Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

Specifies whether a new role is SYSADMIN, which has the highest permission. The default value is **NOSYSADMIN**.

When separation of duties is disabled, users with the SYSADMIN permission can create users with the SYSADMIN, REPLICATION, CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

Specifies whether a role is a MONADMIN.

The default value is **NOMONADMIN**.

- **OPRADMIN | NOOPRADMIN**

Specifies whether a role is an OPRADMIN.

The default value is **NOOPRADMIN**.

- **POLADMIN | NOPOLADMIN**

Specifies whether a role is a POLADMIN.

The default value is **NOPOLADMIN**.

- **AUDITADMIN | NOAUDITADMIN**

Specifies whether a role has the audit and management attributes.

The default value is **NOAUDITADMIN**.

- **CREATEDB | NOCREATEDB**

Specifies a role's permission to create databases.

A new role does not have the permission to create databases.

The default value is **NOCREATEDB**.

- **USEFT | NOUSEFT**

This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the **CREATEROLE** permission can also modify and delete other roles.

The default value is **NOCREATEROLE**.

When separation of duties is disabled, users with the **CREATEROLE** permission can create users with the **CREATEROLE**, **AUDITADMIN**, **MONADMIN**, **POLADMIN**, or **CREATEDB** permission and common users.

When separation of duties is enabled, users with the **CREATEROLE** permission can create users with the **CREATEROLE**, **MONADMIN**, **POLADMIN**, or **CREATEDB** permission and common users.

- **INHERIT | NOINHERIT**

Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

Specifies whether a role is allowed to log in to a database. A role with the **LOGIN** attribute can be considered as a user.

The default value is **NOLOGIN**.

- **REPLICATION | NOREPLICATION**

Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role with **REPLICATION** attribute is specific to replication.

The default value is **NOREPLICATION**.

- **VCADMIN | NOVADMIN**

This parameter has no actual meaning.

- **PERSISTENCE | NOPERSISTENCE**

Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the **PERSISTENCE** attribute.

- **CONNECTION LIMIT**

Specifies how many concurrent connections the role can make.

---

**NOTICE**

- System administrators are not restricted by this parameter.
- The number of concurrent connections of each primary database node is calculated separately (which is the value of **connlimit**). Number of all connections of the database = Value of **connlimit** x Number of normal primary database nodes.

---

Value range: an integer in the range  $[-1, 2^{31}-1]$ . The default value is **-1**, indicating that there is no limit.

- **VALID BEGIN**  
Sets a date and time when the role's password takes effect. If this clause is omitted, the password takes effect immediately.
- **VALID UNTIL**  
Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the password will be valid for all time.
- **USER GROUP**  
Creates a sub-user. This function is not supported in the current version.
- **PERM SPACE**  
Sets the space available for a user.
- **TEMP SPACE**  
Sets the space allocated to the temporary table of a user.
- **SPILL SPACE**  
Sets the operator disk flushing space of a user.
- **NODE GROUP**  
Name of the node group associated with a user. This function is not supported in the current version.
- **IN ROLE**  
Lists one or more existing roles to which the new role will be immediately added as a new member. It is not recommended.
- **IN GROUP**  
Specifies an obsolete spelling of IN ROLE. It is not recommended.
- **ROLE**  
Lists one or more existing roles which are automatically added as members of the new role.
- **ADMIN**  
Similar to ROLE. However, ADMIN grants permissions of new roles to other roles.
- **USER**  
Specifies an obsolete spelling of the ROLE clause.
- **SYSID**

The SYSID clause is ignored.

- **DEFAULT TABLESPACE**

The DEFAULT TABLESPACE clause is ignored.

- **PROFILE**

The PROFILE clause is ignored.

- **PGUSER**

In the current version, this attribute is reserved only for forward compatibility.

## Examples

```
-- Create a role manager whose password is *****.
openGauss=# CREATE ROLE manager IDENTIFIED BY '*****';

-- Create a role with its validity from January 1, 2015 to January 1, 2026.
openGauss=# CREATE ROLE miriam WITH LOGIN PASSWORD '*****' VALID BEGIN '2015-01-01' VALID
UNTIL '2026-01-01';

-- Change the password of role manager to *****.
openGauss=# ALTER ROLE manager IDENTIFIED BY '*****' REPLACE '*****';

-- Change role manager to SYSADMIN.
openGauss=# ALTER ROLE manager SYSADMIN;

-- Drop role manager.
openGauss=# DROP ROLE manager;

-- Drop role miriam.
openGauss=# DROP GROUP miriam;
```

## 7.13.65 CREATE ROW LEVEL SECURITY POLICY

### Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running **ALTER TABLE... ENABLE ROW LEVEL SECURITY**). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (SELECT, UPDATE, and DELETE) of data tables and does not affect the write (INSERT and MERGE INTO) of data tables. The table owner or system administrators can create an expression in the USING clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the expression returns **TRUE**, the tuple is visible to the current user; if the expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that **SELECT**, **UPDATE**, and **DELETE**

will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user who will be affected.

## Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and local temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

## Syntax

```
CREATE [ROW LEVEL SECURITY] POLICY policy_name ON table_name
[AS { PERMISSIVE | RESTRICTIVE }]
[FOR { ALL | SELECT | UPDATE | DELETE }]
[TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...]]
USING (using_expression)
```

## Parameters

- **policy\_name**  
Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.
- **table\_name**  
Specifies the name of a table to which a row-level security policy is applied.
- **PERMISSIVE | RESTRICTIVE**  
**PERMISSIVE** enables the permissive policy for row-level security. The conditions of the permissive policy are joined through the OR expression.  
**RESTRICTIVE** enables the restrictive policy for row-level security. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:  

```
(using_expression_permissive_1 OR using_expression_permissive_2 ...) AND
(using_expression_restrictive_1 AND using_expression_restrictive_2 ...)
```

  
The default value is **PERMISSIVE**.
- **command**  
Specifies the SQL operations limited by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering **SELECT**, **UPDATE**, and **DELETE**.

If *command* is set to **SELECT**, only tuple data that meets the condition (the return value of *using\_expression* is **TRUE**) can be queried. The operations that are affected include **SELECT**, **UPDATE.... RETURNING**, and **DELETE... RETURNING**.

If *command* is set to **UPDATE**, only tuple data that meets the condition (the return value of *using\_expression* is **TRUE**) can be updated. The operations that are affected include **UPDATE**, **UPDATE ... RETURNING**, and **SELECT ... FOR UPDATE/SHARE**.

If *command* is set to **DELETE**, only tuple data that meets the condition (the return value of *using\_expression* is **TRUE**) can be deleted. The operations that are affected include **DELETE** and **DELETE ... RETURNING**.

The following table describes the relationship between row-level security policies and SQL statements.

**Table 7-105** Relationship between row-level security policies and SQL statements.

| Command                        | SELECT/ALL policy | UPDATE/ALL policy | DELETE/ALL policy |
|--------------------------------|-------------------|-------------------|-------------------|
| <b>SELECT</b>                  | Existing row      | No                | No                |
| <b>SELECT FOR UPDATE/SHARE</b> | Existing row      | Existing row      | No                |
| <b>UPDATE</b>                  | No                | Existing row      | No                |
| <b>UPDATE RETURNING</b>        | Existing row      | Existing row      | No                |
| <b>DELETE</b>                  | No                | No                | Existing row      |
| <b>DELETE RETURNING</b>        | Existing row      | No                | Existing row      |

- **role\_name**

Specifies database users limited by a row-level security policy.

- **CURRENT\_USER**: username of the current operating environment.
- **SESSION\_USER**: session username.
- If this parameter is not specified, the default value **PUBLIC** will be used, indicating that all database users will be limited. You can specify multiple database users.

---

**NOTICE**

System administrators are not limited by the row-level security policy.

---

- **using\_expression**

Specifies an expression defined for a row-level security policy (return type: Boolean).

The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For SELECT, UPDATE, and DELETE, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the SELECT statement, update the tuple through the UPDATE statement, or delete the tuple through the DELETE statement.

## Examples

```
-- Create user alice.
openGauss=# CREATE USER alice PASSWORD '*****';

-- Create user bob.
openGauss=# CREATE USER bob PASSWORD '*****';

-- Create data table all_data.
openGauss=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
openGauss=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
openGauss=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
openGauss=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
openGauss=# GRANT SELECT ON all_data TO alice, bob;

-- Enable the row-level security policy.
openGauss=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;

-- Create a row-level security policy to specify that the current user can view only their own data.
openGauss=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role =
CURRENT_USER);

-- View information about the all_data table.
openGauss=# \d+ all_data
 Table "public.all_data"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id | integer | | plain | |
role | character varying(100) | | extended | |
data | character varying(100) | | extended | |
Row Level Security Policies:
 POLICY "all_data_rls"
 USING (((role)::name = "current_user"()))
Has OIDs: no
Options: orientation=row, enable_rowsecurity=true

-- Run SELECT.
openGauss=# SELECT * FROM all_data;
 id | role | data
-----+-----+-----
 1 | alice | alice data
 2 | bob | bob data
 3 | peter | peter data
(3 rows)

openGauss=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
 QUERY PLAN

Seq Scan on all_data
(1 row)

-- Switch to user alice and run SELECT.
```

```
openGauss=# SELECT * FROM all_data;
 id | role | data
-----+-----+-----
 1 | alice | alice data
(1 row)

openGauss=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
QUERY PLAN

Seq Scan on all_data
 Filter: ((role)::name = 'alice'::name)
Notice: This query is influenced by row level security feature
(3 rows)

-- Drop a row-level security policy.
openGauss=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Drop the all_data table.
openGauss=# DROP TABLE public.all_data;

-- Drop users alice and bob.
openGauss=# DROP USER alice, bob;
```

## Helpful Links

[DROP ROW LEVEL SECURITY POLICY](#) and [ALTER ROW LEVEL SECURITY POLICY](#)

## 7.13.66 CREATE RULE

### Description

Defines a new rewriting rule.

### Precautions

- To define or modify rules for a table, you must be the owner of the table.
- If multiple rules of the same type are defined for the same table, the rules are triggered one by one by name in alphabetical order.
- In the view, the RETURNING clause can be added to the INSERT, UPDATE, and DELETE rules to return columns by view. If a rule is triggered by the **INSERT RETURNING**, **UPDATE RETURNING**, or **DELETE RETURNING** command, these clauses are used to calculate the output result. If a rule is triggered by a command without RETURNING, the RETURNING clause of the rule is ignored. Currently, only unconditional INSTEAD rules can contain the RETURNING clause, and only one RETURNING clause can exist in all rules of one event. This ensures that only one RETURNING clause can be used for result calculation. If the RETURNING clause does not exist in any valid rule, the RETURNING query in this view will be rejected.
- Currently, ON SELECT rules must be unconditional INSTEAD rules and must have actions consisting of a single SELECT query. Therefore, an ON SELECT rule actually turns a table into a view whose visible content is the content returned by the **SELECT** command of the rule, rather than the content in the table (if any).

### Syntax

```
CREATE [OR REPLACE] RULE name AS ON event
 TO table_name [WHERE condition]
 DO [ALSO | INSTEAD] { NOTHING | command | (command ; command ...) }
```

Events include:

```
SELECT
INSERT
DELETE
UPDATE
```

## Parameters

- **name**  
Name of the created rule. It must be unique among all the rules for the same table.  
Value range: a string, which complies with the [Identifier Naming Conventions](#). A value can contain a maximum of 63 characters.
- **event**  
One of the SELECT, INSERT, UPDATE, and DELETE events.
- **table\_name**  
Name (optionally schema-qualified) of the table or view to which the rule applies.
- **condition**  
SQL condition expression that returns a Boolean value, which determines whether to execute the rule. Expressions cannot reference any table except **NEW** and **OLD**, and cannot have aggregate functions. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.
- **INSTEAD**  
**INSTEAD** indicates that the initial event is replaced with this command.
- **ALSO**  
**ALSO** indicates that the command should be executed after the initial event. If neither **ALSO** nor **INSTEAD** is specified, **ALSO** is the default value.
- **command**  
Command that composes the rule action. A valid command is one of the SELECT, INSERT, UPDATE, and DELETE statements.

## Examples

```
CREATE RULE "_RETURN" AS
ON SELECT TO t1
DO INSTEAD
SELECT * FROM t2;
```

### NOTICE

- The name specified after ON SELECT rules must be "\_RETURN".
- Currently, the ON SELECT rule must be INSTEAD SELECT, and the table specified by TO is converted to a view. The prerequisite is that the table is empty and does not have restrictions such as triggers, indexes, and child tables. That is, the table must be an initial empty table. Therefore, you are advised to create a view directly instead of using this method.

## 7.13.67 CREATE SCHEMA

### Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, CREATE SCHEMA can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the AUTHORIZATION clause is used, all the created objects are owned by this user.

### Precautions

- Only a user with the CREATE permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not a system administrator.

### Syntax

- Create a schema based on a specified name.  

```
CREATE SCHEMA schema_name
[AUTHORIZATION user_name] [schema_element [...]];
```
- Create a schema based on a username.  

```
CREATE SCHEMA AUTHORIZATION user_name [schema_element [...]];
```

### Parameters

- **schema\_name**  
Specifies the schema name.

---

#### NOTICE

The name must be unique.

The schema name cannot start with **pg\_**.

---

Value range: a string that complies with the [Identifier Naming Conventions](#).

- **AUTHORIZATION user\_name**  
Specifies the owner of a schema. If **schema\_name** is not specified, **user\_name** will be used as the schema name. In this case, **user\_name** can only be a role name.  
Value range: an existing username or role name.
- **schema\_element**  
Specifies an SQL statement defining an object to be created within the schema. Currently, only the CREATE TABLE, CREATE VIEW, CREATE INDEX,

CREATE PARTITION, CREATE SEQUENCE, CREATE TRIGGER, and GRANT clauses are supported.

Objects created by sub-commands are owned by the user specified by **AUTHORIZATION**.

#### NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH\_PATH** to check the schemas on the current search path.

## Examples

```
-- Create the role1 role.
openGauss=# CREATE ROLE role1 IDENTIFIED BY '*****1';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by
the clause is role1.
openGauss=# CREATE SCHEMA AUTHORIZATION role1
CREATE TABLE films (title text, release date, awards text[])
CREATE VIEW winners AS
SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Drop the schema.
openGauss=# DROP SCHEMA role1 CASCADE;
-- Drop the user.
openGauss=# DROP USER role1 CASCADE;
```

## Helpful Links

[ALTER SCHEMA](#) and [DROP SCHEMA](#)

## 7.13.68 CREATE SEQUENCE

### Function

**CREATE SEQUENCE** adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

### Precautions

- A sequence is a special table that stores arithmetic progressions. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views in the same schema.
- After the sequence is created, functions **nextval()** and **generate\_series(1,N)** insert data to the table. Make sure that the number of times for invoking **nextval** is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for invoking function **generate\_series()** is N+1.
- By default, the maximum value of **Sequence** is  $2^{63} - 1$ . If a large identifier is used, the maximum value can be  $2^{127} - 1$ .
- A user granted with the **CREATE ANY SEQUENCE** permission can create sequences in the public and user schemas.

## Syntax

```
CREATE [LARGE] SEQUENCE name [INCREMENT [BY] increment]
 [MINVALUE minvalue | NO MINVALUE | NOMINVALUE] [MAXVALUE maxvalue | NO MAXVALUE |
 NOMAXVALUE]
 [START [WITH] start] [CACHE cache] [[NO] CYCLE | NOCYCLE]
 [OWNED BY { table_name.column_name | NONE }];
```

## Parameter Description

- **name**  
Specifies the name of a sequence to be created.  
Value range: a sting containing only lowercase letters, uppercase letters, special characters #\_\$, and digits.
- **increment**  
Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.  
The default value is **1**.
- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**  
Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **-2<sup>63</sup>-1**. **NOMINVALUE** is equivalent to **NO MINVALUE**.
- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**  
Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is **2<sup>63</sup>-1**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.
- **start**  
Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**  
Specifies the number of sequences stored in the memory for quick access purposes.  
Default value **1** indicates that one sequence can be generated each time.  
  
 **NOTE**  
It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences.
- **CYCLE**  
Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.  
If **NO CYCLE** is specified, any invocation of **nextval** would return an error after the number of sequences reaches **maxvalue** or **minvalue**.  
**NOCYCLE** is equivalent to **NO CYCLE**.  
The default value is **NO CYCLE**.  
If **CYCLE** is specified, the sequence uniqueness cannot be ensured.

- **OWNED BY**

Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. **OWNED BY** only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

The default value **OWNED BY NONE** indicates that such association does not exist.

---

**NOTICE**

You are not advised to use the sequence created using **OWNED BY** in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

---

## Examples

Create an ascending sequence named **serial**, which starts from 101.

```
openGauss=# CREATE SEQUENCE serial
START 101
CACHE 20;
```

Select the next number from the sequence.

```
openGauss=# SELECT nextval('serial');
nextval

101
```

Select the next number from the sequence.

```
openGauss=# SELECT nextval('serial');
nextval

102
```

Create a sequence associated with the table.

```
openGauss=# CREATE TABLE customer_address
(
 ca_address_sk integer not null,
 ca_address_id char(16) not null,
 ca_street_number char(10) ,
 ca_street_name varchar(60) ,
 ca_street_type char(15) ,
 ca_suite_number char(10) ,
 ca_city varchar(60) ,
 ca_county varchar(30) ,
 ca_state char(2) ,
 ca_zip char(10) ,
 ca_country varchar(20) ,
 ca_gmt_offset decimal(5,2) ,
 ca_location_type char(20)
);

openGauss=# CREATE SEQUENCE serial1
START 101
CACHE 20
```

```
OWNED BY customer_address.ca_address_sk;
-- Delete a table and sequences.
openGauss=# DROP TABLE customer_address;
openGauss=# DROP SEQUENCE serial cascade;
openGauss=# DROP SEQUENCE serial1 cascade;
```

## Helpful Links

[DROP SEQUENCE](#) and [ALTER SEQUENCE](#)

## 7.13.69 CREATE SERVER

### Function

Defines a new foreign server.

### Precautions

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

### Syntax

```
CREATE SERVER server_name
 FOREIGN DATA WRAPPER fdw_name
 OPTIONS ({ option_name ' value ' } [, ...]) ;
```

### Parameter Description

- **server\_name**  
Specifies the server name.  
Value range: a string containing no more than 63 characters
- **fdw\_name**  
Specifies the name of the foreign data wrapper.  
Value range: **dist\_fdw**, **log\_fdw**, and **file\_fdw**
- **OPTIONS ( { option\_name ' value ' } [, ...] )**  
Specifies options for the server. These options typically define the connection details of the server, but the actual names and values depend on the foreign data wrapper of the server.
  - Specifies the parameters for the foreign server. The detailed parameter description is as follows:
    - **encrypt**  
Specifies whether data is encrypted. This parameter is available only when **type** is **OBS**. The default value is **on**.  
Value range:
      - **on** indicates that data is encrypted and HTTPS is used for communication.
      - **off** indicates that data is not encrypted and HTTP is used for communication.

- **access\_key**  
Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the AK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.
- **secret\_access\_key**  
Specifies the secret key (SK) value (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the SK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

In addition to the connection parameters supported by libpq, the following parameters are provided:

- **fdw\_startup\_cost**  
Estimates the startup time required for a foreign table scan, including the time to establish a connection, analyze the request at the remote server, and generate a plan. The default value is **100**.
- **fdw\_tuple\_cost**  
Specifies the additional consumption when each tuple is scanned on a remote server. The value specifies the extra consumption of data transmission between servers. The default value is **0.01**.

## Examples

```
-- Create a server.
openGauss=# create server my_server foreign data wrapper log_fdw;
CREATE SERVER

-- Delete my_server.
openGauss=# DROP SERVER my_server;
DROP SERVER
```

## Helpful Links

[ALTER SERVER](#) and [DROP SERVER](#)

## 7.13.70 CREATE SYNONYM

### Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

### Precautions

- The user of a synonym should be its owner.
- If the schema name is specified, create a synonym in the specified schema. Otherwise create a synonym in the current schema.

- Database objects that can be accessed using synonyms include tables, views, functions, and stored procedures.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: SELECT, INSERT, UPDATE, DELETE, EXPLAIN, and CALL.
- You are advised not to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, an error message is displayed, indicating that the synonym has expired.

## Syntax

```
CREATE [OR REPLACE] SYNONYM synonym_name
FOR object_name;
```

## Parameters

- **synonym**  
Specifies the name of the synonym to be created, which can contain the schema name.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **object\_name**  
Specifies the name of an object that is associated (optionally with schema names).  
Value range: a string that complies with the [Identifier Naming Conventions](#).

### NOTE

**object\_name** can be the name of an object that does not exist.

### CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption function `gs_encrypt` and the decryption function `gs_decrypt` or use aliases to call the functions to prevent sensitive information leakage.

## Examples

```
-- Create schema ot.
openGauss=# CREATE SCHEMA ot;

-- Create table ot.t1 and its synonym t1.
openGauss=# CREATE TABLE ot.t1(id int, name varchar2(10));
openGauss=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Use synonym t1.
openGauss=# SELECT * FROM t1;
openGauss=# INSERT INTO t1 VALUES (1, 'ada'), (2, 'bob');
```

```
openGauss=# UPDATE t1 SET t1.name = 'cici' WHERE t1.id = 2;

-- Create synonym v1 and its associated view ot.v_t1.
openGauss=# CREATE SYNONYM v1 FOR ot.v_t1;
openGauss=# CREATE VIEW ot.v_t1 AS SELECT * FROM ot.t1;

-- Use synonym v1.
openGauss=# SELECT * FROM v1;

-- Create overloaded function ot.add and its synonym add.
openGauss=# CREATE OR REPLACE FUNCTION ot.add(a integer, b integer) RETURNS integer AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

openGauss=# CREATE OR REPLACE FUNCTION ot.add(a decimal(5,2), b decimal(5,2)) RETURNS
decimal(5,2) AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

openGauss=# CREATE OR REPLACE SYNONYM add FOR ot.add;

-- Use synonym add.
openGauss=# SELECT add(1,2);
openGauss=# SELECT add(1.2,2.3);

-- Create stored procedure ot.register and its synonym register.
openGauss=# CREATE PROCEDURE ot.register(n_id integer, n_name varchar2(10))
SECURITY INVOKER
AS
BEGIN
 INSERT INTO ot.t1 VALUES(n_id, n_name);
END;
/

openGauss=# CREATE OR REPLACE SYNONYM register FOR ot.register;

-- Use synonym register to call the stored procedure.
openGauss=# CALL register(3,'mia');

-- Drop synonyms.
openGauss=# DROP SYNONYM t1;
openGauss=# DROP SYNONYM IF EXISTS v1;
openGauss=# DROP SYNONYM IF EXISTS add;
openGauss=# DROP SYNONYM register;
openGauss=# DROP SCHEMA ot CASCADE;
```

## Helpful Links

[ALTER SYNONYM](#) and [DROP SYNONYM](#)

## 7.13.71 CREATE TABLE

### Description

Creates an initially empty table in the current database. The table will be owned by the creator.

## Precautions

- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.
- When JDBC is used, the **DEFAULT** value can be set through **PreparedStatement**.
- A user granted with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.

## Syntax

Create a table.

```
CREATE [[GLOBAL | LOCAL] [TEMPORARY | TEMP] | UNLOGGED] TABLE [IF NOT EXISTS] table_name
 ({ column_name data_type [COLLATE collation] [column_constraint [...]]
 | table_constraint
 | LIKE source_table [like_option [...]] }
 [, ...])
 [WITH ({storage_parameter = value} [, ...])]
 [ON COMMIT { PRESERVE ROWS | DELETE ROWS | DROP }]
 [TABLESPACE tablespace_name];
```

- **column\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ NOT NULL |
 NULL |
 CHECK (expression) |
 DEFAULT default_expr |
 GENERATED ALWAYS AS (generation_expr) STORED |
 UNIQUE index_parameters |
 PRIMARY KEY index_parameters |
 REFERENCES reftable [(refcolumn)] [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE]
 [ON DELETE action] [ON UPDATE action] }
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **table\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ CHECK (expression) |
 UNIQUE (column_name [, ...]) index_parameters |
 PRIMARY KEY (column_name [, ...]) index_parameters |
 FOREIGN KEY (column_name [, ...]) REFERENCES reftable [(refcolumn [, ...])]
 [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE] [ON DELETE action] [ON UPDATE action]
 |
 PARTIAL CLUSTER KEY (column_name [, ...]) }
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **like\_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
 COMMENTS | PARTITION | REOPTIONS | ALL }
```

- **index\_parameters** is as follows:

```
[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]
```

## Parameters

- **UNLOGGED**

If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, the data in the unlogged table is cleared after a conflict occurs, the OS is restarted, the database is

restarted, a switchover is performed, the power supply is cut off, or the database is restarted abnormally, which may cause data loss. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to an abnormal shutdown or other unexpected operations, users should rebuild indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using **ON COMMIT PRESERVE ROWS** or **ON COMMIT DELETE ROWS**. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

**NOTICE**

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schemas starting with **pg\_temp** or **pg\_toast\_temp**.
  - If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
  - If global temporary tables and indexes are being used by other sessions, do not perform **ALTER** or **DROP** (except the **ALTER INDEX index\_name REBUILD** command).
  - The DDL of a global temporary table affects only the user data and indexes of the current session. For example, TRUNCATE, REINDEX, and ANALYZE are valid only for the current session.
  - You can set the GUC parameter **max\_active\_global\_temporary\_table** to determine whether to enable the global temporary table function. If **max\_active\_global\_temporary\_table** is set to **0**, the global temporary table function is disabled.
  - A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
  - Temporary tables do not support switchover.
  - The global temporary table does not respond to automatic clearance. In persistent connection scenarios, you are advised to use the global temporary table in the ON COMMIT DELETE ROWS clause or periodically and manually execute the VACUUM statement. Otherwise, Clogs may not be recycled.
- 
- **IF NOT EXISTS**  
Sends a notice, but does not throw an error, if a table with the same name exists.
  - **table\_name**  
Specifies the name of the table to be created.

**NOTICE**

Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog\_** or **matviewmap\_**. Otherwise, some functions of the table are affected.

- 
- **column\_name**  
Specifies the name of a column to be created in the new table.
  - **data\_type**  
Specifies the data type of the column.
  - **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \***

**from pg\_collation;** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically copies all column names, their data types, and their NOT NULL constraints.

The new table and the source table are decoupled after creation is complete. Changes to the source table will not be applied to the new table, and it is not possible to include data of the new table in scans of the source table.

The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another LIKE clause, an error is reported.

- The default expressions are copied from the source table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- If **INCLUDING GENERATED** is specified, the generated expression of the source table column is copied to the new table. By default, the generated expression is not copied.
- The CHECK constraints are copied from the source table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. NOT NULL constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- Any indexes on the source table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the columns, constraints, and indexes of the source table are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the PARTITION BY clause. The default behavior is to exclude partition definition of the source table. If the source table has an index, you can use the INCLUDING PARTITION INCLUDING INDEXES syntax. If only INCLUDING INDEXES is used for a partitioned table, the target table will be defined as an ordinary table, but the index is a partitioned index. In this case, an error will be reported because ordinary tables do not support partitioned indexes.
- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the source table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING GENERATED**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.

## NOTICE

- If the source table contains a sequence with the serial, bigserial, smallserial, or largeserial data type, or a column in the source table is a sequence by default and the sequence is created for this table by using **CREATE SEQUENCE ... OWNED BY**, these sequences will not be copied to the new table, and another sequence specific to the new table will be created. This is different from earlier versions. To share a sequence between the source table and new table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are advised not to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in **CREATE TABLE ... LIKE** execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.
- **EXCLUDING** of a partitioned table must be used together with **INCLUDING ALL**, for example, **INCLUDING ALL EXCLUDING DEFAULTS**, except for **DEFAULTS** of the source partitioned table.

## • **WITH ( { storage\_parameter = value } [, ... ] )**

Specifies an optional storage parameter for a table or an index. The **WITH** clause for a table can contain **OIDS=TRUE** or **OIDS** to specify that each row in the new table is assigned an OID. If **OIDS=FALSE** is specified, no OID is assigned.

### NOTE

When using the numeric type of arbitrary precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

The description of parameters is as follows:

#### – **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100.

#### – **ORIENTATION**

Specifies the storage mode (row-store) of table data. This parameter cannot be modified once it is set.

Value range:

- **ROW** indicates that table data is stored in rows.

Row store applies to OLTP service and scenarios with a large number of point queries or addition/deletion operations.

Default value:

If an ordinary tablespace is specified, the default is **ROW**.

- **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.

---

 **CAUTION**

Currently, Ustore does not support the ultimate RTO replay mode. For a primary node, if **recovery\_parse\_workers** is set to a value greater than 1, an error is reported when Ustore tables are created. For a standby node, if the database contains Ustore tables, replay may fail and an error may be reported if the ultimate RTO function is enabled. In serious cases, data on the standby node may be damaged. In this case, you need to rebuild the standby node.

---

- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in append-only mode by default.

- **INIT\_TD**

Specifies the number of TDs to be initialized when a Ustore table is created. This parameter takes effect only when a Ustore table is created. You can run the **ALTER TABLE** command to change the parameter value.

Value ranges: 2–128. The default value is **4**.

- **segment**

The data is stored in segment-page mode. This parameter supports only row-store tables. Temporary tables and unlogged tables are not supported. Ustore is not supported.

Value range: **on** and **off**

Default value: **off**

- **parallel\_workers**

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32], int type. The value **0** indicates that this function is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

- hasuids

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

Value range: **on** and **off**

Default value: **off**

- min\_tuples

The optimizer selects the larger value of the estimated statistics and the parameter to calculate the data volume based on the estimation table of statistics.

Value range:  $[0, DBL\_MAX)$

**Default value: 0**

- **WITHOUT OIDS**

It is equivalent to **WITH(OIDS=FALSE)**.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS | DROP }**

**ON COMMIT** determines what to do when you commit a temporary table creation operation. The three options are as follows (but only **PRESERVE ROWS** and **DELETE ROWS** can be used):

- **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
- **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.
- **DROP**: The temporary table will be dropped at the end of the current transaction block. Only local temporary tables can be dropped. Global temporary tables cannot be dropped.

- **TABLESPACE tablespace\_name**

Specifies the tablespace where the new table is created. If it is not specified, the default tablespace is used.

- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column.

- **NOT NULL**

Specifies that the column value cannot be **NULL**.

- **NULL**

Specifies that the column value can be **NULL**, which is the default value.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK ( expression )**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is true or unknown; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

 **NOTE**

<>NULL and !=NULL are invalid in an expression. Change them to **is NOT NULL**.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match that of the column.

The default expression will be used in any INSERT operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **GENERATED ALWAYS AS ( generation\_expr ) STORED**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as an ordinary column.

 **NOTE**

- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
  - Default values cannot be specified for generated columns.
  - The generated column cannot be used as a part of the partition key.
  - Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint at the same time. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint at the same time.
  - The method of modifying and deleting generated columns is the same as that of ordinary columns. Delete the ordinary column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
  - The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
  - The permission control for generated columns is the same as that for ordinary columns.
- **UNIQUE index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.

For the purpose of a unique constraint, null is not considered equal.

- **PRIMARY KEY** *index\_parameters*

**PRIMARY KEY** ( *column\_name* [, ... ] ) *index\_parameters*

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-NULL values.

Only one primary key can be specified for a table.

- **REFERENCES** *reftable* [ ( *refcolumn* ) ] [ **MATCH** *matchtype* ] [ **ON DELETE** *action* ] [ **ON UPDATE** *action* ] ( *column constraint* )

**FOREIGN KEY** ( *column\_name* [, ... ] ) **REFERENCES** *reftable* [ ( *refcolumn* [, ... ] ) ] [ **MATCH** *matchtype* ] [ **ON DELETE** *action* ] [ **ON UPDATE** *action* ] ( *table constraint* )

The foreign key constraint requires that the group consisting of one or more columns in the new table should contain and match only the referenced column values in the referenced table. If **refcolumn** is omitted, the primary key of **reftable** is used. The referenced column should be the only column or primary key in the referenced table. A foreign key constraint cannot be defined between a temporary table and a permanent table.

There are three types of matching between a reference column and a referenced column:

- **MATCH FULL**: A column with multiple foreign keys cannot be NULL unless all foreign key columns are NULL.
- **MATCH SIMPLE** (default): Any unexpected foreign key column can be NULL.
- **MATCH PARTIAL**: This option is not supported currently.

In addition, when certain operations are performed on the data in the referenced table, the operations are performed on the corresponding columns in the new table. The ON DELETE clause specifies the operations to be executed after a referenced row in the referenced table is deleted. The ON UPDATE clause specifies the operation to be performed when the referenced column data in the referenced table is updated. Possible responses to the ON DELETE and ON UPDATE clauses are as follows:

- **NO ACTION** (default): When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is reported. If the constraint is deferrable and there are still any referenced rows, this error will occur when the constraint is checked.
- **RESTRICT**: When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. It is the same as **NO ACTION** except that the constraint is not deferrable.
- **CASCADE**: deletes any row that references the deleted row from the new table, or update the column value of the referenced row in the new table to the new value of the referenced column.
- **SET NULL**: sets the referenced columns to NULL.
- **SET DEFAULT**: sets the referenced columns to their default values.

- **DEFERRABLE | NOT DEFERRABLE**

Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the

transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, primary key constraints, and foreign key constraints accept this clause. All the other constraints are not deferrable.

#### NOTE

Ustore tables do not support the keywords **DEFERRABLE** and **INITIALLY DEFERRED**.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered by executing the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace\_name**

Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If this clause is not used, such index will be created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

```
-- Create a simple table.
openGauss=# CREATE TABLE tpcds.warehouse_t1
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
 W_CITY VARCHAR(60) ,
 W_COUNTY VARCHAR(30) ,
 W_STATE CHAR(2) ,
 W_ZIP CHAR(10) ,
 W_COUNTRY VARCHAR(20) ,
 W_GMT_OFFSET DECIMAL(5,2)
);

openGauss=# CREATE TABLE tpcds.warehouse_t2
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
 W_CITY VARCHAR(60) ,
 W_COUNTY VARCHAR(30) ,
 W_STATE CHAR(2) ,
 W_ZIP CHAR(10) ,
 W_COUNTRY VARCHAR(20) ,
 W_GMT_OFFSET DECIMAL(5,2)
);
```

```
-- Create a table and set the default value of the W_STATE column to GA.
openGauss=# CREATE TABLE tpcds.warehouse_t3
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
 W_CITY VARCHAR(60) ,
 W_COUNTY VARCHAR(30) ,
 W_STATE CHAR(2) DEFAULT 'GA',
 W_ZIP CHAR(10) ,
 W_COUNTRY VARCHAR(20) ,
 W_GMT_OFFSET DECIMAL(5,2)
);

-- Create a table and check whether the W_WAREHOUSE_NAME column is unique at the end of its
creation.
openGauss=# CREATE TABLE tpcds.warehouse_t4
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) UNIQUE DEFERRABLE,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
 W_CITY VARCHAR(60) ,
 W_COUNTY VARCHAR(30) ,
 W_STATE CHAR(2) ,
 W_ZIP CHAR(10) ,
 W_COUNTRY VARCHAR(20) ,
 W_GMT_OFFSET DECIMAL(5,2)
);

-- Create a table with its fill factor set to 70%.
openGauss=# CREATE TABLE tpcds.warehouse_t5
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
 W_CITY VARCHAR(60) ,
 W_COUNTY VARCHAR(30) ,
 W_STATE CHAR(2) ,
 W_ZIP CHAR(10) ,
 W_COUNTRY VARCHAR(20) ,
 W_GMT_OFFSET DECIMAL(5,2),
 UNIQUE(W_WAREHOUSE_NAME) WITH(fillfactor=70)
);

-- Alternatively, user the following syntax:
openGauss=# CREATE TABLE tpcds.warehouse_t6
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20) UNIQUE,
 W_WAREHOUSE_SQ_FT INTEGER ,
 W_STREET_NUMBER CHAR(10) ,
 W_STREET_NAME VARCHAR(60) ,
 W_STREET_TYPE CHAR(15) ,
 W_SUITE_NUMBER CHAR(10) ,
```

```
W_CITY VARCHAR(60)
W_COUNTY VARCHAR(30)
W_STATE CHAR(2)
W_ZIP CHAR(10)
W_COUNTRY VARCHAR(20)
W_GMT_OFFSET DECIMAL(5,2)
) WITH(fillfactor=70);

-- Create a table and specify that its data is not written to WALs.
openGauss=# CREATE UNLOGGED TABLE tpcds.warehouse_t7
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20)
 W_WAREHOUSE_SQ_FT INTEGER
 W_STREET_NUMBER CHAR(10)
 W_STREET_NAME VARCHAR(60)
 W_STREET_TYPE CHAR(15)
 W_SUITE_NUMBER CHAR(10)
 W_CITY VARCHAR(60)
 W_COUNTY VARCHAR(30)
 W_STATE CHAR(2)
 W_ZIP CHAR(10)
 W_COUNTRY VARCHAR(20)
 W_GMT_OFFSET DECIMAL(5,2)
);

-- Create a temporary table.

## Helpful Links

[ALTER TABLE](#), [DROP TABLE](#), and [CREATE TABLESPACE](#)

## Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table does not have the primary/standby mechanism. If the database is restarted due to a system fault or abnormal breakpoint, data in the unlogged table will be deleted, which may cause data loss. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of the current session.
- LIKE
  - The new table automatically inherits all column names, data types, and NOT NULL constraints from this table. The new table is irrelevant to the source table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the source table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to

exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.

- **LIKE INCLUDING CONSTRAINTS**
  - The CHECK constraints are copied from the source table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. NOT NULL constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- **LIKE INCLUDING INDEXES**
  - Any indexes on the source table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **LIKE INCLUDING STORAGE**
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- **LIKE INCLUDING COMMENTS**
  - If **INCLUDING COMMENTS** is specified, comments for the columns, constraints, and indexes of the source table are copied. The default behavior is to exclude comments.
- **LIKE INCLUDING PARTITION**
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the PARTITION BY clause. The default behavior is to exclude partition definition of the source table.

---

#### NOTICE

List and hash partitioned tables do not support LIKE INCLUDING PARTITION.

---

- **LIKE INCLUDING REOPTIONS**
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the source table.
- **LIKE INCLUDING ALL**
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.
- **ORIENTATION ROW**
  - Creates a row-store table. Row-store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row-store can improve the efficiency.

## 7.13.72 CREATE TABLE AS

### Description

Creates a table from the results of a query.

CREATE TABLE AS creates a table and fills it with data obtained using SELECT. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

CREATE TABLE AS queries a source table once and writes the data in a new table. The result in the query view changes with the source table. In contrast, the view re-computes and defines its SELECT statement at each query.

### Precautions

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.

### Syntax

```
CREATE [UNLOGGED] TABLE table_name
[(column_name [, ...])]
[WITH ({storage_parameter = value} [, ...])]
[TABLESPACE tablespace_name]
AS query
[WITH [NO] DATA];
```

### Parameters

- **UNLOGGED**

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, it is also insecure. After the database is restarted due to a conflict or abnormal shutdown, the data in the unlogged table is cleared. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are automatically unlogged as well.

- Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
- Troubleshooting: If data is missing in the indexes of unlogged tables due to an abnormal shutdown or other unexpected operations, users should rebuild indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using **ON COMMIT PRESERVE ROWS** or **ON COMMIT DELETE ROWS**. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schemas starting with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- If global temporary tables or indexes are being used by other sessions, do not perform **ALTER** or **DROP** on the tables or indexes.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

---

- **table\_name**

Specifies the name of the table to be created.

Value range: a string that complies with the [Identifier Naming Conventions](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string that complies with the [Identifier Naming Conventions](#).

- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. See details of parameters below.

- **FILLFACTOR**  
The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row-store tables.  
Value range: 10–100.
- **ORIENTATION**  
Value range:  
**COLUMN**: The data will be stored in columns.  
**ROW** (default value): The data will be stored in rows.
- **ON COMMIT { PRESERVE ROWS | DELETE ROWS | DROP }**  
**ON COMMIT** determines what to do when you commit a temporary table creation operation. The three options are as follows (but only **PRESERVE ROWS** and **DELETE ROWS** can be used):
  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
  - **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.
  - **DROP**: The temporary table will be dropped at the end of the current transaction block. Only local temporary tables can be dropped. Global temporary tables cannot be dropped.
- **TABLESPACE tablespace\_name**  
Specifies that the new table will be created in the **tablespace\_name** tablespace. If it is not specified, the default tablespace is used.
- **AS query**  
Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.
- **[ WITH [ NO ] DATA ]**  
Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.store_returns table.
openGauss=# CREATE TABLE tpcds.store_returns
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 sr_item_sk VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER
);
```

```
-- Insert a record into a table.
openGauss=# INSERT INTO tpcds.store_returns(W_WAREHOUSE_SK, W_WAREHOUSE_ID, sr_item_sk,
W_WAREHOUSE_SQ_FT) VALUES (1,
'AAAAAAAAABAAAAAA', '4800', '20');

-- Create the tpcds.store_returns_t1 table and insert numbers that are greater than 4795 into the
sr_item_sk column of the tpcds.store_returns table.
openGauss=# CREATE TABLE tpcds.store_returns_t1 AS SELECT * FROM tpcds.store_returns WHERE
sr_item_sk > '4795';

-- Copy tpcds.store_returns to create the tpcds.store_returns_t2 table.
openGauss=# CREATE TABLE tpcds.store_returns_t2 AS table tpcds.store_returns;

-- Drop the table.
openGauss=# DROP TABLE tpcds.store_returns_t1 ;
openGauss=# DROP TABLE tpcds.store_returns_t2 ;
openGauss=# DROP TABLE tpcds.store_returns;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

[CREATE TABLE](#) and [SELECT](#)

### 7.13.73 CREATE TABLE PARTITION

#### Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, interval partitioning, hash partitioning, and list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions. Currently, range partitioning only allows the use of the range partitioning policy.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

Interval partitioning is a special type of range partitioning. Compared with range partitioning, interval value definition is added. When no matching partition can be found for an inserted record, a partition can be automatically created based on the interval value.

Interval partitioning supports only table-based partitioning of a list where the data type can be `TIMESTAMP[(p)] [WITHOUT TIME ZONE]`, `TIMESTAMP[(p)] [WITH TIME ZONE]` and `DATE`.

Interval partitioning policy: A record is mapped to a created partition based on the partition key value. If the record can be mapped to a created partition, the record is inserted into the corresponding partition. Otherwise, a partition is automatically created based on the partition key value and table definition information, and then the record is inserted into the new partition. The data range of the new partition is equal to the interval value.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values do not overlap in different partitions. Create a partition for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- When querying or updating most of the records in a partition, continuously scanning that partition instead of accessing the entire table can achieve a significant performance improvement.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or deleting that partition. This not only improves performance but also avoids the `VACUUM` overload caused by bulk `DELETE` operations (hash partitions cannot be deleted).

## Precautions

- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning and list partitioning support only single-column partitioning, and do not support multi-column partitioning.
- When you have the `INSERT` permission on an interval partitioned table, partitions can be automatically created when you run `INSERT` to write data to the table.

- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 1048575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient memory. Create partitions based on the value of **local\_syscache\_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.
- Currently, the statement specifying a partition cannot perform global index scan.

## Syntax

```
CREATE TABLE [IF NOT EXISTS] partition_table_name
([
 { column_name data_type [COLLATE collation] [column_constraint [...]]
 | table_constraint
 | LIKE source_table [like_option [...]] }, ...]
)
[WITH ({storage_parameter = value} [, ...])]

[TABLESPACE tablespace_name]
PARTITION BY {
 {RANGE (partition_key) [INTERVAL ('interval_expr') [STORE IN (tablespace_name [, ...])]]
 (partition_less_than_item [, ...]) } |
 {RANGE (partition_key) [INTERVAL ('interval_expr') [STORE IN (tablespace_name [, ...])]]
 (partition_start_end_item [, ...]) } |
 {LIST (partition_key) (PARTITION partition_name VALUES (list_values) [TABLESPACE
tablespace_name][, ...]) } |
 {HASH (partition_key) (PARTITION partition_name [TABLESPACE tablespace_name][, ...]) }
} [{ ENABLE | DISABLE } ROW MOVEMENT];
```

- **column\_constraint:**

```
[CONSTRAINT constraint_name]
{ NOT NULL |
 NULL |
 CHECK (expression) |
 DEFAULT default_expr |
 GENERATED ALWAYS AS (generation_expr) STORED |
 UNIQUE index_parameters |
 PRIMARY KEY index_parameters |
 REFERENCES reftable [(refcolumn)] [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE]
 [ON DELETE action] [ON UPDATE action] }
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```
- **table\_constraint:**

```
[CONSTRAINT constraint_name]
{ CHECK (expression) |
 UNIQUE (column_name [, ...]) index_parameters |
 PRIMARY KEY (column_name [, ...]) index_parameters |
 FOREIGN KEY (column_name [, ...]) REFERENCES reftable [(refcolumn [, ...])]
 [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE] [ON DELETE action] [ON UPDATE
action] }
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```
- **like\_option:**

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | REOPTIONS | ALL }
```

- **index\_parameters:**  
[ WITH ( {storage\_parameter = value} [, ... ] ) ]  
[ USING INDEX TABLESPACE tablespace\_name ]
- **partition\_less\_than\_item:**  
PARTITION partition\_name VALUES LESS THAN ( { partition\_value | MAXVALUE } ) [TABLESPACE tablespace\_name]
- **partition\_start\_end\_item:**  
PARTITION partition\_name {  
    {START(partition\_value) END (partition\_value) EVERY (interval\_value)} |  
    {START(partition\_value) END ({partition\_value | MAXVALUE})} |  
    {START(partition\_value)} |  
    {END({partition\_value | MAXVALUE})}  
} [TABLESPACE tablespace\_name]

## Parameters

- **IF NOT EXISTS**  
Sends a notice instead of an error if tables have identical names. The notice prompts that the table relationship already exists.
- **partition\_table\_name**  
Specifies the name of a partitioned table.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **column\_name**  
Specifies the name of a column to be created in the new table.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **data\_type**  
Specifies the data type of the column.
- **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation;** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.
- **CONSTRAINT constraint\_name**  
Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.  
There are two ways to define constraints:
  - A column constraint is defined as part of a column definition, and it is bound to a particular column.
  - A table constraint is not bound to a particular column but can apply to more than one column.
- **LIKE source\_table [ like\_option ... ]**  
Specifies a table from which the new table automatically copies all column names, their data types, and their NOT NULL constraints.  
Unlike INHERITS, the new table and source table are decoupled after creation is complete. Changes to the source table will not be applied to the new table, and it is not possible to include data of the new table in scans of the source table.

- Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
  - If **INCLUDING GENERATED** is specified, the generated expression of the source table column is copied to the new table. By default, the generated expression is not copied.
  - NOT NULL constraints are always copied to the new table. CHECK constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.
  - Unlike those of **INHERITS**, the copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another LIKE clause, an error is reported.
  - Any indexes on the source table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the source table.
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.
- **WITH ( storage\_parameter [= value] [, ... ] )**  
Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:
    - **FILLFACTOR**  
The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.  
Value range: 10–100.
    - **ORIENTATION**  
Determines the data storage mode of the table.  
Value range:

- **COLUMN**: The data will be stored in columns.
- **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**ORIENTATION** cannot be modified.

---

– **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in append-only mode by default.

– **segment**

The data is stored in segment-page mode. This parameter supports only row-store tables. Temporary tables and unlogged tables are not supported. Ustore is not supported.

Value range: **on** and **off**

Default value: **off**

• **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If it is not specified, the default tablespace is used.

• **PARTITION BY RANGE(partition\_key)**

Creates a range partition. **partition\_key** is the name of the partition key.

(1) Assume that the VALUES LESS THAN syntax is used.

---

**NOTICE**

In this case, a maximum of four partition keys are supported.

---

Data types supported by the partition keys are as follows: SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, CHARACTER VARYING(*n*), VARCHAR(*n*), CHARACTER(*n*), CHAR(*n*), CHARACTER, CHAR, TEXT, NVARCHAR, NVARCHAR2, NAME, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE.

(2) Assume that the START END syntax is used.

#### NOTICE

If the START END clause is used, a range partitioning policy supports only a one-column partition key.

Data types supported by the partition key are as follows: SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.

(3) Assume that the INTERVAL syntax is used.

#### NOTICE

In this case, only one partition key is supported.

In this case, the data types supported by the partition key are TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE] and DATE.

- **PARTITION partition\_name VALUES LESS THAN ( { partition\_value | MAXVALUE } )**

Specifies the information of partitions. **partition\_name** is the name of a range partition. **partition\_value** is the upper limit of a range partition, and the value depends on the type of **partition\_key**. **MAXVALUE** usually specifies the upper limit of the last range partition.

#### NOTICE

- Each partition requires an upper limit.
- The data type of the upper limit must be the same as that of the partition key.
- In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.

- **PARTITION partition\_name {START (partition\_value) END (partition\_value) EVERY (interval\_value)} | {START (partition\_value) END (partition\_value|MAXVALUE)} | {START(partition\_value)} | {END (partition\_value | MAXVALUE)}**

Specifies the information of partitions.

- **partition\_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition\_name** is **p1**):
  - If **START+END+EVERY** is used, the names of partitions will be defined as **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1\_1**, **p1\_2**, and **p1\_3**. In this case, **p1** is a name prefix.
  - If the defined statement is in the first place and has **START** specified, the range (**MINVALUE**, **START**) will be automatically used as the first

actual partition, and its name will be **p1\_0**. The other partitions are then named **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1\_0**, **p1\_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.

- **partition\_value**: start value or end value of a range partition. The value depends on **partition\_key** and cannot be *MAXVALUE*.
- **interval\_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** - **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
- *MAXVALUE* usually specifies the upper limit of the last range partition.

---

**NOTICE**

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
  2. The START END syntax must comply with the following rules:
    - The value of **START** (if any, same for the following situations) in each **partition\_start\_end\_item** must be smaller than that of **END**.
    - In two adjacent **partition\_start\_end\_item** statements, the value of the first **END** must be equal to that of the second **START**.
    - The value of **EVERY** in each **partition\_start\_end\_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
    - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
    - Partitions created by the same **partition\_start\_end\_item** belong to the same tablespace.
    - If **partition\_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
    - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
  3. In statements for creating partitioned tables, START END and LESS THAN cannot be used together.
  4. The START END syntax in a partitioned table creation SQL statement will be replaced by the VALUES LESS THAN syntax when *gs\_dump* is executed.
- 
- **INTERVAL ('interval\_expr') [ STORE IN (tablespace\_name [, ... ] ) ]**  
Defines interval partitioning.
    - **interval\_expr**: interval for automatically creating partitions, for example, 1 day or 1 month.
    - **STORE IN (tablespace\_name [, ... ] )**: Specifies the list of tablespaces for storing automatically created partitions. If this parameter is specified, the

automatically created partitions are cyclically selected from the tablespace list. Otherwise, the default tablespace of the partitioned table is used.

- **PARTITION BY LIST(partition\_key)**

Create a list partition. **partition\_key** is the name of the partition key.

- For **partition\_key**, the list partitioning policy supports only one column of partition keys.
- For the clause syntax VALUES (list\_values), if **list\_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.

Partition keys support the following data types: INT1, INT2, INT4, INT8, NUMERIC, VARCHAR(*n*), CHAR, BPCHAR, NVARCHAR, NVARCHAR2, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition\_key)**

Create a hash partition. **partition\_key** is the name of the partition key.

For **partition\_key**, the hash partitioning policy supports only one column of partition keys.

Partition keys support the following data types: INT1, INT2, INT4, INT8, NUMERIC, VARCHAR(*n*), CHAR, BPCHAR, TEXT, NVARCHAR, NVARCHAR2, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

Specifies whether to enable row movement.

If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE** (default value): Row movement is enabled.
- **DISABLE**: Row movement is disabled.

If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

The old data is marked as deleted under the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, as well as UPDATE and DELETE concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.

If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.

If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the second operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

Specifies that the column value cannot be **NULL**. **ENABLE** can be omitted.

- **NULL**

Specifies that the column value can be **NULL**, which is the default value.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is true or unknown; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match that of the column.

The default expression will be used in any INSERT operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **GENERATED ALWAYS AS ( generation\_expr ) STORED**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as an ordinary column.

 **NOTE**

- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
  - Default values cannot be specified for generated columns.
  - The generated column cannot be used as a part of the partition key.
  - Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint at the same time. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint at the same time.
  - The method of modifying and deleting generated columns is the same as that of ordinary columns. Delete the ordinary column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
  - The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
  - The permission control for generated columns is the same as that for ordinary columns.
- **UNIQUE index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.
  - **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-NULL values.  
Only one primary key can be specified for a table.
  - **DEFERRABLE | NOT DEFERRABLE**  
Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, primary key constraints, and foreign key constraints accept this clause. All the other constraints are not deferrable.
  - **INITIALLY IMMEDIATE | INITIALLY DEFERRED**  
If a constraint is deferrable, this clause specifies the default time to check the constraint.
    - If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
    - If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.The constraint check time can be altered by executing the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace\_name**

Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If this clause is not used, such index will be created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create a range-partitioned table **tpcds.web\_returns\_p1**. The table has eight partitions and their partition keys are of the integer type. The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.web_returns table.
openGauss=# CREATE TABLE tpcds.web_returns
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20)

count

0
(1 row)

-- Query the number of rows in the P1 partition.
openGauss=# SELECT COUNT(*) FROM tpcds.web_returns_p1 PARTITION FOR (2450815);
count

0
(1 row)

-- Drop the tpcds.web_returns_p1 table.
openGauss=# DROP TABLE tpcds.web_returns_p1;

-- Drop the tpcds.web_returns table.
openGauss=# DROP TABLE tpcds.web_returns;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

- Example 2: Create a range-partitioned table **tpcds.web\_returns\_p2**. The table has eight partitions and their partition keys are of the integer type. The upper limit of the eighth partition is *MAXVALUE*.

The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

The tablespace of the **tpcds.web\_returns\_p2** partitioned table is **example1**. Partitions **P1** to **P7** have no specified tablespaces, and use the **example1**

tablespace of the **tpcds.web\_returns\_p2** partitioned table. The tablespace of the **P8** partitioned table is **example2**.

Assume that the following data directories of the database nodes are empty directories for which user **dwsadmin** has the read and write permissions: **/pg\_location/mount1/path1**, **/pg\_location/mount2/path2**, **/pg\_location/mount3/path3**, and **/pg\_location/mount4/path4**.

```
openGauss=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';
openGauss=# CREATE TABLESPACE example2 RELATIVE LOCATION 'tablespace2/tablespace_2';
openGauss=# CREATE TABLESPACE example3 RELATIVE LOCATION 'tablespace3/tablespace_3';
openGauss=# CREATE TABLESPACE example4 RELATIVE LOCATION 'tablespace4/tablespace_4';
```

-- Create a schema.

```
openGauss=# CREATE SCHEMA tpcds;
```

```
openGauss=# CREATE TABLE tpcds.web_returns_p2
```

```
(

## 7.13.74 CREATE TABLESPACE

### Description

Creates a tablespace in a database.

### Precautions

- A system administrator or a user who inherits permissions of the built-in role `gs_role_tablespace` can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If executing **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- For details about how to prepare for creating tablespaces, see the description of parameters below.
- You are advised not to use user-defined tablespaces. This is because user-defined tablespaces are usually used with storage media other than the main storage (storage device where the default tablespace is located, such as a disk) to isolate I/O resources that can be used by different services. Storage devices use standard configurations and do not have other available storage media. If the user-defined tablespace is not properly used, the system cannot run stably for a long time and the overall performance is affected. Therefore, you are advised to use the default tablespace.

## Syntax

```
CREATE TABLESPACE tablespace_name
[OWNER user_name] [RELATIVE] LOCATION 'directory' [MAXSIZE 'space_size']
[with_option_clause];
```

The with\_option\_clause syntax for creating an ordinary tablespace is as follows:

```
WITH ({filesystem= { 'general'| "general" | general} |
 random_page_cost = { 'value ' | value } |
 seq_page_cost = { 'value ' | value }}[,...])
```

## Parameters

- **tablespace\_name**  
Specifies name of a tablespace to be created.  
The tablespace name must be distinct from the name of any existing tablespace in the database and cannot start with "pg", which are reserved for system catalog spaces.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **OWNER user\_name**  
Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.  
Only system administrators can create tablespaces, but they can use the OWNER clause to assign ownership of tablespaces to non-system-administrators.  
Value range: a string. It must be the name an existing user.
- **RELATIVE**  
If this parameter is specified, a relative path is used. The location directory is relative to each CN/DN data directory.  
Directory hierarchy: *data directory/pg\_location/relative path* A relative path contains a maximum of two levels.  
If this parameter is not specified, the absolute tablespace path is used. The location directory must be an absolute path.
- **LOCATION directory**  
Specifies a directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:
  - The GaussDB system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
  - The directory must be an absolute path, and does not contain special characters, such as dollar sign (\$) and greater-than sign (>).
  - The directory cannot be specified under the database data directory.
  - The directory must be a local path.Value range: a string. It must be a valid directory.
- **MAXSIZE 'space\_size'**  
Specifies the maximum value of the tablespace in a single database node.  
Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot

exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **random\_page\_cost**

Specifies the cost of randomly reading the page overhead.

Value range: 0 to 1.79769e+308.

Default value: value of the GUC parameter **random\_page\_cost**

- **seq\_page\_cost**

Specifies the cost of reading the page overhead in specified order.

Value range: 0 to 1.79769e+308.

Default value: value of GUC parameter **seq\_page\_cost**

## Examples

```
-- Create a tablespace.
openGauss=# CREATE TABLESPACE ds_location1 RELATIVE LOCATION 'tablespace/tablespace_1';

-- Create user joe.
openGauss=# CREATE ROLE joe IDENTIFIED BY '*****!';

-- Create user jay.
openGauss=# CREATE ROLE jay IDENTIFIED BY '*****!';

-- Create a tablespace and set its owner to user joe.
openGauss=# CREATE TABLESPACE ds_location2 OWNER joe RELATIVE LOCATION 'tablespace/
tablespace_1';

-- Rename the ds_location1 tablespace to ds_location3.
openGauss=# ALTER TABLESPACE ds_location1 RENAME TO ds_location3;

-- Change the owner of the ds_location2 tablespace.
openGauss=# ALTER TABLESPACE ds_location2 OWNER TO jay;

-- Drop tablespaces.
openGauss=# DROP TABLESPACE ds_location2;
openGauss=# DROP TABLESPACE ds_location3;

-- Drop users.
openGauss=# DROP ROLE joe;
openGauss=# DROP ROLE jay;
```

## Suggestions

- create tablespace

You are advised not to create tablespaces in a transaction.

## 7.13.75 CREATE TABLE SUBPARTITION

### Description

Creates a level-2 partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a

partition. Data is stored on these physical partitions, instead of the logical partitioned table. For a level-2 partitioned table, the top-level node table and level-1 partitioned table are logical tables and do not store data. Only the level-2 partitioned (leaf node) stores data.

The partitioning solution of a level-2 partitioned table is a combination of the partitioning solutions of two level-1 partitions. For details about the partitioning solution of a level-1 partitioned table, see [CREATE TABLE PARTITION](#).

Common combination solutions for level-2 partitioned tables include range-range partitioning, range-list partitioning, range-hash partitioning, list-range partitioning, list-list partitioning, list-hash partitioning, hash-range partitioning, hash-list partitioning, and hash-hash partitioning. Currently, level-2 partitioned tables can only be row-store tables.

## Precautions

- A level-2 partitioned table has two partition keys, and each partition key supports only one column. The two partition keys cannot be the same column.
- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created. If a local unique index is created, all partition keys must be included.
- When a level-2 partitioned table is created, if the specified level-2 partition is not displayed under the level-1 partition, a level-2 partition with the same range is automatically created.
- The number of level-2 partitions (leaf nodes) in a level-2 partitioned table cannot exceed 1048575. There is no limit on the number of level-1 partitions, but there must be at least one level-2 partition under a level-1 partition.
- The maximum total number of partitions (including level-1 and level-2 partitions) in a level-2 partitioned table is 1048575. Generally, it is impossible for services to create so many partitions and the memory will be insufficient if so. Create partitions based on the value of **local\_syscache\_threshold**. The memory allocated to the level-2 partitioned tables can be calculated as follows: total number of partitions x 3/1024, in MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.
- Level-2 partitioned tables support only row store and do not support hash bucket.
- Clusters are not supported.
- When specifying a partition for query, for example, running **SELECT \* FROM tablename PARTITION/SUBPARTITION (partitionname)**, ensure that **PARTITION** and **SUBPARTITION** are correct. If they are incorrect, no error is reported during the query. In this case, the query is performed based on the table alias.
- Row-level security is not supported.
- In the **PARTITION FOR (values)** syntax for level-2 partitioned tables, values can only be constants.
- In the **PARTITION/SUBPARTITION FOR (values)** syntax for level-2 partitioned tables, if data type conversion is required for values, you are advised to use

forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.

- Currently, the statement specifying a partition cannot perform global index scan.

## Syntax

```
CREATE TABLE [IF NOT EXISTS] subpartition_table_name
(
{ column_name data_type [COLLATE collation] [column_constraint [...]]
| table_constraint
| LIKE source_table [like_option [...]] }, ...]
)

FOREIGN KEY (column_name [, ...]) REFERENCES reftable [(refcolumn [, ...])]
[MATCH FULL | MATCH PARTIAL | MATCH SIMPLE] [ON DELETE action] [ON UPDATE
action] }
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- like\_option:**

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | REOPTIONS | ALL }
```

- index\_parameters:**

```
[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]
```

## Parameters

- IF NOT EXISTS**

Sends a notice instead of an error if tables have identical names. The notice prompts that the table relationship already exists.

- subpartition\_table\_name**

Specifies the name of a level-2 partitioned table.

Value range: a string that complies with the [Identifier Naming Conventions](#).

- **column\_name**  
Specifies the name of a column to be created in the new table.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **data\_type**  
Specifies the data type of the column.
- **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT \* FROM pg\_collation;** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.
- **CONSTRAINT constraint\_name**  
Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.  
There are two ways to define constraints:
  - A column constraint is defined as part of a column definition, and it is bound to a particular column.
  - A table constraint is not bound to a particular column but can apply to more than one column.
- **LIKE source\_table [ like\_option ... ]**  
Level-2 partitioned tables do not support this function.
- **WITH ( storage\_parameter [= value] [, ... ] )**  
Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:
  - **FILLFACTOR**  
The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.  
Value range: 10-100.
  - **ORIENTATION**  
Determines the data storage mode of the table.  
Value range:
    - **COLUMN**: The data will be stored in columns.
    - **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**ORIENTATION** cannot be modified.

---

– **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

---

**NOTICE**

To use Ustore tables, you must enable the **track\_counts** and **track\_activities** parameters. Otherwise, space expansion occurs.

---

Default value:

If no table is specified, data is stored in append-only mode by default.

– **segment**

The data is stored in segment-page mode. This parameter supports only row-store tables. Temporary tables and unlogged tables are not supported. Ustore is not supported.

Value range: **on** and **off**

Default value: **off**

• **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If it is not specified, the default tablespace is used.

• **PARTITION BY {RANGE | LIST | HASH} (partition\_key)**

- For **partition\_key**, the partitioning policy supports only one column of partition keys.
- The data types supported by the partition key are the same as those supported by the level-1 partitioned table.

• **SUBPARTITION BY {RANGE | LIST | HASH} (subpartition\_key)**

- For **subpartition\_key**, the partitioning policy supports only one column of partition keys.
- The data types supported by the partition key are the same as those supported by the level-1 partitioned table.

• **{ ENABLE | DISABLE } ROW MOVEMENT**

Specifies whether to enable row movement.

If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE** (default value): Row movement is enabled.
- **DISABLE**: Row movement is disabled.

If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

The old data is marked as deleted under the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, UPDATE and DELETE concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.

If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.

If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the second operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

Specifies that the column value cannot be **NULL**. **ENABLE** can be omitted.

- **NULL**

Specifies that the column value can be **NULL**, which is the default value.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is true or unknown; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match that of the column.

The default expression will be used in any INSERT operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **GENERATED ALWAYS AS ( generation\_expr ) STORED**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as an ordinary column.

 **NOTE**

- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint at the same time. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint at the same time.
- The method of modifying and deleting generated columns is the same as that of ordinary columns. Delete the ordinary column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for ordinary columns.
- **UNIQUE index\_parameters/**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.
- **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

They determine whether the constraint is deferrable. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, primary key constraints, and foreign key constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered by executing the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace\_name**

Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If this clause is not used, such index will be created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create level-2 partitioned tables of various combination types.

```
CREATE TABLE list_list
(
 month_code VARCHAR2 (30) NOT NULL ,
 dept_code VARCHAR2 (30) NOT NULL ,
 user_no VARCHAR2 (30) NOT NULL ,
 sales_amt int
)
PARTITION BY LIST (month_code) SUBPARTITION BY LIST (dept_code)
(
 PARTITION p_201901 VALUES ('201902')
 (
 SUBPARTITION p_201901_a VALUES ('1'),
 SUBPARTITION p_201901_b VALUES ('2')
),
 PARTITION p_201902 VALUES ('201903')
 (
 SUBPARTITION p_201902_a VALUES ('1'),
 SUBPARTITION p_201902_b VALUES ('2')
)
);
insert into list_list values('201902', '1', '1', 1);
insert into list_list values('201902', '2', '1', 1);
insert into list_list values('201902', '1', '1', 1);
insert into list_list values('201903', '2', '1', 1);
insert into list_list values('201903', '1', '1', 1);
insert into list_list values('201903', '2', '1', 1);
select * from list_list;
 month_code | dept_code | user_no | sales_amt
-----+-----+-----+-----
201903 | 2 | 1 | 1
201903 | 2 | 1 | 1
```

```
201903 | 1 | 1 | 1

## 7.13.76 CREATE TRIGGER

### Description

Creates a trigger. The trigger will be associated with the specified table or view, and will execute the specified function operations are performed.

### Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.

### Syntax

```
CREATE [CONSTRAINT] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [OR ...] }
ON table_name
[FROM referenced_table_name]
{ NOT DEFERRABLE | [DEFERRABLE] } { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
[FOR [EACH] { ROW | STATEMENT }]
[WHEN (condition)]
EXECUTE PROCEDURE function_name (arguments);
```

Events include:

```
INSERT
UPDATE [OF column_name [, ...]]
DELETE
TRUNCATE
```

## Parameters

- **CONSTRAINT**

(Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using SET CONSTRAINTS. Constraint triggers must be AFTER ROW triggers.

- **name**

Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using [SET CONSTRAINTS](#).

Value range: a string, which complies with the [Identifier Naming Conventions](#). A value can contain a maximum of 63 characters.

- **BEFORE**

Specifies that the function is called before the event.

- **AFTER**

Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

Specifies that the function is called instead of the event.

- **event**

Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

For **UPDATE** events, it is possible to specify a list of columns using this syntax:

```
UPDATE OF column_name1 [, column_name2 ...]
```

The trigger will only fire if at least one of the listed columns is mentioned as a target of the UPDATE statement. INSTEAD OF UPDATE events do not support lists of columns. If the column specified by UPDATE OF contains a generated column, the trigger is also fired when the column on which the generated column depends is the target column of the UPDATE statement.

- **table\_name**

Specifies the name of the table for which the trigger is created.

Value range: name of an existing table in the database.

- **referenced\_table\_name**

Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.

Value range: name of an existing table in the database.

- **DEFERRABLE | NOT DEFERRABLE**

Specifies the start time of the trigger. It can only be specified for constraint triggers. They determine whether the constraint is deferrable.

For details, see [CREATE TABLE](#).

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If the constraint is deferrable, the two clauses specify the default time to check the constraint. It can only be specified for constraint triggers.

For details, see [CREATE TABLE](#).

- **FOR EACH ROW | FOR EACH STATEMENT**

Specifies the frequency of firing the trigger.

- **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
- **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.

In FOR EACH ROW triggers, the WHEN condition can refer to columns of the old and/or new row values by writing **OLD.column\_name** or **NEW.column\_name** respectively. In addition, INSERT triggers cannot refer to OLD, and DELETE triggers cannot refer to NEW.

INSTEAD OF triggers do not support WHEN conditions.

Currently, WHEN expressions cannot contain subqueries.

Note that for constraint triggers, evaluation of the WHEN condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **function\_name**

Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

- **arguments**

Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

#### **NOTE**

The following details trigger types:

- INSTEAD OF triggers must be marked as FOR EACH ROW and can be defined only on views.
- BEFORE and AFTER triggers on a view must be marked as FOR EACH STATEMENT.
- TRUNCATE triggers must be marked as FOR EACH STATEMENT.

**Table 7-106** Types of triggers supported on tables and views

| When       | Event                | Row-Level      | Statement-Level  |
|------------|----------------------|----------------|------------------|
| BEFORE     | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| AFTER      | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| INSTEAD OF | INSERT/UPDATE/DELETE | Views          | Not supported.   |
|            | TRUNCATE             | Not supported. | Not supported.   |

**Table 7-107** Special variables of PL/pgSQL trigger functions

| Variable        | Description                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------|
| NEW             | New tuple for INSERT and UPDATE operations. This variable is null for DELETE operations.                 |
| OLD             | Old tuple for UPDATE and DELETE operations. This variable is null for INSERT operations.                 |
| TG_NAME         | Trigger name.                                                                                            |
| TG_WHEN         | Trigger timing ( <b>BEFORE</b> , <b>AFTER</b> , or <b>INSTEAD OF</b> ).                                  |
| TG_LEVEL        | Trigger frequency ( <b>ROW</b> or <b>STATEMENT</b> ).                                                    |
| TG_OP           | Trigger event ( <b>INSERT</b> , <b>UPDATE</b> , <b>DELETE</b> , or <b>TRUNCATE</b> ).                    |
| TG_RELID        | OID of the table where the trigger resides.                                                              |
| TG_RELNAME      | Name of the table where the trigger resides. (This variable has been replaced by <b>TG_TABLE_NAME</b> .) |
| TG_TABLE_NAME   | Name of the table where the trigger resides.                                                             |
| TG_TABLE_SCHEMA | Schema of the table where the trigger resides.                                                           |

| Variable  | Description                                    |
|-----------|------------------------------------------------|
| TG_NARGS  | Number of parameters for the trigger function. |
| TG_ARGV[] | List of parameters for the trigger function.   |

## Examples

```
-- Create a source table and a destination table.
openGauss=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
openGauss=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a trigger function.
openGauss=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
 RETURN NEW;
END
$$ LANGUAGE plpgsql;

openGauss=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

openGauss=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
openGauss=# CREATE TRIGGER insert_trigger
BEFORE INSERT ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_insert_func();

-- Create an UPDATE trigger.
openGauss=# CREATE TRIGGER update_trigger
AFTER UPDATE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_update_func();

-- Create a DELETE trigger.
openGauss=# CREATE TRIGGER delete_trigger
BEFORE DELETE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the INSERT event and check the trigger results.
openGauss=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
```

```
-- Execute the UPDATE event and check the trigger results.
openGauss=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Execute the DELETE event and check the trigger results.
openGauss=# DELETE FROM test_trigger_src_tbl WHERE id1=100;
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Modify a trigger.
openGauss=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;

-- Disable insert_trigger.
openGauss=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

-- Disable all triggers on the current table.
openGauss=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;

-- Drop triggers.
openGauss=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;
openGauss=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;
openGauss=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

## 7.13.77 CREATE TYPE

### Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: composite type, base type, shell type, enumerated type, and set type.

- **Composite type**

A composite type is specified by a list of attribute names and data types. If the data type of an attribute is collatable, the attribute's collation rule can also be specified. This is essentially the same as the row type of a table, but using CREATE TYPE avoids the need to create an actual table when all that is wanted is to define a type. A stand-alone composite type is useful as the parameter or return type of a function.

To create a composite type, you must have the USAGE permission on all of its attribute types.

- **Base type**

You can create a base type (scalar type). Generally, these functions must be written in the underlying language.

- **Shell type**

A shell type is simply a placeholder for a type to be defined later; it is created by issuing CREATE TYPE with no parameters except for the type name. Shell types are needed as forward references when base types are created.

- **Enumerated type**

An enumerated type is a list of one or more quoted labels, each of which must be 1 to 63 bytes long.

- **Set type**  
It is similar to an array but has no length limit. It is mainly used in stored procedures.
- A user granted with the CREATE ANY TYPE permission can create types in the public and user schemas.

## Precautions

If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)

## Syntax

```
CREATE TYPE name AS
 ([attribute_name data_type [COLLATE collation] [, ...]])

CREATE TYPE name (
 INPUT = input_function,
 OUTPUT = output_function
 [, RECEIVE = receive_function]
 [, SEND = send_function]
 [, TYPMOD_IN =
type_modifier_input_function]
 [, TYPMOD_OUT =
type_modifier_output_function]
 [, ANALYZE = analyze_function]
 [, INTERNALLENGTH = { internallength |
VARIABLE }]
 [, PASSEDBYVALUE]
 [, ALIGNMENT = alignment]
 [, STORAGE = storage]
 [, LIKE = like_type]
 [, CATEGORY = category]
 [, PREFERRED = preferred]
 [, DEFAULT = default]
 [, ELEMENT = element]
 [, DELIMITER = delimiter]
 [, COLLATABLE = collatable]
)

CREATE TYPE name

CREATE TYPE name AS ENUM
 (['label' [, ...]])

CREATE TYPE name AS TABLE OF data_type
```

## Parameters

Composite type

- **name**  
Specifies the name (optionally schema-qualified) of the type to be created.
- **attribute\_name**  
Specifies the name of an attribute (column) for the composite type.
- **data\_type**

Specifies the name of an existing data type to become a column of the composite type. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

- **collation**

Specifies the name of an existing collation rule to be associated with a column of the composite type. You can run the **select \* from pg\_collation** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.

#### Base type

When creating a base type, you can place parameters in any order. The **input\_function** and **output\_function** parameters are required, and other parameters are optional.

- **input\_function**

Specifies the name of a function that converts data from the type's external textual form to its internal form.

The input function may be declared as taking one parameter of type cstring or taking three parameters of types cstring, oid, and integer.

- The cstring-type parameter is the input text as a C string.
- The oid-type parameter is the type's own OID (except for array types, which instead receive their element type's OID).
- The integer-type parameter is typmod of the destination column, if known (–1 will be passed if not known).

The input function must return a value of the data type itself. Usually, an input function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the input function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

#### NOTE

The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE name** statement, with no additional parameters. Then, the I/O functions written in C can be defined as referencing the shell type. Finally, **CREATE TYPE** with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.

- **output\_function**

Specifies the name of a function that converts data from the type's internal form to its external textual form.

The output function must be declared as taking one parameter of the new data type. The output function must return type cstring. Output functions are not called for **NULL** values.

- **receive\_function**

(Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.)

**receive\_function** should perform adequate checking to ensure that the value is valid.

The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.

- The internal-type parameter is a pointer to a StringInfo buffer holding the received byte strings.
- The oid- and integer-type parameters are the same as those of the text input function.

The receive function must return a value of the data type itself. Usually, a receive function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the receive function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send\_function**

(Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not called for **NULL** values.

- **type\_modifier\_input\_function**

(Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type\_modifier\_output\_function**

(Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

#### NOTE

**type\_modifier\_input\_function** and **type\_modifier\_output\_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as char(5) or numeric(30,2). GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type\_modifier\_input\_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type\_modifier\_input\_function**. The **type\_modifier\_output\_function** converts the internal integer typmod value back to the correct form for user display.

**type\_modifier\_output\_function** must return a cstring value that is the exact string to append to the type name; for example, numeric's function might return (30,2). It is allowed to omit the **type\_modifier\_output\_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze\_function**

(Optional) Specifies the name of a function that performs statistical analysis for the data type.

By default, ANALYZE will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a Boolean result.

- **internallength**

(Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to **-1**.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

(Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

(Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.

- **storage**

(Optional) Specifies the storage strategy for the data type.

If specified, it must be **plain**, **external**, **extended**, or **main**. The default is **plain**.

- **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
- **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
- **external** allows the value to be moved out of the main table, but the system will not try to compress it.
- **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value

given merely determines the default TOAST storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using ALTER TABLE SET STORAGE.

- **like\_type**

(Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this CREATE TYPE statement. Specifying representation in this way is especially useful when the underlying implementation of a new type references an existing type.

- **category**

(Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**; otherwise, the value is **FALSE**. This parameter is optional. The default value is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 **NOTE**

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

(Optional) Specifies the default value for the data type. If this is omitted, the default is null.

A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the DEFAULT keyword. (Such a default can be overridden by an explicit DEFAULT clause attached to a particular column.)

- **element**

(Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), specify **ELEMENT = int4**.

- **delimiter**

(Optional) Specifies the delimiter character to be used between values in arrays made of this type.

**delimiter** can be set to a specific character. The default delimiter is the comma (,). Note that the delimiter is associated with the array element type, not the array type itself.

- **collatable**

(Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

(Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

 **NOTE**

Whenever a user-defined type is created, GaussDB automatically creates an associated array type whose name consists of the element type's name prepended with an underscore (\_).

## Examples

```
-- Create a composite type, create a table, insert data, and make a query.
openGauss=# CREATE TYPE compfoo AS (f1 int, f2 text);
openGauss=# CREATE TABLE t1_compfoo(a int, b compfoo);
openGauss=# CREATE TABLE t2_compfoo(a int, b compfoo);
openGauss=# INSERT INTO t1_compfoo values(1,(1,'demo'));
openGauss=# INSERT INTO t2_compfoo select * from t1_compfoo;
openGauss=# SELECT (b).f1 FROM t1_compfoo;
openGauss=# SELECT * FROM t1_compfoo t1 join t2_compfoo t2 on (t1.b).f1=(t2.b).f1;

-- Rename the data type.
openGauss=# ALTER TYPE compfoo RENAME TO compfoo1;

-- Change the owner of the user-defined type compfoo1 to usr1.
openGauss=# CREATE USER usr1 PASSWORD '*****';
openGauss=# ALTER TYPE compfoo1 OWNER TO usr1;

-- Change the schema of the user-defined type compfoo1 to usr1.
openGauss=# ALTER TYPE compfoo1 SET SCHEMA usr1;

-- Add a new attribute to the data type.
openGauss=# ALTER TYPE usr1.compfoo1 ADD ATTRIBUTE f3 int;

-- Drop the compfoo1 type.
openGauss=# DROP TYPE usr1.compfoo1 cascade;

-- Drop related tables and users.
openGauss=# DROP TABLE t1_compfoo;
openGauss=# DROP TABLE t2_compfoo;
openGauss=# DROP SCHEMA usr1;
openGauss=# DROP USER usr1;

-- Create an enumerated type.
openGauss=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
openGauss=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename a label.
openGauss=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Create a set type.
openGauss=# CREATE TYPE compfoo_table AS TABLE OF compfoo;
```

## Helpful Links

[ALTER TYPE](#) and [DROP TYPE](#)

## 7.13.78 CREATE USER

### Description

Creates a user.

### Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

### Syntax

```
CREATE USER user_name [[WITH] option [...]] [ENCRYPTED | UNENCRYPTED] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The option clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'
| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

## Parameters

- **user\_name**

Username.

Value range: a string that follows the [Identifier Naming Conventions](#) with a maximum of 63 characters.

- **password**

Specifies the login password.

The new password must:

- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$%^&\*()-\_+=\|[{ }];;<.>/?).
- The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, you need to know the plaintext corresponding to the ciphertext password and ensure a complex plaintext password. The database does not verify the complexity of the ciphertext password, so you should ensure the password security.
- When creating a user, enclose the user password in single quotation marks.

Value range: a string.

For details about other parameter values of CREATE USER, see [CREATE ROLE](#).

## Examples

```
-- Create user jim whose login password is *****.
openGauss=# CREATE USER jim PASSWORD '*****';

-- Alternatively, you can run the following statement:
openGauss=# CREATE USER kim IDENTIFIED BY '*****';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
openGauss=# CREATE USER dim CREATEDB PASSWORD '*****';

-- Change the login password of user jim from ***** to *****.
openGauss=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';

-- Add the CREATEROLE permission to jim.
openGauss=# ALTER USER jim CREATEROLE;

-- Set enable_seqscan to on. (The setting will take effect in the next session.)
openGauss=# ALTER USER jim SET enable_seqscan TO on;

-- Reset the enable_seqscan parameter for jim.
openGauss=# ALTER USER jim RESET enable_seqscan;

-- Lock jim.
openGauss=# ALTER USER jim ACCOUNT LOCK;

-- Drop users.
openGauss=# DROP USER kim CASCADE;
openGauss=# DROP USER jim CASCADE;
openGauss=# DROP USER dim CASCADE;
```

## Helpful Links

[ALTER USER](#), [CREATE ROLE](#), and [DROP USER](#)

## 7.13.79 CREATE USER MAPPING

### Description

Defines a new mapping from a user to a foreign server.

### Precautions

If the **password** option is displayed, ensure that the **usermapping.key.cipher** and **usermapping.key.rand** files exist in the *\$GAUSSHOME/bin* directory of each node in GaussDB. If the two files do not exist, use the *gs\\_guc* tool to generate them and use the *gs\\_ssh* tool to release them to the *\$GAUSSHOME/bin* directory on each node in GaussDB.

When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

### Syntax

```
CREATE USER MAPPING FOR { user_name | USER | CURRENT_USER | PUBLIC }
 SERVER server_name
 [OPTIONS (option 'value' [, ...])]
```

### Parameters

- **user\_name**  
Specifies the name of an existing user to map to a foreign server.  
**CURRENT\_USER** and **USER** match the name of the current user. When **PUBLIC** is specified, a public mapping is created and used when no mapping for a particular user is available.
- **server\_name**  
Specifies the name of the existing server for which a user mapping will be created.
- **OPTIONS ( { option\_name ' value ' } [ , ... ] )**  
Specifies options for user mapping. These options typically define the actual username and password for this mapping. The option name must be unique. The allowed option names and values are related to the foreign data wrapper of the server.

 NOTE

- User passwords are encrypted and stored in the system catalog **PG\_USER\_MAPPING**. During the encryption, **usermapping.key.cipher** and **usermapping.key.rand** are used as the encryption password file and encryption factor. Before using the tool for the first time, run the following command to create the two files, save the files to the **\$GAUSSHOME/bin** directory on each node, and ensure that you have the read permission on the files. **gs\_ssh** helps you quickly place files in the specified directory of each node.  
`gs_ssh -c "gs_guc generate -o usermapping -S default -D $GAUSSHOME/bin"`
- If the **-S** parameter is set to default, a password is randomly generated. You can also specify a password for the **-S** parameter to ensure the security and uniqueness of the generated password file. You do not need to save or memorize the password. For details about other parameters, see the description of the **gs\_guc** tool in the "Tool Reference".

## Examples

```
-- Create a role.
openGauss=# CREATE ROLE bob PASSWORD '*****';

-- Create a foreign server.
openGauss=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a user mapping.
openGauss=# CREATE USER MAPPING FOR bob SERVER my_server OPTIONS (user 'bob', password '*****');

-- Modify the user mapping.
openGauss=# ALTER USER MAPPING FOR bob SERVER my_server OPTIONS (SET password '*****');

-- Drop the user mapping.
openGauss=# DROP USER MAPPING FOR bob SERVER my_server;

-- Drop the foreign server.
openGauss=# DROP SERVER my_server;

-- Drop the role.
openGauss=# DROP ROLE bob;
```

## Helpful Links

[ALTER USER MAPPING](#) and [DROP USER MAPPING](#)

## 7.13.80 CREATE VIEW

### Description

Creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

### Precautions

A user granted with the CREATE ANY TABLE permission can create views in the public and user schemas.

## Syntax

```
CREATE [OR REPLACE] [TEMP | TEMPORARY] VIEW view_name [(column_name [, ...])]
[WITH ({view_option_name [= view_option_value]} [, ...])]
AS query;
```

### NOTE

You can use WITH(security\_barrier) to create a relatively secure view. This prevents attackers from printing hidden base table data by using the RAISE statement of low-cost functions.

After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

## Parameters

- **OR REPLACE**  
Redefines the view if it already exists.
- **TEMP | TEMPORARY**  
Creates a temporary view.
- **view\_name**  
Specifies the name (optionally schema-qualified) of the view to be created.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **view\_option\_name [= view\_option\_value]**  
Specifies an optional parameter for a view.  
Currently, **view\_option\_name** supports only the **security\_barrier** parameter.  
Use this parameter when the view provides row-level security.  
Value range: Boolean type, **TRUE** or **FALSE**.
- **query**  
Specifies a SELECT or VALUES statement that will provide the columns and rows of the view.

---

### NOTICE

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If a DDL operation that will change the OID of the specified partition is used, for example, DROP, SPLIT, or MERGE, the view is unavailable. In this case, you need to create a view.

---

## Examples

```
-- Create a view consisting of columns whose spcname is pg_default.
openGauss=# CREATE VIEW myView AS
SELECT * FROM pg_tablespace WHERE spcname = 'pg_default';

-- Query the view.
```

```
openGauss=# SELECT * FROM myView ;

-- Drop the myView view.
openGauss=# DROP VIEW myView;
```

## Helpful Links

[ALTER VIEW](#) and [DROP VIEW](#)

## 7.13.81 CREATE WEAK PASSWORD DICTIONARY

### Description

Inserts one or more weak passwords into the **gs\_global\_config** table.

### Precautions

- Only the initial user and users with the SYSADMIN or CREATEROLE permission can execute this syntax.
- Passwords in the weak password dictionary are stored in the **gs\_global\_config** system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the **gs\_global\_config** table, only one weak password is retained in the table.

### Syntax

```
CREATE WEAK PASSWORD DICTIONARY
[WITH VALUES] ({'weak_password'} [, ...]);
```

### Parameters

**weak\_password**

Specifies a weak password.

Value range: a character string

### Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
openGauss=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
openGauss=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Clear all weak passwords in the gs_global_config system catalog.
openGauss=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
openGauss=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
```

## Helpful Links

[DROP WEAK PASSWORD DICTIONARY](#)

## 7.13.82 CURSOR

### Function

**CURSOR** defines a cursor to retrieve a small number of rows at a time out of a larger query.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

### Syntax

```
CURSOR cursor_name
[BINARY] [NO SCROLL] [{ WITH | WITHOUT } HOLD]
FOR query ;
```

### Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.
  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD | WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.

- **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
- **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
- If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
- Cross-node transactions (for example, DDL-contained transactions created in the database with multiple DBnode) do not support **WITH HOLD**.
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause

## Examples

See [Examples](#) in **FETCH**.

## Helpful Links

[FETCH](#)

## 7.13.83 DEALLOCATE

### Description

**DEALLOCATE** deallocates a previously prepared statement. If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.

The **PREPARE** keyword is always ignored.

### Precautions

None

### Syntax

```
DEALLOCATE [PREPARE] { name | ALL };
```

### Parameters

- **name**  
Specifies the name of the prepared statement to be deallocated.
- **ALL**  
Deallocates all prepared statements.

## Examples

None

## 7.13.84 DECLARE

### Description

**DECLARE** defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in [BEGIN](#).

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

### Syntax

- Define a cursor.  

```
DECLARE cursor_name [BINARY] [NO SCROLL]
 CURSOR [{ WITH | WITHOUT } HOLD] FOR query ;
```
- Enable an anonymous block.  

```
[DECLARE [declare_statements]]
BEGIN
 execution_statements
END;
/
```

### Parameters

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.

- **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
- Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD**  
**WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause
- **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.
- **execution\_statements**  
Specifies the statement to be executed in an anonymous block.  
Value range: an existing function name

## Examples

For details about how to define a cursor, see [Examples](#) in "FETCH."

## Helpful Links

[BEGIN](#), [FETCH](#)

## 7.13.85 DELETE

### Description

Deletes rows that satisfy the WHERE clause from the specified table. If the WHERE clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

### Precautions

The owner of a table, users granted with the DELETE permission on the table, or users granted with the DELETE ANY TABLE permission can delete data from the table. System administrators have the permission to delete data from the table by default, as well as the SELECT permission on any table in the USING clause or whose values are read in **condition**.

## Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
DELETE [/*+ plan_hint */] [FROM] [ONLY] table_name [partition_clause] [*] [[AS] alias]
 [USING using_list]
 [WHERE condition | WHERE CURRENT OF cursor_name]
 [LIMIT { row_count }]
 [RETURNING { * | { output_expr [[AS] output_name] } [, ...] }];
```

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED]
({select | values | insert | update | delete})
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

  - **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column\_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan\_hint clause**

Follows the DELETE keyword in the */\*+ \*/* format. It is used to optimize the plan of a DELETE statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **ONLY**

If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.
- **table\_name**

Specifies the name (optionally schema-qualified) of the target table.

Value range: an existing table name.

- **partition\_clause**

Deletes a specified partition.

PARTITION { ( partition\_name ) | FOR ( partition\_value [, ...] ) } |

SUBPARTITION { ( subpartition\_name ) | FOR ( subpartition\_value [, ...] ) }

For details about the keywords, see [SELECT](#).

For details, see [CREATE TABLE SUBPARTITION](#).

- **alias**

Specifies the alias of the target table.

Value range: a string that complies with the [Identifier Naming Conventions](#).

- **using\_list**

Specifies a USING clause.

- **condition**

Specifies an expression that returns a Boolean value. Only rows for which this expression returns **true** will be deleted. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

This parameter is reserved.

- **LIMIT clause**

For details about the keywords, see [SELECT](#).

- **output\_expr**

Specifies an expression to be computed and returned by the DELETE statement after each row is deleted. The expression can use any column names of the table. Write \* to return all columns.

- **output\_name**

Specifies a name to use for a returned column.

Value range: a string that complies with the [Identifier Naming Conventions](#).

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
openGauss=# CREATE TABLE tpcds.customer_address
(
 ca_address_sk INTEGER NOT NULL,
 ca_address_id CHARACTER(16) NOT NULL,
 ca_street_number INTEGER ,
 ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),
(10000, 'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(15000, 'AAAAAAAADAAAAAAA', '585', 'Dogwood
Washington');

-- Create the tpcds.customer_address_bak table.
openGauss=# CREATE TABLE tpcds.customer_address_bak AS TABLE tpcds.customer_address;
```

```
-- Delete employees whose ca_address_sk is smaller than 14888 from the tpcds.customer_address_bak table.
openGauss=# DELETE FROM tpcds.customer_address_bak WHERE ca_address_sk < 14888;

-- Delete all data from the tpcds.customer_address_bak table.
openGauss=# DELETE FROM tpcds.customer_address_bak;

-- Drop the tpcds.customer_address_bak table.
openGauss=# DROP TABLE tpcds.customer_address_bak;

-- Drop the tpcds.customer_address table.
openGauss=# DROP TABLE tpcds.customer_address;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- **delete**  
To delete all records in a table, use the truncate syntax.

## 7.13.86 DO

### Description

Executes an anonymous code block.

A code block is regarded as a function body without parameters. The return value type is void. It is parsed and executed a single time.

### Precautions

- The procedural language to be used must already have been installed into the current database by means of CREATE LANGUAGE. PL/pgSQL is installed by default, but other languages are not.
- To use an untrusted language, you must have the USAGE permission on the programming language or the SYSADMIN permission.

### Syntax

```
DO [LANGUAGE lang_name] code;
```

### Parameters

- **lang\_name**  
Specifies the name of the procedural language the code is written in. If omitted, the default language is PL/pgSQL.
- **code**  
Specifies the programming language code that can be executed. The value must be a character string.

### Examples

```
-- Create the webuser user.
openGauss=# CREATE USER webuser PASSWORD 'xxxxxxxxx';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
```

```
openGauss=# DO $$DECLARE r record;
BEGIN
 FOR r IN SELECT c.relname table_name,n.nspname table_schema FROM pg_class c,pg_namespace n
 WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
 LOOP
 EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
 END LOOP;
END$$;

-- Drop the webuser user.
openGauss=# DROP USER webuser CASCADE;
```

## 7.13.87 DROP AGGREGATE

### Function

**DROP AGGREGATE** deletes an aggregate function.

### Precautions

**DROP AGGREGATE** deletes an existing aggregate function. Only the owner of the aggregate function can run this command.

### Syntax

```
DROP AGGREGATE [IF EXISTS] name (argtype [, ...]) [CASCADE | RESTRICT]
```

### Parameter Description

- **IF EXISTS**  
Do not throw an error if the specified aggregation does not exist. A notice is issued in this case.
- **name**  
Existing aggregate function name (optionally schema-qualified).
- **argtype**  
Input data type of the aggregate function. To reference a zero-parameter aggregate function, use \* to replace the input data type list.
- **CASCADE**  
Cascade deletes objects that depend on the aggregate function.
- **RESTRICT**  
Refuses to delete the aggregate function if any objects depend on it. This is a default processing.

### Examples

Delete the aggregate function **myavg** of the integer type:

```
DROP AGGREGATE myavg(integer);
```

### Compatibility

The SQL standard does not provide the **DROP AGGREGATE** statement.

## 7.13.88 DROP AUDIT POLICY

### Description

Drops an audit policy.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

### Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string that complies with the [Identifier Naming Conventions](#).

### Examples

See [Examples](#) in "CREATE AUDIT POLICY."

### Helpful Links

[ALTER AUDIT POLICY](#) and [CREATE AUDIT POLICY](#)

## 7.13.89 DROP CAST

### Description

Drops a type conversion.

### Precautions

DROP CAST drops a previously defined type conversion.

To drop a type conversion, you must have permissions on the source or destination data type. This is the same permission as creating a type conversion.

### Syntax

```
DROP CAST [IF EXISTS] (source_type AS target_type) [CASCADE | RESTRICT]
```

### Parameters

- **IF EXISTS**  
Do not throw an error if the specified conversion does not exist. A notice is issued in this case.
- **source\_type**  
Source data type in the type conversion.

- **target\_type**  
Type of the target data in the type conversion.
- **CASCADE**  
**RESTRICT**  
These keys have no effect because there is no dependency on type conversion.

## Examples

Drop the conversion from text to int.

