 5.1.11. You can upgrade the nodes in rolling mode.

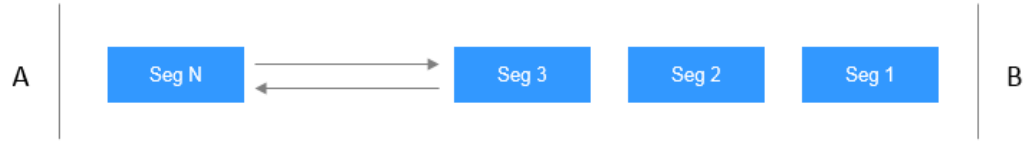
Introduction to TCP SACKs

TCP is a connection-oriented protocol. When two parties wish to communicate over a TCP connection, they establish a connection by exchanging certain information such as requesting to initiate (SYN) a connection, initial sequence number, acknowledgement number, maximum segment size (MSS) to use over this connection, and permissions to send and process Selective Acknowledgments (SACKs). This connection establishment process is known as 3-way handshake.

TCP sends and receives user data by a unit called Segment. A TCP segment consists of TCP Header, Options and user data. Each TCP segment has a sequence number (SEQ) and an acknowledgement number (ACK).

These SEQ and ACK numbers are used to track which segments are successfully received by the receiver. An ACK number indicates the next segment expected by the receiver.

Example:



In this example, user A sends 1 KB data through 13 segments. Each segment has a header of 20 bytes and contains 100 bytes data in total. On the receiving end, user B receives segments 1, 2, 4, 6, and 8-13. Segments 3, 5, and 7 are lost.

By using ACK numbers, user B will indicate that it is expecting segment 3, which user A reads as none of the segments after 2 were received by user B. Then user A will retransmit all the segments from 3 onwards, even though segments 4, 6, and 8-13 were successfully received by user B. This leads to low performance due to repeated transmissions.

3.25 Notice on Fixing the Docker Command Injection Vulnerability (CVE-2019-5736)

Description

Runtimes such as Docker and containerd that sit on top of runC have a security vulnerability. This vulnerability allows attackers to obtain the file descriptor handled in runC of the host and overwrite the host runC binary by leveraging the ability to execute a command as root within a new container with a specific image or an existing container that can be attached with docker exec.

The runC vulnerability CVE-2019-5736 has been fixed in Huawei Cloud CCE.

Table 3-24 Vulnerability information

Type	CVE-ID	Severity	Discovered	Fixed by Huawei Cloud
Code execution	CVE-2019-5736	High	2019-02-11	2019-02-12

For details about CVE-2019-5736, see **https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-5736**.

Impact

Attacker-controlled images implant malicious functions into a malicious dynamic library such as **libseccomp.so.2** and let execution commands point to **/proc/self/exe**.

When runC is performing a dynamic compilation, it loads the dynamic link library from the attacker-controlled container images and consequently the malicious dynamic library is loaded. Running the **/proc/self/exe** (runC) will execute the malicious program in the malicious dynamic link library. Because the malicious program inherits the file handle opened by runC, runC on the host may be replaced by the file handle.

Then, executing runC-related commands allows for container escape.

The impact of this vulnerability is as follows:

- The runC is the core component of Docker containers and this vulnerability in runC affects most containers. The impact of this vulnerability is often observed in multi-tenant clusters. If multiple users share nodes, any of the users may exploit this vulnerability to control the nodes and attack the entire cluster through penetration.
- **CCE**

  The Kubernetes clusters created by CCE are tenant-specific and cannot be shared by multiple tenants. Therefore, this vulnerability has little impact on Kubernetes clusters.

  CCE uses Huawei Docker containers, which are free from this vulnerability because the runC uses static compilation.
- **Cloud Container Instance (CCI)**

  CCI uses Huawei Kata container engine to ensure that multiple containers on a single node are hypervisor isolated. CCI does not use runC containers and therefore this vulnerability does not affect CCI.

Solution

- CCE

  The runC vulnerability CVE-2019-5736 has been fixed in Huawei Cloud CCE.

- On-premises Kubernetes or open source container engine
  - **Upgrade Docker to version 18.09.2**. If the current Docker version is an open source version earlier than v17.06, the upgrade may interrupt container services. This is because significant changes (including architectural decoupling and restructuring) were made to open source Docker versions later than 17.06. To minimize the container service downtime, intensively verify the upgrade plan before starting the upgrade and perform a rolling upgrade node by node.
  - **Upgrade only the runC**. For Docker versions 17.06 and earlier, upgrading runC will not interrupt services. Currently, runC has no vulnerability-fixing version. If you want to upgrade runC separately, you can compile it by yourself.
  - The official Docker patch uses the system call provided by Linux kernel v3.17 or later. The patch may not work with certain old versions of Linux kernel. If the patch does not work, upgrade Linux kernel to v3.17 or later. The security patch provided by Huawei Cloud CCE evolves out of the official Docker patch and has been verified to work well on multiple versions of Linux kernel.

3.26 Notice on Fixing the Kubernetes Permission and Access Control Vulnerability (CVE-2018-1002105)

Description

The security vulnerability CVE-2018-1002105 was reported in the Kubernetes community. By forging requests, Kubernetes users can access the backend over established connections through the Kubernetes API server. The Huawei Cloud CCE has securely fixed this vulnerability in a timely manner.

Table 3-25 Vulnerability information

Type	CVE-ID	Severity	Discovered	Fixed by Huawei Cloud
Privilege escalation	CVE-2018-1002105	Critical	2018-12-05	2018-12-05

For details about the vulnerability, see **https://github.com/kubernetes/kubernetes/issues/71411**.

Impact

If a cluster uses aggregated APIs, the attacker can exploit this vulnerability to send any API request to the aggregated API server, as long as the kube-apiserver is directly connected to the aggregated API server network.

If the access permission of the cluster is granted to anonymous users, anonymous users can also exploit this vulnerability. The access permission of anonymous users

is not prohibited in Kubernetes clusters, where the kube-apiserver startup parameter **anonymous-auth** is set to **true**. Users are granted the exec/attach/portforward permission of pods, and can also exploit this vulnerability to upgrade themselves to the cluster administrator to damage pods.

For more discussion about the vulnerability, see **https://github.com/kubernetes/kubernetes/issues/71411**.

The impact of this vulnerability is as follows:

- Clusters that run aggregated API servers directly accessible from the Kubernetes API server's network
- Clusters visible to attackers, that is, attackers can access the kube-apiserver APIs. If your clusters are deployed on a secure private network, the clusters are not affected.
- Clusters that assign **pod exec**/**attach**/**portforward** permissions to users who are not expected to have full access to kubelet APIs

The affected cluster versions are as follows:

- Kubernetes v1.0.x to 1.9.x
- Kubernetes v1.10.0 to 1.10.10 (fixed in v1.10.11)
- Kubernetes v1.11.0 to 1.11.4 (fixed in v1.11.5)
- Kubernetes v1.12.0 to 1.12.2 (fixed in v1.12.3)

Solution

You do not need to worry about this vulnerability when using Huawei Cloud CCE. The reasons are as follows:

- By default, anonymous access is disabled for clusters created by CCE.
- Clusters created by CCE do not use aggregation APIs.

The Huawei Cloud CCE has completed online patch installation for all Kubernetes clusters of v1.11 and later versions. The Kubernetes community does not provide solutions to fix the vulnerability for clusters of earlier versions. Therefore, the CCE has provided a dedicated patch version for them. Pay attention to the upgrade notices, and install the patch version in time to fix the vulnerability.

NOTE

If you set up Kubernetes clusters without using CCE, you are advised to disable the anonymous access permissions to improve the cluster security.

Upgrade to the vulnerability fixing version provided in the community as soon as possible. When configuring RBAC policies, ensure that the pod exec/attach/portforward permission is granted only to trusted users.

If the Kubernetes version of your clusters is earlier than v1.10, which is not supported by the Kubernetes community, you are advised to add the patch code provided in **https://github.com/kubernetes/kubernetes/pull/71412**.

3.27 Notice on Fixing the Kubernetes Dashboard Security Vulnerability (CVE-2018-18264)

Description

The Kubernetes community has discovered the security vulnerability CVE-2018-18264 in Kubernetes Dashboard v1.10 and earlier versions. This vulnerability allows a user to skip the authentication and query resources that the dashboard service account has access to, such as the private key.

The dashboard add-on provided by Huawei Cloud CCE has been upgraded to v1.10.1 and is free of the Kubernetes Dashboard vulnerability CVE-2018-18264.

Table 3-26 Vulnerability information

Type	CVE-ID	Severity	Discovered	Fixed by Huawei Cloud
Access validation error	CVE-2018-18264	High	2019-01-03	2019-01-05

For details about CVE-2018-18264, see the following:

- https://github.com/kubernetes/dashboard/pull/3289
- https://github.com/kubernetes/dashboard/pull/3400
- https://github.com/kubernetes/dashboard/releases/tag/v1.10.1

Impact

Kubernetes Dashboard v1.10 or an earlier version (v1.7.0 to v1.10.0) that is independently deployed in your Kubernetes clusters, has a login functionality, and uses a custom certificate

Solution

The dashboard add-on provided by Huawei Cloud CCE has been upgraded to v1.10.1 and is free of the Kubernetes Dashboard vulnerability CVE-2018-18264.

4 Product Release Notes

4.1 Release Notes for Kubernetes Versions

4.1.1 Kubernetes Version Policy

CCE provides highly scalable, high-performance, enterprise-class Kubernetes clusters. As the Kubernetes community periodically releases Kubernetes versions, CCE will release cluster Open Beta Test (OBT) and commercially used versions accordingly. This section describes the Kubernetes version policy of CCE clusters.

Lifecycle of CCE Cluster Versions

Kubernetes Version	Status	Community Release In	OBT of CCE Cluster Version In	Commercial Use of CCE Cluster Version In	EOS of CCE Cluster Version In
v1.25	In commercial use[a]	August 2022	November 2022	March 2023	March 2025
v1.23	In commercial use[a]	December 2021	April 2022	September 2022	September 2024
v1.21	In commercial use[b]	April 2021	December 2021	April 2022	April 2024
v1.19	In commercial use[b]	August 2020	December 2020	March 2021	September 2023
v1.17	EOS	December 2019	/	July 2020	January 2023

Kubernetes Version	Status	Community Release In	OBT of CCE Cluster Version In	Commercial Use of CCE Cluster Version In	EOS of CCE Cluster Version In
v1.15	EOS	June 2019	/	December 2019	September 2022
v1.13	EOS	December 2018	/	June 2019	March 2022
v1.11	EOS	August 2018	/	October 2018	March 2021
v1.9	EOS	December 2017	/	March 2018	December 2020

NOTE

The CCE console supports clusters of the latest two commercially used versions:

- a: Clusters created using the console or APIs
- b: Clusters created only using APIs

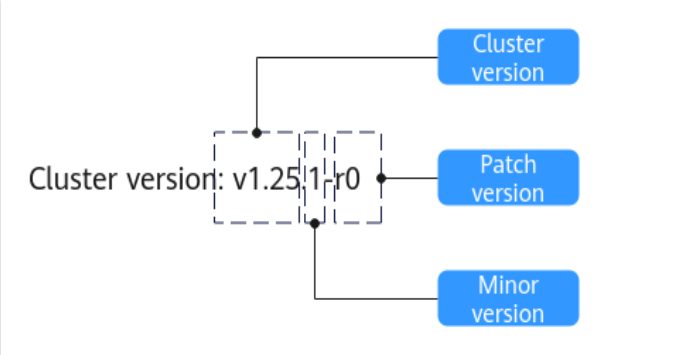
Phases of CCE Cluster Versions

- OBT: You can experience the latest features of this cluster version. However, the stability of clusters of this version has not been completely verified, and the Service Level Agreement (SLA) of CCE is not valid for such clusters.
- In commercial use: The cluster version has been fully verified and is stable and reliable. You can use clusters of this version in the production environment, and the CCE SLA is valid for such clusters.
- EOS: After the cluster version EOS, CCE does not support the creation of new clusters or provide technical support including new feature updates, vulnerability or issue fixes, new patches, work order guidance, and online checks for the EOS cluster version. The CCE SLA is not valid for such clusters.

CCE Cluster Versions

- Cluster version: The format is *x.y*, where *x* indicates the major Kubernetes version and *y* indicates the minor Kubernetes version. For details, see the **Kubernetes community documentation**.
- Patch version: The format is *x.y.z-r(n)*, where *x.y* indicates the **CCE cluster version**, *z* indicates the minor CCE version, and -r(*n*) indicates the patch version.

Figure 4-1 Cluster version



CCE Cluster Upgrade Policy

Periodically upgrade CCE clusters for better user experience. Using an EOS version, you cannot obtain technical support and CCE SLA assurance. Upgrade CCE clusters in a timely manner.

On the CCE console, you can easily upgrade clusters in a visualized manner, improving the stability and reliability of clusters.

- Cluster upgrade

  CCE clusters support cross-version upgrade. For details, see **Table 4-1**.

  Table 4-1 Upgrade paths

CCE Cluster Version	Target Version
v1.15	v1.19
v1.17	v1.19
v1.19	v1.23
	v1.21
v1.21	v1.25
	v1.23
v1.23	v1.25

- Patch version upgrade

  CCE clusters can be upgraded to the latest patch version.

4.1.2 Release History

4.1.2.1 Kubernetes 1.25 Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This document describes the changes made in Kubernetes 1.25 compared with Kubernetes 1.23.

Indexes

New Features

Kubernetes 1.25

- Pod Security Admission is stable. PodSecurityPolicy is deprecated.

  PodSecurityPolicy is replaced by Pod Security Admission. For details about the migration, see **Migrate from PodSecurityPolicy to the Built-In PodSecurity Admission Controller**.

- The ephemeral container is stable.

  An **ephemeral container** is a container that runs temporarily in an existing pod. It is useful for troubleshooting, especially when kubectl exec cannot be used to check a container that breaks down or its image lacks a debugging tool.

- Support for cgroups v2 enters the stable phase.

  Kubernetes supports cgroups v2. cgroups v2 provides some improvements over cgroup v1. For details, see **About cgroup v2**.

- SeccompDefault moves to beta.

  To enable this feature, add the startup parameter **--seccomp-default=true** to kubelet. In this way, **seccomp** is set to **RuntimeDefault** by default, improving system security. Clusters of v1.25 no longer support **seccomp.security.alpha.kubernetes.io/pod** and **container.seccomp.security.alpha.kubernetes.io/annotation**. Replace them with the **securityContext.seccompProfile** field in pods or containers. For details, see **Configure a Security Context for a Pod or Container**.

  NOTE

  After this feature is enabled, the system calls required by the application may be restricted by the runtime. Ensure that the debugging is performed in the test environment, so that application is not affected.

- The EndPort in the network policy moves to stable.

  EndPort in Network Policy is stable. This feature is incorporated in version 1.21. EndPort is added to NetworkPolicy. You can specify a port range.

- Local ephemeral storage capacity isolation is stable.

  This feature provides support for capacity isolation of local ephemeral storage between pods, such as EmptyDir. If a pod's consumption of shared resources exceeds the limit, it will be evicted.

- The CRD verification expression language moves to beta.

  This makes it possible to declare how to validate custom resources using **Common Expression Language (CEL)**. For details, see **Extend the Kubernetes API with CustomResourceDefinitions**.

- KMS v2 APIs are introduced.

The KMS v2 alpha1 API is introduced to add performance, rotation, and observability improvements. This API uses AES-GCM to replace AES-CBC and uses DEK to encrypt data at rest (Kubernetes Secrets). No additional operation is required during this process. Additionally, data can be read through AES-GCM and AES-CBC. For details, see **Using a KMS provider for data encryption**.

- Pod network readiness is introduced.

  Kubernetes 1.25 introduces Alpha support for PodHasNetwork. This status is in the **status** field of the pod. For details, see **Pod network readiness**.

- The two features used for application rollout are stable.
  - In Kubernetes 1.25, **minReadySeconds** for StatefulSets is stable. It allows each pod to wait for an expected period of time to slow down the rollout of a StatefulSet. For details, see **Minimum ready seconds**.
  - In Kubernetes 1.25, **maxSurge** for DaemonSets is stable. It allows a DaemonSet workload to run multiple instances of the same pod on one node during a rollout. This minimizes DaemonSet downtime for users. DaemonSet does not allow **maxSurge** and **hostPort** to be used at the same time because two active pods cannot share the same port on the same node. For details, see **Perform a Rolling Update on a DaemonSet**.

- Alpha support for running pods with user namespaces is provided.

  This feature maps the **root** user in a pod to a non-zero ID outside the container. In this way, the container runs as the **root** user and the node runs as a regular unprivileged user. This feature is still in the internal test phase. The UserNamespacesStatelessPodsSupport gate needs to be enabled, and the container runtime must support this function. For details, see **Kubernetes 1.25: alpha support for running Pods with user namespaces**.

Kubernetes 1.24

- Dockershim is removed from kubelet.

  Dockershim was marked deprecated in Kubernetes 1.20 and officially removed from kubelet in Kubernetes 1.24. If you want to use Docker container, switch to cri-dockerd or other runtimes that support CRI, such as containerd and CRI-O.

  For details about how to switch from Docker to containerd, see **Migrating Nodes from Docker to containerd**.

  NOTE

  Check whether there are agents or applications that depend on Docker Engine. For example, if **docker ps**, **docker run**, and **docker inspect** are used, ensure that multiple runtimes are compatible and switch to the standard CRI.

- Beta APIs are disabled by default.

  The Kubernetes community found 90% cluster administrators did not care about the beta APIs and left them enabled. However, the beta features are not recommended because these APIs enabled in the production environment by default incur risks. Therefore, in 1.24 and later versions, beta APIs are disabled by default, but the existing beta APIs will retain the original settings.

- OpenAPI v3 is supported.

  In Kubernetes 1.24 and later versions, OpenAPI V3 is enabled by default.

- Storage capacity tracking is stable.

  In Kubernetes 1.24 and later versions, the CSIStorageCapacity API supports exposing the available storage capacity. This ensures that pods are scheduled to nodes with sufficient storage capacity, which reduces pod scheduling delay caused by volume creation and mounting failures. For details, see **Storage Capacity**.

- gRPC container probe moves to beta.

  In Kubernetes 1.24 and later versions, the gRPC probe goes to beta. The feature gate GRPCContainerProbe is available by default. For details about how to use this probe, see **Configure Probes**.

- LegacyServiceAccountTokenNoAutoGeneration is enabled by default.

  LegacyServiceAccountTokenNoAutoGeneration moves to beta. By default, this feature is enabled, where no secret token is automatically generated for a service account. To use a token that never expires, create a secret and mount it. For details, see **Service account token Secrets**.

- IP address conflict is prevented.

  In Kubernetes 1.24, **an IP address pool is soft reserved for the static IP addresses of Services**. After you manually enable this function, Service IP addresses will be automatically from the IP address pool to minimize IP address conflict.

- Clusters are compiled based on Go 1.18.

  Kubernetes clusters of versions later than 1.24 are compiled based on Go 1.18. By default, the SHA-1 hash algorithm, such as SHA1WithRSA and ECDSAWithSHA1, is no longer supported for certificate signature verification. Use the certificate generated by the SHA256 algorithm instead.

- The maximum number of unavailable StatefulSet replicas is configurable.

  In Kubernetes 1.24 and later versions, the **maxUnavailable** parameter can be configured for StatefulSets so that pods can be stopped more quickly during a rolling update.

- Alpha support for non-graceful node shutdown is introduced.

  The non-graceful node shutdown is introduced as alpha in Kubernetes v1.24. A node shutdown is considered graceful only if kubelet's node shutdown manager can detect the upcoming node shutdown action. For details, see **Non-graceful node shutdown handling**.

Deprecations and Removals

Kubernetes 1.25

- The iptables chain ownership is cleared up.

  Kubernetes typically creates iptables chains to ensure data packets can be sent to the destination. These iptables chains and their names are for internal use only. These chains were never intended to be part of any Kubernetes API/ABI guarantees. For details, see **Kubernetes's IPTables Chains Are Not API**.

  In versions later than Kubernetes 1.25, Kubelet uses IPTablesCleanup to migrate the Kubernetes-generated iptables chains used by the components outside of Kubernetes in phases so that iptables chains such as KUBE-MARK-DROP, KUBE-MARK-MASQ, and KUBE-POSTROUTING will not be created in the NAT table. For more details, see **Cleaning Up IPTables Chain Ownership**.

- In-tree volume drivers from cloud service vendors are removed.

Kubernetes 1.24

- In Kubernetes 1.24 and later versions, Service.Spec.LoadBalancerIP is deprecated because it cannot be used for dual-stack protocols. Instead, use custom annotations.
- In Kubernetes 1.24 and later versions, the **--address**, **--insecure-bind-address**, **--port**, and **--insecure-port=0** parameters are removed from **kube-apiserver**.
- In Kubernetes 1.24 and later versions, startup parameters **--port=0** and **--address** are removed from **kube-controller-manager** and **kube-scheduler**.
- In Kubernetes 1.24 and later versions, **kube-apiserver --audit-log-version** and **--audit-webhook-version** support only **audit.k8s.io/v1**. In Kubernetes 1.24, **audit.k8s.io/v1[alpha|beta]1** is removed, and only **audit.k8s.io/v1** can be used.
- In Kubernetes 1.24 and later versions, the startup parameter **--network-plugin** is removed from kubelet. This Docker-specific parameter is available only when the container runtime environment is **Docker** and it is deleted with Dockershim.
- In Kubernetes 1.24 and later versions, dynamic log clearance has been discarded and removed accordingly. A log filter is introduced to the logs of all Kubernetes system components to prevent sensitive information from being leaked through logs. However, this function may block logs and therefore is discarded. For more details, see **Dynamic log sanitization** and **KEP-1753**.
- VolumeSnapshot v1beta1 CRD is discarded in Kubernetes 1.20 and removed in Kubernetes 1.24. Use VolumeSnapshot v1 instead.
- In Kubernetes 1.24 and later versions, **service annotation tolerate-unready-endpoints** discarded in Kubernetes 1.11 is replaced by **Service.spec.publishNotReadyAddresses**.
- In Kubernetes 1.24 and later versions, the **metadata.clusterName** field is discarded and will be deleted in the next version.
- In Kubernetes 1.24 and later versions, the logic for kube-proxy to listen to NodePorts is removed. If NodePorts conflict with **kernel net.ipv4.ip_local_port_range**, TCP connections may fail occasionally, which leads to a health check failure or service exception. Before the upgrade, ensure that cluster NodePorts do not conflict with **net.ipv4.ip_local_port_range** of all nodes in the cluster. For more details, see **Kubernetes PR**.