```
DROP CAST (text AS int);
```

## Compatibility

DROP CAST complies with the SQL standard.

## 7.13.90 DROP DATABASE

### Description

Drops a database.

### Precautions

- Only the database owner or a user granted the DROP permission can run the **DROP DATABASE** command. System administrators have this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, and TEMPLATE1 databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql statement **\l**.
- If any users are connected to the database, the database cannot be deleted.
- **DROP DATABASE** cannot be executed within a transaction block.
- If **DROP DATABASE** fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

---

#### NOTICE

**DROP DATABASE** cannot be undone.

---

### Syntax

```
DROP DATABASE [IF EXISTS] database_name ;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified database does not exist.
- **database\_name**  
Specifies the name of the database to be deleted.

Value range: an existing database name

## Examples

See [Examples](#) in CREATE DATABASE.

## Helpful Links

[CREATE DATABASE](#)

## Suggestions

- drop database  
Do not delete databases during transactions.

# 7.13.91 DROP DIRECTORY

## Function

**DROP Directory** deletes a synonym.

## Precautions

When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to delete directory objects. When **enable\_access\_server\_directory** is set to **on**, a user with the SYSADMIN permission, the owner of the directory object, a user who is granted with the DROP permission of the directory, or a user who inherits the **gs\_role\_directory\_drop** permission of the built-in role can delete directory objects.

## Syntax

```
DROP DIRECTORY [IF EXISTS] directory_name;
```

## Parameter Description

- **directory\_name**  
Specifies the name of the directory to be deleted.  
Value range: an existing directory name

## Examples

```
-- Create a directory.
openGauss=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';

-- Delete a directory.
openGauss=# DROP DIRECTORY dir;
```

## Helpful Links

[CREATE DIRECTORY](#) and [ALTER DIRECTORY](#)

## 7.13.92 DROP FUNCTION

### Description

Drops an existing function.

### Precautions

- If a function involves operations on temporary tables, DROP FUNCTION cannot be used.
- Only the function owner or a user granted with the DROP permission can run the **DROP FUNCTION** command. System administrators have this permission by default.

### Syntax

```
DROP FUNCTION [IF EXISTS] function_name
[(([argname] [argmode] argtype) [, ...])) [CASCADE | RESTRICT] ;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified function does not exist.
- **function\_name**  
Specifies the name of the function to be dropped.  
Value range: an existing function name.
- **argmode**  
Specifies the parameter mode of the function.
- **argname**  
Specifies the parameter name of the function.
- **argtype**  
Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops the objects that depend on the function.
  - **RESTRICT**: refuses to drop the function if any objects depend on it. This is the default action.

### Examples

For details, see [Examples](#).

### Helpful Links

[ALTER FUNCTION](#) and [CREATE FUNCTION](#)

## 7.13.93 DROP GLOBAL CONFIGURATION

### Description

Drops parameter values from the gs\_global\_config system catalog.

## Precautions

- Only the initial database user can run this command.
- The parameter name cannot be **weak\_password** or **undostoragetype**.

## Syntax

```
DROP GLOBAL CONFIGURATION name [, ...];
```

## Parameters

- **name**  
The parameter must exist in the gs\_global\_config system catalog. If you drop a parameter that does not exist, an error will be reported.

## Helpful Links

[ALTER GLOBAL CONFIGURATION](#)

## 7.13.94 DROP GROUP

### Description

Drops a user group.

DROP GROUP is an alias for DROP ROLE.

### Precautions

DROP GROUP is an API of the GaussDB management tool. You are advised not to use this API, because doing so affects GaussDB.

### Syntax

```
DROP GROUP [IF EXISTS] group_name [, ...];
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified role does not exist.
- **group\_name**  
Specifies the name of the role to be dropped.  
Value range: an existing role name.

### Examples

See [Examples](#) in "CREATE ROLE."

### Helpful Links

[CREATE GROUP](#), [ALTER GROUP](#), and [DROP ROLE](#)

## 7.13.95 DROP INDEX

### Description

Drops an index.

### Precautions

Only the index owner, a user of a schema where the index resides, or a user who has the INDEX permission on the table where the index resides can run the **DROP INDEX** command. System administrators have this permission by default.

For a global temporary table, if a session has initialized a global temporary table object (including creating a global temporary table and inserting data into the global temporary table for the first time), other sessions cannot drop indexes from the table.

### Syntax

```
DROP INDEX [CONCURRENTLY] [IF EXISTS]
index_name [, ...] [CASCADE | RESTRICT];
```

### Parameters

- **CONCURRENTLY**  
Drops an index without locking it. When an index is dropped, other statements cannot access the table on which the index depends. With this option, the statement does not lock the table during index deletion.  
This parameter allows only one index name and does not support CASCADE.  
The **DROP INDEX** statement can be run within a transaction, but **DROP INDEX CONCURRENTLY** cannot.
- **IF EXISTS**  
Reports a notice instead of an error if the specified index does not exist.
- **index\_name**  
Specifies the name of the index to be dropped.  
Value range: name of an existing index.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops the objects that depend on the index.
  - **RESTRICT**: refuses to drop the index if any objects depend on it. This is the default action.

### Examples

See [Examples](#) in "CREATE INDEX."

### Helpful Links

[ALTER INDEX](#) and [CREATE INDEX](#)

## 7.13.96 DROP LANGUAGE

This version does not support this syntax.

## 7.13.97 DROP MASKING POLICY

### Description

Drops a masking policy.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP MASKING POLICY [IF EXISTS] policy_name;
```

### Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string that complies with the [Identifier Naming Conventions](#).  
The value is an existing policy name.

### Examples

```
-- Drop a masking policy.
openGauss=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Drop a group of masking policies.
openGauss=# DROP MASKING POLICY IF EXISTS maskpol1, maskpol2, maskpol3;
```

### Helpful Links

[ALTER MASKING POLICY](#) and [CREATE MASKING POLICY](#)

## 7.13.98 DROP MATERIALIZED VIEW

### Function

Forcibly deletes an existing materialized view from the database.

### Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted with the DROP permission on the materialized view, or users granted with the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP MATERIALIZED VIEW [IF EXISTS] mv_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified materialized view does not exist.
- **mv\_name**  
Name of the materialized view to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the materialized view.
  - **RESTRICT**: refuses to delete the materialized view if any objects depend on it. This is the default action.

## Examples

```
-- Create a table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a materialized view named my_mv.
openGauss=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
openGauss=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
openGauss=# DROP TABLE my_table;
```

## Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

## 7.13.99 DROP OPERATOR

### Description

Drops an operator object.

### Precautions

DROP OPERATOR drops the definition of an operator. To use DROP OPERATOR, you must be the owner of the operator.

### Syntax

```
DROP OPERATOR [IF EXISTS] name ({ lefttype | NONE } , { righttype | NONE }) [CASCADE | RESTRICT]
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the operator does not exist.
- **name**  
Name (optionally schema-qualified) of an existing operator.

- **lefttype**  
Type of the left operand of an operator. If there is no left operand, **NONE** is used.
- **righttype**  
Type of the right operand of an operator. If there is no right operand, **NONE** is used.
- **CASCADE**  
Automatically drops objects that depend on an operator (such as views that use the operator), and then drops all objects that depend on those objects.
- **RESTRICT**  
Refuses to drop any object that depends on an operator. This is the default value.

## Helpful Links

[ALTER OPERATOR](#) and [CREATE OPERATOR](#)

## 7.13.100 DROP OWNED

### Description

Drops the database objects owned by a database role.

### Precautions

- The role's permissions on all objects in the current database and shared objects (databases and tablespaces) will be revoked.
- DROP OWNED is often used to prepare for removing one or more roles. Because DROP OWNED affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.

### Syntax

```
DROP OWNED BY name [, ...] [CASCADE | RESTRICT];
```

### Parameters

- **name**  
Specifies the role name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops the objects that depend on the objects to be dropped.
  - **RESTRICT**: refuses to drop the objects if other objects depend on them. This is the default action.

## Helpful Links

[REASSIGN OWNED](#) and [DROP ROLE](#)

### 7.13.101 DROP PACKAGE

#### Description

Drops an existing package or package body.

#### Precautions

After the package body is dropped, the stored procedures and functions in the package become invalid at the same time.

#### Syntax

```
DROP PACKAGE [IF EXISTS] package_name;
DROP PACKAGE BODY [IF EXISTS] package_name;
```

#### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified stored procedure does not exist.
- **package\_name**  
Specifies the name of the package to be dropped.  
Value range: an existing package name.

#### Examples

```
-- Create a package.
openGauss=# CREATE OR REPLACE PACKAGE PCK1
IS
a int;
END pck1;
/
CREATE PACKAGE

-- Drop the package.
openGauss=# DROP PACKAGE PCK1;
DROP PACKAGE
```

## Helpful Links

[ALTER PACKAGE](#) and [CREATE PACKAGE](#)

### 7.13.102 DROP PROCEDURE

#### Description

Drops a stored procedure.

#### Syntax

```
DROP PROCEDURE [IF EXISTS] procedure_name ;
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified stored procedure does not exist.
- **procedure\_name**  
Specifies the name of the stored procedure to be dropped.  
Value range: an existing stored procedure name.

## Helpful Links

[CREATE PROCEDURE](#)

## 7.13.103 DROP RESOURCE LABEL

### Description

Drops a resource label.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```

### Parameters

- **label\_name**  
Specifies the resource label name.  
Value range: a string that complies with the [Identifier Naming Conventions](#).

### Examples

```
-- Drop a resource label.
openGauss=# DROP RESOURCE LABEL IF EXISTS res_label1;

-- Drop a group of resource labels.
openGauss=# DROP RESOURCE LABEL IF EXISTS res_label1, res_label2, res_label3;
```

## Helpful Links

[ALTER RESOURCE LABEL](#) and [CREATE RESOURCE LABEL](#)

## 7.13.104 DROP ROLE

### Description

Drops a role.

## Syntax

```
DROP ROLE [IF EXISTS] role_name [, ...];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified role does not exist.
- **role\_name**  
Specifies the name of the role to be dropped.  
Value range: an existing role name.

## Examples

See [Examples](#) in "CREATE ROLE."

## Helpful Links

[CREATE ROLE](#), [ALTER ROLE](#), and [SET ROLE](#)

## 7.13.105 DROP ROW LEVEL SECURITY POLICY

### Description

Drops a row-level security policy from a table.

### Precautions

Only the table owner or administrators can drop a row-level security policy from the table.

## Syntax

```
DROP [ROW LEVEL SECURITY] POLICY [IF EXISTS] policy_name ON table_name [CASCADE | RESTRICT]
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified row-level security policy does not exist.
- **policy\_name**  
Specifies the name of the row-level security policy to be dropped.
- **table\_name**  
Specifies the name of the table containing the row-level security policy.
- **CASCADE | RESTRICT**  
Currently, no objects depend on row-level security policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

## Examples

```
-- Create data table all_data.
openGauss=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));
```

```
-- Create a row-level security policy.
openGauss=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role =
CURRENT_USER);

-- Drop a row-level security policy.
openGauss=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Drop the all_data table.
openGauss=# DROP TABLE all_data;
```

## Helpful Links

[ALTER ROW LEVEL SECURITY POLICY](#) and [CREATE ROW LEVEL SECURITY POLICY](#)

## 7.13.106 DROP RULE

### Description

Drops a rewriting rule.

### Syntax

```
DROP RULE [IF EXISTS] name ON table_name [CASCADE | RESTRICT]
```

### Parameters

- **IF EXISTS**  
If the rule does not exist, a **NOTICE** is thrown.
- **name**  
Name of an existing rule to be dropped.
- **table\_name**  
Name of the table to which the rule applies.
- **CASCADE**  
Automatically cascade drops objects that depend on this rule.
- **RESTRICT**  
Refuses to drop the rule if any objects depend on it. This is the default value.

### Examples

```
-- Create the def_test table and the def_view_test view for creating rules.
openGauss=# CREATE TABLE def_test (
c1 int4 DEFAULT 5,
c2 text DEFAULT 'initial_default'
);
openGauss=# CREATE VIEW def_view_test AS SELECT * FROM def_test;
-- Create the rule def_view_test_ins.
openGauss=# CREATE RULE def_view_test_ins AS
openGauss=# ON INSERT TO def_view_test
openGauss=# DO INSTEAD INSERT INTO def_test SELECT new.*;
-- Drop the rule def_view_test_ins.
openGauss=# DROP RULE def_view_test_ins ON def_view_test;
-- Drop the def_test table and the def_view_test view.
openGauss=# DROP VIEW def_view_test;
openGauss=# DROP TABLE def_test;
```

## 7.13.107 DROP SCHEMA

### Description

Drops a schema from the current database.

### Precautions

Only the schema owner or a user granted with the DROP permission can run the **DROP SCHEMA** command. System administrators have this permission by default.

### Syntax

```
DROP SCHEMA [IF EXISTS] schema_name [, ...] [CASCADE | RESTRICT];
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified schema does not exist.
- **schema\_name**  
Specifies the schema name.  
Value range: an existing schema name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops all the objects contained in the schema.
  - **RESTRICT**: refuses to drop the schema if the schema contains objects. This is the default action.

#### NOTICE

- Schemas beginning with **pg\_temp** or **pg\_toast\_temp** are for internal use. Do not drop them. Otherwise, unexpected consequences may be incurred.
- The schema currently being used cannot be dropped. To drop it, switch to another schema first.

### Examples

See [Examples](#) in "CREATE SCHEMA."

### Helpful Links

[ALTER SCHEMA](#) and [CREATE SCHEMA](#)

## 7.13.108 DROP SEQUENCE

### Description

Drops a sequence from the current database.

## Precautions

- Only the owner of a sequence, the owner of the schema of the sequence, or users granted with the DROP permission on the sequence can drop the sequence. By default, system administrators have the permission to drop the sequence.
- If the LARGE identifier is used when a sequence is created, the LARGE identifier must be used when the sequence is dropped.

## Syntax

```
DROP [LARGE] SEQUENCE [IF EXISTS] {[schema.]sequence_name} [, ...] [CASCADE | RESTRICT];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified sequence does not exist.
- **sequence\_name**  
Specifies the name of the sequence to be dropped.
- **CASCADE**  
Automatically drops the objects that depend on the sequence.
- **RESTRICT**  
Refuses to drop the sequence if any objects depend on it. This is the default action.

## Examples

```
-- Create an ascending sequence named serial, starting from 101.
openGauss=# CREATE SEQUENCE serial START 101;

-- Drop a sequence.
openGauss=# DROP SEQUENCE serial;
```

## Helpful Links

[ALTER SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.13.109 DROP SERVER

### Description

Drops an existing data server.

### Precautions

Only the server owner or a user granted the DROP permission can run the **DROP SERVER** command. System administrators have this permission by default.

### Syntax

```
DROP SERVER [IF EXISTS] server_name [{ CASCADE | RESTRICT }] ;
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified data server does not exist.
- **server\_name**  
Specifies the name of the data server to be dropped.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops the objects that depend on the data server.
  - **RESTRICT**: refuses to drop the server if any objects depend on it. This is the default action.

## Examples

```
-- Create a server.
openGauss=# create server my_server foreign data wrapper log_fdw;
CREATE SERVER

-- Drop my_server.
openGauss=# DROP SERVER my_server;
DROP SERVER
```

## Helpful Links

[ALTER SERVER](#) and [CREATE SERVER](#)

## 7.13.110 DROP SYNONYM

### Description

Drops a synonym.

### Precautions

Only the owner of a synonym or a system administrator has the **DROP SYNONYM** permission.

### Syntax

```
DROP SYNONYM [IF EXISTS] synonym_name [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified synonym does not exist.
- **synonym\_name**  
Specifies the name (optionally schema-qualified) of the synonym to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE SYNONYM."

## Helpful Links

[ALTER SYNONYM](#), [CREATE SYNONYM](#)

# 7.13.111 DROP TABLE

## Description

Drops a table.

## Precautions

- DROP TABLE forcibly drops the specified table and the indexes depending on the table. After the table is dropped, the functions and stored procedures that need to use this table cannot be executed. Dropping a partitioned table also drops all partitions in the table.
- The owner of a table, the owner of the schema of the table, users granted with the DROP permission on the table, or users granted with the DROP ANY TABLE permission can drop the specified table. System administrators have the permission to drop the specified table by default.

## Syntax

```
DROP TABLE [IF EXISTS]
{ [schema.]table_name } [, ...] [CASCADE | RESTRICT] [PURGE];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified table does not exist.
- **schema**  
Specifies the schema name.
- **table\_name**  
Specifies the table name.
- **CASCADE | RESTRICT**
  - **CASCADE**: The objects that depend on the table, such as views, triggers, and indexes, can be dropped cascadingly. Note that joined table objects cannot be dropped cascadingly.
  - **RESTRICT**: refuses to drop the table if any objects depend on it. This is the default action.
- **PURGE**  
Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin.

## Examples

See [Examples](#) in "CREATE TABLE."

## Helpful Links

[ALTER TABLE](#) and [CREATE TABLE](#)

## 7.13.112 DROP TABLESPACE

### Description

Drops a tablespace.

### Precautions

- Only the tablespace owner or a user granted the DROP permission can run the **DROP TABLESPACE** command. A system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- **DROP TABLESPACE** cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of **DROP TABLESPACE**, database queries by other sessions using **\db** may fail and need to be reattempted.
- If **DROP TABLESPACE** fails to be executed, run **DROP TABLESPACE IF EXISTS**.

### Syntax

```
DROP TABLESPACE [IF EXISTS] tablespace_name;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace\_name**  
Specifies the name of the tablespace to be deleted.  
Value range: an existing tablespace name

### Examples

See [Examples](#) in **CREATE TABLESPACE**.

## Helpful Links

[ALTER TABLESPACE](#) and [CREATE TABLESPACE](#)

### Suggestions

- drop tablespace  
Do not delete tablespaces during transactions.

## 7.13.113 DROP TRIGGER

### Function

**DROP TRIGGER** deletes a trigger.

### Precautions

Only the owner of a trigger or a system administrator has the **DROP TRIGGER** permission.

### Syntax

```
DROP TRIGGER [IF EXISTS] trigger_name ON table_name [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified trigger does not exist.
- **trigger\_name**  
Specifies the name of the trigger to be deleted.  
Value range: an existing trigger name
- **table\_name**  
Specifies the name of the table containing the trigger.  
Value range: name of the table containing the trigger
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

### Examples

For details, see [Examples](#) in [CREATE TRIGGER](#).

### Helpful Links

[CREATE TRIGGER](#), [ALTER TRIGGER](#), and [ALTER TABLE](#)

## 7.13.114 DROP TYPE

### Function

**DROP TYPE** deletes a user-defined data type.

### Precautions

Only the type owner or a user granted with the DROP permission can run the **DROP TYPE** command. The system administrator has this permission by default.

## Syntax

```
DROP TYPE [IF EXISTS] name [, ...] [CASCADE | RESTRICT]
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified type does not exist.
- **name**  
Specifies the name (optionally schema-qualified) of the type to be deleted.
- **CASCADE**  
Automatically deletes the objects (such as fields, functions, and operators) that depend on the type.  
**RESTRICT**  
Refuses to delete the type if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE TYPE**.

## Helpful Links

[CREATE TYPE](#) and [ALTER TYPE](#)

## 7.13.115 DROP USER

### Description

Drops a user and the schema with the same name as the user.

### Precautions

- **CASCADE** is used to drop the objects (excluding databases) that depend on the user. It cannot drop locked objects unless the objects are unlocked or the processes locking the objects are terminated.
- In GaussDB, the **enable\_kill\_query** configuration parameter exists in the **postgresql.conf** file. This parameter affects **CASCADE**.
  - If **enable\_kill\_query** is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then drops the specified user.
  - If **enable\_kill\_query** is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then drops the specified user.
- If the dependent objects are other databases or reside in other databases, manually drop them before dropping the user from the current database. **DROP USER** cannot drop objects across databases.
- Before dropping a user, you need to drop all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to drop the objects owned by the user and the granted permissions.

## Syntax

```
DROP USER [IF EXISTS] user_name [, ...] [CASCADE | RESTRICT];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified user does not exist.
- **user\_name**  
Specifies the name of the user to be dropped.  
Value range: an existing username.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops objects that depend on the user and revokes the permissions granted to the user.
  - **RESTRICT**: refuses to drop a user if the user has any dependent objects or has been granted permissions on other objects. This is the default value.

### NOTE

In GaussDB, the **enable\_kill\_query** configuration parameter exists in the **postgresql.conf** file. This parameter affects **CASCADE**.

- If **enable\_kill\_query** is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then drops the specified user.
- If **enable\_kill\_query** is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then drops the specified user.

## Examples

See [Examples](#) in "CREATE USER."

## Helpful Links

[ALTER USER](#) and [CREATE USER](#)

## 7.13.116 DROP USER MAPPING

### Function

**DROP USER MAPPING** drops a user mapping for a foreign server.

### Syntax

```
DROP USER MAPPING [IF EXISTS] FOR { user_name | USER | CURRENT_USER | PUBLIC } SERVER
server_name;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the user mapping does not exist.
- **user\_name**  
Specifies username of the mapping.

CURRENT\_USER and USER match the name of the current user. PUBLIC is used to match all current and future usernames in the system.

- **server\_name**  
Specifies name of the server to which the user is mapped.

## Helpful Links

[ALTER USER MAPPING](#) and [CREATE USER MAPPING](#)

## 7.13.117 DROP VIEW

### Function

**DROP VIEW** forcibly deletes a view from the database.

### Precautions

The owner of a view, owner of the schema of the view, users granted with the DROP permission on the view, or users granted with the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP VIEW [IF EXISTS] view_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified view does not exist.
- **view\_name**  
Specifies the name of the view to be deleted.  
Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

### Examples

See [Examples](#) in **CREATE VIEW**.

## Helpful Links

[ALTER VIEW](#) and [CREATE VIEW](#)

## 7.13.118 DROP WEAK PASSWORD DICTIONARY

### Description

Clears all weak passwords in gs\_global\_config.

### Precautions

Only the initial user and users with the SYSADMIN or CREATEROLE permission can execute this syntax.

### Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

### Examples

See [Examples](#) in "CREATE WEAK PASSWORD DICTIONARY."

### Helpful Links

[CREATE WEAK PASSWORD DICTIONARY](#)

## 7.13.119 EXECUTE

### Description

Executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the PREPARE statement.

### Precautions

If the PREPARE statement declares some parameters when the prepared statement is created, the parameter set passed to the EXECUTE statement must be compatible. Otherwise, an error occurs.

### Syntax

```
EXECUTE name [(parameter [, ...])] ;
```

### Parameters

- **name**  
Specifies the name of the prepared statement to be executed.
- **parameter**  
Specifies a parameter of the prepared statement. It must be of the same data type as that specified parameter in creating and generating the prepared statement.

### Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;
```

```
-- Create the reason table.
openGauss=# CREATE TABLE tpcds.reason (
 CD_DEMO_SK INTEGER NOT NULL,
 CD_GENDER character(16) ,
 CD_MARITAL_STATUS character(100)
);

-- Insert data.
openGauss=# INSERT INTO tpcds.reason VALUES(51, 'AAAAAAAADDAAAAAA', 'reason 51');

-- Create the reason_t1 table.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
openGauss=# PREPARE insert_reason(integer,character(16),character(100)) AS INSERT INTO
tpcds.reason_t1 VALUES($1,$2,$3);

openGauss=# EXECUTE insert_reason(52, 'AAAAAAAADDAAAAAA', 'reason 52');

-- Drop the reason and reason_t1 tables.
openGauss=# DROP TABLE tpcds.reason;
openGauss=# DROP TABLE tpcds.reason_t1;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.120 EXPLAIN

### Description

Shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the SQL statement will be scanned, for example, by plain sequential scan or index scan. If multiple tables are referenced, the execution plan also shows what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, which is the plan generator's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds) and total number of rows it actually returned are added to the display. This is useful for determining whether the plan generator's estimated value is close to the actual one.

### Precautions

- The statement is actually executed when the **ANALYZE** option is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use the following approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

- The **DETAIL**, **NODES**, and **NUM\_NODES** parameters cannot be used in standalone mode. If the parameters are used, the following error is reported:

```
openGauss=# CREATE TABLE student(id int, name char(20));
CREATE TABLE
openGauss=# EXPLAIN (NODES true) INSERT INTO student VALUES(5,'a'),('6','b');
ERROR: unrecognized EXPLAIN option "nodes"
```

```
openGauss=# EXPLAIN (NUM_NODES true) INSERT INTO student VALUES(5,'a'),(6,'b');
ERROR: unrecognized EXPLAIN option "num_nodes"
```

## Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

```
EXPLAIN [(option [, ...])] statement;
```

The syntax of the option clause is as follows:

```
ANALYZE [boolean] |
 ANALYZE [boolean] |
 VERBOSE [boolean] |
 COSTS [boolean] |
 CPU [boolean] |
 DETAIL [boolean] | (Unavailable in the centralized mode)
 NODES [boolean] | (Unavailable in the centralized mode)
 NUM_NODES [boolean] | (Unavailable in the centralized mode)
 BUFFERS [boolean] |
 TIMING [boolean] |
 PLAN [boolean] |
 FORMAT { TEXT | XML | JSON | YAML }
```

- Display the execution plan of an SQL statement, where options are in order.

```
EXPLAIN { [ANALYZE | ANALYSE] [VERBOSE] | PERFORMANCE } statement;
```

## Parameters

- **statement**

Specifies the SQL statement to explain.

- **ANALYZE boolean | ANALYSE boolean**

Specifies whether to display actual run times and other statistics. When two parameters are used at the same time, the latter one in option takes effect.

Value range:

- **TRUE** (default): displays them.
- **FALSE**: does not display them.

- **VERBOSE boolean**

Specifies whether to display additional information regarding the plan.

Value range:

- **TRUE** (default): displays it.
- **FALSE**: does not display it.

- **COSTS boolean**

Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.

Value range:

- **TRUE** (default): displays them.
- **FALSE**: does not display them.

- **CPU boolean**

Specifies whether to display CPU usage.

Value range:

- **TRUE** (default): displays it.
- **FALSE**: does not display it.

- **DETAIL boolean** (Unavailable in the centralized mode)  
Displays information about database nodes.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NODES boolean** (Unavailable in the centralized mode)  
Specifies whether to display information about the nodes executed by query.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NUM\_NODES boolean** (Unavailable in the centralized mode)  
Specifies whether to display the number of executing nodes.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **BUFFERS boolean**  
Specifies whether to display buffer usage.  
Value range:
  - **TRUE**: displays it.
  - **FALSE** (default): does not display it.
- **TIMING boolean**  
Specifies whether to display the actual startup time and time spent on the output node.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **PLAN**  
Specifies whether to store the execution plan in **PLAN\_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.  
Value range:
  - **ON** (default): The execution plan is stored in **PLAN\_TABLE** and not printed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **OFF**: The execution plan is not stored but is printed on the screen.
- **FORMAT**  
Specifies the output format.  
Value range: **TEXT**, **XML**, **JSON**, and **YAML**  
Default value: **TEXT**
- **PERFORMANCE**  
Prints all relevant information in execution.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
openGauss=# CREATE TABLE tpcds.customer_address
(
 ca_address_sk INTEGER NOT NULL,
 ca_address_id CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAABAAAAAAA'),(10000,
'AAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
openGauss=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
openGauss=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
openGauss=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN

Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Node/s: All dbnodes
(2 rows)

-- Generate an execution plan in JSON format (with explain_perf_mode being normal).
openGauss=# EXPLAIN(FORMAT JSON) SELECT * FROM tpcds.customer_address_p1;

## 7.13.121 EXPLAIN PLAN

### Description

EXPLAIN PLAN saves information about an execution plan into the **PLAN\_TABLE** table. Different from the EXPLAIN statement, EXPLAIN PLAN only saves plan information and does not print information on the screen.

### Syntax

```
EXPLAIN PLAN
[SET STATEMENT_ID = name]
FOR statement ;
```

### Parameters

- **name**  
Specifies a query tag.  
Value range: a string.
- **PLAN**: saves plan information into **PLAN\_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT\_ID**: tags each query. The tag information will be stored in **PLAN\_TABLE**.

#### NOTE

If the EXPLAIN PLAN statement does not contain **SET STATEMENT\_ID**, **STATEMENT\_ID** is empty by default. In addition, the value of **STATEMENT\_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

### Precautions

- EXPLAIN PLAN cannot be executed on a database node.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN\_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.

### Example 1

You can perform the following steps to collect execution plans of SQL statements by running **EXPLAIN PLAN**:

**Step 1** Run the **EXPLAIN PLAN** statement.

 **NOTE**

After the **EXPLAIN PLAN** statement is executed, plan information is automatically stored in **PLAN\_TABLE**. INSERT, UPDATE, and ANALYZE cannot be performed on **PLAN\_TABLE**.

For details about **PLAN\_TABLE**, see [PLAN\\_TABLE](#).

```
-- Create tables foo1 and foo2.
openGauss=# CREATE TABLE foo1(f1 int, f2 text, f3 text[]);
openGauss=# CREATE TABLE foo2(f1 int, f2 text, f3 text[]);

-- Run EXPLAIN PLAN.
openGauss=# EXPLAIN PLAN SET STATEMENT_ID = 'TPCH-Q4' FOR SELECT f1, count(*) FROM foo1 WHERE
f1 > 1 AND f1 < 3 AND EXISTS (SELECT * FROM foo2) GROUP BY f1;
```

**Step 2** Query **PLAN\_TABLE**.

```
openGauss=# SELECT * FROM plan_table;
```

**Step 3** Delete data from **PLAN\_TABLE**.

```
openGauss=# DELETE FROM plan_table WHERE STATEMENT_ID = 'TPCH-Q4';
openGauss=# DROP TABLE foo1;
openGauss=# DROP TABLE foo2;
```

----End

## 7.13.122 FETCH

### Description

FETCH retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by FETCH. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If FETCH runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- FETCH ALL or FETCH BACKWARD ALL will always leave the cursor positioned after the last row or before the first row.

### Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like FETCH BACKWARD are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using FORWARD and BACKWARD retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched

row. This action will succeed unless the cursor is positioned before the first row or after the last row. If the cursor is positioned before the first row or after the last row, no row is returned.

## Syntax

```
FETCH [direction { FROM | IN }] cursor_name;
```

The direction clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

## Parameters

- **direction**

Defines the fetch direction.

Value range:

- **NEXT** (default value)  
Fetches the next row.
- **PRIOR**  
Fetches the prior row.
- **FIRST**  
Fetches the first row of the query (same as **ABSOLUTE 1**).
- **LAST**  
Fetches the last row of the query (same as **ABSOLUTE -1**).
- **ABSOLUTE count**  
Fetches the *count*<sup>th</sup> row of the query.

**ABSOLUTE** fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.

Value range: a possibly-signed integer.

- If *count* is positive, the *count*<sup>th</sup> row of the query will be fetched.
- If *count* is negative, the **abs(count)**<sup>th</sup> row from the end of the query result will be fetched.
- If *count* is set to **0**, the cursor is positioned before the first row.
- **RELATIVE count**  
Fetches the *count*<sup>th</sup> succeeding row or the *count*<sup>th</sup> prior row if count is negative.

Value range: a possibly-signed integer.

- If *count* is positive, the *count*th succeeding row will be fetched.
- If **count** is negative, the *abs(count)*th prior rows will be fetched.
- If the current row contains no data, **RELATIVE 0** returns null.
- count  
Fetches the next *count* rows (same as **FORWARD count**).
- ALL  
Fetches all remaining rows (same as **FORWARD ALL**).
- FORWARD  
Fetches the next row (same as **NEXT**).
- FORWARD count  
Fetches the *count* succeeding rows or *count* prior rows if *count* is negative.
- FORWARD ALL  
Fetches all remaining rows.
- BACKWARD  
Fetches the prior row (same as **PRIOR**).
- BACKWARD count  
Fetches the prior *count* rows (scanning backwards).  
Value range: a possibly-signed integer.
  - If *count* is positive, the prior *count* rows will be fetched.
  - If *count* is a negative, the succeeding *abs (count)* rows will be fetched.
  - **BACKWARD 0** re-fetches the current row, if any.
- BACKWARD ALL  
Fetches all prior rows (scanning backwards).
- **{ FROM | IN } cursor\_name**  
Specifies the cursor name using the keyword **FROM** or **IN**.  
Value range: an existing cursor name.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
openGauss=# CREATE TABLE tpcds.customer_address
(
 ca_address_sk INTEGER NOT NULL,
 ca_address_id CHARACTER(16) NOT NULL,
 ca_street_number INTEGER ,
 ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
```

```
openGauss=# INSERT INTO tpceds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),(2,
'AAAAAAAAACAAAAAAA', '362', 'Washington 6th'),(3, 'AAAAAAAADAAAAAAA', '585', 'Dogwood Washington');

-- (For the SELECT statement, traverse a table using a cursor.) Start a transaction.
openGauss=# START TRANSACTION;

-- Set up cursor1.
openGauss=# CURSOR cursor1 FOR SELECT * FROM tpceds.customer_address ORDER BY 1;

-- Fetch the first three rows in cursor1.
openGauss=# FETCH FORWARD 3 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
1 | AAAAAAAAAABAAAAAAA | 18 | Jackson
2 | AAAAAAAAAACAAAAAAA | 362 | Washington 6th
3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(3 rows)

-- Close the cursor and commit the transaction.
openGauss=# CLOSE cursor1;

-- End the transaction.
openGauss=# END;

-- (For the VALUES clause, traverse the clause using a cursor.) Start a transaction.
openGauss=# START TRANSACTION;

-- Set up cursor2.
openGauss=# CURSOR cursor2 FOR VALUES(1,2),(0,3) ORDER BY 1;

-- Fetch the first two rows in cursor2.
openGauss=# FETCH FORWARD 2 FROM cursor2;
column1 | column2
-----+-----
0 | 3
1 | 2
(2 rows)

-- Close the cursor and commit the transaction.
openGauss=# CLOSE cursor2;

-- End the transaction.
openGauss=# END;

-- (WITH HOLD cursor) Start a transaction.
openGauss=# START TRANSACTION;

-- Create a cursor using WITH HOLD.
openGauss=# DECLARE cursor1 CURSOR WITH HOLD FOR SELECT * FROM tpceds.customer_address ORDER
BY 1;

-- Fetch the first two rows in cursor1.
openGauss=# FETCH FORWARD 2 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
1 | AAAAAAAAAABAAAAAAA | 18 | Jackson
2 | AAAAAAAAAACAAAAAAA | 362 | Washington 6th
(2 rows)

-- End the transaction.
openGauss=# END;

-- Fetch the next row in cursor1.
openGauss=# FETCH FORWARD 1 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(1 row)
```

```
-- Close the cursor.
openGauss=# CLOSE cursor1;

-- Drop the tpcds.customer_address table.
openGauss=# DROP TABLE tpcds.customer_address;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.123 GRANT

### Description

Grants permissions to roles and users.

GRANT is used in the following scenarios:

- **Granting system permissions to roles or users**

System permissions are also called user attributes, including SYSADMIN, CREATEDB, CREATEROLE, AUDITADMIN, MONADMIN, OPRADMIN, POLADMIN, INHERIT, REPLICATION, VCADMIN, and LOGIN.

They can be specified only by the CREATE ROLE or ALTER ROLE statement. The SYSADMIN permissions can be granted and revoked using GRANT ALL PRIVILEGE and REVOKE ALL PRIVILEGE, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using PUBLIC.

- **Granting database object permissions to roles or users**

Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

GRANT gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

The keyword PUBLIC indicates that the permissions are to be granted to all roles, including those that might be created later. **PUBLIC** can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to **PUBLIC**.

If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to **PUBLIC**, which is a unique GaussDB attribute.

GaussDB grants the permissions on objects of certain types to PUBLIC users. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to PUBLIC users, but the following permissions are granted to PUBLIC users: CONNECT and CREATE TEMP TABLE permissions on databases, EXECUTE permission on functions, and USAGE permission on languages and data types (including domains). An object owner can revoke the default permissions granted to PUBLIC users and grant permissions to other users as needed. For security

purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. In addition, you can restrict the permissions of the PUBLIC user group by referring to "Permission Management" in *Security Hardening Guide*. These default permissions can be modified using the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the ALTER, DROP, COMMENT, INDEX, VACUUM, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

If **WITH ADMIN OPTION** is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

Database system administrators can grant or revoke permissions to or from any roles or users. Roles with the CREATEROLE permission can grant or revoke permissions to or from non-SYSADMIN roles.

- **Granting ANY permissions to roles or users**

Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to PUBLIC users. When separation of duties is disabled, the initial user and system administrators can grant the ANY permissions to or revoke them from any role or user.

Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE, UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY PACKAGE, EXECUTE ANY PACKAGE, and CREATE ANY TYPE. For details about the ANY permission scope, see [Table 7-108](#).

## Precautions

- It is not allowed to grant the ANY permissions to PUBLIC users or revoke the ANY permissions from PUBLIC users.
- The ANY permissions are database permissions and are valid only for database objects that are granted with the permissions. For example, SELECT ANY TABLE only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted with the CREATE ANY TABLE permission, the owner of a table created in a schema with the same name as the user is the creator of the schema. When the user performs other operations on the table, the user needs to be granted with the corresponding operation permission.

- Exercise caution when granting the CREATE ANY FUNCTION or CREATE ANY PACKAGE permission to users to prevent other users from using DEFINER functions or PACKAGE for privilege escalation.

## Syntax

- Grant the table or view access permission to a user or role.  

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT | INDEX | VACUUM } [, ...]
 | ALL [PRIVILEGES] }
ON { [TABLE] table_name [, ...]
 | ALL TABLES IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the column access permission to a user or role.  

```
GRANT { { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...]) } [, ...]
 | ALL [PRIVILEGES] (column_name [, ...]) }
ON [TABLE] table_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the sequence access permission to a specified role or user. The **LARGE** column is optional. The assignment statement does not distinguish whether the sequence is **LARGE**.  

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
ON { [[LARGE] SEQUENCE] sequence_name [, ...]
 | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the database access permission to a user or role.  

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
ON DATABASE database_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the domain access permission to a user or role.  

```
GRANT { USAGE | ALL [PRIVILEGES] }
ON DOMAIN domain_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
-  **NOTE**
- In the current version, the domain access permission cannot be granted.
- Grant the foreign data source access permission to a user or role.  

```
GRANT { USAGE | ALL [PRIVILEGES] }
ON FOREIGN DATA WRAPPER fdw_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the foreign server access permission to a user or role.  

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON FOREIGN SERVER server_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the function access permission to a user or role.  

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { FUNCTION {function_name ([{[argmode] [arg_name] arg_type} [, ...]) } } [, ...]
 | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { PROCEDURE {proc_name ([{ argmode } [arg_name] arg_type } [, ...]) } } [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the procedural language access permission to a user or role.

```
GRANT { USAGE | ALL [PRIVILEGES] }
 ON LANGUAGE lang_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the large object access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
 ON LARGE OBJECT loid [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

#### NOTE

In the current version, the large object access permission cannot be granted.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON SCHEMA schema_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

#### NOTE

When you grant table or view permissions to other users, you also need to grant the USAGE permission on the schema that the tables and views belong to. Without the USAGE permission, the users with table or view permissions can only see the object names, but cannot access them. This syntax cannot be used to grant the permission to create tables in schemas with the same name, but you can use the syntax for granting permission of a role to another user or role to achieve the same effect.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TABLESPACE tablespace_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TYPE type_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

#### NOTE

In the current version, the type access permission cannot be granted.

- Grant the directory permission to a role.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
 ON DIRECTORY directory_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the package permission to a role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { PACKAGE package_name [, ...]
 | ALL PACKAGES IN SCHEMA schema_name [, ...] }
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
 TO role_name [, ...]
 [WITH ADMIN OPTION];
```

- Grant the SYSADMIN permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT
ANY TABLE | UPDATE ANY TABLE |
DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE } [, ...]
TO [GROUP] role_name [, ...]
[WITH ADMIN OPTION];
```

## Parameters

GRANT permissions are classified as follows:

- **SELECT**  
Allows SELECT from any column, or the specific columns listed, of the specified table, view, or sequence. The SELECT permission on the corresponding field is also required for UPDATE or DELETE.
- **INSERT**  
Allows INSERT of a new row into a table.
- **UPDATE**  
Allows UPDATE of any column of a table. Generally, UPDATE also requires the SELECT permission to query which rows need to be updated. SELECT ... FOR UPDATE and SELECT ... FOR SHARE also require this permission on at least one column, in addition to the SELECT permission.
- **DELETE**  
Allows DELETE of a row from a table. Generally, DELETE also requires the SELECT permission to query which rows need to be deleted.
- **TRUNCATE**  
Allows TRUNCATE on a table.
- **REFERENCES**  
Allows creation of a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables.
- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the CREATE permission on the schema of the object.
  - For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
- **CONNECT**  
Allows the grantee to connect to the database.
- **EXECUTE**  
Allows calling a function, including use of any operators that are implemented on top of the function.
- **USAGE**

- For procedural languages, allows use of the language for the creation of functions in that language.
- For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
- For sequences, allows use of the nextval function.
- **ALTER**  
Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.
- **DROP**  
Allows users to drop specified objects.
- **COMMENT**  
Allows users to define or modify comments of a specified object.
- **INDEX**  
Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.
- **VACUUM**  
Allows users to perform ANALYZE and VACUUM operations on specified tables.
- **ALL PRIVILEGES**  
Grants all available permissions to a user or role at a time. Only a system administrator has the GRANT ALL PRIVILEGES permission.

GRANT parameters are as follows:

- **role\_name**  
Specifies the username.
- **table\_name**  
Specifies the table name.
- **column\_name**  
Specifies the column name.
- **schema\_name**  
Specifies the schema name.
- **database\_name**  
Specifies the database name.
- **function\_name**  
Specifies the function name.
- **procedure\_name**  
Specifies the stored procedure name.
- **sequence\_name**  
Specifies the sequence name.
- **domain\_name**  
Specifies the domain type name.
- **fdw\_name**  
Specifies the foreign data wrapper name.

- **lang\_name**  
Specifies the language name.
- **type\_name**  
Specifies the type name.
- **argmode**  
Specifies the parameter mode.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **arg\_name**  
Specifies the parameter name.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **arg\_type**  
Specifies the parameter type.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **loid**  
Specifies the identifier of the large object that includes this page.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **tablespace\_name**  
Specifies the tablespace name.
- **directory\_name**  
Specifies a directory name.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **WITH GRANT OPTION**  
If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to **PUBLIC**.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The GRANT ALL PRIVILEGES forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

#### NOTE

Database system administrators can access all objects regardless of object permission settings. This is comparable to the permissions of **root** in a Unix system. As with **root**, it is unwise to operate as a system administrator except when necessary.

- **WITH ADMIN OPTION**  
If **WITH ADMIN OPTION** is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.  
For the ANY permissions, if **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

**Table 7-108** ANY permissions

| System Permission    | Description                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CREATE ANY TABLE     | Users can create tables or views in the public and user schemas. The users must be granted with the permission to create sequences to create a table that contains serial columns.                                                                                       |
| ALTER ANY TABLE      | Users' ALTER permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted with the index permission for the table. |
| DROP ANY TABLE       | Users' DROP permission on tables or views in the public and user schemas.                                                                                                                                                                                                |
| SELECT ANY TABLE     | Users' SELECT permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                                |
| UPDATE ANY TABLE     | Users' UPDATE permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                                |
| INSERT ANY TABLE     | Users' INSERT permission on tables or views in the public and user schemas.                                                                                                                                                                                              |
| DELETE ANY TABLE     | Users' DELETE permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                                |
| CREATE ANY FUNCTION  | Users can create functions or stored procedures in the user schemas.                                                                                                                                                                                                     |
| EXECUTE ANY FUNCTION | Users' EXECUTE permission on functions or stored procedures in the public and user schemas.                                                                                                                                                                              |
| CREATE ANY PACKAGE   | Users can create packages in the public and user schemas.                                                                                                                                                                                                                |
| EXECUTE ANY PACKAGE  | Users' EXECUTE permission on packages in the public and user schemas.                                                                                                                                                                                                    |
| CREATE ANY TYPE      | Users can create types in the public and user schemas.                                                                                                                                                                                                                   |
| CREATE ANY SEQUENCE  | Users can create sequences in the public and user schemas.                                                                                                                                                                                                               |
| CREATE ANY INDEX     | Users can create indexes in the public and user schemas. The users must be granted with the permission to create tablespaces to create a partitioned table index in a tablespace.                                                                                        |

 NOTE

If a user is granted with any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except **public** listed in [Table 13-1](#).

## Examples

### Example: Granting system permissions to a user or role

Create the **joe** user and grant the SYSADMIN permissions to it.

```
openGauss=# CREATE USER joe PASSWORD '*****';
openGauss=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the SYSADMIN permission.

### Example: Granting object permissions to a user or role

1. Revoke the SYSADMIN permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

```
openGauss=# CREATE SCHEMA tpcds;

openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk INTEGER NOT NULL,
 r_reason_id CHAR(16) NOT NULL,
 r_reason_desc VARCHAR(20)
);

openGauss=# REVOKE ALL PRIVILEGES FROM joe;
openGauss=# GRANT USAGE ON SCHEMA tpcds TO joe;
openGauss=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
```

Then **joe** has all permissions on the **tpcds.reason** table, including CREATE, RETRIEVE, UPDATE, and DELETE.

2. Grant the retrieve permission of **r\_reason\_sk**, **r\_reason\_id**, and **r\_reason\_desc** columns and the UPDATE permission of the **r\_reason\_desc** column in the **tpcds.reason** table to **joe**.

```
openGauss=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON
tpcds.reason TO joe;
```

Then **joe** has the retrieve permission on the **r\_reason\_sk**, **r\_reason\_id**, and **r\_reason\_desc** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

```
openGauss=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
```

Grant the database connection permission and the permission to create schemas in GaussDB to user **joe**, and allow user **joe** to grant this permission to other users.

```
openGauss=# CREATE DATABASE openGauss;
openGauss=# GRANT create,connect on database openGauss TO joe WITH GRANT OPTION;
```

Create the **tpcds\_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds\_manager**, but do not allow **tpcds\_manager** to grant these permissions to others.

```
openGauss=# CREATE ROLE tpcds_manager PASSWORD '*****';
openGauss=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
```

Grant all permissions on the **tpcds\_tbsp** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

```
openGauss=# CREATE TABLESPACE tpcds_tbspc RELATIVE LOCATION 'tablespace/tablespace_1';
openGauss=# GRANT ALL ON TABLESPACE tpcds_tbspc TO joe;
```

### Example: Granting the permissions of one user or role to others

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

```
openGauss=# CREATE ROLE manager PASSWORD '*****';
openGauss=# GRANT joe TO manager WITH ADMIN OPTION;
```

2. Create the **senior\_manager** user and grant **manager**'s permissions to it.

```
openGauss=# CREATE ROLE senior_manager PASSWORD '*****';
openGauss=# GRANT manager TO senior_manager;
```

3. Revoke permissions and drop users.

```
openGauss=# REVOKE joe FROM manager;
openGauss=# REVOKE manager FROM senior_manager;
openGauss=# DROP USER manager;
```

### Example: Revoking permissions and dropping roles and users

```
openGauss=# REVOKE ALL PRIVILEGES ON tpcds.reason FROM joe;
openGauss=# REVOKE ALL PRIVILEGES ON SCHEMA tpcds FROM joe;
openGauss=# REVOKE ALL ON TABLESPACE tpcds_tbspc FROM joe;
openGauss=# DROP TABLESPACE tpcds_tbspc;
openGauss=# REVOKE USAGE,CREATE ON SCHEMA tpcds FROM tpcds_manager;
openGauss=# DROP ROLE tpcds_manager;
openGauss=# DROP ROLE senior_manager;
openGauss=# DROP USER joe CASCADE;
openGauss=# DROP TABLE tpcds.reason;
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.124 INSERT

### Description

Inserts new rows into a table.

### Precautions

- You must have the INSERT permission on a table to insert data into it. If a user is granted the INSERT ANY TABLE permission, the user has the USAGE permission on all schemas except system schemas and the INSERT permission on tables in these schemas.
- Use of the RETURNING clause requires the SELECT permission on all columns mentioned in RETURNING.
- If ON DUPLICATE KEY UPDATE is used, you must have the INSERT and UPDATE permissions on the table and the SELECT permission on the columns of the UPDATE clause.
- If you use the query clause to insert rows from a query, you need to have the SELECT permission on any table or column used in the query.
- The generated column cannot be directly written. In the INSERT statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.

- When you connect to a database compatible to Teradata and **td\_compatible\_truncation** is **on**, a long string will be automatically truncated. If later INSERT statements insert long strings into columns of char- and varchar-typed columns in the target table (not involving foreign tables), the system will truncate the long strings at the maximum length defined in the target table.

#### NOTE

If inserting multi-byte character data (such as Chinese characters) into a database with the character set byte encoding (SQL\_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

## Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
INSERT [/*+ plan_hint */] INTO table_name [partition_clause] [AS alias] [(column_name [, ...])]
 { DEFAULT VALUES
 | VALUES (({ expression | DEFAULT } [, ...]))[, ...]
 | query
 | ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...] [WHERE
condition] } }
 [RETURNING { * | {output_expression [[AS] output_name] }[, ...] }];
```

## Parameters

- WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED]
({SELECT | VALUES | INSERT | UPDATE | DELETE})
```

– **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

– **column\_name** specifies the column name displayed in the subquery result set.

– Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.

– You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.

– If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

– If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution,

it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

#### NOTE

INSERT ON DUPLICATE KEY UPDATE does not support the WITH or WITH RECURSIVE clauses.

- **plan\_hint** clause

Follows the INSERT keyword in the */\*+ \*/* format. It is used to optimize the plan of an INSERT statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.

- **table\_name**

Specifies the name of the target table where data will be inserted.

Value range: an existing table name.

- **partition\_clause**

Inserts data into a specified partition.

```
PARTITION { (partition_name) | FOR (partition_value [, ...]) } |
SUBPARTITION { (subpartition_name) | FOR (subpartition_value [, ...]) }
```

For details about the keywords, see [SELECT](#).

If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

For details, see [CREATE TABLE SUBPARTITION](#).

- **column\_name**

Specifies the name of a column in a table.

- The column name can be qualified with a subcolumn name or array index, if needed.
- Each column not present in the explicit or implicit column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.
- The target column names **column\_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
- The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
- The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.

Value range: name of an existing column.

- **expression**

Specifies an expression or a value to assign to the corresponding column.

- In the INSERT ON DUPLICATE KEY UPDATE statement, **expression** can be set to **VALUES(column\_name)** or **EXCLUDED.column\_name**, indicating that the value of **column\_name** corresponding to the conflict row is referenced. Note that **VALUES(column\_name)** cannot be nested in an expression (for example, **VALUES(column\_name)+1**). **EXCLUDED** is not subject to this restriction.

- If single quotation marks are inserted in a column, the single quotation marks need to be used for escape.
- If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.
- **DEFAULT**  
Specifies the default value of a column. The value is **NULL** if no default value has been assigned to it.
- **query**  
Specifies a query statement (SELECT statement) that uses the query result as the inserted data.
- **RETURNING**  
Returns the inserted rows. The syntax of the RETURNING list is identical to that of the output list of SELECT. Note that INSERT ON DUPLICATE KEY UPDATE does not support the RETURNING clause.
- **output\_expression**  
Specifies an expression used to calculate the output result of the INSERT statement after each row is inserted.  
Value range: The expression can use any column in the table. You can use the asterisk (\*) to return all columns of the inserted row.
- **output\_name**  
Specifies a name to use for a returned column.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **ON DUPLICATE KEY UPDATE**  
For a table with a unique constraint (UNIQUE INDEX or PRIMARY KEY), if the inserted data violates the unique constraint, the UPDATE clause is executed on the conflicting row to complete the update. For a table without a unique constraint, only the INSERT operation is performed. If the clause of UPDATE is NOTHING, this insertion is ignored. You can use "**EXCLUDE.**" or "**VALUES()**" to select the column corresponding to the source data.
  - Triggers are supported. The execution sequence of triggers is determined by the actual execution process.
    - Executing INSERT will trigger the BEFORE INSERT and AFTER INSERT triggers.
    - Executing **UPDATE** will trigger the BEFORE INSERT, BEFORE UPDATE, and AFTER UPDATE.
    - Executing **UPDATE NOTHING** will trigger the BEFORE INSERT trigger.
  - The unique constraint or primary key of DEFERRABLE is not supported.
  - If a table has multiple unique constraints and the inserted data violates multiple unique constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)

- If multiple rows are inserted and these rows conflict with the same row in the table, the system inserts or updates the first row and then updates other rows in sequence.
- Primary keys and unique index columns cannot be updated.
- MOTs are not supported.
- Subquery expressions are supported. The syntax and function of the expressions are the same as those of UPDATE. In a subquery expression, "**EXCLUDED.**" can be used to select the columns corresponding to the source data.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table.
openGauss=# INSERT INTO tpcds.reason(r_reason_sk, r_reason_id, r_reason_desc) VALUES (0,
'AAAAAAAAAAAAAAAA', 'reason0');

-- Create the tpcds.reason_t2 table.
openGauss=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table.
openGauss=# INSERT INTO tpcds.reason_t2(r_reason_sk, r_reason_id, r_reason_desc) VALUES (1,
'AAAAAAAABAAAAAAA', 'reason1');

-- Insert a record into the table, which is equivalent to the previous syntax.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (2, 'AAAAAAAABAAAAAAA', 'reason2');

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (3, 'AAAAAAAACAAAAAAA', 'reason3'),(4,
'AAAAAAAADAAAAAAA', 'reason4'),(5, 'AAAAAAAAEAAAAAAA', 'reason5');

-- Insert records whose r_reason_sk in the tpcds.reason table is less than 5.
openGauss=# INSERT INTO tpcds.reason_t2 SELECT * FROM tpcds.reason WHERE r_reason_sk <5;

-- Create a unique index for the table.
openGauss=# CREATE UNIQUE INDEX reason_t2_u_index ON tpcds.reason_t2(r_reason_sk);

-- Insert multiple records into the table. If the records conflict, update the r_reason_id column in the
conflict data row to BBBBBBBBCAAAAAAA.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (5, 'BBBBBBBBCAAAAAAA', 'reason5'),(6,
'AAAAAAAADAAAAAAA', 'reason6') ON DUPLICATE KEY UPDATE r_reason_id = 'BBBBBBBBCAAAAAAA';

-- Drop the tpcds.reason_t2.
openGauss=# DROP TABLE tpcds.reason_t2;

-- Drop the tpcds.reason table.
openGauss=# DROP TABLE tpcds.reason;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

### VALUES

When you use the INSERT statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance. Example: **INSERT INTO sections VALUES (30, 'Administration', 31, 1900),(40, 'Development', 35, 2000), (50, 'Development' , 60 , 2001);**

## 7.13.125 LOCK

### Description

LOCK TABLE obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use LOCK if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain SHARE lock mode over the table before the query. This will prevent concurrent data changes and ensure subsequent reads of the table see a stable view of committed data. It is because the SHARE lock mode conflicts with the ROW EXCLUSIVE lock acquired by writers, and your LOCK TABLE name IN SHARE MODE statement will wait until any concurrent holders of ROW EXCLUSIVE mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

### Precautions

- LOCK TABLE is useless outside a transaction block, because the lock would remain held only to the completion of the statement. If LOCK TABLE is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- LOCK TABLE ... IN ACCESS SHARE MODE requires the SELECT permission on the target table. All other forms of LOCK require table-level UPDATE and/or the DELETE permission.
- There is no **UNLOCK TABLE** command. Locks are always released at transaction end.
- LOCK TABLE only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, ROW EXCLUSIVE mode is a shareable table lock. Note that all the lock modes have identical semantics so far as LOCK TABLE is concerned, differing only in the rules about which modes conflict with which. For details about the rules, see [Table 7-109](#).
- If the xc\_maintenance\_mode parameter is not enabled, an error is reported when an ACCESS EXCLUSIVE lock is applied for a system catalog.

## Syntax

```
LOCK [TABLE] {[ONLY] name [, ...]} {name [*]} [, ...]
 [IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE
ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE]
 [NOWAIT];
```

## Parameters

**Table 7-109** Lock mode conflicts

| Requested Lock Mode/<br>Current Lock Mode | ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE |
|-------------------------------------------|--------------|-----------|---------------|------------------------|-------|---------------------|-----------|------------------|
| ACCESS SHARE                              | -            | -         | -             | -                      | -     | -                   | -         | X                |
| ROW SHARE                                 | -            | -         | -             | -                      | -     | -                   | X         | X                |
| ROW EXCLUSIVE                             | -            | -         | -             | -                      | X     | X                   | X         | X                |
| SHARE UPDATE EXCLUSIVE                    | -            | -         | -             | X                      | X     | X                   | X         | X                |
| SHARE                                     | -            | -         | X             | X                      | -     | X                   | X         | X                |
| SHARE ROW EXCLUSIVE                       | -            | -         | X             | X                      | X     | X                   | X         | X                |
| EXCLUSIVE                                 | -            | X         | X             | X                      | X     | X                   | X         | X                |
| ACCESS EXCLUSIVE                          | X            | X         | X             | X                      | X     | X                   | X         | X                |

**LOCK** parameters are as follows:

- **name**  
Specifies the name (optionally schema-qualified) of an existing table to lock. Tables are locked one-by-one in the order specified in the **LOCK TABLE** command.  
Value range: an existing table name.
- **ONLY**  
If **ONLY** is specified, only that table is locked. If it is not specified, the table and all its sub-tables are locked.
- **ACCESS SHARE**  
Conflicts with the ACCESS EXCLUSIVE lock mode only.  
The SELECT statement acquires a lock of this mode on referenced tables. Typically, any command that reads a table without modifying it acquires this lock mode.
- **ROW SHARE**  
It conflicts with the EXCLUSIVE and ACCESS EXCLUSIVE lock modes.  
**SELECT FOR UPDATE** and **SELECT FOR SHARE** automatically acquire the ROW SHARE lock on the target table and add the ACCESS SHARE lock to other referenced tables on which FOR SHARE and FOR UPDATE have not been performed.
- **ROW EXCLUSIVE**  
Allows concurrent read of a table but does not allow modification of data in the table, which is the same as ROW SHARE. UPDATE, DELETE, and INSERT automatically acquire this lock on the target table and add the ACCESS SHARE lock to other referenced tables. Generally, all statements that modify table data acquire the ROW EXCLUSIVE lock for tables.
- **SHARE UPDATE EXCLUSIVE**  
Protects a table against concurrent schema changes and VACUUM runs.  
The **VACUUM** (without **FULL**), **ANALYZE**, and **CREATE INDEX CONCURRENTLY** commands automatically request this lock.
- **SHARE**  
Allows concurrent queries of a table but does not allow modification of the table.  
CREATE INDEX (without **CONCURRENTLY**) automatically requests this lock.
- **SHARE ROW EXCLUSIVE**  
Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.  
No SQL statements automatically acquire this lock mode.
- **EXCLUSIVE**  
Allows concurrent queries of the target table but does not allow any other operations.  
This mode allows only concurrent ACCESS SHARE locks; that is, only reads from the table can proceed in parallel with a transaction holding this lock mode.  
No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

- **ACCESS EXCLUSIVE**

Guarantees that the holder is the only transaction accessing the table in any way.

The ALTER TABLE, DROP TABLE, TRUNCATE, and REINDEX statements automatically request this lock.

This is also the default lock mode for **LOCK TABLE** commands that do not specify a mode explicitly.

- **NOWAIT**

Specifies that LOCK TABLE does not wait for any conflicting locks to be released. If the lock cannot be obtained immediately, the command exits and an error message is displayed.

If a table-level lock is obtained without specifying **NOWAIT** and other mutex locks exist, the system waits for other locks to be released.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk INTEGER NOT NULL,
 r_reason_id CHAR(16) NOT NULL,
 r_reason_desc INTEGER
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAAABAAAAAAA', '18'),(5,
'AAAAAAAACAAAAAAA', '362'),(7, 'AAAAAAAADAAAAAAA', '585');

-- Obtain a SHARE ROW EXCLUSIVE lock on a primary key table when going to perform a DELETE
operation.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

openGauss=# START TRANSACTION;

openGauss=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

openGauss=# DELETE FROM tpcds.reason_t1 WHERE r_reason_desc IN(SELECT r_reason_desc FROM
tpcds.reason_t1 WHERE r_reason_sk < 6);

openGauss=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

openGauss=# COMMIT;

-- Drop the tpcds.reason_t1 table.
openGauss=# DROP TABLE tpcds.reason_t1;

-- Drop the table.
openGauss=# DROP TABLE tpcds.reason;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.126 MERGE INTO

### Description

MERGE INTO conditionally matches data in a target table with that in a source table. If data matches, **UPDATE** is executed on the target table; if data does not

match, **INSERT** is executed. You can use this syntax to run **UPDATE** and **INSERT** at a time for convenience

## Precautions

You have the **INSERT** and **UPDATE** permissions on the target table and the **SELECT** permission on the source table.

## Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [partition_clause] [[AS] alias]
USING { { table_name | view_name } | subquery } [[AS] alias]
ON (condition)
[
 WHEN MATCHED THEN
 UPDATE SET { column_name = { expression | subquery | DEFAULT } |
 (column_name [, ...]) = ({ expression | subquery | DEFAULT } [, ...]) } [, ...]
 [WHERE condition]
]
[
 WHEN NOT MATCHED THEN
 INSERT { DEFAULT VALUES |
 [(column_name [, ...])] VALUES ({ expression | subquery | DEFAULT } [, ...]) [, ...] [WHERE condition] }
];
```

## Parameters

- **plan\_hint** clause  
Follows the **MERGE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **MERGE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **INTO** clause  
Specifies the target table that is being updated or has data being inserted.
- **table\_name**  
Specifies the name of the target table.
- **partition\_clause**  
Performs **MERGE** operations on a specified partition.  

```
PARTITION { (partition_name) | FOR (partition_value [, ...]) } |
SUBPARTITION { (subpartition_name) | FOR (subpartition_value [, ...]) }
```

  
For details about the keywords, see [SELECT](#).  
If the value of the **VALUE** clause is inconsistent with that of the specified partition, an exception is displayed.  
For details, see [CREATE TABLE SUBPARTITION](#).
- **alias**  
Specifies the alias of the target table.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **USING** clause  
Specifies the source table, which can be a table, view, or subquery.
- **ON** clause  
Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.

- **WHEN MATCHED** clause  
Performs UPDATE if data in the source table matches that in the target table based on the condition.  
System catalogs and system columns cannot be updated.
- **WHEN NOT MATCHED** clause  
Performs INSERT if data in the source table does not match that in the target table based on the condition.  
An INSERT clause can contain only one **VALUES**.  
The order of WHEN MATCHED and WHEN NOT MATCHED clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two **WHEN MATCHED** or **WHEN NOT MATCHED** clauses cannot be specified at the same time.
- **DEFAULT**  
Specifies the default value of a column.  
The value is **NULL** if no default value has been assigned to it.
- **WHERE** condition  
Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

## Examples

```
-- Create the target table products and source table newproducts, and insert data into them.
openGauss=# CREATE TABLE products
(
 product_id INTEGER,
 product_name VARCHAR2(60),
 category VARCHAR2(60)
);

openGauss=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
openGauss=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
openGauss=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
openGauss=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
openGauss=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

openGauss=# CREATE TABLE newproducts
(
 product_id INTEGER,
 product_name VARCHAR2(60),
 category VARCHAR2(60)
);

openGauss=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
openGauss=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
openGauss=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
openGauss=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
openGauss=# MERGE INTO products p
 USING newproducts np
 ON (p.product_id = np.product_id)
 WHEN MATCHED THEN
 UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
```

```
'play gym'
WHEN NOT MATCHED THEN
 INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
openGauss=# SELECT * FROM products ORDER BY product_id;
 product_id | product_name | category
-----+-----+-----
 1501 | vivitar 35mm | electrncs
 1502 | olympus camera | electrncs
 1600 | play gym | toys
 1601 | lamaze | toys
 1666 | harry potter | toys
 1700 | wait interface | books
(6 rows)

-- Drop the table.
openGauss=# DROP TABLE products;
openGauss=# DROP TABLE newproducts;
```

## 7.13.127 MOVE

### Description

MOVE repositions a cursor without retrieving any data. MOVE works exactly like the **FETCH** statement, except it only repositions the cursor and does not return rows.

### Syntax

```
MOVE [direction [FROM | IN]] cursor_name;
```

The direction clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

### Parameters

The parameters of **MOVE** and **FETCH** commands are the same. For details, see [Parameters](#) in "FETCH."

#### NOTE

On successful completion, the **MOVE** command returns a "**MOVE count**" tag, where *count* indicates the number of rows that the **FETCH** command with the same parameters would have returned (possibly zero).

### Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;
```

```
-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk INTEGER NOT NULL,
 r_reason_id CHAR(16) NOT NULL,
 r_reason_desc VARCHAR(40)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', 'Xxxxxxxx'),(2,
'AAAAAAAACAAAAAAA', ' Xxxxxxxx'),(3, 'AAAAAAAADAAAAAAA', ' Xxxxxxxx'),(4, 'AAAAAAAEEAAAAAAA',
'Not the product that was ordered'),(5, 'AAAAAAAFAAAAAAA', 'Parts missing'),(6, 'AAAAAAGAAAAAAA',
'Does not work with a product that I have'),(7, 'AAAAAAAHAAAAAAA', 'Gift exchange');

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Define a cursor cursor1.
openGauss=# CURSOR cursor1 FOR SELECT * FROM tpcds.reason;

-- Skip the first three rows of cursor1.
openGauss=# MOVE FORWARD 3 FROM cursor1;

-- Fetch the first four rows from cursor1.
openGauss=# FETCH 4 FROM cursor1;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----
4 | AAAAAAAEEAAAAAAA | Not the product that was
ordered
5 | AAAAAAFAAAAAAAA | Parts missing
6 | AAAAAAGAAAAAAA | Does not work with a product that I
have
7 | AAAAAAHAAAAAAA | Gift
exchange
(4 rows)

-- Close the cursor.
openGauss=# CLOSE cursor1;

-- End the transaction.
openGauss=# END;

-- Drop the table.
openGauss=# DROP TABLE tpcds.reason;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.128 PREPARE

### Description

Creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When **PREPARE** is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the PREPARE statement is created, it exists throughout the database session. Once it is created (even if in a transaction

block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly calling **DEALLOCATE** or automatically deleted when the session ends.

## Syntax

```
PREPARE name [(data_type [, ...])] AS statement;
```

## Parameters

- **name**  
Specifies the name of a prepared statement. It must be unique in the session.
- **data\_type**  
Specifies the type of an argument.
- **statement**  
Specifies a SELECT, INSERT, UPDATE, DELETE, MERGE INTO, or VALUES statement.

## Examples

See [Examples](#) in "EXECUTE."

## Helpful Links

[DEALLOCATE](#)

# 7.13.129 PREPARE TRANSACTION

## Description

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, PREPARE TRANSACTION is not unlike a ROLLBACK statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the PREPARE TRANSACTION statement fails for any reason, it becomes a ROLLBACK and the current transaction is canceled.

## Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.

- When running the **PREPARE TRANSACTION** command, increase the value of **max\_prepared\_transactions** in configuration file **postgresql.conf**. You are advised to set it to a value not less than that of **max\_connections** so that one pending prepared transaction is available for each session.

## Syntax

```
PREPARE TRANSACTION transaction_id;
```

## Parameters

- transaction\_id**  
Specifies an arbitrary identifier that later identifies this transaction for COMMIT PREPARED or ROLLBACK PREPARED. The identifier must be different from those for current prepared transactions.  
Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

## Examples

```
-- Start.
openGauss=# BEGIN;
BEGIN

-- Prepare a transaction whose identifier is trans_test.
openGauss=# PREPARE TRANSACTION 'trans_test';
PREPARE TRANSACTION
```

## Helpful Links

[COMMIT PREPARED](#) and [ROLLBACK PREPARED](#)

## 7.13.130 PURGE

### Description

The PURGE statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.
- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

### Precautions

- The PURGE operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the PURGE operation are as follows:
  - PURGE TABLE:** The user must be the owner of the table and must have the USAGE permission on the schema to which the table belongs. System administrators have this permission by default.

- **PURGE INDEX:** The user must be the owner of the index and have the USAGE permission on the schema to which the index belongs. By default, system administrators have this permission.
- **PURGE RECYCLEBIN:** Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the USAGE permission of the schema to which the objects belong. By default, system administrators can clear all objects in the recycle bin.

## Syntax

```
PURGE { TABLE [schema_name.]table_name
 | INDEX index_name
 | RECYCLEBIN
 }
```

## Parameters

- **schema\_name**  
Schema name
- **TABLE [ schema\_name. ] table\_name**  
Clears a specified table in the recycle bin.
- **INDEX index\_name**  
Clears a specified index in the recycle bin.
- **RECYCLEBIN**  
Clears the objects in the recycle bin.

## Examples

```
-- Create the reason_table_space tablespace.
openGauss=# CREATE TABLESPACE REASON_TABLE_SPACE1 owner tpcds RELATIVE location 'tablespace/
tsp_reason1';
-- Create the tpcds.reason_t1 table in the tablespace.
openGauss=# CREATE TABLE tpcds.reason_t1
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create the tpcds.reason_t2 table in the tablespace.
openGauss=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create the tpcds.reason_t3 table in the tablespace.
openGauss=# CREATE TABLE tpcds.reason_t3
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create an index on the tpcds.reason_t1 table.
openGauss=# CREATE INDEX index_t1 on tpcds.reason_t1(r_reason_id);
openGauss=# DROP TABLE tpcds.reason_t1;
openGauss=# DROP TABLE tpcds.reason_t2;
openGauss=# DROP TABLE tpcds.reason_t3;
-- View the recycle bin.
openGauss=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
rcyname | rcyoriginname | rcytablespace
```

```
-----+-----+-----

BIN$16418$2CF3EC8==$0 | index_t1 | 0
(3 rows)
-- Purge the index.
openGauss=# PURGE INDEX tindex_t1;
openGauss=# SELECT rcynname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcynname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
(2 rows)
-- Purge all objects in the recycle bin.
openGauss=# PURGE recyclebin;
openGauss=# SELECT rcynname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcynname | rcyoriginname | rcytablespace
-----+-----+-----
(0 rows)
```

## 7.13.131 REASSIGN OWNED

### Description

Changes the owner of the database object.

REASSIGN OWNED requires that the system change the owner of all the database objects owned by an old role to a new role.

### Precautions

- REASSIGN OWNED is often executed before role deletion.
- To run **REASSIGN OWNED**, you must have the permissions of the original and target roles.

### Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

### Parameters

- **old\_role**  
Specifies the role name of the old owner.
- **new\_role**  
Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

### Examples

None

## 7.13.132 REFRESH INCREMENTAL MATERIALIZED VIEW

### Function

**REFRESH INCREMENTAL MATERIALIZED VIEW** refreshes a materialized view in incremental mode.

### Precautions

- Incremental refresh supports only fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

### Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

### Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a fast-refresh materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
openGauss=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete the fast-refresh materialized view.
openGauss=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
openGauss=# DROP TABLE my_table;
```

### Helpful Links

## 7.13.133 REFRESH MATERIALIZED VIEW

### Function

**REFRESH MATERIALIZED VIEW** refreshes materialized views in full refresh mode.

### Precautions

- Full refreshing can be performed on both complete- and fast-refresh materialized views.

- To refresh a materialized view, you must have the SELECT permission on the base table.

## Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

## Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

## Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
openGauss=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Create a fast-refresh materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
openGauss=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
openGauss=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete the fast-refresh materialized view.
openGauss=# DROP MATERIALIZED VIEW my_imv;

-- Delete the complete-refresh materialized view.
openGauss=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
openGauss=# DROP TABLE my_table;
```

## Helpful Links

## 7.13.134 REINDEX

### Description

Rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which REINDEX can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.

- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.
- An index build with the **CONCURRENTLY** option failed, leaving an "invalid" index.

## Precautions

**REINDEX DATABASE** and **REINDEX SYSTEM** cannot be executed in transaction blocks. Currently, REINDEX operations cannot be performed on materialized views.

## Syntax

- Rebuild an ordinary index.  
`REINDEX { INDEX | [INTERNAL] TABLE | DATABASE | SYSTEM } name [ FORCE ];`
- Rebuild an index partition.  
`REINDEX { INDEX | [INTERNAL] TABLE } name  
PARTITION partition_name [ FORCE ];`

## Parameters

- **INDEX**  
Rebuilds the specified index.
- **TABLE**  
Rebuilds all indexes of a specified table. The TOAST table (if any) of the table is reindexed as well. If an index in the table has been invalidated by running **alter unusable**, the index cannot be rebuilt.
- **DATABASE**  
Rebuilds all indexes within the current database.
- **SYSTEM**  
Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.
- **name**  
Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.  
  

 **NOTE**

REINDEX DATABASE and REINDEX SYSTEM can rebuild indexes for only the current database. Therefore, **name** must be the same as the current database name.
- **FORCE**  
Specifies an invalid option, which will be ignored.
- **partition\_name**  
Specifies the name of the partition or index partition to be rebuilt.  
Value range:
  - If REINDEX INDEX is used, specify the name of an index partition.
  - If REINDEX TABLE is used, specify the name of a partition.

**NOTICE**

**REINDEX DATABASE** and **REINDEX SYSTEM** cannot be executed in transaction blocks.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
openGauss=# CREATE TABLE tpcds.customer
(
 c_customer_sk INTEGER NOT NULL,
 c_customer_id CHAR(16) NOT NULL
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAA'),(5,
'AAAAAAAAACAAAAAA'),(10, 'AAAAAADAAAAAA');

-- Create a row-store table tpcds.customer_t1 and create an index on the c_customer_sk column in the
table.
openGauss=# CREATE TABLE tpcds.customer_t1
(
 c_customer_sk integer not null,
 c_customer_id char(16) not null,
 c_current_demo_sk integer ,
 c_current_hdemo_sk integer ,
 c_current_addr_sk integer ,
 c_first_shipto_date_sk integer ,
 c_first_sales_date_sk integer ,
 c_salutation char(10) ,
 c_first_name char(20) ,
 c_last_name char(30) ,
 c_preferred_cust_flag char(1) ,
 c_birth_day integer ,
 c_birth_month integer ,
 c_birth_year integer ,
 c_birth_country varchar(20) ,
 c_login char(13) ,
 c_email_address char(50) ,
 c_last_review_date char(10)
)
WITH (orientation = row);

openGauss=# CREATE INDEX tpcds_customer_index1 ON tpcds.customer_t1 (c_customer_sk);

openGauss=# INSERT INTO tpcds.customer_t1 SELECT * FROM tpcds.customer WHERE c_customer_sk < 10;

-- Rebuild a single index.
openGauss=# REINDEX INDEX tpcds.tpcds_customer_index1;

-- Rebuild all indexes in the tpcds.customer_t1 table:
openGauss=# REINDEX TABLE tpcds.customer_t1;

-- Drop the tpcds.customer_t1 table.
openGauss=# DROP TABLE tpcds.customer_t1;

-- Drop the table.
openGauss=# DROP TABLE tpcds.customer;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- **INTERNAL TABLE**  
This scenario is used for fault recovery. You are advised not to perform concurrent operations.
- **DATABASE**  
You are not allowed to re-index a database in a transaction.
- **SYSTEM**  
You are not allowed to re-index system catalogs in transactions.

## 7.13.135 RELEASE SAVEPOINT

### Description

RELEASE SAVEPOINT deletes a savepoint previously defined in the current transaction.

Deleting a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use ROLLBACK TO SAVEPOINT. Deleting a savepoint when it is no longer needed allows the system to recycle some resources earlier than transaction end.

RELEASE SAVEPOINT also deletes all savepoints that were established after the named savepoint was established.

### Precautions

- Releasing a savepoint name that was not previously defined will cause an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

### Syntax

```
RELEASE [SAVEPOINT] savepoint_name;
```

### Parameters

**savepoint\_name**

Specifies the name of the savepoint you want to delete.

### Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create a table.
openGauss=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;
```

```
-- Insert data.
openGauss=# INSERT INTO tpcds.table1 VALUES (3);

-- Create a savepoint.
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
openGauss=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the table content, which should contain both 3 and 4.
openGauss=# SELECT * FROM tpcds.table1;

-- Drop the table.
openGauss=# DROP TABLE tpcds.table1;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

[SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.13.136 RESET

### Description

RESET restores GUC parameters to their default values. The default values are parameter default values compiled in the **postgresql.conf** configuration file.

**RESET** is an alternative spelling for:

```
SET configuration_parameter TO DEFAULT;
```

### Precautions

RESET and SET have the same transaction behavior. Their impact will be rolled back.

### Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME_ZONE | TRANSACTION ISOLATION LEVEL |
SESSION AUTHORIZATION | ALL };
```

### Parameters

- **configuration\_parameter**  
Specifies the name of a GUC parameter.  
Value range: GUC parameters. You can view them by running the **SHOW ALL** command.
- **CURRENT\_SCHEMA**  
Specifies the current schema.

- **TIME ZONE**  
Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**  
Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**  
Specifies the session authorization.
- **ALL**  
Specifies all GUC parameters.

## Examples

```
-- Reset timezone to the default value.
openGauss=# RESET timezone;

-- Set all parameters to their default values.
openGauss=# RESET ALL;
```

## Helpful Links

[SET](#) and [SHOW](#)

## 7.13.137 REVOKE

### Description

REVOKE revokes permissions from one or more roles.

### Precautions

If a non-owner user of an object attempts to the REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the REVOKE ALL PRIVILEGES form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

### Syntax

- Revoke the permission on a specified table or view.  

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
 INDEX | VACUUM }, ... }
 | ALL [PRIVILEGES] }
ON { [TABLE] table_name [, ...]
 | ALL TABLES IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```
- Revoke the permission on a specified field in a table.

```
REVOKE [GRANT OPTION FOR]
{ { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...]) [, ...]
| ALL [PRIVILEGES] (column_name [, ...]) }
ON [TABLE] table_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified sequence. The **LARGE** column is optional. The recycling statement does not distinguish whether the sequence is **LARGE**.

```
REVOKE [GRANT OPTION FOR]
{ { SELECT | UPDATE | ALTER | DROP | COMMENT } [, ...]
| ALL [PRIVILEGES] }
ON { [[LARGE] SEQUENCE] sequence_name [, ...]
| ALL SEQUENCES IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified database.

```
REVOKE [GRANT OPTION FOR]
{ { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
| ALL [PRIVILEGES] }
ON DATABASE database_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified domain.

```
REVOKE [GRANT OPTION FOR]
{ USAGE | ALL [PRIVILEGES] }
ON DOMAIN domain_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified directory.

```
REVOKE [GRANT OPTION FOR]
{ { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
ON DIRECTORY directory_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified external data source.

```
REVOKE [GRANT OPTION FOR]
{ USAGE | ALL [PRIVILEGES] }
ON FOREIGN DATA WRAPPER fdw_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified external server.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON FOREIGN SERVER server_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified function.

```
REVOKE [GRANT OPTION FOR]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { FUNCTION {function_name ([{ [argmode] [arg_name] arg_type } [, ...]) } } [, ...]
| ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [GRANT OPTION FOR]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { PROCEDURE {proc_name ([{ [argmode] [arg_name] arg_type } [, ...]) } } [, ...]
| ALL PROCEDURE IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
 ON LANGUAGE lang_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified large object.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
 ON LARGE OBJECT loid [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified schema.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON SCHEMA schema_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TABLESPACE tablespace_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified type.

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TYPE type_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a package object.

```
REVOKE [GRANT OPTION FOR]
 { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON PACKAGE package_name [, ...]
 FROM {[GROUP] role_name | PUBLIC} [, ...]
 [CASCADE | RESTRICT];
```

- Revoke permissions from a role.

```
REVOKE [ADMIN OPTION FOR]
 role_name [, ...] FROM role_name [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the SYSADMIN permission from a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ADMIN OPTION FOR]
 { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
 TABLE | UPDATE ANY TABLE |
 DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
 EXECUTE ANY FUNCTION |
 CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE } [, ...]
 FROM [GROUP] role_name [, ...];
```

## Parameters

The keyword PUBLIC indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see [Parameters](#) in "GRANT".

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to PUBLIC users. Therefore, revoking the SELECT permission on an object from PUBLIC users does not necessarily mean that the SELECT permission on the object has been revoked from all roles, because the SELECT permission directly granted to roles

and inherited from parent roles remains. Similarly, if the SELECT permission is revoked from a user but is not revoked from PUBLIC users, the user can still use SELECT.

If **GRANT OPTION FOR** is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the UPDATE permission (with **WITH GRANT OPTION**) on a table and has granted it to user B, the permission that user B holds is called dependent permission. When user A's permission or grant option is revoked, **CASCADE** must be declared to revoke all dependent permissions.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted a permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use **CASCADE**. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke A's own grant but not B's grant, so C will still effectively have the permission.

If the role executing **REVOKE** holds permissions indirectly via more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, it is the best practice to use SET ROLE to become the specific role, and then execute **REVOKE**. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

## Examples

See [Examples](#) in "GRANT."

## Helpful Links

[GRANT](#)

## 7.13.138 ROLLBACK

### Description

Rolls back the current transaction and backs out all updates in the transaction.

If a fault occurs during the running of a transaction, the transaction cannot be executed. The system cancels all completed operations on the database in the transaction, and the database status returns to the time when the transaction starts.

### Precautions

If a **ROLLBACK** statement is executed out of a transaction, no error occurs, but a notice is displayed.

### Syntax

```
ROLLBACK [WORK | TRANSACTION];
```

## Parameters

### WORK | TRANSACTION

Specifies the optional keyword that more clearly illustrates the syntax.

## Examples

```
-- Start a transaction.
openGauss=# START TRANSACTION;

-- Back out all changes.
openGauss=# ROLLBACK;
```

## Helpful Links

[COMMIT](#) | [END](#)

## 7.13.139 ROLLBACK PREPARED

### Function

Cancels a transaction ready for two-phase committing.

### Precautions

- The function is only available in maintenance mode (when GUC parameter **xc\_maintenance\_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user that initiates a transaction or the system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

### Syntax

```
ROLLBACK PREPARED transaction_id ;
```

### Parameter Description

#### transaction\_id

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

## Examples

```
-- Start.
openGauss=# BEGIN;
BEGIN

-- Prepare a transaction whose identifier is trans_test.
openGauss=# PREPARE TRANSACTION 'trans_test';
PREPARE TRANSACTION

-- Cancel the transaction whose identifier is trans_test.
```

```
openGauss=# ROLLBACK PREPARED 'trans_test';
ROLLBACK PREPARED
```

## Helpful Links

[COMMIT PREPARED](#) and [PREPARE TRANSACTION](#)

## 7.13.140 ROLLBACK TO SAVEPOINT

### Description

ROLLBACK TO SAVEPOINT rolls back to a savepoint. It implicitly deletes all savepoints that were established after the named savepoint.

Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

### Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a FETCH statement inside a savepoint that is later rolled back, the cursor remains at the position that FETCH left it pointing to (that is, the cursor motion caused by FETCH is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using ROLLBACK TO SAVEPOINT, the cursor can no longer be used.
- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to delete a savepoint but keep the effects of the commands executed after the savepoint was established.

### Syntax

```
ROLLBACK [WORK | TRANSACTION] TO [SAVEPOINT] savepoint_name;
```

### Parameters

*savepoint\_name*

Rolls back to a savepoint.

### Examples

```
-- Undo the effects of the statements executed after my_savepoint was established:
openGauss=# START TRANSACTION;
openGauss=# SAVEPOINT my_savepoint;
openGauss=# ROLLBACK TO SAVEPOINT my_savepoint;
-- Cursor positions are not affected by savepoint rollback.
openGauss=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;
openGauss=# SAVEPOINT foo;
openGauss=# FETCH 1 FROM foo;
?column?

1
openGauss=# ROLLBACK TO SAVEPOINT foo;
```

```
openGauss=# FETCH 1 FROM foo;
?column?

2
openGauss=# RELEASE SAVEPOINT my_savepoint;
openGauss=# COMMIT;
```

## Helpful Links

[SAVEPOINT](#) and [RELEASE SAVEPOINT](#)

## 7.13.141 SAVEPOINT

### Description

SAVEPOINT establishes a new savepoint in the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

### Precautions

- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to delete a savepoint but keep the effects of the commands executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a thread or process caused by a node or connection failure, or of an error caused by the inconsistency between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.
- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. If the latest savepoint is released, the previous savepoint will again become accessible to ROLLBACK TO SAVEPOINT and RELEASE SAVEPOINT. In addition, SAVEPOINT fully complies with the SQL standard.

### Syntax

```
SAVEPOINT savepoint_name;
```

### Parameters

savepoint\_name

Specifies the name of the new savepoint.

**NOTICE**

When using SAVEPOINT, you are advised to release SAVEPOINT promptly to avoid too many nested subtransactions. It is recommended that the number of nested subtransactions be less than or equal to 10,000. If the number of nested subtransactions is too large, the current transaction performance may deteriorate.

## Examples

```
-- Create a table.
openGauss=# CREATE TABLE table1(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
openGauss=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
rolled back.
openGauss=# SELECT * FROM table1;

-- Drop the table.
openGauss=# DROP TABLE table1;

-- Create a table.
openGauss=# CREATE TABLE table2(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO table2 VALUES (3);

-- Create a savepoint.
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table2 VALUES (4);

-- Roll back the savepoint.
openGauss=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the table content, which should contain both 3 and 4.
openGauss=# SELECT * FROM table2;

-- Drop the table.
openGauss=# DROP TABLE table2;
```

## Helpful Links

[RELEASE SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.13.142 SELECT

### Description

SELECT retrieves data from tables or views.

Serving as an overlaid filter on database tables, the SELECT statement uses SQL keywords to filter data tables and extract the required data.

### Precautions

- The owner of a table, users granted the SELECT permission on the table, or users granted the SELECT ANY TABLE permission can read data in the table or view. System administrators have the permission to read data in the table or view by default.
- You must have the SELECT permission on each field used in the SELECT statement.
- Using FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE also requires the UPDATE permission in addition to the SELECT permission.

### Syntax

```
• Query data.
[WITH [RECURSIVE] with_query [, ...]]
SELECT [/*+ plan_hint */] [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name]} [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[[START WITH condition] CONNECT BY [NOCYCLE] condition [ORDER SIBLINGS BY expression]]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
[WINDOW {window_name AS (window_definition)} [, ...]]
[{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause } [NULLS { FIRST | LAST }]} [, ...]]
[LIMIT { [offset,] count | ALL }]
[OFFSET start [ROW | ROWS]]
[FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
[{FOR { UPDATE | NO KEY UPDATE | SHARE | KEY SHARE } [OF table_name [, ...]] [NOWAIT | WAIT n]}
[...]];
TABLE { ONLY {(table_name)| table_name} | table_name [*]};
```

 NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Only reference aliases in **targetlist**.
- Reference a prior expression in a subsequent expression.
- Volatile functions cannot be used.
- Window functions cannot be used.
- Aliases cannot be referenced in the condition of JOIN ON.
- An error is reported if **targetlist** contains multiple aliases to be referenced.
- The subquery **with\_query** is as follows:  

```
with_query_name [(column_name [, ...])]
AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})
```
- The specified query source **from\_item** is as follows:  

```
{[ONLY] table_name [*] [partition_clause] [[AS] alias [(column_alias [, ...])]]
[TABLESAMPLE sampling_method (argument [, ...]) [REPEATABLE (seed)]]
[TIMECAPSULE {TIMESTAMP | CSN} expression]
[(select) [AS] alias [(column_alias [, ...])]]
[with_query_name [[AS] alias [(column_alias [, ...])]]]
[function_name ([argument [, ...]]) [AS] alias [(column_alias [, ...] | column_definition [, ...])]
[function_name ([argument [, ...]]) AS (column_definition [, ...])]
[from_item [NATURAL] join_type from_item [ON join_condition | USING (join_column [, ...])]]
```
- The GROUP clause is as follows:  

```
()
| expression
| (expression [, ...])
| ROLLUP ({ expression | (expression [, ...]) } [, ...])
| CUBE ({ expression | (expression [, ...]) } [, ...])
| GROUPING SETS (grouping_element [, ...])
```
- The specified partition **partition\_clause** in **from\_item** is as follows:  

```
PARTITION { (partition_name) | FOR (partition_value [, ...]) } |
SUBPARTITION { (subpartition_name) | FOR (subpartition_value [, ...]) }
```

 NOTE

Specifying partitions applies only to partitioned tables.

- The sorting order **nlsort\_expression\_clause** is as follows:  

```
NLSSORT (column_name, ' NLS_SORT = { SCHINESE_PINYIN_M | generic_m_ci } ')
```

The second parameter can be **generic\_m\_ci**, which supports only the case-insensitive order for English characters.
- Simplified query syntax, equivalent to SELECT \* FROM *table\_name*.  

```
TABLE { ONLY {(table_name)| table_name} | table_name [*]};
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert |
update | delete})
```

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
- RECURSIVE can appear only after WITH. In the case of multiple CTEs, you only need to declare RECURSIVE at the first CTE.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan\_hint** clause  
Follows the SELECT keyword in the */\*+<Plan hint> \*/* format. It is used to optimize the plan of a **SELECT** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **ALL**  
Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.
- **DISTINCT [ ON ( expression [, ...] ) ]**  
Removes all duplicate rows from the result set of the SELECT statement so that each row in the result set is unique.  
Retains only the first row in the set of rows that have the same result calculated on the given expression.

---

**NOTICE**

DISTINCT ON expression is explained with the same rule of ORDER BY. Unless you use ORDER BY to guarantee that the required row appears first, you cannot know what the first row is.

---

- **SELECT** list

Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (\*) is used to represent the column name.

You may use the *AS output\_name* clause to assign an alias to the output column. The alias is usually used for displaying the output column. The name, value, and type keywords can be used as column aliases.

Column names can be expressed in the following formats:

- Manually input column names which are spaced using commas (,).
- Columns computed in the FROM clause.
- FROM clause

Specifies one or more source tables for SELECT.

The FROM clause can contain the following elements:

- table\_name

Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, *schema\_name.table\_name*.

- alias

Gives a temporary alias to a table to facilitate the reference by other queries.

An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely hides the actual name of the table.

- TABLESAMPLE sampling\_method ( argument [, ...] ) [ REPEATABLE ( seed ) ]

The TABLESAMPLE clause following *table\_name* specifies that the specified *sampling\_method* should be used to retrieve the subset of rows in the table.

The optional REPEATABLE clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

Queries the table data of a specified CSN or at a specified time point.

Currently, the following tables do not support flashback query: system catalogs, MOTs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, inherited tables, and tables with the PARTIAL CLUSTER KEY constraint.

- TIMECAPSULE TIMESTAMP

Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp.

- TIMECAPSULE CSN

Searches for the result set of a specified CSN based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in **gs\_txn\_snapshot**.

- expression

Constants, functions, or SQL expressions.

 NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails.
- Flashback query does not support index query. Flashback query supports only seq scan for full table scanning.
- When the flashback point is too old, the source version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
- After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.

- column\_alias

Specifies the column alias.

- PARTITION

Queries data in the specified partition in a partitioned table.

- partition\_name

Specifies the name of a partition.

- partition\_value

Specifies the value of the specified partition key. If a partitioned table has multiple partition keys, you can use PARTITION FOR to uniquely identify a partition.

- SUBPARTITION

Queries data in the specified level-2 partition in a partitioned table.

- subpartition\_name

Specifies the name of a level-2 partition name.

- subpartition\_value

Specifies the key values of specified level-1 and level-2 partitions. The values of the two partition keys specified by the SUBPARTITION FOR clause can be used to uniquely identify a level-2 partition.

- subquery

Performs a subquery in the FROM clause. A temporary table is created to save subquery results.

- with\_query\_name  
References a WITH clause as the source of a FROM clause by the name of a WITH query.
  - function\_name  
Function name. Functions can be used in a FROM clause.
  - join\_type  
The options are as follows:
    - [ INNER ] JOIN  
A JOIN clause combines two FROM items. You can use parentheses to determine the order of nesting. In the absence of parentheses, JOIN nests left-to-right.
    - LEFT [ OUTER ] JOIN  
Returns all rows that meet the join conditions in the Cartesian product, as well as the rows in the left table that do not match the right table rows according to join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that the condition of the JOIN clause is used only when matches are being calculated. The condition of the outer layer is applied after the calculation.
    - RIGHT [ OUTER ] JOIN  
Returns all result rows of INNER JOIN, as well as all rows on the right that do not have matches (rows on the left are filled with **NULL**).  
This is just a notational convenience because you can always convert it to a LEFT OUTER JOIN by switching the left and right inputs.
    - FULL [ OUTER ] JOIN  
Returns all the joined rows, pluses one row for each unmatched left-hand row (extended with **NULL** on the right), and pluses one row for each unmatched right-hand row (extended with **NULL** on the left).
    - CROSS JOIN  
Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain FROM and WHERE.
-  **NOTE**
- For the INNER and OUTER join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join\_condition**, or **USING (join\_column [, ...])**. For CROSS JOIN, none of these clauses can appear.
- CROSS JOIN and INNER JOIN produce a simple Cartesian product, the same result as you get from listing the two items at the top level of FROM.
- ON join\_condition  
Defines which rows have matches in joins. Example: **ON left\_table.a = right\_table.a**. You are advised not to use numeric types such as int for

**join\_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- USING(join\_column[, ...])

Abbreviation of **ON left\_table.a = right\_table.a AND left\_table.b = right\_table.b** .... The names of the corresponding columns must be the same.

- NATURAL

Shorthand for a USING list that contains all columns in the two tables that have the same names.

- from item

Specifies the name of the query source object connected.

- WHERE clause

The WHERE clause forms an expression for row selection to narrow down the query range of SELECT. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

In a WHERE clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

- a. It can appear only in the WHERE clause.
- b. If a table join has been specified in the FROM clause, the operator (+) cannot be used in the WHERE clause.
- c. The operator (+) can work only on columns of tables or views, instead of on expressions.
- d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
- e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the FROM clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join. Expressions where the operator (+) is used cannot be directly connected through OR.
- f. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the join condition.
- g. A table cannot have multiple foreign tables.
- h. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through AND or OR.

- i. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

**NOTICE**

- For the WHERE clause, if special character "%", "\_", or "\" is queried in LIKE, add the slash "\" before each character.
- For a hierarchical query, the WHERE expression is processed as follows in a multi-table join query:
  - Decompose the WHERE expression based on the disjunctive and conjunctive actions and check whether each subexpression involves multiple tables (potential join conditions) queried at the current layer. If a subexpression is not a subconnection and involves only multiple tables queried at the current layer, push it down to the non-recursive START WITH clause or the recursive CONNECT BY clause of the hierarchical query for prior execution as the JOIN condition. Otherwise, place it after the recursive CONNECT BY clause for execution as a filter condition.
  - During internal implementation, the subexpressions that do not meet pushdown requirements in the parse tree of the original WHERE expression are deleted to obtain the final expression that can be pushed down. Then, the subexpressions that meet the pushdown condition are removed from the parse tree of the original WHERE expression to obtain the final expression that is not pushed down.

To sum up, pay attention to the following points:

- When the WHERE expression is split, the disjunctive action is also split. Therefore, the two expressions joined by OR are also split.
- Sublinks must not be pushed down.
- If an input column is not queried at the current layer, the column will not be pushed down.

Then, for the following example:

```
SELECT * FROM t1,t2
WHERE t1.a=1 or t1.a=t2.a and t1.b=t2.b or t1.c in (SELECT t3.c FROM t3)
START WITH t1.c=1
CONNECT BY PRIOR t2.c=t1.c;
```

The following figure shows the pushdown conditions after the WHERE expression is split disjunctively and conjunctively.

It is equivalent to "t1.a=t2.a AND t1.b=t2.b". The following figure shows the conditions that are not pushed down.

It is equivalent to "t1.a=1 OR t1.c in (SELECT t3.c FROM t3)".

For another example:

```
SELECT * FROM t3 WHERE EXISTS(
 SELECT * FROM t1,t2
 WHERE t1.a+t2.a=t3.a
 START WITH t1.c=1
 CONNECT BY PRIOR t2.c=t1.c;
)
```

The WHERE condition contains **t3.a** inputted by the outer query. Therefore, the WHERE condition is not pushed down.

- **START WITH clause**

The START WITH clause is usually used together with the CONNECT BY clause and indicates the initial condition of recursion: Data is traversed recursively and hierarchically. If this clause is omitted and the CONNECT BY clause is used alone, all rows in the table are used as the initial set. For details, see • [CONNECT BY clause](#).

- **CONNECT BY clause**

CONNECT BY indicates a recursive join condition. It is used together with START WITH to implement data traversal and recursion. Example:

```
openGauss=# CREATE TABLE test(name varchar, id int, fatherid int);
openGauss=# INSERT INTO test VALUES('A', 1, 0), ('B', 2, 1),('C',3,1),('D',4,1),('E',5,2);
openGauss=# SELECT * FROM test START WITH id = 1 CONNECT BY prior id = fatherid ORDER
SIBLINGS BY id desc;
name | id | fatherid
-----+-----+-----
A | 1 | 0
D | 4 | 1
C | 3 | 1
B | 2 | 1
E | 5 | 2
(5 rows)
```

In the CONNECT BY condition, the PRIOR keyword can be specified for a column to indicate that the column is recursive. If NOCYCLE is added before the recursive join condition, recursion stops when a loop record is encountered. (Note: A SELECT statement containing the START WITH .. CONNECT BY clause does not support the FOR SHARE or UPDATE lock.)

The process of executing the **START WITH** statement is as follows:

- The initial dataset is selected based on the condition in the START WITH clause. In the preceding example, **('A', 1, 0)** is selected first. Then, this initial dataset is set as the working set.
- If the working set is not empty, the data in the working set is used as the input for the next query. The filter criteria are specified in the CONNECT

BY clause. The keyword PRIOR indicates the current record. For example, **PRIOR id = fatherid** in the preceding example indicates that the ID of the current record is **fatherid** of the next record.

- c. Set the dataset filtered in step 2 as the working set and repeat the operation in step 2.

In addition, the database adds the following pseudocolumns to each selected data record so that users can learn about the location of the data in the recursive or tree structure.

- **LEVEL**: node level.
- **CONNECT\_BY\_ISLEAF**: specifies whether a node is a leaf node.

NOTICE

**connect\_by\_isleaf**: If a node does not have any subnode, the node is a leaf node and **connect\_by\_isleaf** is set to 1. Otherwise, **connect\_by\_isleaf** is set to 0.

Assume that table T1 exists and the data in table T1 is shown in [Figure 7-12](#).

Figure 7-12 Data structure

| T1 |   |
|----|---|
| A  | B |
| 1  | 2 |
| 2  | 3 |
| 2  | 4 |
| 3  | 5 |

Run the following statement:

```
SELECT * FROM T1 CONNECT BY PRIOR B=A AND LEVEL<=3;
```

The tree structure of the result is shown in [Figure 7-13](#), where the blue nodes are leaf nodes.

Figure 7-13 Logical structure of the execution

In addition to pseudocolumns, the following query functions are provided (for details, see [Hierarchical Recursion Query Functions](#)):

- **sys\_connect\_by\_path(col, separator)**: returns the connection path from the root node to the current row. The **col** parameter indicates the name of the column displayed in the path, and the **separator** parameter indicates the connector.
- **connect\_by\_root(col)**: displays the top-level node of the node. **col** indicates the name of the output column.

If a loop exists in the dataset, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

Besides, in the hierarchical query, the search is performed strictly according to the depth-first order. If ROWNUM is used as the filter condition in START WITH or CONNECT BY, the value of **ROWNUM** is increased by 1 for each record to be returned. Then, the record is verified based on **ROWNUM** conditions. Records that do not satisfy the conditions are discarded and the value of **ROWNUM** is decreased by 1.

#### NOTICE

- The PRIOR keyword can be used only in the CONNECT BY clause instead of the START WITH clause.
  - The PRIOR keyword can be specified only for columns in the table instead of expressions, pseudocolumns, or type conversion. For example, PRIOR (a + 1) is not allowed.
  - In the CONNECT BY clause, the column using the keyword PRIOR cannot be in the same condition with pseudocolumns such as level and rownum. For example, (PRIOR a = level) is not allowed, but (PRIOR a = b) AND (level = 1) is allowed. Different conditions refer to the conditions connected by AND at the top of the CONNECT BY clause. For example, (PRIOR a = 1 OR level = 1) is considered as a condition and is not allowed.
  - In the START WITH and CONNECT BY clauses, pseudocolumns cannot be used for sublinks, for example, "rownum = (subquery)" or "rownum IN (subquery)".
  - You are advised not to use ROWNUM in the CONNECT BY clause. If ROWNUM is required, test it thoroughly to avoid unexpected results.
  - When START WITH or CONNECT BY is called on the CTE defined by WITH AS, if there are multiple CTEs, ensure that the definition of each CTE does not depend on other CTEs.
  - If no loop exists in the data but the error message "runs into cycle" is reported, increase the value of **max\_recursive\_times**.
  - **connect\_by\_isleaf**, **connect\_by\_iscycle**, and **level** are of the int type.
  - **connect\_by\_isleaf**, **connect\_by\_iscycle**, and **level** are parsed as pseudocolumns in hierarchical queries.
  - The alias defined in the projection column cannot be called for START WITH or CONNECT BY.
  - Optimization suggestions for START WITH:
    - Create indexes based on the conditions in the CONNECT BY clause to improve the performance of the START WITH clause.
    - Identify bottlenecks based on the plan collected by running EXPLAIN PERFORMANCE or in WDRs. If the recursive operator (inner plan) of RECURSIVE UNION is the HASH JOIN operator, but the hash table is created for the temporary table **tmp\_result** or the hash table in plan is materialized (that is, the batch size is greater than 1), the possible cause is that the value of **work\_mem** is too small. As a result, the hash table cannot be created for the outer data table. You can increase the value of **work\_mem** to improve performance.
- Note: GaussDB optimizes tables with a small volume of data and caches table results in hash tables to improve performance. In this case, indexes are not required. However, if the data volume exceeds the limit specified by **work\_mem**, the optimization becomes invalid. In this case, you can create indexes for optimization.

 **WARNING**

You are advised not to use recursive query when creating a view definition. Otherwise, the obtained view definition is incorrect or an error is reported. This is because the bottom layer of the recursive query statement is rewritten as the RECURSIVE UNION statement, and the displayed view definition is obtained by reversely parsing the RECURSIVE UNION query tree. After a view with recursive query is created, the view definition is the RECURSIVE UNION statement, instead of the START WITH statement, or even the statement may not be valid. The current database view functions are not affected. However, the restore operation will fail because some tools, such as `gs_dump` and `gs_restore`, migrate views by checking the view definition. In this case, you need to manually create the view again.

- **ORDER SIBLINGS BY clause**

The output of the START WITH statement is returned level by level. However, there is no sequence guarantee at each level because the database automatically selects the optimal execution path during each round of query. In the preceding example, A is output first, but the sequence of B, C, and D is not fixed. If you have requirements on the final output sequence, you can use ORDER SIBLINGS BY. The usage of ORDER SIBLINGS BY is the same as that of ORDER BY. ORDER SIBLINGS BY is used for sorting at each level during recursion.

**NOTICE**

The expression following ORDER SIBLINGS BY only supports sorting by calling non-aggregate and window functions for ordinary columns, column name offsets, and column names. It does not support calling system functions related to START WITH for column names or using pseudocolumns related to START WITH.

- **GROUP BY clause**

Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

- **CUBE ( { expression | ( expression [, ...] ) } [, ...] )**

A CUBE grouping is an extension to the GROUP BY clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions ( $n=3$ ) in the CUBE clause, the operation results in  $2^n = 2^3 = 8$  groupings. Rows grouped on the values of  $n$  expressions are called regular rows, and the rest are called super-aggregate rows.

- **GROUPING SETS ( grouping\_element [, ...] )**

GROUPING SETS is another extension to the GROUP BY clause. It allows you to specify multiple GROUP BY clauses. This improves efficiency by trimming away unnecessary data. After you specify the required data group, the database does not need to compute a whole **ROLLUP** or **CUBE**.

**NOTICE**

- If a SELECT list expression references ungrouped columns and no aggregate function is used, an error is reported. This is because multiple values may be returned for ungrouped columns.
- If a SELECT list expression references a constant, the GROUP BY clause does not need to group the constant. Otherwise, an error is reported.

- **HAVING clause**

Used together with the GROUP BY clause to select special groups. The HAVING clause compares some attributes of groups with a constant. Only groups that match the logical expression in the HAVING clause are extracted.

- **WINDOW clause**

The general format is **WINDOW window\_name AS ( window\_definition ) [, ...]**. **window\_name** is a name can be referenced by **window\_definition**. **window\_definition** can be expressed in the following forms:

```
[existing_window_name]
[PARTITION BY expression [, ...]]
[ORDER BY expression [ASC | DESC | USING operator] [NULLS { FIRST | LAST }] [, ...]]
[frame_clause]
```

**frame\_clause** defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. **frame\_clause** can be expressed in the following forms:

```
[RANGE | ROWS] frame_start
[RANGE | ROWS] BETWEEN frame_start AND frame_end
```

**frame\_start** and **frame\_end** can be expressed in the following forms:

```
UNBOUNDED PRECEDING
value PRECEDING
CURRENT ROW
value FOLLOWING
UNBOUNDED FOLLOWING
```

- **UNION clause**

Computes the set union of the rows returned by multiple SELECT statements. The UNION clause has the following constraints:

- The default result of UNION does not contain any duplicate rows unless the ALL clause is specified.
- Multiple UNION operators in the same SELECT statement are evaluated from left to right, unless otherwise specified by parentheses.
- **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, and **FOR KEY SHARE** cannot be specified in the result or input of **UNION**.

General expression:

```
select_statement UNION [ALL] select_statement
```

- **select\_statement** can be any SELECT statement without the ORDER BY, LIMIT, FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE clause.
- ORDER BY and LIMIT can be attached to the subexpression if it is enclosed in parentheses.

- **INTERSECT clause**

Computes the set intersection of rows returned by the involved SELECT statements. The result of INTERSECT does not contain any duplicate rows.

The INTERSECT clause has the following constraints:

- Multiple INTERSECT operators in the same SELECT statement are evaluated from left to right, unless otherwise specified by parentheses.
- Processing INTERSECT preferentially when UNION and INTERSECT operations are executed for results of multiple SELECT statements.

General format:

```
select_statement INTERSECT select_statement
```

**select\_statement** can be any SELECT statement without the FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE clause.

- EXCEPT clause

Has the following common form:

```
select_statement EXCEPT [ALL] select_statement
```

**select\_statement** can be any SELECT statement without the FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE clause.

The EXCEPT operator computes the set of rows that are in the result of the left SELECT statement but not in the result of the right one.

The result of EXCEPT does not contain any duplicate rows unless the ALL clause is declared. To execute **ALL**, a row that has  $m$  duplicates in the left table and  $n$  duplicates in the right table will appear  $\text{MAX}(m-n, 0)$  times in the result set.

Multiple EXCEPT operators in the same SELECT statement are evaluated from left to right, unless parentheses dictate otherwise. EXCEPT binds at the same level as UNION.

Currently, the FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, and FOR KEY SHARE clauses cannot be specified for the result of EXCEPT or any input of EXCEPT.

- MINUS clause

Has the same function and syntax as EXCEPT clause.

- ORDER BY clause

Sorts data retrieved by SELECT in descending or ascending order. If the ORDER BY expression contains multiple columns:

- If two columns are equal according to the leftmost expression, they are compared according to the next expression.
- If they are equal according to all specified expressions, they are returned in an implementation-dependent order.
- When used with the DISTINCT keyword, the columns to be sorted in ORDER BY must be included in the columns of the result set retrieved by the SELECT statement.
- When used with the GROUP BY clause, the columns to be sorted in ORDER BY must be included in the columns of the result set retrieved by the SELECT statement.

**NOTICE**

To support Chinese pinyin order, specify the **UTF-8**, **GB18030**, or **GBK** encoding mode during database initiation. The statements are as follows:

```
initdb -E UTF8 -D ../data -locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -locale=zh_CN.GB18030,
or initdb -E GBK -D ../data -locale=zh_CN.GBK.
```

- **LIMIT clause**

Consists of two independent sub-clauses:

**LIMIT { count | ALL }** limits the number of rows to be returned. **count** specifies the number of rows to be returned. The effect of **LIMIT ALL** is the same as that of omitting the **LIMIT** clause.

**OFFSET start count** specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

- **OFFSET clause**

The SQL: 2008 standard has introduced a different clause:

**OFFSET start { ROW | ROWS }**

**start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**

If **count** is omitted in a **FETCH** clause, it defaults to **1**.

- **Locking clause**

The **FOR UPDATE** clause locks the rows retrieved by **SELECT**. This prevents these rows from being modified or deleted by other transactions before the current transaction ends. That is, other transactions that attempt to run **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, or **SELECT FOR KEY SHARE** for these rows will be blocked until the current transaction ends. Any **DELETE** on the same row will also acquire the **FOR UPDATE** lock mode, as will **UPDATE** that modifies values on the primary key column. Conversely, **SELECT FOR UPDATE** will wait for concurrent transactions that are running the preceding commands on the same row, and will continue to lock and return the updated rows (there may be no row because the rows may be deleted).

**FOR NO KEY UPDATE** behaves similarly to **FOR UPDATE**, except that it acquires a weaker lock that will not block **SELECT FOR KEY SHARE** that attempts to acquire the lock on the same row. Any **UPDATE** that does not acquire the **FOR UPDATE** lock will also acquire this locking mode.

**FOR SHARE** behaves similarly, except that it requires a shared lock rather than an exclusive lock on each retrieved row. A shared lock blocks other transactions from executing **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, or **SELECT FOR NO KEY UPDATE**, except **SELECT FOR SHARE** and **SELECT FOR KEY SHARE**.

**FOR KEY SHARE** is similar to **FOR SHARE** except that its lock is weak. **SELECT FOR UPDATE** is blocked but **SELECT FOR NO KEY UPDATE** is not blocked. A key-shared lock blocks other transactions from executing **DELETE** or **UPDATE** that modifies the key value, except **UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, and **SELECT FOR KEY SHARE**.

To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately. If you use **WAIT** *n* and the selected row cannot be locked immediately, the operation needs to wait for *n* seconds (the value of *n* is of the int type with a range of  $0 \leq n \leq 2147483$ ). If the lock is obtained within *n* seconds, the operation is performed normally. Otherwise, an error is reported.

If table names are specified in a locking clause, then only those tables will be locked. Other tables used in SELECT will not be locked. Otherwise, locking all tables in the statement.

If a locking clause is applied to a view or sub-query, it affects all tables used in the view or sub-query.

Multiple locking clauses can be written if it is necessary to specify different locking behaviors for different tables.

If a table appears (or implicitly appears) in multiple clauses at the same time, the strongest lock is used. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

---

**NOTICE**

Only FOR SHARE and FOR UPDATE can be used to query the Ustore table.

---

- **NLS\_SORT**

Specifies that a column is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to UTF8, GB18030, or GBK when creating a database. If you set the encoding format to another format, for example, SQL\_ASCII, an error may be reported or the sorting mode may be invalid.

Value range:

- **SCHINESE\_PINYIN\_M**, sorted by Pinyin order.
- **generic\_m\_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

- **PARTITION** clause

Queries data in the specified partition in a partitioned table.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason values(3,'AAAAAAAAABAAAAAAA','reason 1'),
(10,'AAAAAAAAABAAAAAAA','reason 2'),(4,'AAAAAAAAABAAAAAAA','reason 3'),
(10,'AAAAAAAAABAAAAAAA','reason 4'),(10,'AAAAAAAAABAAAAAAA','reason 5'),
```

```
(20,'AAAAAAACAAAAAA','N%reason 6'),(30,'AAAAAAACAAAAAA','W%reason 7');

-- Obtain the temp_t temporary table by a subquery and query all records in this table.
openGauss=# WITH temp_t(name,isdba) AS (SELECT username,usesuper FROM pg_user) SELECT * FROM
temp_t;

-- Query all r_reason_sk records in the tpcds.reason table and delete duplicate records.
openGauss=# SELECT DISTINCT(r_reason_sk) FROM tpcds.reason;

-- Example of a LIMIT clause: Obtain a record from the table.
openGauss=# SELECT * FROM tpcds.reason LIMIT 1;

-- Query all records and sort them in alphabetic order.
openGauss=# SELECT r_reason_desc FROM tpcds.reason ORDER BY r_reason_desc;

-- Use table aliases to obtain data from pg_user and pg_user_status:
openGauss=# SELECT a.username,b.locktime FROM pg_user a,pg_user_status b WHERE a.usesysid=b.roloid;

-- Example of the FULL JOIN clause: Join data in pg_user and pg_user_status.
openGauss=# SELECT a.username,b.locktime,a.usesuper FROM pg_user a FULL JOIN pg_user_status b on
a.usesysid=b.roloid;

-- Example of the GROUP BY clause: Filter data based on query conditions, and group the results.
openGauss=# SELECT r_reason_id, AVG(r_reason_sk) FROM tpcds.reason GROUP BY r_reason_id HAVING
AVG(r_reason_sk) > 25;

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
openGauss=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY
CUBE(r_reason_id,r_reason_sk);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
openGauss=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY GROUPING
SETS((r_reason_id,r_reason_sk),r_reason_sk);

-- Example of the UNION clause: Merge the names started with W and N in the r_reason_desc column in
the tpcds.reason table.
openGauss=# SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'W%'
UNION
SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'N%';

-- Example of the NLS_SORT clause: Sort by Chinese Pinyin.
openGauss=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT =
SCHINESE_PINYIN_M');

-- sorting in case-insensitive order (optional; only English characters are supported in the case-insensitive
order.)
openGauss=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT =
generic_m_ci');

-- Create a range-partitioned table tpcds.reason_p.
openGauss=# CREATE TABLE tpcds.reason_p
(
r_reason_sk integer,
r_reason_id character(16),
r_reason_desc character(100)
)
PARTITION BY RANGE (r_reason_sk)
(
partition P_05_BEFORE values less than (05),
partition P_15 values less than (15),
partition P_25 values less than (25),
partition P_35 values less than (35),
partition P_45_AFTER values less than (MAXVALUE)
```

```
)
;

-- Insert data.
openGauss=# INSERT INTO tpcds.reason_p values(3,'AAAAAAAABAAAAAAA','reason 1'),
(10,'AAAAAAAABAAAAAAA','reason 2'),(4,'AAAAAAAABAAAAAAA','reason 3'),
(10,'AAAAAAAABAAAAAAA','reason 4'),(10,'AAAAAAAABAAAAAAA','reason 5'),
(20,'AAAAAAACAAAAAAA','reason 6'),(30,'AAAAAAACAAAAAAA','reason 7');

-- Example of the PARTITION clause: Obtain data from the P_05_BEFORE partition in the tpcds.reason_p
table.
openGauss=# SELECT * FROM tpcds.reason_p PARTITION (P_05_BEFORE);
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----
 4 | AAAAAAABAAAAAAA | reason 3
 3 | AAAAAAABAAAAAAA | reason 1
(2 rows)

-- Example of the GROUP BY clause: Group records in the tpcds.reason_p table by r_reason_id, and count
the number of records in each group.
openGauss=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id;
 count | r_reason_id
-----+-----
 2 | AAAAAAACAAAAAAA
 5 | AAAAAAABAAAAAAA
(2 rows)

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
openGauss=# SELECT * FROM tpcds.reason GROUP BY CUBE (r_reason_id,r_reason_sk,r_reason_desc);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
openGauss=# SELECT * FROM tpcds.reason GROUP BY GROUPING SETS
((r_reason_id,r_reason_sk),r_reason_desc);

-- Example of the HAVING clause: Group records in the tpcds.reason_p table by r_reason_id, count the
number of records in each group, and display only values whose number of r_reason_id is greater than 2.
openGauss=# SELECT COUNT(*) c,r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id HAVING c>2;
 c | r_reason_id

## 7.13.143 SELECT INTO

### Description

SELECT INTO creates a table based on the query result and inserts data retrieved by the query into the new table.

Different from SELECT, data is not returned to the client. The table columns have the same names and data types as the output columns of SELECT.

### Precautions

CREATE TABLE AS provides functions similar to SELECT INTO in functions and provides a superset of functions provided by SELECT INTO. You are advised to use CREATE TABLE AS, because SELECT INTO cannot be used in a stored procedure.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
 { * | {expression [[AS] output_name]} [, ...] }
 INTO [[GLOBAL | LOCAL] [TEMPORARY | TEMP] | UNLOGGED] [TABLE] new_table
 [FROM from_item [, ...]]
 [WHERE condition]
 [GROUP BY expression [, ...]]
 [HAVING condition [, ...]]
 [WINDOW {window_name AS (window_definition)} [, ...]]
 [{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
 [ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS { FIRST |
LAST }]} [, ...]]
 [LIMIT { count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
 [{FOR {UPDATE | SHARE } [OF table_name [, ...]] [NOWAIT |WAIT N]} [, ...]];
```

### Parameters

- **new\_table**

**new\_table** specifies the name of the new table.

- **UNLOGGED**

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, it is also insecure. After the database is restarted due to a conflict or abnormal shutdown, the data in the unlogged table is cleared. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are automatically unlogged as well.

- Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
- Troubleshooting: If data is missing in the indexes of unlogged tables due to an abnormal shutdown or other unexpected operations, users should rebuild indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified,

GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using **ON COMMIT PRESERVE ROWS** or **ON COMMIT DELETE ROWS**. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schemas starting with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- If another session is using a global temporary table or index, the **ALTER** or **DROP** operation cannot be performed on it.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

---

 **NOTE**

For details about other parameters of **SELECT INTO**, see [Parameters](#) in "SELECT."

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpceds;
```

```
-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAABAAAAAAA','reason 2'),(3,'AAAAAAAABAAAAAAA','reason 3'),
(4,'AAAAAAAABAAAAAAA','reason 4'),(4,'AAAAAAAABAAAAAAA','reason 5'),
(4,'AAAAAAAACAAAAAAA','reason 6'),(5,'AAAAAAAACAAAAAAA','reason 7');

-- Add the values that are less than 5 in the r_reason_sk column of the tpcds.reason table to the new table.
openGauss=# SELECT * INTO tpcds.reason_t1 FROM tpcds.reason WHERE r_reason_sk < 5;
INSERT 0 6

-- Drop the tpcds.reason_t1 table.
openGauss=# DROP TABLE tpcds.reason_t1;

-- Drop the tpcds.reason table.
openGauss=# DROP TABLE tpcds.reason;

-- Drop the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

[SELECT](#)

## 7.13.144 SET

### Description

Modifies GUC parameters.

### Precautions

Most GUC parameters can be modified at runtime by using SET, but some parameters cannot be modified after a service or session starts.

### Syntax

- Set the system time zone.  
SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
- Set the schema of the table.  
SET [ SESSION | LOCAL ]  
    {CURRENT\_SCHEMA { TO | = } { schema | DEFAULT }  
    | SCHEMA 'schema'};
- Set client-side encoding.  
SET [ SESSION | LOCAL ] NAMES encoding\_name;
- Set XML parsing mode.  
SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
- Set other GUC parameters.  
SET [ LOCAL | SESSION ]  
    {config\_parameter { { TO | = } { value | DEFAULT }  
    | FROM CURRENT }};

## Parameters

- **SESSION**

Specifies that the specified parameters take effect for the current session. If neither **SESSION** nor **LOCAL** appears, **SESSION** is the default value.

If this command is executed in a transaction, the effect of the command disappears after the transaction is rolled back. Once the surrounding transaction is committed, the effect will persist until the end of the session, unless the parameters are reset by another SET statement.

- **LOCAL**

Specifies that the specified parameters take effect for the current transaction. After COMMIT or ROLLBACK, session-level settings will take effect again.

The effect of this command lasts only until the end of the current transaction, whether the transaction is committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME\_ZONE timezone**

Specifies the local time zone for the current session.

Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT\_SCHEMA schema**

Specifies the current schema.

Value range: an existing schema name. If the schema name does not exist, the value of **CURRENT\_SCHEMA** will be empty.

- **SCHEMA schema**

Specifies the current schema. Here the schema is a string.

Example: set schema 'public';

- **NAMES encoding\_name**

Specifies the client character encoding. This statement is equivalent to **set client\_encoding to encoding\_name**.

Value range: a valid character encoding name. The GUC parameter corresponding to this option is **client\_encoding**. The default encoding is **UTF8**.

- **XML OPTION option**

Specifies the XML parsing mode.

Value range: **CONTENT** (default) and **DOCUMENT**.

- **config\_parameter**

Specifies the name of a configurable GUC parameter. You can use SHOW ALL to view the available GUC parameters.

### NOTE

Some parameters viewed by SHOW ALL cannot be set by using SET. For example, **max\_datanodes**.

- **value**

Specifies the new value of **config\_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these.

**DEFAULT** can be written to indicate resetting the parameter to its default value.

## Examples

```
-- Set the search path of a schema.
openGauss=# SET search_path TO tpeds, public;

-- Set the date style to the traditional POSTGRES style (date placed before month).
openGauss=# SET datestyle TO postgres,dmy;
```

## 7.13.145 SET CONSTRAINTS

### Function

**SET CONSTRAINTS** sets the behavior of constraint checking within the current transaction.

**IMMEDIATE** constraints are checked at the end of each statement. **DEFERRED** constraints are not checked until transaction commit. Each constraint has its own **IMMEDIATE** or **DEFERRED** mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by **SET CONSTRAINTS**.

**SET CONSTRAINTS** with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, the new mode takes effect retroactively: any outstanding data modifications that would have been checked at the end of the transaction are instead checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction.

Constraints are always checked immediately when a row is inserted or modified.

### Precautions

**SET CONSTRAINTS** sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (**START TRANSACTION/COMMIT** pair), it will not appear to have any effect.

## Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE } ;
```

## Parameter Description

- **name**  
Specifies the constraint name.  
Value range: an existing table name, which can be found in the system catalog **pg\_constraint**.
- **ALL**  
Specifies all constraints.
- **DEFERRED**  
Specifies that constraints are not checked until transaction commit.
- **IMMEDIATE**  
Specifies that constraints are checked at the end of each statement.

## Examples

```
-- Set that constraints are checked when a transaction is committed.
openGauss=# SET CONSTRAINTS ALL DEFERRED;
```

## 7.13.146 SET ROLE

### Description

Sets the current user identifier of the current session.

### Precautions

- Users of the current session must be members of specified **rolename**, but system administrators can choose any roles.
- This statement may add permissions to or restrict permissions of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all permissions of roles that SET ROLE enables the role to be. In this case, SET ROLE physically deletes all permissions directly granted to session users and permissions of its belonging roles and only leaves permissions of the specified roles. If the role of the session user has the **NOINHERITS** attribute, SET ROLE deletes permissions directly granted to the session user and obtains permissions of the specified role.

## Syntax

- Set the current user identifier of the current session.  

```
SET [SESSION | LOCAL] ROLE role_name PASSWORD 'password';
```
- Reset the current user identifier to that of the current session.  

```
RESET ROLE;
```

## Parameters

- **SESSION**  
Specifies that the statement takes effect only for the current session. This parameter is used by default.

- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Specifies the role name.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **password**  
Specifies the password of a role. It must comply with the password convention. Encrypted passwords are not supported.
- **RESET ROLE**  
Resets the current user identifier.

## Examples

```
-- Create a role paul.
openGauss=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
openGauss=# SET ROLE paul PASSWORD '*****';

-- View the current session user and the current user.
openGauss=> SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
openGauss=> RESET ROLE;

-- Drop the user.
openGauss=# DROP USER paul;
```

## 7.13.147 SET SESSION AUTHORIZATION

### Description

Sets the session user identifier and the current user identifier of the current session to a specified user.

### Precautions

The session identifier can be changed only when the initial session user has the SYSADMIN permission. Otherwise, the system supports the statement only when the authenticated username is specified.

### Syntax

- Set the session user identifier and the current user identifier of the current session.  
`SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';`
- Reset the identifiers of the session and current users to the initially authenticated usernames.  
`{SET [ SESSION | LOCAL ] SESSION AUTHORIZATION DEFAULT  
| RESET SESSION AUTHORIZATION};`

## Parameters

- **SESSION**  
Specifies that the specified parameters take effect for the current session.
- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Username.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **password**  
Specifies the password of a role. It must comply with the password convention. Encrypted passwords are not supported.
- **DEFAULT**  
Resets the identifiers of the session and current users to the initially authenticated usernames.

## Examples

```
-- Create a role paul.
openGauss=# CREATE ROLE paul IDENTIFIED BY '*****!';

-- Set the current user to paul.
openGauss=# SET SESSION AUTHORIZATION paul password '*****!';

-- View the current session user and the current user.
openGauss=# SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
openGauss=# RESET SESSION AUTHORIZATION;

-- Drop the user.
openGauss=# DROP USER paul;
```

## Reference

### [SET ROLE](#)

## 7.13.148 SET TRANSACTION

### Description

Sets the transaction characteristics. Transaction characteristics include transaction isolation level and transaction access mode (read/write or read-only). You can set the current transaction characteristics using **LOCAL** or the default transaction characteristics of a session using **SESSION**.

### Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect.

## Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [LOCAL] TRANSACTION|SET SESSION CHARACTERISTICS AS TRANSACTION }
{ ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
| { READ WRITE | READ ONLY } } [, ...]
```

## Parameters

- **LOCAL**

Specifies that the specified statement takes effect only for the current transaction.

- **SESSION**

Specifies that the specified parameters take effect for the current session.

- **ISOLATION\_LEVEL**

Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

 **NOTE**

The isolation level cannot be changed after data is modified using SELECT, INSERT, DELETE, UPDATE, FETCH, or COPY in the current transaction.

Value range:

- **READ COMMITTED**: Only committed data can be read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

Specifies the transaction access mode (read/write or read only).

## Examples

```
-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
openGauss=# START TRANSACTION;
openGauss=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
openGauss=# COMMIT;
```

## 7.13.149 SHOW

### Description

SHOW shows the current value of a GUC parameter.

### Syntax

```
SHOW
{
 [VARIABLES LIKE] configuration_parameter |
 CURRENT_SCHEMA |
 TIME_ZONE |
 TRANSACTION ISOLATION LEVEL |
```

```
SESSION AUTHORIZATION |
ALL
};
```

## Parameters

See [Parameters](#) in "RESET."

## Examples

```
-- Show the value of timezone.
openGauss=# SHOW timezone;

-- Show all parameters.
openGauss=# SHOW ALL;

-- Show all parameters whose names contain var.
openGauss=# SHOW VARIABLES LIKE var;
```

## Helpful Links

[SET](#) and [RESET](#)

## 7.13.150 SHUTDOWN

### Description

SHUTDOWN shuts down the currently connected database node.

### Precautions

Only administrators can run this command.

### Syntax

```
SHUTDOWN [FAST | IMMEDIATE];
```

### Parameters

- **""**  
If the shutdown mode is not specified, the default mode **fast** is used.
- **fast**  
Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.
- **immediate**  
Shuts down the server forcibly. Fault recovery will occur on the next startup.

### Examples

```
-- Shut down the current database node.
openGauss=# SHUTDOWN;

-- Shut down the current database node in fast mode.
openGauss=# SHUTDOWN FAST;
```

## 7.13.151 START TRANSACTION

### Description

START TRANSACTION starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using [SET TRANSACTION](#).

### Syntax

#### Format 1: START TRANSACTION

```
START TRANSACTION
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [, ...]
];
```

#### Format 2: BEGIN

```
BEGIN [WORK | TRANSACTION]
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [, ...]
];
```

### Parameters

- **WORK | TRANSACTION**

Specifies the optional keyword in BEGIN format without functions.

- **ISOLATION LEVEL**

Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

 **NOTE**

The isolation level cannot be changed after data is modified using SELECT, INSERT, DELETE, UPDATE, FETCH, or COPY in the transaction.

Value range:

- **READ COMMITTED**: Only committed data can be read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

Specifies the transaction access mode (read/write or read only).

### Examples

```
-- Start a transaction in default mode.
openGauss=# START TRANSACTION;
```

```
openGauss=# SELECT * FROM tpceds.reason;
openGauss=# END;

-- Start a transaction in default mode.
openGauss=# BEGIN;
openGauss=# SELECT * FROM tpceds.reason;
openGauss=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
openGauss=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
openGauss=# SELECT * FROM tpceds.reason;
openGauss=# COMMIT;
```

## 7.13.152 TIMECAPSULE TABLE

### Description

The TIMECAPSULE TABLE statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the old data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

### Precautions

- The TIMECAPSULE TABLE statement can be used to flash back the old data or the data from the recycle bin.
  - **TO TIMECAPSULE** and **TO CSN** can flash back a table to an earlier version.
  - The recycle bin records the objects dropped or truncated by running **DROP** and **TRUNCATE**. **TO BEFORE DROP** and **TO BEFORE TRUNCATE** flash back from the recycle bin.
- The following object types do not support flashback: system catalogs, MOTs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, and hash bucket tables.
- Between the flashback point and the current point, a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage has been executed. Therefore, the flashback fails.
- To run **DROP**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.  
To run **TRUNCATE**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.
- Scenarios or tables that do not support DROP or TRUNCATE FLASHBACK
  - Scenario where the recycle bin is disabled (**enable\_recyclebin** is set to **off**)

- Scenario where the system is being maintained (**xc\_maintenance\_mode** is set to **on**) or is being upgraded
- Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to drop multiple objects at the same time.)
- System catalogs, MOTs, DFS tables, global temporary tables, local temporary tables, UNLOGGED tables, sequence tables, and hash bucket tables.
- After TRUNCATE FLASHBACK is performed, the statistics remain unchanged and are still displayed as **0**. You can modify the statistics by manual ANALYZE during off-peak hours (to reduce the impact on performance).

## Syntax

```
TIMECAPSULE TABLE [schema.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP [RENAME
TO table_name] | TRUNCATE } }
```

## Parameters

- **schema**  
Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.
- **table\_name**  
Specifies a table name.
- **TO CSN**  
Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.
- **TO TIMESTAMP**  
Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO\_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.  
  
Note: When the flashback point is too old, the source version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- **TO BEFORE DROP**  
Retrieves dropped tables and their subobjects from the recycle bin.  
You can specify either the original user-specified name of the table or the system-generated name assigned to the object when it was deleted.
  - System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **select \* from gs\_recyclebin;**
  - If you specify the user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. If you want to retrieve an older version of the table, then do one of these things:
    - Specify the system-generated recycle bin name of the table you want to retrieve.

- Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
  - When a dropped table is restored, only the base table name is restored, and the names of other subobjects remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.
  - If a table has default values that reference sequences and user-defined functions, flashing back the dropped table will succeed, but the default values will not be restored.
  - Similarly, if a table is referenced by views, dropping the table will cascadingly drop the views. Therefore, flashing back the dropped table will succeed, but the views will not be restored.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
  - The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.
- **RENAME TO**  
Specifies a new name for the table retrieved from the recycle bin.
  - **TRUNCATE**  
Flashes back to the point in time before the TRUNCATE operation.

## Examples

```
-- Drop the tpcds.reason_t2 table.
DROP TABLE IF EXISTS tpcds.reason_t2;
-- Create the tpcds.reason_t2 table.
openGauss=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)with(storage_type = ustore);
-- Insert records into the tpcds.reason_t2 table.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (1, 'AA', 'reason1'),(2, 'AB', 'reason2'),(3, 'AC',
'reason3');
INSERT 0 3
-- Truncate data from the tpcds.reason_t2 table.
openGauss=# TRUNCATE TABLE tpcds.reason_t2;
-- Query data in the tpcds.reason_t2 table.
openGauss=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
(0 rows)
-- Perform the TRUNCATE FLASHBACK operation.
openGauss=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE TRUNCATE;
openGauss=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
+-----+-----+-----
 1 | AA | reason1
 2 | AB | reason2
 3 | AC | reason3
(3 rows)
-- Drop the tpcds.reason_t2 table.
openGauss=# DROP TABLE tpcds.reason_t2;
-- Perform the DROP FLASHBACK operation.
```

```
openGauss=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE DROP;
TimeCapsule Table
```

## 7.13.153 TRUNCATE

### Function

**TRUNCATE** quickly removes all rows from a database table.

It has the same effect as an unqualified **DELETE** on each table, but **TRUNCATE** is faster because it does not actually scan the tables. This is most useful on large tables.

### Precautions

- **TRUNCATE TABLE** has the same function as a **DELETE** statement with no **WHERE** clause, emptying a table.
- **TRUNCATE TABLE** uses less system and transaction log resources as compared with **DELETE**.
  - **DELETE** deletes a row each time, and records the deletion of each row in the transaction log.
  - **TRUNCATE TABLE** deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between **TRUNCATE**, **DELETE**, and **DROP** are as follows:
  - **TRUNCATE TABLE** deletes content, releases space, but does not delete definitions.
  - **DELETE TABLE** deletes content, but does not delete definitions nor release space.
  - **DROP TABLE** deletes content and definitions, and releases space.

### Syntax

- Delete data from a table.

```
TRUNCATE [TABLE] [ONLY] { table_name [*] } [, ...]
[CONTINUE IDENTITY] [CASCADE | RESTRICT] [PURGE];
```

- Truncate the data in a partition.

```
ALTER TABLE [IF EXISTS] { [ONLY] table_name
| table_name *
| ONLY (table_name) }
TRUNCATE PARTITION { partition_name
| FOR (partition_value [, ...]) } [UPDATE GLOBAL INDEX];
```

### Parameter Description

- **ONLY**  
If **ONLY** is specified, only the specified table is cleared. Otherwise, the table and all its subtables (if any) are cleared.
- **table\_name**  
Specifies the name (optionally schema-qualified) of the target table.  
Value range: an existing table name

- **CONTINUE IDENTITY**  
Does not change the values of sequences. This is the default action.
- **CASCADE | RESTRICT**
  - **CASCADE**: Clears all tables that are added to a group.
  - **RESTRICT** (default value): Clears all data.
- **PURGE**: Purges table data in the recycle bin by default.
- **partition\_name**  
Specifies the partition in the target partitioned table.  
Value range: an existing table name
- **partition\_value**  
Specifies the value of the specified partition key.  
The value specified by **PARTITION FOR** can uniquely identify a partition.  
Value range: value range of the partition key for the partition to be renamed

**NOTICE**

When the **PARTITION FOR** clause is used, the entire partition where **partition\_value** is located is cleared.

- **UPDATE GLOBAL INDEX**  
If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(5,'AAAAAAAABAAAAAAA','reason 2'),(15,'AAAAAAAABAAAAAAA','reason 3'),
(25,'AAAAAAAABAAAAAAA','reason 4'),(35,'AAAAAAAABAAAAAAA','reason 5'),
(45,'AAAAAAAACAAAAAAA','reason 6'),(55,'AAAAAAAACAAAAAAA','reason 7');

-- Create a table.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Truncate the tpcds.reason_t1 table.
openGauss=# TRUNCATE TABLE tpcds.reason_t1;

-- Delete the table.
openGauss=# DROP TABLE tpcds.reason_t1;
-- Create a partitioned table.
openGauss=# CREATE TABLE tpcds.reason_p
(
```

```
r_reason_sk integer,
r_reason_id character(16),
r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)
(
 partition p_05_before values less than (05),
 partition p_15 values less than (15),
 partition p_25 values less than (25),
 partition p_35 values less than (35),
 partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
openGauss=# INSERT INTO tpcds.reason_p SELECT * FROM tpcds.reason;

-- Clear the p_05_before partition.
openGauss=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION p_05_before;

-- Clear the p_15 partition.
openGauss=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION for (15);

-- Clear the partitioned table.
openGauss=# TRUNCATE TABLE tpcds.reason_p;

-- Delete the table.
openGauss=# DROP TABLE tpcds.reason_p;

-- Delete the table.
openGauss=# DROP TABLE tpcds.reason;

-- Delete the schema.
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## 7.13.154 UPDATE

### Description

Updates data in a table. UPDATE changes the values of the specified columns in all rows that satisfy the condition. The WHERE clause clarifies conditions. The columns to be modified need to be mentioned in the SET clause; columns not explicitly modified retain their previous values.

### Precautions

- The owner of a table, users granted with the UPDATE permission on the table, or users granted with the UPDATE ANY TABLE permission can update data in the table. System administrators have the permission to update data in the table by default.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The generated column cannot be directly written. In the **UPDATE** statement, values cannot be specified for generated columns, but the keyword **DEFAULT** can be specified.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
UPDATE [/*+ plan_hint */] [ONLY] table_name [partition_clause] [*] [[AS] alias]
SET {column_name = { expression | DEFAULT }
 | (column_name [, ...]) = {({ expression | DEFAULT } [, ...]) | sub_query }}, ...]
[FROM from_list] [WHERE condition]
[RETURNING {*
```

```
| {output_expression [[AS] output_name]} [, ...] }];
```

where sub\_query can be:

```
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name]} [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause } [NULLS { FIRST |
LAST }]} [, ...]]
[LIMIT { [offset,] count | ALL }]
```

The subquery **with\_query** is as follows:

```
with_query_name [(column_name [, ...])]
AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert |
update | delete})
```

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint** clause

Follows the UPDATE keyword in the **/\*+ \*/** format. It is used to optimize the plan of an UPDATE statement block. For details, see [Hint-based Tuning](#). In

each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.

- **table\_name**  
Specifies the name (optionally schema-qualified) of the table to be updated.  
Value range: an existing table name.
- **partition\_clause**  
Updates a specified partition.  
PARTITION { ( partition\_name ) | FOR ( partition\_value [, ...] ) } |  
SUBPARTITION { ( subpartition\_name ) | FOR ( subpartition\_value [, ...] ) }  
For details about the keywords, see [SELECT](#).  
For details, see [CREATE TABLE SUBPARTITION](#).
- **alias**  
Specifies the alias of the target table.  
Value range: a string that complies with the [Identifier Naming Conventions](#).
- **column\_name**  
Specifies the name of the column to be modified.  
You can refer to this column by specifying the target table alias and the column name. For example:  
UPDATE foo AS f SET f.col\_name = 'namecol';  
Value range: name of an existing column.
- **expression**  
Specifies a value assigned to a column or an expression that assigns the value.
- **DEFAULT**  
Specifies the default value of a column.  
The value is **NULL** if no default value has been assigned to it.
- **sub\_query**  
Specifies a subquery.  
This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the **SELECT** statement, see [SELECT](#).  
When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.
- **from\_list**  
Specifies a list of table expressions. You can use columns of other tables in the WHERE condition. It is similar to specifying a table list in a FROM clause of a SELECT statement.

---

#### NOTICE

Note that the target table cannot appear in the **from\_list**, unless you intend a self-join (in which case it must appear with an alias in the **from\_list**).

---

- **condition**  
Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.
- **output\_expression**  
Specifies an expression to be computed and returned by the **UPDATE** command after each row is updated.  
Value range: any table and table columns listed in FROM. Write \* to return all columns.
- **output\_name**  
Specifies a name to use for a returned column.

## Examples

```
-- Create the student1 table.
openGauss=# CREATE TABLE student1
(
 stuno int,
 classno int
);

-- Insert data.
openGauss=# INSERT INTO student1 VALUES(1,1);
openGauss=# INSERT INTO student1 VALUES(2,2);
openGauss=# INSERT INTO student1 VALUES(3,3);

-- View data.
openGauss=# SELECT * FROM student1;

-- Update the values of all records.
openGauss=# UPDATE student1 SET classno = classno*2;

-- View data.
openGauss=# SELECT * FROM student1;

-- Drop the table.
openGauss=# DROP TABLE student1;
```

## 7.13.155 VACUUM

### Description

VACUUM recycles storage space occupied by deleted rows in tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a **VACUUM** is done. Therefore, it is necessary to execute **VACUUM** periodically, especially on frequently-updated tables.

### Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. If a table is specified, VACUUM processes only the specified table.
- To perform VACUUM operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, system

administrators have this permission. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by a system administrator). VACUUM skips over any tables that the calling user does not have permission to vacuum.

- **VACUUM** cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. **VACUUM FULL** usually shrinks a table more than **VACUUM** does. The **FULL** option does not clear indexes. You are advised to periodically run the **REINDEX** statement. Deleting all indexes, running **VACUUM FULL**, and rebuilding indexes is usually a faster choice. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- VACUUM causes a significant increase in I/O traffic, which may affect the performance of other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, VACUUM prints progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- **VACUUM** and **VACUUM FULL** clear deleted tuples after the delay specified by **vacuum\_defer\_cleanup\_age**.
- When VACUUM ANALYZE is used, a VACUUM operation and then an ANALYZE operation are performed for each selected table. This is a handy combination form for routine maintenance scripts.
- A plain VACUUM statement (without the **FULL** option) simply recycles space and makes it available for reuse. This form of statement can operate in parallel with normal reading and writing of the table, as an exclusive lock is not obtained. **VACUUM FULL** executes wider processing, including moving rows across blocks to compress tables so they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- A deadlock may occur when multiple VACUUM FULL statements are executed simultaneously.
- If the **xc\_maintenance\_mode** parameter is not enabled, VACUUM FULL will skip all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be recycled. After executing **DELETE**, execute 1000 non-SELECT

transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to the space.

## Syntax

- Recycle space and update statistics information, without requirements for keyword orders.

```
VACUUM [({ FULL | FREEZE | VERBOSE | {ANALYZE | ANALYSE } } [,...])]
[table_name [(column_name [, ...])] [PARTITION (partition_name) | SUBPARTITION
(subpartition_name)]];
```

- Recycle space, without updating statistics information.

```
VACUUM [FULL [COMPACT]] [FREEZE] [VERBOSE] [table_name
[PARTITION (partition_name) | SUBPARTITION (subpartition_name)]];
```

- Recycle space and update statistics information, and require keywords in order.

```
VACUUM [FULL] [FREEZE] [VERBOSE] { ANALYZE | ANALYSE } [VERBOSE]
[table_name [(column_name [, ...])]] [PARTITION (partition_name)];
```

## Parameters

- FULL**

Selects "FULL" vacuum, which can recycle more space, but takes much longer and exclusively locks the table.

### NOTE

- Using FULL will cause statistics missing. To collect statistics, add the keyword ANALYZE to VACUUM FULL.
- Ustore does not support the DDL statement VACUUM FULL. After VACUUM FULL is executed, "INFO: skipping "test" --- Ustore table does not support vacuum full" is printed.

- FREEZE**

Is equivalent to running **VACUUM** with the **vacuum\_freeze\_min\_age** parameter set to **zero**.

- VERBOSE**

Prints a detailed vacuum activity report for each table.

- ANALYZE | ANALYSE**

Updates statistics used by the planner to determine the most efficient way to execute a query.

### NOTE

VACUUM is also triggered when **autovacuum** is set to **analyze** for a Ustore partitioned table.

- table\_name**

Specifies the name (optionally schema-qualified) of a specific table to vacuum.

Value range: name of a specific table to vacuum. Defaults are all tables in the current database.

- column\_name**

Specifies the name of the column to be analyzed. This parameter must be used together with **ANALYZE**.

Value range: name of the column to be analyzed Defaults are all columns.

 NOTE

The mechanism of the VACUUM ANALYZE statement is to execute **VACUUM** and **ANALYZE** in sequence. Therefore, if **column\_name** is incorrect, **VACUUM** may be successfully executed but **ANALYZE** may fail to be executed. For a partitioned table, **ANALYZE** may fail to be executed after **VACUUM** is successfully executed on a partition.

- **PARTITION**  
**COMPACT** and **PARTITION** cannot be used at the same time.
- **partition\_name**  
Specifies the level-1 partition name of the table to be cleared. If it is left empty, all level-1 partitions are cleared.
- **subpartition\_name**  
Specifies the level-2 partition name of the table to be cleared. If it is left empty, all level-2 partitions are cleared.

## Examples

```
-- Create a schema.
openGauss=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
openGauss=# CREATE TABLE tpcds.reason
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAABAAAAAAA','reason 2');

-- Create an index in the tpcds.reason table.
openGauss=# CREATE UNIQUE INDEX ds_reason_index1 ON tpcds.reason(r_reason_sk);

-- Vacuum the tpcds.reason table that has indexes.
openGauss=# VACUUM (VERBOSE, ANALYZE) tpcds.reason;

-- Drop the index.
openGauss=# DROP INDEX tpcds.ds_reason_index1 CASCADE;
openGauss=# DROP TABLE tpcds.reason;
openGauss=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- vacuum
  - **VACUUM** cannot be executed inside a transaction block.
  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
  - **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.
  - Before performing the VACUUM FULL operation, you are advised to delete all indexes in related tables, run **VACUUM FULL**, and then rebuild the index.

## 7.13.156 VALUES

### Description

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

### Precautions

- VALUES lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. VALUES appearing within INSERT is a special case, because the desired column types are known from the INSERT's target table, and need not be inferred by scanning the VALUES list. In this case, a large number of result rows can be processed.
- If more than one row is specified, all the rows must have the same number of elements.

### Syntax

```
VALUES {(expression [, ...])} [, ...]
 [ORDER BY { sort_expression [ASC | DESC | USING operator] } [, ...]]
 [LIMIT { count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY];
```

### Parameters

- expression**  
Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.  
In a VALUES list appearing at the top level of an INSERT, an expression can be replaced by DEFAULT to indicate that the destination column's default value should be inserted. DEFAULT cannot be used when VALUES appears in other contexts.
- sort\_expression**  
Specifies an expression or integer constant indicating how to sort the result rows.
- ASC**  
Specifies an ascending sort order.
- DESC**  
Specifies a descending sort order.
- operator**  
Specifies a sorting operator.
- count**  
Specifies the maximum number of rows to return.
- OFFSET start [ ROW | ROWS ]**  
Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.
- FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**

The FETCH clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

## Examples

See [Examples](#) in "INSERT."

## 7.14 Appendix

### 7.14.1 Extended Functions

The following table lists the extended functions supported by GaussDB. These functions are for reference only.

| Category                          | Name                                              | Description                                                     |
|-----------------------------------|---------------------------------------------------|-----------------------------------------------------------------|
| Access privilege inquiry function | has_sequence_privilege(user, sequence, privilege) | Queries whether a specified user has privilege for sequences.   |
|                                   | has_sequence_privilege(sequence, privilege)       | Queries whether the current user has privilege for sequence.    |
| Trigger function                  | pg_get_triggerdef(oid)                            | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |
|                                   | pg_get_triggerdef(oid, boolean)                   | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |

### 7.14.2 Extended Syntax

GaussDB provides the following extended syntax:

**Table 7-110** Extended SQL syntax

| Category         | Keyword                                   | Description                                                                 |
|------------------|-------------------------------------------|-----------------------------------------------------------------------------|
| Creating a table | <b>INHERITS ( parent_table [, ... ] )</b> | Currently, the syntax of inherited tables is retained but is not supported. |

| Category            | Keyword                                                                                                                                                                                                      | Description                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | column_constraint:<br><b>REFERENCES reftable</b><br><b>[ ( refcolumn ) ] [ MATCH</b><br><b>FULL   MATCH PARTIAL   MATCH</b><br><b>SIMPLE ] [ ON</b><br><b>DELETE action ] [ ON</b><br><b>UPDATE action ]</b> | You can run <b>REFERENCES reftable[(refcolumn)] [MATCH FULL  MATCH PARTIAL   MATCH SIMPLE] [ON DELETE action] [ON UPDATE action]</b> to create foreign key constraints for tables. |
| Aggregate functions | <b>CREATE AGGREGATE</b>                                                                                                                                                                                      | Defines a new aggregate function.                                                                                                                                                  |
|                     | <b>ALTER AGGREGATE</b>                                                                                                                                                                                       | Alters the definition of an aggregate function.                                                                                                                                    |
|                     | <b>DROP AGGREGATE</b>                                                                                                                                                                                        | Drops an existing aggregate function.                                                                                                                                              |

# 8 Best Practices

## 8.1 Best Practices for Table Design

### 8.1.1 Selecting a Storage Model

During database design, some key factors about table design will greatly affect the subsequent query performance of the database. Table design affects data storage as well. A good table design reduces I/O operations and minimizes memory usage, improving the query performance.

Selecting a model for table storage is the first step of table definition. Select a proper storage model for your service based on the following table:

| Storage Model | Applicable Scenario                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Row store     | Point queries (simple index-based queries that only return a few records)<br>Scenarios requiring frequent addition, deletion, and modification operations |

### 8.1.2 Using Partitioned Tables

A partitioned table is a logical table that is divided into several physical partitions based on a specific plan. The table based on the logic is called a partitioned table, and each physical block is called a partition. A partitioned table is a logical table and does not store data. Data is actually stored in partitions. A partitioned table has the following advantages over an ordinary table:

1. High query performance: You can specify partitions when querying partitioned tables, improving query efficiency.
2. High availability: If a certain partition in a partitioned table is faulty, data in the other partitions is still available.

3. **Easy maintenance:** To fix a partitioned table having a faulty partition, you only need to fix the partition.

Partitioned tables supported by the GaussDB database are level-1 and level-2 partitioned tables. Level-1 partitioned tables include range partitioned tables, interval partitioned tables, list partitioned tables, and hash partitioned tables. Level-2 partitioned tables include nine combinations of any two of range partitioned tables, list partitioned tables, and hash partitioned tables.

- **Range partitioned table:** Data within a certain range is mapped to each partition. The range is determined by the partition key specified when the partitioned table is created. This partitioning method is most commonly used. The partition key is usually a date. For example, sales data is partitioned by month.
- **Interval partitioned table:** a special type of range partitioned tables. Compared with range partitioned tables, interval value definition is added. When no matching partition can be found for an inserted record, a partition can be automatically created based on the interval value.
- **List partitioned table:** Key values contained in the data are stored in different partitions, and the data is mapped to each partition in sequence. The key values contained in the partitions are specified when the partitioned table is created.
- **Hash partitioned table:** Data is mapped to each partition based on the internal hash algorithm. The number of partitions is specified when the partitioned table is created.
- **Level-2 partitioned table:** a partitioned table obtained by randomly combining range partitioning, list partitioning, and hash partitioning. Both level-1 and level-2 partitions can be defined in the preceding three ways.

### 8.1.3 Selecting a Data type

Efficient data types include the following:

1. **Select data types that facilitate data calculation.**

Generally, the calculation of integers (including common comparison calculations, such as =, >, <, ≥, ≤, and ≠, and GROUP BY) is more efficient than that of strings and floating-point numbers.

2. **Select data types with a short length.**

Data types with short length reduce both the data file size and the memory used for computing, improving the I/O and computing performance. For example, use **SMALLINT** instead of **INT**, and **INT** instead of **BIGINT**.

3. **Use the same data type for a join.**

You are advised to use the same data type for a join. To join columns with different data types, the database needs to convert them to the same type, which leads to additional performance overheads.

## 8.2 Best Practices for SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace **UNION** with **UNION ALL**.  
**UNION** eliminates duplicate rows while merging two result sets but **UNION ALL** merges the two result sets without deduplication. Therefore, replace **UNION** with **UNION ALL** if you are sure that the two result sets do not contain duplicate rows based on the service logic.
- Add **NOT NULL** to the join columns.  
If there are many **NULL** values in the **JOIN** columns, you can add the filter criterion **IS NOT NULL** to filter data in advance to improve the **JOIN** efficiency.
- Replace **NOT IN** with **NOT EXISTS**.  
**Nested Loop Anti Join** must be used to implement **NOT IN**, and **Hash Anti Join** is required for **NOT EXISTS**. If no **NULL** value exists in the **JOIN** columns, **NOT IN** is equivalent to **NOT EXISTS**. Therefore, if you are sure that no **NULL** value exists, you can convert **NOT IN** to **NOT EXISTS** to generate hash join and to improve the query performance.

The statements for creating a foreign table are as follows:

```
DROP SCHEMA IF EXISTS no_in_to_no_exists_test CASCADE;
CREATE SCHEMA no_in_to_no_exists_test;
SET CURRENT_SCHEMA=no_in_to_no_exists_test;
CREATE TABLE t1(c1 int, c2 int, c3 int);
CREATE TABLE t2(d1 int, d2 int NOT NULL, d3 int);
```

The statement for implementing the query using **NOT IN** is as follows:

```
SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
```

The plan is as follows:

```
openGauss=# EXPLAIN SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
 QUERY PLAN

Nested Loop Anti Join (cost=0.00..29749.02 rows=968 width=12)
 Join Filter: ((t1.c1 = t2.d2) OR (t1.c1 IS NULL))
 -> Seq Scan on t1 (cost=0.00..29.45 rows=1945 width=12)
 -> Materialize (cost=0.00..39.17 rows=1945 width=4)
 -> Seq Scan on t2 (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

Because there is no null value in the **t2.d2** column (the **t2.d2** column is **NOT NULL** in the table definition), the query can be equivalently modified as follows:

```
SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated plan is as follows:

```
openGauss=# EXPLAIN SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE
t1.c1=t2.d2);
 QUERY PLAN

Hash Anti Join (cost=53.76..99.14 rows=972 width=12)
 Hash Cond: (t1.c1 = t2.d2)
 -> Seq Scan on t1 (cost=0.00..29.45 rows=1945 width=12)
 -> Hash (cost=29.45..29.45 rows=1945 width=4)
 -> Seq Scan on t2 (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

- Use **hashagg**.  
If the **GROUP BY** condition exists in the query statement, the generated plan may contain sorting operations, that is, the plan contains the **GroupAgg+Sort** operator. As a result, the performance is poor. You can set the GUC parameter **work\_mem** to increase the available memory and generate a plan with **HashAgg** to avoid sorting operations and improve performance. For details about how to set **work\_mem**, contact the administrator.

- Replace functions with **CASE** statements.  
The database performance greatly deteriorates if a large number of functions are called. In this case, you can change the pushdown functions to CASE statements.
- Do not use functions or expressions for indexes.  
Using functions or expressions for indexes will stop indexing and enable scanning on the full table.
- Do not use operators **!=**, **<**, **>**, **NULL**, **OR**, or implicit parameter conversion in **WHERE** clauses.
- Split complex SQL statements.  
You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:
  - The same subquery is involved in multiple SQL statements of a job and the subquery contains a large amount of data.
  - Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
  - Functions such as substr and to\_number cause incorrect measures for subqueries containing a large amount of data.
  - BROADCAST subqueries are performed on large tables in multi-DN environment.

For details about optimization, see [Typical SQL Optimization Methods](#).

# 9 User-defined Functions

---

When the database instance is started, the UDF master process is started in addition to the GaussDB main process. To execute a UDF in fenced mode, the UDF master process forks itself to UDF worker processes, and UDF worker processes execute the UDF in fenced mode.

## 9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can create calculation functions with complex conditions and use them to define operators or use them for index expressions.

SQL is used by most databases as a query language. It is portable and easy to learn. Each SQL statement must be executed independently by a database server.

This means that the client application performs the following processes for each query: send a query to the database server, wait for the query to be received, receive and process the result, perform related calculation, and then send more queries to the server. If the client and the database server are not on the same machine, this process also causes inter-process communication and network load.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced.

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in SQL. For details about the PL/SQL syntax for creating functions, see [CREATE FUNCTION](#).

PL/SQL is a loadable procedural language. Its application method is similar to that of [Stored Procedure](#). However, stored procedures have no return values but the PL/SQL functions have.

# 10 Stored Procedure

---

## 10.1 Stored Procedure

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL and PL/SQL. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see [CREATE PROCEDURE](#).

The application methods for PL/SQL functions mentioned in [PL/SQL Functions](#) are the same as those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

## 10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. The GaussDB database consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform addition, subtraction, multiplication, and division operations on data of numeric values.

## 10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types, you can use the type conversion functions provided by GaussDB, such as the **CAST** function, to forcibly convert them.

[Table 10-1](#) lists common implicit data type conversions in GaussDB.

**NOTICE**

The valid value range of **DATE** supported by GaussDB is from 4713 BC to 294276 AD.

**Table 10-1** Implicit data type conversions

| Raw Data Type | Target Data Type | Remarks                                      |
|---------------|------------------|----------------------------------------------|
| CHAR          | VARCHAR2         | -                                            |
| CHAR          | NUMBER           | Raw data must consist of digits.             |
| CHAR          | DATE             | Raw data cannot exceed the valid date range. |
| CHAR          | RAW              | -                                            |
| CHAR          | CLOB             | -                                            |
| VARCHAR2      | CHAR             | -                                            |
| VARCHAR2      | NUMBER           | Raw data must consist of digits.             |
| VARCHAR2      | DATE             | Raw data cannot exceed the valid date range. |
| VARCHAR2      | CLOB             | -                                            |
| NUMBER        | CHAR             | -                                            |
| NUMBER        | VARCHAR2         | -                                            |
| DATE          | CHAR             | -                                            |
| DATE          | VARCHAR2         | -                                            |
| RAW           | CHAR             | -                                            |
| RAW           | VARCHAR2         | -                                            |
| CLOB          | CHAR             | -                                            |
| CLOB          | VARCHAR2         | -                                            |
| CLOB          | NUMBER           | Raw data must consist of digits.             |
| INT4          | CHAR             | -                                            |
| INT4          | BOOLEAN          | -                                            |
| BOOLEAN       | INT4             | -                                            |

## 10.4 Arrays, Sets, and Records

### 10.4.1 Arrays

#### Use of Array Types

Before the use of arrays, an array type needs to be defined.

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

In the preceding information:

- **array\_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array to be defined. The value is a positive integer.
- **data\_type**: indicates the types of members in the array to be created.

#### NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a null value is returned, and no error message is reported.
- The scope of an array type defined in a stored procedure takes effect only in this stored procedure.
- It is recommended that you use one of the preceding methods to define an array type. If both methods are used to define the same array type, GaussDB prefers the array type defined in a stored procedure to declare array variables.
- **data\_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported), but cannot be the array or set type defined in the stored procedure.
- When **data\_type** is set to a type that can define the length and precision, such as varchar and numeric, if an array of varray type is created in a package and called outside the package, the restrictions for the length or precision become invalid.
- The constructors of the array type can be used only in O-compatible mode.

GaussDB supports access to array elements by using parentheses, and it also supports the **extend**, **count**, **first**, **last**, **prior**, **exists**, **trim**, **next**, and **delete** functions.

#### NOTE

- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, or **DELETE**), you are advised to use square brackets to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- Exercise caution when using the **DELETE** statement to delete a single element. Otherwise, the element sequence may be incorrect.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or raise info in a stored procedure.

## Examples

```
-- Perform operations on an array in the stored procedure.
openGauss=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
 TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;-- Define the array type.
 ARRINT ARRAY_INTEGER:= ARRAY_INTEGER(); -- Declare the variable of the array type.
BEGIN
 ARRINT.extend(10);
 FOR I IN 1..10 LOOP
 ARRINT(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
 DBE_OUTPUT.PRINT_LINE(ARRINT(1));
 DBE_OUTPUT.PRINT_LINE(ARRINT(10));
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
 ARRINT.TRIM();

 IF ARRINT.EXISTS(10) THEN
 DBE_OUTPUT.PRINT_LINE('Exist 10th element');
 ELSE
 DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
 END IF;
 DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
 DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
 ARRINT.DELETE();
END;
/

-- Call the stored procedure.
openGauss=# CALL array_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE array_proc;
```

## 10.4.2 Collections

### Use of Set Types

Before the use of sets, a set type needs to be defined.

Define a collection type immediately after the AS keyword in a stored procedure. The definition method is as follows:

In the preceding information:

- **table\_type**: indicates the name of the collection type to be defined.
- **TABLE**: indicates the collection type to be defined.
- **data\_type**: indicates the type of members in the collection to be created.
- **indexby\_type**: indicates the type of the set index to be created.

 NOTE

- In GaussDB, a set automatically increases. If an access violation occurs, a null value is returned, and no error message is reported.
- The scope of a set type defined in a stored procedure takes effect only in this stored procedure.
- The index can only be of the integer or varchar type. The length of the varchar type is not restricted.
- **NOT NULL** has no function but only takes effect in the syntax.
- **data\_type** can also be the record type or set type defined in a stored procedure (anonymous blocks are not supported), but cannot be the array type.
- Variables of the nested set type cannot be used across packages.
- Variables of the TABLE OF index by type cannot be nested in a record as the input and output parameters of a stored procedure.
- Variables of the TABLE OF index by type cannot be used as input and output parameters of functions.
- The **RAISE INFO** command cannot be used to print the entire nested TABLE OF variable.
- The TABLE OF variable cannot be passed across autonomous transactions.
- The input and output parameters of a stored procedure cannot be defined as the nested TABLE OF type.

GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions.

The set functions support multiset union, intersect, except all, and distinct.

 NOTE

- An expression can contain only one variable of the TABLE OF index by type.
- Exercise caution when using the DELETE statement to delete a single element. Otherwise, the element sequence may be incorrect.

## Example

```
-- Perform operations on a set in the stored procedure.
openGauss=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a set type.
 TABLE_INTEGER := TABLE_INTEGER(); -- Declare the variable of the set type.
BEGIN
 TABLE_INTEGER.extend(10);
 FOR I IN 1..10 LOOP
 TABLE_INTEGER(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(TABLE_INTEGER.COUNT);
 DBE_OUTPUT.PRINT_LINE(TABLE_INTEGER(1));
 DBE_OUTPUT.PRINT_LINE(TABLE_INTEGER(10));
END;
/

-- Call the stored procedure.
openGauss=# CALL table_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE table_proc;

-- Perform operations on a nested table in the stored procedure.
openGauss=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a set type.
```

```
TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a set type.
NEST_TABLE_VAR NEST_TABLE_INTEGER; -- Declare a variable of the nested table type.
BEGIN
 FOR I IN 1..10 LOOP
 NEST_TABLE_VAR(I)(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/

-- Call the stored procedure.
openGauss=# CALL nest_table_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE nest_table_proc;
```

## 10.4.3 Records

### Record Variables

Perform the following operations to create a record variable:

Define a record type and use this type to declare a variable.

### Syntax

For the syntax of the record type, see [Figure 10-1](#).

**Figure 10-1** Syntax of the record type

The above syntax diagram is explained as follows:

- **record\_type**: record name
- **field**: record columns
- *datatype*: specifies data types for the member variables.
- *expression*: specifies the expression for setting a default value.

 NOTE

In GaussDB:

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use SELECT INTO or FETCH to assign values to a record type.
  - Assign the **NULL** value to a record variable.
- The INSERT and UPDATE statements cannot use a record variable to insert or update data.
- If a member has a record type, the default value of the inner record type cannot be not transferred to the outer record type.
- When **package\_name.record\_type** is used to declare a record variable, the default value of the record type becomes invalid. Therefore, you are advised not to use **package\_name.record\_type** to declare a record variable when the record type has a default value.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.
- The data type can be the record type, array type, or collection type defined in a stored procedure (anonymous blocks are not supported).

## Examples

The table definition used in the following is defined as follows:

```
openGauss=# \d emp_rec
 Table "public.emp_rec"
 Column | Type | Modifiers
-----+-----+-----
 empno | numeric(4,0) | not null
 ename | character varying(10) |
 job | character varying(9) |
 mgr | numeric(4,0) |
 hiredate | timestamp(0) without time zone |
 sal | numeric(7,2) |
 comm | numeric(7,2) |
 deptno | numeric(2,0) |

-- Perform array operations in the function.
openGauss=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2)
RETURNS
VARCHAR2 AS $$
DECLARE

 -- Declare a record type.
 type rec_type is record (name varchar2(100), epno int);
 employer rec_type;

 -- Use %type to declare the record type.
 type rec_type1 is record (name emp_rec.ename%type, epno int not null :=10);
 employer1 rec_type1;

 -- Declare a record type with a default value.
 type rec_type2 is record (
 name varchar2 not null := 'SCOTT',
 epno int not null :=10);
 employer2 rec_type2;
 CURSOR C1 IS select ename,epno from emp_rec order by 1 limit 1;

BEGIN
 -- Assign a value to a member record variable.
 employer.name := 'WARD';
```

```
employer.epno = 18;
raise info 'employer name: % , epno:%', employer.name, employer.epno;

-- Assign the value of a record variable to another variable.
employer1 := employer;
raise info 'employer1 name: % , epno: %', employer1.name, employer1.epno;

-- Assign the NULL value to a record variable.
employer1 := NULL;
raise info 'employer1 name: % , epno: %', employer1.name, employer1.epno;

-- Obtain the default value of a record variable.
raise info 'employer2 name: % , epno: %', employer2.name, employer2.epno;

-- Use a record variable in the FOR loop.
for employer in select ename,empno from emp_rec order by 1 limit 1
loop
 raise info 'employer name: % , epno: %', employer.name, employer.epno;
end loop;

-- Use a record variable in the SELECT INTO statement.
select ename,empno into employer2 from emp_rec order by 1 limit 1;
raise info 'employer name: % , epno: %', employer2.name, employer2.epno;

-- Use a record variable in a cursor.
OPEN C1;
FETCH C1 INTO employer2;
raise info 'employer name: % , epno: %', employer2.name, employer2.epno;
CLOSE C1;
RETURN employer.name;
END;
$$
LANGUAGE plpgsql;

-- Call this function.
openGauss=# CALL regress_record('abc');

-- Drop the function.
openGauss=# DROP FUNCTION regress_record;
```

## 10.5 DECLARE Syntax

### 10.5.1 Basic Structure

#### Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- **DECLARE:** declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.

DECLARE

#### NOTE

This part is optional if no variable needs to be declared.

- An anonymous block may omit the **DECLARE** keyword if no variable needs to be declared.
- For a stored procedure, **AS** is used, which is equivalent to **DECLARE**. The **AS** keyword must be reserved even if there is no variable declaration part.
- **EXECUTION:** specifies procedure and SQL statements. It is the main part of a program. It is required.

```
BEGIN
```

- Exception part: processes errors. It is optional.

```
EXCEPTION
```

- End. It is required.

```
END;
```

```
/
```

#### NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the **gsql** tool is executed with the **-r** parameter specified.

## Category

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see [Figure 10-2](#).
- Subprogram: a stored procedure, function, operator, or packages stored in a database. A subprogram created in a database can be called by other programs.

## 10.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

## Syntax

[Figure 10-2](#) shows the syntax diagrams for an anonymous block.

**Figure 10-2** anonymous\_block::=

Details about the syntax diagram are as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

**NOTICE**

The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. At least one statement, even a **NULL** statement, must be presented in any implementation blocks.

### 10.5.3 Subprogram

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

## 10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. This chapter describes basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

**NOTE**

You are advised not to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

### 10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

#### Variable Declaration

For details about the variable declaration syntax, see [Figure 10-3](#).

**Figure 10-3** declare\_variable::=

The above syntax diagram is explained as follows:

- *variable\_name*: specifies the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

### Example

```
openGauss=# DECLARE
emp_id INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
emp_id := 5*7784; -- Assign a value to the variable.
END;
/
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

#### **%TYPE** Attribute

**%TYPE** declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the *my\_name* variable whose data type is the same as the data type of **firstname** in **employee**, you can define the variable as follows:

```
my_name employee.firstname%TYPE
```

In this way, you can declare *my\_name* without the need of knowing the data type of **firstname** in **employee**, and the data type of *my\_name* can be automatically updated when the data type of **firstname** changes.

```
TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
my_employee employee_record;
my_id my_employee.id%TYPE;
my_id_copy my_id%TYPE;
```

#### **%ROWTYPE** Attribute

**%ROWTYPE** declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
```

The attribute can also be used on the cursor. The column names and column data types of this set of data are the same as those of the **employee** table. For the cursor in a package, **%ROWTYPE** can be omitted. **%TYPE** can also reference the type of a column in the cursor. You can define the data as follows:

```
cursor cur is select * from employee;
my_employee cur%ROWTYPE
my_name cur.firstname%TYPE
my_employee2 cur -- For the cursor defined in a package, %ROWTYPE can be omitted.
```

#### NOTICE

- **%TYPE** cannot reference the type of a composite variable or a record variable, a column type of the record type, a column type of a variable of the cross-package composite type, or a column type of a cursor variable of the cross-package type.
- **%ROWTYPE** cannot reference the type of a composite variable or a record variable and the type of a cross-package cursor.

## Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

## 10.6.2 Assignment Statements

### Syntax

**Figure 10-4** shows the syntax diagram for assigning a value to a variable.

**Figure 10-4** assignment\_value::=

The above syntax diagram is explained as follows:

- **variable\_name** indicates the name of a variable.
- **value** can be a value or an expression. The type of *value* must be compatible with the type of *variable\_name*.

Example:

```
openGauss=# DECLARE
emp_id INTEGER := 7788; -- Assignment
BEGIN
emp_id := 5; -- Assignment
emp_id := 5*7784;
END;
/
```

## Nested Value Assignment

**Figure 10-5** shows the syntax diagram for assigning a nested value to a variable.

**Figure 10-5** nested\_assignment\_value::=

The syntax in **Figure 10-5** is described as follows:

- **variable\_name**: variable name
- **col\_name**: column name
- **subscript**: index, which is used for an array variable. The value can be a value or an expression and must be of the int type.
- **value**: value or expression. The type of *value* must be compatible with the type of *variable\_name*.

Example:

```
openGauss=#CREATE TYPE o1 as (a int, b int);
openGauss=# DECLARE
 TYPE r1 is VARRAY(10) of o1;
 emp_id r1;
BEGIN
 emp_id(1).a := 5;-- Assign a value.
 emp_id(1).b := 5*7784;
END;
/
```

#### NOTICE

- In INTO mode, values can be assigned only to the columns at the first layer. Two-dimensional or above arrays are not supported.
- When a nested column value is referenced, if an array index exists, only one parenthesis can exist in the first three layers of columns. You are advised to use square brackets to reference the index.

## INTO/BULK COLLECT INTO

Values returned by statements in a stored procedure are stored in variables. BULK COLLECT INTO allows some or all returned values to be temporarily stored in an array.

Example:

```
openGauss=# DROP TABLE IF EXISTS customers;
openGauss=# CREATE TABLE customers(id int,name varchar);
openGauss=# INSERT INTO customers VALUES(1,'ab');
openGauss=# DECLARE
 my_id integer;
BEGIN
 select id into my_id from customers limit 1; -- Assign a value.
END;
/

openGauss=# DECLARE
 type id_list is varray(6) of customers.id%type;
 id_arr id_list;
BEGIN
 select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
```

#### NOTICE

BULK COLLECT INTO can only assign values to arrays or collections in batches. Use LIMIT properly to prevent performance deterioration caused by excessive operations on data.

## 10.6.3 Call Statements

### Syntax

Figure 10-6 shows the syntax diagram for calling a clause.

Figure 10-6 call\_clause::=

The above syntax diagram is explained as follows:

- **procedure\_name** specifies the name of a stored procedure.
- **parameter** specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

### Examples

```
-- Create a table.
openGauss=# CREATE SCHEMA hr;
openGauss=# SET CURRENT_SCHEMA = hr;
openGauss=# CREATE TABLE staffs
(
 section_id INTEGER,
 salary INTEGER
);
openGauss=# INSERT INTO staffs VALUES (30, 10);
openGauss=# INSERT INTO staffs VALUES (30, 20);

-- Create the stored procedure proc_staffs.
openGauss=# CREATE OR REPLACE PROCEDURE proc_staffs
(
 section NUMBER(6),
 salary_sum out NUMBER(8,2),
 staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/

-- Create the stored procedure proc_return.
openGauss=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num); -- Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN; -- Return a statement.
END;
/

-- Call the stored procedure proc_return.
openGauss=# CALL proc_staffs(2,8,6);

-- Drop the stored procedure.
```

```
openGauss=# DROP PROCEDURE proc_staffs;
openGauss=# DROP PROCEDURE proc_return;

-- Create the function func_return.
openGauss=# CREATE OR REPLACE FUNCTION func_return returns void
language plpgsql
AS $$
DECLARE
v_num INTEGER := 1;
BEGIN
dbs_output.print_line(v_num);
RETURN; -- Return a statement.
END $$;

-- Call the function func_return.
openGauss=# CALL func_return();

-- Drop the function.
openGauss=# DROP FUNCTION func_return;

-- Drop the current database schema.
openGauss=# DROP SCHEMA hr CASCADE;
```

## 10.7 Dynamic Statements

### 10.7.1 Executing Dynamic Query Statements

You can perform dynamic queries GaussDB provides two modes: EXECUTE IMMEDIATE and OPEN FOR. The former dynamically executes SELECT statements while the latter combines the use of cursors. If you need to store query results in a dataset, use **OPEN FOR**.

#### EXECUTE IMMEDIATE

Figure 10-7 shows the syntax diagram.

Figure 10-7 EXECUTE IMMEDIATE dynamic\_select\_clause::=

Figure 10-8 shows the syntax diagram for **using\_clause**.

**Figure 10-8** using\_clause::=

The above syntax diagram is explained as follows:

- *define\_variable*: specifies a variable to store single-row query results.
- **USING IN** *bind\_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic\_select\_string*.
- **USING OUT** *bind\_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

#### NOTICE

- In query statements, **INTO** and **OUT** cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind\_argument* in the **USING** clause.
- *bind\_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind\_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument* in the USING clause.

## OPEN FOR

Dynamic queries can be executed by using **OPEN FOR** to open dynamic cursors.

**Figure 10-9** shows the syntax diagram.

**Figure 10-9** open\_for::=

Parameter description:

- **cursor\_name**: specifies the name of the cursor to be opened.
- **dynamic\_string**: specifies the dynamic query statement.
- **USING value**: applies when a placeholder exists in `dynamic_string`.

For the use of cursors, see [Cursors](#).

## 10.7.2 Executing Dynamic Non-Query Statements

### Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 `noselect::=`

Figure 10-11 shows the syntax diagram for `using_clause`.

Figure 10-11 `using_clause::=`

The above syntax diagram is explained as follows:

**USING IN** *bind\_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic\_noselect\_string*. That is, a placeholder is replaced by the corresponding *bind\_argument* when a dynamic SQL statement is executed. Note that *bind\_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object. In addition, duplicate placeholders are allowed in dynamic statements. A placeholder can correspond to only one *bind\_argument* by position.

### Examples

```
-- Create a table.
openGauss=# CREATE TABLE sections_t1
(
 section NUMBER(4) ,
 section_name VARCHAR2(30),
 manager_id NUMBER(6),
 place_id NUMBER(4)
);
```

```
-- Declare a variable.
openGauss=# DECLARE
section NUMBER(4) := 280;
section_name VARCHAR2(30) := 'Info support';
manager_id NUMBER(6) := 103;
place_id NUMBER(4) := 1400;
new_colname VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
 USING section, section_name, manager_id, place_id;
-- Execute the query (duplicate placeholders).
EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
 USING section, section_name, manager_id;
-- Run the ALTER statement. (You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.)
EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/

-- Query data.
openGauss=# SELECT * FROM sections_t1;

-- Drop the table.
openGauss=# DROP TABLE sections_t1;
```

### 10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

#### Syntax

Figure 10-12 shows the syntax diagram.

Figure 10-12 call\_procedure::=

Figure 10-13 shows the syntax diagram for **using\_clause**.

**Figure 10-13** using\_clause::=

The above syntax diagram is explained as follows:

- **CALL procedure\_name:** calls the stored procedure.
- **[;placeholder1;;placeholder2,...]:** specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]bind\_argument:** specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.

## Example

```
-- Create the stored procedure proc_add.
openGauss=# CREATE OR REPLACE PROCEDURE proc_add
(
 param1 in INTEGER,
 param2 out INTEGER,
 param3 in INTEGER
)
AS
BEGIN
 param2:= param1 + param3;
END;
/

openGauss=# DECLARE
 input1 INTEGER:=1;
 input2 INTEGER:=2;
 statement VARCHAR2(200);
 param2 INTEGER;
BEGIN
 -- Declare the call statement.
 statement := 'call proc_add(:col_1, :col_2, :col_3)';
 -- Execute the statement.
 EXECUTE IMMEDIATE statement
 USING IN input1, OUT param2, IN input2;
 db_output.print_line('result is: '||to_char(param2));
END;
/

-- Drop the stored procedure.
openGauss=# DROP PROCEDURE proc_add;
```

## 10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

## Syntax

Figure 10-14 shows the syntax diagram.

Figure 10-14 call\_anonymous\_block::=

Figure 10-15 shows the syntax diagram for using\_clause.

Figure 10-15 using\_clause::=

The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind\_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.
- Currently in GaussDB, when dynamic statements call anonymous blocks, placeholders cannot be used to pass input and output parameters in an EXCEPTION statement.
- Overloaded functions with placeholders cannot be called.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.

- Only SQL statements in anonymous blocks can be called to bind parameters. Parameters cannot be bound in other scenarios. For example, a stored procedure is called in an anonymous block, expressions and cursors are used in an anonymous block, and dynamic statements are called in an anonymous block.

## Examples

```
-- Create a table.
openGauss=# CREATE SCHEMA hr;
openGauss=# SET CURRENT_SCHEMA = hr;
-- Create the stored procedure dynamic_proc.
openGauss=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
 staff_id NUMBER(6) := 200;
 first_name VARCHAR2(20);
 salary NUMBER(8,2);
BEGIN
 -- Execute the anonymous block.
 EXECUTE IMMEDIATE 'begin select first_name, salary into :first_name, :salary from hr.staffs where
staff_id= :dno; end;'
 USING OUT first_name, OUT salary, IN staff_id;
 db_output.print_line(first_name|| ' ' || salary);
END;
/

-- Call the stored procedure.
openGauss=# CALL dynamic_proc();

-- Drop the stored procedure.
openGauss=# DROP PROCEDURE dynamic_proc;

-- Drop the current database schema.
openGauss=# SET CURRENT_SCHEMA = public;
openGauss=# DROP SCHEMA hr CASCADE;
```

## 10.8 Control Statements

### 10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

#### 10.8.1.1 RETURN

##### Syntax

Figure 10-16 shows the syntax diagram for a return statement.

Figure 10-16 return\_clause::=

The above syntax diagram is explained as follows:

This statement returns control from a stored procedure or function to a caller.

## Examples

See [Examples](#) for call statement examples.

### 10.8.1.2 RETURN NEXT and RETURN QUERY

#### Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

return\_next\_clause::=

return\_query\_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use **RETURN NEXT** or **RETURN QUERY** to add results to the result set, and then continue to execute the next statement of the function. As the **RETURN NEXT** or **RETURN QUERY** statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

**RETURN NEXT** can be used for scalar and compound data types.

**RETURN QUERY** has a variant **RETURN QUERY EXECUTE**. You can add dynamic queries and add parameters to the queries by **USING**.

## Examples

```
openGauss=# CREATE TABLE t1(a int);
openGauss=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
openGauss=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
 r t1%ROWTYPE;
BEGIN
 FOR r IN select * from t1
 LOOP
 RETURN NEXT r;
 END LOOP;
 RETURN;
END;
$$ LANGUAGE plpgsql;
openGauss=# call fun_for_return_next();
 a

 1
10
(2 rows)

-- RETURN QUERY
openGauss=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
 r t1%ROWTYPE;
```

```
BEGIN
 RETURN QUERY select * from t1;
END;
$$
language plpgsql;
openGauss=# call fun_for_return_query();
a

1
10
(2 rows)
```

## 10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of **IF**:

- **IF\_THEN**

**Figure 10-17 IF\_THEN::=**

**IF\_THEN** is the simplest form of **IF**. If the condition is true, statements are executed. If it is false, they are skipped.

Example:

```
openGauss=#
DECLARE
 v_user_id integer default 1;
BEGIN
 IF v_user_id <> 0 THEN
 raise info 'v_user_id is NOT 0';
 END IF;
END;
/
INFO: v_user_id is NOT 0
```

- **IF\_THEN\_ELSE**

**Figure 10-18 IF\_THEN\_ELSE::=**

**IF\_THEN\_ELSE** statements add **ELSE** branches and can be executed if the condition is false.

Example:

```
openGauss=#
DECLARE
 v_user_id integer default 1;
BEGIN
```

```
IF v_user_id <> 0 THEN
 raise info 'v_user_id is NOT 0';
ELSE
 raise info 'v_user_id is 0';
END IF;
END;
/
INFO: v_user_id is NOT 0
```

- **IF\_THEN\_ELSE IF**

**IF** statements can be nested in the following way:

```
openGauss=#
DECLARE
 v_user_id integer default 1;
BEGIN
 IF v_user_id = 0 THEN
 raise info 'v_user_id is 0';
 ELSE
 IF v_user_id > 0 THEN
 raise info 'v_user_id > 0';
 END IF;
 END IF;
END;
/
INFO: v_user_id > 0
```

Actually, this is a way of an **IF** statement nesting in the **ELSE** part of another **IF** statement. Therefore, an **END IF** statement is required for each nesting **IF** statement and another **END IF** statement is required to end the parent **IF-ELSE** statement. To set multiple options, use the following form:

- **IF\_THEN\_ELSEIF\_ELSE**

**Figure 10-19** IF\_THEN\_ELSEIF\_ELSE::=

Example:

```
DECLARE
 v_user_id integer default NULL;
BEGIN
 IF v_user_id = 0 THEN
 raise info 'v_user_id is 0';
 ELSIF v_user_id > 0 THEN
 raise info 'v_user_id > 0';
 ELSIF v_user_id < 0 THEN
 raise info 'v_user_id < 0';
 ELSE
 raise info 'v_user_id is NULL';
 END IF;
END;
/
INFO: v_user_id is NULL
```

- **IF\_THEN\_ELSEIF\_ELSE**

**ELSEIF** is an alias of **ELSIF**.

Example:

```
CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
BEGIN
 IF i > 0 THEN
 raise info 'i:% is greater than 0. ',i;
 ELSIF i < 0 THEN
 raise info 'i:% is smaller than 0. ',i;
 ELSE
 raise info 'i:% is equal to 0. ',i;
 END IF;
 RETURN;
END;
/

CALL proc_control_structure(3);

-- Delete the stored procedure.
DROP PROCEDURE proc_control_structure;
```

## 10.8.3 Loop Statements

### Simple LOOP Statements

#### Syntax diagram

Figure 10-20 loop::=

#### Example

```
CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
BEGIN
 count:=0;
 LOOP
 IF count > i THEN
 raise info 'count is %. ', count;
 EXIT;
 ELSE
 count:=count+1;
 END IF;
 END LOOP;
END;
/

CALL proc_loop(10,5);
```

#### NOTICE

The loop must be exploited together with **EXIT**; otherwise, a dead loop occurs.

### WHILE\_LOOP Statements

#### Syntax diagram

**Figure 10-21** while\_loop::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

### Example

```
CREATE TABLE integertable(c1 integer) ;
CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
 DECLARE
 i int :=1;
 BEGIN
 WHILE i < maxval LOOP
 INSERT INTO integertable VALUES(i);
 i:=i+1;
 END LOOP;
 END;
/

-- Call a function.
CALL proc_while_loop(10);

-- Delete the stored procedure and table.
DROP PROCEDURE proc_while_loop;
DROP TABLE integertable;
```

## FOR\_LOOP (*Integer variable*) Statement

### Syntax diagram

**Figure 10-22** for\_loop::=

### NOTE

- The variable *name* is automatically defined as the integer type and exists only in this loop. The value of *name* ranges from **lower\_bound** to **upper\_bound**.
- When the keyword **REVERSE** is used, the value of **lower\_bound** must be greater than or equal to that of **upper\_bound**; otherwise, the loop body is not executed.