Enhanced Kubernetes 1.25 on CCE

During a version maintenance period, CCE periodically updates Kubernetes 1.25 and provides enhanced functions.

For details about cluster version updates, see **Release Notes for CCE Cluster Versions**.

References

For more details about the performance comparison and function evolution between Kubernetes 1.25 and other versions, see the following documents:

- **Kubernetes v1.25 Release Notes**
- **Kubernetes v1.24 Release Notes**

4.1.2.2 Kubernetes 1.23 Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.23.

Resource Changes and Deprecations

Kubernetes 1.23 Release Notes

- FlexVolume is deprecated. Use CSI.
- HorizontalPodAutoscaler v2 is promoted to GA, and HorizontalPodAutoscaler API v2 is gradually stable in version 1.23. The HorizontalPodAutoscaler v2beta2 API is not recommended. Use the v2 API.
- **PodSecurity** moves to beta, replacing the deprecated PodSecurityPolicy. PodSecurity is an admission controller that enforces pod security standards on pods in the namespace based on specific namespace labels that set the enforcement level. PodSecurity is enabled by default in version 1.23.

Kubernetes 1.22 Release Notes

- Ingresses no longer support networking.k8s.io/v1beta1 and extensions/v1beta1 APIs. If you use the API of an earlier version to manage ingresses, an application cannot be exposed to external services. Use networking.k8s.io/v1.
- CustomResourceDefinitions no longer support the apiextensions.k8s.io/v1beta1 API. If you use the API of an earlier version to create a CRD, the creation will fail, which affects the controller that reconciles this CRD. Use apiextensions.k8s.io/v1.
- ClusterRoles, ClusterRoleBindings, Roles, and RoleBindings no longer support the rbac.authorization.k8s.io/v1beta1 API. If you use the API of an earlier version to manage RBAC resources, application permission control is affected and even cannot work in the cluster. Use rbac.authorization.k8s.io/v1.
- The Kubernetes release cycle is changed from four releases a year to three releases a year.
- StatefulSets support **minReadySeconds**.
- During scale-in, pods are randomly selected and deleted based on the pod UID by default (LogarithmicScaleDown). This feature enhances the randomness of the pods to be deleted and alleviates the problems caused by pod topology spread constraints. For more information, see **KEP-2185** and **issue 96748**.
- The **BoundServiceAccountTokenVolume** is stable. This feature improves the token security of the service account and changes the method of mounting tokens to pods. Kubernetes clusters of v1.21 and later enable this approach by default.

References

For more details about the performance comparison and function evolution between Kubernetes 1.23 and other versions, see the following documents:

- **Kubernetes v1.23 Release Notes**
- **Kubernetes v1.22 Release Notes**

4.1.2.3 Kubernetes 1.21 Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.21.

Resource Changes and Deprecations

Kubernetes 1.21 Release Notes

- CronJob is now in the stable state, and the version number changes to batch/v1.
- The immutable Secret and ConfigMap have now been upgraded to the stable state. A new immutable field is added to these objects to reject changes. The rejection protects clusters from accidental updates that may cause application outages. As these resources are immutable, kubelet does not monitor or poll for changes. This reduces the load of kube-apiserver and improves scalability and performance of your clusters. For more information, see **Immutable ConfigMaps**.
- Graceful node shutdown has been upgraded to the test state. With this update, kubelet can detect that a node is shut down and gracefully terminate the pods on the node. Prior to this update, when the node was shut down, its pod did not follow the expected termination lifecycle, which caused workload problems. Now kubelet can use systemd to detect the systems that are about to be shut down and notify the running pods to terminate them gracefully.
- For a pod with multiple containers, you can use **kubectl.kubernetes.io/** to pre-select containers.
- PodSecurityPolicy is deprecated. For details, see **https://kubernetes.io/blog/2021/04/06/podsecuritypolicy-deprecation-past-present-and-future/**.
- The **BoundServiceAccountTokenVolume** feature has entered the beta test. This feature improves the token security of the service account and changes the method of mounting tokens to pods. Kubernetes clusters of v1.21 and later enable this approach by default.

Kubernetes 1.20 Release Notes

- The API priority and fairness have reached the test state and are enabled by default. This allows kube-apiserver to classify incoming requests by priority. For more information, see **API Priority and Fairness**.
- The bug of **exec probe timeouts** is fixed. Before this bug is fixed, the exec probe does not consider the **timeoutSeconds** field. Instead, the probe will run indefinitely, even beyond its configured deadline. It will stop until the result is returned. Now, if no value is specified, the default value is used, that is, one second. If the detection time exceeds one second, the application health check may fail. Update the **timeoutSeconds** field for the applications that use this feature during the upgrade. The repair provided by the newly introduced ExecProbeTimeout feature gating enables the cluster operator to restore the previous behavior, but this behavior will be locked and removed in later versions.

- RuntimeClass enters the stable state. RuntimeClass provides a mechanism to support multiple runtimes in a cluster and expose information about the container runtime to the control plane.
- kubectl debugging has reached the test state. kubectl debugging provides support for common debugging workflows.
- Dockershim was marked as deprecated in Kubernetes 1.20. Currently, you can continue to use Docker in the cluster. This change is irrelevant to the container image used by clusters. You can still use Docker to build your images. For more information, see **Dockershim Deprecation FAQ**.

- **Kubernetes v1.20 Release Notes**

4.1.2.4 Kubernetes 1.19 Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.19.

Resource Changes and Deprecations

Kubernetes 1.19 Release Notes

- vSphere in-tree volumes can be migrated to vSphere CSI drivers. The in-tree vSphere Volume plugin is no longer used and will be deleted in later versions.
- **apiextensions.k8s.io/v1beta1** has been deprecated. Use **apiextensions.k8s.io/v1** instead.
- **apiregistration.k8s.io/v1beta1** has been deprecated. Use **apiregistration.k8s.io/v1** instead.
- **authentication.k8s.io/v1beta1** and **authorization.k8s.io/v1beta1** have been deprecated and will be removed from Kubernetes 1.22. Use **authentication.k8s.io/v1** and **authorization.k8s.io/v1** instead.
- **autoscaling/v2beta1** has been deprecated. Use **autoscaling/v2beta2** instead.
- **coordination.k8s.io/v1beta1** has been deprecated in Kubernetes 1.19 and will be removed from version 1.22. Use **coordination.k8s.io/v1** instead.
- kube-apiserver: The **componentstatus** API has been deprecated.
- kubeadm: The **kubeadm config view** command has been deprecated and will be deleted in later versions. Use **kubectl get cm -o yaml -n kube-system kubeadm-config** to directly obtain the kubeadm configuration.
- kubeadm: The **kubeadm alpha kubelet config enable-dynamic** command has been deprecated.
- kubeadm: The **--use-api** flag in the **kubeadm alpha certs renew** command has been deprecated.
- Kubernetes no longer supports **hyperkube** image creation.
- The **--export** flag is removed from the **kubectl get** command.

- The alpha feature **ResourceLimitsPriorityFunction** has been deleted.
- **storage.k8s.io/v1beta1** has been deprecated. Use **storage.k8s.io/v1** instead.

Kubernetes 1.18 Release Notes

- kube-apiserver
  - All resources in the **apps/v1beta1** and **apps/v1beta2** API versions are no longer served. You can use the **apps/v1** API version.
  - DaemonSets, Deployments, and ReplicaSets in the **extensions/v1beta1** API version are no longer served. You can use the **apps/v1** API version.
  - NetworkPolicies in the **extensions/v1beta1** API version are no longer served. You can use the **networking.k8s.io/v1** API version.
  - PodSecurityPolicies in the **extensions/v1beta1** API version are no longer served. Migrate to use the **policy/v1beta1** API version.
- kubelet
  - **--redirect-container-streaming** is not recommended and will be deprecated in v1.20.
  - The resource measurement endpoint **/metrics/resource/v1alpha1** and all measurement standards under this endpoint have been deprecated. Use the measurement standards under the endpoint **/metrics/resource** instead:
    - scrape_error --> scrape_error
    - node_cpu_usage_seconds_total --> node_cpu_usage_seconds
    - node_memory_working_set_bytes --> node_memory_working_set_bytes
    - container_cpu_usage_seconds_total --> container_cpu_usage_seconds
    - container_memory_working_set_bytes --> container_memory_working_set_bytes
    - scrape_error --> scrape_error
  - In future releases, kubelet will no longer create the target directory **CSI NodePublishVolume** according to the CSI specifications. You may need to update the CSI driver accordingly to correctly create and process the target path.
- kube-proxy
  - You are not advised to use the **--healthz-port** and **--metrics-port** flags. Use **--healthz-bind-address** and **--metrics-bind-address** instead.
  - The **EndpointSliceProxying** function option is added to control the use of EndpointSlices in kube-proxy. This function is disabled by default.
- kubeadm
  - The **--kubelet-version** flag of **kubeadm upgrade node** has been deprecated and will be deleted in later versions.
  - The **--use-api** flag in the **kubeadm alpha certs renew** command has been deprecated.
  - kube-dns has been deprecated and will no longer be supported in future versions.

  - The ClusterStatus structure in the kubeadm-config ConfigMap has been deprecated and will be deleted in later versions.
- kubectl
  - You are not advised to use boolean and unset values for **--dry-run**. **server|client|none** is used in the new version.
  - **--server-dry-run** has been deprecated for **kubectl apply** and replaced by **--dry-run=server**.
- add-ons

The cluster-monitoring is deleted.

- kube-scheduler
  - The **scheduling_duration_seconds** metric has been deprecated.
  - The **scheduling_algorithm_predicate_evaluation_seconds** and **scheduling_algorithm_priority_evaluation_seconds counters** metrics are no longer used and are replaced by **framework_extension_point_duration_seconds[extension_point="Filter"]** and **framework_extension_point_duration_seconds[extension_point="Score"]**.
  - The scheduler policy AlwaysCheckAllPredictes has been deprecated.
- Other changes
  - The k8s.io/node-api component is no longer updated. Instead, you can use the **RuntimeClass** type in **k8s.io/api** and the generated clients in **k8s.io/client-go**.
  - The **client** label has been deleted from **apiserver_request_total**.

4.1.2.5 Kubernetes 1.17 (EOM) Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.17.

Resource Changes and Deprecations

- All resources in the **apps/v1beta1** and **apps/v1beta2** API versions are no longer served. Migrate to use the **apps/v1** API version.
- DaemonSets, Deployments, and ReplicaSets in the **extensions/v1beta1** API version are no longer served. You can use the **apps/v1** API version.
- NetworkPolicies in the **extensions/v1beta1** API version are no longer served. Migrate to use the **networking.k8s.io/v1** API version.
- PodSecurityPolicies in the **extensions/v1beta1** API version are no longer served. Migrate to use the **policy/v1beta1** API version.

- Ingresses in the **extensions/v1beta1** API version will no longer be served in v1.20. Migrate to use the **networking.k8s.io/v1beta1** API version.
- PriorityClass in the **scheduling.k8s.io/v1beta1** and **scheduling.k8s.io/v1alpha1** API versions is no longer served in v1.17. Migrate to use the **scheduling.k8s.io/v1** API version.
- The **event series.state** field in the **events.k8s.io/v1beta1** API version has been deprecated and will be removed from v1.18.
- **CustomResourceDefinition** in the **apiextensions.k8s.io/v1beta1** API version has been deprecated and will no longer be served in v1.19. Use the **apiextensions.k8s.io/v1** API version.
- **MutatingWebhookConfiguration** and **ValidatingWebhookConfiguration** in the **admissionregistration.k8s.io/v1beta1** API version have been deprecated and will no longer be served in v1.19. You can use the **admissionregistration.k8s.io/v1** API version.
- The **rbac.authorization.k8s.io/v1alpha1** and **rbac.authorization.k8s.io/v1beta1** API versions have been deprecated and will no longer be served in v1.20. Use the **rbac.authorization.k8s.io/v1** API version.
- The **CSINode** object of **storage.k8s.io/v1beta1** has been deprecated and will be removed in later versions.

Other Deprecations and Removals

- **OutOfDisk node condition** is removed in favor of **DiskPressure**.
- The **scheduler.alpha.kubernetes.io/critical-pod** annotation is removed in favor of **priorityClassName**.
- **beta.kubernetes.io/os** and **beta.kubernetes.io/arch** have been deprecated in v1.14 and will be removed in v1.18.
- Do not use **--node-labels** to set labels prefixed with **kubernetes.io** and **k8s.io**. The **kubernetes.io/availablezone** label in earlier versions is removed in v1.17 and changed to **failure-domain.beta.kubernetes.io/zone**.
- The **beta.kubernetes.io/instance-type** is deprecated in favor of **node.kubernetes.io/instance-type**.
- Remove the **{kubelet_root_dir}/plugins** path.
- Remove the built-in cluster roles **system:csi-external-provisioner** and **system:csi-external-attacher**.

4.1.2.6 Kubernetes 1.15 (EOM) Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.15.

Upgrade your Kubernetes clusters before the version EOM for more stable, reliable cluster running.

Description

CCE provides full-link component optimization and upgrade for Kubernetes v1.15, which includes two minor versions v1.15.11 and v1.15.6-r1.

Resource Changes and Deprecations

- Ingress in the **extensions/v1beta1** API version has been deprecated. It will be no longer served from Kubernetes 1.19. You can use the **networking.k8s.io/v1beta1** API version.
- NetworkPolicy in the **extensions/v1beta1** API version will be officially suspended in 1.16. Migrate to use the **networking.k8s.io/v1** API version.
- PodSecurityPolicy in the **extensions/v1beta1** API version will be officially suspended in 1.16. Migrate to use the **policy/v1beta1** API version.
- DaemonSets, Deployments, and ReplicaSets in the **extensions/v1beta1**, **apps/v1beta1**, and **apps/v1beta2** API versions will not be served in 1.16. You can use the **apps/v1** API version.
- PriorityClass is upgraded to **scheduling.k8s.io/v1**, **scheduling.k8s.io/v1beta1**, and **scheduling.k8s.io/v1alpha1**. It will be deprecated in 1.17.
- The **series.state** field in the **events.k8s.io/v1beta1** Event API version has been deprecated and will be removed from 1.18.

4.1.2.7 Kubernetes 1.13 (EOM) Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.13.

Table 4-2 Version 1.13 description

Kubernetes (CCE Enhanced Version)	Description
v1.13.10-r0	**Highlights**: • Arm nodes can be added to a CCE cluster. • The load balancer name is configurable. • Layer-4 load balancing supports health check, and layer-7 load balancing supports health check, allocation policy, and sticky session. • BMS nodes can be created in a CCE cluster (when the tunnel network model is used). • Ascend-accelerated nodes (powered by HiSilicon Ascend 310 AI processors) apply to scenarios such as image recognition, video processing, inference computing, and machine learning. • The docker baseSize is configurable. • Namespace affinity scheduling is supported. • User space can be partitioned in node data disks. • Cluster CPU management policies can be configured. • Nodes in a cluster can be configured across subnets (when the tunnel network mode is used).
v1.13.7-r0	**Highlights**: • Features of Kubernetes v1.13.7 are incorporated. • The network attachment definition is supported.

4.1.2.8 Kubernetes 1.11 (EOM) Release Notes

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.11.

Table 4-3 Version 1.11 description

Kubernetes (CCE Enhanced Version)	Description
v1.11.7-r2	**Highlights**: • Support for GPU V100 is provided. • Support for permission management is provided.
v1.11.7-r0	**Highlights**: • Features of Kubernetes v1.11.7 are incorporated. • Node pools, VMs, and Kunpeng clusters can be created. • BMS nodes can be created in a CCE cluster (when the VPC network model is used), and hybrid deployment of BMSs and VMs is supported. • Support for GPU V100 is provided. • Application Operations Management (AOM) notifies users when alarms are generated for container clusters of v1.11. • Access type switching is supported for Services. • Service network segments can be configured. • The number of IP addresses allocated to a node in a cluster can be customized.
v1.11.3-r2	**Highlights**: • Clusters support IPv6 dual stack. • ELB load balancing algorithms: source IP hash and sticky sessions with backend servers.
v1.11.3-r1	**Highlights**: • Perl regular expressions can be used for matching ingress URLs.
v1.11.3-r0	**Highlights**: • Features of Kubernetes v1.11.3 are incorporated. • Master nodes of a cluster can be deployed across multiple AZs. • CCE works with SFS Turbo to provide container storage.

4.1.2.9 Release Notes for Kubernetes 1.9 (EOM) and Earlier Versions

CCE has passed the Certified Kubernetes Conformance Program and is a certified Kubernetes offering. This section describes the updates in CCE Kubernetes 1.9 and earlier versions.

Table 4-4 Description of v1.9 and earlier versions

Kubernetes (CCE Enhanced Version)	Description
v1.9.10-r2	**Highlights**: • ELB load balancing algorithms: source IP hash and sticky sessions with backend servers.
v1.9.10-r1	**Highlights**: • CCE works with SFS. • Enhanced ELBs can be automatically created for Services. • Transparent transmission of source IP addresses is supported for enhanced ELBs on the public network. • The maximum number of pods on a node can be configured.
v1.9.10-r0	**Highlights**: • Use of ELB/ingress for Kubernetes clusters; new traffic control mechanism • Features of Kubernetes v1.9.10 are incorporated. • Kubernetes RBAC capability authorization is supported. **Fault rectification**: • Occasional memory leak on nodes, which is caused by kernel cgroup bugs

Kubernetes (CCE Enhanced Version)	Description
v1.9.7-r1	**Highlights**: ● The mechanism for reporting PVC and PersistentVolume (PV) events is enhanced. Events can be viewed on the PVC details page. ● CCE works with a third-party authentication system. ● Physical machines that use EulerOS 2.3 can be managed. ● Data disk allocation can be user-defined. ● Elastic Volume Service (EVS) disks are supported for BMSs. ● InfiniBand NICs are supported for BMSs. ● Nodes can be created using the CM-v3 API in BMS scenarios.
v1.9.7-r0	**Highlights**: ● The Docker version of new clusters is upgraded to v17.06. ● DNS cascading is supported. ● Add-ons can be managed. ● Features of Kubernetes v1.9.7 are incorporated. ● The HTTPS of layer-7 ingress is supported. ● StatefulSets can be migrated, scheduled, updated, and upgraded.
v1.9.2-r3	**Highlights**: ● Cluster nodes that use CentOS 7.4 can be created or managed. ● DNAT Services are supported. ● NetworkPolicy APIs are provided. ● Multiple ports can be configured for a Kubernetes Service that uses an ELB. **Fault rectification**: ● Incomplete pod resource recycling caused by a disconnection with kube-apiserver ● Data inaccuracy during auto node scaling

Kubernetes (CCE Enhanced Version)	Description
v1.9.2-r2	**Highlights**: • Custom health check ports can be configured for classic load balancers. • Performance of classic load balancers is enhanced. • Kubernetes Service ports can be configured for layer-4 load balancing. **Fault rectification**: • Bugs in network add-ons, which cause deadlocks in health checks • A limited number of HAProxy connections in an HA cluster
v1.9.2-r1	**Highlights**: • Features of Kubernetes v1.9.2 are incorporated. • Cluster nodes support CentOS 7.1. • GPU nodes are supported and GPU resource use can be restricted. • The web-terminal add-on is supported.
v1.7.3-r13	**Highlights**: • The Docker version of new clusters is upgraded to v17.06. • DNS cascading is supported. • Add-ons can be managed. • The mechanism for reporting PVC and PV events is enhanced. • OBS is supported for BMS clusters.
v1.7.3-r12	**Highlights**: • Cluster nodes that use CentOS 7.4 can be created or managed. • DNAT Services are supported. • NetworkPolicy APIs are provided. • Multiple ports can be configured for a Kubernetes Service that uses an ELB. **Fault rectification**: • Incomplete pod resource recycling caused by a disconnection with kube-apiserver • Data inaccuracy during auto node scaling • The event aging period prompt is modified. The cluster aging period is 1 hour.

Kubernetes (CCE Enhanced Version)	Description
v1.7.3-r11	**Highlights**: ● Custom health check ports can be configured for classic load balancers. ● Performance of classic load balancers is enhanced. ● Kubernetes Service ports can be configured for layer-4 load balancing. ● Namespaces can be deleted. ● EVS disks can be unbound. ● Migration policies can be configured. **Fault rectification**: ● Bugs in network add-ons, which cause deadlocks in health checks ● A limited number of HAProxy connections in an HA cluster
v1.7.3-r10	**Highlights**: ● Overlay L2 container networks are supported. ● Cluster nodes can be GPU-accelerated VMs. ● Cluster nodes support CentOS 7.1 and the operating system can be selected. ● Windows clusters support ELBs. ● CCE nodes can use SFS for storage. ● BMS clusters support SFS.
v1.7.3-r9	**Highlights**: ● Cross-AZ deployment is supported for workloads. ● Containers support OBS. ● Layer-7 load balancing is supported. ● Windows clusters support EVS. ● Device mapper in direct-lvm mode is supported in BMS scenarios.
v1.7.3-r8	**Highlights**: ● Auto scaling is supported for cluster nodes. ● Arm nodes can be managed.