## FOR\_LOOP Query Statements

### Syntax diagram

Figure 10-23 for\_loop\_query::=

### NOTE

The variable *target* is automatically defined, its type is the same as that in the query result, and it is valid only in this loop. The **target** value is the query result.

## FORALL Batch Query Statements

### Syntax diagram

Figure 10-24 forall::=

### NOTE

- The variable *index* is automatically defined as the integer type and exists only in this loop. The value of *index* falls between the value of **low\_bound** and the value of **upper\_bound**.
- If **SAVE EXCEPTIONS** is specified, exceptions occurred during DML execution in the loop body are saved in **SQL&BULK\_EXCEPTIONS** and an exception is thrown after the execution is complete. If there is no abnormal execution result in the loop, the loop will not be rolled back in the current subtransaction.

### Example

```

CREATE TABLE hdfs_t1 (
 title NUMBER(6),
 did VARCHAR2(20),
 data_period VARCHAR2(25),
 kind VARCHAR2(25),
 interval VARCHAR2(20),
 time DATE,
 isModified VARCHAR2(10)
);

```

```
INSERT INTO hdfs_t1 VALUES(8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833', to_date('21-06-1999',
'dd-mm-yyyy'), 'SH_CLERK');

CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
 FORALL i IN 100..120
 update hdfs_t1 set title = title + 100*i;
END;
/

-- Call a function.
CALL proc_forall();

-- Query the calling result of the stored procedure.
SELECT * FROM hdfs_t1 WHERE title BETWEEN 100 AND 120;

-- Delete the stored procedure and table.
DROP PROCEDURE proc_forall;
DROP TABLE hdfs_t1;
```

## 10.8.4 Branch Statements

### Syntax

Figure 10-25 shows the syntax diagram for a branch statement.

Figure 10-25 case\_when::=

Figure 10-26 shows the syntax diagram for when\_clause.

Figure 10-26 when\_clause::=

Parameters:

- *case\_expression*: specifies the variable or expression.
- *when\_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

## Examples

```
CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
BEGIN
 CASE pi_result
 WHEN 1 THEN
 pi_return := 111;
 WHEN 2 THEN
 pi_return := 222;
 WHEN 3 THEN
 pi_return := 333;
 WHEN 6 THEN
 pi_return := 444;
 WHEN 7 THEN
 pi_return := 555;
 WHEN 8 THEN
 pi_return := 666;
 WHEN 9 THEN
 pi_return := 777;
 WHEN 10 THEN
 pi_return := 888;
 ELSE
 pi_return := 999;
 END CASE;
 raise info 'pi_return : %',pi_return ;
END;
/

CALL proc_case_branch(3,0);

-- Delete the stored procedure.
DROP PROCEDURE proc_case_branch;
```

## 10.8.5 NULL Statements

In PL/SQL programs, **NULL** statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

### Syntax

The following shows example use of **NULL** statements.

```
DECLARE
...
BEGIN
...
 IF v_num IS NULL THEN
 NULL; -- No data needs to be processed.
 END IF;
END;
/
```

## 10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
 declarations]
BEGIN
 statements
```

```
EXCEPTION
 WHEN condition [OR condition ...] THEN
 handler_statements
 [WHEN condition [OR condition ...] THEN
 handler_statements
 ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler\_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in SQL standard error codes. The special condition name **OTHERS** matches every error type except **QUERY\_CANCELED**.

If a new error occurs within the selected **handler\_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) ;

INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');

CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
 x INT :=0;
 y INT;
BEGIN
 UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
 x := x + 1;
 y := x / 0;
EXCEPTION
 WHEN division_by_zero THEN
 RAISE NOTICE 'caught division_by_zero';
 RETURN x;
END;$$
LANGUAGE plpgsql;

call fun_exp();
NOTICE: caught division_by_zero
fun_exp

 1
(1 row)

select * from mytab;
 id | firstname | lastname
-----+-----+-----
```

```
| Tom | Jones
(1 row)
```

```
DROP FUNCTION fun_exp();
DROP TABLE mytab;
```

When control reaches the assignment to **y**, it will fail with a **division\_by\_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

#### NOTE

A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.

In the following scenario, an exception cannot be caught, and the entire transaction rolls back. The threads of the nodes participating the stored procedure exit abnormally due to node failure and network fault, or the source data is inconsistent with that of the table structure of the target table during the COPY FROM operation.

#### Example: Exceptions with **UPDATE/INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
CREATE TABLE db (a INT, b TEXT);

CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
 LOOP

 -- First try to update the key
 UPDATE db SET b = data WHERE a = key;
 IF found THEN
 RETURN;
 END IF;

 -- The key does not exist. Therefore, try to insert one. If someone else inserts the same key concurrently, the
 unique key may fail to be obtained.
 BEGIN
 INSERT INTO db(a,b) VALUES (key, data);
 RETURN;
 EXCEPTION WHEN unique_violation THEN
 -- Do nothing, and loop to try the UPDATE again.
 END;
 END LOOP;
 END;
$$
LANGUAGE plpgsql;

SELECT merge_db(1, 'david');
SELECT merge_db(1, 'dennis');

-- Drop the function and table.
DROP FUNCTION merge_db;
DROP TABLE db ;
```

## 10.8.7 GOTO Statements

A GOTO statement unconditionally transfers the control from the current statement to a labeled statement. The GOTO statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the EXCEPTION statement to handle issues in special scenarios. To run a GOTO statement, the labeled statement must be unique.

## Syntax

label declaration ::=

goto statement ::=

## Examples

```
openGauss=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
 v1 int;
BEGIN
 v1 := 0;
 LOOP
 EXIT WHEN v1 > 100;
 v1 := v1 + 2;
 if v1 > 25 THEN
 GOTO pos1;
 END IF;
 END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %.', v1;
END;
/

call GOTO_test();
```

## Constraints

Using GOTO statements has the following constraints:

- A GOTO statement does not allow multiple labeled statements even if the statements are in different blocks.

```
BEGIN
 GOTO pos1;
<<pos1>>
 SELECT * FROM ...
<<pos1>>
 UPDATE t1 SET ...
END;
```

- A GOTO statement cannot transfer control to the IF, CASE, or LOOP statement.

```
BEGIN
 GOTO pos1;
 IF valid THEN
 <<pos1>>
 SELECT * FROM ...
 END IF;
END;
```

- A GOTO statement cannot transfer control from one IF clause to another, or from one WHEN clause in the CASE statement to another.

```
BEGIN
 IF valid THEN
 GOTO pos1;
 SELECT * FROM ...
 ELSE
```

```
<<pos1>>
UPDATE t1 SET ...
END IF;
END;
```

- Transferring control from an outer block to an inner BEGIN-END block is not supported.

```
BEGIN
GOTO pos1;
BEGIN
<<pos1>>
UPDATE t1 SET ...
END;
END;
```

- Transferring control from an exception handler to the current BEGIN-END block is not supported. However, transferring control to the upper-layer BEGIN-END block is supported.

```
BEGIN
<<pos1>>
UPDATE t1 SET ...
EXCEPTION
WHEN condition THEN
GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, add the NULL statement.

```
DECLARE
done BOOLEAN;
BEGIN
FOR i IN 1..50 LOOP
IF done THEN
GOTO end_loop;
END IF;
<<end_loop>> -- not allowed unless an executable statement follows
NULL; -- add NULL statement to avoid error
END LOOP; -- raises an error without the previous NULL
END;
/
```

## 10.9 Transaction Management

Calling a stored procedure automatically starts a transaction. When the calling is complete, the transaction is automatically committed, or rolled back upon an exception. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

## Syntax

```
Define a savepoint.
SAVEPOINT savepoint_name;
Roll back a savepoint.
ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
RELEASE [SAVEPOINT] savepoint_name;
```

## Usage Scenarios

The applicable contexts are as follows:

- COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures that contain EXCEPTION.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
- A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
- A stored procedure that contains savepoints can be called in a subtransaction. That is, an externally defined savepoint is used in the stored procedure to roll back the transaction to the savepoint defined outside the stored procedure.
- A stored procedure is visible to a savepoint defined in the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
- COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.
- A stored procedure or function that contains COMMIT, ROLLBACK, or SAVEPOINT can be called in the return values and simple expression calculation of stored procedures.

The following content can be committed or rolled back:

- DDL statements after COMMIT/ROLLBACK can be committed or rolled back.
- DML statements after COMMIT/ROLLBACK can be committed.
- GUC parameters in stored procedures can be committed or rolled back.

## Usage Restrictions

The unapplicable contexts are as follows:

- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Python.
- COMMIT, ROLLBACK, SAVEPOINT and stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in functions.
- After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.

- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in EXECUTE statements.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
- Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
- Savepoints defined outside a stored procedure cannot be released in the stored procedure.
- An autonomous transaction and a stored procedure transaction are two independent transactions that cannot use the savepoints defined in each other.

The following content cannot be committed or rolled back:

- Variables declared or imported in stored procedures cannot be committed or rolled back.
- In stored procedures, GUC parameters that take effect only after a restart cannot be committed or rolled back.

## Examples

- Example 1: COMMIT and ROLLBACK can be used in PL/SQL stored procedures.

```
CREATE TABLE EXAMPLE1(COL1 INT);

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(COL1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/

DROP PROCEDURE TRANSACTION_EXAMPLE;
DROP TABLE EXAMPLE1;
```

- Example 2:

COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.

COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.

DDL statements after COMMIT/ROLLBACK can be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
```

```
BEGIN
DROP TABLE IF EXISTS TEST_COMMIT;
CREATE TABLE TEST_COMMIT(A INT, B INT);
INSERT INTO TEST_COMMIT SELECT 1, 1;
COMMIT;
 CREATE TABLE TEST_ROLLBACK(A INT, B INT);
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
 WHEN OTHERS THEN
INSERT INTO TEST_COMMIT SELECT 2, 2;
ROLLBACK;
END;
/
```

- Example 3: A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
BEGIN;
 CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
DROP PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK;
```

- Example 4: COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT);
 FOR I IN REVERSE 3..0 LOOP
INSERT INTO TEST_COMMIT SELECT I;
COMMIT;
 END LOOP;
 FOR I IN REVERSE 2..4 LOOP
UPDATE TEST_COMMIT SET A=I;
COMMIT;
 END LOOP;
EXCEPTION
 WHEN OTHERS THEN
INSERT INTO TEST_COMMIT SELECT 4;
COMMIT;
END;
/
DROP PROCEDURE TEST_COMMIT2;
```

- Example 5: Return values and simple expression calculation of stored procedures are supported.

```
CREATE OR REPLACE PROCEDURE exec_func3(RET_NUM OUT INT)
AS
BEGIN
 RET_NUM := 1+1;
COMMIT;
END;
/
CREATE OR REPLACE PROCEDURE exec_func4(ADD_NUM IN INT)
AS
SUM_NUM INT;
BEGIN
SUM_NUM := ADD_NUM + exec_func3();
COMMIT;
END;
/
DROP PROCEDURE exec_func3;
DROP PROCEDURE exec_func4;
```

- Example 6: GUC parameters in stored procedures can be rolled back to a commit.

Note: You are advised not to use the **enable\_force\_vector\_engine** GUC parameter.

```
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;

CREATE OR REPLACE PROCEDURE GUC_ROLLBACK()
AS
BEGIN
 SET enable_force_vector_engine = on;
 COMMIT;
 SET explain_perf_mode TO pretty;
 ROLLBACK;
END;
/

call GUC_ROLLBACK();
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;
SET enable_force_vector_engine = off;
DROP PROCEDURE GUC_ROLLBACK;
```

- Example 7: COMMIT, ROLLBACK, and stored procedures that contain COMMIT or ROLLBACK cannot be called in functions.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE1() RETURN INT
AS
EXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
 RETURN EXP;
END;
/
DROP FUNCTION FUNCTION_EXAMPLE1;
```

- Example 8: Stored procedures that contain COMMIT or ROLLBACK cannot be called in functions.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE2() RETURN INT
AS
EXP INT;
BEGIN
 -- transaction_example is a stored procedure and contains the COMMIT/ROLLBACK statement.
 CALL transaction_example();
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
 RETURN EXP;
END;
/
DROP FUNCTION FUNCTION_EXAMPLE2;
```

- Example 9: A TRIGGER stored procedure cannot contain COMMIT or ROLLBACK or call another stored procedure that contains COMMIT or ROLLBACK.

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
```

```
 ROLLBACK;
 END IF;
END LOOP;
SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/

CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();

DELETE FROM EXAMPLE1;
DROP TRIGGER TRIGGER_EXAMPLE ON EXAMPLE1;
DROP FUNCTION FUNCTION_TRI_EXAMPLE2;
DROP TABLE EXAMPLE1;
```

- Example 10: Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, or another stored procedure that contains COMMIT or ROLLBACK.

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
DROP PROCEDURE TRANSACTION_EXAMPLE1;
DROP TABLE EXAMPLE1;
```

- Example 11: Variables declared or specified in stored procedures cannot be committed.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN
 EXP_OUT := 0;
 COMMIT;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
 EXP_OUT := 1;
 ROLLBACK;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
DROP PROCEDURE TRANSACTION_EXAMPLE2;
```

- Example 12: Calling in SQL statements (other than Select Procedure) is not supported.

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 EXECUTE IMMEDIATE 'COMMIT';
 ELSE
 EXECUTE IMMEDIATE 'ROLLBACK';
 END IF;
 END LOOP;
END;
/
```

```
DROP PROCEDURE TRANSACTION_EXAMPLE3;
DROP TABLE EXAMPLE1;
```

- **Example 13: COMMIT or ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.**

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
DROP PROCEDURE TRANSACTION_EXAMPLE4;
DROP TABLE EXAMPLE1;
```

- **Example 14: A stored procedure whose cursor is open cannot contain COMMIT or ROLLBACK.**

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
 INTOUT := INTIN + 1;
 COMMIT;
END;
/

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()
AS
CURSOR CURSOR1(EXPIN INT)
IS SELECT TRANSACTION_EXAMPLE5(EXPIN);
INTEXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 OPEN CURSOR1(i);
 FETCH CURSOR1 INTO INTEXP;
 INSERT INTO EXAMPLE1(COL1) VALUES (INTEXP);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 CLOSE CURSOR1;
 END LOOP;
END;
/

DROP PROCEDURE TRANSACTION_EXAMPLE5;
DROP PROCEDURE TRANSACTION_EXAMPLE6;
```

- **Example 15: COMMIT or ROLLBACK cannot be called in expressions or CURSOR and EXECUTE statements.**

```
CREATE OR REPLACE PROCEDURE exec_func1()
AS
BEGIN
 CREATE TABLE TEST_exec(A INT);
 COMMIT;
END;
/
CREATE OR REPLACE PROCEDURE exec_func2()
AS
BEGIN
 EXECUTE exec_func1();
 COMMIT;
```

```
END;
/
DROP PROCEDURE exec_func1;
DROP PROCEDURE exec_func2;
```

- **Example 16: Roll back some modifications of stored procedure on a transaction to a savepoint.**

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE1()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
 SAVEPOINT s1;
 INSERT INTO EXAMPLE1 VALUES(2);
 ROLLBACK TO s1; -- Roll back the insertion of record 2.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/
DROP PROCEDURE STP_SAVEPOINT_EXAMPLE1;
DROP TABLE EXAMPLE1;
```

- **Example 17: Roll back a stored procedure to a savepoint defined outside the stored procedure.**

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE2()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(2);
 ROLLBACK TO s1; -- Roll back the insertion of record 2.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE2();
SELECT * FROM EXAMPLE1;
COMMIT;
DROP PROCEDURE STP_SAVEPOINT_EXAMPLE2;
DROP TABLE EXAMPLE1;
```

- **Example 18: Savepoints defined outside the stored procedure cannot be released in the stored procedure.**

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(2);
 RELEASE SAVEPOINT s1; -- Release the savepoint defined outside the stored procedure.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE3();
COMMIT;
DROP PROCEDURE STP_SAVEPOINT_EXAMPLE3;
DROP TABLE EXAMPLE1;
```

- **Example 19: Roll back an external SQL or other stored procedure to a savepoint defined in the stored procedure.**

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
```

```
SAVEPOINT s1;
INSERT INTO EXAMPLE1 VALUES(2);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(3);
CALL STP_SAVEPOINT_EXAMPLE3();
ROLLBACK TO SAVEPOINT s1; -- Roll back the insertion of record 2 to the stored procedure.
SELECT * FROM EXAMPLE1;
COMMIT;
DROP PROCEDURE STP_SAVEPOINT_EXAMPLE3;
DROP TABLE EXAMPLE1;
```

## 10.10 Other Statements

### 10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, ALTER TABLE cannot be executed on the same table.

For the complete lock operations, see [LOCK](#).

### 10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see [Explicit Cursor](#).

## 10.11 Cursors

### 10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

---

#### NOTICE

If JDBC is used to call a stored procedure whose returned value is a cursor, the returned cursor cannot be used.

---

Cursors are classified into explicit cursors and implicit cursors. [Table 10-2](#) shows the usage conditions of explicit and implicit cursors for different SQL statements.

**Table 10-2** Cursor usage conditions

| SQL Statement                             | Cursor               |
|-------------------------------------------|----------------------|
| Non-query statements                      | Implicit             |
| Query statements with single-line results | Implicit or explicit |
| Query statements with multi-line results  | Explicit             |

## 10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

### Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

- Step 1** Define a static cursor: Define a cursor name and its corresponding **SELECT** statement.

[Figure 10-27](#) shows the syntax diagram for defining a static cursor.

**Figure 10-27** static\_cursor\_define::=

Parameter description:

- *cursor\_name*: defines a cursor name.
- *parameter*: specifies cursor parameters. Only input parameters are allowed. Its format is as follows:  
parameter\_name datatype
- *select\_statement*: specifies a query statement.

 NOTE

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a **SELECT** statement through **OPEN FOR** when the cursor is opened.

**Figure 10-28** and **Figure 10-29** show the syntax diagrams for defining a dynamic cursor.

**Figure 10-28** cursor\_typename::=

**Figure 10-29** dynamic\_cursor\_define::=

**Step 2** Open the static cursor: Execute the **SELECT** statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the **OPEN** statement locks the data rows corresponding to the cursor result set in the database table.

**Figure 10-30** shows the syntax diagram for opening a static cursor.

**Figure 10-30** open\_static\_cursor::=

Open the dynamic cursor: Use the **OPEN FOR** statement to open the dynamic cursor and the SQL statement is dynamically bound.

**Figure 10-31** shows the syntax diagrams for opening a dynamic cursor.

**Figure 10-31** open\_dynamic\_cursor::=

A PL/SQL program cannot use the **OPEN** statement to repeatedly open a cursor.

**Step 3** Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

**Figure 10-32** shows the syntax diagrams for fetching cursor data.

**Figure 10-32** fetch\_cursor::=

**Step 4** Process the record.

**Step 5** Continue to process until the active set has no record.

**Step 6** Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the **FETCH** statement can no longer be used to fetch data. A closed cursor can be reopened by an **OPEN** statement.

**Figure 10-33** shows the syntax diagram for closing a cursor.

**Figure 10-33** close\_cursor::=

----End

## Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which works opposite to the **%FOUND** attribute.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

## Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```
DROP SCHEMA IF EXISTS hr CASCADE;
CREATE SCHEMA hr;
SET current_schema = hr;
DROP TABLE IF EXISTS sections;
DROP TABLE IF EXISTS staffs;
DROP TABLE IF EXISTS department;
-- Create a department table.
CREATE TABLE sections(
 section_name varchar(100),
 place_id int,
 section_id int
);
INSERT INTO sections VALUES ('hr',1,1);

-- Create an employee table.
CREATE TABLE staffs(
 staff_id number(6),
 salary number(8,2),
 section_id int,
 first_name varchar(20)
);
INSERT INTO staffs VALUES (1,100,1,'Tom');

-- Create a department table.
CREATE TABLE department(
 section_id int
);
-- Specify the method for passing cursor parameters.
CREATE OR REPLACE PROCEDURE cursor_proc1()
AS
DECLARE
 DEPT_NAME VARCHAR(100);
 DEPT_LOC NUMBER(4);
 -- Define a cursor.
 CURSOR C1 IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= 50;
 CURSOR C2(sect_id INTEGER) IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= sect_id;
 TYPE CURSOR_TYPE IS REF CURSOR;
 C3 CURSOR_TYPE;
 SQL_STR VARCHAR(100);
BEGIN
 OPEN C1;-- Open the cursor.
 LOOP
 -- Fetch data from the cursor.
 FETCH C1 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C1%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C1;-- Close the cursor.

 OPEN C2(10);
 LOOP
 FETCH C2 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C2%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C2;

 SQL_STR := 'SELECT section_name, place_id FROM hr.sections WHERE section_id <= :DEPT_NO;';
 OPEN C3 FOR SQL_STR USING 50;
 LOOP
 FETCH C3 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C3%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C3;
END;
/
```

```
CREATE PROCEDURE
CALL cursor_proc1();

hr---1
hr---1
hr---1
cursor_proc1

(1 row)
DROP PROCEDURE cursor_proc1;
DROP PROCEDURE
-- Give a salary raise to employees whose salary is lower than 3000 by adding 500.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;
INSERT 0 1

CREATE OR REPLACE PROCEDURE cursor_proc2()
AS
DECLARE
 V_EMPNO NUMBER(6);
 V_SAL NUMBER(8,2);
 CURSOR C IS SELECT staff_id, salary FROM hr.staffs_t1;
BEGIN
 OPEN C;
 LOOP
 FETCH C INTO V_EMPNO, V_SAL;
 EXIT WHEN C%NOTFOUND;
 IF V_SAL<=3000 THEN
 UPDATE hr.staffs_t1 SET salary =salary + 500 WHERE staff_id = V_EMPNO;
 END IF;
 END LOOP;
 CLOSE C;
END;
/
CREATE PROCEDURE
CALL cursor_proc2();
cursor_proc2

(1 row)
-- Delete the stored procedure.
DROP PROCEDURE cursor_proc2;
DROP PROCEDURE
DROP TABLE hr.staffs_t1;
DROP TABLE
-- Use function parameters of the SYS_REFCURSOR type.
CREATE OR REPLACE PROCEDURE proc_sys_ref(O OUT SYS_REFCURSOR)
IS
C1 SYS_REFCURSOR;
BEGIN
 OPEN C1 FOR SELECT section_ID FROM HR.sections ORDER BY section_ID;
 O := C1;
END;
/

DECLARE
C1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
proc_sys_ref(C1);
LOOP
 FETCH C1 INTO TEMP;
 DBE_OUTPUT.PRINT_LINE(C1%ROWCOUNT);
 EXIT WHEN C1%NOTFOUND;
END LOOP;
END;
/
```

```
-- Delete the stored procedure.
DROP PROCEDURE proc_sys_ref;
```

### 10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

#### Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

#### NOTE

- INSERT, UPDATE, DELETE, and SELECT statements do not need defined cursors.
- In O-compatible mode, if the GUC parameter **behavior\_compat\_options** is set to **compat\_cursor**, implicit cursors are valid across stored procedures.

#### Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which works opposite to the **SQL%FOUND** attribute.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

```
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;
CREATE TABLE hr.sections_t1 AS TABLE hr.sections;
-- Delete all employees in a department from the hr.staffs table. If the department has no employees,
-- delete the department from the hr.sections table.
CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
 DECLARE
 V_DEPTNO NUMBER(4) := 100;
 BEGIN
 DELETE FROM hr.staffs WHERE section_ID = V_DEPTNO;
 -- Proceed based on cursor status.
 IF SQL%NOTFOUND THEN
 DELETE FROM hr.sections_t1 WHERE section_ID = V_DEPTNO;
 END IF;
 END;
/

CALL proc_cursor3();

-- Delete the stored procedure and the temporary table.
DROP PROCEDURE proc_cursor3;
```

```
DROP TABLE hr.staffs_t1;
DROP TABLE hr.sections_t1;
```

## 10.11.4 Cursor Loop

Use of cursors in WHILE and LOOP statements is called a cursor loop. Generally, OPEN, FETCH, and CLOSE statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

### Syntax

Figure 10-34 shows the syntax diagram of the FOR AS loop.

Figure 10-34 FOR\_AS\_loop::=

### Precautions

- The UPDATE operation for the queried table is not allowed in the loop statement.
- The variable *loop\_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select\_statement*. The value of *loop\_name* is the query result of *select\_statement*.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.
- The specific type of the **loop\_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop\_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported. To parse the specific type of a variable, set **behavior\_compat\_options** to 'allow\_procedure\_compile\_check'.

### Examples

```
BEGIN
FOR ROW_TRANS IN
 SELECT first_name FROM hr.staffs
LOOP
 DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name);
END LOOP;
END;
/

-- Create a table.
CREATE TABLE integerTable1(A INTEGER);
CREATE TABLE integerTable2(B INTEGER);
INSERT INTO integerTable2 VALUES(2);
```

```
-- Multiple cursors share the parameters of cursor attributes.
DECLARE
 CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
 CURSOR C2 IS SELECT B FROM integerTable2;
 PI_A INTEGER;
 PI_B INTEGER;
BEGIN
 OPEN C1;-- Open the cursor.
 OPEN C2;
 FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
 FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
 -- Determine the cursor status.
 IF C1%FOUND THEN
 IF C2%FOUND THEN
 DBE_OUTPUT.PRINT_LINE('Dual cursor share paremeter.');
```

## 10.12 Advanced Packages

Advanced packages have two sets of APIs. The first set is basic APIs, and the second set is secondary encapsulation APIs that are used improve usability. The second set is recommended.

### 10.12.1 Basic APIs

#### 10.12.1.1 PKG\_SERVICE

**Table 10-3** lists all APIs supported by the **PKG\_SERVICE** package.

**Table 10-3** PKG\_SERVICE

| API                                                | Description                             |
|----------------------------------------------------|-----------------------------------------|
| <a href="#">PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE</a>  | Checks whether a context is registered. |
| <a href="#">PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS</a> | Deregisters all registered contexts.    |
| <a href="#">PKG_SERVICE.SQL_REGISTER_CONTEXT</a>   | Registers a context.                    |
| <a href="#">PKG_SERVICE.SQL_UNREGISTER_CONTEXT</a> | Deregisters a context.                  |

| API                                                 | Description                                                                                                                      |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PKG_SERVICE.SQL_SET_SQL</a>             | Sets an SQL statement for a context. Currently, only the SELECT statement is supported.                                          |
| <a href="#">PKG_SERVICE.SQL_RUN</a>                 | Executes the configured SQL statement on a context.                                                                              |
| <a href="#">PKG_SERVICE.SQL_NEXT_ROW</a>            | Reads the next row of data in a context.                                                                                         |
| <a href="#">PKG_SERVICE.SQL_GET_VALUE</a>           | Reads a dynamically defined column value in a context.                                                                           |
| <a href="#">PKG_SERVICE.SQL_SET_RESULT_TYPE</a>     | Dynamically defines a column of a context based on the type OID.                                                                 |
| <a href="#">PKG_SERVICE.JOB_CANCEL</a>              | Removes a scheduled task by task ID.                                                                                             |
| <a href="#">PKG_SERVICE.JOB_FINISH</a>              | Disables or enables scheduled task execution.                                                                                    |
| <a href="#">PKG_SERVICE.JOB_SUBMIT</a>              | Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.                             |
| <a href="#">PKG_SERVICE.JOB_UPDATE</a>              | Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval. |
| <a href="#">PKG_SERVICE.SUBMIT_ON_NODES</a>         | Submits a task to all nodes. The task ID is automatically generated by the system.                                               |
| <a href="#">PKG_SERVICE.ISUBMIT_ON_NODES</a>        | Submits a job to all nodes. The job ID is specified by the user.                                                                 |
| <a href="#">PKG_SERVICE.SQL_GET_ARRAY_RESULT</a>    | Obtains the array value returned in the context.                                                                                 |
| <a href="#">PKG_SERVICE.SQL_GET_VARIABLE_RESULT</a> | Obtains the column value returned in the context.                                                                                |

- [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#)

This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#) function is as follows:

```
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
 context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-4** PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE API parameters

| Parameter  | Description                      |
|------------|----------------------------------|
| context_id | ID of the context to be queried. |

- PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS

This function cancels all contexts.

The prototype of the PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS function is as follows:

```
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
)
RETURN VOID;
```

- PKG\_SERVICE.SQL\_REGISTER\_CONTEXT

This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

The prototype of the PKG\_SERVICE.SQL\_REGISTER\_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT

This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-5** PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT API parameter

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the context to be closed. |

- PKG\_SERVICE.SQL\_SET\_SQL

This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the SELECT query statement can be parsed. The statement parameters can be specified only through the TEXT type. The length cannot exceed 1 GB.

The prototype of the PKG\_SERVICE.SQL\_SET\_SQL function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id IN INTEGER,
```

```
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-6** PKG\_SERVICE.SQL\_SET\_SQL API parameters

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| context_id    | ID of the context whose query statement is to be parsed.        |
| query_string  | Query statement to be parsed.                                   |
| language_flag | Version language number. Currently, only <b>1</b> is supported. |

- **PKG\_SERVICE.SQL\_RUN**

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the **SELECT** query statement can be executed.

The prototype of the PKG\_SERVICE.SQL\_RUN function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-7** PKG\_SERVICE.SQL\_RUN API parameters

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| context_id | ID of the context whose query statement is to be parsed. |

- **PKG\_SERVICE.SQL\_NEXT\_ROW**

This function returns the number of data rows returned after the SQL statement is executed. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the PKG\_SERVICE.SQL\_NEXT\_ROW function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-8** PKG\_SERVICE.SQL\_NEXT\_ROW API parameters

| Parameter  | Description                       |
|------------|-----------------------------------|
| context_id | ID of the context to be executed. |

- **PKG\_SERVICE.SQL\_GET\_VALUE**

This function returns the context element value in a specified position of a context and accesses the data obtained by PKG\_SERVICE.SQL\_NEXT\_ROW.

The prototype of the PKG\_SERVICE.SQL\_GET\_VALUE function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-9** PKG\_SERVICE.SQL\_GET\_VALUE API parameters

| Parameter  | Description                                                           |
|------------|-----------------------------------------------------------------------|
| context_id | ID of the context to be executed.                                     |
| pos        | Position of a dynamically defined column in the query.                |
| col_type   | Variable of any type, which defines the return value type of columns. |

- PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE

This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of

PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id IN INTEGER,
pos IN INTEGER,
coltype_oid IN ANYELEMENT,
maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-10** PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE API parameters

| Parameter   | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| context_id  | ID of the context to be executed                                                                    |
| pos         | Position of a dynamically defined column in the query                                               |
| coltype_oid | Variable of any type. The OID of the corresponding type can be obtained based on the variable type. |
| maxsize     | Length of a defined column                                                                          |

- PKG\_SERVICE.JOB\_CANCEL

The stored procedure CANCEL deletes a specified task.

The prototype of the PKG\_SERVICE.JOB\_CANCEL function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
job IN INTEGER);
```

**Table 10-11** PKG\_SERVICE.JOB\_CANCEL API parameters

| Parameter | Type    | Input/Output Parameter | Empty or Not | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| id        | integer | IN                     | No           | Specifies the job ID. |

Example:

```
SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
job_submit

 101
(1 row)
CALL PKG_SERVICE.JOB_CANCEL(101);
job_cancel

(1 row)
```

- **PKG\_SERVICE.JOB\_FINISH**

The stored procedure FINISH disables or enables a scheduled task.

The prototype of the PKG\_SERVICE.JOB\_FINISH function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id IN INTEGER,
broken IN BOOLEAN,
next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-12** PKG\_SERVICE.JOB\_FINISH API parameters

| Parameter | Type    | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | integer | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                      |
| broken    | Boolean | IN                     | No           | Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged. |

| Parameter | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_time | timestamp | IN                     | Yes          | Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case. |

- PKG\_SERVICE.JOB\_SUBMIT

The stored procedure JOB\_SUBMIT commits a scheduled task provided by the system.

The prototype of the PKG\_SERVICE.JOB\_SUBMIT function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id IN BIGINT,
content IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
job OUT INTEGER);
```

 **NOTE**

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-13** PKG\_SERVICE.JOB\_SUBMIT API parameters

| Parameter | Type   | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                      |
|-----------|--------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | bigint | IN                     | No           | Specifies the job ID. If the input ID is <b>NULL</b> , a job ID is generated internally.                                                                                         |
| context   | text   | IN                     | No           | Specifies the SQL statement to be executed. One or multiple DML statements, anonymous blocks, and statements for calling stored procedures, or all three combined are supported. |

| Parameter     | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_time     | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| interval_time | text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| job           | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When <b>pkg_service.job_submit</b> is called using <b>select</b> , this parameter can be omitted.                                                                                                                                                       |

## Example:

```
CREATE TABLE test_table(a int);
CREATE TABLE

CREATE OR REPLACE PROCEDURE test_job(a in int) IS
BEGIN
INSERT INTO test_table VALUES(a);
COMMIT;
END;
/
CREATE PROCEDURE
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1');
job_submit

28269
(1 row)
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
job_submit

1506
(1 row)
CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc("day",SYSDATE) + 1 +(8*60+30.0)/
(24*60)' ,:jobid);
job

14131
(1 row)
SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
job_submit

```

101  
(1 row)

- **PKG\_SERVICE.JOB\_UPDATE**

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the PKG\_SERVICE.JOB\_UPDATE function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id IN BIGINT,
next_time IN TIMESTAMP,
interval_time IN TEXT,
content IN TEXT);
```

**Table 10-14** PKG\_SERVICE.JOB\_UPDATE API parameters

| Parameter     | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| next_time     | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.                                                                                                                                                                                                                          |
| interval_time | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| content       | text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.                                                                                                                                                                             |

Example:

```
CALL PKG_SERVICE.JOB_UPDATE(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
job_update

(1 row)
CALL PKG_SERVICE.JOB_UPDATE(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
job_update

(1 row)
```

- **PKG\_SERVICE.SUBMIT\_ON\_NODES**

Creates a scheduled job on a node. Only SYSADMIN and MONADMIN have this permission.

The prototype of the PKG\_SERVICE.SUBMIT\_ON\_NODES function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name IN NAME,
database IN NAME,
what IN TEXT,
next_date IN TIMESTAMP WITHOUT TIME ZONE,
job_interval IN TEXT,
job OUT INTEGER);
```

**Table 10-15** PKG\_SERVICE.SUBMIT\_ON\_NODES API parameters

| Parameter | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                       |
|-----------|-----------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name | text      | IN                     | No           | Specifies the node where a job is executed. Currently, the value can be ' <b>ALL_NODE</b> ' (the job is executed on all nodes) or ' <b>CCN</b> '. (Note: CCN is invalid in a centralized deployment environment.) |
| database  | text      | IN                     | No           | Database used by a database instance job. When the node type is ' <b>ALL_NODE</b> ', the value can only be ' <b>postgres</b> '.                                                                                   |
| what      | text      | IN                     | No           | Specifies the SQL statement to be executed. One or multiple DML statements, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.                                  |
| nextdate  | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.               |

| Parameter    | Type    | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                     |
|--------------|---------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_interval | text    | IN                     | No           | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| job          | integer | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When dbms.submit_on_nodes is called using SELECT, this parameter can be omitted.                                                                                                                                                                        |

Example:

```
SELECT pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
submit_on_nodes
```

```

25376
(1 row)
```

- **PKG\_SERVICE.ISUBMIT\_ON\_NODES**

ISUBMIT\_ON\_NODES has the same syntax function as SUBMIT\_ON\_NODES, but the first parameter of ISUBMIT\_ON\_NODES is an input parameter, that is, a specified task ID. In contrast, that last parameter of ISUBMIT\_ON\_NODES is an output parameter, indicating the task ID automatically generated by the system. Only SYSADMIN and MONADMIN have this permission.

- **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT**

This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

The prototype of the PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
 context_id in int,
 pos in VARCHAR2,
 column_value inout anyarray,
 result_type in anyelement
);
```

**Table 10-16** PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT parameters

| Parameter  | Description                      |
|------------|----------------------------------|
| context_id | ID of the context to be queried. |
| pos        | Name of the bound parameter      |

| Parameter    | Description  |
|--------------|--------------|
| column_value | Return value |
| result_type  | Return type  |

- **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT**

This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

The prototype of the PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
 context_id in int,
 pos in VARCHAR2,
 result_type in anyelement
)
RETURNS anyelement;
```

**Table 10-17** PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT parameters

| Parameter   | Description                      |
|-------------|----------------------------------|
| context_id  | ID of the context to be queried. |
| pos         | Name of the bound parameter.     |
| result_type | Return type.                     |

### 10.12.1.2 PKG\_UTIL

**Table 10-18** lists all APIs supported by the PKG\_UTIL package.

**Table 10-18** PKG\_UTIL

| API                            | Description                                                                   |
|--------------------------------|-------------------------------------------------------------------------------|
| <b>PKG_UTIL.LOB_GET_LENGTH</b> | Obtains the length of a LOB.                                                  |
| <b>PKG_UTIL.LOB_READ</b>       | Reads a part of a LOB.                                                        |
| <b>PKG_UTIL.LOB_WRITE</b>      | Writes the source object to the target object in the specified format.        |
| <b>PKG_UTIL.LOB_APPEND</b>     | Appends a specified number of characters of the source LOB to the target LOB. |
| <b>PKG_UTIL.LOB_COMPARE</b>    | Compares two LOBs based on the specified length.                              |
| <b>PKG_UTIL.LOB_MATCH</b>      | Returns the position of the Mth occurrence of a character string in a LOB.    |

| API                                                   | Description                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">PKG_UTIL.LOB_RESET</a>                    | Resets the character in specified position of a LOB to a specified character. |
| <a href="#">PKG_UTIL.IO_PRINT</a>                     | Displays character strings.                                                   |
| <a href="#">PKG_UTIL.RAW_GET_LENGTH</a>               | Obtains the length of RAW data.                                               |
| <a href="#">PKG_UTIL.RAW_CAST_FROM_VARCHAR2</a>       | Converts VARCHAR2 data to RAW data.                                           |
| <a href="#">PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER</a> | Converts binary integers to RAW data.                                         |
| <a href="#">PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER</a>   | Converts RAW data to binary integers.                                         |
| <a href="#">PKG_UTIL.RANDOM_SET_SEED</a>              | Sets a random seed.                                                           |
| <a href="#">PKG_UTIL.RANDOM_GET_VALUE</a>             | Returns a random value.                                                       |
| <a href="#">PKG_UTIL.FILE_SET_DIRNAME</a>             | Sets the directory to be operated.                                            |
| <a href="#">PKG_UTIL.FILE_OPEN</a>                    | Opens a file based on the specified file name and directory.                  |
| <a href="#">PKG_UTIL.FILE_SET_MAX_LINE_SIZE</a>       | Sets the maximum length of a line to be written to a file.                    |
| <a href="#">PKG_UTIL.FILE_IS_CLOSE</a>                | Checks whether a file handle is closed.                                       |
| <a href="#">PKG_UTIL.FILE_READ</a>                    | Reads data of a specified length from an open file handle.                    |
| <a href="#">PKG_UTIL.FILE_READLINE</a>                | Reads a line of data from an open file handle.                                |
| <a href="#">PKG_UTIL.FILE_WRITE</a>                   | Writes the data specified in the buffer to a file.                            |
| <a href="#">PKG_UTIL.FILE_WRITELINE</a>               | Writes the buffer to a file and adds newline characters.                      |
| <a href="#">PKG_UTIL.FILE_NEWLINE</a>                 | Adds a line.                                                                  |
| <a href="#">PKG_UTIL.FILE_READ_RAW</a>                | Reads binary data of a specified length from an open file handle.             |
| <a href="#">PKG_UTIL.FILE_WRITE_RAW</a>               | Writes binary data to a file.                                                 |
| <a href="#">PKG_UTIL.FILE_FLUSH</a>                   | Writes data from a file handle to a physical file.                            |
| <a href="#">PKG_UTIL.FILE_CLOSE</a>                   | Closes an open file handle.                                                   |

| API                                                     | Description                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------|
| <a href="#">PKG_UTIL.FILE_REMOVE</a>                    | Deletes a physical file. To do so, you must have the corresponding permission. |
| <a href="#">PKG_UTIL.FILE_RENAME</a>                    | Renames files on the disk, similar to <b>mv</b> in Unix.                       |
| <a href="#">PKG_UTIL.FILE_SIZE</a>                      | Returns the size of a file.                                                    |
| <a href="#">PKG_UTIL.FILE_BLOCK_SIZE</a>                | Returns the number of blocks contained in a file.                              |
| <a href="#">PKG_UTIL.FILE_EXISTS</a>                    | Checks whether a file exists.                                                  |
| <a href="#">PKG_UTIL.FILE_GETPOS</a>                    | Specifies the offset of a returned file, in bytes.                             |
| <a href="#">PKG_UTIL.FILE_SEEK</a>                      | Sets the offset for file position.                                             |
| <a href="#">PKG_UTIL.FILE_CLOSE_ALL</a>                 | Closes all file handles opened in a session.                                   |
| <a href="#">PKG_UTIL.EXCEPTION_REPORT_ERROR</a>         | Throws an exception.                                                           |
| <a href="#">PKG_UTIL.APP_READ_CLIENT_INFO</a>           | Reads the client information.                                                  |
| <a href="#">PKG_UTIL.APP_SET_CLIENT_INFO</a>            | Sets the client information.                                                   |
| <a href="#">PKG_UTIL.LOB_CONVERTTOBLOB</a>              | Converts the CLOB type to the BLOB type.                                       |
| <a href="#">PKG_UTIL.LOB_CONVERTTOCLOB</a>              | Converts the BLOB type to the CLOB type.                                       |
| <a href="#">PKG_UTIL.LOB_RAWTOTEXT</a>                  | Converts the raw type to the text type.                                        |
| <a href="#">PKG_UTIL.LOB_TEXTTORAW</a>                  | Converts the text type to the raw type.                                        |
| <a href="#">PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY</a> | Calculates the difference between two character strings.                       |
| <a href="#">PKG_UTIL.RAW_CAST_TO_VARCHAR2</a>           | Converts the raw type to the varchar2 type.                                    |
| <a href="#">PKG_UTIL.SESSION_CLEAR_CONTEXT</a>          | Clears the attribute values in <b>session_context</b> .                        |
| <a href="#">PKG_UTIL.SESSION_SEARCH_CONTEXT</a>         | Searches for an attribute value.                                               |
| <a href="#">PKG_UTIL.SESSION_SET_CONTEXT</a>            | Sets an attribute value.                                                       |
| <a href="#">PKG_UTIL.UTILITY_FORMAT_CALL_STACK</a>      | Displays the call stack of a stored procedure.                                 |

| API                                                     | Description                                              |
|---------------------------------------------------------|----------------------------------------------------------|
| <a href="#">PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE</a> | Displays the error stack of a stored procedure.          |
| <a href="#">PKG_UTIL.UTILITY_FORMAT_ERROR_STACK</a>     | Displays the error information about a stored procedure. |
| <a href="#">PKG_UTIL.UTILITY_GET_TIME</a>               | Displays the Unix timestamp of the system.               |

- **PKG\_UTIL.LOB\_GET\_LENGTH**

Obtains the length of the input data.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob IN anyelement
)
RETURN INTEGER;
```

**Table 10-19** PKG\_UTIL.LOB\_GET\_LENGTH parameters

| Parameter | Type        | Input/Output Parameter | Can Be Empty | Description                                          |
|-----------|-------------|------------------------|--------------|------------------------------------------------------|
| lob       | clob / blob | IN                     | No           | Indicates the object whose length is to be obtained. |

- **PKG\_UTIL.LOB\_READ**

Reads an object and returns the specified part.

The prototype of the PKG\_UTIL.LOB\_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob IN anyelement,
len IN int,
start IN int,
mode IN int
)
RETURN ANYELEMENT
```

**Table 10-20** PKG\_UTIL.LOB\_READ parameters

| Parameter | Type       | Input/Output Parameter | Can Be Empty | Description                  |
|-----------|------------|------------------------|--------------|------------------------------|
| lob       | clob/ blob | IN                     | No           | Specifies CLOB or BLOB data. |

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                        |
|-----------|------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | int  | IN                     | No           | Specifies the length of the returned result.                                                                                                       |
| start     | int  | IN                     | No           | Specifies the offset to the first character.                                                                                                       |
| mode      | int  | IN                     | No           | Specifies the type of the read operation. <b>0</b> indicates <b>READ</b> , <b>1</b> indicates <b>TRIM</b> , and <b>2</b> indicates <b>SUBSTR</b> . |

- **PKG\_UTIL.LOB\_WRITE**

Writes the source object to the target object based on the specified parameters and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob INOUT blob,
src_lob IN raw
len IN int,
start_pos IN int
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob INOUT clob,
src_lob IN varchar2
len IN int,
start_pos IN int
)
RETURN CLOB;
```

**Table 10-21** PKG\_UTIL.LOB\_WRITE parameters

| Parameter | Type          | Input/Output Parameter | Can Be Empty | Description                                               |
|-----------|---------------|------------------------|--------------|-----------------------------------------------------------|
| dest_lob  | clob/<br>blob | INOUT                  | No           | Specifies the target object that data will be written to. |
| src_lob   | clob/<br>blob | IN                     | No           | Specifies the source object to be written.                |
| len       | int           | IN                     | No           | Specifies the write length of the source object.          |
| start_pos | int           | IN                     | No           | Specifies the write start position of the target object.  |

- **PKG\_UTIL.LOB\_APPEND**

Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

The prototype of the PKG\_UTIL.LOB\_APPEND function is as follows:

```
PKG_UTIL.LOB_APPEND(
dest_lob INOUT blob,
src_lob IN blob,
len IN int default NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob INOUT clob,
src_lob IN clob,
len IN int default NULL
)
RETURN CLOB;
```

**Table 10-22** PKG\_UTIL.LOB\_APPEND parameters

| Parameter | Type        | Input/Output Parameter | Can Be Empty | Description                                                                                                              |
|-----------|-------------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | blob / clob | INOUT                  | No           | Specifies the target BLOB/CLOB that data will be written to.                                                             |
| src_lob   | blob / clob | IN                     | No           | Specifies the source BLOB/CLOB to be written.                                                                            |
| len       | int         | IN                     | Yes          | Length of the source object to be written. If the value is <b>NULL</b> , the entire source object is written by default. |

- **PKG\_UTIL.LOB\_COMPARE**

Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **-1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

The prototype of the PKG\_UTIL.LOB\_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1 IN anyelement,
lob2 IN anyelement,
len IN int default 1073741771,
start_pos1 IN int default 1,
start_pos2 IN int default 1
)
RETURN INTEGER;
```

**Table 10-23** PKG\_UTIL.LOB\_COMPARE parameters

| Parameter  | Type      | Input / Output Parameter | Can Be Empty | Description                                    |
|------------|-----------|--------------------------|--------------|------------------------------------------------|
| lob1       | clob/blob | IN                       | No           | Indicates the character string for comparison. |
| lob2       | clob/blob | IN                       | No           | Indicates the character string for comparison. |
| len        | int       | IN                       | No           | Indicates the length to be compared.           |
| start_pos1 | int       | IN                       | No           | Specifies the start offset of <b>lob1</b> .    |
| start_pos2 | int       | IN                       | No           | Specifies the start offset of <b>lob2</b> .    |

- PKG\_UTIL.LOB\_MATCH

Returns the position where a pattern is displayed in a LOB for the *match\_nth* time.

The prototype of the PKG\_UTIL.LOB\_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob IN anyelement,
pattern IN anyelement,
start IN int,
match_nth IN int default 1
)
RETURN INTEGER;
```

**Table 10-24** PKG\_UTIL.LOB\_MATCH parameters

| Parameter | Type      | Input / Output Parameter | Can Be Empty | Description                                      |
|-----------|-----------|--------------------------|--------------|--------------------------------------------------|
| lob       | clob/blob | IN                       | No           | Indicates the character string for comparison.   |
| pattern   | clob/blob | IN                       | No           | Specifies the pattern to be matched.             |
| start     | int       | IN                       | No           | Specifies the start position for LOB comparison. |

| Parameter | Type | Input / Output Parameter | Can Be Empty | Description                   |
|-----------|------|--------------------------|--------------|-------------------------------|
| match_nth | int  | IN                       | No           | Specifies the matching times. |

- **PKG\_UTIL.LOB\_RESET**

Clears a character string and resets the string to the value of **value**.

The prototype of the PKG\_UTIL.LOB\_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob INOUT blob,
len INOUT int,
start IN int DEFAULT 1,
value IN int default 0
)
RETURN record;
```

**Table 10-25** PKG\_UTIL.LOB\_RESET parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                     |
|-----------|------|------------------------|--------------|-------------------------------------------------|
| lob       | blob | IN                     | No           | Indicates the character string for reset.       |
| len       | int  | IN                     | No           | Specifies the length of the string to be reset. |
| start     | int  | IN                     | No           | Specifies the start position for reset.         |
| value     | int  | IN                     | Yes          | Sets characters. Default value: '0'.            |

- **PKG\_UTIL.IO\_PRINT**

Outputs a string.

The prototype of the PKG\_UTIL.IO\_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(
format IN text,
is_one_line IN boolean
)
RETURN void;
```

**Table 10-26** PKG\_UTIL.IO\_PRINT parameters

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                       |
|-------------|---------|------------------------|--------------|---------------------------------------------------|
| format      | text    | IN                     | No           | Indicates the character string to be output.      |
| is_one_line | boolean | IN                     | No           | Specifies whether to output the string as a line. |

- PKG\_UTIL.RAW\_GET\_LENGTH

Obtains the length of RAW data.

The prototype of the PKG\_UTIL.RAW\_GET\_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value IN raw
)
RETURN integer;
```

**Table 10-27** PKG\_UTIL.RAW\_GET\_LENGTH parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                          |
|-----------|------|------------------------|--------------|------------------------------------------------------|
| raw       | raw  | IN                     | No           | Indicates the object whose length is to be obtained. |

- PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2

Converts VARCHAR2 data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str IN varchar2
)
RETURN raw;
```

**Table 10-28** PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                                |
|-----------|----------|------------------------|--------------|--------------------------------------------|
| str       | varchar2 | IN                     | No           | Specifies the source data to be converted. |

- PKG\_UTIL.RAW\_CAST\_FROM\_BINARY\_INTEGER

Converts BIGINT data to RAW data.

The prototype of the `PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER` function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER(
value IN BIGINT,
endianess IN INTEGER
)
RETURN RAW;
```

**Table 10-29** `PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                    |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| value     | BIGINT  | IN                     | No           | Specifies the source data to be converted.                                                                                     |
| endianess | INTEGER | IN                     | No           | The value is an integer in lexicographic order. Currently, the value can be <b>1</b> (BIG_ENDIAN) or <b>2</b> (LITTLE_ENDIAN). |

- `PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER`

Converts RAW data into BINARY\_INTEGER.

The prototype of the `PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER` function is as follows:

```
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER(
value IN RAW,
endianess IN INTEGER
)
RETURN INTEGER;
```

**Table 10-30** `PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                    |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| value     | RAW     | IN                     | No           | Specifies the source data to be converted.                                                                                     |
| endianess | INTEGER | IN                     | No           | The value is an integer in lexicographic order. Currently, the value can be <b>1</b> (BIG_ENDIAN) or <b>2</b> (LITTLE_ENDIAN). |

- `PKG_UTIL.RANDOM_SET_SEED`

Sets a random seed.

The prototype of the **`PKG_UTIL.RANDOM_SET_SEED`** function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed IN int
)
RETURN integer;
```

**Table 10-31** PKG\_UTIL.RANDOM\_SET\_SEED parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description         |
|-----------|------|------------------------|--------------|---------------------|
| seed      | int  | IN                     | No           | Sets a random seed. |

- PKG\_UTIL.RANDOM\_GET\_VALUE

Returns a 15-digit random number ranging from 0 to 1.

The prototype of the PKG\_UTIL.RANDOM\_GET\_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN numeric;
```

- PKG\_UTIL.FILE\_SET\_DIRNAME

Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

The prototype of the **PKG\_UTIL.FILE\_SET\_DIRNAME** function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir IN text
)
RETURN bool
```

**Table 10-32** PKG\_UTIL.FILE\_SET\_DIRNAME parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dirname   | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b><br>File directories need to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist is reported. Functions that involve <b>location</b> as parameters also comply with this rule. |

- PKG\_UTIL.FILE\_OPEN

Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the PKG\_UTIL.FILE\_OPEN function is as follows:

```
PKG_UTIL.FILE_OPEN(
file_name IN text,
open_mode IN integer)
```

**Table 10-33** PKG\_UTIL.FILE\_OPEN parameters

| Parameter | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file_name | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.). |

| Parameter | Description                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| open_mode | File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append).<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- **PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE**

Sets the maximum length of a line to be written to a file.

The prototype of the PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE function is as follows:

```
PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
max_line_size in integer)
RETURN BOOL
```

**Table 10-34** PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE parameters

| Parameter     | Description                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used. |

- **PKG\_UTIL.FILE\_IS\_CLOSE**

Checks whether a file handle is closed.

The prototype of the PKG\_UTIL.FILE\_IS\_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file in integer
)
RETURN BOOL
```

**Table 10-35** PKG\_UTIL.FILE\_IS\_CLOSE parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

- **PKG\_UTIL.FILE\_READ**

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file IN integer,
buffer OUT text,
len IN bigint default 1024)
```

**Table 10-36** PKG\_UTIL.FILE\_READ parameters

| Parameter | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown. |
| buffer    | Buffer used to receive data.                                                                                                                        |
| len       | Number of bytes read from a file.                                                                                                                   |

- PKG\_UTIL.FILE\_READLINE

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(
file IN integer,
buffer OUT text,
len IN integer default NULL)
```

**Table 10-37** PKG\_UTIL.FILE\_READLINE parameters

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.                   |
| buffer    | Buffer used to receive data.                                                                                                                                          |
| len       | Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size. |

- PKG\_UTIL.FILE\_WRITE

Writes the data specified in the buffer to a file.

The prototype of the PKG\_UTIL.FILE\_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-38** PKG\_UTIL.FILE\_WRITE parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffer    | Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- **PKG\_UTIL.FILE\_NEWLINE**

Writes a line terminator to an open file. The line terminator is related to the platform.

The prototype of the PKG\_UTIL.FILE\_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file in integer
)
RETURN BOOL
```

**Table 10-39** PKG\_UTIL.FILE\_NEWLINE parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

- **PKG\_UTIL.FILE\_WRITELINE**

Writes a line to a file.

The prototype of the PKG\_UTIL.FILE\_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-40** PKG\_UTIL.FILE\_WRITELINE parameters

| Parameter | Description            |
|-----------|------------------------|
| file      | Opened file handle.    |
| buffer    | Content to be written. |

- **PKG\_UTIL.FILE\_READ\_RAW**

Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

The prototype of the PKG\_UTIL.FILE\_READ\_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file in integer,
length in integer default NULL
)
RETURN raw
```

**Table 10-41** PKG\_UTIL.FILE\_READ\_RAW parameters

| Parameter | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle.                                                                                                                   |
| length    | Length of the data to be read. The default value is <b>NULL</b> . By default, all data in the file is read. The maximum size is 1 GB. |

- PKG\_UTIL.FILE\_WRITE\_RAW

Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

The prototype of the PKG\_UTIL.FILE\_WRITE\_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file in integer,
r in raw
)
RETURN BOOL
```

**Table 10-42** PKG\_UTIL.FILE\_NEWLINE parameters

| Parameter | Description                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle.                                                                                                                                                                |
| r         | Data to be written to the file.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- PKG\_UTIL.FILE\_FLUSH

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the PKG\_UTIL.FILE\_FLUSH function is as follows:

```
PKG_UTIL.FILE_FLUSH (
file in integer
)
RETURN VOID
```

**Table 10-43** PKG\_UTIL.FILE\_FLUSH parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

- PKG\_UTIL.FILE\_CLOSE

Closes an open file handle.

The prototype of the PKG\_UTIL.FILE\_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file in integer
```

```
)
RETURN BOOL
```

**Table 10-44** PKG\_UTIL.FILE\_CLOSE parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

- PKG\_UTIL.FILE\_REMOVE

Deletes a disk file. To perform this operation, you must have required permissions.

The prototype of the PKG\_UTIL.FILE\_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(
file_name in text
)
RETURN VOID
```

**Table 10-45** PKG\_UTIL.FILE\_REMOVE parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| filen_ame | Name of the file to be deleted |

- PKG\_UTIL.FILE\_RENAME

The function renames files on the disk, similar to **mv** in Unix.

The prototype of the PKG\_UTIL.FILE\_RENAME function is as follows:

```
PKG_UTIL.FILE_RENAME(
src_dir in text,
src_file_name in text,
dest_dir in text,
dest_file_name in text,
overwrite boolean default false)
```

**Table 10-46** PKG\_UTIL.FILE\_RENAME parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir       | Source file directory (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"><li>• File directories need to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported. Functions that involve <b>location</b> as parameters also comply with this rule.</li><li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| src_file_name | Source file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_dir       | Target file directory (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"><li>File directories need to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported. Functions that involve <b>location</b> as parameters also comply with this rule.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| dest_file_name | Target file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| overwrite      | The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- **PKG\_UTIL.FILE\_SIZE**

Returns the size of a specified file.

The prototype of the PKG\_UTIL.FILE\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(
file_name in text
)return bigint
```

**Table 10-47** PKG\_UTIL.FILE\_SIZE parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- **PKG\_UTIL.FILE\_BLOCK\_SIZE**

Returns the number of blocks contained in a specified file.

The prototype of the PKG\_UTIL.FILE\_BLOCK\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_BLOCK_SIZE(
file_name in text
)return bigint
```

**Table 10-48** PKG\_UTIL.FILE\_BLOCK\_SIZE parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- **PKG\_UTIL.FILE\_EXISTS**

Checks whether a file exists.

The prototype of the PKG\_UTIL.FILE\_EXISTS function is as follows:

```
PKG_UTIL.FILE_EXISTS(
file_name in text
)
RETURN BOOL
```

**Table 10-49** PKG\_UTIL.FILE\_EXISTS parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- PKG\_UTIL.FILE\_GETPOS

Specifies the offset of a returned file, in bytes.

The prototype of the PKG\_UTIL.FILE\_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file in integer
)
RETURN BIGINT
```

**Table 10-50** PKG\_UTIL.FILE\_GETPOS parameters

| Parameter | Description         |
|-----------|---------------------|
| file      | Opened file handle. |

- PKG\_UTIL.FILE\_SEEK

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the PKG\_UTIL.FILE\_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file in integer,
start in bigint
)
RETURN VOID
```

**Table 10-51** PKG\_UTIL.FILE\_SEEK parameters

| Parameter | Description            |
|-----------|------------------------|
| file      | Opened file handle.    |
| start     | File offset, in bytes. |

- PKG\_UTIL.FILE\_CLOSE\_ALL

Closes all file handles opened in a session.

The prototype of the PKG\_UTIL.FILE\_CLOSE\_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

**Table 10-52** PKG\_UTIL.FILE\_CLOSE\_ALL parameters

| Parameter | Description |
|-----------|-------------|
| None      | None        |

- **PKG\_UTIL.EXCEPTION\_REPORT\_ERROR**

Throws an exception.

The prototype of the PKG\_UTIL.EXCEPTION\_REPORT\_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code integer,
log text,
flag boolean DEFAULT false
)
RETURN INTEGER
```

**Table 10-53** PKG\_UTIL.EXCEPTION\_REPORT\_ERROR parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| code      | Error code displayed when an exception occurs. |
| log       | Logs displayed when an exception occurs.       |
| flag      | Reserved. The default value is <b>false</b> .  |

- **PKG\_UTIL.APP\_READ\_CLIENT\_INFO**

Reads the client information.

The prototype of the PKG\_UTIL.APP\_READ\_CLIENT\_INFO function is as follows:

```
PKG_UTIL.APP_READ_CLIENT_INFO(
OUT buffer text
)return text
```

**Table 10-54** PKG\_UTIL.APP\_READ\_CLIENT\_INFO parameters

| Parameter | Description                  |
|-----------|------------------------------|
| buffer    | Client information returned. |

- **PKG\_UTIL.APP\_SET\_CLIENT\_INFO**

Sets the client information.

The prototype of the PKG\_UTIL.APP\_SET\_CLIENT\_INFO function is as follows:

```
PKG_UTIL.APP_SET_CLIENT_INFO(
str text
)
```

**Table 10-55** PKG\_UTIL.APP\_SET\_CLIENT\_INFO parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| str       | Client information to be set. |

- **PKG\_UTIL.LOB\_CONVERTTOBLOB**

Converts a CLOB to a BLOB. **amount** indicates the conversion length.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB(
dest_lob blob,
src_clob clob,
amount integer,
dest_offset integer,
src_offset integer
)return raw
```

**Table 10-56** PKG\_UTIL.LOB\_CONVERTTOBLOB parameters

| Parameter   | Description                        |
|-------------|------------------------------------|
| dest_lob    | Target LOB.                        |
| src_clob    | CLOB to be converted.              |
| amount      | Conversion length.                 |
| dest_offset | Start position of the target LOB.  |
| src_offset  | Start position of the source CLOB. |

- PKG\_UTIL.LOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. **amount** indicates the conversion length.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB(
dest_lob clob,
src_blob blob,
amount integer,
dest_offset integer,
src_offset integer
)return text
```

**Table 10-57** PKG\_UTIL.LOB\_CONVERTTOCLOB parameters

| Parameter   | Description                        |
|-------------|------------------------------------|
| dest_lob    | Target LOB.                        |
| src_blob    | BLOB to be converted.              |
| amount      | Conversion length.                 |
| dest_offset | Start position of the target LOB.  |
| src_offset  | Start position of the source CLOB. |

- PKG\_UTIL.LOB\_RAWTOTEXT

Converts RAW data to TEXT data.

The prototype of the PKG\_UTIL.LOB\_RAWTOTEXT function is as follows:

```
PKG_UTIL.LOB_RAWTOTEXT(
src_lob IN BLOB
)
RETURN TEXT
```

**Table 10-58** PKG\_UTIL.LOB\_RAWTOTEXT parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description          |
|-----------|------|------------------------|--------------|----------------------|
| src_lob   | LOB  | IN                     | No           | LOB to be converted. |

- PKG\_UTIL.LOB\_TEXTTORAW

Converts from the text type to the raw type.

The prototype of the PKG\_UTIL.LOB\_TEXTTORAW function is as follows:

```
PKG_UTIL.LOB_TEXTTORAW(
src_lob clob
)
RETURN raw
```

**Table 10-59** PKG\_UTIL.LOB\_TEXTTORAW parameters

| Parameter | Description          |
|-----------|----------------------|
| src_lob   | LOB to be converted. |

- PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY

Calculates the difference between two character strings.

The prototype of the PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY function is as follows:

```
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY(
str1 text,
str2 text
)
RETURN INTEGER
```

**Table 10-60** PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY parameters

| Parameter | Description              |
|-----------|--------------------------|
| str1      | First character string.  |
| str2      | Second character string. |

- PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2

Converts the raw type to the varchar2 type.

The prototype of the PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_TO_VARCHAR2(
 str raw
)
RETURN varchar2
```

**Table 10-61** PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2 parameters

| Parameter | Description        |
|-----------|--------------------|
| str       | Hexadecimal string |

- PKG\_UTIL.SESSION\_CLEAR\_CONTEXT

Clears the session context.

The prototype of the PKG\_UTIL.SESSION\_CLEAR\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_CLEAR_CONTEXT(
 namespace text,
 client_identifier text,
 attribute text
)
RETURN INTEGER
```

**Table 10-62** PKG\_UTIL.SESSION\_CLEAR\_CONTEXT parameters

| Parameter         | Description                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace         | Namespace of an attribute.                                                                                                                                      |
| client_identifier | Usually the value of this parameter is the same as that of <b>namespace</b> . If this parameter is set to <b>null</b> , all namespaces are modified by default. |
| attribute         | Attribute to be cleared.                                                                                                                                        |

- PKG\_UTIL.SESSION\_SEARCH\_CONTEXT

Searches for an attribute value.

The prototype of the PKG\_UTIL.SESSION\_SEARCH\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SEARCH_CONTEXT(
 namespace text,
 attribute text
)
RETURN INTEGER
```

**Table 10-63** PKG\_UTIL.SESSION\_SEARCH\_CONTEXT parameters

| Parameter | Description                |
|-----------|----------------------------|
| namespace | Namespace of an attribute. |
| attribute | Attribute to be cleared.   |

- **PKG\_UTIL.SESSION\_SET\_CONTEXT**

Sets the attribute value.

The prototype of the PKG\_UTIL.SESSION\_SET\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SET_CONTEXT(
namespace text,
attribute text,
value text
)
RETURN INTEGER
```

**Table 10-64** PKG\_UTIL.SESSION\_SET\_CONTEXT parameters

| Parameter | Description                |
|-----------|----------------------------|
| namespace | Namespace of an attribute. |
| attribute | Attribute to be set.       |
| value     | Attribute value.           |

- **PKG\_UTIL.UTILITY\_GET\_TIME**

This function prints the Unix timestamp.

The prototype of the PKG\_UTIL.UTILITY\_GET\_TIME function is as follows:

```
PKG_UTIL.UTILITY_GET_TIME()
RETURN bigint
```

- **PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_BACKTRACE**

Displays the error stack of a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_BACKTRACE function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE()
RETURN text
```

- **PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_STACK**

Displays the error information about a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_STACK function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_ERROR_STACK()
RETURN text
```

- **PKG\_UTIL.UTILITY\_FORMAT\_CALL\_STACK**

Displays the call stack of a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_CALL\_STACK function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_CALL_STACK()
RETURN text
```

## 10.12.2 Secondary Encapsulation APIs (Recommended)

### 10.12.2.1 DBE\_LOB

#### API Description

**Table 10-65** lists all APIs supported by the **DBE\_LOB** package.

**Table 10-65** DBE\_LOB

| API                             | Description                                                                                                                                                    |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DBE_LOB.GET_LENGTH</b>       | Obtains and returns the specified length of a LOB.                                                                                                             |
| <b>DBE_LOB.OPEN</b>             | Opens a LOB and returns a LOB descriptor.                                                                                                                      |
| <b>DBE_LOB.READ</b>             | Loads a part of LOB content to the buffer based on the specified length and initial position offset.                                                           |
| <b>DBE_LOB.WRITE</b>            | Copies content in the buffer to a LOB based on the specified length and initial position offset.                                                               |
| <b>DBE_LOB.WRITE_APPEND</b>     | Copies content in the buffer to the end part of a LOB based on the specified length.                                                                           |
| <b>DBE_LOB.COPY</b>             | Copies content in a BLOB to another BLOB based on the specified length and initial position offset.                                                            |
| <b>DBE_LOB.ERASE</b>            | Deletes content in a BLOB based on the specified length and initial position offset.                                                                           |
| <b>DBE_LOB.CLOSE</b>            | Closes a LOB descriptor.                                                                                                                                       |
| <b>DBE_LOB.MATCH</b>            | Returns the position of the <i>N</i> th occurrence of a character string in a LOB.                                                                             |
| <b>DBE_LOB.COMPARE</b>          | Compares two LOBs or a certain part of two LOBs.                                                                                                               |
| <b>DBE_LOB.SUBSTR</b>           | Reads the substring of a LOB and returns the number of read bytes or the number of characters.                                                                 |
| <b>DBE_LOB.STRIP</b>            | Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter. |
| <b>DBE_LOB.CREATE_TEMPORARY</b> | Creates a temporary BLOB or CLOB.                                                                                                                              |
| <b>DBE_LOB.APPEND</b>           | Adds the content of a LOB to another LOB.                                                                                                                      |
| <b>DBE_LOB.FREETEMPORARY</b>    | Deletes a temporary BLOB or CLOB.                                                                                                                              |
| <b>DBE_LOB.FILEOPEN</b>         | Opens a database-external file and returns a file descriptor.                                                                                                  |
| <b>DBE_LOB.FILECLOSE</b>        | Closes an external file opened by <b>FILEOPEN</b> .                                                                                                            |
| <b>DBE_LOB.LOADFROMFILE</b>     | Reads a database-external file to a BLOB file.                                                                                                                 |

| API                                      | Description                                    |
|------------------------------------------|------------------------------------------------|
| <a href="#">DBE_LOB.LOADBLOBFROMFILE</a> | Reads a database-external file to a BLOB file. |
| <a href="#">DBE_LOB.LOADCLOBFROMFILE</a> | Reads a database-external file to a CLOB file. |
| <a href="#">DBE_LOB.CONVERTTOBLOB</a>    | Converts a CLOB file to a BLOB file.           |
| <a href="#">DBE_LOB.CONVERTTOCLOB</a>    | Converts a BLOB file to a CLOB file.           |

- DBE\_LOB.GET\_LENGTH

The stored procedure GET\_LENGTH obtains and returns the size of a specified LOB. The maximum size is 2 GB.

The prototype of the DBE\_LOB.GET\_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
lob IN BLOB)
RETURN INTEGER;
```

```
DBE_LOB.GET_LENGTH (
lob IN CLOB)
RETURN INTEGER;
```

**Table 10-66** DBE\_LOB.GET\_LENGTH parameters

| Parameter | Description                              |
|-----------|------------------------------------------|
| lob       | BLOB/CLOB whose length is to be obtained |

- DBE\_LOB.OPEN

Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

The prototype of the DBE\_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
lob INOUT BLOB
);
```

```
DBE_LOB.OPEN (
lob INOUT CLOB
);
```

```
DBE_LOB.OPEN (
bfile db_lob.bfile,
open_mode text DEFAULT 'null':text
);
```

**Table 10-67** DBE\_LOB.OPEN parameters

| Parameter | Description                  |
|-----------|------------------------------|
| lob       | BLOB or CLOB that is opened. |

- DBE\_LOB.READ

The stored procedure READ loads a part of LOB content to the buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.READ function is as follows:

```
DBE_LOB.READ (
lob IN BLOB,
len IN INTEGER,
start IN INTEGER,
buffer OUT RAW);

DBE_LOB.READ (
lob IN CLOB,
len INOUT INTEGER,
start IN INTEGER,
buffer OUT VARCHAR2);
```

**Table 10-68** DBE\_LOB.READ parameters

| Parameter | Description                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob       | BLOB/CLOB to be read                                                                                                                                                                        |
| len       | Read size. A maximum of 32767 characters are supported.<br><b>NOTE</b><br>If the length is negative, the error message "ERROR: argument 2 is null, invalid, or out of range." is displayed. |
| start     | Indicates where to start reading the LOB content, that is, the offset bytes to initial position of LOB content.                                                                             |
| buffer    | Target buffer to store the read LOB content.                                                                                                                                                |

The value of **lob** can be a CLOB with a size greater than 1 GB. The maximum size is 2 GB. The maximum value of **buffer** is 32 KB and cannot be greater than the value of **len**.

- DBE\_LOB.WRITE

The stored procedure WRITE copies content in the buffer to LOB variables based on the specified length and initial position.

The prototype of the DBE\_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
dest_lob INOUT BLOB,
len IN INTEGER,
start IN INTEGER,
src_lob IN RAW);

DBE_LOB.WRITE (
dest_lob INOUT CLOB,
len IN INTEGER,
```

```
start IN INTEGER,
src_lob IN VARCHAR2);
```

**Table 10-69** DBE\_LOB.WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | BLOB/CLOB to which the buffer content is written                                                                                                                                                                                                                                               |
| len       | Length to write, up to 32767 characters.<br><b>NOTE</b><br>If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.                                                                                                                |
| start     | Indicates where to start writing the LOB content, that is, the offset bytes to initial position of LOB content.<br><b>NOTE</b><br>If the offset value is less than 1, an error is reported. If the offset value is greater than the maximum length of LOB type contents, no error is reported. |
| src_lob   | Content to be written                                                                                                                                                                                                                                                                          |

The value of **dest\_lob** can be a CLOB with a size greater than 1 GB. The maximum size is 2 GB. The maximum value of **src\_lob** is 1 GB.

- DBE\_LOB.WRITE\_APPEND

The stored procedure WRITE\_APPEND copies content in the buffer to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.WRITE\_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
dest_lob INOUT BLOB,
len IN INTEGER,
src_lob IN RAW);

DBE_LOB.WRITE_APPEND (
dest_lob INOUT CLOB,
len IN INTEGER,
src_lob IN VARCHAR2);
```

**Table 10-70** DBE\_LOB.WRITE\_APPEND parameters

| Parameter | Description                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | BLOB/CLOB to which the buffer content is written                                                                                                                                |
| len       | Length to write, up to 32767 characters.<br><b>NOTE</b><br>If the length to write is less than 1 or greater than the length of the content to be written, an error is reported. |
| src_lob   | Content to be written                                                                                                                                                           |

- DBE\_LOB.COPY

The stored procedure COPY copies content in a BLOB to another BLOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
dest_lob INOUT BLOB,
src_lob IN BLOB,
len IN INTEGER,
dest_start IN INTEGER DEFAULT 1,
src_start IN INTEGER DEFAULT 1);
```

**Table 10-71** DBE\_LOB.COPY parameters

| Parameter  | Description                                                                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob   | BLOB to be pasted.                                                                                                                                                                                                                   |
| src_lob    | BLOB to be copied.                                                                                                                                                                                                                   |
| len        | Length of copied content<br><b>NOTE</b><br>If the length of copied content is shorter than 1 or longer than the maximum length of BLOB, an error is reported.                                                                        |
| dest_start | Indicates where to start pasting the BLOB content, that is, the offset bytes to initial position of BLOB content.<br><b>NOTE</b><br>If the offset is shorter than 1 or longer than the maximum length of BLOB, an error is reported. |
| src_start  | Indicates where to start copying the BLOB content, that is, the offset bytes to initial position of BLOB content.<br><b>NOTE</b><br>If the offset is shorter than 1 or longer than the length of source BLOB, an error is reported.  |

- DBE\_LOB.ERASE

The stored procedure ERASE deletes content in BLOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
lob INOUT BLOB,
len INOUT INTEGER,
start IN INTEGER DEFAULT 1);
```

**Table 10-72** DBE\_LOB.ERASE parameters

| Parameter | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob       | BLOB whose content is to be deleted.                                                                                                                                   |
| len       | Length of content to be deleted.<br><b>NOTE</b><br>If the length of deleted content is shorter than 1 or longer than the maximum length of BLOB, an error is reported. |

| Parameter | Description                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start     | Indicates where to start deleting the BLOB content, that is, the offset bytes to initial position of BLOB content.<br><b>NOTE</b><br>If the offset is shorter than 1 or longer than the maximum length of BLOB, an error is reported. |

- DBE\_LOB.CLOSE

Closes the LOB descriptor that has been opened.

The prototype of the DBE\_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
lob IN BLOB);

DBE_LOB.CLOSE (
lob IN CLOB);

DBE_LOB.CLOSE (
file IN INTEGER);
```

**Table 10-73** DBE\_LOB.CLOSE parameters

| Parameter | Description               |
|-----------|---------------------------|
| lob       | BLOB/CLOB to be disabled. |

- DBE\_LOB.MATCH

This function returns the *N*th occurrence position of **pattern** in a LOB. **NULL** is returned for any of the following conditions: offset < 1 or offset > **LOBMAXSIZE**; *n*th < 1 or *n*th > **LOBMAXSIZE**.

The prototype of the DBE\_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH (
lob IN BLOB,
pattern IN RAW,
start_index IN INTEGER DEFAULT 1,
match_index IN INTEGER DEFAULT 1)
RETURN INTEGER;

DBE_LOB.MATCH (
lob IN CLOB,
pattern IN VARCHAR2,
start_index IN INTEGER DEFAULT 1,
match_index IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

**Table 10-74** DBE\_LOB.MATCH API parameters

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| lob       | BLOB/CLOB descriptor to be searched for.                |
| pattern   | Pattern to match. It is RAW for BLOB and TEXT for CLOB. |

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| start_index | For BLOB, the absolute offset is in the unit of byte. For CLOB, the offset is in the unit of character. The matching start position is 1. |
| match_index | Number of pattern matching times. The minimum value is 1.                                                                                 |

- DBE\_LOB.COMPARE

This function compares two LOBs or a certain part of two LOBs.

- If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
- If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
- If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.

The prototype of the DBE\_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
lob1 IN BLOB,
lob2 IN BLOB,
len IN INTEGER DEFAULT DBE_LOB.LOBMAXSIZE,
start1 IN INTEGER DEFAULT 1,
start2 IN INTEGER DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
lob1 IN CLOB,
lob2 IN CLOB,
len IN INTEGER DEFAULT DBE_LOB.LOBMAXSIZE,
start1 IN INTEGER DEFAULT 1,
start2 IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

**Table 10-75** DBE\_LOB.COMPARE parameters

| Parameter | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| lob1      | First BLOB/CLOB to be compared.                                                                |
| lob2      | Second BLOB/CLOB to be compared.                                                               |
| len       | Number of characters or bytes to be compared. The maximum value is <b>DBE_LOB.LOBMAXSIZE</b> . |
| start1    | Offset of the first LOB descriptor. The initial position is 1.                                 |
| start2    | Offset of the second LOB descriptor. The initial position is 1.                                |

- DBE\_LOB.SUBSTR

This function reads the substring of a LOB and returns the number of read bytes or the number of characters. **NULL** is returned for any of the following conditions: value of **amount** < 1 or value of **amount** > 32767; value of **offset** < 1 or value of **offset** > value of **LOBMAXSIZE**

The prototype of the DBE\_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR (
lob IN BLOB,
len IN INTEGER DEFAULT 32767,
start IN INTEGER DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR (
lob IN CLOB,
len IN INTEGER DEFAULT 32767,
start IN INTEGER DEFAULT 1)
RETURN VARCHAR2;
```

**Table 10-76** DBE\_LOB.SUBSTR parameters

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob       | LOB descriptor of the substring to be read. For BLOB, the return value is the number of read bytes. For CLOB, the return value is the number of characters. |
| len       | Number of bytes or characters to be read.                                                                                                                   |
| start     | Number of characters or bytes offset from the start position.                                                                                               |

- DBE\_LOB.STRIP

Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. If an empty LOB is truncated, no execution result is displayed. If the specified length is longer than the length of the LOB, an exception occurs.

The prototype of the DBE\_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP (
lob IN OUT BLOB,
newlen IN INTEGER);

DBE_LOB.STRIP (
lob IN OUT CLOB,
newlen IN INTEGER);
```

**Table 10-77** DBE\_LOB.STRIP parameters

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| lob       | BLOB to be read.                                                            |
| newlen    | New length after truncation, in bytes for BLOBs or in characters for CLOBs. |

- DBE\_LOB.CREATE\_TEMPORARY

Creates a temporary BLOB or CLOB. This API is used only for syntax compatibility.

The prototype of the DBE\_LOB.CREATE\_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
locator INOUT BLOB,
```

```
cache IN BOOLEAN,
keep_alive_time IN INTEGER);

DBE_LOB.CREATE_TEMPORARY (
locator INOUT CLOB,
cache IN BOOLEAN,
keep_alive_time IN INTEGER);
```

**Table 10-78** DBE\_LOB.CREATE\_TEMPORARY parameters

| Parameter       | Description                         |
|-----------------|-------------------------------------|
| locator         | LOB descriptor                      |
| cache           | Used only for syntax compatibility. |
| keep_alive_time | Used only for syntax compatibility. |

- DBE\_LOB.APPEND

The stored procedure APPEND loads a part of BLOB content to the buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
dest_lob INOUT BLOB,
src_lob IN BLOB);

DBE_LOB.APPEND (
dest_lob INOUT CLOB,
src_lob IN CLOB);
```

**Table 10-79** DBE\_LOB.APPEND parameters

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| dest_lob  | BLOB/CLOB to which the buffer content is to be written |
| src_lob   | BLOB/CLOB from which the buffer content is to be read  |

The value of **dest\_lob** can be a CLOB with a size greater than 1 GB. The maximum size is 2 GB. The maximum value of **src\_lob** is 1 GB.

- DBE\_LOB.FREETEMPORARY

Frees LOB files created by CREATE\_TEMPORARY.

The prototype of the DBE\_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
lob_loc INOUT BLOB);

DBE_LOB.FREETEMPORARY (
lob_loc INOUT CLOB);
```

**Table 10-80** DBE\_LOB.FREETEMPORARY parameters

| Parameter | Description            |
|-----------|------------------------|
| lob_loc   | BLOB/CLOB to be freed. |

- DBE\_LOB.FILEOPEN

This function is used to open a database-external file of the BFILE type and return the file descriptor corresponding to the file.

The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
 directory text,
 filename text);
```

The prototype of the DBE\_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (
 file IN DBE_LOB.BFILE,
 open_mode IN text)
RETURN integer;
```

**Table 10-81** DBE\_LOB.FILEOPEN parameters

| Parameter | Description                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------|
| file      | Specifies the database-external file to be opened. The BFILE type contains the file path and file name. |
| open_mode | Specifies the file open mode ( <b>w</b> , <b>r</b> , or <b>a</b> ).                                     |

- DBE\_LOB.FILECLOSE

Closes an external BFILE file.

The prototype of the DBE\_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (
 file IN integer);
```

**Table 10-82** DBE\_LOB.FILECLOSE parameters

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| file      | External database file to be closed (that is opened by FILEOPEN). |

- DBE\_LOB.LOADFROMFILE

This is used to read an external BFILE file to a BLOB file.

The prototype of the DBE\_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
 dest_lob IN BLOB,
 src_file IN INTEGER,
 amount IN INTEGER,
 dest_offset IN INTEGER,
 src_offset IN INTEGER)
RETURN raw;
```

**Table 10-83** DBE\_LOB.LOADFROMFILE parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| dest_lob  | Target BLOB file. The BFILE file will be read to this file. |

| Parameter   | Description                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_bfile   | Source BFILE file to be read.                                                                                                                                      |
| amount      | Size of a BLOB file. If the size of a file exceeds this threshold, the file will not be saved to the BLOB file.                                                    |
| dest_offset | Offset length of the BLOB file. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the BFILE file. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.   |

The size of the file to be imported can exceed 1 GB. The maximum value of **amount** is the value of **LOBMAXSIZE** (4 GB). When the value of **src\_offset** or **dest\_offset** is greater than that of **LOBMAXSIZE**, or the value of **amount** is greater than that of **LOBMAXSIZE**, an error is reported for the advanced package.

- DBE\_LOB.LOADBLOBFROMFILE

This is used to read an external BFILE file to a BLOB file.

The prototype of the DBE\_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
dest_lob IN BLOB,
src_file IN INTEGER,
amount IN INTEGER,
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN raw;
```

**Table 10-84** DBE\_LOB.LOADBLOBFROMFILE parameters

| Parameter   | Description                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target BLOB file. The BFILE file will be read to this file.                                                                                                        |
| src_bfile   | Source BFILE file to be read.                                                                                                                                      |
| amount      | Length of a BLOB file. If the length of a file exceeds this threshold, the file will not be saved to the BLOB file.                                                |
| dest_offset | Offset length of the BLOB file. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the BFILE file. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.   |

- DBE\_LOB.LOADCLOBFROMFILE

This is used to read an external BFILE file to a CLOB file.

The prototype of the DBE\_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
dest_lob IN CLOB,
src_file IN INTEGER,
amount IN INTEGER,
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN row;
```

**Table 10-85** DBE\_LOB.LOADCLOBFROMFILE parameters

| Parameter   | Description                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target CLOB file. The BFILE file will be read to this file.                                                                                                        |
| src_bfile   | Source BFILE file to be read.                                                                                                                                      |
| amount      | Size of a CLOB file. If the size of a file exceeds this threshold, the file will not be saved to the CLOB file.                                                    |
| dest_offset | Offset length of the CLOB file. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the BFILE file. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.   |

- DBE\_LOB.CONVERTTOBLOB

This function is used to convert a CLOB file to a BLOB file.

The prototype of the DBE\_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
dest_blob IN BLOB,
src_clob IN CLOB,
amount IN INTEGER default 32767,
dest_offset IN INTEGER default 1,
src_offset IN INTEGER default 1)
RETURN row;
```

**Table 10-86** DBE\_LOB.CONVERTTOBLOB parameters

| Parameter   | Description                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target BLOB file, which is converted from a CLOB file.                                                                                                             |
| src_bfile   | Source CLOB file to be read.                                                                                                                                       |
| amount      | Size of a BLOB file. If the size of a file exceeds this threshold, the file will not be saved to the BLOB file.                                                    |
| dest_offset | Offset length of the BLOB file. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the CLOB file. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.    |

- DBE\_LOB.CONVERTTOCLOB

This function is used to convert a BLOB file to a CLOB file.

The prototype of the DBE\_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
dest_clob IN CLOB,
src_blob IN BLOB,
amount IN INTEGER default 32767,
dest_offset IN INTEGER default 1,
src_offset IN INTEGER default 1)
RETURN text;
```

**Table 10-87** DBE\_LOB.CONVERTTOCLOB parameters

| Parameter   | Description                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target CLOB file, which is converted from a BLOB file.                                                                                                             |
| src_bfile   | Source BLOB file to be read.                                                                                                                                       |
| amount      | Size of a CLOB file. If the size of a file exceeds this threshold, the file will not be saved to the CLOB file.                                                    |
| dest_offset | Offset length of the CLOB file. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the BLOB file. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.    |

## Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');
get_length

8
(1 row)
DECLARE
myraw RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/
0123
ANONYMOUS BLOCK EXECUTE

CREATE TABLE blob_Table (t1 blob);
CREATE TABLE blob_Table_bak (t2 blob);
INSERT INTO blob_Table VALUES('abcdef');
INSERT INTO blob_Table_bak VALUES('22222');

DECLARE
str varchar2(100) := 'abcdef';
source raw(100);
dest blob;
copyto blob;
amount int;
PSV_SQL varchar2(100);
```

```
PSV_SQL1 varchar2(100);
a int :=1;
len int;
BEGIN
source := dbc_raw.cast_from_varchar2_to_raw(str);
amount := dbc_raw.get_length(source);

PSV_SQL := 'select * from blob_Table for update';
PSV_SQL1 := 'select * from blob_Table_bak for update';

EXECUTE IMMEDIATE PSV_SQL into dest;
EXECUTE IMMEDIATE PSV_SQL1 into copyto;

DBC_LOB.WRITE(dest, amount, 1, source);
DBC_LOB.WRITE_APPEND(dest, amount, source);

DBC_LOB.ERASE(dest, a, 1);
DBC_OUTPUT.PRINT_LINE(a);
DBC_LOB.COPY(copyto, dest, amount, 10, 1);
perform DBC_LOB.CLOSE(dest);
RETURN;
END;
/

-- Delete the table.
DROP TABLE blob_Table;
DROP TABLE
DROP TABLE blob_Table_bak;
DROP TABLE
```

### 10.12.2.2 DBE\_RANDOM

#### API Description

**Table 10-88** lists all APIs supported by the **DBE\_RANDOM** package.

**Table 10-88** DBE\_RANDOM API parameters

| API                         | Description                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------|
| <b>DBE_RANDOM.SET_SEED</b>  | Sets a seed for a random number.                                                       |
| <b>DBE_RANDOM.GET_VALUE</b> | Generates a random number between a specified <b>low</b> and a specified <b>high</b> . |

- DBE\_RANDOM.SET\_SEED

The stored procedure SEED is used to set a seed for a random number. The prototype of the DBE\_RANDOM.SET\_SEED function is as follows:

```
DBE_RANDOM.SET_SEED (seed IN INTEGER);
```

**Table 10-89** DBE\_RANDOM.SET\_SEED API parameters

| Parameter | Description                           |
|-----------|---------------------------------------|
| seed      | Generates a seed for a random number. |

- DBE\_RANDOM.GET\_VALUE

The GET\_VALUE function generates a random number between a specified **low** and a specified **high**. The prototype of the DBE\_RANDOM.GET\_VALUE function is as follows:

```
DBE_RANDOM.GET_VALUE(
min IN NUMBER default 0,
max IN NUMBER default 1)
RETURN NUMBER;
```

**Table 10-90** DBE\_RANDOM.GET\_VALUE API parameters

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| min       | Sets the low bound for a random number. The generated random number is greater than or equal to <b>min</b> . |
| max       | Sets the high bound for a random number. The generated random number is less than <b>max</b> .               |

 **NOTE**

- The only requirement is that the parameter type is numeric regardless of the right and left bound values.
- DBE\_RANDOM implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

## Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);
get_value

.917468812743886
(1 row)
-- For integers within a specified range, add the arguments min and max, and truncate the decimals from
-- the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you
-- can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
trunc

26
(1 row)
```

### 10.12.2.3 DBE\_OUTPUT

#### API Description

[Table 10-91](#) provides all APIs supported by the **DBE\_OUTPUT** package.

**Table 10-91** DBE\_OUTPUT

| API                                        | Description                                                                                                                                                                                                                        |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_OUTPUT.PRINT_LINE</a>      | Outputs the specified text with newline characters.                                                                                                                                                                                |
| <a href="#">DBE_OUTPUT.PRINT</a>           | Outputs the specified text without newline characters.                                                                                                                                                                             |
| <a href="#">DBE_OUTPUT.SET_BUFFER_SIZE</a> | Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes. |

- [DBE\\_OUTPUT.PRINT\\_LINE](#)

The stored procedure **PRINT\_LINE** writes a row of text carrying a line end symbol in the buffer. The function prototype of [DBE\\_OUTPUT.PRINT\\_LINE](#) is as follows:

```
DBE_OUTPUT.PRINT_LINE (
format IN VARCHAR2);
```

**Table 10-92** DBE\_OUTPUT.PRINT\_LINE API parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| format    | Specifies the text that was written to the buffer. |

- [DBE\\_OUTPUT.PRINT](#)

The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The prototype of the [DBE\\_OUTPUT.PRINT](#) function is as follows:

```
DBE_OUTPUT.PRINT (
format IN VARCHAR2);
```

**Table 10-93** DBE\_OUTPUT.PRINT API parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| format    | Specifies the text that was written to the specified text. |

- [DBE\\_OUTPUT.SET\\_BUFFER\\_SIZE](#)

The stored procedure **SET\_BUFFER\_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of [DBE\\_OUTPUT.SET\\_BUFFER\\_SIZE](#) is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

**Table 10-94** DBE\_OUTPUT.SET\_BUFFER\_SIZE API parameters

| Parameter | Description                  |
|-----------|------------------------------|
| size      | Sets the output buffer size. |

## Examples

```
BEGIN
 DBE_OUTPUT.SET_BUFFER_SIZE(50);
 DBE_OUTPUT.PRINT('hello, ');
 DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!".
END;
/
```

### 10.12.2.4 DBE\_RAW

#### API Description

**Table 10-95** provides all APIs supported by the **DBE\_RAW** package.

**Table 10-95** DBE\_RAW

| API                                                     | Description                                                                                 |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW</a> | Converts a value of the <b>INTEGER</b> type to a binary representation ( <b>RAW</b> type).  |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER</a> | Converts a binary representation ( <b>RAW</b> type) to a value of the <b>INTEGER</b> type.  |
| <a href="#">DBE_RAW.GET_LENGTH</a>                      | Obtains the length of a <b>RAW</b> object.                                                  |
| <a href="#">DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW</a>       | Converts a value of the <b>VARCHAR2</b> type to a binary representation ( <b>RAW</b> type). |
| <a href="#">DBE_RAW.CAST_TO_VARCHAR2</a>                | Converts a value of the <b>RAW</b> type to a value of the <b>VARCHAR2</b> type.             |
| <a href="#">DBE_RAW.BIT_OR</a>                          | Performs the bitwise OR operation on raw data.                                              |
| <a href="#">DBE_RAW.SUBSTR</a>                          | Returns the substring of the <b>RAW</b> type.                                               |

#### NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

- DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW

The stored procedure **CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW** converts a value of the **INTEGER** type to a binary representation (**RAW** type).

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
value IN INTEGER,
endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-96** DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | Specifies the <b>INTEGER</b> value to be converted to the <b>RAW</b> value.                                                                                          |
| endianess | Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .) |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER

The stored procedure **CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER** converts a binary representation (**RAW** type) to a value of the **INTEGER** type.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
value IN RAW,
endianess IN INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

**Table 10-97** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | Specifies an <b>INTEGER</b> value in a binary representation ( <b>RAW</b> type).                                                                                     |
| endianess | Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .) |

- DBE\_RAW.GET\_LENGTH

The stored procedure **GET\_LENGTH** returns the length of a **RAW** object.

The prototype of the DBE\_RAW.GET\_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
value IN RAW)
RETURN INTEGER;
```

**Table 10-98** DBE\_RAW.GET\_LENGTH parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| value     | Specifies a <b>RAW</b> object. |

- DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW

The stored procedure **CAST\_FROM\_VARCHAR2\_TO\_RAW** converts a **VARCHAR2** object to a **RAW** object.