Kubernetes (CCE Enhanced Version)	Description
v1.7.3-r7	**Highlights**: ● SUSE 12 sp2 nodes can be managed in the container clusters (in the tunnel network mode). ● Docker supports the device mapper in direct-lvm mode. ● Clusters support the dashboard add-on. ● Windows clusters can be created.
v1.7.3-r6	**Highlights**: ● Native EVS APIs are supported for clusters.
v1.7.3-r5	**Highlights**: ● HA clusters can be created. **Fault rectification**: ● Container network disconnection after a node restart
v1.7.3-r4	**Highlights**: ● Cluster performance is enhanced. ● Interconnection with ELB is allowed in BMS scenarios.
v1.7.3-r3	**Highlights**: ● Storage can be attached to kernel-based virtual machines (KVMs).
v1.7.3-r2	**Highlights**: ● SFS is supported to provide container storage. ● Custom logs can be configured for workloads. ● Graceful scaling-in is supported for workloads. **Fault rectification**: ● Expiration of Access Key ID/Secret Access Key (AK/SK) of container storage volumes
v1.7.3-r1	**Highlights**: ● External domain names can be resolved by kube-dns.
v1.7.3-r0	**Highlights**: ● Features of Kubernetes v1.7.3 are incorporated. ● Elastic Load Balance (ELB) is supported. ● Storage can be attached to Xen VMs. ● EVS is supported to provide container storage.

4.2 Release Notes for CCE Cluster Versions

Version 1.25

NOTICE

All nodes in the CCE clusters of version 1.25, except the ones running EulerOS 2.5, use containerd by default.

Table 4-5 Release notes for the v1.25 patch

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.25.3-r10	v1.25.5	The timeout interval can be configured for a load balancer.	High-frequency parameters of kube-apiserver are configurable.	Fixed some security issues.
v1.25.3-r0	v1.25.5	None	Enhanced network stability of CCE Turbo clusters when their specifications are modified.	Fixed some security issues.
v1.25.1-r0	v1.25.5	CCE clusters of v1.25 are released for the first time. For more information, see **Kubernetes 1.25 Release Notes**.	None	None

Version 1.23

Table 4-6 Release notes for the v1.23 patch

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.23.8-r10	v1.23.11	The timeout interval can be configured for a load balancer.	High-frequency parameters of kube-apiserver are configurable.	Fixed some security issues.
v1.23.8-r0	v1.23.11	None	• Enhanced Docker reliability during upgrades. • Optimized node time synchronization.	Fixed some security issues.
v1.23.5-r0	v1.23.11	• Fault detection and isolation are supported on GPU nodes. • Security groups can be customized by cluster. • CCE Turbo clusters support ENIs pre-binding by node. • containerd is supported.	• The ETCD version of the master node has been upgraded to the Kubernetes version 3.5.6. • Scheduling is optimized so that pods are evenly distributed across AZs after pods are scaled in. • Optimized the memory usage of kube-apiserver when CRDs are frequently updated.	Fixed some security issues and the following CVE vulnerabilities: • **CVE-2022-3294** • **CVE-2022-3162** • **CVE-2022-3172** • **CVE-2021-25749**
v1.23.1-r0	v1.23.4	CCE clusters of v1.23 are released for the first time. For more information, see **Kubernetes 1.23 Release Notes**.	None	None

Version 1.21

Table 4-7 Release notes for the v1.21 patch

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.21.10-r10	v1.21.14	The timeout interval can be configured for a load balancer.	High-frequency parameters of kube-apiserver are configurable.	Fixed some security issues.
v1.21.10-r0	v1.21.14	None	• Enhanced Docker reliability during upgrades. • Optimized node time synchronization. • Enhanced the stability of the Docker runtime for pulling images after nodes are restarted.	Fixed some security issues.
v1.21.7-r0	v1.21.14	• Fault detection and isolation are supported on GPU nodes. • Security groups can be customized by cluster. • CCE Turbo clusters support ENIs pre-binding by node. • Control plane logs can be collected.	Improved the stability of LoadBalancer Services/ingresses with a large number of connections.	Fixed some security issues and the following CVE vulnerabilities: • **CVE-2022-3294** • **CVE-2022-3162** • **CVE-2022-3172**

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.21.1-r0	v1.21.7	CCE clusters of v1.21 are released for the first time. For more information, see **Kubernetes 1.21 Release Notes**.	None	None

Version 1.19

Table 4-8 Release notes of the v1.19 patch

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.19.16-r30	v1.19.16	The timeout interval can be configured for a load balancer.	High-frequency parameters of kube-apiserver are configurable.	Fixed some security issues.
v1.19.16-r20	v1.19.16	None	• Cloud Native 2.0 Networks allow you to specify subnets for a namespace. • Enhanced the stability of the Docker runtime for pulling images after nodes are restarted. • Optimized the performance of CCE Turbo clusters in allocating ENIs if not all ENIs are pre-bound.	Fixed some security issues.

CCE Cluster Patch Version	Kubernetes Version	Feature Updates	Optimization	Vulnerability Fixing
v1.19.16-r4	v1.19.16	• Containers support SFS 3.0 for storage. • Fault detection and isolation are supported on GPU nodes. • Security groups can be customized by cluster. • CCE Turbo clusters support ENIs pre-binding by node.	• Scheduling is optimized on taint nodes. • Enhanced the long-term running stability of containerd when cores are bound. • Improved the stability of LoadBalancer Services/ingresses with a large number of connections. • Optimized the memory usage of kube-apiserver when CRDs are frequently updated.	Fixed some security issues and the following CVE vulnerabilities: • CVE-2022-3294 • CVE-2022-3162 • CVE-2022-3172
v1.19.16-r0	v1.19.16	None	Enhanced the stability in updating LoadBalancer Services when workloads are upgraded and nodes are scaled in or out.	Fixed some security issues and the following CVE vulnerabilities: • CVE-2021-25741 • CVE-2021-25737
v1.19.10-r0	v1.19.10	CCE clusters of v1.19 are released for the first time. For more information, see **Kubernetes 1.19 Release Notes**.	None	None

4.3 Release Notes for OS Images

4.3.1 OS Version Support Mechanism

Synchronization Mechanism

CCE cluster node components are updated with the release of CCE cluster versions.

Major OS vulnerability fixing: The policy for fixing major OS vulnerabilities is released with the cluster patch upgrade policy.

Mappings Between Cluster Versions and OS Versions

The following table lists the mappings between released cluster versions and OS versions.

Table 4-9 Mappings between VM node OS versions and cluster versions

OS	Cluster Version	Latest Kernel
CentOS Linux release 7.6	v1.25	3.10.0-1160.66.1.el7.x86_64
	v1.23	3.10.0-1160.66.1.el7.x86_64
	v1.21	3.10.0-1160.66.1.el7.x86_64
	v1.19.16	3.10.0-1160.66.1.el7.x86_64
	v1.19.10	3.10.0-1160.25.1.el7.x86_64
	v1.19.8	3.10.0-1160.15.2.el7.x86_64
	v1.17.17 (end of maintenance)	3.10.0-1160.15.2.el7.x86_64
	v1.17.9 (end of maintenance)	3.10.0-1062.12.1.el7.x86_64

4.3.2 OS Image Release History

This section describes the latest updates on CCE cluster OS versions.

For more information, see **Mappings Between Cluster Versions and OS Versions**.

EulerOS 2.10

Kernel Version	Release Date	Supported Cluster Version	Release Note
4.18.0-147.5.2.10.h933.eulerosv2r10.x86_64	April 2023	v1.23 v1.25	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.10 (Arm)

Kernel Version	Release Date	Supported Cluster Version	Release Note
4.19.90-vhulk2204.1.0.h1160.eulerosv2r10.aarch64	April 2023	v1.23 v1.25	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.9

Kernel Version	Release Date	Supported Cluster Version	Release Note
4.18.0-147.5.1.6.h841.eulerosv2r9.x86_64	January 2023	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.
4.18.0-147.5.1.6.h766.eulerosv2r9.x86_64	December 2022	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.9 (Arm)

Kernel Version	Release Date	Supported Cluster Version	Release Note
4.19.90-vhulk2103.1.0.h848.eulerosv2r9.aarch64	January 2023	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.8 (Arm)

Kernel Version	Release Date	Supported Cluster Version	Release Note
4.19.36-vhulk1907.1.0.h1350.eulerosv2r8.aarch64	December 2022	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.5

Kernel Version	Release Date	Supported Cluster Version	Release Note
3.10.0-862.14.1.5.h687.eulerosv2r7.x86_64	December 2022	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.

EulerOS 2.3

Kernel Version	Release Date	Supported Cluster Version	Release Note
3.10.0-514.41.4.28.h62.x86_64	December 2022	v1.25 v1.23 v1.21 v1.19.16	The system kernel is updated to fix security vulnerabilities.

CentOS 7.6

Kernel Version	Release Date	Supported Cluster Version	Release Note
3.10.0-1160.66.1.el7.x86_64	January 2023	v1.19.16-r4 and later v1.21.7-r0 and later v1.23.5-r0 and later v1.25.1-r0 and later	The system kernel is updated to fix security vulnerabilities.

4.4 Add-On Version Release History

4.4.1 coredns Release History

Table 4-12 coredns updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.25.11	v1.19 v1.21 v1.23 v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Upgrades to its community version 1.10.1.	1.10.1
1.25.1	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.	1.8.4
1.23.3	v1.15 v1.17 v1.19 v1.21 v1.23	• Regular upgrade of add-on dependencies	1.8.4
1.23.2	v1.15 v1.17 v1.19 v1.21 v1.23	• Regular upgrade of add-on dependencies	1.8.4
1.23.1	v1.15 v1.17 v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.	1.8.4
1.17.15	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	1.8.4
1.17.9	v1.15 v1.17 v1.19	• Regular upgrade of add-on dependencies	1.8.4

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.17.7	v1.15 v1.17 v1.19	• Updates the add-on to its community version v1.8.4.	1.8.4
1.17.4	v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	1.6.5
1.17.3	v1.17	• Supports clusters of version 1.17 and fixes stub domain configuration issues.	1.6.5
1.17.1	v1.17	• Supports clusters of version 1.17.	1.6.5

4.4.2 everest Release History

Table 4-13 everest updates

Add-on Version	Supported Cluster Version	New Feature
2.1.30	v1.19 v1.21 v1.23 v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adapts the obsfs Package to Ubuntu 22.04.
2.1.13	v1.19 v1.21 v1.23 v1.25	• Optimizes the performance of creating subpath PVCs in batches for SFS Turbo volumes.
2.1.9	v1.19 v1.21 v1.23 v1.25	• Supports graceful exit of the controller. • Adapts to CCE clusters of version 1.25.
2.0.9	v1.19 v1.21 v1.23	• Rebuilds certain code and architecture of everest to improve its scalability and stability. • Enables graceful exit. • Supports OBS process monitoring.