The prototype of the DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_TO_RAW(
str IN VARCHAR2)
RETURN RAW;
```

**Table 10-99** DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| c         | Specifies a <b>VARCHAR2</b> object to be converted. |

- DBE\_RAW.CAST\_TO\_VARCHAR2

The stored procedure **CAST\_TO\_VARCHAR2** converts a **RAW** object to a **VARCHAR2** object.

The prototype of the DBE\_RAW.CAST\_TO\_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
str IN RAW)
RETURN VARCHAR2;
```

**Table 10-100** DBE\_RAW.CAST\_TO\_VARCHAR2 parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| str       | Specifies a <b>RAW</b> object to be converted. |

- DBE\_RAW.BIT\_OR

The stored procedure **BIT\_OR** calculates the bitwise OR result of two raw data records.

The prototype of the DBE\_RAW.BIT\_OR function is as follows:

```
DBE_RAW.BIT_OR(
str1 IN RAW,
str2 IN RAW)
RETURN RAW;
```

**Table 10-101** DBE\_RAW.BIT\_OR parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| str1      | First character string of the bitwise OR operation  |
| str2      | Second character string of the bitwise OR operation |

- DBE\_RAW.SUBSTR

The stored procedure **SUBSTR** truncates an object of the **RAW** type based on the start bit and length.

The prototype of the DBE\_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
 IN lob_loc raw,
 IN off_set integer default 1,
 IN amount integer default 32767)
RETURN RAW;
```

**Table 10-102** DBE\_RAW.SUBSTR parameters

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| lob_loc   | Source raw character string.                                     |
| off_set   | Start position of the substring. The default value is <b>1</b> . |
| amount    | Substring length. The default value is <b>32767</b> .            |

## Examples

```
-- Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
 str varchar2(100) := 'abcdef';
 source raw(100);
 amount integer;
BEGIN
 source := dbe_raw.cast_from_varchar2_to_raw(str);-- Convert the type.
 amount := dbe_raw.get_length(source);-- Obtain the length.
 dbe_output.print_line(amount);
END;
/

-- Call the stored procedure.
CALL proc_raw();

-- Delete the stored procedure.
DROP PROCEDURE proc_raw;
```

### 10.12.2.5 DBE\_TASK

## API Description

**Table 10-103** lists all APIs supported by the **DBE\_TASK** package.

**Table 10-103** DBE\_TASK

| API                    | Description                                                                   |
|------------------------|-------------------------------------------------------------------------------|
| <b>DBE_TASK.SUBMIT</b> | Commits a scheduled job. The job ID is automatically generated by the system. |

| API                                 | Description                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_TASK.JOB_SUBMIT</a> | Same as <a href="#">DBE_TASK.SUBMIT</a> . However, It provides syntax compatibility parameters.                                  |
| <a href="#">DBE_TASK.ID_SUBMIT</a>  | Commits a scheduled job. The job ID is specified by the user.                                                                    |
| <a href="#">DBE_TASK.CANCEL</a>     | Removes a scheduled task by job ID.                                                                                              |
| <a href="#">DBE_TASK.RUN</a>        | Executes a scheduled task.                                                                                                       |
| <a href="#">DBE_TASK.FINISH</a>     | Disables or enables scheduled task execution.                                                                                    |
| <a href="#">DBE_TASK.UPDATE</a>     | Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval. |
| <a href="#">DBE_TASK.CHANGE</a>     | Same as <a href="#">DBE_TASK.UPDATE</a> . However, It provides syntax compatibility parameters.                                  |
| <a href="#">DBE_TASK.CONTENT</a>    | Modifies the job content attribute of a scheduled job.                                                                           |
| <a href="#">DBE_TASK.NEXT_TIME</a>  | Modifies the next-execution time attribute of a scheduled task.                                                                  |
| <a href="#">DBE_TASK.INTERVAL</a>   | Modifies the execution interval attribute of a scheduled task.                                                                   |

- **DBE\_TASK.SUBMIT**

The stored procedure SUBMIT commits a scheduled task provided by the system.

The prototype of the DBE\_TASK.SUBMIT function is as follows:

```
DBE_TASK.SUBMIT(
 what IN TEXT,
 next_time IN TIMESTAMP DEFAULT sysdate,
 interval_time IN TEXT DEFAULT 'null',
 id OUT INTEGER
)RETURN INTEGER;
```

#### NOTE

When a scheduled task is created (using **DBE\_TASK**), the system binds the current database and the username to the task by default. This function can be called by using the CALL or SELECT statement. If you call this function by using the SELECT statement, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-104** DBE\_TASK.SUBMIT parameters

| Parameter     | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| what          | Text      | IN                     | No           | SQL statement to be executed. One or multiple DDL operations (excluding database-related operations), DML operations, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.                                                                                       |
| next_time     | Timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.                                                                                                             |
| interval_time | Text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| id            | Integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.                                                                                                                           |

**NOTICE**

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so.

**Example:**

```
openGauss=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');
submit

31031
(1 row)

openGauss=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');
submit

512
(1 row)
```

```
openGauss=# DECLARE
openGauss=# jobid int;
openGauss=# BEGIN
openGauss$$ PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval "5 minute"', jobid);
openGauss$# END;
openGauss$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE\_TASK.JOB\_SUBMIT

The stored procedure SUBMIT commits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

The prototype of the DBE\_TASK.JOB\_SUBMIT function is as follows:

```
DBE_TASK.JOB_SUBMIT(
job OUT INTEGER,
what IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
job_interval IN TEXT DEFAULT 'null',
no_parse IN BOOLEAN DEFAULT false,
instance IN INTEGER DEFAULT 0,
force IN BOOLEAN DEFAULT false
)RETURN INTEGER;
```

**Table 10-105** DBE\_TASK.JOB\_SUBMIT parameters

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|--------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job          | Integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When dbe.job_submit is called by using the SELECT statement, this parameter can be omitted.                                                                                                                                                             |
| what         | Text      | IN                     | No           | SQL statement to be executed. One or multiple DDL operations (excluding database-related operations), DML operations, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.                                                                                       |
| next_date    | Timestamp | IN                     | Yes          | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.                                                                                                             |
| job_interval | Text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                      |
|-----------|---------|------------------------|--------------|----------------------------------------------------------------------------------|
| no_parse  | Boolean | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility. |
| instance  | Integer | IN                     | Yes          | The default value is <b>0</b> , which is used only for syntax compatibility.     |
| force     | Boolean | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility. |

**Example:**

```
openGauss=# DECLARE
openGauss-# id integer;
openGauss-# BEGIN
openGauss$$ id = DBE_TASK.JOB_SUBMIT(
openGauss$$ what => 'insert into t1 values (1, 2)',
openGauss$$ job_interval => 'sysdate + 1' --daily
openGauss$$);
openGauss$$ END;
openGauss$$ /
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_TASK.ID\_SUBMIT**

ID\_SUBMIT has the same syntax function as SUBMIT, but the first parameter of ID\_SUBMIT is an input parameter, that is, a specified job ID. In contrast, that last parameter of ID\_SUBMIT is an output parameter, indicating the job ID automatically generated by the system.

```
DBE_TASK.ID_SUBMIT(
id IN BIGINT,
what IN TEXT,
next_time IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null');
```

**Example:**

```
openGauss=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
id_submit

(1 row)
```

- **DBE\_TASK.CANCEL**

The stored procedure CANCEL deletes a specified task.

The prototype of the DBE\_TASK.CANCEL function is as follows:

```
CANCEL(id IN INTEGER);
```

**Table 10-106** DBE\_TASK.CANCEL parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| id        | Integer | IN                     | No           | Specifies the job ID. |

Example:

```
openGauss=# CALL dbe_task.cancel(101);
cancel

(1 row)
```

- **DBE\_TASK.RUN**

The stored procedure runs a scheduled task.

The prototype of the DBE\_TASK.RUN function is as follows:

```
DBE_TASK.RUN(
job IN BIGINT,
force IN BOOLEAN DEFAULT FALSE);
```

**Table 10-107** DBE\_TASK.RUN parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|---------|------------------------|--------------|-------------------------------------|
| job       | bigint  | IN                     | No           | Specifies the job ID.               |
| force     | Boolean | IN                     | Yes          | Used only for syntax compatibility. |

Example:

```
openGauss=# BEGIN
openGauss$$ DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
openGauss$$ DBE_TASK.RUN(12345);
openGauss$$ END;
openGauss$$ /
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_TASK.FINISH**

The stored procedure FINISH disables or enables a scheduled task.

The prototype of the DBE\_TASK.FINISH function is as follows:

```
DBE_TASK.FINISH(
id IN INTEGER,
broken IN BOOLEAN,
next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-108** DBE\_TASK.FINISH parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | Integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                          |
| broken    | Boolean   | IN                     | No           | Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.                                                                                                                                                                                     |
| next_time | Timestamp | IN                     | Yes          | Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case. |

**Example:**

```
openGauss=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
id_submit
```

```

(1 row)
```

```
openGauss=# CALL dbe_task.finish(101, true);
finish
```

```

(1 row)
```

- **DBE\_TASK.UPDATE**

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the DBE\_TASK.UPDATE function is as follows:

```
DBE_TASK.UPDATE(
id IN INTEGER,
content IN TEXT,
next_time IN TIMESTAMP,
interval_time IN TEXT);
```

**Table 10-109** DBE\_TASK.UPDATE parameters

| Parameter     | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | Integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| content       | Text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.                                                                                                                                                                            |
| next_time     | Timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.                                                                                                                                                                                                                         |
| interval_time | Text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job state will change to 'd' afterward. |

**Example:**

```
openGauss=# CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
update

```

(1 row)

```
openGauss=# CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
update

```

(1 row)

- DBE\_TASK.CHANGE

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the DBE\_TASK.CHANGE function is as follows:

```
DBE_TASK.CHANGE(
job IN INTEGER,
what IN TEXT DEFAULT NULL,
next_date IN TIMESTAMP DEFAULT NULL,
job_interval IN TEXT DEFAULT NULL,
instance IN INTEGER DEFAULT NULL,
force IN BOOLEAN DEFAULT false);
```

**Table 10-110** DBE\_TASK.CHANGE parameters

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|-----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job          | Integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| what         | Text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>what</b> parameter for the specified job. Otherwise, the system updates the <b>what</b> parameter for the specified job.                                                                                                                                                                                |
| next_date    | Timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_date</b> parameter for the specified job. Otherwise, the system updates the <b>next_date</b> parameter for the specified job.                                                                                                                                                                                                                       |
| job_interval | Text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>job_interval</b> parameter for the specified job. Otherwise, the system updates the <b>job_interval</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job state will change to 'd' afterward. |
| instance     | Integer   | IN                     | Yes          | Used only for syntax compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|---------|------------------------|--------------|-------------------------------------|
| force     | Boolean | IN                     | No           | Used only for syntax compatibility. |

Example:

```
openGauss=# BEGIN
openGauss$$ DBE_TASK.CHANGE(
openGauss$$ job => 101,
openGauss$$ what => 'insert into t2 values (2);'
openGauss$$);
openGauss$$ END;
openGauss$$ /
ANONYMOUS BLOCK EXECUTE
```

- DBE\_TASK.CONTENT

The stored procedure CONTENT modifies the procedures to be executed by a specified task.

The prototype of the DBE\_TASK.CONTENT function is as follows:

```
DBE_TASK.CONTENT(
id IN INTEGER,
content IN TEXT);
```

**Table 10-111** DBE\_TASK.CONTENT parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                  |
|-----------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------|
| id        | Integer | IN                     | No           | Specifies the job ID.                                                                        |
| content   | Text    | IN                     | No           | Specifies the stored procedure call, SQL statement block, or program block that is executed. |

 **NOTE**

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
openGauss=# CALL db_e_task.content(101, 'call userproc();');
content

```

```
(1 row)

openGauss=# CALL db_task.content(101, 'insert into tbl_a values(sysdate);');
content

(1 row)
```

- DBE\_TASK.NEXT\_TIME

The stored procedure NEXT\_TIME modifies the next-execution time attribute of a task.

The prototype of the DBE\_TASK.NEXT\_TIME function is as follows:

```
DBE_TASK.NEXT_TIME(
id IN BIGINT,
next_time IN TEXT);
```

**Table 10-112** DBE\_TASK.NEXT\_TIME parameters

| Parameter | Type   | Input/Output Parameter | Can Be Empty | Description                        |
|-----------|--------|------------------------|--------------|------------------------------------|
| id        | bigint | IN                     | No           | Specifies the job ID.              |
| next_time | Text   | IN                     | No           | Specifies the next execution time. |

 **NOTE**

If the specified **next\_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
openGauss=# CALL db_task.next_time(101, sysdate);
next_time

(1 row)
```

- DBE\_TASK.INTERVAL

The stored procedure INTERVAL modifies the execution interval attribute of a task.

The prototype of the DBE\_TASK.INTERVAL function is as follows:

```
DBE_TASK.INTERVAL(
id IN INTEGER,
interval_time IN TEXT);
```

**Table 10-113** DBE\_TASK.INTERVAL parameters

| Parameter     | Type    | Input / Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                        |
|---------------|---------|--------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | Integer | IN                       | No           | Specifies the job ID.                                                                                                                                                                                                                                                                              |
| interval_time | Text    | IN                       | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. The job interval must be of a valid time type or interval type. |

Example:

```
openGauss=# CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
interval

(1 row)

openGauss=# CALL dbe_task.cancel(101);
cancel

(1 row)
```

#### NOTE

For a job that is currently running (that is, **job\_status** is 'r'), it is not allowed to use **cancel**, **update**, **next\_time**, **content**, or **interval** to delete or modify job parameters.

## Constraints

1. You can create, update, and delete jobs only using the procedures provided by the **DBE\_TASK** package. These procedures synchronize job information between different primary database nodes and associate primary keys between the pg\_job and pg\_job\_proc catalogs. If you use DML statements to add, delete, or modify records in the pg\_job catalog, job information will become inconsistent between primary database nodes and system catalogs may fail to be associated, compromising internal job management.
2. Each task created by a user is bound to a primary database node. If the primary database node fails while a task is being executed, the task status cannot be updated in real time and will stay at 'r'. The task status will be updated to 's' only after the primary database node recovers. When a primary database node fails, all tasks on this primary database node cannot be scheduled or executed until the primary database node is restored manually, or deleted and then replaced.

- For each job, the bound primary database node updates the real-time job information (including the job status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the pg\_job system catalog, and synchronizes the information to other primary database nodes, ensuring consistent job information between different primary database nodes. In the case of primary database node failures, job information synchronization is reattempted by the hosting primary database nodes, which increases job execution time. Although job information fails to be synchronized between primary database nodes, job information can still be properly updated in the pg\_job table on the hosting primary database nodes, and jobs can be executed successfully. After a primary database node recovers, job information such as job execution time and status in its pg\_job table may be incorrect and will be updated only after the jobs are executed again on related primary database nodes.
- For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

### 10.12.2.6 DBE\_SCHEDULER

#### API Description

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled jobs through scheduling and programing. For details about all the supported APIs, see [Table 10-114](#).

**Table 10-114** DBE\_SCHEDULER

| API                                              | Description                            |
|--------------------------------------------------|----------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_JOB</a>         | Creates a scheduled job.               |
| <a href="#">DBE_SCHEDULER.DROP_JOB</a>           | Deletes a scheduled job.               |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB</a>    | Deletes a single scheduled job.        |
| <a href="#">DBE_SCHEDULER.SET_ATTRIBUTE</a>      | Sets object attributes.                |
| <a href="#">DBE_SCHEDULER.RUN_JOB</a>            | Executes a scheduled job.              |
| <a href="#">DBE_SCHEDULER.RUN_BACKGROUND_JOB</a> | Runs a scheduled job in the backend.   |
| <a href="#">DBE_SCHEDULER.RUN_FOREGROUND_JOB</a> | Runs a scheduled job in the frontend.  |
| <a href="#">DBE_SCHEDULER.STOP_JOB</a>           | Stops a scheduled job.                 |
| <a href="#">DBE_SCHEDULER.STOP_SINGLE_JOB</a>    | Stops a single scheduled job.          |
| <a href="#">DBE_SCHEDULER.GENERATE_JOB_NAME</a>  | Generates the name of a scheduled job. |

| API                                                     | Description                                  |
|---------------------------------------------------------|----------------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_PROGRAM</a>            | Creates a program.                           |
| <a href="#">DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT</a>   | Defines program parameters.                  |
| <a href="#">DBE_SCHEDULER.DROP_PROGRAM</a>              | Deletes a program.                           |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_PROGRAM</a>       | Deletes a single program.                    |
| <a href="#">DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE</a>    | Sets the parameters of a scheduled job.      |
| <a href="#">DBE_SCHEDULER.CREATE_SCHEDULE</a>           | Creates a schedule.                          |
| <a href="#">DBE_SCHEDULER.DROP_SCHEDULE</a>             | Deletes a schedule.                          |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_SCHEDULE</a>      | Deletes a single schedule.                   |
| <a href="#">DBE_SCHEDULER.CREATE_JOB_CLASS</a>          | Creates the class of a scheduled job.        |
| <a href="#">DBE_SCHEDULER.DROP_JOB_CLASS</a>            | Deletes the class of a scheduled job.        |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS</a>     | Deletes the class of a single scheduled job. |
| <a href="#">DBE_SCHEDULER.GRANT_USER_AUTHORIZATION</a>  | Grants special permissions to a user.        |
| <a href="#">DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION</a> | Revokes special permissions from a user.     |
| <a href="#">DBE_SCHEDULER.CREATE_CREDENTIAL</a>         | Creates a certificate.                       |
| <a href="#">DBE_SCHEDULER.DROP_CREDENTIAL</a>           | Destroys a certificate.                      |
| <a href="#">DBE_SCHEDULER.ENABLE</a>                    | Enables an object.                           |
| <a href="#">DBE_SCHEDULER.ENABLE_SINGLE</a>             | Enables a single object.                     |
| <a href="#">DBE_SCHEDULER.DISABLE</a>                   | Disables an object.                          |
| <a href="#">DBE_SCHEDULER.DISABLE_SINGLE</a>            | Disables a single object.                    |

| API                                                    | Description                         |
|--------------------------------------------------------|-------------------------------------|
| <a href="#">DBE_SCHEDULER.EVAL_CALENDAR_STRING</a>     | Analyzes the scheduling job period. |
| <a href="#">DBE_SCHEDULER.EVALUATE_CALENDAR_STRING</a> | Analyzes the scheduling job period. |

- **DBE\_SCHEDULER.CREATE\_JOB**

Creates a scheduled job.

The prototypes of the DBE\_SCHEDULER.CREATE\_JOB function are as follows:

```
-- Scheduled jobs of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created scheduled jobs of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created program and the scheduled job of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created schedule and the scheduled job of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
```

```
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

 **NOTE**

The scheduled job created through **DBE\_SCHEDULER** does not conflict with the scheduled job in **DBE\_TASK**.

The scheduled job created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, **job\_id** is meaningless.

**Table 10-115** DBE\_SCHEDULER.CREATE\_JOB API parameters

| Parameter           | Type                     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text                     | IN                     | No           | Name of a scheduled job.                                                                                                                                                                                                                                                                               |
| job_type            | text                     | IN                     | No           | Inline program type of a scheduled job. The options are as follows: <ul style="list-style-type: none"><li>• <b>'PLSQL_BLOCK'</b>: fast anonymous stored procedure.</li><li>• <b>'STORED_PROCEDURE'</b>: stored procedure that is saved.</li><li>• <b>'EXTERNAL_SCRIPT'</b>: external script.</li></ul> |
| job_action          | text                     | IN                     | No           | Content executed by an inline program of a scheduled job.                                                                                                                                                                                                                                              |
| number_of_arguments | integer                  | IN                     | No           | Number of inline program parameters of a scheduled job.                                                                                                                                                                                                                                                |
| program_name        | text                     | IN                     | No           | Name of the program referenced by a scheduled job.                                                                                                                                                                                                                                                     |
| start_date          | timestamp with time zone | IN                     | Yes          | Inline scheduling start time of a scheduled job.                                                                                                                                                                                                                                                       |

| Parameter        | Type                     | Input/Output Parameter | Can Be Empty | Description                                                              |
|------------------|--------------------------|------------------------|--------------|--------------------------------------------------------------------------|
| repeat_interval  | text                     | IN                     | Yes          | Inline scheduling period of a scheduled job.                             |
| end_date         | timestamp with time zone | IN                     | Yes          | Inline scheduling expiration time of a scheduled job.                    |
| schedule_name    | text                     | IN                     | No           | Name of the schedule referenced by a scheduled job.                      |
| job_class        | text                     | IN                     | No           | Class name of a scheduled job.                                           |
| enabled          | boolean                  | IN                     | No           | Status of a scheduled job.                                               |
| auto_drop        | boolean                  | IN                     | No           | Automatic deletion of a scheduled job.                                   |
| comments         | text                     | IN                     | Yes          | Comments.                                                                |
| job_style        | text                     | IN                     | No           | Behavior pattern of a scheduled job. Only <b>'REGULAR'</b> is supported. |
| credential_name  | text                     | IN                     | Yes          | Certificate name of a scheduled job.                                     |
| destination_name | text                     | IN                     | Yes          | Target name of a scheduled job.                                          |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job
```

```

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

#### NOTICE

To create a scheduled job of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- **DBE\_SCHEDULER.DROP\_JOB**

Deletes a scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_JOB function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean default false,
defer boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

#### NOTE

DBE\_SCHEDULER.DROP\_JOB can specify one or more jobs, or specify a job class to delete a scheduled job.

**Table 10-116** DBE\_SCHEDULER.DROP\_JOB API parameters

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name         | text    | IN                     | No           | Name or class of a scheduled job. You can specify one or more scheduled jobs. If you specify multiple scheduled jobs, separate them with commas (.).                                                                                                                                                                                                                                                                                                                     |
| force            | boolean | IN                     | No           | Specifies whether to delete a scheduled job. <ul style="list-style-type: none"><li>• <b>true</b>: The current scheduled job is stopped and then deleted.</li><li>• <b>false</b>: The scheduled job fails to be deleted if it is running.</li></ul>                                                                                                                                                                                                                       |
| defer            | boolean | IN                     | No           | Specifies whether to delete a scheduled job. <ul style="list-style-type: none"><li>• <b>true</b>: A scheduled job can be deleted after it is complete.</li><li>• <b>false</b>: The scheduled job cannot be executed and is deleted.</li></ul>                                                                                                                                                                                                                            |
| commit_semantics | text    | IN                     | No           | Commit rules: <ul style="list-style-type: none"><li>• <b>'STOP_ON_FIRST_ERROR'</b>: The deletion operation performed before the first error is reported is committed.</li><li>• <b>'TRANSACTIONAL'</b>: Transaction-level commit. The deletion operation performed before an error is reported will be rolled back.</li><li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the deletion operation that is performed successfully.</li></ul> |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

**NOTICE**

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- DBE\_SCHEDULER.DROP\_SINGLE\_JOB

Deletes a scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_JOB function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean default false,
defer boolean default false
)
```

**Table 10-117** DBE\_SCHEDULER.DROP\_SINGLE\_JOB API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                   |
|-----------|------|------------------------|--------------|---------------------------------------------------------------|
| job_name  | text | IN                     | No           | Specifies the name of a scheduled job or scheduled job class. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                          |
|-----------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force     | boolean | IN                     | No           | Specifies whether to delete a scheduled job.<br><ul style="list-style-type: none"> <li><b>true:</b> The current scheduled job is stopped and then deleted.</li> <li><b>false:</b> The scheduled job fails to be deleted if it is running.</li> </ul> |
| defer     | boolean | IN                     | No           | Specifies whether to delete a scheduled job.<br><ul style="list-style-type: none"> <li><b>true:</b> A scheduled job can be deleted after it is complete.</li> <li><b>false:</b> The scheduled job cannot be executed and is deleted.</li> </ul>      |

#### Example:

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 0, false, 'test');
create_program

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
create_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
drop_single_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

- DBE\_SCHEDULER.SET\_ATTRIBUTE

Modifies the attributes of a scheduled job.

The prototypes of the DBE\_SCHEDULER.SET\_ATTRIBUTE function are as follows:

```
DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value boolean
)
```

```
DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text default NULL
)
```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULER**.

**Table 10-118** DBE\_SCHEDULER.SET\_ATTRIBUTE API parameters

| Parameter | Type                                                 | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|------------------------------------------------------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | text                                                 | IN                     | No           | Object name.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| attribute | text                                                 | IN                     | No           | Attribute name.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| value     | boolean/date/timestamp/timestamp with time zone/text | IN                     | No           | Attribute value. The options are as follows:<br><br>Scheduled-job-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.<br><br>Scheduling-related: program_action, program_type, number_of_arguments, comments.<br><br>Program-related: start_date, repeat_interval, end_date, comments. |

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                       |
|-----------|------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| value2    | text | IN                     | Yes          | Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported. |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program

```

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
set_attribute

```

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type',
'STORED_PROCEDURE');
set_attribute

```

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

```

(1 row)

**NOTICE**

Do not use DBE\_SCHEDULER.SET\_ATTRIBUTE to leave the parameters empty. The object name cannot be changed using DBE\_SCHEDULER.SET\_ATTRIBUTE.

- **DBE\_SCHEDULER.RUN\_JOB**

Executes a scheduled job.

The prototype of the DBE\_SCHEDULER.RUN\_JOB function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean default true
)
```

 NOTE

DBE\_SCHEDULER.RUN\_JOB is used to run scheduled jobs immediately. It is independent of the scheduling of scheduled jobs and can even run at the same time.

**Table 10-119** DBE\_SCHEDULER.RUN\_JOB API parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                     |
|---------------------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text    | IN                     | No           | One or more scheduled job names. If you specify multiple scheduled jobs, separate them with commas (,).                                                                                                                                                                                         |
| use_current_session | boolean | IN                     | No           | Specifies whether to run a scheduled job. <ul style="list-style-type: none"><li>• <b>true</b>: Use the current session to check whether the scheduled job can run properly.</li><li>• <b>false</b>: Start the scheduled job in the backend. The execution result is recorded in logs.</li></ul> |

## Example:

```
openGauss=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1
values(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.run_job('job1', false);
run_job
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```

(1 row)
```

**NOTICE**

**use\_current\_session** cannot be used to record execution results.

- DBE\_SCHEDULER.RUN\_BACKEND\_JOB

Runs a scheduled job in the backend.

The prototype of the DBE\_SCHEDULER.RUN\_BACKEND\_JOB function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

**Table 10-120** DBE\_SCHEDULER.RUN\_BACKEND\_JOB API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description              |
|-----------|------|------------------------|--------------|--------------------------|
| job_name  | text | IN                     | No           | Name of a scheduled job. |

Example:

```
openGauss=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1
values(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.run_backend_job('job1');
run_backend_job
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----

(1 row)

- DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB

Executes a scheduled job in the current session.

Only external jobs can be executed.

Return value: text

The prototype of the DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

**Table 10-121** DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description              |
|-----------|------|------------------------|--------------|--------------------------|
| job_name  | text | IN                     | No           | Name of a scheduled job. |

**Example:**

```
openGauss=# create user test1 identified by '*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
openGauss=# select DBE_SCHEDULER.create_credential('cre_1', 'test1', '*****');
create_credential

(1 row)

openGauss=# select DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
create_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.run_foreground_job('job1');
run_foreground_job

Host key verification failed.\r+
(1 row)

```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled job.

The prototype of the DBE\_SCHEDULER.STOP\_JOB function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-122** DBE\_SCHEDULER.STOP\_JOB API parameters

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                              |
|------------------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name         | text    | IN                     | No           | Name or class of a scheduled job. You can specify one or more scheduled jobs. If you specify multiple scheduled jobs, separate them with commas (,).                                                                                                                     |
| force            | boolean | IN                     | No           | Specifies whether to delete a scheduled job.<br><b>true</b> : The scheduler sends a termination signal to end the job thread immediately.<br><b>false</b> : The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.                    |
| commit_semantics | text    | IN                     | No           | Commit rules:<br><b>'STOP_ON_FIRST_ERROR'</b> : The interrupt operation performed before the first error is reported is committed.<br><b>'ABSORB_ERRORS'</b> : The system attempts to bypass an error and commit the interrupt operation that is performed successfully. |

**Example:**

```
openGauss=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1
values(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
stop_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)
```

- DBE\_SCHEDULER.STOP\_SINGLE\_JOB

Stops a single scheduled job.

The prototype of the DBE\_SCHEDULER.STOP\_SINGLE\_JOB function is as follows:

```
DBE_SCHEDULER.stop_single_job(
 job_name text,
 force boolean default false
)
```

**Table 10-123** DBE\_SCHEDULER.STOP\_SINGLE\_JOB API parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                  |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | text    | IN                     | No           | Specifies the name of a scheduled job or scheduled job class.                                                                                                                                                                                                                                                |
| force     | boolean | IN                     | No           | <p>Specifies whether to delete a scheduled job.</p> <ul style="list-style-type: none"><li><b>true:</b> The scheduler sends a termination signal to end the job thread immediately.</li><li><b>false:</b> The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.</li></ul> |

Example:

```
openGauss=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1
values(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
stop_single_job

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)
```

- DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Generates the name of a scheduled job.

The prototype of the DBE\_SCHEDULER.GENERATE\_JOB\_NAME function is as follows:

```
DBE_SCHEDULER.generate_job_name(
 prefix text default 'JOB$_
)return text
```

**Table 10-124** DBE\_SCHEDULER.GENERATE\_JOB\_NAME API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                          |
|-----------|------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prefix    | text | IN                     | No           | Prefix of the generated name. The default value is 'JOB\$_. Scheduled jobs that are repeatedly executed are named as follows: <b>job\$_1</b> , <b>job\$_2</b> , <b>job\$_3</b> , ... |

Example:

```
openGauss=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name

JOB$_1
(1 row)

openGauss=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name

JOB$_2
(1 row)

openGauss=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name

job3
(1 row)

openGauss=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name

job4
(1 row)
```

**NOTICE**

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program.

The prototype of the DBE\_SCHEDULER.CREATE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer default 0,
enabled boolean default false,
comments text default NULL
)
```

**Table 10-125** DBE\_SCHEDULER.CREATE\_PROGRAM API parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                       |
|---------------------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name        | text    | IN                     | No           | Program name.                                                                                                                                                                                                                                     |
| program_type        | text    | IN                     | No           | Program type. The options are as follows: <ul style="list-style-type: none"><li>'PLSQL_BLOCK': fast anonymous stored procedure.</li><li>'STORED_PROCEDURE': stored procedure that is saved.</li><li>'EXTERNAL_SCRIPT': external script.</li></ul> |
| program_action      | text    | IN                     | No           | Program operation.                                                                                                                                                                                                                                |
| number_of_arguments | integer | IN                     | No           | Number of parameters used by the program.                                                                                                                                                                                                         |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                               |
|-----------|---------|------------------------|--------------|-------------------------------------------|
| enabled   | boolean | IN                     | No           | Specifies whether the program is enabled. |
| comments  | text    | IN                     | Yes          | Comments.                                 |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

```

(1 row)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters.

An API with the default value **default\_value** will not convert characters to lowercase letters by default. In this version, characters are case-sensitive.

The prototype of the DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
out_argument boolean default false
)
```

-- With a default value --

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
default_value text,
out_argument boolean default false
)
```

**Table 10-126** DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT API parameters

| Parameter         | Type    | Input/Output Parameter | Can Be Empty | Description         |
|-------------------|---------|------------------------|--------------|---------------------|
| program_name      | text    | IN                     | No           | Program name.       |
| argument_position | integer | IN                     | No           | Parameter location. |
| argument_name     | text    | IN                     | No           | Parameter name.     |
| argument_type     | text    | IN                     | No           | Parameter type.     |
| default_value     | text    | IN                     | No           | Default value.      |
| out_argument      | boolean | IN                     | No           | Reserved parameter. |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program

(1 row)

openGauss=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
define_program_argument

(1 row)

openGauss=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
define_program_argument

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

- **DBE\_SCHEDULER.DROP\_PROGRAM**  
Deletes a program.

The prototype of the DBE\_SCHEDULER.DROP\_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_program(
program_name text,
force boolean default false
)
```

**Table 10-127** DBE\_SCHEDULER.DROP\_PROGRAM API parameters

| Parameter    | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                      |
|--------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name | text    | IN                     | No           | Program name.                                                                                                                                                                                                                                                                    |
| force        | boolean | IN                     | No           | Specifies whether to delete a program. <ul style="list-style-type: none"><li>• <b>true</b>: Before a program is deleted, all jobs that use the program are disabled.</li><li>• <b>false</b>: The program cannot be referenced by any job. Otherwise, an error is sent.</li></ul> |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

-----

(1 row)

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_single_program(
program_name text,
force boolean default false
)
```

**Table 10-128** DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM API parameters

| Parameter    | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                      |
|--------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name | text    | IN                     | No           | Program name.                                                                                                                                                                                                                                                                    |
| force        | boolean | IN                     | No           | Specifies whether to delete a program. <ul style="list-style-type: none"><li>• <b>true</b>: Before a program is deleted, all jobs that use the program are disabled.</li><li>• <b>false</b>: The program cannot be referenced by any job. Otherwise, an error is sent.</li></ul> |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
drop_single_program
```

```

(1 row)
```

- **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE**

Sets the parameters of a scheduled job. **argument\_value** can be left empty.

The prototype of the DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)
```

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

**Table 10-129** DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE API parameters

| Parameter         | Type    | Input/<br>Output<br>Parameter | Can Be<br>Empty | Description              |
|-------------------|---------|-------------------------------|-----------------|--------------------------|
| job_name          | text    | IN                            | No              | Name of a scheduled job. |
| argument_position | integer | IN                            | No              | Parameter location.      |
| argument_name     | text    | IN                            | Yes             | Parameter name.          |
| argument_value    | text    | IN                            | Yes             | Parameter value.         |

Example:

```
openGauss=# CALL db_scheduler.create_job('job1','EXTERNAL_SCRIPT','begin insert into test1
values(12); end;','2,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

-----  
(1 row)

```
openGauss=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
set_job_argument_value
```

-----  
(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----  
(1 row)

- **DBE\_SCHEDULER.CREATE\_SCHEDULE**

Creates a schedule.

The prototype of the DBE\_SCHEDULER.CREATE\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone default NULL,
repeat_interval text,
end_date timestamp with time zone default NULL,
comments text default NULL
)
```

**Table 10-130** DBE\_SCHEDULER.CREATE\_SCHEDULE API parameters

| Parameter       | Type                     | Input/Output Parameter | Can Be Empty | Description                         |
|-----------------|--------------------------|------------------------|--------------|-------------------------------------|
| schedule_name   | text                     | IN                     | No           | Name of a schedule.                 |
| start_date      | timestamp with time zone | IN                     | Yes          | Start time of a schedule.           |
| repeat_interval | text                     | IN                     | No           | Repetition frequency of a schedule. |
| end_date        | timestamp with time zone | IN                     | Yes          | End time of a schedule.             |
| comments        | text                     | IN                     | Yes          | Comments.                           |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)', null, 'test1');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;', null, 'test1');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule

(1 row)
```

- DBE\_SCHEDULER.DROP\_SCHEDULE

Deletes a schedule.

The prototype of the DBE\_SCHEDULER.DROP\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_schedule(
 schedule_name text,
 force boolean default false
)
```

**Table 10-131** DBE\_SCHEDULER.DROP\_SCHEDULE API parameters

| Parameter     | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                            |
|---------------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name | text    | IN                     | No           | Name of a schedule.                                                                                                                                                                                                                                                                                    |
| force         | boolean | IN                     | No           | Specifies whether to delete a schedule. <ul style="list-style-type: none"><li><b>true</b>: Any jobs or windows that use this schedule are disabled before the schedule is deleted.</li><li><b>false</b>: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.</li></ul> |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)', null, 'test1');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;', null, 'test1');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule

```

```
(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule

```

```
(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule

```

```
(1 row)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean default false
)
```

**Table 10-132** DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE API parameters

| Parameter     | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                |
|---------------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name | text    | IN                     | No           | Name of a schedule.                                                                                                                                                                                                                                                                                        |
| force         | boolean | IN                     | No           | Specifies whether to delete a schedule. <ul style="list-style-type: none"><li>• <b>true</b>: Any jobs or windows that use this schedule are disabled before the schedule is deleted.</li><li>• <b>false</b>: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.</li></ul> |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)', null, 'test1');
create_schedule

```

```
(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;', null, 'test1');
```

```
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY;
BYHOUR=6;');
create_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_single_schedule('schedule1');
drop_single_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_single_schedule('schedule2', false);
drop_single_schedule

(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_single_schedule('schedule3', true);
drop_single_schedule

(1 row)
```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates the class of a scheduled job.

The prototype of the DBE\_SCHEDULER.CREATE\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text default NULL,
service text default NULL,
logging_level integer default 0,
log_history integer default NULL,
comments text default NULL
)
```

**Table 10-133** DBE\_SCHEDULER.CREATE\_JOB\_CLASS API parameters

| Parameter               | Type    | Input/Output Parameter | Can Be Empty | Description                                              |
|-------------------------|---------|------------------------|--------------|----------------------------------------------------------|
| job_class_name          | text    | IN                     | No           | Name of a scheduled job class.                           |
| resource_consumer_group | text    | IN                     | Yes          | Inline resource consumer group of a scheduled job class. |
| service                 | text    | IN                     | Yes          | Inline database service of a scheduled job class.        |
| logging_level           | integer | IN                     | No           | Number of scheduled job records.                         |

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                       |
|-------------|---------|------------------------|--------------|---------------------------------------------------|
| log_history | integer | IN                     | Yes          | Number of days for storing scheduled job records. |
| comments    | text    | IN                     | Yes          | Comments.                                         |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1',
resource_consumer_group => '123');
create_job_class
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
```

```

(1 row)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_job_class(
job_class_name text,
force boolean default false
)
```

**Table 10-134** DBE\_SCHEDULER.DROP\_JOB\_CLASS API parameters

| Parameter      | Type | Input/Output Parameter | Can Be Empty | Description                    |
|----------------|------|------------------------|--------------|--------------------------------|
| job_class_name | text | IN                     | No           | Name of a scheduled job class. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force     | boolean | IN                     | No           | <p>Specifies whether to delete a scheduled job class.</p> <ul style="list-style-type: none"><li>• <b>true:</b> Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted.</li><li>• <b>false:</b> The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.</li></ul> |

**Example:**

```
openGauss=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1',
resource_consumer_group => '123');
create_job_class
```

-----  
(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
```

-----  
(1 row)

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS**

Deletes the class of a single scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(
job_class_name text,
force boolean default false
)
```

**Table 10-135** DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS API parameters

| Parameter      | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_class_name | text    | IN                     | No           | Name of a scheduled job class.                                                                                                                                                                                                                                                                                                                                                            |
| force          | boolean | IN                     | No           | Specifies whether to delete a scheduled job class. <ul style="list-style-type: none"><li>• <b>true</b>: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted.</li><li>• <b>false</b>: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.</li></ul> |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1',
resource_consumer_group => '123');
create_job_class
```

-----  
(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
drop_job_class
```

-----  
(1 row)

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled job permissions to the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
username text,
privilege text
)
```

**Table 10-136** DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description               |
|-----------|------|------------------------|--------------|---------------------------|
| username  | text | IN                     | No           | Database username.        |
| privilege | text | IN                     | No           | Scheduled job permission. |

Example:

```
openGauss=# create user user1 password '1*G*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
openGauss=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
grant_user_authorization

(1 row)
openGauss=# drop user user1;
DROP ROLE
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**

Revokes the scheduled job permissions from the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username text,
privilege text
)
```

**Table 10-137** DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description               |
|-----------|------|------------------------|--------------|---------------------------|
| username  | text | IN                     | No           | Database username.        |
| privilege | text | IN                     | No           | Scheduled job permission. |

Example:

```
openGauss=# create user user1 password '1*G*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
```

```
CREATE ROLE
openGauss=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
grant_user_authorization

(1 row)

openGauss=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'create job');
revoke_user_authorization

(1 row)

openGauss=# drop user user1;
DROP ROLE
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**

Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.CREATE\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name text,
username text,
password text default NULL,
database_role text default NULL,
windows_domain text default NULL,
comments text default NULL
)
```

**Table 10-138** DBE\_SCHEDULER.CREATE\_CREDENTIAL API parameters

| Parameter       | Type | Input/Output Parameter | Can Be Empty | Description                             |
|-----------------|------|------------------------|--------------|-----------------------------------------|
| credential_name | text | IN                     | No           | Name of the authorization certificate.  |
| username        | text | IN                     | No           | Database username.                      |
| password        | text | IN                     | Yes          | User password.                          |
| database_role   | text | IN                     | Yes          | Database system permission.             |
| windows_domain  | text | IN                     | Yes          | Domain to which a Windows user belongs. |
| comments        | text | IN                     | Yes          | Comments.                               |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential

(1 row)
```

**NOTICE**

The **password** parameter of DBE\_SCHEDULER.CREATE\_CREDENTIAL must be set to **NULL** or '\*\*\*\*\*'. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE\_SCHEDULER.DROP\_CREDENTIAL

Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.DROP\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name text,
force boolean default false
)
```

**Table 10-139** DBE\_SCHEDULER.DROP\_CREDENTIAL API parameters

| Parameter       | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                    |
|-----------------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| credential_name | text    | IN                     | No           | Name of the authorization certificate.                                                                                                                                                                                                                                                         |
| force           | boolean | IN                     | No           | Specifies whether to delete the authorization certificate. <ul style="list-style-type: none"><li><b>true:</b> The certificate will be deleted no matter whether it is referenced by any job.</li><li><b>false:</b> No job can reference the certificate. Otherwise, an error occurs.</li></ul> |

Example:

```
openGauss=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential

```

```
(1 row)

openGauss=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential

(1 row)
```

• DBE\_SCHEDULER.ENABLE

Enables an object.

The prototype of the DBE\_SCHEDULER.ENABLE function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-140 DBE\_SCHEDULER.ENABLE API parameters

| Parameter        | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | text | IN                     | No           | Object name. You can specify one or more objects. If you specify multiple objects, separate them with commas (,).                                                                                                                                                                                                                                                                                                                                                                                           |
| commit_semantics | text | IN                     | No           | Commit rules. The following types are supported: <ul style="list-style-type: none"><li>• <b>'STOP_ON_FIRST_ERROR'</b>: The enabling operation performed before the first error is reported is committed.</li><li>• <b>'TRANSACTIONAL'</b>: Transaction-level commit. The enabling operation performed before an error is reported will be rolled back.</li><li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the enabling operation that is performed successfully.</li></ul> |

Example:

```
openGauss=# CALL db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
lse, 'test');
create_job
```

```

(1 row)
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
create_program

(1 row)
openGauss=# CALL DBE_SCHEDULER.enable('job1');
enable

(1 row)
openGauss=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
enable

(1 row)
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)
openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

- DBE\_SCHEDULER.ENABLE\_SINGLE

Enables a single object.

The prototype of the DBE\_SCHEDULER.ENABLE\_SINGLE function is as follows:

```
DBE_SCHEDULER.enable_single(
name text
)
```

**Table 10-141** DBE\_SCHEDULER.ENABLE\_SINGLE API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description  |
|-----------|------|------------------------|--------------|--------------|
| name      | text | IN                     | No           | Object name. |

Example:

```
openGauss=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
lse, 'test');
create_job
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.enable_single('job1');
enable_single
```

```

(1 row)
```

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```

(1 row)
```

- **DBE\_SCHEDULER.DISABLE**

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object. Operations are synchronized only when operation synchronization is enabled.

The prototype of the DBE\_SCHEDULER.DISABLE function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-142** DBE\_SCHEDULER.DISABLE API parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                             |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | text    | IN                     | No           | Object name.                                                                                                                                                                                                                                                            |
| force     | boolean | IN                     | No           | Specifies whether to disable an object. <ul style="list-style-type: none"><li>• <b>true</b>: The object is disabled regardless of whether other objects depend on it.</li><li>• <b>false</b>: No object can depend on the object. Otherwise, an error occurs.</li></ul> |

| Parameter        | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_semantics | text | IN                     | No           | Commit rules. The following types are supported: <ul style="list-style-type: none"><li>• <b>'STOP_ON_FIRST_ERROR'</b>: The disabling operation performed before the first error is reported is committed.</li><li>• <b>'TRANSACTIONAL'</b>: Transaction-level commit. The disabling operation performed before an error is reported will be rolled back.</li><li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the disabling operation that is performed successfully.</li></ul> |

## Example:

```
openGauss=# CALL db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;','0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
create_program
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.disable('job1');
disable
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
disable
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

```

(1 row)

- DBE\_SCHEDULER.DISABLE\_SINGLE

Disables a single object.

The prototype of the DBE\_SCHEDULER.DISABLE\_SINGLE function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean default false
)
```

**Table 10-143** DBE\_SCHEDULER.DISABLE\_SINGLE API parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                             |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | text    | IN                     | No           | Object name.                                                                                                                                                                                                                                                            |
| force     | boolean | IN                     | No           | Specifies whether to disable an object. <ul style="list-style-type: none"><li>• <b>true</b>: The object is disabled regardless of whether other objects depend on it.</li><li>• <b>false</b>: No object can depend on the object. Otherwise, an error occurs.</li></ul> |

Example:

```
openGauss=# CALL db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

```

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.disable_single('job1', false);
disable_single

```

(1 row)

```
openGauss=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

```

(1 row)

- DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING

Analyzes the scheduling job period.

Return type: timestamp with time zone

The prototype of the DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
 IN calendar_string text,
 IN start_date timestamp with time zone,
 IN return_date_after timestamp with time zone
)return timestamp with time zone
```

**Table 10-144** DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING API parameters

| Parameter         | Type                     | Input/<br>Output<br>Param<br>eter | Can Be<br>Empty | Description                            |
|-------------------|--------------------------|-----------------------------------|-----------------|----------------------------------------|
| calendar_string   | text                     | IN                                | No              | Date string of a scheduled job.        |
| start_date        | timestamp with time zone | IN                                | No              | Start time of a scheduled job.         |
| return_date_after | timestamp with time zone | IN                                | No              | Date when a scheduled job is returned. |

Example:

```
openGauss=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate,
eval_calendar_string

2023-09-16 06:05:55+08
(1 row)
```

- DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING

Analyzes the scheduling job period.

Return type: timestamp with time zone

The prototype of the DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
 IN calendar_string text,
 IN start_date timestamp with time zone,
 IN return_date_after timestamp with time zone,
 OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

**Table 10-145** DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING API parameters

| Parameter         | Type                     | Input/Output Parameter | Can Be Empty | Description                                     |
|-------------------|--------------------------|------------------------|--------------|-------------------------------------------------|
| calendar_string   | text                     | IN                     | No           | Date string of a scheduled job.                 |
| start_date        | timestamp with time zone | IN                     | No           | Start time of a scheduled job.                  |
| return_date_after | timestamp with time zone | IN                     | No           | Date when a scheduled job is returned.          |
| next_run_date     | timestamp with time zone | OUT                    | No           | The next date when a scheduled job is returned. |

Example:

```
openGauss=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
DECLARE
 start_date timestamp with time zone;
 return_date_after timestamp with time zone;
 next_run_date timestamp with time zone;
BEGIN
 start_date := '2003-2-1 10:30:00.111111+8':timestamp with time zone;
 return_date_after := start_date;
 DBE_SCHEDULER.evaluate_calendar_string(
 calendar_str,
 start_date, return_date_after, next_run_date);
 DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
 return_date_after := next_run_date;
END;
/
CREATE PROCEDURE
openGauss=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
pr1

(1 row)
```

### 10.12.2.7 DBE\_SQL

#### API Description

**Table 10-146** lists APIs supported by the **DBE\_SQL** package.

**Table 10-146** DBE\_SQL

| API                             | Description     |
|---------------------------------|-----------------|
| <b>DBE_SQL.REGISTER_CONTEXT</b> | Opens a cursor. |

| API                                                  | Description                                                       |
|------------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">DBE_SQL.SQL_UNREGISTER_CON<br/>TEXT</a>  | Closes an open cursor.                                            |
| <a href="#">DBE_SQL.SQL_SET_SQL</a>                  | Passes a set of SQL statements to a cursor.                       |
| <a href="#">DBE_SQL.SQL_RUN</a>                      | Performs a set of dynamically defined operations on a cursor.     |
| <a href="#">DBE_SQL.NEXT_ROW</a>                     | Reads a row of cursor data.                                       |
| <a href="#">DBE_SQL.SET_RESULT_TYPE</a>              | Dynamically defines a column.                                     |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_CHA<br/>R</a>    | Dynamically defines a column of the <b>CHAR</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_INT</a>          | Dynamically defines a column of the <b>INT</b> type.              |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_LON<br/>G</a>    | Dynamically defines a column of the <b>LONG</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_RAW</a>          | Dynamically defines a column of the <b>RAW</b> type.              |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_BYTE<br/>A</a>   | Dynamically defines a column of the bytea type.                   |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_TEXT</a>         | Dynamically defines a column of the <b>TEXT</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_UNK<br/>NOWN</a> | Dynamically defines a column of an unknown type.                  |
| <a href="#">DBE_SQL.GET_RESULT</a>                   | Reads a dynamically defined column value.                         |
| <a href="#">DBE_SQL.GET_RESULT_CHAR</a>              | Reads a dynamically defined column value of the <b>CHAR</b> type. |

| <a href="#">DBE_SQL.DESC_TAB</a>                 | TABLE type of DESC_REC.                                              |
| <a href="#">DBE_SQL.DATE_TABLE</a>               | TABLE type of DATE.                                                  |
| <a href="#">DBE_SQL.NUMBER_TABLE</a>             | TABLE type of NUMBER.                                                |
| <a href="#">DBE_SQL.VARCHAR2_TABLE</a>           | TABLE type of VARCHAR2.                                              |
| <a href="#">DBE_SQL.BIND_VARIABLE</a>            | Binds parameters.                                                    |
| <a href="#">DBE_SQL.SQL_SET_RESULTS_TYPE_C</a>   | Dynamically defines a column of the array type.                      |
| <a href="#">DBE_SQL.SQL_GET_VALUES_C</a>         | Reads a dynamically defined column value.                            |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT</a>      | Reads the return value of an SQL statement.                          |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_CHAR</a> | Reads the return value (of the char type) of an SQL statement.       |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_RAW</a>  | Reads the return value (of the raw type) of an SQL statement.        |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a> | Reads the return value (of the text type) of an SQL statement.       |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_INT</a>  | Reads the return value (of the int type) of an SQL statement.        |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_TEXT</a>    | Reads the return value (of the text array type) of an SQL statement. |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_RAW</a>     | Reads the return value (of the raw array type) of an SQL statement.  |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_CHAR</a>    | Reads the return value (of the char array type) of an SQL statement. |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_INT</a>     | Reads the return value (of the int array type) of an SQL statement.  |

 NOTE

- You are advised to use **dbe\_sql.set\_result\_type** and **dbe\_sql.get\_result** to define columns.
- If the size of the result set is greater than the value of **work\_mem**, the result set will be spilled to a disk temporarily. The value of **work\_mem** must be no greater than 512 MB.

- DBE\_SQL.REGISTER\_CONTEXT

This function opens a cursor, which is the prerequisite for the subsequent **dbe\_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

The prototype of the DBE\_SQL.REGISTER\_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- DBE\_SQL.SQL\_UNREGISTER\_CONTEXT

This function closes a cursor, which is the end of each **dbe\_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the DBE\_SQL.SQL\_UNREGISTER\_CONTEXT function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-147** DBE\_SQL.SQL\_UNREGISTER\_CONTEXT parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be closed. |

- DBE\_SQL.SQL\_SET\_SQL

This function is used to parse the query statement of a specified cursor. The statement parameters can be specified only through the text type. The length cannot exceed 1 GB.

The prototype of the **DBE\_SQL.SQL\_SET\_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
context_id IN INTEGER,
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-148** DBE\_SQL.SQL\_SET\_SQL parameters

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| context_id    | ID of the cursor whose query statement is to be parsed.         |
| query_string  | Query statement to be parsed.                                   |
| language_flag | Version language number. Currently, only <b>1</b> is supported. |

- DBE\_SQL.SQL\_RUN

This function executes a given cursor. It receives a cursor ID first, and the data obtained after execution is used for subsequent operations.

The prototype of the **DBE\_SQL.SQL\_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-149** DBE\_SQL.SQL\_RUN parameters

| Parameter  | Description                                             |
|------------|---------------------------------------------------------|
| context_id | ID of the cursor whose query statement is to be parsed. |

- DBE\_SQL.NEXT\_ROW

This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the **DBE\_SQL.NEXT\_ROW** function is as follows:

```
DBE_SQL.NEXT_ROW(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-150** DBE\_SQL.NEXT\_ROW parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

- DBE\_SQL.SET\_RESULT\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
context_id IN INTEGER,
pos IN INTEGER,
```

```
column_ref IN ANYELEMENT,
maxsize IN INTEGER default 1024
)
RETURN INTEGER;
```

**Table 10-151** DBE\_SQL.SET\_RESULT\_TYPE parameters

| Parameter  | Description                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------|
| context_id | ID of the cursor to be executed                                                                                |
| pos        | Position of a dynamically defined column in the query                                                          |
| column_ref | Variable of any type. You can select an appropriate API to dynamically define columns based on variable types. |
| maxsize    | Length of a defined column.                                                                                    |

- DBE\_SQL.SET\_RESULT\_TYPE\_CHAR

This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
context_id IN INTEGER,
pos IN INTEGER,
column_ref IN TEXT,
column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-152** DBE\_SQL.SET\_RESULT\_TYPE\_CHAR parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Parameter to be defined.                              |
| column_size | Length of a dynamically defined column.               |

- DBE\_SQL.SET\_RESULT\_TYPE\_INT

This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-153** DBE\_SQL.SET\_RESULT\_TYPE\_INT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.SET\_RESULT\_TYPE\_LONG

This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-154** DBE\_SQL.SET\_RESULT\_TYPE\_LONG parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.SET\_RESULT\_TYPE\_RAW

This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
context_id IN INTEGER,
pos IN INTEGER,
column_ref IN RAW,
column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-155** DBE\_SQL.SET\_RESULT\_TYPE\_RAW parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Parameter of the RAW type.                            |
| column_size | Column length.                                        |

- DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA

Defines columns of the BYTEA type returned from a given cursor and can be used only for cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_BYTEA(
context_id IN INTEGER,
pos IN INTEGER,
column_ref IN BYTEA,
column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-156** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Parameter of the BYTEA type.                          |
| column_size | Column length.                                        |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXT

This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
context_id IN INTEGER,
pos IN INTEGER,
maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-157** DBE\_SQL.SET\_RESULT\_TYPE\_TEXT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| maxsize    | Maximum length of the defined <b>TEXT</b> type        |

- DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN

This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN TEXT
)
RETURN INTEGER;
```

**Table 10-158** DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| posn       | Position of a dynamically defined column in the query |
| col_type   | Dynamically defined parameter.                        |

- DBE\_SQL.GET\_RESULT

This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
context_id IN INTEGER,
pos IN INTEGER,
column_value INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-159** DBE\_SQL.GET\_RESULT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

| Parameter    | Description                       |
|--------------|-----------------------------------|
| column_value | Return value of a defined column. |

- DBE\_SQL.GET\_RESULT\_CHAR

This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the DBE\_SQL.GET\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER,
 err INOUT NUMERIC,
 actual_length INOUT INTEGER
);
```

**Table 10-160** DBE\_SQL.GET\_RESULT\_CHAR parameters

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor to be executed                                                                                                                          |
| pos           | Position of a dynamically defined column in the query                                                                                                    |
| tr            | Return value                                                                                                                                             |
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value.                                                                                                                                |

The overloading of the DBE\_SQL.GET\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER
);
```

**Table 10-161** DBE\_SQL.GET\_RESULT\_CHAR parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Return value                                          |

- DBE\_SQL.GET\_RESULT\_INT

This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. The prototype of the **DBE\_SQL.GET\_RESULT\_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-162** DBE\_SQL.GET\_RESULT\_INT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.GET\_RESULT\_LONG

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
context_id IN INTEGER,
pos IN INTEGER,
lgth IN INTEGER,
off_set IN INTEGER,
vl INOUT TEXT,
vl_length INOUT INTEGER
)
RETURN RECORD;
```

**Table 10-163** DBE\_SQL.GET\_RESULT\_LONG parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| lgth       | Length of a return value.                             |
| off_set    | Start position of a return value.                     |
| vl         | Return value                                          |
| vl_length  | Length of a return value.                             |

- DBE\_SQL.GET\_RESULT\_RAW

Returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_RAW** stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id IN INTEGER,
pos IN INTEGER,
tr INOUT RAW,
err INOUT NUMERIC,
actual_length INOUT INTEGER
);
```

**Table 10-164** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor to be executed                                                                                                                          |
| pos           | Position of a dynamically defined column in the query                                                                                                    |
| tr            | Returned column value.                                                                                                                                   |
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value. The value longer than this length will be truncated.                                                                           |

- The overloading of the DBE\_SQL.GET\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id IN INTEGER,
pos IN INTEGER,
tr INOUT RAW
);
```

**Table 10-165** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Returned column value.                                |

- DBE\_SQL.GET\_RESULT\_BYTEA

Returns the value of the BYTEA type in a specified position of a cursor that is obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULT_BYTEA(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN BYTEA;
```

**Table 10-166** DBE\_SQL.GET\_RESULT\_BYTEA parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.GET\_RESULT\_TEXT

This function returns the value of the **TEXT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN TEXT;
```

**Table 10-167** DBE\_SQL.GET\_RESULT\_TEXT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.GET\_RESULT\_UNKNOWN

This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

The prototype of the **DBE\_SQL.GET\_RESULT\_UNKNOWN** function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN TEXT
)
RETURN TEXT;
```

**Table 10-168** DBE\_SQL.GET\_RESULT\_UNKNOWN parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| col_type   | Returned parameter type.                              |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR

This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. Different

from **DBE\_SQL.GET\_RESULT\_CHAR**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN CHARACTER;
```

**Table 10-169** DBE\_SQL.GET\_RESULT\_CHAR parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG**

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_LONG**, the length of the return value is not set and the entire BIGINT value is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
context_id IN INTEGER,
pos IN INTEGER
)
RETURN BIGINT;
```

**Table 10-170** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW**

This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_RAW**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id IN INTEGER,
pos IN INTEGER,
tr INOUT RAW
)
RETURN RAW;
```

**Table 10-171** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.IS\_ACTIVE

This function returns the status of a cursor. The status can be **open**, **parse**, **execute**, or **define**. If the status is **open**, the value is **TRUE**. If the status is unknown, an error is reported. In other cases, the value is **FALSE**.

The prototype of the **DBE\_SQL.IS\_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
 context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-172** DBE\_SQL.IS\_ACTIVE parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be queried. |

- DBE\_SQL.SQL\_BIND\_VARIABLE

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the **DBE\_SQL.SQL\_BIND\_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
 context_id in int,
 query_string in text,
 language_flag in anyelement,
 out_value_size in int default null
)
RETURNS void;
```

**Table 10-173** DBE\_SQL.SQL\_BIND\_VARIABLE parameters

| Parameter      | Description                                            |
|----------------|--------------------------------------------------------|
| context_id     | ID of the cursor to be queried.                        |
| query_string   | Name of a bind variable.                               |
| language_flag  | Bound value.                                           |
| out_value_size | Size of the return value. Default value: <b>null</b> . |

- DBE\_SQL.SQL\_BIND\_ARRAY

This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE\_SQL.SQL\_BIND\_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
 IN context_id int,
 IN query_string text,
 IN value anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
 IN context_id int,
 IN query_string text,
 IN value anyarray,
 IN lower_index int default 1,
 IN higher_index int default 1
)
RETURNS void;
```

**Table 10-174** DBE\_SQL.SQL\_BIND\_ARRAY parameters

| Parameter    | Description                       |
|--------------|-----------------------------------|
| context_id   | ID of the cursor to be queried.   |
| query_string | Name of a bind variable.          |
| value        | Bound array.                      |
| lower_index  | Minimum index of the bound array. |
| higher_index | Maximum index of the bound array. |

- **DBE\_SQL.SET\_RESULT\_TYPE\_INTS**

This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int
)
RETURNS integer;
```

**Table 10-175** DBE\_SQL.SET\_RESULT\_TYPE\_INTS parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried.                       |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array.                           |

| Parameter | Description                            |
|-----------|----------------------------------------|
| cnt       | Number of values obtained at a time.   |
| lower_bnd | Start index when an array is returned. |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS

This function defines columns of the **TEXT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int,
 IN maxsize int
)
RETURNS integer;
```

**Table 10-176** DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried.                       |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array.                           |
| cnt        | Number of values obtained at a time.                  |
| lower_bnd  | Start index when an array is returned.                |
| maxsize    | Maximum length of the defined <b>TEXT</b> type        |

- DBE\_SQL.SET\_RESULT\_TYPE\_RAWS

This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int,
```

```
 IN column_size int
)
RETURNS integer;
```

**Table 10-177** DBE\_SQL.SET\_RESULT\_TYPE\_RAWS parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried.                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array.                           |
| cnt         | Number of values obtained at a time.                  |
| lower_bnd   | Start index when an array is returned.                |
| column_size | Column length.                                        |

- DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS

This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int,
 IN column_size int
)
RETURNS integer;
```

**Table 10-178** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried.                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array.                           |
| cnt         | Number of values obtained at a time.                  |
| lower_bnd   | Start index when an array is returned.                |
| column_size | Column length.                                        |

- DBE\_SQL.SET\_RESULT\_TYPE\_CHARS

This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int,
 IN column_size int
)
RETURNS integer;
```

**Table 10-179** DBE\_SQL.SET\_RESULT\_TYPE\_CHARS parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried.                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array.                           |
| cnt         | Number of values obtained at a time.                  |
| lower_bnd   | Start index when an array is returned.                |
| column_size | Column length.                                        |

- **DBE\_SQL.SET\_RESULTS\_TYPE**

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULTS\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
 IN context_id int,
 IN pos int,
 IN column_ref anyarray,
 IN cnt int,
 IN lower_bnd int,
 IN maxsize int DEFAULT 1024
) returns void;
```

**Table 10-180** DBE\_SQL.SET\_RESULTS\_TYPE parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried.                       |
| pos        | Position of a dynamically defined column in the query |

| Parameter  | Description                            |
|------------|----------------------------------------|
| column_ref | Type of the returned array.            |
| cnt        | Number of values obtained at a time.   |
| lower_bnd  | Start index when an array is returned. |
| maxsize    | Maximum length of the defined type.    |

- DBE\_SQL.GET\_RESULTS\_INT

This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-181** DBE\_SQL.GET\_RESULTS\_INT parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_TEXT

This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-182** DBE\_SQL.GET\_RESULTS\_TEXT parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_RAW

This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-183** DBE\_SQL.GET\_RESULTS\_RAW parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.GET\_RESULTS\_BYTEA**

This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-184** DBE\_SQL.GET\_RESULTS\_BYTEA parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.GET\_RESULTS\_CHAR**

This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-185** DBE\_SQL.GET\_RESULTS\_CHAR parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS

This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

 **NOTE**

The bottom-layer mechanism of DBE\_SQL.GET\_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the database A.

The prototype of the **DBE\_SQL.GET\_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
 IN context_id int,
 IN pos int,
 INOUT column_value anyarray
);
```

**Table 10-186** DBE\_SQL.GET\_RESULTS parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried.                       |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.SQL\_DESCRIBE\_COLUMNS

This function is used to describe column information and can be used only for cursors defined by **SELECT**.

The prototype of the **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
 context_id in int,
 col_cnt inout int,
 desc_t inout db_sql.desc_tab
)RETURNS record ;
```

**Table 10-187** DBE\_SQL.SQL\_DESCRIBE\_COLUMNS parameters

| Parameter  | Description                         |
|------------|-------------------------------------|
| context_id | ID of the cursor to be queried.     |
| col_cnt    | Number of columns returned.         |
| desc_t     | Description of the returned column. |

- DBE\_SQL.DESC\_REC

This type is a composite type and is used to store the description of the SQL\_DESCRIBE\_COLUMNS API.

The prototype of the DBE\_SQL.DESC\_REC function is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
 col_type int,
 col_max_len int,
 col_name VARCHAR2(32),
 col_name_len int,
 col_schema_name VARCHAR2(32),
 col_schema_name_len int,
 col_precision int,
 col_scale int,
 col_charsetid int,
 col_charsetform int,
 col_null_ok BOOLEAN
);
```

- DBE\_SQL.DESC\_TAB

This type is the TABLE type of DESC\_REC and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.DESC\_TAB function is as follows:

```
CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC;
```

- DBE\_SQL.DATE\_TABLE

This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.DATE\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE;
```

- DBE\_SQL.NUMBER\_TABLE

This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.NUMBER\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER;
```

- DBE\_SQL.VARCHAR2\_TABLE

This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.VARCHAR2 function is as follows:

```
CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(2000);
```

- DBE\_SQL.BIND\_VARIABLE

This function is used to bind parameters. You are advised to use **DBE\_SQL.SQL\_BIND\_VARIABLE**.

- DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C

This function is used to dynamically define a column of the array type. You are advised not to use it.

The prototype of the DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C function is as follows:

```
DBE_SQL.sql_set_results_type_c(
 context_id in int,
 pos in int,
 column_ref in anyarray,
 cnt in int,
 lower_bnd in int,
 col_type in anyelement,
 maxsize in int
)return integer;
```

**Table 10-188** DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C parameters

| Parameter  | Description                                             |
|------------|---------------------------------------------------------|
| context_id | ID of the cursor to be queried.                         |
| pos        | Position of a dynamically defined column in the query   |
| column_ref | Type of the returned array.                             |
| cnt        | Number of values obtained at a time.                    |
| lower_bnd  | Start index when an array is returned.                  |
| col_type   | Variable type corresponding to the returned array type. |
| maxsize    | Maximum length of the defined type.                     |

- DBE\_SQL.SQL\_GET\_VALUES\_C

This function is used to read a dynamically defined column value. You are advised not to use it.

The prototype of the DBE\_SQL.SQL\_GET\_VALUES\_C function is as follows:

```
DBE_SQL.sql_get_values_c(
 context_id in int,
 pos in int,
 results_type inout anyarray,
 result_type in anyelement
)return anyarray;
```

**Table 10-189** DBE\_SQL.SQL\_GET\_VALUES\_C parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Parameter position.             |
| results_type | Obtained result.                |

| Parameter   | Description                  |
|-------------|------------------------------|
| result_type | Type of the obtained result. |

- DBE\_SQL.GET\_VARIABLE\_RESULT

This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT column_value anyelement
);
```

**Table 10-190** DBE\_SQL.GET\_VARIABLE\_RESULT parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Name of the bound parameter.    |
| column_value | Return value                    |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR

This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
 IN context_id int,
 IN pos VARCHAR2
)
RETURNS char
```

**Table 10-191** DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be queried. |
| pos        | Name of the bound parameter.    |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW

This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT value anyelement
```

```
)
RETURNS anyelement
```

**Table 10-192** DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be queried. |
| pos        | Name of the bound parameter.    |
| value      | Return value                    |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
 IN context_id int,
 IN pos VARCHAR2
)
RETURNS text
```

**Table 10-193** DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be queried. |
| pos        | Name of the bound parameter.    |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_INT

This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT value anyelement
)
RETURNS anyelement
```

**Table 10-194** DBE\_SQL.GET\_VARIABLE\_RESULT\_INT parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be queried. |
| pos        | Name of the bound parameter.    |
| value      | Return value                    |

- DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT column_value anyarray
)
```

**Table 10-195** DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Name of the bound parameter.    |
| column_value | Return value                    |

- DBE\_SQL.GET\_ARRAY\_RESULT\_RAW

This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT column_value anyarray
)
```

**Table 10-196** DBE\_SQL.GET\_ARRAY\_RESULT\_RAW parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Name of the bound parameter.    |
| column_value | Return value                    |

- DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR

This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT column_value anyarray
)
```

**Table 10-197** DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Name of the bound parameter.    |
| column_value | Return value                    |

- DBE\_SQL.GET\_ARRAY\_RESULT\_INT

This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
 IN context_id int,
 IN pos VARCHAR2,
 INOUT column_value anyarray
)
```

**Table 10-198** DBE\_SQL.GET\_ARRAY\_RESULT\_INT parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the cursor to be queried. |
| pos          | Name of the bound parameter.    |
| column_value | Return value                    |

## Examples

```
-- Perform operations on RAW data in a stored procedure.
openGauss=# create or replace procedure pro_dbe_sql_all_02(in_raw raw,v_in int,v_offset int)
as
context_id int;
v_id int;
v_info bytea :=1;
query varchar(2000);
execute_ret int;
define_column_ret_raw bytea :='1';
define_column_ret int;
begin
drop table if exists pro_dbe_sql_all_tb1_02 ;
create table pro_dbe_sql_all_tb1_02(a int ,b blob);
insert into pro_dbe_sql_all_tb1_02 values(1,HEXTORAW('DEADBEEE'));
insert into pro_dbe_sql_all_tb1_02 values(2,in_raw);
query := 'select * from pro_dbe_sql_all_tb1_02 order by 1';
-- Open a cursor.
context_id := dbe_sql.register_context();
-- Compile the cursor.
dbe_sql.sql_set_sql(context_id, query, 1);
-- Define columns.
define_column_ret:= dbe_sql.set_result_type(context_id,1,v_id);
define_column_ret_raw:= dbe_sql.set_result_type_raw(context_id,2,v_info,10);
-- Execute the cursor.
execute_ret := dbe_sql.sql_run(context_id);
loop
exit when (dbe_sql.next_row(cursorid) <= 0);
```

```
-- Obtain values.
dbe_sql.get_result(context_id,1,v_id);
dbe_sql.get_result_raw(context_id,2,v_info,v_in,v_offset);
-- Output the result.
dbe_output.print_line('id'|| v_id || ' info:' || v_info);
end loop;
-- Close the cursor.
dbe_sql.sql_unregister_context(context_id);
end;
/
-- Call the stored procedure.
openGauss=# call pro_dbe_sql_all_02(HEXTORAW('DEADBEEF'),0,1);

-- Drop the stored procedure.
openGauss=# DROP PROCEDURE pro_dbe_sql_all_02;
```

### 10.12.2.8 DBE\_FILE

The DBE\_FILE package provides the capabilities of reading and writing OS text files for stored procedures.

#### API Description

**Table 10-199** lists all APIs supported by the **DBE\_FILE** package.

**Table 10-199** DBE\_FILE

| API                          | Description                                                              |
|------------------------------|--------------------------------------------------------------------------|
| <b>DBE_FILE.OPEN</b>         | Opens a file based on the specified directory and file name.             |
| <b>DBE_FILE.IS_CLOSED</b>    | Checks whether a file is closed.                                         |
| <b>DBE_FILE.IS_OPEN</b>      | Checks whether a file is opened.                                         |
| <b>DBE_FILE.READ_LINE</b>    | Reads a line of a specified length from an open file handle.             |
| <b>DBE_FILE.WRITE</b>        | Writes data to an open file.                                             |
| <b>DBE_FILE.NEW_LINE</b>     | Writes one or more line terminators to an open file.                     |
| <b>DBE_FILE.WRITE_LINE</b>   | Writes data to an open file and automatically appends a line terminator. |
| <b>DBE_FILE.FORMAT_WRITE</b> | Writes data in a specified format to the buffer of an open file.         |
| <b>DBE_FILE.GET_RAW</b>      | Reads RAW data from an open file.                                        |
| <b>DBE_FILE.PUT_RAW</b>      | Writes RAW data to an open file.                                         |
| <b>DBE_FILE.FLUSH</b>        | Writes cached data to a physical file.                                   |
| <b>DBE_FILE.CLOSE</b>        | Closes an open file handle.                                              |

| API                                    | Description                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_FILE.CLOSE_ALL</a>     | Closes all file handles opened in a session.                                                                                     |
| <a href="#">DBE_FILE.REMOVE</a>        | Deletes a disk file. To perform this operation, you must have required permissions.                                              |
| <a href="#">DBE_FILE.RENAME</a>        | Renames a disk file, which is similar to the mv command of Unix.                                                                 |
| <a href="#">DBE_FILE.COPY</a>          | Copies data in a continuous area to a new file. If <b>start_line</b> and <b>end_line</b> are omitted, the entire file is copied. |
| <a href="#">DBE_FILE.GET_ATTR</a>      | Reads and returns the attributes of a disk file.                                                                                 |
| <a href="#">DBE_FILE.SEEK</a>          | Adjusts the position of a file pointer forward or backward based on the specified number of bytes.                               |
| <a href="#">DBE_FILE.GET_POSITIONS</a> | Returns the current offset of a file, in bytes.                                                                                  |

- DBE\_FILE.OPEN

This function opens a file. You can specify the maximum number of characters in each line. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the DBE\_FILE.OPEN function is as follows:

```
DBE_FILE.OPEN (
 dir IN VARCHAR2,
 file_name IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;
```

**Table 10-200** DBE\_FILE.OPEN API parameters

| Parameter     | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir           | VARCHAR2 | IN                     | No           | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"><li>File directories need to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| file_name     | VARCHAR2 | IN                     | No           | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).                                                                                                                                                                                                                                                                                                                                                                                                 |
| open_mode     | VARCHAR2 | IN                     | No           | File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append).<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.                                                                                                                                                                                                                                                                                                                                                                            |
| max_line_size | INTEGER  | IN                     | Yes          | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.                                                                                                                                                                                                                                                                                                                                                                                                  |

- DBE\_FILE.IS\_CLOSE

Checks whether a file handle is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown. The prototype of the DBE\_FILE.IS\_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE (
file IN INTEGER)
RETURN BOOLEAN;
```

**Table 10-201** DBE\_FILE.IS\_CLOSE parameters

| Parameter          | Type                | Input/<br>Output<br>Parameter | Can<br>Be<br>Empty | Description                          |
|--------------------|---------------------|-------------------------------|--------------------|--------------------------------------|
| file IN<br>INTEGER | IN<br>TE<br>GE<br>R | IN                            | Yes                | Passes a file handle to be detected. |

- DBE\_FILE.READ\_LINE

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified when the file is opened.

The prototype of the DBE\_FILE.READ\_LINE function is as follows:

```
DBE_FILE.READ_LINE (
file IN INTEGER,
buffer OUT VARCHAR2,
len IN INTEGER DEFAULT NULL)
```

**Table 10-202** DBE\_FILE.READ\_LINE parameters

| Parameter | Type                | Input/<br>Output<br>Parameter | Can<br>Be<br>Empty | Description                                                                                                                                  |
|-----------|---------------------|-------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| file      | IN<br>TE<br>GE<br>R | IN                            | No                 | File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown. |

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                           |
|-----------|----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffer    | VARCHAR2 | OUT                    | No           | Buffer used to receive data.                                                                                                                                          |
| len       | INTEGER  | IN                     | Yes          | Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size. |

- DBE\_FILE.WRITE

Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation does not write a line terminator.

The prototype of the **DBE\_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE (
file IN INTEGER,
buffer IN TEXT)
RETURN BOOLEAN;;
```

**Table 10-203** DBE\_FILE.WRITE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                         |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------|
| file      | INTEGER | IN                     | No           | This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written. |

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffer    | TEXT | IN                     | Yes          | <p>Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by WRITE operations cannot exceed 32767 bytes.</p> <p><b>NOTE</b></p> <p>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.</p> |

- DBE\_FILE.NEW\_LINE

Writes one or more line terminators to the buffer corresponding to a file. The line terminators are related to the platform used.

The prototype of the **DBE\_FILE.NEW\_LINE** function is as follows:

```
DBE_FILE.NEW_LINE (
file IN INTEGER,
line_nums IN INTEGER := 1)
RETURN BOOLEAN;
```

**Table 10-204** DBE\_FILE.NEW\_LINE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                      |
|-----------|---------|------------------------|--------------|------------------------------------------------------------------|
| line_nums | INTEGER | IN                     | Yes          | Number of terminators written to a file. The default value is 1. |

- DBE\_FILE.WRITE\_LINE

Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation automatically adds a line terminator.

The prototype of the **DBE\_FILE.WRITE\_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
file IN INTEGER,
buffer IN TEXT,
flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

**Table 10-205** DBE\_FILE.WRITE\_LINE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffer    | TEXT    | IN                     | Yes          | <p>Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified during the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by PUT operations cannot exceed 32767 bytes.</p> <p><b>NOTE</b><br/>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.</p> |
| flush     | BOOLEAN | IN                     | Yes          | <p>Specifies whether to flush data to the disk after the writing.</p>                                                                                                                                                                                                                                                                                                                                                        |

- DBE\_FILE.FORMAT\_WRITE

Writes formatted data to the buffer corresponding to an open file. It is a DBE\_FILE.WRITE API that allows formatting.

The prototype of the **DBE\_FILE.FORMAT\_WRITE** function is as follows:

```
DBE_FILE.FORMAT_WRITE (
file IN INTEGER,
format IN VARCHAR2,
arg1 IN VARCHAR2 DEFAULT NULL,
...
arg6 IN VARCHAR2 DEFAULT NULL))
RETURN BOOLEAN;
```

**Table 10-206** DBE\_FILE.FORMAT\_WRITE parameters

| Parameter     | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                     |
|---------------|----------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file          | INTEGER  | IN                     | No           | File handle opened using OPEN.                                                                                                                                                                                                                  |
| format        | VARCHAR2 | IN                     | Yes          | A string to be formatted, containing the text and format characters \n and %s.                                                                                                                                                                  |
| [arg1...arg6] | VARCHAR2 | IN                     | Yes          | Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s. |

- DBE\_FILE.GET\_RAW

Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

The prototype of the DBE\_FILE.GET\_RAW function is as follows:

```
DBE_FILE.GET_RAW (
file IN INTEGER,
r OUT RAW,
length IN INTEGER DEFAULT NULL);
```

**Table 10-207** DBE\_FILE.GET\_RAW parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                 |
|-----------|---------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN.                                                                                              |
| r         | RAW     | OUTPUT                 | No           | Output binary data.                                                                                                         |
| length    | INTEGER | IN                     | Yes          | Length of the file to be read. The default value is <b>NULL</b> . All data in the file is read. The maximum length is 1 GB. |

- DBE\_FILE.PUT\_RAW

Writes raw data to the buffer corresponding to a file.

The prototype of the DBE\_FILE.PUT\_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
file IN INTEGER,
r IN RAW,
flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

**Table 10-208** DBE\_FILE.PUT\_RAW parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                            |
|-----------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN.                                                                                                                                         |
| r         | RAW     | IN                     | No           | Output binary data.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| flush     | BOOLEAN | IN                     | Yes          | Specifies whether to flush data to a file. The default value is <b>false</b> .                                                                                         |

- DBE\_FILE.FLUSH

Writes cached data to a physical file. The cached data must have a line terminator.

The prototype of the DBE\_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH (
file IN INTEGER)
RETURN VOID;
```

**Table 10-209** DBE\_FILE.FLUSH parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

- DBE\_FILE.CLOSE

Closes an open file. When this function is called, if there is cached data to be written, exception information may be received.

The prototype of the DBE\_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE (
file IN INTEGER
)RETURN INTEGER;
```

**Table 10-210** DBE\_FILE.CLOSE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

- DBE\_FILE.CLOSE\_ALL

Closes all file handles opened in a session. This function can be used for emergency cleanup.

The prototype of the DBE\_FILE.CLOSE\_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL()
RETRUN VOID;
```

**Table 10-211** DBE\_FILE.CLOSE\_ALL API parameters

| Parameter | Description |
|-----------|-------------|
| None.     | None.       |

- DBE\_FILE.REMOVE

Deletes a disk file. To use this function, you must have the required permission.

The prototype of the DBE\_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE (
 dir IN VARCHAR2,
 file_name IN VARCHAR2)
RETURN VOID;
```

**Table 10-212** DBE\_FILE.REMOVE parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir       | VARCHAR2 | IN                     | No           | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"><li>File directories need to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| file_name | VARCHAR2 | IN                     | No           | File name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- DBE\_FILE.RENAME

Renames a disk file. This function is similar to the mv command of Unix.

The prototype of the DBE\_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-213** DBE\_FILE.RENAME parameters

| Parameter     | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Parameter      | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                |
|----------------|----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_file_name | VARCHAR2 | IN                     | No           | New file name                                                                                                                                                                                                              |
| overwrite      | BOOLEAN  | IN                     | Yes          | Specifies whether to overwrite the file. If the parameter is left empty or not specified, the parameter is not overwritten. If a file with the same name exists in the target directory, the file will not be overwritten. |

- DBE\_FILE.COPY

Copies data in a continuous area to a new file. If **start\_line** and **end\_line** are omitted, the entire file is copied.

The prototype of the DBE\_FILE.COPY function is as follows:

```
DBE_FILE.COPY (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
start_line IN INTEGER DEFAULT 1,
end_line IN INTEGER DEFAULT NULL)
RETURN VOID;
```

**Table 10-214** DBE\_FILE.COPY parameters

| Parameter      | Type     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| end_line   | IN<br>TE<br>GE<br>R | IN                            | Yes                | Number of the line where the copy ends.<br>The default value is <b>NULL</b> , indicating the<br>end of the file. |

- DBE\_FILE.GET\_ATTR

Reads and returns the attributes of a disk file.

The prototype of the DBE\_FILE.GET\_ATTR stored procedure is as follows:

```
DBE_FILE.GET_ATTR(
location IN text,
filename IN text,
OUT fexists boolean,
OUT file_length bigint,
OUT block_size integer);
```

**Table 10-215** DBE\_FILE.GET\_ATTR parameters

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location    | TEXT    | IN                     | No           | File directory<br><b>NOTE</b> <ul style="list-style-type: none"><li>File directories need to be added to the system catalog <a href="#">PG_DIRECTORY</a>. If the input path does not match the path in <a href="#">PG_DIRECTORY</a>, an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| filename    | TEXT    | IN                     | No           | File name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| fexists     | BOOLEAN | OUT                    | No           | Specifies whether the file exists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| file_length | BIGINT  | OUT                    | No           | File length (unit: byte). If the file does not exist, <b>NULL</b> is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| block_size  | INTEGER | OUT                    | No           | Block size of the file system (unit: byte). If the file does not exist, <b>NULL</b> is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

- DBE\_FILE.SEEK

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the DBE\_FILE.SEEK function is as follows:

```
DBE_FILE.SEEK (
file IN INTEGER,
absolute_start IN BIGINT DEFAULT NULL,
```

```
relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

**Table 10-216** DBE\_FILE.SEEK parameters

| Parameter      | Type    | Input/<br>Output<br>Parameter | Can<br>Be<br>Empty | Description                                                                                                                                                                                                                                                            |
|----------------|---------|-------------------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file           | INTEGER | IN                            | No                 | File handle opened using OPEN.                                                                                                                                                                                                                                         |
| absolute_start | BIGINT  | IN                            | Yes                | Absolute offset of a file. The default value is <b>NULL</b> .                                                                                                                                                                                                          |
| relative_start | BIGINT  | IN                            | Yes                | Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is <b>NULL</b> . If both <b>absolute_start</b> and this parameter are specified, the <b>absolute_start</b> parameter is used. |

- DBE\_FILE.GET\_POS

Returns the current offset of the file in bytes.

The prototype of the DBE\_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS (
file IN INTEGER)
RETURN BIGINT;
```

**Table 10-217** DBE\_FILE.GET\_POS parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

- DBE\_FILE.IS\_OPEN

Returns the current offset of the file in bytes.

The prototype of the DBE\_FILE.IS\_OPEN function is as follows:

```
DBE_FILE.IS_OPEN (
file IN INTEGER)
RETURN BOOLEAN;
```

**Table 10-218** DBE\_FILE.IS\_OPEN parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                    |
|-----------|---------|------------------------|--------------|--------------------------------|
| file      | INTEGER | IN                     | No           | File handle opened using OPEN. |

## Examples

```
-- Add the /temp/ directory to the PG_DIRECTORY system catalog as a SYSADMIN.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- The expected result is as follows:
CREATE DIRECTORY
-- Open a file and write data into the file.
```

```
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := dbe_file.open(dir, 'sample.txt', 'w');
 PERFORM dbe_file.write_line(f, 'ABC');
 PERFORM dbe_file.write_line(f, '123'::numeric);
 PERFORM dbe_file.write_line(f, '-----');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.write_line(f, '*****');
 PERFORM dbe_file.new_line(f, 0);
 PERFORM dbe_file.write_line(f, '+++++++');
 PERFORM dbe_file.new_line(f, 2);
 PERFORM dbe_file.write_line(f, '#####');
 PERFORM dbe_file.write(f, 'A');
 PERFORM dbe_file.write(f, 'B');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.format_write(f, '[1 -> %s, 2 -> %s, 3 -> %s, 4 -> %s, 5 -> %s]', 'gaussdb', 'dbe', 'file',
'get', 'line');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.write_line(f, '1234567890');
 f := dbe_file.close(f);
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Read data from the file mentioned above.
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := dbe_file.open(dir, 'sample.txt', 'r');
 FOR i IN 1..11 LOOP
 RAISE INFO '[%] : %', i, dbe_file.read_line(f);
 END LOOP;
END;
/
-- The expected result is as follows:
INFO: [1] : ABC
INFO: [2] : 123

INFO: [10] : AB
INFO: [11] : [1 -> gaussdb, 2 -> dbe, 3 -> file, 4 -> get, 5 -> line]
ANONYMOUS BLOCK EXECUTE

-- Offset the file handle and obtain the current file location.
DECLARE
 l_file integer;
 l_buffer VARCHAR2(32767);
 dir text := 'dir';
 abs_offset number := 100;
 rel_offset number := NULL;
BEGIN
 l_file := dbe_file.open(dir => dir, file_name => 'sample.txt', open_mode => 'R');
 dbe_output.print_line('before seek: current position is ' || dbe_file.get_pos(file => l_file)); -- before seek:
current position is 0
 dbe_file.seek(file => l_file, absolute_start=>abs_offset, relative_start=>rel_offset);
 dbe_output.print_line('fseek: current position is ' || dbe_file.get_pos(file => l_file)); -- seek: current
position is 100
 l_file := dbe_file.close(file => l_file);
END;
/
```

```
-- The expected result is as follows:
before seek: current position is 0
fseek: current position is 100
ANONYMOUS BLOCK EXECUTE
```

### 10.12.2.9 DBE\_UTILITY

#### API Description

**Table 10-219** provides all APIs supported by the **DBE\_UTILITY** package.

**Table 10-219** DBE\_UTILITY

| API                                       | Description                                                               |
|-------------------------------------------|---------------------------------------------------------------------------|
| <b>DBE_UTILITY.FORMAT_ERROR_BACKTRACE</b> | Outputs the call stack of an abnormal stored procedure.                   |
| <b>DBE_UTILITY.FORMAT_ERROR_STACK</b>     | Outputs detailed information about a stored procedure exception.          |
| <b>DBE_UTILITY.FORMAT_CALL_STACK</b>      | Outputs the call stack of a stored procedure.                             |
| <b>DBE_UTILITY.GET_TIME</b>               | Outputs the current time, which is used to obtain the execution duration. |

- **DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE**

Returns the call stack where an error occurs during execution. The prototype of the **DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE** function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```

- **DBE\_UTILITY.FORMAT\_ERROR\_STACK**

Returns the detailed information about the error location when an error occurs during the execution. The prototype of the **DBE\_UTILITY.FORMAT\_ERROR\_STACK** function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```

- **DBE\_UTILITY.FORMAT\_CALL\_STACK**

Sets the call stack of the output function. The prototype of the **DBE\_UTILITY.FORMAT\_CALL\_STACK** function is as follows:

```
DBE_UTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```

- **DBE\_UTILITY.GET\_TIME**

Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the **DBE\_UTILITY.GET\_TIME** function is as follows:

```
DBE_UTILITY.GET_TIME()
RETURN BIGINT;
```

## Examples

```
CREATE OR REPLACE PROCEDURE test_get_time1()
AS
declare
 start_time bigint;
 end_time bigint;
BEGIN
 start_time:= dbe_utility.get_time ();
 pg_sleep(1);
 end_time:=dbe_utility.get_time ();
 dbe_output.print_line(end_time - start_time);
END;
/
```

### 10.12.2.10 DBE\_SESSION

#### API Description

**Table 10-220** provides all APIs supported by the **DBE\_SESSION** package. **DBE\_SESSION** takes effect at the session level.

**Table 10-220** DBE\_SESSION

| API                                        | Description                                               |
|--------------------------------------------|-----------------------------------------------------------|
| <a href="#">DBE_SESSION.SET_CONTEXT</a>    | Sets the value of an attribute in a specified context.    |
| <a href="#">DBE_SESSION.CLEAR_CONTEXT</a>  | Clears the value of an attribute in a specified context.  |
| <a href="#">DBE_SESSION.SEARCH_CONTEXT</a> | Queries the value of an attribute in a specified context. |

- **DBE\_SESSION.SET\_CONTEXT**

Sets the value of an attribute in a specified namespace (context). The prototype of the **DBE\_SESSION.SET\_CONTEXT** function is as follows:

```
DBE_SESSION.SET_CONTEXT(
 namespace text,
 attribute text,
 value text
)returns void;
```

**Table 10-221** DBE\_SESSION.SET\_CONTEXT API parameters

| Parameter | Description                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------|
| namespace | Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 characters. |
| attribute | Attribute name. The value contains a maximum of 128 characters.                                                                 |

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| value     | Name of the value to be set. The value contains a maximum of 128 characters. |

- DBE\_SESSION.CLEAR\_CONTEXT

Clears the value of an attribute in a specified namespace (context). The prototype of the DBE\_SESSION.CLEAR\_CONTEXT function is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
 namespace text,
 client_identifier text default 'null',
 attribute text
)returns void ;
```

**Table 10-222** DBE\_SESSION.CLEAR\_CONTEXT API parameters

| Parameter         | Description                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| namespace         | User-specified context.                                                                                                 |
| client_identifier | Client authentication. The default value is ' <b>null</b> '. Generally, you do not need to manually set this parameter. |
| attribute         | Attribute to be cleared.                                                                                                |

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The prototype of the DBE\_SESSION.SEARCH\_CONTEXT function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
 namespace text,
 attribute text
)returns text;
```

**Table 10-223** DBE\_SESSION.SEARCH\_CONTEXT API parameters

| Parameter | Description              |
|-----------|--------------------------|
| namespace | User-specified context.  |
| attribute | Attribute to be queried. |

## Example

```
BEGIN
 select DBE_SESSION.set_context('test', 'gaussdb', 'one'); -- Set the gaussdb attribute of the test context to one.
 select DBE_SESSION.search_context('test', 'gaussdb');
 select DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
```

### 10.12.2.11 DBE\_MATCH

#### API Description

[Table 10-224](#) provides all APIs supported by the **DBE\_MATCH** package.

**Table 10-224** DBE\_MATCH

| API                                | Description                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBE_MATCH.EDIT_DISTANCE_SIMILARITY | Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different. |

- DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The prototype of the **DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY** function is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
 str1 IN text,
 str2 IN text
)returns integer ;
```

**Table 10-225** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY API parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| str1      | First character string. If the value is <b>null</b> , <b>0</b> is returned.  |
| str2      | Second character string. If the value is <b>null</b> , <b>0</b> is returned. |

### 10.12.2.12 DBE\_APPLICATION\_INFO

#### API Description

[Table 10-226](#) provides all APIs supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-226** DBE\_APPLICATION\_INFO

| API                                   | Description                |
|---------------------------------------|----------------------------|
| DBE_APPLICATION_INFO.SET_CLIENT_INFO  | Writes client information. |
| DBE_APPLICATION_INFO.READ_CLIENT_INFO | Reads client information.  |

- DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO  
Writes client information. The prototype of the **DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO** function is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
 str text
)returns void;
```

**Table 10-227** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO API parameters

| Parameter | Description                |
|-----------|----------------------------|
| str       | Writes client information. |

- DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO  
The prototype of the **DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO** function is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

**Table 10-228** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO API parameters

| Parameter   | Description        |
|-------------|--------------------|
| client_info | Client information |

## 10.13 Retry Management

Retry is a process in which the database executes an SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
openGauss=# CREATE OR REPLACE PROCEDURE retry_basic (IN x INT)
AS
BEGIN
 INSERT INTO t1 (a) VALUES (x);
 INSERT INTO t1 (a) VALUES (x+1);
```

```
END;
/
openGauss=# CALL retry_basic(1);
```

## 10.14 Debugging

### Syntax

#### RAISE

The syntax of RAISE is as follows:

**Figure 10-35** raise\_format::=

**Figure 10-36** raise\_condition::=

**Figure 10-37** raise\_sqlstate::=

**Figure 10-38** raise\_option::=

**Figure 10-39** raise::=**Parameter description:**

- The level option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The parameters **log\_min\_messages** and **client\_min\_messages** determine whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:  
--v\_job\_id replaces % in the string.  
`RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;`
- **option = expression**: inserts additional information to an error report. The keyword option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor an **SQLSTATE** is designated in a **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is designated, the condition name or SQLSTATE is used as the message text by default.

**NOTICE**

- If the **SQLSTATE** designates an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In O-compatible mode, **SQLCODE** is equivalent to **SQLSTATE**.

**NOTE**

The syntax described in [Figure 10-39](#) does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

**EXCEPTION\_INIT**

In O-compatible mode, **EXCEPTION\_INIT** can be used to define the **SQLCODE** error code. The syntax is as follows:

**Figure 10-40** exception\_init::=**Parameter description:**

- **exception\_name**: indicates the name of the exception declared by the user. The **EXCEPTION\_INIT** syntax must follow the declared exception.
- **sqlcode** is a customized SQL code, which must be a negative integer ranging from -2147483647 to -1.

**NOTICE**

When **EXCEPTION\_INIT** is used to customize an SQL code, **SQLSTATE** is equivalent to **SQLCODE**, and **SQLERRM** is in the format of **xxx: non-GaussDB Exception**. For example, if the customized SQL code is -1, **SQLSTATE** is -1 and **SQLERRM** is 1: **non-GaussDB Exception**.

**Example**

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result:
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting **SQLSTATE**:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result:
```

```
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
LOCATION: exec_stmt_raise, pl_exec.cpp:3482
```

If the main parameter is a condition name or **SQLSTATE**, the following applies:

```
RAISE division_by_zero;
```

```
RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
BEGIN
IF dividend=0 THEN
RAISE division_by_zero;
RETURN;
ELSE
res := div/dividend;
RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/
call division(3,0);

-- Execution result:
ERROR: division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

In O-compatible mode, EXCEPTION\_INIT can be used to customize error codes SQLCODE.

```
declare
deadlock_detected exception;
pragma exception_init(deadlock_detected, -1);
begin
if 1 > 0 then
raise deadlock_detected;
end if;
exception
when deadlock_detected then
raise notice 'sqlcode:%,sqlstate:%,sqlerrm:%',sqlcode,sqlstate,sqlerrm;
end;
/
-- Execution result:
NOTICE: sqlcode:-1,sqlstate:-1,sqlerrm: 1: non-GaussDB Exception
```

## 10.15 Package

A package is a combination of PL/SQL programs, such as stored procedures, functions, variables, constants, and cursors. It is object-oriented and can encapsulate PL/SQL program design elements. Functions in a package are created, deleted, and modified in a unified manner.

A package contains two parts: package specifications and package body. The declaration contained in the package specifications can be accessed by external functions and anonymous blocks. The declaration contained in the package body cannot be accessed by external functions or anonymous blocks, but can be accessed only by functions and stored procedures in the package body.

For details about how to create a package, see [CREATE PACKAGE](#).

---

**NOTICE**

- Cross-package variables cannot be used as control variables in the for loops.
  - Types defined in a package cannot be deleted or modified, and cannot be used to define tables.
  - Cursor variables cannot be referenced in SCHEMA.PACKAGE.CUROS mode.
  - A cursor with parameters can be opened only in the current package.
-

# 11 Autonomous Transaction

---

An autonomous transaction is an independent transaction that is started during the execution of a main transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the main transaction. In addition, an autonomous transaction is not affected by the main transaction.

Autonomous transactions are defined in stored procedures, functions, anonymous blocks, and packages, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
create table t2(a int, b int);
insert into t2 values(1,2);
select * from t2;

-- Create a stored procedure that contains an autonomous transaction.
CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int) AS
DECLARE
 num3 int := a;
 num4 int := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(num3, num4);
 db_output.print_line('just use call. ');
END;
/

-- Create a common stored procedure that calls an autonomous transaction stored procedure.
CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
BEGIN
 db_output.print_line('just no use call. ');
 insert into t2 values(666, 666);
 autonomous_4(a,b);
 rollback;
END;
```

```
/
-- Call a common stored procedure.
select autonomous_5(11,22);
-- View the table result.
select * from t2 order by a;
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the main transaction does not affect content that has been committed by the autonomous transaction.

## 11.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
create table t1(a int ,b text);

START TRANSACTION;
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 db_output.print_line('just use call. ');
 insert into t1 values(1,'you are so cute,will commit!');
END;
/
insert into t1 values(1,'you will rollback!');
rollback;

select * from t1;
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the main transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
create table t4(a int, b int, c text);

CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t4 values(a, b, c);
 return 1;
END;
/
CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS
```

```
DECLARE
 num3 int := 220;
 tmp int;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 num3 := num3/num1;
 return num3;
EXCEPTION
 WHEN division_by_zero THEN
 select autonomous_32(num3, num1, sqlerrm) into tmp;
 return 0;
END;
/

select autonomous_33(0);

select * from t4;
```

## 11.4 Package Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure or function in a package. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure or function in a package. The following is an example.

```
-- Create a table.
drop table t2;
create table t2(a int, b int);
insert into t2 values(1,2);
select * from t2;

-- Create a stored procedure or function in a package that contains autonomous transactions.
CREATE OR REPLACE PACKAGE autonomous_pkg AS
 PROCEDURE autonomous_4(a int, b int);
 FUNCTION autonomous_32(a int ,b int) RETURN int;
END autonomous_pkg;
/
CREATE OR REPLACE PACKAGE body autonomous_pkg AS
 PROCEDURE autonomous_4(a int, b int) AS
 DECLARE
 num3 int := a;
 num4 int := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
 BEGIN
 insert into t2 values(num3, num4);
 END;
 FUNCTION autonomous_32(a int ,b int) RETURN int AS
 DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
 BEGIN
 insert into t2 values(a, b);
 return 1;
 END;
END autonomous_pkg;
/

-- Create a common stored procedure that calls a stored procedure or function from a package that
contains autonomous transactions.
CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
 DECLARE
 va int;
 BEGIN
 insert into t2 values(666, 666);
 autonomous_pkg.autonomous_4(a,b);
 va := autonomous_pkg.autonomous_32(a + 1, b + 1);
 rollback;
```

```
END;
/
-- Call a common stored procedure.
select autonomous_5(11,22);
-- View the table result.
select * from t2 order by a;
```

In the preceding example, a stored procedure or function in a package containing autonomous transactions is finally executed in a transaction block that is rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the main transaction does not affect content that has been committed by an autonomous transaction.

## 11.5 Restrictions

### CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 1024, and the default value is **10**.
- When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.

- A trigger function does not support autonomous transactions.

```
CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
 RETURN NEW;
END
$$ LANGUAGE plpgsql;
```

- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
create table t1(a int ,b text);

DECLARE
 --PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
 BEGIN
```

```
dbe_output.print_line('just use call.');
```

```
insert into t1 values(1,'can you rollback!');
```

```
END;
```

```
insert into t1 values(2,'I will rollback!');
```

```
rollback;
```

```
END;
```

```
/
```

```
select * from t1;
```

- In an autonomous transaction, the **ref cursor** parameter can be passed only through the **PROCEDURE OUT** parameter. The **ref cursor** parameter cannot be passed through the **IN**, **INOUT**, or **FUNCTION** parameter.

```
create table sections(section_ID int);
```

```
insert into sections values(1);
```

```
insert into sections values(1);
```

```
insert into sections values(1);
```

```
insert into sections values(1);
```

1. The **PROCEDURE OUT** output parameter passes the **ref cursor** parameter (supported).

```
CREATE OR REPLACE PROCEDURE proc_sys_ref(OUT c1 refcursor)
```

```
IS
```

```
declare
```

```
 PRAGMA AUTONOMOUS_TRANSACTION;
```

```
BEGIN
```

```
 OPEN c1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
```

```
END;
```

```
/
```

```
CREATE OR REPLACE PROCEDURE proc_sys_call() AS
```

```
DECLARE
```

```
 c1 SYS_REFCURSOR;
```

```
 TEMP NUMBER(4);
```

```
BEGIN
```

```
 proc_sys_ref(c1);
```

```
 if c1%isopen then
```

```
 raise notice '%','ok';
```

```
 end if;
```

```
LOOP
```

```
 FETCH C1 INTO TEMP;
```

```
 raise notice '%',C1%ROWCOUNT;
```

```
 EXIT WHEN C1%NOTFOUND;
```

```
END LOOP;
```

```
END;
```

```
/
```

2. The **PROCEDURE IN** or **INOUT** output parameter passes the **ref cursor** parameter (not supported).

```
CREATE OR REPLACE PROCEDURE proc_sys_ref(IN c1 refcursor)
```

```
IS
```

```
declare
```

```
 PRAGMA AUTONOMOUS_TRANSACTION;
```

```
 TEMP NUMBER(4);
```

```
BEGIN
```

```
 if c1%isopen then
```

```
 raise notice '%','ok';
```

```
 end if;
```

```
LOOP
```

```
 FETCH C1 INTO TEMP;
```

```
 raise notice '%',C1%ROWCOUNT;
```

```
 EXIT WHEN C1%NOTFOUND;
```

```
END LOOP;
```

```
END;
```

```
/
```

```
CREATE OR REPLACE PROCEDURE proc_sys_call() AS
```

```
DECLARE
```

```
c1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
OPEN c1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
proc_sys_ref(c1);
END;
/
```

3. **FUNCTION RETURN** passes the **ref cursor** parameter (not supported)  
CREATE OR REPLACE function proc\_sys\_ref()  
return SYS\_REFCURSOR

```
IS
declare
PRAGMA AUTONOMOUS_TRANSACTION;
C1 SYS_REFCURSOR;
BEGIN
OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
return C1;
END;
/
```

4. The **FUNCTION OUT** output parameter passes the **ref cursor** parameter (not supported).  
CREATE OR REPLACE function proc\_sys\_ref(C1 out SYS\_REFCURSOR)  
return SYS\_REFCURSOR

```
IS
declare
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
return 1;
END;
/
```

- Autonomous transaction functions only return records in the out format.

```
create table test_in (id int,a date);
CREATE OR REPLACE FUNCTION autonomous_out()
RETURNS record
LANGUAGE plpgsql AS $$
DECLARE PRAGMA AUTONOMOUS_TRANSACTION;
r1 record;
BEGIN
DBE_OUTPUT.PRINT_LINE('this is in autonomous_f_139_7');
truncate test_in;
insert into test_in values (1,'1909-01-01');
select * into r1 from test_in;
RETURN r1;
END;
$$;
select ok.id,ok.a from autonomous_f_139_7() as ok(id int,a date);
```

- The isolation level of an autonomous transaction cannot be changed.
- Autonomous transactions do not support the **setof** return type.

```
create table test_in (id int,a date);
create table test_main (id int,a date);
insert into test_main values (1111,'2021-01-01'),(2222,'2021-02-02');
truncate test_in,test_main;
CREATE OR REPLACE FUNCTION autonomous_f_022(num1 int) RETURNS SETOF test_in
LANGUAGE plpgsql AS $$
DECLARE
count int :=3;
test_row test_in%ROWTYPE;
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
while true
loop
if count=3 then
null;
else
if count=2 then
insert into test_main values (count,'2021-03-03');
```