Add-on Version	Supported Cluster Version	New Feature
1.3.28	v1.19 v1.21 v1.23	• Enables graceful exit. • Supports OBS process monitoring.
1.3.22	v1.19 v1.21 v1.23	• Handles occasional read and write failures after repeated disk mounting.
1.3.20	v1.19 v1.21 v1.23	• Handles occasional read and write failures after repeated disk mounting.
1.3.17	v1.19 v1.21 v1.23	• Updates the rollingUpdates.maxUnavailable of everest-csi-driver from 10 to 10%. • Supports user-defined pod anti-affinity rules. • Counts the maximum number of SCSI volumes that can be managed by the CSI plug-in on a node. • Drivers can be deployed based on customized resource specifications.
1.3.8	v1.23	• Adapts to CCE clusters of version 1.23.
1.3.6	v1.23	• Adapts to CCE clusters of version 1.23.
1.2.78	v1.15 v1.17 v1.19 v1.21	• Supports anti-affinity scheduling of pods on nodes in different AZs.
1.2.70	v1.15 v1.17 v1.19 v1.21	• Optimizes the performance of creating subpath PVCs in batches for SFS Turbo volumes.
1.2.67	v1.15 v1.17 v1.19 v1.21	• Supports graceful exit of the controller. • Supports OBS process monitoring.
1.2.61	v1.15 v1.17 v1.19 v1.21	• Enables graceful exit. • Supports OBS process monitoring.

Add-on Version	Supported Cluster Version	New Feature
1.2.55	v1.15 v1.17 v1.19 v1.21	• Handles occasional read and write failures after repeated disk mounting.
1.2.53	v1.15 v1.17 v1.19 v1.21	• Handles occasional read and write failures after repeated disk mounting.
1.2.51	v1.15 v1.17 v1.19 v1.21	• Updates the rollingUpdates.maxUnavailable of everest-csi-driver from 10 to 10%. • Supports user-defined pod anti-affinity rules. • Counts the maximum number of SCSI volumes that can be managed by the CSI plug-in on a node.
1.2.44	v1.15 v1.17 v1.19 v1.21	• Enterprise projects can be selected for EVS and OBS volumes. • By default, the **enable_noobj_cache** parameter is no longer used for mounting OBS buckets.
1.2.42	v1.15 v1.17 v1.19 v1.21	• Enterprise projects can be selected for EVS and OBS volumes. • By default, the **enable_noobj_cache** parameter is no longer used for mounting OBS buckets.
1.2.30	v1.15 v1.17 v1.19 v1.21	• Supports emptyDir.
1.2.28	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.
1.2.27	v1.15 v1.17 v1.19 v1.21	• Supports ultra-fast SSD (ESSD) and general-purpose SSD (GPSSD) EVS disks.

Add-on Version	Supported Cluster Version	New Feature
1.2.13	v1.15 v1.17 v1.19	• Supports EulerOS 2.10.
1.2.9	v1.15 v1.17 v1.19	• Enhances the reliability of PV resource lifecycle maintenance. • Attach/Detach Controller can be used to attach or detach volumes in clusters of version 1.19.10. • Improves SFS mounting stability. • Changes the default EVS creation type of a new cluster to SAS.
1.2.5	v1.15 v1.17 v1.19	• Improves the reliability of mounting-related capabilities. • Optimizes the authentication function of using OBS, which requires you to upload the access key. • Improves the compatibility of the everest add-on with FlexVolume volumes. • Improves running stability of the add-on.
1.1.12	v1.15 v1.17	• Enhances the reliability of the everest-csi-controller component.
1.1.11	v1.15 v1.17	• Supports security hardening. • Supports third-party OBS storage. • Switches to the EVS query API with better performance. • Uses snapshots to create disks in clone mode by default. • Optimizes and enhances disk status detection and log output for attaching and detaching operations. • Improves the reliability of determining authentication expiration.
1.1.8	v1.15 v1.17	• Supports CCE v1.17. If CCE v1.13 is upgraded to v1.15, everest can take over all functions of the FlexVolume driver.
1.1.7	v1.15 v1.17	• Supports CCE v1.17. If CCE v1.13 is upgraded to v1.15, everest can take over all functions of the FlexVolume driver.

4.4.3 npd Release History

Table 4-14 npd updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.18.10	v1.19 v1.21 v1.23 v1.25	• Optimizes the configuration page. • Adds threshold configuration to the DiskSlow check item. • Adds threshold configuration to the NTPProblem check item. • Supports anti-affinity scheduling of pods on nodes in different AZs. • Supports interruption detection for spot ECSs and evicts pods on nodes before the interruption.	0.8.10
1.17.4	v1.17 v1.19 v1.21 v1.23 v1.25	• Optimizes DiskHung check item.	0.8.10
1.17.3	v1.17 v1.19 v1.21 v1.23 v1.25	• The maximum number of taint nodes that can be added to the NPC can be configured by percentage. • Adds the ProcessZ check item. • Adds the time deviation detection to the NTPProblem check item. • Fixes the processes consistently in the D state (exist in the BMS node).	0.8.10

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.17.2	v1.17 v1.19 v1.21 v1.23 v1.25	• Adds the DiskHung check item for disk I/O. • Adds the DiskSlow check item for disk I/O. • Adds the ProcessD check item. • Adds MountPointProblem to check the health of mount points. • To avoid conflicts with the service port range, the default health check listening port is changed to **19900**, and the default Prometheus metric exposure port is changed to **19901**. • Supports clusters of version 1.25.	**0.8.10**
1.16.4	v1.17 v1.19 v1.21 v1.23	• Adds the beta check item ScheduledEvent to detect cold and live VM migration events caused by host machine exceptions using the metadata API. This check item is disabled by default.	**0.8.10**
1.16.3	v1.17 v1.19 v1.21 v1.23	• Adds the function of checking the ResolvConf configuration file.	**0.8.10**
1.16.1	v1.17 v1.19 v1.21 v1.23	• Adds node-problem-controller. Supports basic fault isolation. • Adds the PID, FD, disk, memory, temporary volume pool, and PV pool check items.	**0.8.10**

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.15.0	v1.17 v1.19 v1.21 v1.23	• Hardens check items comprehensively to avoid false positives. • Supports kernel check. Supports reporting of OOMKilled and TaskHung events.	0.8.10
1.14.11	v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	0.7.1
1.14.5	v1.17 v1.19	• Fixes the issue that monitoring metrics cannot be obtained.	0.7.1
1.14.4	v1.17 v1.19	• Supports containerd nodes.	0.7.1
1.14.2	v1.17 v1.19	• Provides support for CCE v1.19, Ubuntu OS, and Kata containers.	0.7.1
1.13.8	v1.15.11 v1.17	• Fixes the CNI health check issue on the container tunnel network. • Adjusts resource quotas.	0.7.1
1.13.6	v1.15.11 v1.17	• Fixes the issue that zombie processes are not reclaimed.	0.7.1
1.13.5	v1.15.11 v1.17	• Adds taint tolerance configuration.	0.7.1
1.13.2	v1.15.11 v1.17	• Adds resource restrictions and enhances the detection capability of the cni add-on.	0.7.1

4.4.4 dashboard Release History

Table 4-15 dashboard updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
2.2.3	v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25. • Updates the add-on to its community version v2.7.0.	2.7.0
2.1.1	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23. • Updates the add-on to its community version v2.5.0.	2.5.0
2.0.10	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	2.0.0
2.0.4	v1.15 v1.17 v1.19	• Adds the default seccomp profile.	2.0.0
2.0.3	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.15.	2.0.0
2.0.2	v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	2.0.0
2.0.1	v1.15 v1.17		2.0.0
2.0.0	v1.17	• Enables interconnection with CCE v1.17	2.0.0

4.4.5 autoscaler Release History

Table 4-16 Updates of autoscaler adapted to clusters v1.25

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.25.21	v1.25	• Fixes the issue that the autoscaler's least-waste is disabled by default. • Fixes the issue that the node pool cannot be switched to another pool for scaling out after a scale-out failure and the add-on has to restart. • The default taint tolerance duration is changed to 60s. • Fixes the issue that scale-out is still triggered after the scale-out rule is disabled.	1.25.0
1.25.11	v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient.	1.25.0
1.25.7	v1.25	• Adapts to CCE clusters of version 1.25. • Modifies the memory request and limit of a customized flavor. • Enables to report an event indicating that scaling cannot be performed in a node pool with auto scaling disabled. • Fixes the bug that NPU node scale-out is triggered again during scale-out.	1.25.0

Table 4-17 Updates of autoscaler adapted to clusters v1.23

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.23.44	v1.23	• Optimizes the method of identifying GPUs and NPUs. • Uses the remaining node quota of a cluster for the extra nodes that are beyond the cluster scale.	1.23.0
1.23.31	v1.23	• Fixes the issue that the autoscaler's least-waste is disabled by default. • Fixes the issue that the node pool cannot be switched to another pool for scaling out after a scale-out failure and the add-on has to restart. • The default taint tolerance duration is changed to 60s. • Fixes the issue that scale-out is still triggered after the scale-out rule is disabled.	1.23.0
1.23.21	v1.23	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient.	1.23.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.23.17	v1.23	• Supports NPUs and security containers. • Supports node scaling policies without a step. • Fixes a bug so that deleted node pools are automatically removed. • Supports scheduling by priority. • Supports the emptydir scheduling policy. • Fixes a bug so that scale-in can be triggered on the nodes whose capacity is lower than the scale-in threshold when the node scaling policy is disabled. • Modifies the memory request and limit of a customized flavor. • Enables to report an event indicating that scaling cannot be performed in a node pool with auto scaling disabled. • Fixes the bug that NPU node scale-out is triggered again during scale-out.	1.23.0
1.23.10	v1.23	• Optimizes logging. • Supports scale-in waiting so that operations such as data dump can be performed before a node is deleted.	1.23.0
1.23.9	v1.23	• Adds the **nodenetworkconfigs.crd.yangtse.cni** resource object permission.	1.23.0
1.23.8	v1.23	• Fixes the issue that scale-out fails when the number of nodes to be added at a time exceeds the upper limit in periodic scale-outs.	1.23.0
1.23.7	v1.23		1.23.0
1.23.3	v1.23	• Adapts to CCE clusters of version 1.23.	1.23.0