```
 goto pos1;
 end if;
end if;
count=count-1;
end loop;
insert into test_main values (1000,'2021-04-04');
<<pos1>>
for test_row in select * from test_main
loop
 return next test_row;
end loop;
return;
END;
$$
;
```

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and system views are visible to either users with the SYSADMIN permission or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even database unavailability.
  - For details about column types in system catalogs and system views, see [Data Type](#).
- 

## 12.2 System Catalogs

## 12.2.1 GS\_ASP

GS\_ASP displays the persistent ACTIVE SESSION PROFILE samples. This catalog can be queried only in the system database but cannot be queried in the user database.

**Table 12-1** GS\_ASP columns

| Name              | Type                     | Description                                                                                                                                                      |
|-------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sampleid          | bigint                   | Sample ID                                                                                                                                                        |
| sample_time       | timestamp with time zone | Sampling time                                                                                                                                                    |
| need_flush_sample | Boolean                  | Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul> |
| databaseid        | oid                      | Database ID                                                                                                                                                      |
| thread_id         | bigint                   | Thread ID                                                                                                                                                        |
| sessionid         | bigint                   | Session ID                                                                                                                                                       |
| start_time        | timestamp with time zone | Start time of a session                                                                                                                                          |
| event             | text                     | Event name                                                                                                                                                       |
| lwtid             | integer                  | Lightweight thread ID of the current thread                                                                                                                      |
| psessionid        | bigint                   | Parent thread of the streaming thread                                                                                                                            |
| tlevel            | integer                  | Level of the streaming thread, which corresponds to the level ( <b>id</b> ) of the execution plan                                                                |
| smpid             | integer                  | Concurrent thread ID in SMP execution mode                                                                                                                       |
| userid            | oid                      | ID of a session user                                                                                                                                             |
| application_name  | text                     | Name of an application                                                                                                                                           |
| client_addr       | inet                     | IP address of a client                                                                                                                                           |
| client_hostname   | text                     | Name of a client                                                                                                                                                 |
| client_port       | integer                  | TCP port number used by a client to communicate with the backend                                                                                                 |
| query_id          | bigint                   | Debug query ID                                                                                                                                                   |

| Name             | Type                     | Description                                                                                                                                                                                                                                                    |
|------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| unique_query_id  | bigint                   | Unique query ID                                                                                                                                                                                                                                                |
| user_id          | oid                      | User ID in the key of the unique query                                                                                                                                                                                                                         |
| cn_id            | integer                  | ID of the node that delivers the unique SQL statement. <b>cn_id</b> is in the key of the unique query.                                                                                                                                                         |
| unique_query     | text                     | Standardized unique SQL text string.                                                                                                                                                                                                                           |
| locktag          | text                     | Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b>                                                                                                                                                              |
| lockmode         | text                     | Mode of a lock that the session waits for <ul style="list-style-type: none"><li>• <b>LW_EXCLUSIVE</b>: exclusive lock</li><li>• <b>LW_SHARED</b>: shared lock</li><li>• <b>LW_WAIT_UNTIL_FREE</b>: waits for the <b>LW_EXCLUSIVE</b> to be available</li></ul> |
| block_sessionid  | bigint                   | Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.                                                                                                                                                               |
| wait_status      | text                     | Provides more details about an event column.                                                                                                                                                                                                                   |
| global_sessionid | text                     | Global session ID                                                                                                                                                                                                                                              |
| xact_start_time  | timestamp with time zone | Start time of the transaction                                                                                                                                                                                                                                  |
| query_start_time | timestamp with time zone | Time when the statement starts to be executed                                                                                                                                                                                                                  |
| state            | text                     | Current transaction state.<br>The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .                                                      |

### 12.2.2 GS\_AUDITING\_POLICY

GS\_AUDITING\_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-2** GS\_AUDITING\_POLICY columns

| Name        | Type                        | Description                                                                                                                                            |
|-------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid         | oid                         | Row identifier (hidden attribute, which must be specified)                                                                                             |
| polname     | name                        | Policy name, which must be unique                                                                                                                      |
| polcomments | name                        | Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword                       |
| modifydate  | timestamp without time zone | Latest timestamp when a policy is created or modified                                                                                                  |
| polenabled  | boolean                     | Specifies whether to enable a policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled</li></ul> |

### 12.2.3 GS\_AUDITING\_POLICY\_ACCESS

GS\_AUDITING\_POLICY\_ACCESS records the unified audit information about DML database operations. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-3** GS\_AUDITING\_POLICY\_ACCESS columns

| Name       | Type                        | Description                                                                                                                             |
|------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| oid        | oid                         | Row identifier (hidden attribute, which must be specified).                                                                             |
| accesstype | name                        | DML database operation type. For example, SELECT, INSERT, and DELETE.                                                                   |
| labelname  | name                        | Resource label name. This column corresponds to the <b>polname</b> column in the system catalog in <a href="#">GS_AUDITING_POLICY</a> . |
| policyoid  | oid                         | OID of the audit policy, corresponding to the OID in the GS_AUDITING_POLICY system catalog.                                             |
| modifydate | timestamp without time zone | Latest creation or modification timestamp.                                                                                              |

## 12.2.4 GS\_AUDITING\_POLICY\_FILTERS

GS\_AUDITING\_POLICY\_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-4** GS\_AUDITING\_POLICY\_FILTERS columns

| Name            | Type                        | Description                                                                                             |
|-----------------|-----------------------------|---------------------------------------------------------------------------------------------------------|
| oid             | oid                         | Row identifier (hidden attribute, which must be specified).                                             |
| filtertype      | name                        | Filter type. Currently, the value is <b>logical_expr</b> .                                              |
| labelname       | name                        | Name. Currently, the value is <b>logical_expr</b> .                                                     |
| policyoid       | oid                         | OID of the audit policy, corresponding to OID in the <a href="#">GS_AUDITING_POLICY</a> system catalog. |
| modifydate      | timestamp without time zone | Latest creation or modification timestamp.                                                              |
| logicaloperator | text                        | Logical character string of a filter criterion.                                                         |

## 12.2.5 GS\_AUDITING\_POLICY\_PRIVILEGES

GS\_AUDITING\_POLICY\_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-5** GS\_AUDITING\_POLICY\_PRIVILEGES columns

| Name            | Type | Description                                                                                                                             |
|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------|
| oid             | oid  | Row identifier (hidden attribute, which must be specified).                                                                             |
| privilegegetype | name | DDL database operation type. For example, CREATE, ALTER, and DROP.                                                                      |
| labelname       | name | Resource label name. This column corresponds to the <b>polname</b> column in the system catalog in <a href="#">GS_AUDITING_POLICY</a> . |

| Name       | Type                        | Description                                                                                  |
|------------|-----------------------------|----------------------------------------------------------------------------------------------|
| policyoid  | oid                         | This column corresponds to the OID in the <a href="#">GS_AUDITING_POLICY</a> system catalog. |
| modifydate | timestamp without time zone | Latest creation or modification timestamp.                                                   |

## 12.2.6 GS\_DB\_PRIVILEGE

**GS\_DB\_PRIVILEGE** records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-6** GS\_DB\_PRIVILEGE columns

| Name           | Type    | Description                                                                                                                                                                                   |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid            | oid     | Row identifier (hidden attribute, which must be specified).                                                                                                                                   |
| roleid         | oid     | User ID.                                                                                                                                                                                      |
| privilege_type | text    | ANY permission of a user. For details about the value, see <a href="#">Table 7-108</a> .                                                                                                      |
| admin_option   | boolean | Specifies whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted. <ul style="list-style-type: none"><li>• <b>t</b>: yes.</li><li>• <b>f</b>: no.</li></ul> |

## 12.2.7 GS\_GLOBAL\_CONFIG

**GS\_GLOBAL\_CONFIG** records the parameter values specified by users during database instance initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**.

**Table 12-7** GS\_GLOBAL\_CONFIG columns

| Name | Type | Description                                                                                                                      |
|------|------|----------------------------------------------------------------------------------------------------------------------------------|
| name | name | Specifies the preset parameter name, weak password name, or parameter required by users during database instance initialization. |

| Name  | Type | Description                                                                                                                              |
|-------|------|------------------------------------------------------------------------------------------------------------------------------------------|
| value | text | Specifies the preset parameter value, weak password value, or parameter value required by users during database instance initialization. |

## 12.2.8 GS\_JOB\_ARGUMENT

GS\_JOB\_ARGUMENT provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-8** GS\_JOB\_ARGUMENT columns

| Name              | Type    | Description                                                                                                                                      |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| oid               | oid     | Row identifier (hidden column)                                                                                                                   |
| argument_position | integer | Location of a parameter of a scheduled task or program.                                                                                          |
| argument_type     | name    | Parameter type of a scheduled task or program.                                                                                                   |
| job_name          | text    | Name of a scheduled task or program.                                                                                                             |
| argument_name     | text    | Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null. |
| argument_value    | text    | Parameter value of a scheduled task. (The program cannot bind a value.)                                                                          |
| default_value     | text    | Default parameter value of a program.                                                                                                            |

## 12.2.9 GS\_JOB\_ATTRIBUTE

GS\_JOB\_ATTRIBUTE records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules.

**Table 12-9** GS\_JOB\_ATTRIBUTE columns

| Name | Type | Description                    |
|------|------|--------------------------------|
| oid  | oid  | Row identifier (hidden column) |

| Name            | Type | Description                                                                                                                |
|-----------------|------|----------------------------------------------------------------------------------------------------------------------------|
| job_name        | text | Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.        |
| attribute_name  | text | Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content. |
| attribute_value | text | Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.                        |

## 12.2.10 GS\_MASKING\_POLICY

GS\_MASKING\_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-10** GS\_MASKING\_POLICY columns

| Name        | Type                        | Description                                                                                                                                            |
|-------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid         | oid                         | Row identifier (hidden attribute, which must be specified).                                                                                            |
| polname     | name                        | Policy name, which must be unique                                                                                                                      |
| polcomments | name                        | Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword                       |
| modifydate  | timestamp without time zone | Latest timestamp when a policy is created or modified                                                                                                  |
| polenabled  | boolean                     | Specifies whether to enable a policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled</li></ul> |

## 12.2.11 GS\_MASKING\_POLICY\_ACTIONS

GS\_MASKING\_POLICY\_ACTIONS records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-11** GS\_MASKING\_POLICY\_ACTIONS columns

| Name          | Type                        | Description                                                                                                      |
|---------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|
| oid           | oid                         | Row identifier (hidden attribute, which must be specified).                                                      |
| actiontype    | name                        | Name of a masking function used by a masking policy                                                              |
| actparams     | name                        | Parameter information specified in a masking function                                                            |
| actlabelname  | name                        | Name of a masked label                                                                                           |
| policyoid     | oid                         | OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> |
| actmodifydate | timestamp without time zone | Latest timestamp when a record is created or modified                                                            |

## 12.2.12 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filter criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

**Table 12-12** GS\_MASKING\_POLICY\_FILTERS columns

| Name            | Type                        | Description                                                                                                                           |
|-----------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| oid             | oid                         | Row identifier (hidden attribute, which must be specified).                                                                           |
| filtertype      | name                        | Filter type. Currently, the value is <b>logical_expr</b> .                                                                            |
| filterlabelname | name                        | Filter range. Currently, the value is <b>logical_expr</b> .                                                                           |
| policyoid       | oid                         | OID of the masking policy to which a user filter criterion belongs, which corresponds to the OID in <a href="#">GS_MASKING_POLICY</a> |
| modifydate      | timestamp without time zone | Latest timestamp when a user filter criterion is created or modified                                                                  |
| logicaloperator | text                        | Polish notation of a filter criterion                                                                                                 |

## 12.2.13 GS\_MATVIEW

**GS\_MATVIEW** provides information about each materialized view in the database.

**Table 12-13** GS\_MATVIEW columns

| Name        | Type      | Description                                                                                                                                                                                                                                     |
|-------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid         | oid       | Row identifier (hidden attribute, which must be specified)                                                                                                                                                                                      |
| matviewid   | oid       | OID of a materialized view                                                                                                                                                                                                                      |
| mapid       | oid       | OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a complete-refresh materialized view does not correspond to a map table, the value of this column is <b>0</b> .                 |
| ivm         | boolean   | Type of a materialized view. The value <b>t</b> indicates a fast-refresh materialized view, and the value <b>f</b> indicates a complete-refresh materialized view.                                                                              |
| needrefresh | boolean   | Reserved column                                                                                                                                                                                                                                 |
| refreshtime | timestamp | Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for fast-refresh materialized views. For complete-refresh materialized views, the value is null. |

## 12.2.14 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each fast-refresh materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the complete-refresh materialized view. Therefore, no record is written into the Mlog table.

**Table 12-14** GS\_MATVIEW\_DEPENDENCY columns

| Name      | Type | Description                                                |
|-----------|------|------------------------------------------------------------|
| oid       | oid  | Row identifier (hidden attribute, which must be specified) |
| matviewid | oid  | OID of a materialized view                                 |
| relid     | oid  | OID of a base table of a materialized view                 |

| Name   | Type | Description                                                                                                       |
|--------|------|-------------------------------------------------------------------------------------------------------------------|
| mlogid | oid  | OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table. |
| mxmin  | int4 | Reserved column                                                                                                   |

## 12.2.15 GS\_OPT\_MODEL

GS\_OPT\_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

**Table 12-15** GS\_OPT\_MODEL columns

| Name          | Type    | Description                                                                                                                                                         |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid     | Database object ID.                                                                                                                                                 |
| template_name | name    | Template name of the machine learning model, which determines the APIs called for training and prediction. Currently, only rlstm is implemented.                    |
| model_name    | name    | Model name. Each model corresponds to a set of parameters, training logs, and model coefficients in the AI engine online learning process. The name must be unique. |
| datname       | name    | Name of the database served by the model. Each model is specific to a single database. This parameter determines data used for training.                            |
| ip            | name    | IP address of the host where the AI engine is deployed                                                                                                              |
| port          | integer | Listening port number of the AI engine                                                                                                                              |

| Name          | Type    | Description                                                                                                                                                       |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_epoch     | integer | Maximum number of iterations in an epoch                                                                                                                          |
| learning_rate | real    | Learning rate of model training. The default value <b>1</b> is recommended.                                                                                       |
| dim_red       | real    | Number of model feature dimensions whose retention is reduced                                                                                                     |
| hidden_units  | integer | Number of neurons in the model's hidden layer. If the model cannot be converged for a long time, increase the value of this parameter.                            |
| batch_size    | integer | Size of a batch in each iteration. It is recommended that the size be greater than or equal to the total training data volume to accelerate model convergence.    |
| feature_size  | integer | Length of the model feature, which is used to trigger retraining. This parameter is automatically updated after model training and does not need to be specified. |
| available     | Boolean | Specifies whether the model is converged. This parameter does not need to be specified.                                                                           |
| Is_training   | Boolean | Specifies whether the model is being trained. This parameter does not need to be specified.                                                                       |

| Name        | Type     | Description                                                                                                                                                                                                                                   |
|-------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| label       | "char"[] | Target task of the model. <ul style="list-style-type: none"><li>• S: startup time</li><li>• T: total time</li><li>• R: rows</li><li>• M: peak memory</li></ul> Currently, {S, T} or {R} is recommended due to model performance restrictions. |
| max         | bigint[] | Maximum value of each task label of the model, which is used to trigger retraining. This parameter does not need to be specified.                                                                                                             |
| acc         | real[]   | Accuracy of each model task. This parameter does not need to be specified.                                                                                                                                                                    |
| description | text     | Model comment                                                                                                                                                                                                                                 |

## 12.2.16 GS\_PACKAGE

**GS\_PACKAGE** records package information.

**Table 12-16** GS\_PACKAGE columns

| Name           | Type      | Description                                                |
|----------------|-----------|------------------------------------------------------------|
| oid            | oid       | Row identifier (hidden attribute, which must be specified) |
| pkgnamespace   | oid       | Schema to which a package belongs                          |
| pkgowner       | oid       | Owner of a package                                         |
| pkgname        | name      | Name of a package                                          |
| pkgspecsrc     | text      | Package specification                                      |
| pkgbodydeclsrc | text      | Package body                                               |
| pkgbodyinitsrc | text      | Package initialization source                              |
| pkgacl         | aclitem[] | Access permission                                          |

| Name      | Type    | Description                                                         |
|-----------|---------|---------------------------------------------------------------------|
| pkgsecdef | boolean | Specifies whether a user has the definer permission on the package. |

## 12.2.17 GS\_POLICY\_LABEL

**GS\_POLICY\_LABEL** records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only users with the SYSADMIN or POLADMIN permission can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-17** GS\_POLICY\_LABEL columns

| Name          | Type | Description                                                                                                                           |
|---------------|------|---------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid  | Row identifier (hidden attribute, which must be specified)                                                                            |
| labelname     | name | Resource label name                                                                                                                   |
| labeltype     | name | Resource tag type. Currently, the value is <b>RESOURCE</b> .                                                                          |
| fqdnnamespace | oid  | OID of a namespace to which an identified database resource belongs                                                                   |
| fqdnid        | oid  | OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.                  |
| relcolumn     | name | Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty. |
| fqdtype       | name | Type of the identified database resource, for example, schema, table, column, or view                                                 |

## 12.2.18 GS\_RECYCLEBIN

**GS\_RECYCLEBIN** describes details about objects in the recycle bin.

**Table 12-18** GS\_RECYCLEBIN columns

| Name           | Type                     | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid            | oid                      | System column.                                                                                                                                                                                                                                                                                                                                                                                          |
| rcybaseid      | oid                      | Base table object ID, which references <b>gs_recyclebin.oid</b> .                                                                                                                                                                                                                                                                                                                                       |
| rcydbid        | oid                      | OID of the database to which the current object belongs.                                                                                                                                                                                                                                                                                                                                                |
| rcyrelid       | oid                      | OID of the current object.                                                                                                                                                                                                                                                                                                                                                                              |
| rcyname        | name                     | Name of the object in the recycle bin. The format is BIN\$ <i>unique_id</i> \$ <i>oid</i> \$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.                                                                                                                                                                                       |
| rcyoriginname  | name                     | Original object name.                                                                                                                                                                                                                                                                                                                                                                                   |
| rcyoperation   | char                     | Operation type. <ul style="list-style-type: none"><li>• <b>d</b>: drop</li><li>• <b>t</b>: truncate</li></ul>                                                                                                                                                                                                                                                                                           |
| rcytype        | integer                  | Object type. <ul style="list-style-type: none"><li>• <b>0</b>: table</li><li>• <b>1</b>: index</li><li>• <b>2</b>: TOAST table</li><li>• <b>3</b>: TOAST index</li><li>• <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li><li>• <b>5</b>: partition.</li><li>• <b>6</b>: global index.</li></ul> |
| rcyrecyclecsn  | bigint                   | CSN when an object is dropped or truncated.                                                                                                                                                                                                                                                                                                                                                             |
| rcyrecycletime | timestamp with time zone | Time when an object is dropped or truncated.                                                                                                                                                                                                                                                                                                                                                            |
| rcycreatecsn   | bigint                   | CSN when an object is created.                                                                                                                                                                                                                                                                                                                                                                          |
| rcychangecsn   | bigint                   | CSN when an object definition is modified.                                                                                                                                                                                                                                                                                                                                                              |
| rcynamespace   | oid                      | OID of the namespace that contains this relationship                                                                                                                                                                                                                                                                                                                                                    |
| rcyowner       | oid                      | Relationship owner                                                                                                                                                                                                                                                                                                                                                                                      |

| Name           | Type  | Description                                                                                                                                                                                 |
|----------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rcytablespace  | oid   | Tablespace where the relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file. |
| rcyrelfilenode | oid   | File name of the recycle bin object on a disk, or <b>0</b> if none, used to restore the texture file when the <b>TRUNCATE</b> object is restored.                                           |
| rcycanrestore  | bool  | Specifies whether flashback can be performed separately.                                                                                                                                    |
| rcycanpurge    | bool  | Specifies whether the purge operation can be performed independently.                                                                                                                       |
| rcyfrozenxid   | xid32 | All transaction IDs before this one have been replaced by a permanent (frozen) transaction ID in the table.                                                                                 |
| rcyfrozenxid64 | xid   | All transaction IDs before this one have been replaced by a permanent (frozen) transaction ID in the table.                                                                                 |

## 12.2.19 GS\_SQL\_PATCH

**GS\_SQL\_PATCH** records the status information about all SQL patches.

**Table 12-19** GS\_SQL\_PATCH columns

| Name           | Type         | Description                                   |
|----------------|--------------|-----------------------------------------------|
| patch_name     | name         | Patch name.                                   |
| unique_sql_id  | bigint       | Global unique ID.                             |
| owner          | oid          | ID of the user who creates the patch.         |
| enable         | boolean      | Specifies whether the patch takes effect.     |
| status         | "char"       | Patch status (reserved column).               |
| abort          | boolean      | Specifies whether the patch is an abort hint. |
| hint_string    | text         | Hint text.                                    |
| hint_node      | pg_node_tree | Hint parsing and serialization result.        |
| original_query | text         | Original statement (reserved column).         |

| Name                | Type         | Description                                          |
|---------------------|--------------|------------------------------------------------------|
| patched_query       | text         | Patched statement (reserved column).                 |
| original_query_tree | pg_node_tree | Original statement parsing result (reserved column). |
| patched_query_tree  | pg_node_tree | Patched statement parsing result (reserved column).  |
| description         | text         | Patch description.                                   |

## 12.2.20 GS\_TXN\_SNAPSHOT

GS\_TXN\_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN value corresponding to the timestamp in the range.

**Table 12-20** GS\_TXN\_SNAPSHOT columns

| Name        | Data Type                | Description              |
|-------------|--------------------------|--------------------------|
| snptime     | timestamp with time zone | Snapshot time            |
| snpxmin     | bigint                   | Minimum snapshot ID      |
| snpcsn      | bigint                   | Snapshot CSN             |
| snpsnapshot | text                     | Serialized snapshot text |

## 12.2.21 GS\_UID

GS\_UID records the unique identification meta information of the hasuids attribute table in the database.

**Table 12-21** GS\_UID columns

| Name       | Type   | Description                                                |
|------------|--------|------------------------------------------------------------|
| relid      | oid    | OID of a table.                                            |
| uid_backup | bigint | Largest unique identifier that can be assigned to a table. |

## 12.2.22 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in PG\_AGGREGATE is an extension of an entry in PG\_PROC. The PG\_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-22** PG\_AGGREGATE columns

| Name           | Type    | Reference                                 | Description                                                                                                                                                                                                                                              |
|----------------|---------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aggfnoid       | regproc | <b>prname</b> in <a href="#">PG_PROC</a>  | <a href="#">PG_PROC</a> prname of the aggregate function.                                                                                                                                                                                                |
| aggtransfn     | regproc | <b>prname</b> in <a href="#">PG_PROC</a>  | Transition function                                                                                                                                                                                                                                      |
| aggcollectfn   | regproc | <b>prname</b> in <a href="#">PG_PROC</a>  | Collect function                                                                                                                                                                                                                                         |
| aggfinalfn     | regproc | <b>prname</b> in <a href="#">PG_PROC</a>  | Final function ( <b>0</b> if none)                                                                                                                                                                                                                       |
| aggsortop      | oid     | <b>oid</b> in <a href="#">PG_OPERATOR</a> | Associated sort operator ( <b>0</b> if none)                                                                                                                                                                                                             |
| aggtranstype   | oid     | <b>oid</b> in <a href="#">PG_TYPE</a>     | Data type of the aggregate function's internal transition (state) data<br><br>The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic. |
| agginitval     | text    | -                                         | Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.                                                    |
| agginitcollect | text    | -                                         | Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.                                                    |

| Name              | Type     | Reference | Description                                                                                                                                                                                                   |
|-------------------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aggkind           | "char"   | -         | Type of the aggregate function: <ul style="list-style-type: none"><li>• <b>n</b>: normal aggregate</li><li>• <b>o</b>: ordered set aggregate</li></ul>                                                        |
| aggnumdirect args | smallint | -         | Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is <b>0</b> . |

### 12.2.23 PG\_AM

PG\_AM records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-23** PG\_AM columns

| Name         | Type     | Reference | Description                                                                                                                                                                                                               |
|--------------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid          | oid      | -         | Row identifier (hidden attribute, which must be specified)                                                                                                                                                                |
| amname       | name     | -         | Name of the access method                                                                                                                                                                                                 |
| amstrategies | smallint | -         | Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies)                                                                                     |
| amsupport    | smallint | -         | Number of support routines for the access method                                                                                                                                                                          |
| amcanorder   | Boolean  | -         | Specifies whether the access method supports ordered scans sorted by the indexed column's value. <ul style="list-style-type: none"><li>• <b>t</b> (true): supported.</li><li>• <b>f</b> (false): not supported.</li></ul> |

| Name           | Type    | Reference | Description                                                                                                                                                                                                                                          |
|----------------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| amcanorderbyop | Boolean | -         | Specifies whether the access method supports ordered scans sorted by the result of an operator on the indexed column.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul> |
| amcanbackward  | Boolean | -         | Specifies whether the access method supports backward scanning.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>                                                       |

## 12.2.24 PG\_AMOP

PG\_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-24** PG\_AMOP columns

| Name           | Type | Reference                                 | Description                                                                                                                              |

| amopmethod     | oid      | oid in <a href="#">PG_AM</a>       | Operator family of the index access method.                                                                               |
| amopsortfamily | oid      | oid in <a href="#">PG_OPFAMILY</a> | The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator) |

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

## 12.2.25 PG\_AMPROC

PG\_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-25** PG\_AMPROC columns

| Name         | Type | Reference                          | Description                                                 |
|--------------|------|------------------------------------|-------------------------------------------------------------|
| oid          | oid  | -                                  | Row identifier (hidden attribute, which must be specified). |
| amprocfamily | oid  | oid in <a href="#">PG_OPFAMILY</a> | Operator family of this entry.                              |

| Name            | Type     | Reference                         | Description                                                                                                                                         |
|-----------------|----------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| amproclefttype  | oid      | oid in <a href="#">PG_TYPE</a>    | Left-hand input data type of the associated operator. For details about the possible values and their description, see <a href="#">Data Type</a> .  |
| amprocrighttype | oid      | oid in <a href="#">PG_TYPE</a>    | Right-hand input data type of the associated operator. For details about the possible values and their description, see <a href="#">Data Type</a> . |
| amprocnum       | smallint | -                                 | Support procedure number.                                                                                                                           |
| amproc          | regproc  | prname in <a href="#">PG_PROC</a> | OID of the procedure.                                                                                                                               |

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

## 12.2.26 PG\_APP\_WORKLOADGROUP\_MAPPING

**PG\_APP\_WORKLOADGROUP\_MAPPING** provides load mapping group information in the database.

**Table 12-26** PG\_APP\_WORKLOADGROUP\_MAPPING columns

| Name            | Type | Description                                                |
|-----------------|------|------------------------------------------------------------|
| oid             | oid  | Row identifier (hidden attribute, which must be specified) |
| appname         | name | Application name                                           |
| workload_gpname | name | Mapped workload group name                                 |

## 12.2.27 PG\_ATTRDEF

**PG\_ATTRDEF** records default values of columns.

**Table 12-27** PG\_ATTRDEF columns

| Name     | Type         | Description                                                                                                                                                                                                                     |
|----------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid      | oid          | Row identifier (hidden attribute, which must be specified)                                                                                                                                                                      |
| adrelid  | oid          | Table to which a column belongs                                                                                                                                                                                                 |
| adnum    | smallint     | Number of columns                                                                                                                                                                                                               |
| adbin    | pg_node_tree | Internal representation of the default value of a column or of a generated expression                                                                                                                                           |
| adsrc    | text         | Internal representation of a readable default value or of a generated expression                                                                                                                                                |
| adgencol | "char"       | Specifies whether a column is a generated column. The value <b>s</b> indicates that the column is a generated column, and the value <b>\0</b> indicates that the column is an ordinary column. The default value is <b>\0</b> . |

## 12.2.28 PG\_ATTRIBUTE

PG\_ATTRIBUTE records information about table columns.

**Table 12-28** PG\_ATTRIBUTE columns

| Name          | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attrelid      | oid      | Table to which a column belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| attname       | name     | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| atttypid      | oid      | Column type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| attstattarget | integer  | Level of details of statistics collected for this column by <b>ANALYZE</b> . <ul style="list-style-type: none"><li>• The value <b>0</b> indicates that no statistics should be collected.</li><li>• A negative value indicates that the system default statistic object is used.</li><li>• The exact meaning of positive values is data type-dependent.</li></ul> For scalar data types, <b>attstattarget</b> is both the target number of "most common values" to collect, and the target number of histogram bins to create. |
| attlen        | smallint | Copy of <b>PG_TYPE</b> in the column's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| attnum        | smallint | Number of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| attn_dims     | integer  | Number of dimensions if the column is an array ( <b>0</b> in other cases)                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name          | Type      | Description                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attcacheoff   | integer   | This column is always set to <b>-1</b> on disks. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.                                                                                                                                                         |
| atttypmod     | integer   | Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need <b>atttypmod</b> . |
| attbyval      | Boolean   | Copy of <b>PG_TYPE</b> of this column's type.                                                                                                                                                                                                                                                                                    |
| attstorage    | "char"    | Copy of <b>PG_TYPE</b> of this column's type.                                                                                                                                                                                                                                                                                    |
| attalign      | "char"    | Copy of <b>PG_TYPE</b> of this column's type.                                                                                                                                                                                                                                                                                    |
| attnotnull    | Boolean   | A NOT NULL constraint. It is possible to change this column to enable or disable the constraint.                                                                                                                                                                                                                                 |
| atthasdef     | Boolean   | This column has a default value, in which case there will be a corresponding entry in the <b>PG_ATTRDEF</b> table that actually defines the value.                                                                                                                                                                               |
| attisdropped  | Boolean   | Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.                                                                                                                              |
| attislocal    | Boolean   | Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.                                                                                                                                                                                       |
| attinhcount   | integer   | Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.                                                                                                                                                                                                                        |
| attcollation  | oid       | Defined collation of a column.                                                                                                                                                                                                                                                                                                   |
| attacl        | aclitem[] | Permissions for column-level access.                                                                                                                                                                                                                                                                                             |
| attoptions    | text[]    | Column attribute. Currently, the following attributes are supported:<br><b>n_distinct</b> : number of <b>distinct</b> values of a column (excluding subtables).<br><b>n_distinct_inherited</b> : number of <b>distinct</b> values of a column (including subtables).                                                             |
| attfdwoptions | text[]    | Column attribute of a foreign table. Currently, <b>dist_fdw</b> , <b>file_fdw</b> , and <b>log_fdw</b> do not use foreign table column attributes.                                                                                                                                                                               |

| Name          | Type    | Description                                                                                                                                                                                                             |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attinitdefval | bytea   | <b>attinitdefval</b> stores the default value expression. <b>ADD COLUMN</b> in the row-store table must use this column.                                                                                                |
| attkvtype     | tinyint | Specifies the key value type for a column. Value:<br>0. <b>ATT_KV_UNDEFINED</b> : default value.<br>1. <b>ATT_KV_TAG</b> : dimension.<br>2. <b>ATT_KV_FIELD</b> : indicator.<br>3. <b>ATT_KV_TIMETAG</b> : time column. |

## 12.2.29 PG\_AUTHID

PG\_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose **rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For GaussDB, only one PG\_AUTHID exists, which is not available for every database. This system catalog is accessible only to users with the SYSADMIN permission.

**Table 12-29** PG\_AUTHID columns

| Name          | Type    | Description                                                                                                                                                                                                                                      |
|---------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid     | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                      |
| rolname       | name    | Role name.                                                                                                                                                                                                                                       |
| rolsuper      | Boolean | Specifies whether a role is the initial SYSADMIN with the highest permission. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                            |
| rolinherit    | Boolean | Specifies whether a role automatically inherits permissions of roles of which it is a member. <ul style="list-style-type: none"><li>• <b>t</b> (true): automatically inherited</li><li>• <b>f</b> (false): not automatically inherited</li></ul> |
| rolcreatorole | Boolean | Specifies whether a role can create more roles. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                          |

| Name           | Type                     | Description                                                                                                                                                                                                                                                                                                          |
|----------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rolcreatedb    | Boolean                  | Specifies whether a role can create databases.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                                         |
| rolcatupdate   | Boolean                  | Specifies whether a role can directly update system catalogs. Only the initial SYSADMIN whose <b>usesysid</b> is set to <b>10</b> has this permission. This permission is unavailable for other users.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul> |
| rolcanlogin    | Boolean                  | Specifies whether a role can log in, that is, whether a role can be given as the initial session authorization identifier.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                             |
| rolreplication | Boolean                  | Specifies whether a role has the replication permission.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                               |
| rolauditadmin  | Boolean                  | Specifies whether a role has the AUDITADMIN permission.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                                |
| rolsystemadmin | Boolean                  | Specifies whether a role has the SYSADMIN permission.<br><ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                                  |
| rolconnlimit   | integer                  | Maximum number of concurrent connections that the role can make (valid for roles that can log in).<br>The value <b>-1</b> indicates there is no limit.                                                                                                                                                               |
| rolpassword    | text                     | Password ciphertext ( <b>NULL</b> if no password).                                                                                                                                                                                                                                                                   |
| rolvalidbegin  | timestamp with time zone | Account validity start time ( <b>NULL</b> if no start time).                                                                                                                                                                                                                                                         |
| rolvaliduntil  | timestamp with time zone | Password expiry time ( <b>NULL</b> if no expiration).                                                                                                                                                                                                                                                                |

| Name              | Type    | Description                                                                                                                                                                      |
|-------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 12.2.30 PG\_AUTH\_HISTORY

PG\_AUTH\_HISTORY records the authentication history of a role. This system catalog is accessible only to users with the SYSADMIN permission.

**Table 12-30** PG\_AUTH\_HISTORY columns

| Name         | Type                     | Description                                                                                                               |
|--------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| oid          | oid                      | Row identifier (hidden attribute, which must be specified).                                                               |
| roloid       | oid                      | ID of a role.                                                                                                             |
| passwordtime | timestamp with time zone | Time of password creation and change.                                                                                     |
| rolpassword  | text                     | Ciphertext of the role password. The encryption mode is determined by the GUC parameter <b>password_encryption_type</b> . |

## 12.2.31 PG\_AUTH\_MEMBERS

PG\_AUTH\_MEMBERS records the membership between roles.

**Table 12-31** PG\_AUTH\_MEMBERS columns

| Name         | Type    | Description                                                                                                                    |
|--------------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| roleid       | oid     | ID of a role that has a member.                                                                                                |
| member       | oid     | ID of a role that is a member of ROLEID.                                                                                       |
| grantor      | oid     | ID of a role that grants this membership.                                                                                      |
| admin_option | Boolean | Specifies whether a member can grant membership in ROLEID to others. The value can be <b>true</b> (yes) and <b>false</b> (no). |

## 12.2.32 PG\_CAST

PG\_CAST records the conversion relationship between data types.

**Table 12-32** PG\_CAST columns

| Name       | Type | Description                                                                      |
|------------|------|----------------------------------------------------------------------------------|
| oid        | oid  | Row identifier (hidden attribute, which must be specified).                      |
| castsource | oid  | OID of the source data type                                                      |
| casttarget | oid  | OID of the target data type                                                      |
| castfunc   | oid  | OID of the conversion function ( <b>0</b> if no conversion function is required) |

| Name        | Type   | Description                                                                                                                                                                                                                                                                                                                                             |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| castcontext | "char" | Conversion mode between the source and target data types. <ul style="list-style-type: none"><li>• <b>e</b>: Only explicit conversion can be performed (using the CAST or :: syntax).</li><li>• <b>i</b>: Implicit conversion can be performed.</li><li>• <b>a</b>: Both explicit and implicit conversion can be performed between data types.</li></ul> |
| castmethod  | "char" | Conversion method. <ul style="list-style-type: none"><li>• <b>f</b>: Conversion is performed using the specified function in the <b>castfunc</b> column.</li><li>• <b>b</b>: Binary forcible conversion rather than the specified function in the <b>castfunc</b> column is performed between data types.</li></ul>                                     |

## 12.2.33 PG\_CLASS

PG\_CLASS records database objects and their relationship.

**Table 12-33** PG\_CLASS columns

| Name          | Type | Description                                                                                                                                                                                      |
|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid  | Row identifier (hidden attribute, which must be specified).                                                                                                                                      |
| relname       | name | Name of an object, such as a table, index, or view.                                                                                                                                              |
| relnamespace  | oid  | OID of the namespace that contains the relationship.                                                                                                                                             |
| reltype       | oid  | Data type that corresponds to the table's row type. The index is 0 because the index does not have <b>PG_TYPE</b> records.                                                                       |
| reloftype     | oid  | OID of the composite type ( <b>0</b> for other types).                                                                                                                                           |
| relowner      | oid  | Owner of the relationship.                                                                                                                                                                       |
| relam         | oid  | Access method used, such as B-tree and hash, if this is an index.                                                                                                                                |
| relfilenode   | oid  | Name of the on-disk file of this relationship ( <b>0</b> if such file does not exist).                                                                                                           |
| reltablespace | oid  | Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file. |

| Name           | Type             | Description                                                                                                                                                                                                                                                                                                                             |
|----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relpages       | double precision | Size of the on-disk representation of the table in pages (of size <b>BLCKSZ</b> ). This is only an estimate used by the optimizer.                                                                                                                                                                                                      |
| reltuples      | double precision | Number of rows in the table. This is only an estimate used by the optimizer.                                                                                                                                                                                                                                                            |
| relallvisible  | integer          | Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by <b>VACUUM</b> , <b>ANALYZE</b> , and a few DDL statements such as <b>CREATE INDEX</b> .                                                                                                         |
| reltoastrelid  | oid              | OID of the TOAST table associated with the table ( <b>0</b> if no TOAST table exists).<br>The TOAST table stores large columns "offline" in a secondary table.                                                                                                                                                                          |
| reltoastidxid  | oid              | OID of the index for a TOAST table ( <b>0</b> for a table other than a TOAST table).                                                                                                                                                                                                                                                    |
| relhasindex    | Boolean          | Its value is <b>true</b> if this column is a table and has (or recently had) at least one index.<br>It is set by <b>CREATE INDEX</b> but is not immediately cleared by <b>DROP INDEX</b> . If the <b>VACUUM</b> process detects that a table has no index, it clears the <b>relhasindex</b> column and sets the value to <b>false</b> . |
| relisshared    | Boolean          | Its value is <b>true</b> if the table is shared across all database nodes in the database. Only certain system catalogs (such as PG_DATABASE) are shared.                                                                                                                                                                               |
| relpersistence | "char"           | <ul style="list-style-type: none"><li>• <b>p</b>: permanent table</li><li>• <b>u</b>: non-log table</li><li>• <b>t</b>: temporary table</li><li>• <b>g</b>: global temporary table.</li></ul>                                                                                                                                           |

| Name             | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relkind          | "char"   | <ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table</li> <li>• <b>i</b>: index</li> <li>• <b>I</b>: global index of a partitioned table</li> <li>• <b>s</b>: sequence</li> <li>• <b>L</b>: long sequence</li> <li>• <b>v</b>: view</li> <li>• <b>c</b>: composite type</li> <li>• <b>t</b>: TOAST table</li> <li>• <b>f</b>: foreign table</li> <li>• <b>m</b>: materialized view</li> </ul> |
| relnatts         | smallint | Number of user columns in the relationship (excluding system columns). <a href="#">PG_ATTRIBUTE</a> has the same number of rows as the user columns.                                                                                                                                                                                                                                                       |
| relchecks        | smallint | Number of check constraints in the table. For details, see the system catalog <a href="#">PG_CONSTRAINT</a> .                                                                                                                                                                                                                                                                                              |
| relhasoids       | Boolean  | Its value is <b>true</b> if an OID is generated for each row of the relationship. Otherwise, the value is <b>false</b> .                                                                                                                                                                                                                                                                                   |
| relhaspkey       | Boolean  | Its value is <b>true</b> if the table has (or once had) a primary key. Otherwise, the value is <b>false</b> .                                                                                                                                                                                                                                                                                              |
| relhasrules      | Boolean  | Its value is <b>true</b> if the table has rules. For details, see the system catalog <a href="#">PG_REWRITE</a> .                                                                                                                                                                                                                                                                                          |
| relhastriggers   | Boolean  | The value is <b>true</b> if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog <a href="#">PG_TRIGGER</a> .                                                                                                                                                                                                                                           |
| relhassubclass   | Boolean  | Its value is <b>true</b> if the table has (or once had) any inheritance child table. Otherwise, the value is <b>false</b> .                                                                                                                                                                                                                                                                                |
| relhasclusterkey | Boolean  | Specifies whether the local cluster storage is used. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>                                                                                                                                                                                                                                                      |
| relrowmovement   | Boolean  | Specifies whether row migration is allowed when the partitioned table is updated. <ul style="list-style-type: none"> <li>• <b>true</b>: Row migration is allowed.</li> <li>• <b>false</b>: Row migration is not allowed.</li> </ul>                                                                                                                                                                        |

| Name           | Type      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parttype       | "char"    | Specifies whether the table or index has the property of a partitioned table. <ul style="list-style-type: none"> <li>• <b>p</b>: The table or index has the property of a partitioned table.</li> <li>• <b>n</b>: The table or index does not have the property of a partitioned table.</li> <li>• <b>v</b>: The table is a value partitioned table in HDFS.</li> <li>• <b>s</b>: The table is a level-2 partitioned table.</li> </ul>                                                                                               |
| relfrozenxid   | xid32     | All transaction IDs before this one have been replaced by a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.<br><br>To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.                                                    |
| relacl         | aclitem[] | Access permissions.<br><br>The command output of the query is as follows:<br>rolename=xxxx/yyyy -- Assigning permissions to a role<br>=xxxx/yyyy -- Assigning the permission to public<br><br>xxxx indicates assigned permissions, and yyyy indicates roles with the assigned permissions. For details on permission descriptions, see <a href="#">Table 12-34</a> .                                                                                                                                                                 |
| reloptions     | text[]    | Table or index access method, using character strings in the format of "keyword=value"                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| relreplident   | "char"    | Identifier of a decoding column in logical decoding. <ul style="list-style-type: none"> <li>• <b>d</b>: default (primary key, if any)</li> <li>• <b>n</b>: none</li> <li>• <b>f</b>: all columns</li> <li>• <b>i</b>: The indisreplident of the index is specified or the default index is used.</li> </ul>                                                                                                                                                                                                                          |
| relfrozenxid64 | xid       | All transaction IDs before this one have been replaced by a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.<br><br>For a global temporary table, this field is meaningless. You can view <b>relfrozenxid64</b> of the global temporary table of each session in the pg_catalog.pg_gtt_relstats view. |

| Name         | Type           | Description                                                                                                                                                                                                                                                                                                                         |
|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relbucket    | oid            | Bucket information in <a href="#">PG_HASHBUCKET</a> .                                                                                                                                                                                                                                                                               |
| relbucketkey | int2vect<br>or | Column number of a hash partition.                                                                                                                                                                                                                                                                                                  |
| relminmxid   | xid            | All multi-transaction IDs before this one have been replaced by a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table. |

**Table 12-34** Description of permissions

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| r         | SELECT (read)                                   |
| w         | UPDATE (write)                                  |
| a         | INSERT (insert)                                 |
| d         | DELETE                                          |
| D         | TRUNCATE                                        |
| x         | REFERENCES                                      |
| t         | TRIGGER                                         |
| X         | EXECUTE                                         |
| U         | USAGE                                           |
| C         | CREATE                                          |
| c         | CONNECT                                         |
| T         | TEMPORARY                                       |
| A         | ALTER                                           |
| P         | DROP                                            |
| m         | COMMENT                                         |
| i         | INDEX                                           |
| v         | VACUUM                                          |
| *         | Authorization options for preceding permissions |

## 12.2.34 PG\_COLLATION

PG\_COLLATION describes available collations, which are essentially mappings from an SQL name to OS local categories.

**Table 12-35** PG\_COLLATION columns

| Name          | Type    | Reference                         | Description                                                                                                                 |
|---------------|---------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| oid           | oid     | -                                 | Row identifier (hidden attribute, which must be specified)                                                                  |
| collname      | name    | -                                 | Collation name (unique per namespace and encoding)                                                                          |
| collnamespace | oid     | <b>oid</b> in <b>PG_NAMESPACE</b> | OID of the namespace that contains this collation                                                                           |
| collowner     | oid     | <b>oid</b> in <b>PG_AUTHID</b>    | Owner of the collation                                                                                                      |
| collencoding  | integer | -                                 | Encoding in which the collation is applicable, or <b>-1</b> if it works for any encoding. It is compatible with PostgreSQL. |
| collcollate   | name    | -                                 | <b>LC_COLLATE</b> for this collation object                                                                                 |
| collctype     | name    | -                                 | <b>LC_CTYPE</b> for this collation object                                                                                   |

## 12.2.35 PG\_CONSTRAINT

PG\_CONSTRAINT records check, primary key, and unique constraints on tables.

**Table 12-36** PG\_CONSTRAINT columns

| Name         | Type | Description                                                 |
|--------------|------|-------------------------------------------------------------|
| oid          | oid  | Row identifier (hidden attribute, which must be specified). |
| conname      | name | Constraint name (not necessarily unique).                   |
| connamespace | oid  | OID of the namespace that contains the constraint           |

| Name          | Type    | Description                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| contype       | "char"  | <ul style="list-style-type: none"><li>• <b>c</b>: check constraint</li><li>• <b>p</b>: primary key constraint</li><li>• <b>u</b>: unique constraint</li><li>• <b>t</b>: trigger constraint</li><li>• <b>x</b>: mutual exclusion constraint</li><li>• <b>f</b>: foreign key constraint</li><li>• <b>s</b>: clustering constraint</li><li>• <b>i</b>: invalid constraint</li></ul> |
| condeferrable | Boolean | Specifies whether the constraint is deferrable. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no.</li></ul>                                                                                                                                                                                                                                  |
| condeferred   | Boolean | Specifies whether the constraint can be deferrable by default. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no.</li></ul>                                                                                                                                                                                                                   |
| convalidated  | Boolean | Specifies whether the constraint is valid. Currently, it can be set to <b>false</b> only for foreign key and check constraints. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no.</li></ul>                                                                                                                                                  |
| conrelid      | oid     | Table containing this constraint ( <b>0</b> if it is not a table constraint).                                                                                                                                                                                                                                                                                                    |
| contypid      | oid     | Domain containing this constraint ( <b>0</b> if it is not a domain constraint).                                                                                                                                                                                                                                                                                                  |
| conindid      | oid     | ID of the index associated with the constraint.                                                                                                                                                                                                                                                                                                                                  |
| confrelid     | oid     | Referenced table if this constraint is a foreign key. Otherwise, the value is <b>0</b> .                                                                                                                                                                                                                                                                                         |
| confupdtype   | "char"  | Foreign key update action code. <ul style="list-style-type: none"><li>• <b>a</b>: no action.</li><li>• <b>r</b>: restriction.</li><li>• <b>c</b>: cascading.</li><li>• <b>n</b>: The parameter is set to null.</li><li>• <b>d</b>: The default value is used.</li></ul>                                                                                                          |

| Name          | Type       | Description                                                                                                                                                                                                                                                                    |
|---------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| confdeltype   | "char"     | Foreign key deletion action code <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul> |
| confmatchtype | "char"     | Foreign key match type. <ul style="list-style-type: none"> <li>• <b>f</b>: full match.</li> <li>• <b>p</b>: partial match.</li> <li>• <b>u</b>: unspecified (The NULL value can be matched if <b>f</b> is specified.)</li> </ul>                                               |
| conislocal    | Boolean    | Specifies whether the constraint is defined locally for the relation. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>                                                                                                       |
| coninhcount   | integer    | Number of direct inheritance parent tables that this constraint has. When the value is not <b>0</b> , the constraint cannot be deleted or renamed.                                                                                                                             |
| connoinherit  | Boolean    | Specifies whether the constraint can be inherited. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>                                                                                                                          |
| consoft       | Boolean    | Specifies whether the column indicates an informational constraint. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>                                                                                                         |
| conopt        | Boolean    | Specifies whether you can use the informational constraint to optimize the execution plan. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>                                                                                  |
| conkey        | smallint[] | Column list of the constrained control if this column is a table constraint.                                                                                                                                                                                                   |
| confkey       | smallint[] | List of referenced columns if this column is a foreign key.                                                                                                                                                                                                                    |
| confeqop      | oid[]      | ID list of the equality operators for PK = FK comparisons if this column is a foreign key.                                                                                                                                                                                     |

| Name         | Type         | Description                                                                                                                                                     |
|--------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| conppeqop    | oid[]        | ID list of the equality operators for PK = PK comparisons if this column is a foreign key.                                                                      |
| conffeqop    | oid[]        | ID list of the equality operators for FK = FK comparisons if this column is a foreign key. The value is empty because foreign keys are not supported currently. |
| conexclp     | oid[]        | ID list of the per-column exclusion operators if this column is an exclusion constraint.                                                                        |
| conbin       | pg_node_tree | Internal representation of the expression if this column is a check constraint.                                                                                 |
| consrc       | text         | Readable representation of the expression if this column is a check constraint.                                                                                 |
| conincluding | smallint[]   | Not for constraint, but will be included in the attribute column of <b>INDEX</b> .                                                                              |

**NOTICE**

- **consrc** is not updated when referenced objects change and does not track new column names. Instead of relying on this column to update, you are advised to use `pg_get_constraintdef()` to extract the definition of a check constraint.
- **relchecks** of **PG\_CLASS** must agree with the number of check-constraint entries found in the table for each relationship.

## 12.2.36 PG\_CONVERSION

PG\_CONVERSION describes encoding conversion information.

**Table 12-37** PG\_CONVERSION columns

| Name           | Type    | Reference                         | Description                                                |
|----------------|---------|-----------------------------------|------------------------------------------------------------|
| oid            | oid     | -                                 | Row identifier (hidden attribute, which must be specified) |
| conname        | name    | -                                 | Conversion name (unique within a namespace)                |
| connamespace   | oid     | <b>oid</b> in <b>PG_NAMESPACE</b> | OID of the namespace that contains this conversion         |
| conowner       | oid     | <b>oid</b> in <b>PG_AUTHID</b>    | Owner of the conversion                                    |
| conforencoding | integer | -                                 | Source encoding ID                                         |

| Name          | Type    | Reference                                | Description                                                                                          |
|---------------|---------|------------------------------------------|------------------------------------------------------------------------------------------------------|
| contoencoding | integer | -                                        | Destination encoding ID                                                                              |
| conproc       | regproc | <b>prname</b> in <a href="#">PG_PROC</a> | Conversion procedure                                                                                 |
| condefault    | Boolean | -                                        | If this is the default conversion, the value is <b>true</b> . Otherwise, the value is <b>false</b> . |

## 12.2.37 PG\_DATABASE

PG\_DATABASE records information about available databases.

**Table 12-38** PG\_DATABASE columns

| Name          | Type    | Description                                                                                                                                                                                                           |
|---------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid     | Row identifier (hidden attribute, which must be specified).                                                                                                                                                           |
| datname       | name    | Database name                                                                                                                                                                                                         |
| datdba        | oid     | Owner of the database, usually the user who created it.                                                                                                                                                               |
| encoding      | integer | Character encoding for the database.                                                                                                                                                                                  |
| datcollate    | name    | Sequence used by the database.                                                                                                                                                                                        |
| datctype      | name    | Character type used by the database.                                                                                                                                                                                  |
| datistemplate | Boolean | Specifies whether the database can be used as a template database.                                                                                                                                                    |
| datallowconn  | Boolean | If the value is <b>true</b> , users can connect to the database. If the value is <b>false</b> , no one can connect to this database. This column is used to protect the <b>template0</b> database from being altered. |
| datconnlimit  | integer | Maximum number of concurrent connections allowed on this database. The value <b>-1</b> indicates no limit.                                                                                                            |
| datlastsysoid | oid     | Last system OID in the database.                                                                                                                                                                                      |

| Name             | Type      | Description                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datfrozenxid     | xid32     | Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is deprecated in the current version. To ensure forward compatibility, this column is reserved. The <b>datfrozenxid64</b> column is added to record the information.                                                                           |
| dattablespace    | oid       | Default tablespace of the database.                                                                                                                                                                                                                                                                                                               |
| datcompatibility | name      | Database compatibility mode. Currently, four compatibility modes are supported: A, B, C, and PG, indicating that the Oracle, MySQL, Teradata, and Postgres databases are compatible.                                                                                                                                                              |
| datacl           | aclitem[] | Access permission.                                                                                                                                                                                                                                                                                                                                |
| datfrozenxid64   | xid       | Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.                                                                                                                                                                                                                                                            |
| datminmxid       | xid       | All multi-transaction IDs before this one have been replaced by a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of <b>relminmxid</b> in <b>PG_CLASS</b> of all tables in the database. |

## 12.2.38 PG\_DB\_ROLE\_SETTING

**PG\_DB\_ROLE\_SETTING** records the default values of configuration items bound to each role and database when the database is running.

**Table 12-39** PG\_DB\_ROLE\_SETTING columns

| Name        | Type   | Description                                                                               |
|-------------|--------|-------------------------------------------------------------------------------------------|
| setdatabase | oid    | Database corresponding to the configuration items ( <b>0</b> if no database is specified) |
| setrole     | oid    | Role corresponding to the configuration items ( <b>0</b> if no role is specified)         |
| setconfig   | text[] | Default value of GUC items.                                                               |

## 12.2.39 PG\_DEFAULT\_ACL

**PG\_DEFAULT\_ACL** records initial permissions assigned to newly created objects.

**Table 12-40** PG\_DEFAULT\_ACL columns

| Name            | Type      | Description                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid             | oid       | Row identifier (hidden attribute, which must be specified)                                                                                                                                                                                                                                                                                             |
| defaclrole      | oid       | ID of the role associated with the permission                                                                                                                                                                                                                                                                                                          |
| defaclnamespace | oid       | Namespace associated with the permission ( <b>0</b> if no ID)                                                                                                                                                                                                                                                                                          |
| defaclobjtype   | "char"    | Object type of the permission <ul style="list-style-type: none"><li>• <b>r</b> indicates a table or view.</li><li>• <b>S</b> indicates a sequence.</li><li>• <b>f</b> indicates a function.</li><li>• <b>T</b> indicates a type.</li><li>• <b>K</b> indicates the client master key.</li><li>• <b>k</b> indicates the column encryption key.</li></ul> |
| defaclacl       | aclitem[] | Access permissions that this type of object should have on creation                                                                                                                                                                                                                                                                                    |

## 12.2.40 PG\_DEPEND

**PG\_DEPEND** records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also [PG\\_SHDEPEND](#), which performs a similar function for dependencies involving objects that are shared across databases.

**Table 12-41** PG\_DEPEND columns

| Name     | Type    | Reference                              | Description                                                                                                                                                   |
|----------|---------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| classid  | oid     | <b>oid</b> in <a href="#">PG_CLASS</a> | OID of the system catalog where a dependent object resides                                                                                                    |
| objid    | oid     | Any OID column                         | OID of the dependent object                                                                                                                                   |
| objsubid | integer | -                                      | For a table column, this is the column number ( <b>objid</b> and <b>classid</b> refer to the table itself). The value is <b>0</b> for all other object types. |

| Name        | Type    | Reference              | Description                                                                                                                                                         |
|-------------|---------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| refclassid  | oid     | oid in <b>PG_CLASS</b> | OID of the system catalog where a referenced object resides                                                                                                         |
| refobjid    | oid     | Any OID column         | OID of the referenced object                                                                                                                                        |
| refobjsubid | integer | -                      | For a table column, this is the column number ( <b>refobjid</b> and <b>refclassid</b> refer to the table itself). The value is <b>0</b> for all other object types. |
| deptype     | "char"  | -                      | A code defining the specific semantics of this dependency                                                                                                           |

In all cases, a PG\_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- **DEPENDENCY\_NORMAL** (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- **DEPENDENCY\_AUTO** (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of **RESTRICT** or **CASCADE** mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- **DEPENDENCY\_INTERNAL** (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A **DROP** of the dependent object will be disallowed outright (We'll tell the user to issue a **DROP** against the referenced object, instead). A **DROP** of the referenced object will be propagated through to drop the dependent object whether **CASCADE** is specified or not.
- **DEPENDENCY\_EXTENSION** (e): The dependent object is a member of the extension of the referenced object. The dependent object can be dropped only via **DROP EXTENSION** on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify **GS\_DUMP**.
- **DEPENDENCY\_PIN** (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

## 12.2.41 PG\_DESCRIPTION

**PG\_DESCRIPTION** records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG\_DESCRIPTION**.

See also [PG\\_SHDESCRIPTION](#), which provides a similar function for descriptions involving objects that are shared within the entire database.

**Table 12-42** PG\_DESCRIPTION columns

| Name        | Type    | Reference                              | Description                                                                                                                                       |
|-------------|---------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| objoid      | oid     | Any OID column                         | OID of the object that this description pertains to                                                                                               |
| classoid    | oid     | <b>oid</b> in <a href="#">PG_CLASS</a> | OID of the system catalog where the object appears                                                                                                |
| objsubid    | integer | -                                      | Column number for a comment on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself); <b>0</b> for all other object types |
| description | text    | -                                      | Arbitrary text that serves as the description of the object                                                                                       |

## 12.2.42 PG\_DIRECTORY

**PG\_DIRECTORY** stores directory objects added by users. You can execute the CREATE DIRECTORY statement to add records to this system catalog. When **enable\_access\_server\_directory** is set to **off**, only the initial user can create directory objects. When **enable\_access\_server\_directory** is set to **on**, users with the SYSADMIN permission and users inheriting permissions of the built-in role gs\_role\_directory\_create can create directory objects.

**Table 12-43** PG\_DIRECTORY columns

| Name    | Type      | Description                                                |
|---------|-----------|------------------------------------------------------------|
| oid     | oid       | Row identifier (hidden attribute, which must be specified) |
| dirname | name      | Name of a directory object                                 |
| owner   | oid       | Owner of a directory object                                |
| dirpath | text      | Directory path.                                            |
| diracl  | aclitem[] | Access permissions.                                        |

## 12.2.43 PG\_ENUM

**PG\_ENUM** contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG\_ENUM.

**Table 12-44** PG\_ENUM columns

| Name          | Type | Reference                      | Description                                                            |
|---------------|------|--------------------------------|------------------------------------------------------------------------|
| oid           | oid  | -                              | Row identifier (hidden attribute, which must be specified).            |
| enumtypid     | oid  | oid in <a href="#">PG_TYPE</a> | OID of the <a href="#">PG_TYPE</a> entry owning this enumerated value. |
| enumsortorder | real | -                              | Sort position of this enumerated value within its enumerated type.     |
| enumlabel     | name | -                              | Textual label for this enumerated value.                               |

The OIDs for **PG\_ENUM** rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to  $n$ . However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

## 12.2.44 PG\_FOREIGN\_SERVER

**PG\_FOREIGN\_SERVER** records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

**Table 12-45** PG\_FOREIGN\_SERVER columns

| Name     | Type | Reference                                      | Description                                                |
|----------|------|------------------------------------------------|------------------------------------------------------------|
| oid      | oid  | -                                              | Row identifier (hidden attribute, which must be specified) |
| srvname  | name | -                                              | Name of a foreign server                                   |
| srvowner | oid  | OID in <a href="#">PG_AUTHID</a>               | Owner of the foreign server                                |
| srvfdw   | oid  | oid in <a href="#">PG_FOREIGN_DATA_WRAPPER</a> | OID of the foreign-data wrapper on a foreign server        |
| srvtype  | text | -                                              | Type of the server (optional)                              |

| Name       | Type      | Reference | Description                                                                           |
|------------|-----------|-----------|---------------------------------------------------------------------------------------|
| srvversion | text      | -         | Version of the server (optional)                                                      |
| srvacl     | aclitem[] | -         | Access permissions                                                                    |
| srvoptions | text[]    | -         | Option used for foreign servers, expressed in a string in the format of keyword=value |

## 12.2.45 PG\_HASHBUCKET

**PG\_HASHBUCKET** records hash bucket information.

**Table 12-46** PG\_HASHBUCKET columns

| Name           | Type             | Description                                                                                                                                                                                           |
|----------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid            | oid              | Row identifier (hidden attribute, which must be specified)                                                                                                                                            |
| bucketid       | oid              | Hash value calculated for a bucket vector. The hash value can be used to accelerate the search for a bucket vector.                                                                                   |
| bucketcnt      | integer          | Number of shards                                                                                                                                                                                      |
| bucketmap size | integer          | Total number of shards on all DN's                                                                                                                                                                    |
| bucketref      | integer          | Reserved column with 1 as its default value                                                                                                                                                           |
| bucketvector   | oidvector_extend | Records all bucket IDs contained in the bucket information in this row. A unique index is created in this column. Tables with the same bucket ID share the <b>PG_HASHBUCKET</b> data in the same row. |

## 12.2.46 PG\_INDEX

**PG\_INDEX** records part of index information. The rest is mostly recorded in **PG\_CLASS**.

**Table 12-47** PG\_INDEX columns

| Name       | Type | Description                                     |
|------------|------|-------------------------------------------------|
| indexrelid | oid  | OID of the <b>PG_CLASS</b> entry for the index. |

| Name           | Type     | Description                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| indrelid       | oid      | OID of the <b>PG_CLASS</b> entry for the table that uses the index.                                                                                                                                                                                                                                                                            |
| indnatts       | smallint | Number of columns in the index.                                                                                                                                                                                                                                                                                                                |
| indisunique    | Boolean  | Specifies whether the index is unique. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is unique.</li> <li>• <b>false</b>: The index is not unique.</li> </ul>                                                                                                                                                                 |
| indisprimary   | Boolean  | Specifies whether the index is the primary key of the table. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is the primary key of the table. <b>indisunique</b> should always be <b>true</b> when the value of this column is <b>true</b>.</li> <li>• <b>false</b>: The index is not the primary key of the table.</li> </ul> |
| indisexclusion | Boolean  | Specifies whether the index supports exclusive constraints. <ul style="list-style-type: none"> <li>• <b>true</b>: The index supports exclusive constraints.</li> <li>• <b>false</b>: The index does not support exclusive constraints.</li> </ul>                                                                                              |
| indimmediate   | Boolean  | Specifies whether to check the uniqueness of data to be inserted. <ul style="list-style-type: none"> <li>• <b>true</b>: The uniqueness check is performed immediately when data is inserted.</li> <li>• <b>false</b>: The uniqueness check is not performed when data is inserted.</li> </ul>                                                  |
| indisclustered | Boolean  | Specifies whether the table is clustered on the index. <ul style="list-style-type: none"> <li>• <b>true</b>: The table is clustered on the index.</li> <li>• <b>false</b>: The table is not clustered on the index.</li> </ul>                                                                                                                 |
| indisusable    | Boolean  | Specifies whether the index is available for insert and select operations. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is available for insert and select operations.</li> <li>• <b>false</b>: The index is unavailable for insert and select operations.</li> </ul>                                                       |
| indisvalid     | Boolean  | <ul style="list-style-type: none"> <li>• <b>true</b>: The index can be used for query.</li> <li>• <b>false</b>: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not <b>true</b>.</li> </ul>   |

| Name           | Type         | Description                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| indcheckxmin   | Boolean      | <ul style="list-style-type: none"> <li><b>true:</b> Queries must not use the index until the xmin of this row in PG_INDEX is lower than their <b>TransactionXmin</b>, because the table may contain broken HOT chains with incompatible rows that they can see.</li> <li><b>false:</b> Indexes can be used for query.</li> </ul>                                        |
| indisready     | Boolean      | <ul style="list-style-type: none"> <li><b>true:</b> The index is available for inserting data.</li> <li><b>false:</b> The index is ignored when data is inserted or modified.</li> </ul>                                                                                                                                                                                |
| indkey         | int2vector   | This is an array of <b>indnatts</b> values indicating that this index creates table columns. For example, a value of <b>1 3</b> indicates that the first and the third columns make up the index key. The value <b>0</b> in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference. |
| indcollation   | oidvector    | ID of each column used by the index.                                                                                                                                                                                                                                                                                                                                    |
| indclass       | oidvector    | For each column in the index key, this contains the OID of the operator class to use. See <a href="#">PG_OPCLASS</a> for details.                                                                                                                                                                                                                                       |
| indoption      | int2vector   | Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.                                                                                                                                                                                                                                                       |
| indexprs       | pg_node_tree | Expression trees (in <b>nodeToString()</b> representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.                                                                                                                    |
| indpred        | pg_node_tree | Expression tree (in <b>nodeToString()</b> representation) for partial index predicate. If the index is not a partial index, this column is an empty string.                                                                                                                                                                                                             |
| indisreplident | Boolean      | <p>Specifies whether the column of this index is a decoded column of logical decoding.</p> <ul style="list-style-type: none"> <li><b>true:</b> The column of this index is a decoded column of logical decoding.</li> <li><b>false:</b> The column of this index is not a decoded column of logical decoding.</li> </ul>                                                |
| indnkeyatts    | smallint     | Total number of columns in the index. The columns that exceed the value of <b>indnatts</b> are not involved in the index query.                                                                                                                                                                                                                                         |

## 12.2.47 PG\_INHERITS

**PG\_INHERITS** records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

**Table 12-48** PG\_INHERITS columns

| Name      | Type    | Reference                    | Description                                                                                                                                                                              |
|-----------|---------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inhrelid  | oid     | <a href="#">PG_CLASS.oid</a> | OID of a child table                                                                                                                                                                     |
| inhparent | oid     | <a href="#">PG_CLASS.oid</a> | OID of a parent table                                                                                                                                                                    |
| inhseqno  | integer | -                            | If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1. |

## 12.2.48 PG\_JOB

**PG\_JOB** records detailed information about jobs created by users. Dedicated threads poll the system catalog **PG\_JOB** and trigger jobs based on scheduled job execution time, and update job status in **PG\_JOB**. This system catalog belongs to the Shared Relation category. All job records are visible to all databases.

**Table 12-49** PG\_JOB columns

| Name                 | Type   | Description                                                                                                                                                      |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid                  | oid    | Row identifier (hidden attribute, which must be specified)                                                                                                       |
| job_id               | bigint | Job ID, primary key, unique (with a unique index)                                                                                                                |
| current_postgres_pid | bigint | If the current job has been executed, the thread ID of this job is recorded. The default value is <b>-1</b> , indicating that the job has not yet been executed. |
| log_user             | name   | Username of the job creator                                                                                                                                      |
| priv_user            | name   | Username of the job executor                                                                                                                                     |
| dbname               | name   | Name of the database in which the job will be executed                                                                                                           |
| node_name            | name   | Primary database node on which the job will be executed                                                                                                          |

| Name            | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_status      | "char"                      | <p>Execution status of the current task. The default value is 's'. The options are as follows:</p> <ul style="list-style-type: none"><li>• 'r': running</li><li>• 's': successfully finished</li><li>• 'f': job failed</li><li>• 'd': disable</li></ul> <p>If a job fails to be executed for 16 consecutive times, <b>job_status</b> is automatically set to 'd', and no more attempt will be made on this job.</p> <p>Note: When you disable a scheduled task (by setting the GUC parameter <b>job_queue_processes</b> to 0), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (the GUC parameter <b>job_queue_processes</b> is not set to 0), the system updates the value of this column based on the real-time job status.</p> |
| start_date      | timestamp without time zone | Start time of the first job execution, accurate to millisecond                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| next_run_date   | timestamp without time zone | Time when a scheduled job is executed next time. The time is accurate to milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| failure_count   | smallint                    | Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| interval        | text                        | Job execution interval                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| last_start_date | timestamp without time zone | Start time of the last job execution, accurate to millisecond                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| last_end_date   | timestamp without time zone | End time of the last job execution, accurate to millisecond                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| last_suc_date   | timestamp without time zone | Start time of the last successful job execution, accurate to millisecond                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| this_run_date   | timestamp without time zone | Start time of the ongoing job execution, accurate to millisecond                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| job_name        | text                        | Name of the DBE_SCHEDULER scheduled task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Name            | Type                        | Description                                                                                                                                                                           |
|-----------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_date        | timestamp without time zone | Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.                                                                                                         |
| enable          | Boolean                     | The DBE_SCHEDULER scheduled task enabling status. The options are as follows: <ul style="list-style-type: none"><li>• <b>true</b>: enabled</li><li>• <b>false</b>: disabled</li></ul> |
| failure_message | text                        | Error information about the latest task execution.                                                                                                                                    |

## 12.2.49 PG\_JOB\_PROC

PG\_JOB\_PROC records the content of each job in the [PG\\_JOB](#) table, including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG\_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed.

**Table 12-50** PG\_JOB\_PROC columns

| Name     | Type    | Description                                                                                    |
|----------|---------|------------------------------------------------------------------------------------------------|
| oid      | oid     | Row identifier (hidden attribute, which must be specified).                                    |
| job_id   | integer | Foreign key, which is joined with <b>job_id</b> in the system catalog <a href="#">PG_JOB</a> . |
| what     | text    | Job content, which is the program content in the DBE_SCHEDULER scheduled task.                 |
| job_name | text    | Name of the DBE_SCHEDULER scheduled task or program.                                           |

## 12.2.50 PG\_LANGUAGE

PG\_LANGUAGE registers programming languages. You can use them and APIs to write functions or stored procedures.

**Table 12-51** PG\_LANGUAGE columns

| Name | Type | Reference | Description                                                 |
|------|------|-----------|-------------------------------------------------------------|
| oid  | oid  | -         | Row identifier (hidden attribute, which must be specified). |

| Name          | Type      | Reference                           | Description                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lanname       | name      | -                                   | Language name.                                                                                                                                                                                                                                                                                                              |
| lanowner      | oid       | oid in<br><a href="#">PG_AUTHID</a> | Owner of the language.                                                                                                                                                                                                                                                                                                      |
| lanispl       | Boolean   | -                                   | <ul style="list-style-type: none"><li>• <b>true</b>: user-defined language.</li><li>• <b>false</b>: internal language, for example, SQL.</li></ul> Currently, <b>gs_dump</b> still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.      |
| lanpltrusted  | Boolean   | -                                   | <ul style="list-style-type: none"><li>• <b>true</b>: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment.</li><li>• <b>false</b>: The language is untrusted. Only the initial user can create functions in untrusted languages.</li></ul> |
| lanplcallfoid | oid       | oid in<br><a href="#">PG_PROC</a>   | For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.                                                                                                                                   |
| laninline     | oid       | oid in<br><a href="#">PG_PROC</a>   | This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is <b>0</b> if inline blocks are not supported.                                                                                                                                                           |
| lanvalidator  | oid       | oid in<br><a href="#">PG_PROC</a>   | This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is <b>0</b> if no validator is provided.                                                                                                                            |
| lanacl        | aclitem[] | -                                   | Access permissions                                                                                                                                                                                                                                                                                                          |

## 12.2.51 PG\_LARGEOBJECT

**PG\_LARGEOBJECT** records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in **PG\_LARGEOBJECT**. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to users with the SYSADMIN permission.

**Table 12-52** PG\_LARGEOBJECT columns

| Name   | Type    | Reference                                   | Description                                                                                             |
|--------|---------|---------------------------------------------|---------------------------------------------------------------------------------------------------------|
| loid   | oid     | <a href="#">PG_LARGEOBJECT_METADATA.oid</a> | Identifier of the large object that includes this page                                                  |
| pageno | integer | -                                           | Page number of this page within its large object (counting from zero)                                   |
| data   | bytea   | -                                           | Data stored in the large object. This will never be more than <b>LOBLKSIZE</b> bytes and might be less. |

Each row of **PG\_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno** \* **LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

## 12.2.52 PG\_LARGEOBJECT\_METADATA

**PG\_LARGEOBJECT\_METADATA** records metadata associated with large objects. The actual large object data is stored in **PG\_LARGEOBJECT**.

**Table 12-53** PG\_LARGEOBJECT\_METADATA columns

| Name     | Type      | Reference                     | Description                                                |
|----------|-----------|-------------------------------|------------------------------------------------------------|
| oid      | oid       | -                             | Row identifier (hidden attribute, which must be specified) |
| lomowner | oid       | <a href="#">PG_AUTHID.oid</a> | Owner of the large object                                  |
| lomacl   | aclitem[] | -                             | Access permissions                                         |

## 12.2.53 PG\_NAMESPACE

**PG\_NAMESPACE** records namespaces, that is, schema-related information.

**Table 12-54** PG\_NAMESPACE columns

| Name | Type | Description                                                |
|------|------|------------------------------------------------------------|
| oid  | oid  | Row identifier (hidden attribute, which must be specified) |

| Name              | Type      | Description                                                                                                                                                                              |
|-------------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nspname           | name      | Name of a namespace                                                                                                                                                                      |
| nspowner          | oid       | Owner of a namespace                                                                                                                                                                     |
| nsptimeline       | bigint    | Timeline when a namespace is created on the database node. This column is for internal use and valid only on the database node.                                                          |
| nspacl            | aclitem[] | Access permission                                                                                                                                                                        |
| in_redistribution | "char"    | Specifies whether the content is in the redistribution state.                                                                                                                            |
| nspblockchain     | boolean   | <ul style="list-style-type: none"><li>If the value is <b>true</b>, the tamper-proof schema is used.</li><li>If the value is <b>false</b>, the non-tamper-proof schema is used.</li></ul> |

## 12.2.54 PG\_OBJECT

**PG\_OBJECT** records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

**Table 12-55** PG\_OBJECT columns

| Name        | Type                     | Description                                                                                                                                                                                                    |
|-------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_oid  | oid                      | Object identifier                                                                                                                                                                                              |
| object_type | "char"                   | Object type <ul style="list-style-type: none"><li><b>r</b>: ordinary table</li><li><b>i</b>: index</li><li><b>s</b>: sequence</li><li><b>v</b>: view</li><li><b>p</b>: stored procedure and function</li></ul> |
| creator     | oid                      | ID of a creator                                                                                                                                                                                                |
| ctime       | timestamp with time zone | Creation time of an object                                                                                                                                                                                     |
| mtime       | timestamp with time zone | Last modification time of an object. The modification operations include <b>ALTER</b> , <b>GRANT</b> , and <b>REVOKE</b> .                                                                                     |
| createcsn   | bigint                   | CSN when an object is created.                                                                                                                                                                                 |

| Name      | Type   | Description                                                   |
|-----------|--------|---------------------------------------------------------------|
| changeagn | bigint | CSN when DDL operations are performed on a table or an index. |

**NOTICE**

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG\_OBJECT** does not contain these object records.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changeagn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createagn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createagn** and **changeagn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- When **enable\_gtt\_concurrent\_truncate** is set to **on**, the **mtime** field is not updated when the global temporary table is truncated.

## 12.2.55 PG\_OPCLASS

**PG\_OPCLASS** defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are whichever ones accept the column's data type as their left-hand input.

**Table 12-56** PG\_OPCLASS columns

| Name         | Type | Reference                           | Description                                                    |
|--------------|------|-------------------------------------|----------------------------------------------------------------|
| oid          | oid  | -                                   | Row identifier (hidden attribute, which must be specified)     |
| opcmeth      | oid  | OID in <a href="#">PG_AM</a>        | Index access method operator class served by an operator class |
| opcname      | name | -                                   | Name of the operator class                                     |
| opcnamespace | oid  | OID in <a href="#">PG_NAMESPACE</a> | Namespace of the operator class                                |
| opcowner     | oid  | OID in <a href="#">PG_AUTHID</a>    | Owner of the operator class                                    |

| Name       | Type    | Reference                          | Description                                                                           |
|------------|---------|------------------------------------|---------------------------------------------------------------------------------------|
| opcfamily  | oid     | OID in <a href="#">PG_OPFAMILY</a> | Operator family containing the operator class                                         |
| opcintype  | oid     | OID in <a href="#">PG_TYPE</a>     | Data type that the operator class indexes                                             |
| opcdefault | boolean | -                                  | The value is <b>true</b> if this operator class is the default for <b>opcintype</b> . |
| opckeytype | oid     | OID in <a href="#">PG_TYPE</a>     | Type of data stored in an index, or zero if same as <b>opcintype</b>                  |

An operator class's **opcmethod** must match the **opfmetho**d of its containing operator family.

## 12.2.56 PG\_OPERATOR

PG\_OPERATOR records information about operators.

**Table 12-57** PG\_OPERATOR columns

| Name         | Type    | Reference                           | Description                                                                                                                                                |
|--------------|---------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid          | oid     | -                                   | Row identifier (hidden attribute, which must be specified)                                                                                                 |
| oprname      | name    | -                                   | Name of an operator                                                                                                                                        |
| oprnamespace | oid     | oid in <a href="#">PG_NAMESPACE</a> | OID of the namespace that contains the operator.                                                                                                           |
| oprowner     | oid     | oid in <a href="#">PG_AUTHID</a>    | Owner of the operator.                                                                                                                                     |
| oprkind      | "char"  | -                                   | <ul style="list-style-type: none"><li>• <b>b</b>: infix ("both").</li><li>• <b>l</b>: prefix ("left").</li><li>• <b>r</b>: postfix ("right").</li></ul>    |
| oprcanmerge  | Boolean | -                                   | Specifies whether the operator supports merge joins. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes</li><li>• <b>f (false)</b>: no</li></ul> |

| Name       | Type    | Reference                          | Description                                                                                                                                               |
|------------|---------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| oprcanhash | Boolean | -                                  | Specifies whether the operator supports hash joins. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes</li><li>• <b>f (false)</b>: no</li></ul> |
| oprleft    | oid     | oid in <a href="#">PG_TYPE</a>     | Type of the left operand.                                                                                                                                 |
| oprright   | oid     | oid in <a href="#">PG_TYPE</a>     | Type of the right operand.                                                                                                                                |
| oprresult  | oid     | oid in <a href="#">PG_TYPE</a>     | Type of the result.                                                                                                                                       |
| oprcom     | oid     | oid in <a href="#">PG_OPERATOR</a> | If it exists, the value is the exchange character of this operator. If it does not exist, the value is <b>0</b> .                                         |
| oprnegate  | oid     | oid in <a href="#">PG_OPERATOR</a> | If it exists, the value is the invertor of this operator. If it does not exist, the value is <b>0</b> .                                                   |
| oprcode    | regproc | prname in <a href="#">PG_PROC</a>  | Function that implements the operator                                                                                                                     |
| oprrest    | regproc | prname in <a href="#">PG_PROC</a>  | Restriction selectivity estimation function for the operator.                                                                                             |
| oprjoin    | regproc | prname in <a href="#">PG_PROC</a>  | Join selectivity estimation function for the operator.                                                                                                    |

## 12.2.57 PG\_OPFAMILY

**PG\_OPFAMILY** defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

**Table 12-58** PG\_OPFAMILY columns

| Name | Type | Reference | Description                                                |
|------|------|-----------|------------------------------------------------------------|
| oid  | oid  | -         | Row identifier (hidden attribute, which must be specified) |

| Name         | Type | Reference                        | Description                                    |
|--------------|------|----------------------------------|------------------------------------------------|
| opfmethod    | oid  | <a href="#">PG_AM.oid</a>        | Index access method used by an operator family |
| opfname      | name | -                                | Name of the operator family                    |
| opfnamespace | oid  | <a href="#">PG_NAMESPACE.oid</a> | Namespace of the operator family               |
| opfowner     | oid  | <a href="#">PG_AUTHID.oid</a>    | Owner of the operator family                   |

The majority of the information defining an operator family is not in its **PG\_OPFAMILY** row, but in the associated rows in [PG\\_AMOP](#), [PG\\_AMPROC](#), and [PG\\_OPCLASS](#).

## 12.2.58 PG\_PARTITION

PG\_PARTITION records all partitioned tables, table partitions, TOAST tables on table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG\_PARTITION.

**Table 12-59** PG\_PARTITION columns

| Name        | Type    | Description                                                                                                                                                                                                                                |
|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid         | oid     | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                |
| relname     | name    | Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.                                                                                                                                 |
| parttype    | "char"  | Object type. <ul style="list-style-type: none"><li>● <b>r</b>: partitioned table</li><li>● <b>p</b>: table partition</li><li>● <b>s</b>: table subpartition</li><li>● <b>x</b>: index partition</li><li>● <b>t</b>: TOAST table.</li></ul> |
| parentid    | oid     | OID of the partitioned table in PG_CLASS when the object is a partitioned table or a partition.<br>OID of the partitioned index when the object is an index partition.                                                                     |
| rangenum    | integer | Reserved column.                                                                                                                                                                                                                           |
| intervalnum | integer | Reserved column.                                                                                                                                                                                                                           |

| Name           | Type             | Description                                                                                                                                                                                                                                                                                                    |
|----------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| partstrategy   | "char"           | Partition policy of the partitioned table <ul style="list-style-type: none"><li>• <b>r</b>: range partition</li><li>• <b>v</b>: numeric partition</li><li>• <b>i</b>: interval partition</li><li>• <b>l</b>: list partition</li><li>• <b>h</b>: hash partition</li><li>• <b>n</b>: invalid partition</li></ul> |
| relfilenode    | oid              | Physical storage locations of the table partition, index partition, and TOAST table on the table partition                                                                                                                                                                                                     |
| reltablespace  | oid              | OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition                                                                                                                                                                                                  |
| relpages       | double precision | Statistics: numbers of data pages of the table partition and index partition                                                                                                                                                                                                                                   |
| reltuples      | double precision | Statistics: numbers of tuples of the table partition and index partition                                                                                                                                                                                                                                       |
| relallvisible  | integer          | Statistics: number of visible data pages of the table partition and index partition                                                                                                                                                                                                                            |
| reltoastrelid  | oid              | OID of the TOAST table corresponding to the table partition                                                                                                                                                                                                                                                    |
| reltoastidxid  | oid              | OID of the TOAST table index corresponding to the table partition                                                                                                                                                                                                                                              |
| indextblid     | oid              | OID of the table partition corresponding to the index partition                                                                                                                                                                                                                                                |
| indisusable    | boolean          | Specifies whether the index partition is available.                                                                                                                                                                                                                                                            |
| reldeltarelid  | oid              | OID of a Delta table                                                                                                                                                                                                                                                                                           |
| reldeltaidx    | oid              | OID of the index for a Delta table                                                                                                                                                                                                                                                                             |
| relcudescrelid | oid              | OID of a CU description table                                                                                                                                                                                                                                                                                  |
| relcudescidx   | oid              | OID of the index for a CU description table                                                                                                                                                                                                                                                                    |
| relfrozenxid   | xid32            | Frozen transaction ID<br>To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.                                                                                                                                                        |
| intspnum       | integer          | Number of tablespaces that the interval partition belongs to                                                                                                                                                                                                                                                   |

| Name               | Type       | Description                                                                                                                                                                        |
|--------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| partkey            | int2vector | Column number of the partition key                                                                                                                                                 |
| intervaltablespace | oidvector  | Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.                                                          |
| interval           | text[]     | Interval value of the interval partition                                                                                                                                           |
| boundaries         | text[]     | Upper boundary of the range partition and interval partition                                                                                                                       |
| transit            | text[]     | Transit of the interval partition                                                                                                                                                  |
| reloptions         | text[]     | Storage property of a partition used for collecting online scale-out information. Same as <b>pg_class.reloptions</b> , it is expressed in a string in the format of keyword=value. |
| relfrozenxid64     | xid        | Frozen transaction ID                                                                                                                                                              |
| relminmxid         | xid        | Frozen multi-transaction ID                                                                                                                                                        |

## 12.2.59 PG\_PLTEMPLATE

PG\_PLTEMPLATE records template information for procedural languages.

**Table 12-60** PG\_PLTEMPLATE columns

| Name          | Type    | Description                                                                                                              |
|---------------|---------|--------------------------------------------------------------------------------------------------------------------------|
| tmplname      | name    | Name of the language for which this template is used.                                                                    |
| tmpltrusted   | Boolean | The value is <b>true</b> if the language is considered trusted. Otherwise, the value is <b>false</b> .                   |
| tmpldbcreate  | Boolean | The value is <b>true</b> if the language is created by the owner of the database. Otherwise, the value is <b>false</b> . |
| tmplhandler   | text    | Name of the call handler function                                                                                        |
| tmpline       | text    | Name of the anonymous block handler ( <b>NULL</b> if no name of the block handler exists).                               |
| tmplvalidator | text    | Name of the verification function ( <b>NULL</b> if no verification function is available).                               |
| tmplib        | text    | Path of the shared library that implements languages.                                                                    |

| Name    | Type      | Description                                     |
|---------|-----------|-------------------------------------------------|
| tmplacl | aclitem[] | Access permissions for template (not yet used). |

## 12.2.60 PG\_PROC

PG\_PROC records information about functions or procedures.

**Table 12-61** PG\_PROC columns

| Name         | Type    | Description                                                                                                                                                                        |
|--------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid          | oid     | Row identifier (hidden attribute, which must be specified).                                                                                                                        |
| proname      | name    | Function name.                                                                                                                                                                     |
| pronamespace | oid     | OID of the namespace that contains the function.                                                                                                                                   |
| proowner     | oid     | Owner of the function.                                                                                                                                                             |
| prolang      | oid     | Implementation language or call API of the function.                                                                                                                               |
| procost      | real    | Estimated execution cost.                                                                                                                                                          |
| prorows      | real    | Estimated number of rows that are influenced.                                                                                                                                      |
| provariadic  | oid     | Data type of parameter element.                                                                                                                                                    |
| protransform | regproc | Simplified call method for the function.                                                                                                                                           |
| proisagg     | Boolean | Specifies whether the function is an aggregate function. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                     |
| proiswindow  | Boolean | Specifies whether the function is a window function. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                         |
| prosecdef    | Boolean | Specifies whether the function is a security definer (or a setuid function). <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul> |

| Name            | Type      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| proleakproof    | Boolean   | Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. <ul style="list-style-type: none"> <li>• <b>t</b> (true): There is no side effect.</li> <li>• <b>f</b> (false): There are side effects.</li> </ul>                                                                                                                                                                                                                                                                                        |
| proisstrict     | Boolean   | <ul style="list-style-type: none"> <li>• <b>t</b> (true): When this function is used, the function does not call the function and returns null if the input parameter is null.</li> <li>• <b>f</b> (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.</li> </ul>                                                                                                                                                                                                                       |
| proretset       | Boolean   | Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). <ul style="list-style-type: none"> <li>• <b>true</b>: The return value of the function is a set.</li> <li>• <b>false</b>: The return value of the function is not a set.</li> </ul>                                                                                                                                                                                                                                                                       |
| provolatile     | "char"    | Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. <ul style="list-style-type: none"> <li>• <b>i</b>: immutable functions, which always deliver the same result for the same inputs.</li> <li>• <b>s</b>: stable functions, whose results (for fixed inputs) do not change within a scan.</li> <li>• <b>v</b>: volatile functions, whose results may change at any time. It is also used for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.</li> </ul> |
| pronargs        | smallint  | Number of parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| pronargdefaults | smallint  | Number of parameters that have default values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| prorettype      | oid       | Data type of return values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| proargtypes     | oidvector | Array that stores the data types of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.                                                                                                                                                                                                                                                                                                                                                                              |

| Name             | Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| proallargtypes   | oid[]        | Array that contains the data types of function parameters. This array includes all parameter types (including <b>OUT</b> and <b>INOUT</b> parameters); however, if all the parameters are <b>IN</b> parameters, this column is null. Note that array subscripting is 1-based, whereas for historical reasons, <b>proargtypes</b> is subscripted from 0.                                                                                                                                       |
| proargmodes      | "char"[]     | Array with the modes of the function parameters, encoded as follows: <ul style="list-style-type: none"> <li>• <b>i</b> indicates the IN parameter.</li> <li>• <b>o</b> indicates the OUT parameter.</li> <li>• <b>b</b> indicates the INOUT parameter.</li> <li>• <b>v</b> indicates the VARIADIC parameter.</li> </ul> If all the parameters are <b>IN</b> parameters, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> . |
| proargnames      | text[]       | Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .                                                                                                                                                                                                         |
| proargdefaults   | pg_node_tree | Expression tree of the default value. This is the list of <b>pronargdefaults</b> elements.                                                                                                                                                                                                                                                                                                                                                                                                    |
| prosrc           | text         | A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.                                                                                                                                                                                                         |
| probin           | text         | Additional information about how to call the function. Again, the interpretation is language-specific.                                                                                                                                                                                                                                                                                                                                                                                        |

|----------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fencedmode     | Boolean              | Execution mode of a function, indicating whether the function is executed in fence or not fence mode. <ul style="list-style-type: none"><li>• <b>true</b>: fence mode. In this mode, the function is executed in the fork process.</li><li>• <b>false</b>: not fence mode.</li></ul> For built-in functions, <b>fencedmode</b> is set to <b>false</b> , indicating the not fence mode. |
| proshippable   | Boolean              | Specifies whether the function can be pushed down to database nodes. The default value is <b>false</b> . <ul style="list-style-type: none"><li>• Functions of the IMMUTABLE type can always be pushed down to the database nodes.</li><li>• A STABLE or VOLATILE function can be pushed down to the database nodes only if SHIPPABLE is specified for it.</li></ul>                    |
| propackage     | Boolean              | Specifies whether the function supports overloading. The default value is <b>false</b> . <ul style="list-style-type: none"><li>• <b>t</b> (true): supported.</li><li>• <b>f</b> (false): not supported.</li></ul>                                                                                                                                                                      |
| prokind        | "char"               | Specifies whether the object is a function or a stored procedure. <ul style="list-style-type: none"><li>• <b>'f'</b>: The object is a function.</li><li>• <b>'p'</b>: The object is a stored procedure.</li></ul>                                                                                                                                                                      |
| proargsrc      | text                 | Describes the parameter input strings of functions or stored procedures that are A-compatible syntax, including parameter comments. The default value is <b>NULL</b> .                                                                                                                                                                                                                 |
| proisprivate   | Boolean              | Specifies whether a function is a private function in the package. The default value is <b>false</b> .                                                                                                                                                                                                                                                                                 |
| propackageid   | oid                  | OID of the package to which the function belongs. If the function is not in the package, the value is <b>0</b> .                                                                                                                                                                                                                                                                       |
| proargtypesext | oidvector<br>_extend | Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.                                                                                                                                         |

| Name                | Type              | Description                                                                                                                                                                                                                                 |
|---------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prodefaultargposext | int2vector_extend | Position of the input parameter with a default value when the function has a large number of parameters.                                                                                                                                    |
| allargtypes         | oidvector         | Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and <b>INOUT</b> parameters) of the stored procedure.                                                       |
| allargtypesext      | oidvector_extend  | Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and <b>INOUT</b> parameters). |

## 12.2.61 PG\_RANGE

PG\_RANGE records information about range types, except for records of types in [PG\\_TYPE](#).

**Table 12-62** PG\_RANGE columns

| Name         | Type    | Reference                                  | Description                                                                                                                                                                                                                           |
|--------------|---------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rngtypid     | oid     | <b>oid</b> in <a href="#">PG_TYPE</a>      | OID of the range type.                                                                                                                                                                                                                |
| rngsubtype   | oid     | <b>oid</b> in <a href="#">PG_TYPE</a>      | OID of the element type (subtype) of this range type.                                                                                                                                                                                 |
| rngcollation | oid     | <b>oid</b> in <a href="#">PG_COLLATION</a> | OID of the collation used for range comparisons ( <b>0</b> if none).                                                                                                                                                                  |
| rngsubopc    | oid     | <b>oid</b> in <a href="#">PG_OPCLASS</a>   | OID of the subtype's operator class used for range comparisons.                                                                                                                                                                       |
| rngcanonical | regproc | <b>prname</b> in <a href="#">PG_PROC</a>   | Name of the function to convert a range value into canonical form ( <b>0</b> if none).                                                                                                                                                |
| rngsubdiff   | regproc | <b>prname</b> in <a href="#">PG_PROC</a>   | Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of <b>rngsubdiff</b> is <b>0</b> . |

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

## 12.2.62 PG\_REPLICATION\_ORIGIN

PG\_REPLICATION\_ORIGIN contains all created replication sources. This catalog is shared among all databases of a database instance. That is, there is only one copy for each instance, not for each database.

**Table 12-63** PG\_REPLICATION\_ORIGIN columns

| Name    | Type | Description                                                      |
|---------|------|------------------------------------------------------------------|
| roident | oid  | Unique replication source identifier within a database instance. |
| roname  | text | External user-defined replication source name.                   |

## 12.2.63 PG\_RESOURCE\_POOL

PG\_RESOURCE\_POOL provides information about database resource pools.

**Table 12-64** PG\_RESOURCE\_POOL columns

| Name              | Type    | Description                                                                               |
|-------------------|---------|-------------------------------------------------------------------------------------------|
| oid               | oid     | Row identifier (hidden attribute, which must be specified).                               |
| respool_name      | name    | Name of the resource pool.                                                                |
| mem_percent       | integer | Percentage of the memory configuration.                                                   |
| cpu_affinity      | bigint  | Value of cores bound to the CPU.                                                          |
| control_group     | name    | Name of the Cgroup where the resource pool is located.                                    |
| active_statements | integer | Maximum number of concurrent statements in the resource pool.                             |
| max_dop           | integer | Maximum scanning concurrency during data redistribution. This column is used for scaling. |
| memory_limit      | name    | Maximum memory of the resource pool.                                                      |
| parentid          | oid     | OID of the parent resource pool.                                                          |
| io_limits         | integer | Upper limit of IOPS. It is counted by 10,000 per second for row store.                    |

| Name        | Type    | Description                                                                                                                                                                                                                    |
|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| io_priority | name    | I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.                                                                                                                     |
| nodegroup   | name    | Name of the logical database to which the resource pool belongs.                                                                                                                                                               |
| is_foreign  | Boolean | Specifies whether the resource pool can be used for users outside the logical database. If it is set to <b>true</b> , the resource pool controls the resources of common users who do not belong to the current resource pool. |
| max_worker  | integer | Concurrency in a table during data redistribution. This column is used only for scaling.                                                                                                                                       |

Note: **max\_dop** and **max\_worker** are used for scaling and are not applicable to the centralized deployment.

## 12.2.64 PG\_REWRITE

PG\_REWRITE records rewrite rules defined for tables and views.

**Table 12-65** PG\_REWRITE columns

| Name     | Type     | Description                                                                                                                                                                  |
|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid      | oid      | Row identifier (hidden attribute, which must be specified)                                                                                                                   |
| rulename | name     | Rule name                                                                                                                                                                    |
| ev_class | oid      | Name of the table that uses the rule                                                                                                                                         |
| ev_attr  | smallint | Column to which this rule applies (always <b>0</b> to indicate the entire table)                                                                                             |
| ev_type  | "char"   | Event type for the rule. <ul style="list-style-type: none"><li>• <b>1</b>: SELECT</li><li>• <b>2</b>: UPDATE</li><li>• <b>3</b>: INSERT</li><li>• <b>4</b>: DELETE</li></ul> |

| Name       | Type         | Description                                                                                                                                                                                                                                                                                                    |
|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ev_enabled | "char"       | Controls the mode in which the rule is triggered. <ul style="list-style-type: none"><li>• <b>O</b>: The rule is triggered in origin and local modes.</li><li>• <b>D</b>: The rule is disabled.</li><li>• <b>R</b>: The rule is triggered in replica mode.</li><li>• <b>A</b>: The rule always fires.</li></ul> |
| is_instead | Boolean      | The value is <b>true</b> if the rule is of the <b>INSTEAD</b> type. Otherwise, the value is <b>false</b> .                                                                                                                                                                                                     |
| ev_qual    | pg_node_tree | Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.                                                                                                                                                                                                          |
| ev_action  | pg_node_tree | Query tree (in the form of a nodeToString() representation) for the rule's action.                                                                                                                                                                                                                             |

## 12.2.65 PG\_RLSPOLICY

PG\_RLSPOLICY records row-level security policies.

**Table 12-66** PG\_RLSPOLICY columns

| Name          | Type         | Description                                                                                                                                                                                                        |
|---------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid           | oid          | Row identifier (hidden attribute, which must be specified).                                                                                                                                                        |
| polname       | name         | Name of an access control policy.                                                                                                                                                                                  |
| polrelid      | oid          | OID of the table object on which the row-level security policy takes effect.                                                                                                                                       |
| polcmd        | "char"       | SQL operations affected by a row-level security policy.                                                                                                                                                            |
| polpermissive | Boolean      | Attribute of the row-level security policy. <ul style="list-style-type: none"><li>• <b>t</b>: OR condition concatenation of expressions.</li><li>• <b>f</b>: AND condition concatenation of expressions.</li></ul> |
| polroles      | oid[]        | OID list of users affected by the row-level security policy. If this parameter is not specified, all users are affected.                                                                                           |
| polqual       | pg_node_tree | Expression of a row-level security policy.                                                                                                                                                                         |

## 12.2.66 PG\_SECLABEL

PG\_SECLABEL records security labels on database objects.

See also [PG\\_SHSECLABEL](#), which provides a similar function for security labels of database objects that are shared within one database.

**Table 12-67** PG\_SECLABEL columns

| Name     | Type    | Reference                              | Description                                            |
|----------|---------|----------------------------------------|--------------------------------------------------------|
| objoid   | oid     | Any OID column                         | OID of the object that this security label pertains to |
| classoid | oid     | <b>oid</b> in <a href="#">PG_CLASS</a> | OID of the system catalog where the object appears     |
| objsubid | integer | -                                      | Column number for a security label on a table column   |
| provider | text    | -                                      | Label provider associated with the label               |
| label    | text    | -                                      | Security label applied to the object                   |

## 12.2.67 PG\_SHDEPEND

PG\_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also [PG\\_DEPEND](#), which provides a similar function for dependencies involving objects within a single database.

PG\_SHDEPEND is shared among all databases of a database instance. That is, there is only one PG\_SHDEPEND for each instance, not for each database.

**Table 12-68** PG\_SHDEPEND columns

| Name    | Type | Reference                                 | Description                                                                     |
|---------|------|-------------------------------------------|---------------------------------------------------------------------------------|
| dbid    | oid  | <b>oid</b> in <a href="#">PG_DATABASE</a> | OID of the database where a dependent object is ( <b>0</b> for a shared object) |
| classid | oid  | <b>oid</b> in <a href="#">PG_CLASS</a>    | OID of the system catalog where a dependent object resides                      |
| objid   | oid  | Any OID column                            | OID of the dependent object                                                     |

| Name       | Type    | Reference                     | Description                                                                                                                                       |
|------------|---------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| objsubid   | integer | -                             | Column number for a table column. ( <b>objid</b> and <b>classid</b> refer to the table itself.) The value is <b>0</b> for all other object types. |
| refclassid | oid     | <b>oid</b> in <b>PG_CLASS</b> | OID of the system catalog (must be a shared catalog) where a referenced object is located.                                                        |
| refobjid   | oid     | Any OID column                | OID of the referenced object                                                                                                                      |
| deptype    | "char"  | -                             | Code segment defining the specific semantics of this dependency relationship. See the following for details.                                      |

In all cases, a PG\_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED\_DEPENDENCY\_OWNER (o)  
The referenced object (which must be a role) is the owner of the dependent object.
- SHARED\_DEPENDENCY\_ACL (a)  
The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED\_DEPENDENCY\_ACL does not add a record to the owner of the object because the owner will have a SHARED\_DEPENDENCY\_OWNER record.
- SHARED\_DEPENDENCY\_PIN (p)  
This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.
- SHARED\_DEPENDENCY\_DBPRIV(d)  
The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the **GS\_DB\_PRIVILEGE** system catalog).

## 12.2.68 PG\_SHDESCRIPTION

PG\_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the **\d** command.

See also PG\_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG\_SHDESCRIPTION is shared among all databases of a database instance. That is, there is only one PG\_SHDESCRIPTION for each instance, not for each database.

**Table 12-69** PG\_SHDESCRIPTION columns

| Name        | Type | Reference                              | Description                                         |
|-------------|------|----------------------------------------|-----------------------------------------------------|
| objoid      | oid  | Any OID column                         | OID of the described object.                        |
| classoid    | oid  | <b>oid</b> in <a href="#">PG_CLASS</a> | OID of the system catalog where the object appears. |
| description | text | -                                      | Description of the object.                          |

## 12.2.69 PG\_SHSECLABEL

**PG\_SHSECLABEL** records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see [PG\\_SECLABELS](#).

See also [PG\\_SECLABEL](#), which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG\_SHSECLABEL** is shared across all databases in the system. There is only one copy of **PG\_SHSECLABEL** in the GaussDB system, not one per database.

**Table 12-70** PG\_SHSECLABEL columns

| Name     | Type | Reference                    | Description                                            |
|----------|------|------------------------------|--------------------------------------------------------|
| objoid   | oid  | Any OID column               | OID of the object that this security label pertains to |
| classoid | oid  | <a href="#">PG_CLASS.oid</a> | OID of the system catalog where the object appears     |
| provider | text | -                            | Label provider associated with the label               |
| label    | text | -                            | Security label applied to the object                   |

## 12.2.70 PG\_STATISTIC

**PG\_STATISTIC** stores statistics about tables and index columns in a database. By default, only users with the **SYSADMIN** permission can access this system catalog. Common users can access it only after being authorized.

**Table 12-71** PG\_STATISTIC columns

| Name     | Type | Description                                          |
|----------|------|------------------------------------------------------|
| starelid | oid  | Table or index that the described column belongs to. |

| Name            | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| starelkind      | "char"   | Type of an object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| staattnum       | smallint | Number of the described column in the table, starting from 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| stainherit      | Boolean  | Specifies whether to collect statistics for objects that have inheritance relationship.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| stanullfrac     | real     | Percentage of column entries that are null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| stawidth        | integer  | Average stored width, in bytes, of non-null entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| stadistinct     | real     | <p>Number of distinct, non-null data values in the column for database nodes.</p> <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul> |
| stakindN        | smallint | <p>Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                                                                                                                                                                                                              |
| staopN          | oid      | <p>Operator used to generate the statistics stored in slot <i>N</i>. For example, a histogram slot shows the &lt; operator that defines the sort order of the data.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                                                                                                                                                        |
| stanumbers<br>N | real[]   | <p>Numerical statistics of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot does not involve numerical values.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                                                                                                                                                                                 |
| stavaluesN      | anyarray | <p>Column data values of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so there is no way to define these columns' type more specifically than anyarray.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                  |

| Name          | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**NOTICE**

PG\_STATISTIC stores sensitive information about statistical objects, such as MCVs. Users with the SYSADMIN permission and authorized users can access the PG\_STATISTIC system catalog to query the sensitive information about the statistical objects.

## 12.2.71 PG\_STATISTIC\_EXT

PG\_STATISTIC\_EXT records extended statistics about tables in a database. You can specify the extended statistics to be collected. This system catalog is accessible only to users with the SYSADMIN permission.

**Table 12-72** PG\_STATISTIC\_EXT columns

| Name        | Type    | Description                                                                                                                    |
|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| starelid    | oid     | Table or index that the described column belongs to.                                                                           |
| starelkind  | char    | Type of the object to which a table belongs. <b>c</b> indicates an ordinary table, and <b>p</b> indicates a partitioned table. |
| stainherit  | Boolean | Specifies whether to collect statistics for objects that have inheritance relationship.                                        |
| stanullfrac | real    | Percentage of column entries that are null.                                                                                    |
| stawidth    | integer | Average stored width, in bytes, of non-null entries.                                                                           |

| Name          | Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| stakey        | int2vector   | Array of a column ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| stanumbersN   | real[]       | <p>Numerical statistics of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot does not involve numerical values.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                                                                                                                                                                                 |
| stavaluesN    | anyarray     | <p>Column data values of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so there is no way to define these columns' type more specifically than anyarray.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>                                                                                                                                                                  |
| staexprs      | pg_node_tree | Expression corresponding to the extended statistics information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**NOTICE**

PG\_STATISTIC\_EXT stores sensitive information about statistical objects, such as MCVs. Users with the SYSADMIN permission and authorized users can access the PG\_STATISTIC\_EXT system catalog to query the sensitive information about the statistical objects.

## 12.2.72 PG\_SYNONYM

PG\_SYNONYM records the mapping between synonym object names and other database object names.

**Table 12-73** PG\_SYNONYM columns

| Name         | Type | Description                                                    |
|--------------|------|----------------------------------------------------------------|
| oid          | oid  | Database object ID                                             |
| synname      | name | Synonym name                                                   |
| synnamespace | oid  | OID of the namespace that contains a synonym                   |
| synowner     | oid  | Owner of a synonym, usually the OID of the user who created it |
| synobjschema | name | Schema name specified by an associated object                  |
| synobjname   | name | Name of an associated object                                   |

## 12.2.73 PG\_TABLESPACE

PG\_TABLESPACE records tablespace information.

**Table 12-74** PG\_TABLESPACE columns

| Name       | Type      | Description                                                                             |
|------------|-----------|-----------------------------------------------------------------------------------------|
| oid        | oid       | Row identifier (hidden attribute, which must be specified).                             |
| spcname    | name      | Tablespace name.                                                                        |
| spcowner   | oid       | Owner of the tablespace, usually the user who created it.                               |
| spcacl     | aclitem[] | Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> . |
| spcoptions | text[]    | Options of the tablespace.                                                              |

| Name       | Type    | Description                                                                                                                                                                              |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spcmaxsize | text    | Maximum size of the available disk space, in bytes.                                                                                                                                      |
| relative   | Boolean | Specifies whether the storage path specified by the tablespace is a relative path. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul> |

## 12.2.74 PG\_TRIGGER

PG\_TRIGGER records trigger information.

**Table 12-75** PG\_TRIGGER columns

| Name           | Type     | Description                                                                                                                                                                                                                                                             |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid            | oid      | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                                             |
| tgrelid        | oid      | OID of the table where the trigger is located.                                                                                                                                                                                                                          |
| tgname         | name     | Trigger name.                                                                                                                                                                                                                                                           |
| tgfoid         | oid      | Function to be called by the trigger.                                                                                                                                                                                                                                   |
| tgtype         | smallint | Trigger type.                                                                                                                                                                                                                                                           |
| tgenabled      | "char"   | <ul style="list-style-type: none"><li>• <b>O</b>: The trigger is enabled in origin or local mode.</li><li>• <b>D</b>: The trigger is disabled.</li><li>• <b>R</b>: The trigger is enabled in replica mode.</li><li>• <b>A</b>: The trigger is always enabled.</li></ul> |
| tgisinternal   | Boolean  | Internal trigger ID. If the value is <b>true</b> , it indicates an internal trigger.                                                                                                                                                                                    |
| tgconstrrelid  | oid      | Table referenced by the integrity constraint.                                                                                                                                                                                                                           |
| tgconstrindid  | oid      | Index of the integrity constraint.                                                                                                                                                                                                                                      |
| tgconstraint   | oid      | OID of the constraint trigger in <a href="#">PG_CONSTRAINT</a> .                                                                                                                                                                                                        |
| tgdeferrable   | Boolean  | Specifies whether the constraint trigger is of the DEFERRABLE type.                                                                                                                                                                                                     |
| tginitdeferred | Boolean  | Specifies whether the trigger is of the INITIALLY DEFERRED type.                                                                                                                                                                                                        |
| tgargs         | smallint | Number of input parameters of the trigger function.                                                                                                                                                                                                                     |

| Name    | Type         | Description                                                                            |
|---------|--------------|----------------------------------------------------------------------------------------|
| tgattr  | int2vector   | Column ID specified by the trigger. If no column is specified, an empty array is used. |
| tgargs  | bytea        | Parameter specified in the trigger.                                                    |
| tgqual  | pg_node_tree | WHEN condition of the trigger ( <b>NULL</b> if the WHEN condition does not exist).     |
| tgowner | oid          | Trigger owner.                                                                         |

## 12.2.75 PG\_TS\_CONFIG

**PG\_TS\_CONFIG** contains entries representing text search configurations. A configuration specifies a particular text search parser and a list of dictionaries to use for each of the parser's output token types.

The parser is shown in the **PG\_TS\_CONFIG** entry, but the token-to-dictionary mapping is defined by subsidiary entries in [PG\\_TS\\_CONFIG\\_MAP](#).

**Table 12-76** PG\_TS\_CONFIG columns

| Name         | Type   | Reference                         | Description                                                |
|--------------|--------|-----------------------------------|------------------------------------------------------------|
| oid          | oid    | -                                 | Row identifier (hidden attribute, which must be specified) |
| cfgname      | name   | -                                 | Text search configuration name                             |
| cfgnamespace | oid    | <a href="#">PG_NAMESPACE</a> .oid | OID of the namespace that contains the configuration       |
| cfgowner     | oid    | <a href="#">PG_AUTHID</a> .oid    | Owner of the configuration                                 |
| cfgparser    | oid    | <a href="#">PG_TS_PARSER</a> .oid | OID of the text search parser for this configuration       |
| cfoptions    | text[] | -                                 | Configuration options                                      |

## 12.2.76 PG\_TS\_CONFIG\_MAP

**PG\_TS\_CONFIG\_MAP** contains entries showing which text search dictionaries should be consulted, and in what order, for each output token type of each text search configuration's parser.

**Table 12-77** PG\_TS\_CONFIG\_MAP columns

| Name         | Type    | Reference                           | Description                                                                                          |
|--------------|---------|-------------------------------------|------------------------------------------------------------------------------------------------------|
| mapcfg       | oid     | OID in <a href="#">PG_TS_CONFIG</a> | OID of the <a href="#">PG_TS_CONFIG</a> entry owning this map entry                                  |
| maptokentype | integer | -                                   | Token type generated by the configuration's parser                                                   |
| mapseqno     | integer | -                                   | Sequence number of a token type when the values of <b>mapcfg</b> or <b>maptokentype</b> are the same |
| mapdict      | oid     | OID in <a href="#">PG_TS_DICT</a>   | OID of the text search dictionary to consult                                                         |

## 12.2.77 PG\_TS\_DICT

**PG\_TS\_DICT** contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

**Table 12-78** PG\_TS\_DICT columns

| Name           | Type | Reference                           | Description                                                |
|----------------|------|-------------------------------------|------------------------------------------------------------|
| oid            | oid  | -                                   | Row identifier (hidden attribute, which must be specified) |
| dictname       | name | -                                   | Text search dictionary name                                |
| dictnamespace  | oid  | <a href="#">PG_NAMESPACE</a> .oid   | OID of the namespace that contains the dictionary          |
| dictowner      | oid  | <a href="#">PG_AUTHID</a> .oid      | Owner of the dictionary                                    |
| dicttemplate   | oid  | <a href="#">PG_TS_TEMPLATE</a> .oid | OID of the text search template for the dictionary         |
| dictinitoption | text | -                                   | Initialization option string for the template              |

## 12.2.78 PG\_TS\_PARSER

**PG\_TS\_PARSER** contains entries defining text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. The new parser must be created by the database system administrator.

**Table 12-79** PG\_TS\_PARSER columns

| Name         | Type    | Reference                         | Description                                                |
|--------------|---------|-----------------------------------|------------------------------------------------------------|
| oid          | oid     | -                                 | Row identifier (hidden attribute, which must be specified) |
| prsname      | name    | -                                 | Text search parser name                                    |
| prsnamespace | oid     | <a href="#">PG_NAMESPACE</a> .oid | OID of the namespace that contains the parser              |
| prsstart     | regproc | <a href="#">PG_PROC</a> .praname  | Name of the parser's startup function                      |
| prstoken     | regproc | <a href="#">PG_PROC</a> .praname  | Name of the parser's next-token function                   |
| prsend       | regproc | <a href="#">PG_PROC</a> .praname  | Name of the parser's shutdown function                     |
| prsheadline  | regproc | <a href="#">PG_PROC</a> .praname  | Name of the parser's headline function                     |
| prsllextype  | regproc | <a href="#">PG_PROC</a> .praname  | Name of the parser's lextype function                      |

## 12.2.79 PG\_TS\_TEMPLATE

**PG\_TS\_TEMPLATE** contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

**Table 12-80** PG\_TS\_TEMPLATE columns

| Name          | Type | Reference                         | Description                                                |
|---------------|------|-----------------------------------|------------------------------------------------------------|
| oid           | oid  | -                                 | Row identifier (hidden attribute, which must be specified) |
| tmplname      | name | -                                 | Text search template name                                  |
| tmplnamespace | oid  | <a href="#">PG_NAMESPACE</a> .oid | OID of the namespace that contains the template            |

| Name       | Type    | Reference                        | Description                                    |
|------------|---------|----------------------------------|------------------------------------------------|
| tmplinit   | regproc | <a href="#">PG_PROC</a> .proname | Name of the template's initialization function |
| tmpllexize | regproc | <a href="#">PG_PROC</a> .proname | Name of the template's lexize function         |

## 12.2.80 PG\_TYPE

PG\_TYPE stores information about data types.

**Table 12-81** PG\_TYPE columns

| Name         | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid          | oid      | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                                                                                                                                                                                                                                                        |
| typename     | name     | Data type name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| typnamespace | oid      | OID of the namespace that contains the type.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| typowner     | oid      | Owner of the type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| typlen       | smallint | <p>Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type.</p> <ul style="list-style-type: none"><li>• <b>-1</b>: a "varlena" type (one that has a length word).</li><li>• <b>-2</b>: a null-terminated C string.</li></ul>                                                                                                                                                                          |
| typbyval     | Boolean  | <ul style="list-style-type: none"><li>• <b>true</b>: A value of this type is passed by value internally.</li><li>• <b>false</b>: A value of this type is passed by reference internally.</li></ul> <p>If <b>typlen</b> of this type is not <b>1</b>, <b>2</b>, <b>4</b>, or <b>8</b>, you are advised to transfer a reference value for <b>typbyval</b>. You can also transfer a value for <b>typbyval</b>. Variable-length types are usually passed by reference or by value.</p> |
| typtype      | "char"   | <ul style="list-style-type: none"><li>• <b>b</b>: basic type.</li><li>• <b>c</b>: composite type (for example, the row type of a table).</li><li>• <b>d</b>: domain type.</li><li>• <b>p</b>: pseudo type.</li><li>• <b>o</b>: set type.</li></ul> <p>For details, see <b>typrelid</b> and <b>typbasetype</b>.</p>                                                                                                                                                                 |

| Name           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| typcategory    | "char"  | Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| typispreferred | Boolean | <ul style="list-style-type: none"><li>• <b>true</b>: Data is converted when it complies with the conversion rule specified by <b>typcategory</b>.</li><li>• <b>false</b>: Data is not converted.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                             |
| typisdefined   | Boolean | <ul style="list-style-type: none"><li>• <b>true</b>: The type has been defined.</li><li>• <b>false</b>: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.</li></ul>                                                                                                                                                                                                                                                                                                                                                        |
| typdelim       | "char"  | Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| typrelid       | oid     | If this is a composite type (see <b>typtype</b> ), then this column points to the <b>PG_CLASS</b> entry that defines the corresponding table. For a free-standing composite type, the PG_CLASS entry does not represent a table, but it is required for the type's <b>PG_ATTRIBUTE</b> entries to link to. It is <b>0</b> for non-composite type.                                                                                                                                                                                                                                                                      |
| typelem        | oid     | If <b>typelem</b> is not <b>0</b> , it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type <b>typelem</b> . A "true" array type has a variable length ( <b>typlen</b> = <b>-1</b> ), but some fixed-length types ( <b>typlen</b> > <b>0</b> ) also have non-zero <b>typelem</b> , for example <b>name</b> and <b>point</b> . If a fixed-length type has a <b>typelem</b> , its internal representation must be a number of values of the <b>typelem</b> data type with no other data. Variable-length array types have a header defined by the array subroutines. |
| typarray       | oid     | If the value is not <b>0</b> , the corresponding type record is available in PG_TYPE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| typalign    | "char"  | <p>Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are:</p> <ul style="list-style-type: none"><li>• <b>c</b>: char alignment, that is, no alignment required</li><li>• <b>s</b>: short alignment (2 bytes on most machines)</li><li>• <b>i</b>: integer alignment (4 bytes on most machines)</li><li>• <b>d</b>: double alignment (8 bytes on many machines, but by no means all)</li></ul> <p><b>NOTICE</b><br/>For types used in system catalogs, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.</p> |
| typstorage  | "char"  | <p><b>typstorage</b> tells for varlena types (those with <b>typlen = -1</b>) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are:</p> <ul style="list-style-type: none"><li>• <b>p</b>: Values are always stored plain.</li><li>• <b>e</b>: Values can be stored in a secondary relationship (if the relation has one, see <a href="#">PG_CLASS.reltoastrelid</a>).</li><li>• <b>m</b>: Values can be stored compressed inline.</li><li>• <b>x</b>: Values can be stored compressed inline or stored in secondary storage.</li></ul> <p><b>NOTICE</b><br/><b>m</b> domains can also be moved out to secondary storage, but only as a last resort (<b>e</b> and <b>x</b> domains are moved first).</p>                                                                                                                                                                                                              |
| typnotnull  | Boolean | Specifies whether the type has a NOTNULL constraint. Currently, it is used for domains only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| typbasetype | oid     | If this is a domain (see <b>typtype</b> ), then <b>typbasetype</b> identifies the type that this one is based on. The value is <b>0</b> if this type is not a derived type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Name          | Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| typtypmod     | integer      | Records the <b>typtypmod</b> to be applied to domains' base types by domains (the value is <b>-1</b> if the base type does not use <b>typmod</b> ). This is <b>-1</b> if this type is not a domain.                                                                                                                                                                                                                                                                                                |
| typndims      | integer      | If a field is an array, <b>typndims</b> is the number of array dimensions. This is <b>0</b> for types other than domains over array types.                                                                                                                                                                                                                                                                                                                                                         |
| typcollation  | oid          | Sequence rule for specified types. For details about the value, see the <a href="#">PG_COLLATION</a> system catalog. ( <b>0</b> if sequencing is not supported)                                                                                                                                                                                                                                                                                                                                    |
| typdefaultbin | pg_node_tree | nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.                                                                                                                                                                                                                                                                                                                                                      |
| typdefault    | text         | The value is <b>NULL</b> if a type has no associated default value. <ul style="list-style-type: none"><li>• If <b>typdefaultbin</b> is not <b>NULL</b>, <b>typdefault</b> must contain a default expression represented by <b>typdefaultbin</b>.</li><li>• If <b>typdefaultbin</b> is <b>NULL</b> and <b>typdefault</b> is not, then <b>typdefault</b> is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.</li></ul> |
| typacl        | aclitem[]    | Access permission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 12.2.81 PG\_USER\_MAPPING

**PG\_USER\_MAPPING** records mappings from local users to remote.

This system catalog is accessible only to users with the SYSADMIN permission. Common users can query the [PG\\_USER\\_MAPPINGS](#) view.

**Table 12-82** PG\_USER\_MAPPING columns

| Name     | Type | Reference                              | Description                                                                  |
|----------|------|----------------------------------------|------------------------------------------------------------------------------|
| oid      | oid  | -                                      | Row identifier (hidden attribute, which must be specified)                   |
| umuser   | oid  | <a href="#">PG_AUTHID</a> .oid         | OID of the local role being mapped ( <b>0</b> if the user mapping is public) |
| umserver | oid  | <a href="#">PG_FOREIGN_SERVER</a> .oid | OID of the foreign server that contains the mapping                          |

| Name      | Type   | Reference | Description                                                                         |
|-----------|--------|-----------|-------------------------------------------------------------------------------------|
| umoptions | text[] | -         | User mapping specific options, expressed in a string in the format of keyword=value |

## 12.2.82 PG\_USER\_STATUS

PG\_USER\_STATUS records the states of users who access the database. Only users with the SYSADMIN permission can access this system catalog.

**Table 12-83** PG\_USER\_STATUS columns

| Name             | Type                     | Description                                                                                                                                                                                                                                                              |
|------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid              | oid                      | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                                              |
| roloid           | oid                      | ID of the role.                                                                                                                                                                                                                                                          |
| failcount        | integer                  | Number of failed attempts.                                                                                                                                                                                                                                               |
| locktime         | timestamp with time zone | Time at which the role is locked.                                                                                                                                                                                                                                        |
| rolstatus        | smallint                 | Role state. <ul style="list-style-type: none"><li>• <b>0</b>: normal</li><li>• <b>1</b>: The role is locked for a specific period of time because the failed login attempts exceed the threshold.</li><li>• <b>2</b>: The role is locked by the administrator.</li></ul> |
| permpspace       | bigint                   | Size of the permanent table storage space used by the role.                                                                                                                                                                                                              |
| tempSPACE        | bigint                   | Size of the temporary table storage space used by the role.                                                                                                                                                                                                              |
| password expired | smallint                 | Specifies whether a password is valid. <ul style="list-style-type: none"><li>• <b>0</b>: The password is valid.</li><li>• <b>1</b>: The password is invalid.</li></ul>                                                                                                   |

## 12.2.83 PG\_WORKLOAD\_GROUP

PG\_WORKLOAD\_GROUP provides workload group information in the database.

**Table 12-84** PG\_WORKLOAD\_GROUP columns

| Name            | Type    | Description                                                |
|-----------------|---------|------------------------------------------------------------|
| oid             | oid     | Row identifier (hidden attribute, which must be specified) |
| workload_gpname | name    | Workload group name                                        |
| respool_oid     | oid     | ID bound to the resource pool                              |
| act_statements  | integer | Maximum number of active statements in the workload group  |

## 12.2.84 PGXC\_CLASS

PGXC\_CLASS records the replicated or distributed information for each table. **PGXC\_CLASS** can only be used to query table definitions in centralized mode.

**Table 12-85** PGXC\_CLASS columns

| Name            | Type             | Description                                                                                                                                                                                                                  |
|-----------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pcrelid         | oid              | Table OID.                                                                                                                                                                                                                   |
| pclocatortype   | "char"           | Locator type. <ul style="list-style-type: none"><li>• <b>H</b>: Hash</li><li>• <b>G</b>: Range</li><li>• <b>L</b>: List</li><li>• <b>M</b>: Modulo</li><li>• <b>N</b>: Round Robin</li><li>• <b>R</b>: Replication</li></ul> |
| pchashalgorithm | smallint         | Distributed tuple using the hash algorithm.                                                                                                                                                                                  |
| pchashbuckets   | smallint         | Value of a hash container.                                                                                                                                                                                                   |
| pgroup          | name             | Name of a node group.                                                                                                                                                                                                        |
| redistributed   | "char"           | Indicates that a table has been redistributed.                                                                                                                                                                               |
| redis_order     | integer          | Redistribution sequence. Tables whose values are <b>0</b> will not be redistributed in this round of redistribution.                                                                                                         |
| pcattnum        | int2vector       | Column number used as a distributed key.                                                                                                                                                                                     |
| nodeoids        | oidvector_extend | List of distributed table node OIDs.                                                                                                                                                                                         |
| options         | text             | Extension status information. This is a reserved column in the system.                                                                                                                                                       |

## 12.2.85 PGXC\_GROUP

PGXC\_GROUP records information about node groups. PGXC\_GROUP can only be used to query table definitions in the centralized system.

**Table 12-86** PGXC\_GROUP columns

| Name              | Type              | Description                                                                                                                                                                                                                                                                                                           |
|-------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid               | oid               | Row identifier (hidden attribute, which must be specified).                                                                                                                                                                                                                                                           |
| group_name        | name              | Node group name.                                                                                                                                                                                                                                                                                                      |
| in_redistribution | "char"            | Specifies whether redistribution is required. Valid value: <ul style="list-style-type: none"><li>• <b>n</b>: The node group is not redistributed.</li><li>• <b>y</b>: The source node group is in redistribution.</li><li>• <b>t</b>: The destination node group is in redistribution.</li></ul>                      |
| group_members     | oidvector_ext end | Node OID list of the node group.                                                                                                                                                                                                                                                                                      |
| group_buckets     | text              | Distributed data bucket group.                                                                                                                                                                                                                                                                                        |
| is_installation   | Boolean           | Specifies whether to install a sub-database instance. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                                                                                                                                                           |
| group_acl         | aclitem[]         | Access permission.                                                                                                                                                                                                                                                                                                    |
| group_kind        | "char"            | Node group type. The options are as follows: <ul style="list-style-type: none"><li>• <b>i</b>: installation node group</li><li>• <b>n</b>: node group in a common non-logical database instance</li><li>• <b>v</b>: node group in a logical database instance</li><li>• <b>e</b>: elastic database instance</li></ul> |
| group_parent      | oid               | For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.                                                                                                                                                                                     |

## 12.2.86 PGXC\_NODE

PGXC\_NODE stores information about database instance nodes. **PGXC\_NODE** can only be used to query table definitions in centralized mode.

**Table 12-87** PGXC\_NODE columns

| Name             | Type    | Description                                                                                                                                                                                                            |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| oid              | oid     | Row identifier (hidden attribute, which must be specified)                                                                                                                                                             |
| node_name        | name    | Node name                                                                                                                                                                                                              |
| node_type        | "char"  | Node type <ul style="list-style-type: none"><li>● <b>C</b>: CN</li><li>● <b>D</b>: DN</li><li>● <b>S</b>: standby node</li></ul>                                                                                       |
| node_port        | integer | Port number of the node                                                                                                                                                                                                |
| node_host        | name    | Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)                                                                                                         |
| node_port1       | integer | Port number of a replication node                                                                                                                                                                                      |
| node_host1       | name    | Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)                                                                                             |
| hostis_primary   | boolean | Specifies whether a primary/standby switchover occurs on the current node. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>                                       |
| nodeis_primary   | boolean | Specifies whether the current node is preferred to execute non-query operations in the <b>replication</b> table. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul> |
| nodeis_preferred | boolean | Specifies whether the current node is preferred to execute queries in the <b>replication</b> table. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>              |
| node_id          | integer | Node ID. The value is obtain by calculating the value of <b>node_name</b> using the hash function.                                                                                                                     |
| sctp_port        | integer | Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)                                  |
| control_port     | integer | Port used by the TCP proxy communications library of the primary node to listen to the control channel                                                                                                                 |

| Name           | Type    | Description                                                                                                                                                                           |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sctp_port1     | integer | Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.) |
| control_port1  | integer | Port used by the TCP proxy communications library of the standby node to listen to the control channel                                                                                |
| nodeis_central | boolean | Specifies whether the current node is a CN. It is invalid for DNs. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>              |
| nodeis_active  | boolean | Specifies whether the current node is normal. It is invalid for DNs. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>            |

## 12.2.87 PGXC\_SLICE

PGXC\_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

PGXC\_SLICE can only be used to query table definitions in centralized mode.

**Table 12-88** PGXC\_SLICE columns

| Name             | Type   | Description                                                                                                                                                                                      |
|------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relname          | name   | Table name or shard name, which is distinguished by <b>type</b> .                                                                                                                                |
| type             | "char" | <ul style="list-style-type: none"><li>• <b>'t'</b>: <b>relname</b> is the table name.</li><li>• <b>'s'</b>: <b>relname</b> is the shard name.</li></ul>                                          |
| strategy         | "char" | <ul style="list-style-type: none"><li>• <b>'r'</b>: range distributed table.</li><li>• <b>'l'</b>: list distributed table.</li></ul> This value will be extended for subsequent interval shards. |
| relid            | oid    | OID of the distributed table to which the tuple belongs.                                                                                                                                         |
| referenc<br>eoid | oid    | OID of the referenced distributed table, which is used for slice reference table creation syntax.                                                                                                |

| Name            | Type    | Description                                                                                                            |
|-----------------|---------|------------------------------------------------------------------------------------------------------------------------|
| sindex          | integer | Position of the current boundary in a shard when the table is a list distributed table.                                |
| interval        | text[]  | Reserved column.                                                                                                       |
| transitboundary | text[]  | Reserved column.                                                                                                       |
| transitno       | integer | Reserved column.                                                                                                       |
| nodeoid         | oid     | When <b>relname</b> is set to a shard name, <b>nodeoid</b> indicates the OID of the DN where the shard data is stored. |
| boundaries      | text[]  | When <b>relname</b> is set to a shard name, this parameter indicates the boundary value of the shard.                  |
| specified       | Boolean | Specifies whether the DN corresponding to the current shard is explicitly specified in the DDL.                        |
| sliceorder      | integer | User-defined shard sequence.                                                                                           |

## 12.2.88 PLAN\_TABLE\_DATA

PLAN\_TABLE\_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN\_TABLE view, the system catalog PLAN\_TABLE\_DATA stores EXPLAIN PLAN information collected by all sessions and users.

**Table 12-89** PLAN\_TABLE\_DATA columns

| Name         | Type         | Description                                                                                                                                              |
|--------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| session_id   | text         | Session that inserts the data. Its value consists of a worker thread start timestamp and a worker thread ID. Values are constrained by <b>NOT NULL</b> . |
| user_id      | oid          | ID of the user who inserts the data. Values are constrained by <b>NOT NULL</b> .                                                                         |
| statement_id | varchar2(30) | Query tag specified by a user.                                                                                                                           |
| plan_id      | bigint       | Query ID The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.                                   |
| id           | integer      | Node ID in a plan                                                                                                                                        |
| operation    | varchar2(30) | Operation description.                                                                                                                                   |

| Name         | Type             | Description                                                 |
|--------------|------------------|-------------------------------------------------------------|
| options      | varchar2(255)    | Operation action.                                           |
| object_name  | name             | Name of an operated object. It is defined by users.         |
| object_type  | varchar2(30)     | Object type.                                                |
| object_owner | name             | Schema to which the object belongs. It is defined by users. |
| projection   | varchar2(4000)   | Returned column information.                                |
| cost         | double precision | Execution cost estimated by the optimizer for an operator   |
| cardinality  | double precision | Number of rows estimated by the optimizer for an operator   |

 NOTE

- PLAN\_TABLE\_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the [PLAN\\_TABLE](#) view.
- Data is automatically inserted into PLAN\_TABLE\_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN\_TABLE\_DATA. Otherwise, data in PLAN\_TABLE\_DATA may be disordered. To delete data, you are advised to use the [PLAN\\_TABLE](#) view.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

## 12.2.89 STATEMENT\_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the SYSADMIN permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track\_stmt\_stat\_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each field, see the following table.
- For slow SQL statements, if the value of **track\_stmt\_stat\_level** is not **OFF** and the SQL execution time exceeds the value of **log\_min\_duration\_statement**, the SQL statement is recorded as a slow SQL statement.

**Table 12-90** STATEMENT\_HISTORY columns

| Name               | Type                     | Description                                                                                                                                                                                                                           | Record Level |
|--------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| db_name            | name                     | Database name.                                                                                                                                                                                                                        | L0           |
| schema_name        | name                     | Schema name.                                                                                                                                                                                                                          | L0           |
| origin_node        | integer                  | Node name.                                                                                                                                                                                                                            | L0           |
| user_name          | name                     | Username.                                                                                                                                                                                                                             | L0           |
| application_name   | text                     | Name of the application that sends a request.                                                                                                                                                                                         | L0           |
| client_addr        | text                     | IP address of the client that sends a request.                                                                                                                                                                                        | L0           |
| client_port        | integer                  | Port number of the client that sends a request.                                                                                                                                                                                       | L0           |
| unique_query_id    | bigint                   | ID of the normalized SQL statement.                                                                                                                                                                                                   | L0           |
| debug_query_id     | bigint                   | ID of the unique SQL statement.                                                                                                                                                                                                       | L0           |
| query              | text                     | Normalized SQL statement.                                                                                                                                                                                                             | L0           |
| start_time         | timestamp with time zone | Time when a statement starts.                                                                                                                                                                                                         | L0           |
| finish_time        | timestamp with time zone | Time when a statement ends.                                                                                                                                                                                                           | L0           |
| slow_sql_threshold | bigint                   | Standard for slow SQL statement execution.                                                                                                                                                                                            | L0           |
| transaction_id     | bigint                   | Transaction ID.                                                                                                                                                                                                                       | L0           |
| thread_id          | bigint                   | ID of an execution thread.                                                                                                                                                                                                            | L0           |
| session_id         | bigint                   | Session ID of a user.                                                                                                                                                                                                                 | L0           |
| n_soft_parse       | bigint                   | Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . | L0           |

| Name                | Type   | Description                                                                                                                                                                                                                           | Record Level |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| n_hard_parse        | bigint | Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . | L0           |
| query_plan          | text   | Statement execution plan.                                                                                                                                                                                                             | L1           |
| n_returned_rows     | bigint | Number of rows in the result set returned by the <b>SELECT</b> statement.                                                                                                                                                             | L0           |
| n_tuples_fetched    | bigint | Number of rows randomly scanned.                                                                                                                                                                                                      | L0           |
| n_tuples_returned   | bigint | Number of rows sequentially scanned.                                                                                                                                                                                                  | L0           |
| n_tuples_inserted   | bigint | Number of rows inserted.                                                                                                                                                                                                              | L0           |