Table 4-18 Updates of autoscaler adapted to clusters v1.21

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.21.43	v1.21	• Optimizes the method of identifying GPUs and NPUs. • Uses the remaining node quota of a cluster for the extra nodes that are beyond the cluster scale.	1.21.0
1.21.29	v1.21	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient. • Fixes the issue that the node pool cannot be switched to another pool for scaling out after a scale-out failure and the add-on has to restart. • The default taint tolerance duration is changed to 60s. • Fixes the issue that scale-out is still triggered after the scale-out rule is disabled.	1.21.0
1.21.20	v1.21	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient.	1.21.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.21.16	v1.21	• Supports NPUs and security containers. • Supports node scaling policies without a step. • Fixes a bug so that deleted node pools are automatically removed. • Supports scheduling by priority. • Supports the emptydir scheduling policy. • Fixes a bug so that scale-in can be triggered on the nodes whose capacity is lower than the scale-in threshold when the node scaling policy is disabled. • Modifies the memory request and limit of a customized flavor. • Enables to report an event indicating that scaling cannot be performed in a node pool with auto scaling disabled. • Fixes the bug that NPU node scale-out is triggered again during scale-out.	1.21.0
1.21.9	v1.21	• Optimizes logging. • Supports scale-in waiting so that operations such as data dump can be performed before a node is deleted.	1.21.0
1.21.8	v1.21	• Adds the **nodenetworkconfigs.crd.yangtse.cni** resource object permission.	1.21.0
1.21.6	v1.21	• Fixes the issue that authentication fails due to incorrect signature in the add-on request retries.	1.21.0
1.21.4	v1.21	• Fixes the issue that authentication fails due to incorrect signature in the add-on request retries.	1.21.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.21.2	v1.21	• Fixes the issue that auto scaling may be blocked due to a failure in deleting an unregistered node.	1.21.0
1.21.1	v1.21	• Fixes the issue that the node pool modification in the existing periodic auto scaling rule does not take effect.	1.21.0

Table 4-19 Updates of autoscaler adapted to clusters v1.19

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.19.48	v1.19	• Optimizes the method of identifying GPUs and NPUs. • Uses the remaining node quota of a cluster for the extra nodes that are beyond the cluster scale.	1.19.0
1.19.35	v1.19	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient. • Fixes the issue that the node pool cannot be switched to another pool for scaling out after a scale-out failure and the add-on has to restart. • The default taint tolerance duration is changed to 60s. • Fixes the issue that scale-out is still triggered after the scale-out rule is disabled.	1.19.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.19.27	v1.19	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • Fixes the issue that the number of node pools cannot be restored when AS group resources are insufficient.	1.19.0
1.19.22	v1.19	• Supports NPUs and security containers. • Supports node scaling policies without a step. • Fixes a bug so that deleted node pools are automatically removed. • Supports scheduling by priority. • Supports the emptydir scheduling policy. • Fixes a bug so that scale-in can be triggered on the nodes whose capacity is lower than the scale-in threshold when the node scaling policy is disabled. • Modifies the memory request and limit of a customized flavor. • Enables to report an event indicating that scaling cannot be performed in a node pool with auto scaling disabled. • Fixes the bug that NPU node scale-out is triggered again during scale-out.	1.19.0
1.19.14	v1.19	• Optimizes logging. • Supports scale-in waiting so that operations such as data dump can be performed before a node is deleted.	1.19.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.19.13	v1.19	• Fixes the issue that scale-out fails when the number of nodes to be added at a time exceeds the upper limit in periodic scale-outs.	1.19.0
1.19.12	v1.19	• Fixes the issue that authentication fails due to incorrect signature in the add-on request retries.	1.19.0
1.19.11	v1.19	• Fixes the issue that authentication fails due to incorrect signature in the add-on request retries.	1.19.0
1.19.9	v1.19	• Fixes the issue that auto scaling may be blocked due to a failure in deleting an unregistered node.	1.19.0
1.19.8	v1.19	• Fixes the issue that the node pool modification in the existing periodic auto scaling rule does not take effect.	1.19.0
1.19.7	v1.19	• Regular upgrade of add-on dependencies	1.19.0
1.19.6	v1.19	• Fixes the issue that repeated scale-out is triggered when taints are asynchronously updated.	1.19.0
1.19.3	v1.19	• Supports scheduled scaling policies based on the total number of nodes, CPU limit, and memory limit. Fixes other functional defects.	1.19.0

Table 4-20 Updates of autoscaler adapted to clusters v1.17

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.17.27	v1.17	• Optimizes logging. • Fixes a bug so that deleted node pools are automatically removed. • Supports scheduling by priority. • Fixes the issue that taints on newly added nodes are overwritten. • Fixes a bug so that scale-in can be triggered on the nodes whose capacity is lower than the scale-in threshold when the node scaling policy is disabled. • Modifies the memory request and limit of a customized flavor. • Enables to report an event indicating that scaling cannot be performed in a node pool with auto scaling disabled.	1.17.0
1.17.22	v1.17	• Optimizes logging.	1.17.0
1.17.21	v1.17	• Fixes the issue that scale-out fails when the number of nodes to be added at a time exceeds the upper limit in periodic scale-outs.	1.17.0
1.17.19	v1.17	• Fixes the issue that authentication fails due to incorrect signature in the add-on request retries.	1.17.0
1.17.17	v1.17	• Fixes the issue that auto scaling may be blocked due to a failure in deleting an unregistered node.	1.17.0
1.17.16	v1.17	• Fixes the issue that the node pool modification in the existing periodic auto scaling rule does not take effect.	1.17.0
1.17.15	v1.17	• Unifies resource specification configuration unit.	1.17.0

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.17.14	v1.17	• Fixes the issue that repeated scale-out is triggered when taints are asynchronously updated.	1.17.0
1.17.8	v1.17	• Fixes bugs.	1.17.0
1.17.7	v1.17	• Adds log content and fixes bugs.	1.17.0
1.17.5	v1.17	• Supports clusters of version 1.17, and allows scaling events to be displayed on the CCE console.	1.17.0
1.17.2	v1.17	• Supports clusters of version 1.17.	1.17.0

4.4.6 nginx-ingress Release History

Table 4-21 nginx-ingress updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
2.2.3	v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs. • Adds the tolerance time during which the pods with temporary storage volumes cannot be scheduled. • The default taint tolerance duration is changed to 60s.	1.5.1
2.2.1	v1.25	• Adapts to CCE clusters of version 1.25. • Updates the add-on to its community version v1.5.1.	1.5.1
2.1.3	v1.19 v1.21 v1.23	• Enables publishService for nginx-ingress.	1.2.1

Add-on Version	Supported Cluster Version	New Feature	Community Version
2.1.1	v1.19 v1.21 v1.23	• Updates the add-on to its community version v1.2.1.	1.2.1
2.1.0	v1.19 v1.21 v1.23	• Updates the add-on to its community version v1.2.0. • Fixes the CVE-2021-25745 and CVE-2021-25746 vulnerabilities.	1.2.0
2.0.1	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23. • Updates the add-on to its community version v1.1.1.	1.1.1
1.3.2	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21. • Updates the add-on to its community version v0.49.3.	0.49.3
1.2.6	v1.15 v1.17 v1.19	• Adds the default seccomp profile.	0.46.0
1.2.5	v1.15 v1.17 v1.19	• Updates the add-on to its community version v0.46.0.	0.46.0
1.2.3	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	0.43.0
1.2.2	v1.15 v1.17	• Updates the add-on to its community version v0.43.0.	0.43.0

4.4.7 metrics-server Release History

Table 4-22 metrics-server updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.3.6	v1.19 v1.21 v1.23 v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs. • The default taint tolerance duration is changed to 60s.	0.6.2
1.3.3	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25. • Allows CronHPA to adjust the number of Deployments with the skip scenario supported.	0.6.2
1.3.2	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.	0.6.2
1.2.1	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.	0.4.4
1.1.10	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	0.4.4
1.1.4	v1.15 v1.17 v1.19	• Unifies resource specification configuration unit.	0.4.4
1.1.2	v1.15 v1.17 v1.19	• Updates the add-on to its community version v0.4.4.	0.4.4
1.1.1	v1.13 v1.15 v1.17 v1.19	• Allows you to change the maximum number of invalid pods to 1.	0.3.7

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.1.0	v1.13 v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	0.3.7
1.0.5	v1.13 v1.15 v1.17	• Updates the add-on to its community version v0.3.7.	0.3.7

4.4.8 cce-hpa-controller Release History

Table 4-23 cce-hpa-controller updates

Add-on Version	Supported Cluster Version	New Feature
1.3.7	v1.19 v1.21 v1.23 v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs.
1.3.3	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25. • Allows CronHPA to adjust the number of Deployments with the skip scenario supported.
1.3.1	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.
1.2.12	v1.15 v1.17 v1.19 v1.21	• Optimizes the add-on performance to reduce resource consumption.
1.2.11	v1.15 v1.17 v1.19 v1.21	• Enables the Kubernetes metrics API to obtain resource metrics. • Takes not-ready pods into consideration when calculating resource usage.

Add-on Version	Supported Cluster Version	New Feature
1.2.10	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.
1.2.4	v1.15 v1.17 v1.19	• Regular upgrade of add-on dependencies • Allows custom add-on resource specifications.
1.2.3	v1.15 v1.17 v1.19	• Supports ARM64 nodes.
1.2.2	v1.15 v1.17 v1.19	• Enhances the health check function.
1.2.1	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.19. • Updates the add-on to a stable version.
1.1.3	v1.15 v1.17	• Supports periodic scaling rules.

4.4.9 virtual-kubelet Release History

Table 4-24 virtual-kubelet updates

Add-on Version	Supported Cluster Version	New Feature
1.3.25	v1.17 v1.19 v1.21 v1.23	• Supports Downward API volumes. • Supports Projected volumes. • Supports custom StorageClass.
1.3.19	v1.17 v1.19 v1.21 v1.23	• Supports schedule profile.

Add-on Version	Supported Cluster Version	New Feature
1.3.7	v1.17 v1.19 v1.21 v1.23	• Supports clusters of v1.21 and v1.23.
1.2.12	v1.13 v1.15 v1.17 v1.19	• Adds some metrics. • Supports HPA and CustomedHPA. • Enables the hostPath in the pod that is scaled to CCI to be converted to other types of storage. • Fixes an issue that the Kubernetes dashboard cannot run on terminals.
1.2.5	v1.13 v1.15 v1.17 v1.19	• Automatically clears CCI resources that are no longer used by pods. • **Requests** and **Limits** can be set to different values. When CCI is scaled, the number of applied resources is subject to **Limits**. • Fixes the issue that the add-on fails to be uninstalled when the CCI namespace does not exist. • Adds the function of intercepting creation requests when the pod specifications exceed the CCI limit.

Add-on Version	Supported Cluster Version	New Feature
1.2.0	v1.13 v1.15 v1.17 v1.19	• Supports clusters of version 1.19. • Supports SFS and SFS Turbo storage. • Supports CronJob. • Supports envFrom configuration. • Supports automatic logs dumping. • Shields TCPSocket health check. • Supports resource tags (pod-tag). • Improves performance and reliability. • Resolves some known issues.
1.0.5	v1.13 v1.15 v1.17	• Supports clusters of version 1.17.

4.4.10 gpu-beta (gpu-device-plugin) Release History

Table 4-25 gpu-beta (gpu-device-plugin) updates

Add-on Version	Supported Cluster Version	New Feature
1.2.28	v1.19 v1.21 v1.23 v1.25	• Adapts to Ubuntu 22.04. • Optimizes the automatic mounting of the GPU driver directory.
1.2.24	v1.19 v1.21 v1.23 v1.25	• Enables the node pool to configure GPU driver versions. • Supports GPU metric collection.
1.2.20	v1.19 v1.21 v1.23 v1.25	• Sets the add-on alias to **gpu**.

Add-on Version	Supported Cluster Version	New Feature
1.2.17	v1.15 v1.17 v1.19 v1.21 v1.23	• Adds the nvidia-driver-install pod limits configuration.
1.2.15	v1.15 v1.17 v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.
1.2.11	v1.15 v1.17 v1.19 v1.21	• Supports EulerOS 2.10.
1.2.10	v1.15 v1.17 v1.19 v1.21	• CentOS supports the GPU driver of the new version.
1.2.9	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.
1.2.2	v1.15 v1.17 v1.19	• Supports the new EulerOS kernel.
1.2.1	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.19. • Adds taint tolerance configuration.
1.1.13	v1.13 v1.15 v1.17	• Supports kernel-3.10.0-1127.19.1.el7.x86_64 for CentOS 7.6.
1.1.11	v1.15 v1.17	• Allows users to customize driver addresses to download drivers. • Supports clusters v1.15 and v1.17.

4.4.11 huawei-npu Release History

Table 4-26 huawei-npu updates

Add-on Version	Supported Cluster Version	New Feature
1.2.5	v1.19 v1.21 v1.23 v1.25	• Supports automatical installation of NPU drivers.
1.2.4	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.
1.2.2	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.
1.2.1	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.
1.1.8	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.
1.1.2	v1.15 v1.17 v1.19	• Adds the default seccomp profile.
1.1.1	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.15.
1.1.0	v1.17 v1.19	• Adapts to CCE clusters of version 1.19.
1.0.8	v1.13 v1.15 v1.17	• Adapts to the D310 C75 driver.

Add-on Version	Supported Cluster Version	New Feature
1.0.6	v1.13 v1.15 v1.17	• Supports the Ascend C75 driver.
1.0.5	v1.13 v1.15 v1.17	• Allows containers to use Huawei NPU add-ons.
1.0.3	v1.13 v1.15 v1.17	• Allows containers to use Huawei NPU add-ons.

4.4.12 volcano Release History

Table 4-27 volcano updates

Add-on Version	Supported Cluster Version	New Feature
1.10.5	v1.19.16 v1.21 v1.23 v1.25	• The volcano agent supports resource oversubscription. • Adds the verification admission for GPUs. The value of **nvidia.com/gpu** must be less than 1 or a positive integer, and the value of **volcano.sh/gpu-core.percentage** must be less than 100 and a multiple of 5. • Fixes the issue that pod scheduling is slow after PVC binding fails. • Fixes the issue that newly added pods cannot run when there are terminating pods on a node for a long time. • Fixes the issue that volcano restarts when creating or mounting PVCs to pods.

Add-on Version	Supported Cluster Version	New Feature
1.9.1	v1.19.16 v1.21 v1.23 v1.25	• Fixes the issue that the counting pipeline pod of the networkresource add-on occupies supplementary network interfaces (Sub-ENI). • Fixes the issue where the binpack add-on scores nodes with insufficient resources. • Fixes the issue of processing resources in the pod with unknown end status. • Optimizes event output. • Supports HA deployment by default.
1.7.2	v1.19.16 v1.21 v1.23 v1.25	• Adapts to clusters of version 1.25. • Improves scheduling performance of volcano.
1.7.1	v1.19.16 v1.21 v1.23 v1.25	Adapts to clusters of version 1.25.
1.4.7	v1.15 v1.17 v1.19 v1.21	Deletes the pod status Undetermined to adapt to cluster Autoscaler.
1.4.5	v1.17 v1.19 v1.21	• Changes the deployment mode of volcano-scheduler from **statefulset** to **deployment**, and fixes the issue that pods cannot be automatically migrated when the node is abnormal.
1.4.2	v1.15 v1.17 v1.19 v1.21	• Resolves the issue that cross-GPU allocation fails. • Supports the updated EAS API.

Add-on Version	Supported Cluster Version	New Feature
1.3.7	v1.15 v1.17 v1.19 v1.21	• Supports hybrid deployment of online and offline jobs and resource oversubscription. • Optimizes the scheduling throughput for clusters. • Fixes the issue where the scheduler panics in certain scenarios. • Fixes the issue that the volumes.secret verification of the volcano job in the CCE clusters of version 1.15 fails. • Fixes the issue that jobs fail to be scheduled when volumes are mounted.
1.3.3	v1.15 v1.17 v1.19 v1.21	• Fixes the scheduler crash caused by GPU exceptions and the privileged init container admission failure.
1.3.1	v1.15 v1.17 v1.19	• Upgrades the volcano framework to the latest version. • Supports Kubernetes v1.19. • Adds the numa-aware add-on. • Fixes the deployment scaling issue in the multi-queue scenario. • Adjusts the algorithm add-on enabled by default.
1.2.5	v1.15 v1.17 v1.19	• Fixes the OutOfcpu issue in some scenarios. • Fixes the issue that pods cannot be scheduled when some capabilities are set for a queue. • Makes the log time of the volcano component consistent with the system time. • Fixes the issue of preemption between multiple queues. • Fixes the issue that the result of the ioaware add-on does not meet the expectation in some extreme scenarios. • Supports hybrid clusters.

Add-on Version	Supported Cluster Version	New Feature
1.2.3	v1.15 v1.17 v1.19	• Fixes the training task OOM issue caused by insufficient precision. • Fixes the GPU scheduling issue in CCE v1.15 and later versions. Rolling upgrade of CCE versions during task distribution is not supported. • Fixes the issue where the queue status is unknown in certain scenarios. • Fixes the issue where a panic occurs when a PVC is mounted to a job in a specific scenario. • Fixes the issue that decimals cannot be configured for GPU jobs. • Adds the ioaware add-on. • Adds the ring controller.

4.4.13 dew-provider Release History

Table 4-28 dew-provider updates

Add-on Version	Supported Cluster Version	New Feature
1.0.3	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.
1.0.2	v1.19 v1.21 v1.23	• Adapts to CCE clusters of version 1.23.
1.0.1	v1.19 v1.21	• Actively detects SecretProviderClass object changes.

4.4.14 dolphin Release History

Table 4-29 dolphin updates

Add-on Version	Supported Cluster Version	New Feature
1.2.2	v1.19 v1.21 v1.23 v1.25	• Supports health check for pod VPCs.
1.1.8	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.
1.1.6	v1.19 v1.21 v1.23	• Optimizes liveness health check.
1.1.5	v1.19 v1.21 v1.23	• Optimizes liveness health check.
1.1.2	v1.19 v1.21 v1.23	• Supports wide matching of operating system types.
1.0.1	v1.19 v1.21	• Supports traffic statistics persistence and local socket communications.

4.4.15 node-local-dns Release History

Table 4-30 node-local-dns updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.2.7	v1.19 v1.21 v1.23 v1.25	• Supports anti-affinity scheduling of pods on nodes in different AZs.	1.21.1

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.2.4	v1.19 v1.21 v1.23 v1.25	• Adapts to CCE clusters of version 1.25.	1.21.1
1.2.2	v1.19 v1.21 v1.23	• Supports customized NodeLocal DNSCache specifications.	1.21.1

4.4.16 kube-prometheus-stack Release History

Table 4-31 kube-prometheus-stack updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
3.7.3	v1.17 v1.19 v1.21 v1.23 v1.25	Supports collection of pod metrics on Virtual Kubelet.	**2.35.0**
3.7.2	v1.17 v1.19 v1.21 v1.23 v1.25	Supports collection of pod metrics on Virtual Kubelet.	**2.35.0**
3.7.1	v1.17 v1.19 v1.21 v1.23 v1.25	Supports PrometheusAgent.	**2.35.0**
3.6.6	v1.17 v1.19 v1.21 v1.23 v1.25	• Grafana is upgraded to 7.5.17. • Supports containerd nodes.	**2.35.0**

Add-on Version	Supported Cluster Version	New Feature	Community Version
3.5.1	v1.17 v1.19 v1.21 v1.23	Updates the add-on to its community version v2.35.0.	2.35.0
3.5.0	v1.17 v1.19 v1.21 v1.23	Updates the add-on to its community version v2.35.0.	2.35.0

4.4.17 log-agent Release History

Table 4-32 log-agent updates

Add-on Version	Supported Cluster Version	New Feature
1.3.2	v1.17 v1.19 v1.21 v1.23 v1.25	Supports reporting Kubernetes events to AOM.
1.3.0	v1.17 v1.19 v1.21 v1.23 v1.25	Supports clusters v1.25.
1.2.3	v1.17 v1.19 v1.21 v1.23	log-agent is a cloud native log collection add-on built on open source Fluent Bit and OpenTelemetry and supports CRD-based log collection policies. It collects and forwards standard container output logs, container file logs, node logs, and Kubernetes event logs in a cluster following your rules.

Add-on Version	Supported Cluster Version	New Feature
1.2.2	v1.17 v1.19 v1.21 v1.23	log-agent is a cloud native log collection add-on built on open source Fluent Bit and OpenTelemetry and supports CRD-based log collection policies. It collects and forwards standard container output logs, container file logs, node logs, and Kubernetes event logs in a cluster following your rules.

4.4.18 e-backup (EOM) Release History

Table 4-33 e-backup updates

Add-on Version	Supported Cluster Version	New Feature
1.2.0	v1.15 v1.17 v1.19 v1.21	• Supports EulerOS 2.0 (SP5, SP9). • Supports security hardening. • Optimizes functions.

4.4.19 web-terminal (EOM) Release History

Table 4-34 web-terminal updates

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.1.12	v1.15 v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	0.6.6
1.1.6	v1.15 v1.17 v1.19	• Adds the default seccomp profile.	0.6.6
1.1.5	v1.15 v1.17 v1.19	• Adapts to CCE clusters of version 1.15.	0.6.6

Add-on Version	Supported Cluster Version	New Feature	Community Version
1.1.3	v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	0.6.6
1.0.6	v1.15 v1.17	• Adds pod security policies.	0.6.6
1.0.5	v1.9 v1.11 v1.13 v1.15 v1.17	• Supports clusters of version 1.17.	0.6.6

4.4.20 prometheus Release History (End of Maintenance)

Table 4-35 prometheus updates

Add-On Version	Supported Cluster Version	New Feature	Community Version
2.23.32	v1.17 v1.19 v1.21	-	2.10.0
2.23.31	v1.15	• Adapts to CCE clusters of version 1.15.	2.10.0
2.23.30	v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	2.10.0
2.21.14	v1.17 v1.19 v1.21	• Adapts to CCE clusters of version 1.21.	2.10.0
2.21.12	v1.15	• Adapts to CCE clusters of version 1.15.	2.10.0
2.21.11	v1.17 v1.19	• Adapts to CCE clusters of version 1.19.	2.10.0
1.15.1	v1.15 v1.17	• The add-on is a monitoring system and time series library.	2.10.0