| n_tuples_updated    | bigint | Number of rows updated.                                                                                                                                                                                                               | L0           |
| n_tuples_deleted    | bigint | Number of rows deleted.                                                                                                                                                                                                               | L0           |
| n_blocks_fetched    | bigint | Number of buffer block access times.                                                                                                                                                                                                  | L0           |
| n_blocks_hit        | bigint | Number of buffer block hits.                                                                                                                                                                                                          | L0           |
| db_time             | bigint | Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).                                                                                                                                                 | L0           |
| cpu_time            | bigint | CPU time (unit: $\mu$ s).                                                                                                                                                                                                             | L0           |
| execution_time      | bigint | Execution time in the executor (unit: $\mu$ s).                                                                                                                                                                                       | L0           |
| parse_time          | bigint | SQL parsing time (unit: $\mu$ s).                                                                                                                                                                                                     | L0           |
| plan_time           | bigint | SQL plan generation time (unit: $\mu$ s).                                                                                                                                                                                             | L0           |
| rewrite_time        | bigint | SQL rewriting time (unit: $\mu$ s).                                                                                                                                                                                                   | L0           |
| pl_execution_time   | bigint | Execution time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                           | L0           |
| pl_compilation_time | bigint | Compilation time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                         | L0           |
| data_io_time        | bigint | I/O time (unit: $\mu$ s).                                                                                                                                                                                                             | L0           |

| Name                 | Type   | Description                                                                                                                                                                                           | Record Level |
|----------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| net_send_info        | text   | Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.     | L0           |
| net_rcv_info         | text   | Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode. | L0           |
| net_stream_send_info | text   | Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.      | L0           |
| net_stream_rcv_info  | text   | Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.  | L0           |
| lock_count           | bigint | Number of locks.                                                                                                                                                                                      | L0           |
| lock_time            | bigint | Time required for locking.                                                                                                                                                                            | L1           |
| lock_wait_count      | bigint | Number of lock waits.                                                                                                                                                                                 | L0           |
| lock_wait_time       | bigint | Time required for lock waiting.                                                                                                                                                                       | L1           |
| lock_max_count       | bigint | Maximum number of locks.                                                                                                                                                                              | L0           |
| lwlock_count         | bigint | Number of lightweight locks (reserved).                                                                                                                                                               | L0           |
| lwlock_wait_count    | bigint | Number of lightweight lock waits.                                                                                                                                                                     | L0           |
| lwlock_time          | bigint | Time required for lightweight locking (reserved).                                                                                                                                                     | L1           |
| lwlock_wait_time     | bigint | Time required for lightweight lock waiting.                                                                                                                                                           | L1           |

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Record Level |
|-------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| details     | bytea   | List of statement lock events, which are recorded in time sequence. The number of records is affected by the <b>track_stmt_details_size</b> parameter. This field is in binary format and needs to be read by using the parsing function <code>pg_catalog.statement_detail_decode</code> . For details, see <a href="#">Table 7-51</a> .<br>Events include: <ul style="list-style-type: none"><li>• Start locking.</li><li>• Complete locking.</li><li>• Start lock waiting.</li><li>• Complete lock waiting.</li><li>• Start unlocking.</li><li>• Complete unlocking.</li><li>• Start lightweight lock waiting.</li><li>• Complete lightweight lock waiting.</li></ul> | L2           |
| is_slow_sql | Boolean | Specifies whether the SQL statement is a slow SQL statement. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | L0           |
| trace_id    | text    | Driver-specific trace ID, which is associated with an application request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | L0           |

| Name   | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Record Level |
|--------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| advise | text | <p>Risks which may cause slow SQL statements. (Multiple risks may exist at the same time.)</p> <ul style="list-style-type: none"><li>• Cast Function Cause Index Miss. : Index matching may fail due to implicit conversion.</li><li>• Limit too much rows. : The SQL statement execution may slow down due to a large <b>limit</b> value.</li><li>• Proleakproof of function is false. : The <b>proleakproof</b> of the function is set to <b>false</b>. In this case, the function does not use statistics when generating a plan due to data leakage risks. As a result, the accuracy of the generated plan is affected and the SQL statement execution may slow down.</li></ul> | L0           |

## 12.2.90 STREAMING\_STREAM

**STREAMING\_STREAM** records the metadata of all STREAM objects.

**Table 12-91** STREAMING\_STREAM columns

| Name    | Type  | Description                                                 |
|---------|-------|-------------------------------------------------------------|
| relid   | oid   | STREAM object ID.                                           |
| queries | bytea | Bitmap mapping of the CONTVIEW corresponding to the STREAM. |

## 12.2.91 STREAMING\_CONT\_QUERY

**STREAMING\_CONT\_QUERY** records the metadata of all CONTVIEW objects.

**Table 12-92** STREAMING\_CONT\_QUERY columns

| Name | Type    | Description                               |
|------|---------|-------------------------------------------|
| id   | integer | Unique identifier of the CONTVIEW object. |

| Name        | Type       | Description                                                                                                                                                                 |
|-------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | "char"     | CONTVIEW type. <ul style="list-style-type: none"><li>• <b>'r'</b>: CONTVIEW is based on the row-store model.</li></ul>                                                      |
| relid       | oid        | CONTVIEW object ID.                                                                                                                                                         |
| defrelid    | oid        | ID of the continuous computing rule view corresponding to CONTVIEW.                                                                                                         |
| active      | Boolean    | Determines whether the CONTVIEW is in the continuous computing state. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul> |
| streamrelid | oid        | ID of STREAM corresponding to CONTVIEW.                                                                                                                                     |
| matrelid    | oid        | ID of the materialized table corresponding to CONTVIEW.                                                                                                                     |
| lookupidxid | oid        | ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.                                             |
| step_factor | smallint   | CONTVIEW step mode. The main values are <b>0</b> (no overlapping window) and <b>1</b> (sliding window, with one step).                                                      |
| ttl         | integer    | Value of <b>ttl_interval</b> set by CONTVIEW.                                                                                                                               |
| ttl_attno   | smallint   | Number of a time column corresponding to the TTL function set by CONTVIEW.                                                                                                  |
| dictrelid   | oid        | ID of the dictionary table corresponding to CONTVIEW.                                                                                                                       |
| grpnum      | smallint   | Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.                                                                     |
| grpidx      | int2vector | Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.                                                    |

## 12.2.92 STREAMING\_REAPER\_STATUS

**STREAMING\_REAPER\_STATUS** records the status information about the reaper thread of the streaming engine. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

**Table 12-93** STREAMING\_REAPER\_STATUS columns

| Name                   | Type    | Description                                                                                                                                        |
|------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| id                     | integer | Unique identifier of the CONTVIEW object.                                                                                                          |
| contquery_name         | name    | Name of the CONTVIEW object.                                                                                                                       |
| gather_interval        | text    | Value of <b>gather_interval</b> (time parameter for automatically aggregating historical data before a specific time) set for the CONTVIEW object. |
| gather_completion_time | text    | Time when the latest GATHER (historical data aggregation) operation on the CONTVIEW object is completed.                                           |

## 12.3 System Views

### 12.3.1 ADM\_COL\_COMMENTS

ADM\_COL\_COMMENTS displays information about table column comments in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-94** ADM\_COL\_COMMENTS columns

| Name        | Type                  | Description  |
|-------------|-----------------------|--------------|
| owner       | character varying(64) | Table owner. |
| table_name  | character varying(64) | Table name.  |
| column_name | character varying(64) | Column name. |
| comments    | text                  | Comments.    |

### 12.3.2 ADM\_CONS\_COLUMNS

ADM\_CONS\_COLUMNS displays information about constraint columns in database tables. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-95** ADM\_CONS\_COLUMNS columns

| Name            | Type                  | Description                          |
|-----------------|-----------------------|--------------------------------------|
| owner           | character varying(64) | Constraint creator.                  |
| column_name     | character varying(64) | Name of a constraint-related column. |
| constraint_name | character varying(64) | Constraint name.                     |
| position        | smallint              | Position of a column in a table.     |
| table_name      | character varying(64) | Name of a constraint-related table.  |

### 12.3.3 ADM\_CONSTRAINTS

ADM\_CONSTRAINTS displays information about table constraints in database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-96** ADM\_CONSTRAINTS columns

| Name            | Type                  | Description                                                                                                                                                                                                                   |
|-----------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | character varying(64) | Constraint creator.                                                                                                                                                                                                           |
| constraint_name | character varying(64) | Constraint name.                                                                                                                                                                                                              |
| constraint_type | text                  | Constraint type. <ul style="list-style-type: none"><li>• <b>c</b>: check constraint.</li><li>• <b>f</b>: foreign key constraint.</li><li>• <b>p</b>: primary key constraint.</li><li>• <b>u</b>: unique constraint.</li></ul> |
| table_name      | character varying(64) | Name of a constraint-related table.                                                                                                                                                                                           |
| index_owner     | character varying(64) | Owner of a constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                              |
| index_name      | character varying(64) | Name of the constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                             |

## 12.3.4 ADM\_DATA\_FILES

ADM\_DATA\_FILES displays the description of database files. By default, only the SYSADMIN can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-97** ADM\_DATA\_FILES columns

| Name            | Type             | Description                                     |
|-----------------|------------------|-------------------------------------------------|
| tablespace_name | name             | Name of the tablespace to which a file belongs. |
| bytes           | double precision | Length of a file, in bytes.                     |

## 12.3.5 ADM\_HIST\_SNAPSHOT

ADM\_HIST\_SNAPSHOT records the index information and start time of WDR snapshots stored in the current system. By default, only the SYSADMIN can access this view. Common users can access the view only after being authorized.

**Table 12-98** ADM\_HIST\_SNAPSHOT columns

| Name                | Type      | Description                   |
|---------------------|-----------|-------------------------------|
| snap_id             | bigint    | WDR snapshot ID.              |
| begin_interval_time | timestamp | Start time of a WDR snapshot. |

## 12.3.6 ADM\_HIST\_SQL\_PLAN

ADM\_HIST\_SQL\_PLAN displays plan information collected by the current user by running the **EXPLAIN PLAN** statement. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized.

**Table 12-99** ADM\_HIST\_SQL\_PLAN columns

| Name            | Type                  | Description                                                                                                                                              |
|-----------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | character varying(30) | Session that inserts the data. Its value consists of a worker thread start timestamp and a worker thread ID. Values are constrained by <b>NOT NULL</b> . |
| plan_hash_value | bigint                | Query ID.                                                                                                                                                |

| Name        | Type                   | Description                                         |
|-------------|------------------------|-----------------------------------------------------|
| operation   | character varying(30)  | Operation description.                              |
| options     | character varying(255) | Operation option.                                   |
| object_name | name                   | Name of an operated object. It is defined by users. |

### 12.3.7 ADM\_HIST\_SQLSTAT

ADM\_HIST\_SQLSTAT displays information about statements executed on the current node. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized.

**Table 12-100** ADM\_HIST\_SQLSTAT columns

| Name                 | Type    | Description                                                                                                  |
|----------------------|---------|--------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER      | integer | Instance ID of a snapshot.                                                                                   |
| SQL_ID               | bigint  | Query ID.                                                                                                    |
| PLAN_HASH_VALUE      | bigint  | ID of the normalized SQL statement.                                                                          |
| MODULE               | text    | Name of the module that is executing when the SQL statement is first parsed.                                 |
| ELAPSED_TIME_DELTA   | bigint  | Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).                        |
| CPU_TIME_DELTA       | bigint  | CPU time (unit: $\mu$ s)                                                                                     |
| EXECUTIONS_DELTA     | integer | Increment in the number of executions that have occurred on this object since it was brought into the cache. |
| IOWAIT_DELTA         | bigint  | I/O time (unit: $\mu$ s)                                                                                     |
| APWAIT_DELTA         | integer | Delta value of the application wait time.                                                                    |
| ROWS_PROCESSED_DELTA | bigint  | Number of rows in the result set returned by the SELECT statement.                                           |
| SNAP_ID              | integer | Unique snapshot ID.                                                                                          |

### 12.3.8 ADM\_IND\_COLUMNS

ADM\_IND\_COLUMNS displays column information about all indexes in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-101** ADM\_IND\_COLUMNS columns

| Name            | Type                  | Description                          |
|-----------------|-----------------------|--------------------------------------|
| index_owner     | character varying(64) | Index owner.                         |
| index_name      | character varying(64) | Index name.                          |
| table_owner     | character varying(64) | Table owner.                         |
| table_name      | character varying(64) | Table name.                          |
| column_name     | name                  | Column name.                         |
| column_position | smallint              | Position of the column in the index. |

### 12.3.9 ADM\_IND\_EXPRESSIONS

ADM\_IND\_EXPRESSIONS displays information about expression indexes in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-102** ADM\_IND\_EXPRESSIONS columns

| Name              | Type                  | Description                                            |
|-------------------|-----------------------|--------------------------------------------------------|
| table_owner       | character varying(64) | Table owner.                                           |
| table_name        | character varying(64) | Table name.                                            |
| index_owner       | character varying(64) | Index owner.                                           |
| index_name        | character varying(64) | Index name.                                            |
| column_expression | text                  | Function-based index expression of a specified column. |
| column_position   | smallint              | Position of the column in the index.                   |

### 12.3.10 ADM\_IND\_PARTITIONS

ADM\_IND\_PARTITIONS displays information about all index partitions in the database (excluding global indexes on partitioned tables). Each index partition of

a partitioned table in the database, if present, has a row of records in ADM\_IND\_PARTITIONS. By default, only the SYSADMIN can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-103** ADM\_IND\_PARTITIONS columns

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| index_owner            | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs.                                                                                                                                                                                                                                                                                                       |
| index_name             | character varying(64) | Name of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                                   |
| partition_name         | character varying(64) | Name of the index partition.                                                                                                                                                                                                                                                                                                                                                                |
| def_tablespace_name    | name                  | Tablespace name of the index partition.                                                                                                                                                                                                                                                                                                                                                     |
| high_value             | text                  | Limit of the partition corresponding to the index partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul> |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                                                                                                 |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                                 |
| high_value_length      | integer               | Character length of the limit of the partition corresponding to an index partition.                                                                                                                                                                                                                                                                                                         |

## 12.3.11 ADM\_IND\_SUBPARTITIONS

ADM\_IND\_SUBPARTITIONS displays information about level-2 partitions of all indexes (excluding global indexes of partitioned tables) in the database. Each level-2 index partition of a level-2 partitioned table in the database, if present, has a row of records in ADM\_IND\_SUBPARTITIONS. By default, only the SYSADMIN can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-104** ADM\_IND\_SUBPARTITIONS columns

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| index_owner            | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs.                                                                                                                                                                                                                                         |
| index_name             | character varying(64) | Name of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                     |
| partition_name         | character varying(64) | Name of the partition where an index is located.                                                                                                                                                                                                                                                                              |
| subpartition_name      | character varying(64) | Name of the level-2 partition where an index is located.                                                                                                                                                                                                                                                                      |
| def_tablespace_name    | name                  | Tablespace name of an index partition.                                                                                                                                                                                                                                                                                        |
| high_value             | text                  | Limit of the partition corresponding to an index partition.<br><b>NOTE</b><br>For range partitioning and interval partitioning, the upper limit of each partition is displayed.<br>For list partitioning, the value list of each partition is displayed.<br>For hash partitioning, the number of each partition is displayed. |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                                   |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                   |

| Name              | Type    | Description                                                                         |
|-------------------|---------|-------------------------------------------------------------------------------------|
| high_value_length | integer | Character length of the limit of the partition corresponding to an index partition. |

## 12.3.12 ADM\_INDEXES

ADM\_INDEXES displays all indexes in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-105** ADM\_INDEXES columns

| Name        | Type                  | Description                                                         |
|-------------|-----------------------|---------------------------------------------------------------------|
| owner       | character varying(64) | Index owner.                                                        |
| index_name  | character varying(64) | Index name.                                                         |
| table_name  | character varying(64) | Name of the table corresponding to the index.                       |
| uniqueness  | text                  | Specifies whether an index is unique.                               |
| partitioned | character(3)          | Specifies whether the index has the property of partitioned tables. |
| generated   | character varying(1)  | Specifies whether the index name is generated by the system.        |

## 12.3.13 ADM\_OBJECTS

ADM\_OBJECTS displays all database objects in the database. Only the SYSADMIN can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-106** ADM\_OBJECTS columns

| Name        | Type | Description   |
|-------------|------|---------------|
| owner       | name | Object owner. |
| object_name | name | Object name.  |

| Name          | Type                     | Description                                         |
|---------------|--------------------------|-----------------------------------------------------|
| object_id     | oid                      | Object OID.                                         |
| object_type   | name                     | Object type. For example, table, schema, and index. |
| namespace     | oid                      | Namespace containing an object.                     |
| created       | timestamp with time zone | Creation time of the object.                        |
| last_ddl_time | timestamp with time zone | Last modification time of the object.               |

**NOTICE**

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

## 12.3.14 ADM\_PART\_INDEXES

ADM\_PART\_INDEXES displays information about all partitioned table indexes (excluding global indexes of partitioned tables) in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-107** ADM\_PART\_INDEXES columns

| Name                   | Type                  | Description                                              |
|------------------------|-----------------------|----------------------------------------------------------|
| def_tablespace_name    | name                  | Tablespace name of a partitioned table index.            |
| index_owner            | character varying(64) | Owner name of a partitioned table index.                 |
| index_name             | character varying(64) | Name of a partitioned table index.                       |
| partition_count        | bigint                | Number of index partitions of a partitioned table index. |
| partitioning_key_count | integer               | Number of partition keys of the partitioned table.       |

| Name                      | Type                  | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| partitioning_type         | text                  | Partitioning policy of the partitioned table.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .                                                                                                     |
| schema                    | character varying(64) | Name of the schema to which the partitioned table index belongs.                                                                                                                                                                                                                                         |
| table_name                | character varying(64) | Name of the partitioned table to which a partitioned table index belongs.                                                                                                                                                                                                                                |
| subpartitioning_type      | text                  | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer               | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer               | Number of level-2 partition keys of the partitioned table.                                                                                                                                                                                                                                               |

### 12.3.15 ADM\_PART\_TABLES

ADM\_PART\_TABLES displays information about all partitioned tables in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-108** ADM\_PART\_TABLES columns

| Name        | Type                  | Description                        |
|-------------|-----------------------|------------------------------------|
| table_owner | character varying(64) | Owner name of a partitioned table. |

| Name                      | Type                     | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name                | character<br>varying(64) | Name of the partitioned table.                                                                                                                                                                                                                                                                           |
| partitioning_type         | text                     | Partitioning policy of the partitioned table.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .                                                                                                     |
| partition_count           | bigint                   | Number of partitions of the partitioned table.                                                                                                                                                                                                                                                           |
| partitioning_key_count    | integer                  | Number of partition keys of the partitioned table.                                                                                                                                                                                                                                                       |
| def_tablespace_name       | name                     | Tablespace name of the partitioned table.                                                                                                                                                                                                                                                                |
| schema                    | character<br>varying(64) | Schema of the partitioned table.                                                                                                                                                                                                                                                                         |
| subpartitioning_type      | text                     | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer                  | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer                  | Number of level-2 partition keys of the partitioned table.                                                                                                                                                                                                                                               |

## 12.3.16 ADM\_PROCEEDURES

ADM\_PROCEEDURES displays information about all stored procedures or functions in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-109** ADM\_PROCEDURES columns

| Name            | Type                  | Description                                       |
|-----------------|-----------------------|---------------------------------------------------|
| owner           | character varying(64) | Owner of a stored procedure or function.          |
| object_name     | character varying(64) | Name of a stored procedure or function.           |
| argument_number | smallint              | Number of input parameters in a stored procedure. |

### 12.3.17 ADM\_SCHEDULER\_JOBS

ADM\_SCHEDULER\_JOBS displays information about all DBE\_SCHEDULER scheduled jobs in the database.

**Table 12-110** ADM\_SCHEDULER\_JOBS columns

| Name                | Type                        | Description                                         |
|---------------------|-----------------------------|-----------------------------------------------------|
| owner               | name                        | Owner of a scheduled job.                           |
| job_name            | text                        | Name of a scheduled job.                            |
| job_style           | text                        | Action mode of a scheduled job.                     |
| job_creator         | name                        | Creator of a scheduled job.                         |
| program_name        | text                        | Name of the program referenced by a scheduled job.  |
| job_action          | text                        | Program content of a scheduled job.                 |
| number_of_arguments | text                        | Number of parameters of a scheduled job.            |
| schedule_name       | text                        | Name of the schedule referenced by a scheduled job. |
| start_date          | timestamp without time zone | Start time of a scheduled job.                      |
| repeat_interval     | text                        | Period of a scheduled job.                          |
| end_date            | timestamp without time zone | End time of a scheduled job.                        |

| Name            | Type                        | Description                                                       |
|-----------------|-----------------------------|-------------------------------------------------------------------|
| job_class       | text                        | Name of the scheduled job class to which a scheduled job belongs. |
| enabled         | Boolean                     | Status of a scheduled job.                                        |
| auto_drop       | text                        | Status of the automatic deletion function of a scheduled job.     |
| state           | "char"                      | Status of a scheduled job.                                        |
| failure_count   | smallint                    | Number of scheduled job failures.                                 |
| last_start_date | timestamp without time zone | Last time when a scheduled job was started.                       |
| next_run_date   | timestamp without time zone | Next execution time of a scheduled job.                           |
| destination     | text                        | Target name of a scheduled job.                                   |
| credential_name | text                        | Credential name of a scheduled job.                               |
| comments        | text                        | Comments of a scheduled job.                                      |

## 12.3.18 ADM\_SEQUENCES

ADM\_SEQUENCES displays information about all sequences in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-111** ADM\_SEQUENCES columns

| Name           | Type                  | Description                    |
|----------------|-----------------------|--------------------------------|
| sequence_owner | character varying(64) | Owner of a sequence.           |
| sequence_name  | character varying(64) | Name of the sequence.          |
| min_value      | int16                 | Minimum value of the sequence. |
| max_value      | int16                 | Maximum value of the sequence. |

| Name         | Type         | Description                                                                                                                                                                                                                     |
|--------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| increment_by | int16        | Increment of the sequence.                                                                                                                                                                                                      |
| last_number  | int16        | Value of the previous sequence.                                                                                                                                                                                                 |
| cache_size   | int16        | Size of the sequence disk cache.                                                                                                                                                                                                |
| cycle_flag   | character(1) | Specifies whether the sequence is a cycle sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cycle sequence.</li><li>• <b>N</b>: It is not a cycle sequence.</li></ul> |

### 12.3.19 ADM\_SOURCE

ADM\_SOURCE displays all stored procedures or functions in the database and provides columns defined by the stored procedures or functions. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-112** ADM\_SOURCE columns

| Name  | Type                  | Description                                   |
|-------|-----------------------|-----------------------------------------------|
| owner | character varying(64) | Owner of a stored procedure or function.      |
| name  | character varying(64) | Name of a stored procedure or function.       |
| text  | text                  | Definition of a stored procedure or function. |

### 12.3.20 ADM\_SYNONYMS

ADM\_SYNONYMS displays all synonyms in the database. This view is accessible only to users with SYSADMIN permissions. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-113** ADM\_SYNONYMS columns

| Name              | Type | Description                                                                                                                                                                                                                          |
|-------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner             | text | Owner of a synonym.                                                                                                                                                                                                                  |
| schema_name       | text | Name of the schema to which the synonym belongs.                                                                                                                                                                                     |
| synonym_name      | text | Synonym name.                                                                                                                                                                                                                        |
| table_owner       | text | Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.             |
| table_name        | text | Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.               |
| table_schema_name | text | Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym. |

### 12.3.21 ADM\_TAB\_COLUMNS

ADM\_TAB\_COLUMNS displays information about the columns of tables. Each column of each table in the database has a row of data in ADM\_TAB\_COLUMNS. By default, only the SYSADMIN can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-114** ADM\_TAB\_COLUMNS columns

| Name        | Type                   | Description                   |
|-------------|------------------------|-------------------------------|
| owner       | character varying(64)  | Table owner.                  |
| table_name  | character varying(64)  | Table name.                   |
| column_name | character varying(64)  | Column name.                  |
| data_type   | character varying(128) | Data type of the column.      |
| data_length | integer                | Length of a column, in bytes. |

| Name           | Type    | Description                                                                                                    |
|----------------|---------|----------------------------------------------------------------------------------------------------------------|
| data_precision | integer | Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types. |
| data_scale     | integer | Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.    |
| nullable       | bpchar  | Specifies whether a column can be empty ( <b>n</b> for the primary key constraint and NOT NULL constraint).    |
| column_id      | integer | Sequence number of a column when a table is created.                                                           |
| avg_col_len    | numeric | Average length of a column, in bytes.                                                                          |
| char_length    | numeric | Column length (in characters) which is valid only for the varchar, nvarchar2, bpchar, and char types.          |
| comments       | text    | Comments.                                                                                                      |

### 12.3.22 ADM\_TAB\_COMMENTS

ADM\_TAB\_COMMENTS displays comments about all tables and views in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-115** ADM\_TAB\_COMMENTS columns

| Name       | Type                  | Description                |
|------------|-----------------------|----------------------------|
| owner      | character varying(64) | Owner of a table or view.  |
| table_name | character varying(64) | Name of the table or view. |
| comments   | text                  | Comments.                  |

### 12.3.23 ADM\_TAB\_PARTITIONS

ADM\_TAB\_PARTITIONS displays information about all partitioned tables in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-116** ADM\_TAB\_PARTITIONS columns

| Name               | Type                  | Description                                                                                                                                                                                                                                                                                                                                          |
|--------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_owner        | character varying(64) | Role name.                                                                                                                                                                                                                                                                                                                                           |
| table_name         | character varying(64) | Relational table name.                                                                                                                                                                                                                                                                                                                               |
| partition_name     | character varying(64) | Partition name.                                                                                                                                                                                                                                                                                                                                      |
| high_value         | text                  | Limit of a partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name    | name                  | Tablespace name of the partitioned table.                                                                                                                                                                                                                                                                                                            |
| schema             | character varying(64) | Name of a namespace.                                                                                                                                                                                                                                                                                                                                 |
| subpartition_count | bigint                | Number of level-2 partitions.                                                                                                                                                                                                                                                                                                                        |
| high_value_length  | integer               | Length of the partition boundary value expression.                                                                                                                                                                                                                                                                                                   |

### 12.3.24 ADM\_TAB\_SUBPARTITIONS

ADM\_TAB\_SUBPARTITIONS displays information about all level-2 partitions in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-117** ADM\_TAB\_SUBPARTITIONS columns

| Name              | Type                  | Description                  |
|-------------------|-----------------------|------------------------------|
| table_owner       | character varying(64) | Role name.                   |
| table_name        | character varying(64) | Relational table name.       |
| partition_name    | character varying(64) | Partition name.              |
| subpartition_name | character varying(64) | Name of a level-2 partition. |

| Name              | Type                  | Description                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| high_value        | text                  | Limit of a level-2 partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name   | name                  | Tablespace name of a level-2 partitioned table.                                                                                                                                                                                                                                                                                                        |
| schema            | character varying(64) | Name of a namespace.                                                                                                                                                                                                                                                                                                                                   |
| high_value_length | integer               | Character length of the limit of a level-2 partition.                                                                                                                                                                                                                                                                                                  |

### 12.3.25 ADM\_TABLES

ADM\_TABLES displays information about all partitioned tables in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-118** ADM\_TABLES columns

| Name            | Type                  | Description                                                                                                                                                      |
|-----------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | character varying(64) | Table owner.                                                                                                                                                     |
| table_name      | character varying(64) | Table name.                                                                                                                                                      |
| tablespace_name | character varying(64) | Tablespace name of the table.                                                                                                                                    |
| dropped         | character varying     | Specifies whether the current table is deleted. <ul style="list-style-type: none"><li><b>YES:</b> It is deleted.</li><li><b>NO:</b> It is not deleted.</li></ul> |
| num_rows        | numeric               | Estimated number of rows in the table.                                                                                                                           |

| Name      | Type                 | Description                                                                                                                                                                                            |
|-----------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | character varying(8) | Specifies whether the current table is valid. <ul style="list-style-type: none"><li>• <b>VALID</b>: The current table is valid.</li><li>• <b>UNUSABLE</b>: The current table is unavailable.</li></ul> |
| temporary | character(1)         | Specifies whether the table is a temporary table. <ul style="list-style-type: none"><li>• <b>Y</b>: The table is a temporary table.</li><li>• <b>N</b>: The table is not a temporary table.</li></ul>  |

### 12.3.26 ADM\_TABLESPACES

ADM\_TABLESPACES displays information about available tablespaces. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-119** ADM\_TABLESPACES columns

| Name            | Type                  | Description     |
|-----------------|-----------------------|-----------------|
| tablespace_name | character varying(64) | Tablespace name |

### 12.3.27 ADM\_TRIGGERS

ADM\_TRIGGERS displays information about triggers in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-120** ADM\_TRIGGERS columns

| Name         | Type                  | Description   |
|--------------|-----------------------|---------------|
| trigger_name | character varying(64) | Trigger name. |
| table_owner  | character varying(64) | Role name.    |

| Name       | Type                  | Description                                                                                                                                                                                                                                                             |
|------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name | character varying(64) | Relational table name.                                                                                                                                                                                                                                                  |
| status     | character varying(64) | <ul style="list-style-type: none"><li>• <b>O</b>: The trigger is enabled in origin or local mode.</li><li>• <b>D</b>: The trigger is disabled.</li><li>• <b>R</b>: The trigger is enabled in replica mode.</li><li>• <b>A</b>: The trigger is always enabled.</li></ul> |

### 12.3.28 ADM\_TYPE\_ATTRS

ADM\_TYPE\_ATTRS displays the attributes of the current database object type. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized.

**Table 12-121** ADM\_TYPE\_ATTRS columns

| Name            | Type     | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | oid      | Owner of the type.                                                                                                                                                                                                                                                                                                                       |
| type_name       | name     | Data type name.                                                                                                                                                                                                                                                                                                                          |
| attr_name       | name     | Column name.                                                                                                                                                                                                                                                                                                                             |
| attr_type_mod   | integer  | Type-specific data supplied at the table creation time (for example, the maximum length of a varchar column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.                        |
| attr_type_owner | oid      | Owner of an attribute of this type.                                                                                                                                                                                                                                                                                                      |
| attr_type_name  | name     | Data type attribute name.                                                                                                                                                                                                                                                                                                                |
| length          | smallint | Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"><li>• The value <b>-1</b> indicates a "varlena" type (one that has a length word).</li><li>• The value <b>-2</b> indicates a NULL-terminated C string.</li></ul> |
| precision       | integer  | Precision of the numeric type.                                                                                                                                                                                                                                                                                                           |
| scale           | integer  | Range of the numeric type                                                                                                                                                                                                                                                                                                                |

| Name               | Type         | Description                                                                                |
|--------------------|--------------|--------------------------------------------------------------------------------------------|
| character_set_name | character(1) | Character set name of an attribute ( <b>c</b> or <b>n</b> ).                               |
| attr_no            | smallint     | Attribute number                                                                           |
| inherited          | character(1) | Specifies whether the attribute is inherited from the super type ( <b>Y</b> or <b>N</b> ). |

## 12.3.29 ADM\_USERS

ADM\_USERS displays information about all database users. This view is accessible only to users with SYSADMIN permissions. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-122** ADM\_USERS columns

| Name     | Type                  | Description |
|----------|-----------------------|-------------|
| username | character varying(64) | Username.   |

## 12.3.30 ADM\_VIEWS

ADM\_VIEWS displays views in the database. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-123** ADM\_VIEWS columns

| Name      | Type                  | Description      |
|-----------|-----------------------|------------------|
| owner     | character varying(64) | Owner of a view. |
| view_name | character varying(64) | View name.       |

## 12.3.31 DB\_ALL\_TABLES

DB\_ALL\_TABLES displays tables or views accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-124** DB\_ALL\_TABLES columns

| Name            | Type | Description                                    |
|-----------------|------|------------------------------------------------|
| owner           | name | Owner of a table or view.                      |
| table_name      | name | Name of the table or view.                     |
| tablespace_name | name | Tablespace where the table or view is located. |

### 12.3.32 DB\_COL\_COMMENTS

DB\_COL\_COMMENTS displays comment information about table columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-125** DB\_COL\_COMMENTS columns

| Name        | Type                  | Description  |
|-------------|-----------------------|--------------|
| owner       | character varying(64) | Table owner. |
| table_name  | character varying(64) | Table name.  |
| column_name | character varying(64) | Column name. |
| comments    | text                  | Comments.    |

### 12.3.33 DB\_CONS\_COLUMNS

DB\_CONS\_COLUMNS displays information about constraint columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-126** DB\_CONS\_COLUMNS columns

| Name            | Type                  | Description                          |
|-----------------|-----------------------|--------------------------------------|
| owner           | character varying(64) | Constraint creator.                  |
| constraint_name | character varying(64) | Constraint name.                     |
| table_name      | character varying(64) | Name of a constraint-related table.  |
| column_name     | character varying(64) | Name of a constraint-related column. |
| position        | smallint              | Position of a column in a table.     |

## 12.3.34 DB\_CONSTRAINTS

DB\_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-127** DB\_CONSTRAINTS columns

| Name            | Type                  | Description                                                                                                                                                                                                                   |
|-----------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | character varying(64) | Constraint creator.                                                                                                                                                                                                           |
| constraint_name | character varying(64) | Constraint name.                                                                                                                                                                                                              |
| constraint_type | text                  | Constraint type. <ul style="list-style-type: none"><li>• <b>c</b>: check constraint.</li><li>• <b>f</b>: foreign key constraint.</li><li>• <b>p</b>: primary key constraint.</li><li>• <b>u</b>: unique constraint.</li></ul> |
| table_name      | character varying(64) | Name of a constraint-related table.                                                                                                                                                                                           |
| index_owner     | character varying(64) | Owner of a constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                              |
| index_name      | character varying(64) | Name of the constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                             |

## 12.3.35 DB\_DEPENDENCIES

DB\_DEPENDENCIES displays dependencies between functions and advanced packages accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

---

**NOTICE**

In GaussDB, this table is empty without any record due to information constraints.

---

**Table 12-128** DB\_DEPENDENCIES columns

| Name  | Type                  | Description   |
|-------|-----------------------|---------------|
| owner | character varying(30) | Object owner. |
| name  | character varying(30) | Object name.  |

| Name                 | Type                   | Description                                                                                          |
|----------------------|------------------------|------------------------------------------------------------------------------------------------------|
| type                 | character varying(17)  | Object type.                                                                                         |
| referenced_owner     | character varying(30)  | Owner of a referenced object.                                                                        |
| referenced_name      | character varying(64)  | Name of a referenced object.                                                                         |
| referenced_type      | character varying(17)  | Type of a referenced object.                                                                         |
| referenced_link_name | character varying(128) | Name of the link to a referenced object.                                                             |
| schemaid             | numeric                | ID of the current schema.                                                                            |
| dependency_type      | character varying(4)   | Dependency type ( <b>REF</b> indicates soft reference and <b>HARD</b> indicates direct description). |

### 12.3.36 DB\_IND\_COLUMNS

DB\_IND\_COLUMNS displays all index columns accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-129** DB\_IND\_COLUMNS columns

| Name            | Type                  | Description                          |
|-----------------|-----------------------|--------------------------------------|
| index_owner     | character varying(64) | Index owner.                         |
| index_name      | character varying(64) | Index name.                          |
| table_owner     | character varying(64) | Table owner.                         |
| table_name      | character varying(64) | Table name.                          |
| column_name     | name                  | Column name.                         |
| column_position | smallint              | Position of the column in the index. |

### 12.3.37 DB\_IND\_EXPRESSIONS

DB\_IND\_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-130** DB\_IND\_EXPRESSIONS columns

| Name              | Type                  | Description                                            |
|-------------------|-----------------------|--------------------------------------------------------|
| index_owner       | character varying(64) | Index owner.                                           |
| index_name        | character varying(64) | Index name.                                            |
| table_owner       | character varying(64) | Table owner.                                           |
| table_name        | character varying(64) | Table name.                                            |
| column_expression | text                  | Function-based index expression of a specified column. |
| column_position   | smallint              | Position of the column in the index.                   |

### 12.3.38 DB\_IND\_PARTITIONS

DB\_IND\_PARTITIONS displays information about partitioned table indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-131** DB\_IND\_PARTITIONS columns

| Name                | Type                  | Description                                                                           |
|---------------------|-----------------------|---------------------------------------------------------------------------------------|
| index_owner         | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs. |
| index_name          | character varying(64) | Name of the partitioned table index to which the index partition belongs.             |
| partition_name      | character varying(64) | Name of the partition where an index is located.                                      |
| def_tablespace_name | name                  | Tablespace name of the index partition.                                               |

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| high_value             | text                  | Limit of the partition corresponding to the index partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li><b>t</b> (true): yes.</li><li><b>f</b> (false): no.</li></ul>                                                                                                                                                                                                                               |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                           |
| high_value_length      | integer               | Character length of the limit of the partition corresponding to an index partition.                                                                                                                                                                                                                                                                                                   |

### 12.3.39 DB\_IND\_SUBPARTITIONS

DB\_IND\_SUBPARTITIONS displays information about level-2 partitions of indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-132** DB\_IND\_SUBPARTITIONS columns

| Name           | Type                  | Description                                                                           |
|----------------|-----------------------|---------------------------------------------------------------------------------------|
| index_owner    | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs. |
| index_name     | character varying(64) | Name of the partitioned table index to which the index partition belongs.             |
| partition_name | character varying(64) | Name of the index partition.                                                          |

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subpartition_name      | character varying(64) | Name of a level-2 index partition.                                                                                                                                                                                                                                                                                                                                                         |
| def_tablespace_name    | name                  | Tablespace name of an index partition.                                                                                                                                                                                                                                                                                                                                                     |
| high_value             | text                  | Limit of the partition corresponding to an index partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul> |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                                                                                                 |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                                |
| high_value_length      | integer               | Character length of the limit of the partition corresponding to an index partition.                                                                                                                                                                                                                                                                                                        |

## 12.3.40 DB\_INDEXES

DB\_INDEXES displays information about indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-133** DB\_INDEXES columns

| Name       | Type                  | Description                                   |
|------------|-----------------------|-----------------------------------------------|
| owner      | character varying(64) | Index owner.                                  |
| index_name | character varying(64) | Index name.                                   |
| table_name | character varying(64) | Name of the table corresponding to the index. |

| Name        | Type                 | Description                                                         |
|-------------|----------------------|---------------------------------------------------------------------|
| uniqueness  | text                 | Specifies whether the index is unique.                              |
| partitioned | character(3)         | Specifies whether the index has the property of partitioned tables. |
| generated   | character varying(1) | Specifies whether the name of an index is generated by the system.  |

### 12.3.41 DB\_OBJECTS

DB\_OBJECTS displays all database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-134** DB\_OBJECTS columns

| Name          | Type                     | Description                                   |
|---------------|--------------------------|-----------------------------------------------|
| owner         | name                     | Object owner.                                 |
| object_name   | name                     | Object name.                                  |
| object_id     | oid                      | Object OID.                                   |
| object_type   | name                     | Object type.                                  |
| namespace     | oid                      | ID of the namespace where the object resides. |
| created       | timestamp with time zone | Time when the object was created.             |
| last_ddl_time | timestamp with time zone | Last time when the object was modified.       |

#### NOTICE

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.42 DB\_PART\_INDEXES

DB\_PART\_INDEXES displays information about partitioned table indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-135** DB\_PART\_INDEXES columns

| Name                      | Type                  | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| def_tablespace_name       | name                  | Tablespace name of a partitioned table index                                                                                                                                                                                                                                                             |
| index_owner               | character varying(64) | Owner name of a partitioned table index                                                                                                                                                                                                                                                                  |
| index_name                | character varying(64) | Name of a partitioned table index                                                                                                                                                                                                                                                                        |
| partition_count           | bigint                | Number of index partitions of a partitioned table index                                                                                                                                                                                                                                                  |
| partitioning_key_count    | integer               | Number of partition keys of a partitioned table                                                                                                                                                                                                                                                          |
| partitioning_type         | text                  | Partitioning policy of a partitioned table<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .                                                                                                        |
| schema                    | character varying(64) | Name of the schema to which a partitioned table index belongs                                                                                                                                                                                                                                            |
| table_name                | character varying(64) | Name of the partitioned table to which a partitioned table index belongs                                                                                                                                                                                                                                 |
| subpartitioning_type      | text                  | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer               | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer               | Number of level-2 partition keys of a partitioned table                                                                                                                                                                                                                                                  |

## 12.3.43 DB\_PART\_TABLES

DB\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-136** DB\_PART\_TABLES columns

| Name                      | Type                  | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_owner               | character varying(64) | Owner name of a partitioned table.                                                                                                                                                                                                                                                                       |
| table_name                | character varying(64) | Name of the partitioned table.                                                                                                                                                                                                                                                                           |
| partitioning_type         | text                  | Partitioning policy of the partitioned table.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .                                                                                                     |
| partition_count           | bigint                | Number of partitions of the partitioned table.                                                                                                                                                                                                                                                           |
| partitioning_key_count    | integer               | Number of partition keys of the partitioned table.                                                                                                                                                                                                                                                       |
| def_tablespace_name       | name                  | Tablespace name of the partitioned table.                                                                                                                                                                                                                                                                |
| schema                    | character varying(64) | Schema of the partitioned table.                                                                                                                                                                                                                                                                         |
| subpartitioning_type      | text                  | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer               | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer               | Number of level-2 partition keys of the partitioned table.                                                                                                                                                                                                                                               |

## 12.3.44 DB\_PROCEEDURES

DB\_PROCEEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-137** DB\_PROCEEDURES columns

| Name        | Type | Description   |
|-------------|------|---------------|
| owner       | name | Object owner. |
| object_name | name | Object name.  |

## 12.3.45 DB\_SEQUENCES

DB\_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-138** DB\_SEQUENCES columns

| Name           | Type         | Description                                                                                                                                                                                                                     |
|----------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sequence_owner | name         | Owner of a sequence.                                                                                                                                                                                                            |
| sequence_name  | name         | Name of the sequence.                                                                                                                                                                                                           |
| min_value      | int16        | Minimum value of the sequence.                                                                                                                                                                                                  |
| max_value      | int16        | Maximum value of the sequence.                                                                                                                                                                                                  |
| increment_by   | int16        | Value by which the sequence is incremented.                                                                                                                                                                                     |
| cycle_flag     | character(1) | Specifies whether the sequence is a cycle sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cycle sequence.</li><li>• <b>N</b>: It is not a cycle sequence.</li></ul> |
| last_number    | int16        | Value of the previous sequence.                                                                                                                                                                                                 |
| cache_size     | int16        | Size of the sequence disk cache.                                                                                                                                                                                                |

## 12.3.46 DB\_SOURCE

DB\_SOURCE displays information about stored procedures or functions accessible to the current user, and provides columns defined by the stored procedures and functions. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-139** DB\_SOURCE columns

| Name  | Type | Description        |
|-------|------|--------------------|
| owner | name | Object owner.      |
| name  | name | Object name.       |
| type  | name | Object class.      |
| text  | text | Object definition. |

## 12.3.47 DB\_SYNONYMS

DB\_SYNONYMS displays all synonyms accessible to the current user.

**Table 12-140** DB\_SYNONYMS columns

| Name              | Type | Description                                                                                                                                                                                                                          |
|-------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner             | text | Owner of a synonym.                                                                                                                                                                                                                  |
| schema_name       | text | Name of the schema to which the synonym belongs.                                                                                                                                                                                     |
| synonym_name      | text | Synonym name.                                                                                                                                                                                                                        |
| table_owner       | text | Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.             |
| table_name        | text | Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.               |
| table_schema_name | text | Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym. |

## 12.3.48 DB\_TAB\_COLUMNS

DB\_TAB\_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-141** DB\_TAB\_COLUMNS columns

| Name           | Type                   | Description                                                                                                    |
|----------------|------------------------|----------------------------------------------------------------------------------------------------------------|
| owner          | character varying(64)  | Table owner.                                                                                                   |
| table_name     | character varying(64)  | Table name.                                                                                                    |
| column_name    | character varying(64)  | Column name.                                                                                                   |
| data_type      | character varying(128) | Data type of the column.                                                                                       |
| data_length    | integer                | Length of a column, in bytes.                                                                                  |
| data_precision | integer                | Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types. |
| data_scale     | integer                | Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.    |
| nullable       | bpchar                 | Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint).       |
| column_id      | integer                | Column ID generated when an object is created or a column is added.                                            |
| char_length    | numeric                | Column length (in characters) which is valid only for varchar, nvarchar2, bpchar, and char types.              |
| avg_col_len    | numeric                | Average length of a column, in bytes.                                                                          |
| comments       | text                   | Comments.                                                                                                      |

## 12.3.49 DB\_TAB\_COMMENTS

DB\_TAB\_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-142** DB\_TAB\_COMMENTS columns

| Name       | Type                  | Description                |
|------------|-----------------------|----------------------------|
| owner      | character varying(64) | Owner of a table or view.  |
| table_name | character varying(64) | Name of the table or view. |
| comments   | text                  | Comments.                  |

## 12.3.50 DB\_TAB\_PARTITIONS

DB\_TAB\_PARTITIONS displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-143** DB\_TAB\_PARTITIONS columns

| Name               | Type                  | Description                                                                                                                                                                                                                                                                                                                                    |
|--------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_owner        | character varying(64) | Role name.                                                                                                                                                                                                                                                                                                                                     |
| table_name         | character varying(64) | Relational table name.                                                                                                                                                                                                                                                                                                                         |
| partition_name     | character varying(64) | Partition name.                                                                                                                                                                                                                                                                                                                                |
| high_value         | text                  | Limit of a partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name    | name                  | Tablespace name of the partitioned table.                                                                                                                                                                                                                                                                                                      |
| schema             | character varying(64) | Name of a namespace.                                                                                                                                                                                                                                                                                                                           |
| subpartition_count | bigint                | Number of level-2 partitions.                                                                                                                                                                                                                                                                                                                  |
| high_value_length  | integer               | Length of the partition boundary value expression.                                                                                                                                                                                                                                                                                             |

## 12.3.51 DB\_TAB\_SUBPARTITIONS

DB\_TAB\_SUBPARTITIONS displays information about level-2 partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-144** DB\_TAB\_SUBPARTITIONS columns

| Name              | Type                  | Description                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_owner       | character varying(64) | Role name.                                                                                                                                                                                                                                                                                                                                             |
| table_name        | character varying(64) | Relational table name.                                                                                                                                                                                                                                                                                                                                 |
| partition_name    | character varying(64) | Partition name.                                                                                                                                                                                                                                                                                                                                        |
| subpartition_name | character varying(64) | Name of a level-2 partition.                                                                                                                                                                                                                                                                                                                           |
| high_value        | text                  | Limit of a level-2 partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name   | name                  | Tablespace name of a level-2 partitioned table.                                                                                                                                                                                                                                                                                                        |
| schema            | character varying(64) | Name of a namespace.                                                                                                                                                                                                                                                                                                                                   |
| high_value_length | integer               | Length of the boundary value expression in level-2 partition.                                                                                                                                                                                                                                                                                          |

## 12.3.52 DB\_TABLES

DB\_TABLES displays all tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-145** DB\_TABLES columns

| Name            | Type                  | Description                            |
|-----------------|-----------------------|----------------------------------------|
| owner           | character varying(64) | Table owner.                           |
| table_name      | character varying(64) | Table name.                            |
| tablespace_name | character varying(64) | Tablespace name of the table.          |
| num_rows        | numeric               | Estimated number of rows in the table. |

| Name      | Type                 | Description                                                                                                                                                                                            |
|-----------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | character varying(8) | Specifies whether the current table is valid. <ul style="list-style-type: none"><li>● <b>VALID</b>: The current table is valid.</li><li>● <b>UNUSABLE</b>: The current table is unavailable.</li></ul> |
| temporary | character(1)         | Specifies whether the table is a temporary table. <ul style="list-style-type: none"><li>● <b>Y</b>: The table is a temporary table.</li><li>● <b>N</b>: The table is not a temporary table.</li></ul>  |
| dropped   | character varying    | Specifies whether the current table is deleted. <ul style="list-style-type: none"><li>● <b>YES</b>: It is deleted.</li><li>● <b>NO</b>: It is not deleted.</li></ul>                                   |

### 12.3.53 DB\_TRIGGERS

DB\_TRIGGERS displays information about triggers accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-146** DB\_TRIGGERS columns

| Name         | Type                  | Description                                                                                                                                                                                                                                                             |
|--------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trigger_name | character varying(64) | Trigger name.                                                                                                                                                                                                                                                           |
| table_owner  | character varying(64) | Role name.                                                                                                                                                                                                                                                              |
| table_name   | character varying(64) | Relational table name.                                                                                                                                                                                                                                                  |
| status       | character varying(64) | <ul style="list-style-type: none"><li>● <b>O</b>: The trigger is enabled in origin or local mode.</li><li>● <b>D</b>: The trigger is disabled.</li><li>● <b>R</b>: The trigger is enabled in replica mode.</li><li>● <b>A</b>: The trigger is always enabled.</li></ul> |

### 12.3.54 DB\_USERS

DB\_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only users with the SYSADMIN permission can access this view. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-147** DB\_USERS columns

| Name     | Type | Description    |
|----------|------|----------------|
| user_id  | oid  | OID of a user. |
| username | name | Username.      |

## 12.3.55 DB\_VIEWS

DB\_VIEWS displays the description about all views accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-148** DB\_VIEWS columns

| Name        | Type    | Description              |
|-------------|---------|--------------------------|
| owner       | name    | Owner of a view.         |
| view_name   | name    | View name.               |
| text        | text    | Text in the view.        |
| text_length | integer | Text length of the view. |

## 12.3.56 DV\_SESSIONS

DV\_SESSIONS displays all session information about the current session. By default, only users with the SYSADMIN permission can access this system view. Common users can access it only after being authorized.

**Table 12-149** DV\_SESSIONS columns

| Name    | Type    | Description                                                                                                              |
|---------|---------|--------------------------------------------------------------------------------------------------------------------------|
| sid     | bigint  | OID of the active backend thread of the current session.                                                                 |
| serial# | integer | Sequence number of the active backend thread, which is <b>0</b> in GaussDB                                               |
| user#   | oid     | OID of the user logged in to the backend thread. The OID is <b>0</b> if the backend thread is a global auxiliary thread. |

| Name     | Type | Description                                                                                                                                                                                                                                                                                                                                                          |
|----------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username | name | Name of the user logged in to the backend thread.<br><b>username</b> is null if the backend thread is a global auxiliary thread.<br><b>application_name</b> can be identified by associating with <b>pg_stat_get_activity()</b> .<br>Example:<br>SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid; |

### 12.3.57 DV\_SESSION\_LONGOPS

DV\_SESSION\_LONGOPS displays the progress of ongoing operations. The view can be accessed only after being authorized.

**Table 12-150** DV\_SESSION\_LONGOPS columns

| Name      | Type    | Description                                                                   |
|-----------|---------|-------------------------------------------------------------------------------|
| sid       | bigint  | OID of the running backend process.                                           |
| serial#   | integer | Sequence number of the running backend process, which is <b>0</b> in GaussDB. |
| sofar     | integer | Completed workload, which is null in GaussDB.                                 |
| totalwork | integer | Total workload, which is null in GaussDB.                                     |

### 12.3.58 GET\_GLOBAL\_PREPARED\_XACTS (Deprecated)

This view is not supported in the centralized system.

### 12.3.59 GS\_ALL\_CONTROL\_GROUP\_INFO

This view is not supported in the centralized system.

### 12.3.60 GS\_AUDITING

GS\_AUDITING displays all audit information about database-related operations. Only users with the SYSADMIN or POLADMIN permission can access this view.

**Table 12-151** GS\_AUDITING columns

| Name    | Type | Description                        |
|---------|------|------------------------------------|
| polname | name | Policy name, which must be unique. |

| Name        | Type    | Description                                                                                                                                                                                                                  |
|-------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pol_type    | text    | Audit policy type. The value can be <b>access</b> or <b>privilege</b> . <ul style="list-style-type: none"><li>• <b>access</b>: DML operations are audited.</li><li>• <b>privilege</b>: DDL operations are audited.</li></ul> |
| polenabled  | Boolean | Specifies whether to enable a policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled</li><li>• <b>f</b> (false): disabled</li></ul>                                                                        |
| access_type | name    | DML database operation type. For example, SELECT, INSERT, and DELETE.                                                                                                                                                        |
| label_name  | name    | Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.                                                                                                          |
| priv_object | text    | Describes the path of the database asset.                                                                                                                                                                                    |
| filter_name | text    | Logical character string of a filter criterion.                                                                                                                                                                              |

### 12.3.61 GS\_AUDITING\_ACCESS

GS\_AUDITING\_ACCESS displays all audit information about database DML-related operations. Only users with the SYSADMIN or POLADMIN permission can access this view.

**Table 12-152** GS\_AUDITING\_ACCESS columns

| Name          | Type    | Description                                                                                                                                             |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| polname       | name    | Policy name, which must be unique.                                                                                                                      |
| pol_type      | text    | Audit policy type. The value ' <b>access</b> ' indicates that DML operations are audited.                                                               |
| polenabled    | Boolean | Specifies whether to enable a policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul> |
| access_type   | name    | DML database operation type. For example, SELECT, INSERT, and DELETE.                                                                                   |
| label_name    | name    | Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.                                     |
| access_object | text    | Describes the path of the database asset.                                                                                                               |
| filter_name   | text    | Logical character string of a filter criterion.                                                                                                         |

## 12.3.62 GS\_AUDITING\_PRIVILEGE

GS\_AUDITING\_PRIVILEGE displays all audit information about database DDL-related operations. Only users with the SYSADMIN or POLADMIN permission can access this view.

**Table 12-153** GS\_AUDITING\_PRIVILEGE columns

| Name        | Type    | Description                                                                                                                                             |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| polname     | name    | Policy name, which must be unique.                                                                                                                      |
| pol_type    | text    | Audit policy type. The value <b>privilege</b> indicates that DDL operations are audited.                                                                |
| polenabled  | Boolean | Specifies whether to enable a policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul> |
| access_type | name    | DDL database operation type. For example, CREATE, ALTER, and DROP.                                                                                      |
| label_name  | name    | Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.                                     |
| priv_object | text    | Full domain name of a database object.                                                                                                                  |
| filter_name | text    | Logical character string of a filter criterion.                                                                                                         |

## 12.3.63 GS\_CLUSTER\_RESOURCE\_INFO

This view is not supported in the centralized system.

## 12.3.64 GS\_COMM\_PROXY\_THREAD\_STATUS

GS\_COMM\_PROXY\_THREAD\_STATUS displays statistics on packets sent and received by the proxy communications library **comm\_proxy**. This view displays statistics about data sent and received by **comm\_proxy** only when the user-mode network deployment mode is enabled during the installation of the centralized database and **enable\_dfx** of **comm\_proxy\_attr** is set to **true**. In other scenarios, this view cannot be queried.

**Table 12-154** GS\_COMM\_PROXY\_THREAD\_STATUS columns

| Name             | Type   | Description                                                                                               |
|------------------|--------|-----------------------------------------------------------------------------------------------------------|
| ProxyThreadId    | bigint | ID of the current network proxy thread <b>comm_proxy</b> .                                                |
| ProxyCpuAffinity | text   | NUMA-CPU affinity of the current network proxy thread <b>comm_proxy</b> , indicating the NUMA and CPU ID. |

| Name            | Type   | Description                                                                          |
|-----------------|--------|--------------------------------------------------------------------------------------|
| ThreadStartTime | text   | Start time of the current network proxy thread <b>comm_proxy</b> .                   |
| RxPckNums       | bigint | Number of packets received by the current network proxy thread <b>comm_proxy</b> .   |
| TxPckNums       | bigint | Number of packets sent by the current network proxy thread <b>comm_proxy</b> .       |
| RxPcks          | float  | Number of packets received by the network proxy thread <b>comm_proxy</b> per second. |
| TxPcks          | float  | Number of packets sent by the network proxy thread <b>comm_proxy</b> per second.     |

### 12.3.65 GS\_DB\_PRIVILEGES

**GS\_DB\_PRIVILEGES** displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-155** GS\_DB\_PRIVILEGES columns

| Name           | Type | Description                                                                                                                                                                           |
|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rolename       | name | Username.                                                                                                                                                                             |
| privilege_type | text | ANY permission of a user. For details about the value, see <a href="#">Table 7-108</a> .                                                                                              |
| admin_option   | text | Specifies whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted. <ul style="list-style-type: none"><li>• <b>yes</b></li><li>• <b>no</b></li></ul> |

### 12.3.66 GS\_FILE\_STAT

**GS\_FILE\_STAT** records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 12-156** GS\_FILE\_STAT columns

| Name    | Type | Description     |
|---------|------|-----------------|
| filenum | oid  | File identifier |
| dbid    | oid  | Database ID     |

| Name      | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| spcid     | oid    | Tablespace ID                                            |
| phyrds    | bigint | Number of times of reading physical files                |
| phywrts   | bigint | Number of times of writing into physical files           |
| phyblkrd  | bigint | Number of times of reading physical file blocks          |
| phyblkwrt | bigint | Number of times of writing into physical file blocks     |
| readtim   | bigint | Total duration of reading, in microseconds               |
| writetim  | bigint | Total duration of writing, in microseconds               |
| avgiotim  | bigint | Average duration of reading and writing, in microseconds |
| lstiotim  | bigint | Duration of the last file reading, in microseconds       |
| miniotim  | bigint | Minimum duration of reading and writing, in microseconds |
| maxiowtm  | bigint | Maximum duration of reading and writing, in microseconds |

### 12.3.67 GS\_GET\_CONTROL\_GROUP\_INFO

This view is not supported in the centralized system.

### 12.3.68 GS\_GSC\_MEMORY\_DETAIL

GS\_GSC\_MEMORY\_DETAIL displays the memory usage of the global system cache of the current process on the current node. The data is displayed only when GSC is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

**Table 12-157** GS\_GSC\_MEMORY\_DETAIL columns

| Name      | Type    | Description                                |
|-----------|---------|--------------------------------------------|
| db_id     | text    | Database ID.                               |
| totalsize | numeric | Total size of the shared memory, in bytes. |

| Name     | Type    | Description                                    |
|----------|---------|------------------------------------------------|
| freesize | numeric | Remaining size of the shared memory, in bytes. |
| usedsize | numeric | Used size of the shared memory, in bytes.      |

### 12.3.69 GS\_INSTANCE\_TIME

**GS\_INSTANCE\_TIME** records time consumption information of the current node. The time consumption information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios.
- CPU\_TIME: CPU time cost.
- EXECUTION\_TIME: time spent in the executor.
- PARSE\_TIME: time spent on parsing SQL statements.
- PLAN\_TIME: time spent on generating plans.
- REWRITE\_TIME: time spent on rewriting SQL statements.
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure.
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure.
- NET\_SEND\_TIME: time spent on the network.
- DATA\_IO\_TIME: time spent on I/Os.

**Table 12-158** GS\_INSTANCE\_TIME columns

| Name      | Type    | Description            |
|-----------|---------|------------------------|
| stat_id   | integer | Statistics ID          |
| stat_name | text    | Type name              |
| value     | bigint  | Time value, in $\mu$ s |

### 12.3.70 GS\_LABELS

**GS\_LABELS** displays all configured resource labels. Only users with the SYSADMIN or POLADMIN permission can access this view.

**Table 12-159** GS\_LABELS columns

| Name      | Type | Description                                                                                                                          |
|-----------|------|--------------------------------------------------------------------------------------------------------------------------------------|
| labelname | name | Resource label name.                                                                                                                 |
| labeltype | name | Resource label type This parameter corresponds to the <b>labeltype</b> column in the <a href="#">GS_POLICY_LABEL</a> system catalog. |

| Name       | Type | Description                                                                                                          |
|------------|------|----------------------------------------------------------------------------------------------------------------------|
| fqdtype    | name | Database resource type. For example, table, schema, or index.                                                        |
| schemaname | name | Name of the schema to which the database resource belongs.                                                           |
| fqdnname   | name | Database resource name.                                                                                              |
| columnname | name | Name of the database resource column. If the marked database resource is not a column, this parameter is left blank. |

### 12.3.71 GS\_LSC\_MEMORY\_DETAIL

GS\_LSC\_MEMORY\_DETAIL displays statistics about the local SysCache memory usage of all threads based on the MemoryContext node. The statistics are available only when GSC is enabled.

**Table 12-160** GS\_LSC\_MEMORY\_DETAIL columns

| Name        | Type     | Description                                                                              |
|-------------|----------|------------------------------------------------------------------------------------------|
| threadid    | text     | Thread start time and ID (string: <i>timestamp.sessionid</i> ).                          |
| tid         | bigint   | Thread ID.                                                                               |
| thrdtype    | text     | Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor. |
| contextname | text     | Name of the memory context.                                                              |
| level       | smallint | Hierarchy of the memory context.                                                         |
| parent      | text     | Name of the parent memory context.                                                       |
| totalsize   | bigint   | Total size of the memory context, in bytes.                                              |
| freesize    | bigint   | Total size of released memory in the memory context, in bytes.                           |
| usedsize    | bigint   | Total size of used memory in the memory context, in bytes.                               |

### 12.3.72 GS\_MASKING

GS\_MASKING displays all configured dynamic masking policies. Only users with the SYSADMIN or POLADMIN permission can access this view.

**Table 12-161** GS\_MATVIEWS columns

| Name           | Type    | Description                                              |
|----------------|---------|----------------------------------------------------------|
| polname        | name    | Name of the masking policy                               |
| polenabed      | Boolean | Specifies whether to enable the masking policy.          |
| maskaction     | name    | Masking function                                         |
| labelname      | name    | Name of the label to which the masking function applies. |
| masking_object | text    | Masking database resource object                         |
| filter_name    | text    | Logical expression of a filter criterion                 |

### 12.3.73 GS\_MATVIEWS

GS\_MATVIEWS displays information about each materialized view in the database.

**Table 12-162** GS\_MATVIEWS columns

| Name         | Type    | Reference                              | Description                                                                                                   |
|--------------|---------|----------------------------------------|---------------------------------------------------------------------------------------------------------------|
| schemaname   | name    | <a href="#">PG_NAMESPACE</a> .nspname  | Name of the schema of a materialized view                                                                     |
| matviewname  | name    | <a href="#">PG_CLASS</a> .relname      | Name of a materialized view                                                                                   |
| matviewowner | name    | <a href="#">PG_AUTHID</a> .rolname     | Owner of a materialized view                                                                                  |
| tablespace   | name    | <a href="#">PG_TABLESPACE</a> .spcname | Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null. |
| hasindexes   | boolean | -                                      | This column is true if a materialized view has (or has recently had) any indexes.                             |
| definition   | text    | -                                      | Definition of a materialized view (a reconstructed SELECT query)                                              |

### 12.3.74 GS\_OS\_RUN\_INFO

GS\_OS\_RUN\_INFO displays the running status of the OS.

**Table 12-163** GS\_OS\_RUN\_INFO columns

| Name       | Type    | Description                                                         |
|------------|---------|---------------------------------------------------------------------|
| id         | integer | ID                                                                  |
| name       | text    | Name of the OS running status.                                      |
| value      | numeric | Value of the OS running status.                                     |
| comments   | text    | Remarks of the OS running status.                                   |
| cumulative | boolean | Specifies whether the value of the OS running status is cumulative. |

## 12.3.75 GS\_REDO\_STAT

GS\_REDO\_STAT displays the log replay of session threads.

**Table 12-164** GS\_REDO\_STAT columns

| Name      | Type   | Description                                                               |
|-----------|--------|---------------------------------------------------------------------------|
| phywrts   | bigint | Number of times that data is written during log replay.                   |
| phyblkwrt | bigint | Number of data blocks written during log replay.                          |
| writetim  | bigint | Total time required for writing data during log replay.                   |
| avgiotim  | bigint | Average time required for writing data during log replay.                 |
| lstiotim  | bigint | Time consumed by the last data write operation during log replay.         |
| miniotim  | bigint | Minimum time consumed by a single data write operation during log replay. |
| maxiowtm  | bigint | Maximum time consumed by a single data write operation during log replay. |

## 12.3.76 GS\_SESSION\_MEMORY

GS\_SESSION\_MEMORY displays the memory usage at the session level, including all the memory allocated to GaussDB and Stream threads on DN for jobs currently executed by users. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-165** GS\_SESSION\_MEMORY columns

| Name     | Type    | Description                                                                           |
|----------|---------|---------------------------------------------------------------------------------------|
| sessid   | text    | Thread start time and ID                                                              |
| init_mem | integer | Memory allocated to the currently executed jobs before they enter the executor, in MB |
| used_mem | integer | Memory allocated to the currently executed jobs, in MB                                |
| peak_mem | integer | Peak memory allocated to the currently executed jobs, in MB                           |

### 12.3.77 GS\_SESSION\_MEMORY\_CONTEXT

GS\_SESSION\_MEMORY\_CONTEXT displays the memory usage of all sessions based on the MemoryContext node. If the GUC parameter **enable\_memory\_limit** or **enable\_thread\_pool** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-166** GS\_SESSION\_MEMORY\_CONTEXT columns

| Name        | Type     | Description                                                      |
|-------------|----------|------------------------------------------------------------------|
| sessid      | text     | Session start time and ID (string: <i>timestamp.sessionid</i> ). |
| threadid    | bigint   | ID of the thread bound to a session (-1 if no thread is bound).  |
| contextname | text     | Name of the memory context.                                      |
| level       | smallint | Hierarchy of the memory context.                                 |
| parent      | text     | Name of the parent memory context.                               |
| totalsize   | bigint   | Total size of the memory context, in bytes.                      |
| freesize    | bigint   | Total size of released memory in the memory context, in bytes.   |

| Name     | Type   | Description                                                                                                                                               |
|----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| usedsize | bigint | Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts. |

### 12.3.78 GS\_SESSION\_MEMORY\_DETAIL

GS\_SESSION\_MEMORY\_DETAIL displays the session memory usage based on the MemoryContext node. When **enable\_thread\_pool** is set to **on**, this view contains memory usage of all threads and sessions. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the `SELECT * FROM gs_session_memctx_detail(threadid, '');` statement to record information about all memory contexts of a thread into the *threadid\_timestamp.log* file in the `$GAUSSLOG/pg_log/${node_name}/dumppmem` directory. *threadid* can be obtained from **sessid** in the following table.

**Table 12-167** GS\_SESSION\_MEMORY\_DETAIL columns

| Name        | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sessid      | text     | <ol style="list-style-type: none"><li>1. When the thread pool is disabled (<b>enable_thread_pool</b> is set to <b>off</b>), this column indicates the thread start time + session ID (string: <i>timestamp.sessionid</i>).</li><li>2. When the thread pool is enabled (<b>enable_thread_pool</b> is set to <b>on</b>): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: <i>timestamp.threadid</i>). If the memory context is at the session level, the column indicates the thread start time + session ID (string: <i>timestamp.sessionid</i>).</li></ol> |
| sesstype    | text     | Thread name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| contextname | text     | Name of the memory context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| level       | smallint | Hierarchy of the memory context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| parent      | text     | Name of the parent memory context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Name      | Type   | Description                                                                                                                                               |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| totalsize | bigint | Total size of the memory context, in bytes.                                                                                                               |
| freesize  | bigint | Total size of released memory in the memory context, in bytes.                                                                                            |
| usedsize  | bigint | Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts. |

### 12.3.79 GS\_SESSION\_STAT

GS\_SESSION\_STAT displays the session states based on session threads or the AutoVacuum thread.

**Table 12-168** GS\_SESSION\_STAT columns

| Name     | Type    | Description                      |
|----------|---------|----------------------------------|
| sessid   | text    | Thread ID and start time.        |
| statid   | integer | Statistics ID.                   |
| statname | text    | Name of the statistics session.  |
| statunit | text    | Unit of the statistics session.  |
| value    | bigint  | Value of the statistics session. |

### 12.3.80 GS\_SESSION\_TIME

GS\_SESSION\_TIME displays the running time of session threads and time consumed in each execution phase.

**Table 12-169** GS\_SESSION\_TIME columns

| Name      | Type    | Description                      |
|-----------|---------|----------------------------------|
| sessid    | text    | Thread ID and start time.        |
| stat_id   | integer | ID of the statistics session.    |
| stat_name | text    | Session type.                    |
| value     | bigint  | Value of the statistics session. |

## 12.3.81 GS\_SQL\_COUNT

GS\_SQL\_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database.

- When a common user queries the GS\_SQL\_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS\_SQL\_COUNT view, statistics about the current node of all users are displayed.
- When the database or the node is restarted, the statistics are cleared and will be measured again.
- The system counts when a node receives a query, including a query inside the database.

**Table 12-170** GS\_SQL\_COUNT columns

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| node_name           | name   | Node name.                                                  |
| user_name           | name   | Username.                                                   |
| select_count        | bigint | Statistical result of the SELECT statement.                 |
| update_count        | bigint | Statistical result of the UPDATE statement.                 |
| insert_count        | bigint | Statistical result of the INSERT statement.                 |
| delete_count        | bigint | Statistical result of the DELETE statement.                 |
| mergeinto_count     | bigint | Statistical result of the <b>MERGE INTO</b> statement.      |
| ddl_count           | bigint | Number of DDL statements.                                   |
| dml_count           | bigint | Number of DML statements.                                   |
| dcl_count           | bigint | Number of DML statements.                                   |
| total_select_elapse | bigint | Total response time of SELECT statements (unit: $\mu$ s).   |
| avg_select_elapse   | bigint | Average response time of SELECT statements (unit: $\mu$ s). |
| max_select_elapse   | bigint | Maximum response time of SELECT statements (unit: $\mu$ s). |
| min_select_elapse   | bigint | Minimum response time of SELECT statements (unit: $\mu$ s). |
| total_update_elapse | bigint | Total response time of UPDATE statements (unit: $\mu$ s).   |

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| avg_update_elapse   | bigint | Average response time of UPDATE statements (unit: $\mu$ s). |
| max_update_elapse   | bigint | Maximum response time of UPDATE statements (unit: $\mu$ s). |
| min_update_elapse   | bigint | Minimum response time of UPDATE statements (unit: $\mu$ s). |
| total_insert_elapse | bigint | Total response time of INSERT statements (unit: $\mu$ s).   |
| avg_insert_elapse   | bigint | Average response time of INSERT statements (unit: $\mu$ s). |
| max_insert_elapse   | bigint | Maximum response time of INSERT statements (unit: $\mu$ s). |
| min_insert_elapse   | bigint | Minimum response time of INSERT statements (unit: $\mu$ s). |
| total_delete_elapse | bigint | Total response time of DELETE statements (unit: $\mu$ s).   |
| avg_delete_elapse   | bigint | Average response time of DELETE statements (unit: $\mu$ s). |
| max_delete_elapse   | bigint | Maximum response time of DELETE statements (unit: $\mu$ s). |
| min_delete_elapse   | bigint | Minimum response time of DELETE statements (unit: $\mu$ s). |

### 12.3.82 GS\_STAT\_SESSION\_CU

GS\_STAT\_SESSION\_CU queries the CU hit rate of running sessions on each node of the entire database. The data about a session is cleared after you exit this session or restart the database.

**Table 12-171** GS\_STAT\_SESSION\_CU columns

| Name          | Type    | Description                             |
|---------------|---------|-----------------------------------------|
| mem_hit       | integer | Number of memory hits.                  |
| hdd_sync_read | integer | Number of synchronous hard disk reads.  |
| hdd_asyn_read | integer | Number of asynchronous hard disk reads. |

### 12.3.83 GS\_THREAD\_MEMORY\_CONTEXT

GS\_THREAD\_MEMORY\_CONTEXT displays the memory usage of all threads based on the MemoryContext node. This view is equivalent to the GS\_SESSION\_MEMORY\_DETAIL view when **enable\_thread\_pool** is set to **off**. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-172** GS\_THREAD\_MEMORY\_CONTEXT columns

| Name        | Type     | Description                                                                                                                                               |
|-------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| threadid    | text     | Thread start time and ID (string: <i>timestamp.sessionid</i> ).                                                                                           |
| tid         | bigint   | Thread ID.                                                                                                                                                |
| thrdtype    | text     | Thread type.                                                                                                                                              |
| contextname | text     | Name of the memory context.                                                                                                                               |
| level       | smallint | Hierarchy of the memory context.                                                                                                                          |
| parent      | text     | Name of the parent memory context.                                                                                                                        |
| totalsize   | bigint   | Total size of the memory context, in bytes.                                                                                                               |
| freesize    | bigint   | Total size of released memory in the memory context, in bytes.                                                                                            |
| usedsize    | bigint   | Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts. |

### 12.3.84 GS\_TOTAL\_MEMORY\_DETAIL

GS\_TOTAL\_MEMORY\_DETAIL displays the memory usage of the current database node, in MB. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-173** GS\_TOTAL\_MEMORY\_DETAIL columns

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| memorybytes | integer | Size of allocated memory-typed memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 12.3.85 GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL

GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL returns the memory usage (in MB) of the current logical instance of the database. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-174** GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL columns

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| memorytype  | text    | Memory type. The value must be one of the following: <ul style="list-style-type: none"><li>• <b>ng_total_memory</b>: total memory of the logical instance.</li><li>• <b>ng_used_memory</b>: memory usage of the logical instance.</li><li>• <b>ng_estimate_memory</b>: estimated memory usage of the logical instance.</li><li>• <b>ng_foreignrp_memsize</b>: total memory of the external resource pool of the logical instance.</li><li>• <b>ng_foreignrp_usesize</b>: memory usage of the external resource pool of the logical instance.</li><li>• <b>ng_foreignrp_peaksize</b>: peak memory usage of the external resource pool of the logical instance.</li><li>• <b>ng_foreignrp_mempct</b>: percentage of the external resource pool of the logical instance to the total memory of the logical instance.</li><li>• <b>ng_foreignrp_estmsize</b>: estimated memory usage of the external resource pool of the logical instance.</li></ul> |
| memorybytes | integer | Size of allocated memory-typed memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 12.3.86 GV\_SESSION

GV\_SESSION displays all session information about the current session.

**Table 12-175** GV\_SESSION columns

| Name       | Type    | Description                                            |
|------------|---------|--------------------------------------------------------|
| sid        | bigint  | Name of the database where the hotspot key is located. |
| serial#    | integer | Name of the schema where the hotspot key is located.   |
| schemaname | name    | Name of the table where the hotspot key is located.    |
| user#      | oid     | Value of the hotspot key.                              |

| Name           | Type      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username       | name      | Hash value of the hotspot key in the database. If the table is a list or range distributed table, the value of this column is <b>0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| machine        | text      | Frequency of accessing the hotspot key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| sql_id         | bigint    | SQL OID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| status         | text      | Overall status of this backend. The value can be: <ul style="list-style-type: none"><li>• <b>active</b>: The backend is executing a query.</li><li>• <b>idle</b>: The backend is waiting for a new client command.</li><li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li><li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li><li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li><li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li></ul> |

## 12.3.87 MPP\_TABLES

The following information is displayed in the MPP\_TABLES view.

**Table 12-176** MPP\_TABLES columns

| Name       | Type | Description                               |
|------------|------|-------------------------------------------|
| schemaname | name | Name of the schema that contains a table. |
| tablename  | name | Table name.                               |

| Name       | Type             | Description                          |
|------------|------------------|--------------------------------------|
| tableowner | name             | Table owner.                         |
| tablespace | name             | Tablespace containing the table.     |
| pgroup     | name             | Name of a node group.                |
| nodeoids   | oidvector_extend | List of distributed table node OIDs. |

## 12.3.88 MY\_COL\_COMMENTS

MY\_COL\_COMMENTS displays column comments of the table accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-177** MY\_COL\_COMMENTS columns

| Name        | Type                  | Description         |
|-------------|-----------------------|---------------------|
| owner       | character varying(64) | Constraint creator. |
| owner       | character varying(64) | Table owner.        |
| table_name  | character varying(64) | Table name.         |
| column_name | character varying(64) | Column name.        |
| comments    | text                  | Comments.           |

## 12.3.89 MY\_CONS\_COLUMNS

MY\_CONS\_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-178** MY\_CONS\_COLUMNS columns

| Name        | Type                  | Description                          |
|-------------|-----------------------|--------------------------------------|
| owner       | character varying(64) | Constraint creator.                  |
| table_name  | character varying(64) | Name of a constraint-related table.  |
| column_name | character varying(64) | Name of a constraint-related column. |

| Name            | Type                  | Description                      |
|-----------------|-----------------------|----------------------------------|
| constraint_name | character varying(64) | Constraint name.                 |
| position        | smallint              | Position of a column in a table. |

## 12.3.90 MY\_CONSTRAINTS

MY\_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-179** MY\_CONSTRAINTS columns

| Name            | Type                   | Description                                                                                                                                                                                                                   |
|-----------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | character varying(64)  | Constraint creator.                                                                                                                                                                                                           |
| constraint_name | vcharacter varying(64) | Constraint name.                                                                                                                                                                                                              |
| constraint_type | text                   | Constraint type. <ul style="list-style-type: none"><li>• <b>c</b>: check constraint.</li><li>• <b>f</b>: foreign key constraint.</li><li>• <b>p</b>: primary key constraint.</li><li>• <b>u</b>: unique constraint.</li></ul> |
| table_name      | character varying(64)  | Name of a constraint-related table.                                                                                                                                                                                           |
| index_owner     | character varying(64)  | Owner of a constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                              |
| index_name      | character varying(64)  | Name of the constraint-related index (only for the unique constraint and primary key constraint).                                                                                                                             |

## 12.3.91 MY\_IND\_COLUMNS

MY\_IND\_COLUMNS displays column information about all indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-180** MY\_IND\_COLUMNS columns

| Name        | Type                  | Description  |
|-------------|-----------------------|--------------|
| index_owner | character varying(64) | Index owner. |

| Name            | Type                  | Description                          |
|-----------------|-----------------------|--------------------------------------|
| index_name      | character varying(64) | Index name.                          |
| table_owner     | character varying(64) | Table owner.                         |
| table_name      | character varying(64) | Table name.                          |
| column_name     | name                  | Column name.                         |
| column_position | smallint              | Position of the column in the index. |

## 12.3.92 MY\_IND\_EXPRESSIONS

MY\_IND\_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-181** MY\_IND\_EXPRESSIONS columns

| Name              | Type                  | Description                                            |
|-------------------|-----------------------|--------------------------------------------------------|
| table_owner       | character varying(64) | Table owner.                                           |
| table_name        | character varying(64) | Table name.                                            |
| index_owner       | character varying(64) | Index owner.                                           |
| index_name        | character varying(64) | Index name.                                            |
| column_expression | text                  | Function-based index expression of a specified column. |
| column_position   | smallint              | Position of the column in the index.                   |

## 12.3.93 MY\_IND\_PARTITIONS

MY\_IND\_PARTITIONS displays the partition information of indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-182** MY\_IND\_PARTITIONS columns

| Name        | Type                  | Description                                                                           |
|-------------|-----------------------|---------------------------------------------------------------------------------------|
| index_owner | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs. |

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| index_name             | character varying(64) | Name of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                             |
| partition_name         | character varying(64) | Name of the index partition.                                                                                                                                                                                                                                                                                                                                                          |
| def_tablespace_name    | name                  | Tablespace name of the index partition.                                                                                                                                                                                                                                                                                                                                               |
| high_value             | text                  | Limit of the partition corresponding to the index partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li><b>t</b> (true): yes.</li><li><b>f</b> (false): no.</li></ul>                                                                                                                                                                                                                               |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                           |
| high_value_length      | integer               | Character length of the limit of the partition corresponding to an index partition.                                                                                                                                                                                                                                                                                                   |

### 12.3.94 MY\_IND\_SUBPARTITIONS

**MY\_IND\_SUBPARTITIONS** displays information about level-2 partitions of indexes (excluding global indexes of partitioned tables) owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-183** MY\_IND\_SUBPARTITIONS columns

| Name        | Type                  | Description                                                                           |
|-------------|-----------------------|---------------------------------------------------------------------------------------|
| index_owner | character varying(64) | Name of the owner of the partitioned table index to which an index partition belongs. |

| Name                   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| index_name             | character varying(64) | Name of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                                  |
| partition_name         | character varying(64) | Name of the partition where an index is located                                                                                                                                                                                                                                                                                                                                            |
| subpartition_name      | character varying(64) | Name of the level-2 partition where an index is located.                                                                                                                                                                                                                                                                                                                                   |
| def_tablespace_name    | name                  | Tablespace name of an index partition.                                                                                                                                                                                                                                                                                                                                                     |
| high_value             | text                  | Limit of the partition corresponding to an index partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul> |
| index_partition_usable | Boolean               | Specifies whether the index partition is available. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                                                                                                                                                                                                                                  |
| schema                 | character varying(64) | Schema of the partitioned table index to which the index partition belongs.                                                                                                                                                                                                                                                                                                                |
| high_value_length      | integer               | Character length of the limit of the partition corresponding to an index partition.                                                                                                                                                                                                                                                                                                        |

### 12.3.95 MY\_INDEXES

MY\_INDEXES displays index information about the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-184** MY\_INDEXES columns

| Name        | Type                  | Description                                                         |
|-------------|-----------------------|---------------------------------------------------------------------|
| owner       | character varying(64) | Index owner.                                                        |
| index_name  | character varying(64) | Index name.                                                         |
| table_name  | character varying(64) | Name of the table corresponding to the index.                       |
| uniqueness  | text                  | Specifies whether the index is unique.                              |
| partitioned | character(3)          | Specifies whether the index has the property of partitioned tables. |
| generated   | character varying(1)  | Specifies whether the index name is generated by the system.        |

## 12.3.96 MY\_JOBS

MY\_JOBS displays details about the scheduled jobs owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-185** MY\_JOBS columns

| Name       | Type                        | Description                                         |
|------------|-----------------------------|-----------------------------------------------------|
| job        | bigint                      | Job ID.                                             |
| log_user   | name                        | Username of a job creator.                          |
| priv_user  | name                        | Username of a job executor.                         |
| dbname     | name                        | Name of the database where the job is created.      |
| start_date | timestamp without time zone | Job start time.                                     |
| start_suc  | text                        | Start time of the successful job execution.         |
| last_date  | timestamp without time zone | Start time of the last job execution.               |
| last_suc   | text                        | Start time of the last successful job execution.    |
| this_date  | timestamp without time zone | Start time of the ongoing job execution.            |
| this_suc   | text                        | Start time of the ongoing successful job execution. |

| Name      | Type                        | Description                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_date | timestamp without time zone | Schedule time of the next job execution.                                                                                                                                                                                                                                                  |
| next_suc  | text                        | Schedule time of the next successful job execution.                                                                                                                                                                                                                                       |
| broken    | text                        | If the value of the <b>status</b> column is 'd', the value is 'y'. Otherwise, the value is 'n'.                                                                                                                                                                                           |
| status    | "char"                      | Status of the current job. The value can be 'r', 's', 'f', or 'd'. The default value is 'r'. <ul style="list-style-type: none"><li>• <b>r</b>: running</li><li>• <b>s</b>: successful execution</li><li>• <b>f</b>: failed execution</li><li>• <b>d</b>: canceling an execution</li></ul> |
| interval  | text                        | Time expression used to calculate the next time the job will be executed. If this parameter is set to <b>null</b> , the job will be executed once only.                                                                                                                                   |
| failures  | smallint                    | Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.                                                                                                                                               |
| what      | text                        | Executable job.                                                                                                                                                                                                                                                                           |

### 12.3.97 MY\_OBJECTS

MY\_OBJECTS displays database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-186** MY\_OBJECTS columns

| Name        | Type | Description                                                                    |
|-------------|------|--------------------------------------------------------------------------------|
| object_name | name | Object name.                                                                   |
| object_id   | oid  | Object OID.                                                                    |
| object_type | name | Object type ( <b>TABLE</b> , <b>INDEX</b> , <b>SEQUENCE</b> , or <b>VIEW</b> ) |
| namespace   | oid  | Namespace that the object belongs to.                                          |

| Name          | Type                     | Description                           |
|---------------|--------------------------|---------------------------------------|
| created       | timestamp with time zone | Creation time of the object.          |
| last_ddl_time | timestamp with time zone | Last modification time of the object. |

**NOTICE**

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

## 12.3.98 MY\_PART\_INDEXES

MY\_PART\_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-187** MY\_PART\_INDEXES columns

| Name                   | Type                  | Description                                                                                                                                                                                       |
|------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| def_tablespace_name    | name                  | Tablespace name of a partitioned table index                                                                                                                                                      |
| index_owner            | character varying(64) | Owner name of a partitioned table index                                                                                                                                                           |
| index_name             | character varying(64) | Name of a partitioned table index                                                                                                                                                                 |
| partition_count        | bigint                | Number of index partitions of a partitioned table index                                                                                                                                           |
| partitioning_key_count | integer               | Number of partition keys of a partitioned table                                                                                                                                                   |
| partitioning_type      | text                  | Partitioning policy of a partitioned table<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> . |
| schema                 | character varying(64) | Schema of a partitioned table index                                                                                                                                                               |
| table_name             | character varying(64) | Name of the partitioned table to which a partitioned table index belongs                                                                                                                          |

| Name                      | Type    | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subpartitioning_type      | text    | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer | Number of level-2 partition keys of the partitioned table.                                                                                                                                                                                                                                               |

## 12.3.99 MY\_PART\_TABLES

MY\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-188** MY\_PART\_TABLES columns

| Name                   | Type                  | Description                                                                                                                                                                                          |
|------------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_owner            | character varying(64) | Owner name of a partitioned table.                                                                                                                                                                   |
| table_name             | character varying(64) | Name of the partitioned table.                                                                                                                                                                       |
| partitioning_type      | text                  | Partitioning policy of the partitioned table.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> . |
| partition_count        | bigint                | Number of partitions of the partitioned table.                                                                                                                                                       |
| partitioning_key_count | integer               | Number of partition keys of the partitioned table.                                                                                                                                                   |
| def_tablespace_name    | name                  | Tablespace name of the partitioned table.                                                                                                                                                            |
| schema                 | character varying(64) | Schema of the partitioned table.                                                                                                                                                                     |

| Name                      | Type    | Description                                                                                                                                                                                                                                                                                              |
|---------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subpartitioning_type      | text    | Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.<br><b>NOTE</b><br>For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> . |
| def_subpartition_count    | integer | Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.                                                                                                                                                  |
| subpartitioning_key_count | integer | Number of level-2 partition keys of the partitioned table.                                                                                                                                                                                                                                               |

## 12.3.100 MY\_PROCEEDURES

MY\_PROCEEDURES displays information about stored procedures or functions owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-189** MY\_PROCEEDURES columns

| Name            | Type                  | Description                                       |
|-----------------|-----------------------|---------------------------------------------------|
| owner           | character varying(64) | Owner of a stored procedure or function.          |
| object_name     | character varying(64) | Name of a stored procedure or function.           |
| argument_number | smallint              | Number of input parameters in a stored procedure. |

## 12.3.101 MY\_SEQUENCES

MY\_SEQUENCES displays the sequence information about the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-190** MY\_SEQUENCES columns

| Name           | Type                  | Description          |
|----------------|-----------------------|----------------------|
| sequence_owner | character varying(64) | Owner of a sequence. |
| sequence_name  | character varying(64) | Name of a sequence.  |

## 12.3.102 MY\_SOURCE

MY\_SOURCE displays information about stored procedures or functions owned by the current user and provides columns defined by the stored procedures or the functions. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-191** MY\_SOURCE columns

| Name  | Type                  | Description                                   |
|-------|-----------------------|-----------------------------------------------|
| owner | character varying(64) | Owner of a stored procedure or function.      |
| name  | character varying(64) | Name of a stored procedure or function.       |
| text  | text                  | Definition of a stored procedure or function. |

## 12.3.103 MY\_SYNONYMS

MY\_SYNONYMS displays synonyms accessible to the current user.

**Table 12-192** MY\_SYNONYMS columns

| Name         | Type | Description                                                                                                                                                                                                              |
|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name  | text | Name of the schema to which the synonym belongs.                                                                                                                                                                         |
| synonym_name | text | Synonym name.                                                                                                                                                                                                            |
| table_owner  | text | Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym. |

| Name              | Type | Description                                                                                                                                                                                                                          |
|-------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name        | text | Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.               |
| table_schema_name | text | Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym. |

### 12.3.104 MY\_TAB\_COLUMNS

MY\_TAB\_COLUMNS displays information about table columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-193** MY\_TAB\_COLUMNS columns

| Name           | Type                   | Description                                                                                                    |
|----------------|------------------------|----------------------------------------------------------------------------------------------------------------|
| owner          | character varying(64)  | Table owner.                                                                                                   |
| table_name     | character varying(64)  | Table name.                                                                                                    |
| column_name    | character varying(64)  | Column name.                                                                                                   |
| data_type      | character varying(128) | Data type of the column.                                                                                       |
| data_length    | integer                | Length of a column, in bytes.                                                                                  |
| data_precision | integer                | Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types. |
| data_scale     | integer                | Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.    |
| nullable       | bpchar                 | Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint).       |

| Name        | Type    | Description                                                                                                         |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------|
| column_id   | integer | Sequence number of a column when a table is created.                                                                |
| avg_col_len | numeric | Average length of a column, in bytes.                                                                               |
| char_length | numeric | Length of a column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types. |
| comments    | text    | Comments.                                                                                                           |

### 12.3.105 MY\_TAB\_COMMENTS

MY\_TAB\_COMMENTS displays comments on all tables and views owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-194** MY\_TAB\_COMMENTS columns

| Name       | Type                  | Description                |
|------------|-----------------------|----------------------------|
| owner      | character varying(64) | Owner of a table or view.  |
| table_name | character varying(64) | Name of the table or view. |
| comments   | text                  | Comments.                  |

### 12.3.106 MY\_TAB\_PARTITIONS

MY\_TAB\_PARTITIONS displays all table partitions accessible to the current user. Each table partition of a partitioned table accessible to the current user has one record in USER\_TAB\_PARTITIONS. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-195** MY\_TAB\_PARTITIONS columns

| Name           | Type                  | Description                        |
|----------------|-----------------------|------------------------------------|
| table_owner    | character varying(64) | Owner name of a partitioned table. |
| table_name     | character varying(64) | Name of a partitioned table.       |
| partition_name | character varying(64) | Partition name.                    |

| Name               | Type                  | Description                                                                                                                                                                                                                                                                                                                                          |
|--------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| high_value         | text                  | Limit of a partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name    | name                  | Tablespace name of a partition.                                                                                                                                                                                                                                                                                                                      |
| schema             | character varying(64) | Schema of a partitioned table.                                                                                                                                                                                                                                                                                                                       |
| subpartition_count | bigint                | Number of level-2 partitions.                                                                                                                                                                                                                                                                                                                        |
| high_value_length  | integer               | Length of the partition boundary value expression.                                                                                                                                                                                                                                                                                                   |

## 12.3.107 MY\_TAB\_SUBPARTITIONS

MY\_TAB\_SUBPARTITIONS displays information about level-2 partitions owned by the current user. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-196** MY\_TAB\_SUBPARTITIONS columns

| Name              | Type                  | Description                  |
|-------------------|-----------------------|------------------------------|
| table_owner       | character varying(64) | Role name.                   |
| table_name        | character varying(64) | Relational table name.       |
| partition_name    | character varying(64) | Partition name.              |
| subpartition_name | character varying(64) | Name of a level-2 partition. |

| Name              | Type                  | Description                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| high_value        | text                  | Limit of a level-2 partition.<br><b>NOTE</b> <ul style="list-style-type: none"><li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>For list partitioning, the value list of each partition is displayed.</li><li>For hash partitioning, the number of each partition is displayed.</li></ul> |
| tablespace_name   | name                  | Tablespace name of a level-2 partitioned table.                                                                                                                                                                                                                                                                                                        |
| schema            | character varying(64) | Name of a namespace.                                                                                                                                                                                                                                                                                                                                   |
| high_value_length | integer               | Length of the boundary value expression in level-2 partition.                                                                                                                                                                                                                                                                                          |

### 12.3.108 MY\_TABLES

MY\_TABLES displays information about the tables owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-197** MY\_TABLES columns

| Name            | Type                  | Description                                                                                                                                           |
|-----------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner           | character varying(64) | Table owner.                                                                                                                                          |
| table_name      | character varying(64) | Table name.                                                                                                                                           |
| tablespace_name | character varying(64) | Tablespace name of the table.                                                                                                                         |
| dropped         | character varying     | Specifies whether the current record is deleted. <ul style="list-style-type: none"><li><b>yes</b>: deleted.</li><li><b>no</b>: not deleted.</li></ul> |
| num_rows        | numeric               | Estimated number of rows in the table.                                                                                                                |
| status          | character varying(8)  | Specifies whether the current record is valid. <ul style="list-style-type: none"><li><b>valid</b>: valid.</li></ul>                                   |

| Name      | Type         | Description                                                                                                                                                                                           |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| temporary | character(1) | Specifies whether the table is a temporary table. <ul style="list-style-type: none"><li>• <b>y</b>: The table is a temporary table.</li><li>• <b>n</b>: The table is not a temporary table.</li></ul> |

## 12.3.109 MY\_TRIGGERS

MY\_TRIGGERS displays information about the triggers owned by the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-198** MY\_TRIGGERS columns

| Name         | Type                  | Description                                                                                                                                                                                                                                                                             |
|--------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trigger_name | character varying(64) | Trigger name.                                                                                                                                                                                                                                                                           |
| table_name   | character varying(64) | Relational table name.                                                                                                                                                                                                                                                                  |
| table_owner  | character varying(64) | Role name.                                                                                                                                                                                                                                                                              |
| status       | character varying(64) | Trigger status. <ul style="list-style-type: none"><li>• <b>O</b>: The trigger is enabled in origin or local mode.</li><li>• <b>D</b>: The trigger is disabled.</li><li>• <b>R</b>: The trigger is enabled in replica mode.</li><li>• <b>A</b>: The trigger is always enabled.</li></ul> |

## 12.3.110 MY\_VIEWS

MY\_VIEWS displays information about all views of the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-199** MY\_VIEWS columns

| Name      | Type                  | Description      |
|-----------|-----------------------|------------------|
| owner     | character varying(64) | Owner of a view. |
| view_name | character varying(64) | View name.       |

## 12.3.111 PG\_CURSORS

PG\_CURSORS displays cursors that are currently available.

**Table 12-200** PG\_CURSORS columns

| Name          | Type                     | Description                                                                                                                                                                                                                      |
|---------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | text                     | Cursor name.                                                                                                                                                                                                                     |
| statement     | text                     | Query statement when the cursor is declared to change.                                                                                                                                                                           |
| is_holdable   | boolean                  | Specifies whether the cursor is holdable (that is, whether the cursor can be accessed after the transaction that declared the cursor has committed). If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> . |
| is_binary     | boolean                  | Specifies whether the cursor is declared BINARY. If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .                                                                                                     |
| is_scrollable | boolean                  | Specifies whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .                                               |
| creation_time | timestamp with time zone | Timestamp at which the cursor is declared.                                                                                                                                                                                       |

## 12.3.112 PG\_COMM\_DELAY

PG\_COMM\_DELAY displays the communications library delay status for a single DN.

**Table 12-201** PG\_COMM\_DELAY columns

| Name        | Type    | Description                                                                  |
|-------------|---------|------------------------------------------------------------------------------|
| node_name   | text    | Node name                                                                    |
| remote_name | text    | Name of the peer node                                                        |
| remote_host | text    | IP address of the peer node                                                  |
| stream_num  | integer | Number of logical stream connections used by the current physical connection |

| Name      | Type    | Description                                                                                                                                                                               |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| min_delay | integer | Minimum delay of the current physical connection within 1 minute, in microsecond.<br><b>NOTE</b><br>A negative result is invalid. Wait until the delay status is updated and query again. |
| average   | integer | Average delay of the current physical connection within 1 minute, in microsecond.                                                                                                         |
| max_delay | integer | Maximum delay of the current physical connection within 1 minute, in microsecond.                                                                                                         |

### 12.3.113 PG\_COMM\_RECV\_STREAM

**PG\_COMM\_RECV\_STREAM** displays the receiving stream status of all the communication libraries for a single DN.

**Table 12-202** PG\_COMM\_RECV\_STREAM columns

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name   | text    | Node name                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| local_tid   | bigint  | ID of the thread using this stream                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| remote_name | text    | Name of the peer node                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| remote_tid  | bigint  | Peer thread ID                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| idx         | integer | Peer DN ID in the local DN                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sid         | integer | Stream ID in the physical connection                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| tcp_sock    | integer | TCP socket used in the stream                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| state       | text    | Status of the stream <ul style="list-style-type: none"><li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li><li>• <b>READY</b>: The logical connection is ready.</li><li>• <b>RUN</b>: The logical connection sends packets normally.</li><li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li><li>• <b>CLOSED</b>: The logical connection is closed.</li><li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li></ul> |
| query_id    | bigint  | <b>debug_query_id</b> corresponding to the stream                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name       | Type    | Description                                                      |
|------------|---------|------------------------------------------------------------------|
| pn_id      | integer | <b>plan_node_id</b> of the query executed by the stream          |
| send_smp   | integer | <b>smpid</b> of the sender of the query executed by the stream   |
| recv_smp   | integer | <b>smpid</b> of the receiver of the query executed by the stream |
| recv_bytes | bigint  | Total data volume received from the stream, in byte              |
| time       | bigint  | Current lifecycle service duration of the stream, in ms          |
| speed      | bigint  | Average receiving rate of the stream, in byte/s                  |
| quota      | bigint  | Current communication quota value of the stream, in byte         |
| buff_use   | bigint  | Current size of the data cache of the stream, in byte            |

### 12.3.114 PG\_COMM\_SEND\_STREAM

**PG\_COMM\_SEND\_STREAM** displays the sending stream status of all the communication libraries for a single DN.

**Table 12-203** PG\_COMM\_SEND\_STREAM columns

| Name        | Type    | Description                          |
|-------------|---------|--------------------------------------|
| node_name   | text    | Node name                            |
| local_tid   | bigint  | ID of the thread using this stream   |
| remote_name | text    | Name of the peer node                |
| remote_tid  | bigint  | Peer thread ID                       |
| idx         | integer | Peer DN ID in the local DN           |
| sid         | integer | Stream ID in the physical connection |
| tcp_sock    | integer | TCP socket used in the stream        |

| Name       | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| send_bytes | bigint  | Total data volume sent by the stream, in byte                                                                                                                                                                                                                                                                                                                                                                                                                          |
| time       | bigint  | Current lifecycle service duration of the stream, in ms                                                                                                                                                                                                                                                                                                                                                                                                                |
| speed      | bigint  | Average sending rate of the stream, in byte/s                                                                                                                                                                                                                                                                                                                                                                                                                          |
| quota      | bigint  | Current communication quota value of the stream, in byte                                                                                                                                                                                                                                                                                                                                                                                                               |
| wait_quota | bigint  | Extra time generated when the stream waits the quota value, in ms                                                                                                                                                                                                                                                                                                                                                                                                      |

## 12.3.115 PG\_COMM\_STATUS

PG\_COMM\_STATUS displays the communications library status for a single DN.

**Table 12-204** PG\_COMM\_STATUS columns

| Name       | Type    | Description                                                          |
|------------|---------|----------------------------------------------------------------------|
| node_name  | text    | Node name.                                                           |
| rxpck_rate | integer | Receiving rate of the communications library on the node, in byte/s. |

| Name             | Type    | Description                                                              |
|------------------|---------|--------------------------------------------------------------------------|
| txpck_rate       | integer | Sending rate of the communications library on the node, in byte/s.       |
| rxkbyte_rate     | bigint  | Receiving rate of the communications library on the node, in kbyte/s.    |
| txkbyte_rate     | bigint  | Sending rate of the communications library on the node, in kbyte/s.      |
| buffer           | bigint  | Size of the buffer of the Cmailbox.                                      |
| memkbyte_libcomm | bigint  | Communication memory size of the <b>libcomm</b> process, in bytes.       |
| memkbyte_libpq   | bigint  | Communication memory size of the <b>libpq</b> process, in bytes.         |
| used_pm          | integer | Real-time usage of the <b>postmaster</b> thread.                         |
| used_sflow       | integer | Real-time usage of the <b>gs_sender_flow_controller</b> thread.          |
| used_rflow       | integer | Real-time usage of the <b>gs_receiver_flow_controller</b> thread.        |
| used_rloop       | integer | Highest real-time usage among multiple <b>gs_receivers_loop</b> threads. |
| stream           | integer | Total number of used logical connections.                                |

### 12.3.116 PG\_CONTROL\_GROUP\_CONFIG

PG\_CONTROL\_GROUP\_CONFIG displays Cgroup configuration information in the system. Only users with the SYSADMIN permission can query this view.

**Table 12-205** PG\_CONTROL\_GROUP\_CONFIG columns

| Name                    | Type | Description                             |
|-------------------------|------|-----------------------------------------|
| pg_control_group_config | text | Configuration information of the Cgroup |

### 12.3.117 PG\_EXT\_STATS

PG\_EXT\_STATS displays extended statistics stored in [PG\\_STATISTIC\\_EXT](#).

**Table 12-206** PG\_EXT\_STATS columns

| Name       | Type       | Reference                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemaname | name       | <b>nspname</b> in <a href="#">PG_NAMESPACE</a>    | Name of the schema that contains a table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| tablename  | name       | <b>relname</b> in <a href="#">PG_CLASS</a>        | Table name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| attname    | int2vector | <b>stakey</b> in <a href="#">PG_STATISTIC_EXT</a> | Columns to be combined for collecting statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| inherited  | boolean    | -                                                 | Table inheritance is not supported currently. The value of this column is <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| null_frac  | real       | -                                                 | Percentage of column combinations that are null to all records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| avg_width  | integer    | -                                                 | Average width of column combinations, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| n_distinct | real       | -                                                 | <ul style="list-style-type: none"><li>Estimated number of distinct values in a column combination if the value is greater than 0.</li><li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, <b>-1</b> indicates that the number of distinct values is the same as the number of rows for a column combination.<ol style="list-style-type: none"><li>The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li><li>The positive form is used when the column seems to have a fixed number of possible values.</li></ol></li><li>The number of distinct values is unknown if the value is <b>0</b>.</li></ul> |

| Name                  | Type     | Reference | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name                   | Type     | Reference | Description                                                                                                                                                                                                                                                                                |
|------------------------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| most_common_freqs_null | real[]   | -         | List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals_null</b> is <b>NULL</b> , the value of this column is <b>NULL</b> . |
| histogram_bounds       | anyarray | -         | Boundary value list of the histogram.                                                                                                                                                                                                                                                      |

### 12.3.118 PG\_GET\_INVALID\_BACKENDS

**PG\_GET\_INVALID\_BACKENDS** provides information about background threads on the primary database node that are connected to the current standby node.

**Table 12-207** PG\_GET\_INVALID\_BACKENDS columns

| Name          | Type                     | Description                                         |
|---------------|--------------------------|-----------------------------------------------------|
| pid           | bigint                   | Thread ID                                           |
| node_name     | text                     | Node information connected to the background thread |
| dbname        | name                     | Name of the connected database                      |
| backend_start | timestamp with time zone | Background thread startup time                      |
| query         | text                     | Query statement executed by the background thread   |

### 12.3.119 PG\_GET\_SENDERS\_CATCHUP\_TIME

**PG\_GET\_SENDERS\_CATCHUP\_TIME** provides catchup information of the currently active primary/standby instance sender thread on the database node.

**Table 12-208** PG\_GET\_SENDERS\_CATCHUP\_TIME columns

| Name | Type   | Description               |
|------|--------|---------------------------|
| pid  | bigint | Current sender thread ID. |

| Name          | Type                     | Description                         |
|---------------|--------------------------|-------------------------------------|
| lwpid         | integer                  | Current sender lwpid.               |
| local_role    | text                     | Local role.                         |
| peer_role     | text                     | Peer role.                          |
| state         | text                     | Current sender's replication status |
| type          | text                     | Current sender type                 |
| catchup_start | timestamp with time zone | Startup time of a catchup task.     |
| catchup_end   | timestamp with time zone | End time of the catchup task.       |

### 12.3.120 PG\_GROUP

PG\_GROUP displays the database role authentication and the relationship between group members.

**Table 12-209** PG\_GROUP columns

| Name     | Type  | Description                                         |
|----------|-------|-----------------------------------------------------|
| groname  | name  | Group name                                          |
| grosysid | oid   | Group ID                                            |
| grolist  | oid[] | Array containing the IDs of all roles in the group. |

### 12.3.121 PG\_GTT\_ATTACHED\_PIDS

PG\_GTT\_ATTACHED\_PIDS is used to check which sessions are using global temporary tables by calling the `pg_gtt_attached_pid()` function.

**Table 12-210** PG\_GTT\_ATTACHED\_PIDS columns

| Name       | Type     | Description                       |
|------------|----------|-----------------------------------|
| schemaname | name     | Schema name.                      |
| tablename  | name     | Name of a global temporary table. |
| relid      | oid      | OID of a global temporary table.  |
| pids       | bigint[] | Thread PID list.                  |

| Name       | Type     | Description      |
|------------|----------|------------------|
| sessionids | bigint[] | Session ID list. |

## 12.3.122 PG\_GTT\_RELSTATS

PG\_GTT\_RELSTATS displays basic information about all global temporary tables of the current session by calling `pg_get_gtt_relstats()`.

**Table 12-211** PG\_GTT\_RELSTATS columns

| Name          | Type    | Description                                                                                                 |
|---------------|---------|-------------------------------------------------------------------------------------------------------------|
| schemaname    | name    | Schema name.                                                                                                |
| tablename     | name    | Name of a global temporary table.                                                                           |
| relfilenode   | oid     | ID of a file object.                                                                                        |
| relpages      | integer | Number of disk pages of a global temporary table.                                                           |
| reltuples     | real    | Number of records in a global temporary table.                                                              |
| relallvisible | integer | Number of pages that are marked as all visible.                                                             |
| relfrozenxid  | xid     | All transaction IDs before this one have been replaced by a permanent (frozen) transaction ID in the table. |
| relminmxid    | xid     | Reserved.                                                                                                   |

## 12.3.123 PG\_GTT\_STATS

PG\_GTT\_STATS displays statistics about a single column in all global temporary tables of the current session by calling `pg_get_gtt_statistics()`.

**Table 12-212** PG\_GTT\_STATS columns

| Name       | Type    | Description                                                                             |
|------------|---------|-----------------------------------------------------------------------------------------|
| schemaname | name    | Schema name.                                                                            |
| tablename  | name    | Name of a global temporary table.                                                       |
| attname    | name    | Attribute name.                                                                         |
| inherited  | Boolean | Specifies whether to collect statistics for objects that have inheritance relationship. |

| Name                      | Type    | Description                                                                                       |
|---------------------------|---------|---------------------------------------------------------------------------------------------------|
| null_frac                 | real    | Percentage of column entries that are null.                                                       |
| avg_width                 | integer | Average stored width, in bytes, of non-null entries.                                              |
| n_distinct                | real    | Number of distinct, non-null data values in the column.                                           |
| most_common_vals          | text[]  | List of the most common values, which is sorted by occurrence frequency.                          |
| most_common_freqs         | real[]  | Frequencies of the most common values.                                                            |
| histogram_bounds          | text[]  | Data distribution (excluding the most common values) in a frequency histogram description column. |
| correlation               | real    | Correlation coefficient.                                                                          |
| most_common_elements      | text[]  | List of the most common element values, which is used for the array type or some other type.      |
| most_common_element_freqs | real[]  | Frequencies of the most common element values.                                                    |
| elem_count_histogram      | real[]  | Array type histogram.                                                                             |

## 12.3.124 PG\_INDEXES

PG\_INDEXES displays information about each index in the database.

**Table 12-213** PG\_INDEXES columns

| Name       | Type | Reference                              | Description                                          |
|------------|------|----------------------------------------|------------------------------------------------------|
| schemaname | name | <b>nspname</b> in <b>PG_NAMESPACE</b>  | Name of the schema that contains tables and indexes. |
| tablename  | name | <b>relname</b> in <b>PG_CLASS</b>      | Name of the table where the index is located.        |
| indexname  | name | <b>relname</b> in <b>PG_CLASS</b>      | Index name                                           |
| tablespace | name | <b>nspname</b> in <b>PG_TABLESPACE</b> | Name of the tablespace that contains the index.      |

| Name     | Type | Reference | Description                                                     |
|----------|------|-----------|-----------------------------------------------------------------|
| indexdef | text | -         | Index definition (a reconstructed <b>CREATE INDEX</b> command). |

## 12.3.125 PG\_LOCKS

PG\_LOCKS displays information about locks held by open transactions.

**Table 12-214** PG\_LOCKS columns

| Name          | Type     | Reference                                 | Description                                                                                                                                                                                                                        |
|---------------|----------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| locktype      | text     | -                                         | Type of the locked object: relation, extend, page, tuple, transactionid, virtualxid, object, userlock, and advisory.                                                                                                               |
| database      | oid      | <b>oid</b> in <a href="#">PG_DATABASE</a> | OID of the database in which the locked target exists. <ul style="list-style-type: none"><li>The OID is <b>0</b> if the target is a shared object.</li><li>The OID is <b>NULL</b> if the locked object is a transaction.</li></ul> |
| relation      | oid      | <b>oid</b> in <a href="#">PG_CLASS</a>    | OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.                                                                                              |
| page          | integer  | -                                         | Page number targeted by the lock within the relationship ( <b>NULL</b> if the object is not a relation page or row page).                                                                                                          |
| tuple         | smallint | -                                         | Row number targeted by the lock within the page ( <b>NULL</b> if the object is not a row).                                                                                                                                         |
| bucket        | integer  | -                                         | Bucket number corresponding to the child table. The value is <b>NULL</b> if the target is not a table.                                                                                                                             |
| virtualxid    | text     | -                                         | ID of the virtual transaction. The value is <b>NULL</b> if the object is not a virtual transaction.                                                                                                                                |
| transactionid | xid      | -                                         | ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.                                                                                                                        |

| Name                | Type     | Reference                     | Description                                                                                                                                                               |
|---------------------|----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| classid             | oid      | <b>oid</b> in <b>PG_CLASS</b> | OID of the system catalog that contains the object ( <b>NULL</b> if the object is not a general database object).                                                         |
| objid               | oid      | -                             | OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.                                              |
| objsubid            | smallint | -                             | Column number for a column in the table ( <b>0</b> if the object is of other object type and <b>NULL</b> if the object is not a general database object).                 |
| virtualtrans action | text     | -                             | ID of the virtual transaction holding or awaiting this lock.                                                                                                              |
| pid                 | bigint   | -                             | ID of the server logic thread that holds or waits for the lock. ( <b>NULL</b> if the lock is held by a prepared transaction)                                              |
| sessionid           | bigint   | -                             | ID of the session that holds or waits for the lock.                                                                                                                       |
| mode                | text     | -                             | Lock mode held or desired by this thread.                                                                                                                                 |
| granted             | boolean  | -                             | <ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul> |
| fastpath            | boolean  | -                             | The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.                      |
| locktag             | text     | -                             | Lock information that the session waits for. It can be parsed using the locktag_decode() function.                                                                        |
| global_sessionid    | text     | -                             | Global session ID.                                                                                                                                                        |

### 12.3.126 PG\_NODE\_ENV

PG\_NODE\_ENV displays the environment variable information of the current node.

**Table 12-215** PG\_NODE\_ENV columns

| Name          | Type    | Description                         |
|---------------|---------|-------------------------------------|
| node_name     | text    | Current node name.                  |
| host          | text    | Host name of the node.              |
| process       | integer | Number of the node process.         |
| port          | integer | Port ID of the node.                |
| installpath   | text    | Installation directory of the node. |
| datapath      | text    | Data directory of the node.         |
| log_directory | text    | Log directory of the node.          |

## 12.3.127 PG\_OS\_THREADS

**PG\_OS\_THREADS** provides status information about all the threads under the current node.

**Table 12-216** PG\_OS\_THREADS columns

| Name          | Type                     | Description                                              |
|---------------|--------------------------|----------------------------------------------------------|
| node_name     | text                     | Current node name                                        |
| pid           | bigint                   | PID of the thread running under the current node process |
| lwpid         | integer                  | Lightweight thread ID corresponding to the PID           |
| thread_name   | text                     | Thread name corresponding to the PID                     |
| creation_time | timestamp with time zone | Thread creation time corresponding to the PID            |

## 12.3.128 PG\_PREPARED\_STATEMENTS

**PG\_PREPARED\_STATEMENTS** displays information about all prepared statements that are available in the current session.

**Table 12-217** PG\_PREPARED\_STATEMENTS columns

| Name | Type | Description                           |
|------|------|---------------------------------------|
| name | text | Identifier of the prepared statement. |

| Name            | Type                     | Description                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statement       | text                     | Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement committed by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself. |
| prepare_time    | timestamp with time zone | Timestamp when the prepared statement is created.                                                                                                                                                                                                                                |
| parameter_types | regtype[]                | Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to an OID value.                                                        |
| from_sql        | boolean                  | <ul style="list-style-type: none"><li>• <b>True</b> if the prepared statement was created through the PREPARE statement</li><li>• <b>False</b> if the statement was prepared through the frontend/backend protocol</li></ul>                                                     |

## 12.3.129 PG\_PREPARED\_XACTS

PG\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit.

**Table 12-218** PG\_PREPARED\_XACTS columns

| Name        | Type                     | Reference                            | Description                                          |
|-------------|--------------------------|--------------------------------------|------------------------------------------------------|
| transaction | xid                      | -                                    | Numeric identifier of the prepared transaction.      |
| gid         | text                     | -                                    | Global identifier of the prepared transaction.       |
| prepared    | timestamp with time zone | -                                    | Time at which the transaction is prepared for commit |
| owner       | name                     | <b>rolname</b> in <b>PG_AUTHID</b>   | Name of the user who executes the transaction.       |
| database    | name                     | <b>datname</b> in <b>PG_DATABASE</b> | Name of the database that executes the transaction.  |

## 12.3.130 PG\_REPLICATION\_ORIGIN\_STATUS

PG\_REPLICATION\_ORIGIN\_STATUS displays the replication status of the replication source.

**Table 12-219** PG\_REPLICATION\_ORIGIN\_STATUS columns

| Name        | Type | Description                           |
|-------------|------|---------------------------------------|
| local_id    | oid  | Replication source ID.                |
| external_id | text | Name of the replication source.       |
| remote_lsn  | text | Remote LSN of the replication source. |
| local_lsn   | text | Local LSN of the replication source.  |

## 12.3.131 PG\_REPLICATION\_SLOTS

PG\_REPLICATION\_SLOTS displays replication slot information.

**Table 12-220** PG\_REPLICATION\_SLOTS columns

| Name      | Type    | Description                                                                                                                                                              |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| slot_name | text    | Replication slot name.                                                                                                                                                   |
| plugin    | text    | Name of the output plug-in corresponding to the logical replication slot.                                                                                                |
| slot_type | text    | Replication slot type. <ul style="list-style-type: none"><li>• <b>physical</b>: physical replication slot.</li><li>• <b>logical</b>: logical replication slot.</li></ul> |
| datoid    | oid     | OID of the database where the replication slot resides.                                                                                                                  |
| database  | name    | Name of the database where the replication slot resides.                                                                                                                 |
| active    | Boolean | Determines whether the replication slot is activated. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>            |
| xmin      | xid     | XID of the earliest transaction that the database must reserve for the replication slot.                                                                                 |

| Name            | Type    | Description                                                                                                              |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------|
| catalog_xmin    | xid     | XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot. |
| restart_lsn     | text    | Physical location of the earliest Xlog required by the replication slot.                                                 |
| dummy_standby   | Boolean | Not supported in the current version.                                                                                    |
| confirmed_flush | text    | Dedicated logical replication slot. The client confirms the location of the received log.                                |

## 12.3.132 PG\_RLSPOLICIES

PG\_RLSPOLICIES displays information about row-level security policies. The initial user and users with the SYSADMIN attribute can view all policy information. Other users can view only the policy information in their own tables.

**Table 12-221** PG\_RLSPOLICIES columns

| Name             | Type   | Description                                                                                                                                                                                                                                                                                                         |
|------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemaname       | name   | Name of the schema of the table object to which a row-level security policy is applied.                                                                                                                                                                                                                             |
| tablename        | name   | Name of the table object to which the row-level security policy is applied.                                                                                                                                                                                                                                         |
| polycyname       | name   | Name of a row-level security policy.                                                                                                                                                                                                                                                                                |
| policypermissive | text   | Expression concatenation mode of a row-level security policy. Value range: <ul style="list-style-type: none"><li>● <b>PERMISSIVE</b>: permissive policy, which is concatenated using the OR expression.</li><li>● <b>RESTRICTIVE</b>: restrictive policy, which is concatenated using the AND expression.</li></ul> |
| policyroles      | name[] | List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.                                                                                                                                                                                                |
| polycycmd        | text   | SQL operations affected by a row-level security policy.                                                                                                                                                                                                                                                             |
| policyqual       | text   | Expression of a row-level security policy.                                                                                                                                                                                                                                                                          |

## 12.3.133 PG\_ROLES

PG\_ROLES displays information about database roles. The initial user and users with the SYSADMIN or CREATEROLE attribute can view information about all roles. Other users can view only their own information.

**Table 12-222** PG\_ROLES columns

| Name          | Type    | Reference | Description                                                                                                                                                                                                                                                                                                      |
|---------------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rolname       | name    | N/A       | Role name.                                                                                                                                                                                                                                                                                                       |
| rolsuper      | boolean | N/A       | Specifies whether the role is the initial SYSADMIN with the highest permissions. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                         |
| rolinherit    | boolean | N/A       | Specifies whether the role inherits the permissions for this type of roles. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                              |
| rolcreatorole | boolean | N/A       | Specifies whether the role can create other roles. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                       |
| rolcreatedb   | boolean | N/A       | Specifies whether the role can create databases. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                         |
| rolcatupdate  | boolean | N/A       | Specifies whether the role can update system catalogs directly. Only the initial SYSADMIN whose <b>usesysid</b> is set to <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul> |
| rolcanlogin   | boolean | N/A       | Specifies whether the role can log in to the database. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                                                                                                   |

| Name           | Type                     | Reference                                     | Description                                                                                                                                                 |

## 12.3.134 PG\_RULES

PG\_RULES is used to query useful information about rewriting rules.

**Table 12-223** PG\_RULES columns

| Name       | Type | Description                                  |
|------------|------|----------------------------------------------|
| schemaname | name | Name of the schema that contains a table.    |
| tablename  | name | Name of the table to which the rule applies. |

| Name       | Type | Description                                              |
|------------|------|----------------------------------------------------------|
| rulename   | name | Name of a rule.                                          |
| definition | text | Rule definition (reconstructed by the CREATE statement). |

### 12.3.135 PG\_RUNNING\_XACTS

PG\_RUNNING\_XACTS displays the running transaction information on the current node.

**Table 12-224** PG\_RUNNING\_XACTS columns

| Name        | Type    | Description                                                                                                                                                       |
|-------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| handle      | integer | Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .                                                          |
| gxid        | xid     | Transaction ID.                                                                                                                                                   |
| state       | tinyint | Transaction status. <ul style="list-style-type: none"><li>• <b>3</b>: prepared.</li><li>• <b>0</b>: starting.</li></ul>                                           |
| node        | text    | Node name.                                                                                                                                                        |
| xmin        | xid     | Minimum transaction ID on the node.                                                                                                                               |
| vacuum      | Boolean | Specifies whether the current transaction is lazy vacuum. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul> |
| timeline    | bigint  | Number of database restarts.                                                                                                                                      |
| prepare_xid | xid     | ID of the transaction in the prepared state; otherwise, the value is <b>0</b> .                                                                                   |
| pid         | bigint  | Thread ID corresponding to the transaction.                                                                                                                       |
| next_xid    | xid     | Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .                                                                          |

### 12.3.136 PG\_SECLABELS

PG\_SECLABELS provides information about security labels.

**Table 12-225** PG\_SECLABELS columns

| Name         | Type    | Reference                                      | Description                                                                                                                                                                               |
|--------------|---------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| objoid       | oid     | Any OID column                                 | OID of the object that this security label pertains to.                                                                                                                                   |
| classoid     | oid     | <b>oid</b> in <a href="#">PG_CLASS</a>         | OID of the system catalog where the object to which the security label belongs is located.                                                                                                |
| objsubid     | integer | -                                              | Column number for the security label on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself). The value is <b>0</b> for all other object types.                  |
| objtype      | text    | -                                              | Type of the object to which the label belongs, in text format. Example: <ul style="list-style-type: none"><li>• <b>table</b>: table type.</li><li>• <b>column</b>: column type.</li></ul> |
| objnamespace | oid     | <b>oid</b> in <a href="#">PG_NAMESPACE</a>     | OID of the namespace for the object, if applicable; otherwise, <b>NULL</b> .                                                                                                              |
| objname      | text    | -                                              | Name of the object to which the label belongs, in text format.                                                                                                                            |
| provider     | text    | <b>provider</b> in <a href="#">PG_SECLABEL</a> | Provider of the label.                                                                                                                                                                    |
| label        | text    | <b>label</b> in <a href="#">PG_SECLABEL</a>    | Security label name.                                                                                                                                                                      |

## 12.3.137 PG\_SETTINGS

PG\_SETTINGS displays information about parameters of the running database.

**Table 12-226** PG\_SETTINGS columns

| Name     | Type | Description                     |
|----------|------|---------------------------------|
| name     | text | Parameter name.                 |
| setting  | text | Current parameter value.        |
| unit     | text | Unit of the parameter.          |
| category | text | Logical group of the parameter. |

| Name       | Type    | Description                                                                                                                                                                       |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| short_desc | text    | Brief description of the parameter.                                                                                                                                               |
| extra_desc | text    | Detailed description of the parameter.                                                                                                                                            |
| context    | text    | Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> .                |
| vartype    | text    | Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b> .                                                                           |
| source     | text    | Method of assigning the parameter value.                                                                                                                                          |
| min_val    | text    | Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                                   |
| max_val    | text    | Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                                   |
| enumvals   | text[]  | Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .                                                              |
| boot_val   | text    | Default parameter value used upon the database startup.                                                                                                                           |
| reset_val  | text    | Default parameter value used upon the database reset.                                                                                                                             |
| sourcefile | text    | Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .                   |
| sourceline | integer | Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> . |

### 12.3.138 PG\_SHADOW

PG\_SHADOW displays the attributes of all roles marked with rolcanlogin in **PG\_AUTHID**. Only users with the SYSADMIN permission can access this system view.

The information in this view is basically the same as that of the view in **PG\_USER**. The difference is that passwords are sensitive and displayed as **\*\*\*\*\*** in the latter.

**Table 12-227** PG\_SHADOW columns

| Name        | Type                     | Reference                              | Description                                                                                                                                                                                                                     |
|-------------|--------------------------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username    | name                     | <b>rolname</b> in <b>PG_AUTHID</b>     | Username.                                                                                                                                                                                                                       |
| usesysid    | oid                      | <b>oid</b> in <b>PG_AUTHID</b>         | ID of this user.                                                                                                                                                                                                                |
| usecreatedb | boolean                  | -                                      | Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                       |
| usesuper    | boolean                  | -                                      | Specifies whether the user is a SYSADMIN. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                                                               |
| usecatupd   | boolean                  | -                                      | Specifies whether the user can update a view. Even the SYSADMIN cannot update the view unless this column is <b>t</b> . <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul> |
| userepl     | boolean                  | -                                      | Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                                               |
| passwd      | text                     | <b>rolpassword</b> in <b>PG_AUTHID</b> | Password ciphertext. <b>NULL</b> if no password.                                                                                                                                                                                |

## 12.3.139 PG\_STATS

PG\_STATS displays single-column statistics stored in the pg\_statistic table. The **autovacuum\_naptime** parameter specifies the interval for updating statistics recorded in the view.

**Table 12-228** PG\_STATS columns

| Name       | Type    | Reference                                      | Description                                                                              |
|------------|---------|------------------------------------------------|------------------------------------------------------------------------------------------|
| schemaname | name    | <b>nspname</b> in <a href="#">PG_NAMESPACE</a> | Name of the schema that the table is in.                                                 |
| tablename  | name    | <b>relname</b> in <a href="#">PG_CLASS</a>     | Table name.                                                                              |
| attname    | name    | <b>attname</b> in <a href="#">PG_ATTRIBUTE</a> | Column name.                                                                             |
| inherited  | boolean | -                                              | Table inheritance is not supported currently. The value of this column is <b>false</b> . |

| Name         | Type    | Reference | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| null_frac    | real    | -         | Percentage of column entries that are null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| avg_width    | integer | -         | Average width in bytes of column's entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| n_distinct   | real    | -         | <ul style="list-style-type: none"> <li>Estimated number of distinct values in the column if the value is greater than <b>0</b>.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by <b>-1</b> if the value is less than <b>0</b>. For example, <b>-1</b> indicates that the number of distinct values is the same as the number of rows for a column combination. <ol style="list-style-type: none"> <li>The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows.</li> <li>The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>The number of distinct values is unknown if the value is <b>0</b>.</li> </ul> |
| n_dndistinct | real    | -         | <p>Number of not-null distinct values in the <b>dn1</b> column.</p> <ul style="list-style-type: none"> <li>Exact number of distinct values if the value is greater than <b>0</b>.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by <b>-1</b> if the value is less than <b>0</b>. For example, if the value of a column appears twice in average, set <b>n_dndistinct</b> to <b>-0.5</b>.</li> <li>The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>                                                                                                                                                                                                                                                          |

| Name                   | Type     | Reference | Description                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| most_common_vals       | anyarray | -         | List of the most common values in a column. If this column does not have the most common value, the value is <b>NULL</b> .                                                                                                                                                                                                                                                   |
| most_common_freqs      | real[]   | -         | List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. The value is <b>NULL</b> if the value of <b>most_common_vals</b> is <b>NULL</b> .                                                                                                                     |
| histogram_bounds       | anyarray | -         | Frequency histogram consisting of values excluding null values and MCVs. If a value appears in the value of <b>most_common_vals</b> , it does not appear in the histogram. If the column data type does not have the < operator or the list specified by <b>most_common_vals</b> contains all values of the column, the histogram information of the column is <b>NULL</b> . |
| correlation            | real     | -         | Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from -1 to +1. When the value is close to -1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is <b>NULL</b> if the column data type does not have a < operator.           |
| most_common_elems      | anyarray | -         | A list of non-null element values most often appearing.                                                                                                                                                                                                                                                                                                                      |
| most_common_elem_freqs | real[]   | -         | List that records the frequency of the most commonly used non-null elements.                                                                                                                                                                                                                                                                                                 |
| elem_count_histogram   | real[]   | -         | A histogram of the counts of distinct non-null element values.                                                                                                                                                                                                                                                                                                               |

## 12.3.140 PG\_STAT\_ACTIVITY

PG\_STAT\_ACTIVITY shows information about the current user's queries. The columns save information about the last query.

**Table 12-229** PG\_STAT\_ACTIVITY columns

| Name             | Type                     | Description                                                                                                                                                                                                                           |
|------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid            | oid                      | OID of the database that the user session connects to in the backend.                                                                                                                                                                 |
| datname          | name                     | Name of the database that the user session connects to in the backend.                                                                                                                                                                |
| pid              | bigint                   | Backend thread ID.                                                                                                                                                                                                                    |
| sessionid        | bigint                   | Session ID.                                                                                                                                                                                                                           |
| usesysid         | oid                      | OID of the user logged in to the backend.                                                                                                                                                                                             |
| username         | name                     | Name of the user logged in to the backend.                                                                                                                                                                                            |
| application_name | text                     | Name of the application connected to the backend.                                                                                                                                                                                     |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>null</b> , it indicates either the client is connected through a Unix socket on the server or this is an internal process, such as AUTOVACUUM.                |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                                     |
| client_port      | integer                  | TCP port number that the client uses for communication with this backend ( <b>-1</b> if a Unix socket is used).                                                                                                                       |
| backend_start    | timestamp with time zone | Time when this session was started, that is, when the client connected to the server.                                                                                                                                                 |
| xact_start       | timestamp with time zone | Time when the current active transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column. |

| Name         | Type                     | Description                                                                                                                                                                                                                                                                                             |
|--------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query_start  | timestamp with time zone | Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure. |
| state_change | timestamp with time zone | Time when <b>state</b> was last modified.                                                                                                                                                                                                                                                               |
| waiting      | Boolean                  | Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> .                                                                                                                                                               |
| enqueue      | text                     | Unsupported currently.                                                                                                                                                                                                                                                                                  |

| Name          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state         | text   | <p>Overall status of the backend. The value must be one of the following:</p> <ul style="list-style-type: none"><li>• <b>active</b>: The backend is executing a query.</li><li>• <b>idle</b>: The backend is waiting for a new client command.</li><li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li><li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li><li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li><li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li></ul> <p><b>NOTE</b><br/>Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user omm in <b>pg_stat_activity</b> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pg_stat_activity;  datname   username   usesysid   state    pid -----+-----+-----+-----+-----  testdb   omm             10          139968752121616  testdb   omm             10          139968903116560  db_tpcc   judy       16398   active   139968391403280  testdb   omm             10          139968643069712  testdb   omm             10          139968680818448  testdb   joe        16390          139968563377936 (6 rows)</pre> |
| resource_pool | name   | Resource pool used by the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| query_id      | bigint | Query ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name            | Type   | Description                                                                                                                                                                       |
|-----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query           | text   | Latest query at the backend. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed. |
| connection_info | text   | A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database.                                           |
| unique_sql_id   | bigint | Unique SQL statement ID.                                                                                                                                                          |
| trace_id        | text   | Driver-specific trace ID, which is associated with an application request.                                                                                                        |

## 12.3.141 PG\_STAT\_ACTIVITY\_NG

PG\_STAT\_ACTIVITY\_NG displays information about all queries in the logical database instance of the current user.

**Table 12-230** PG\_STAT\_ACTIVITY\_NG columns

| Name             | Type   | Description                                                                                                                                                                                                            |
|------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid            | oid    | OID of the database that the user session connects to in the backend.                                                                                                                                                  |
| datname          | name   | Name of the database that the user session connects to in the backend.                                                                                                                                                 |
| pid              | bigint | Backend thread ID.                                                                                                                                                                                                     |
| sessionid        | bigint | Session ID.                                                                                                                                                                                                            |
| usesysid         | oid    | OID of the user logged in to the backend.                                                                                                                                                                              |
| username         | name   | Name of the user logged in to the backend.                                                                                                                                                                             |
| application_name | text   | Name of the application connected to the backend.                                                                                                                                                                      |
| client_addr      | inet   | IP address of the client connected to the backend. If this column is null, it indicates either that the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum. |

| Name            | Type                     | Description                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_hostname | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                                                                                          |
| client_port     | integer                  | TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used)                                                                                                                                                                                      |
| backend_start   | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                                                                                       |
| xact_start      | timestamp with time zone | Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.                                                                         |
| query_start     | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure. |
| state_change    | timestamp with time zone | Time when <b>state</b> was last modified.                                                                                                                                                                                                                                                  |
| waiting         | Boolean                  | Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> . Otherwise, the value is <b>false</b> .                                                                                                           |
| enqueue         | text                     | Queuing status of a statement. Possible values are: <ul style="list-style-type: none"> <li><b>waiting in queue</b>: The statement is in the queue.</li> <li><b>Empty</b>: The statement is running.</li> </ul>                                                                             |

| Name          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| query_id      | bigint | Query ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name       | Type | Description                                                                                                                                                                       |
|------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query      | text | Latest query at the backend. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed. |
| node_group | text | Logical database instance of the user to which the statement belongs.                                                                                                             |

### 12.3.142 PG\_STAT\_ALL\_INDEXES

PG\_STAT\_ALL\_INDEXES is used to query statistics about accesses to a specific index by querying each index row in the current database.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of several indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg\_stat\_all\_indexes.idx\_tup\_read** count(s) for the index(es) it uses, and it increments the **pg\_stat\_all\_tables.idx\_tup\_fetch** count for the table, but it does not affect **pg\_stat\_all\_indexes.idx\_tup\_fetch**.

**Table 12-231** PG\_STAT\_ALL\_INDEXES columns

| Name          | Type   | Description                                                              |
|---------------|--------|--------------------------------------------------------------------------|
| relid         | oid    | OID of the table that the index is created for.                          |
| indexrelid    | oid    | OID of the index.                                                        |
| schemaname    | name   | Name of the schema that the index is in.                                 |
| relname       | name   | Name of the table for the index.                                         |
| indexrelname  | name   | Index name.                                                              |
| idx_scan      | bigint | Number of index scans initiated on the index.                            |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index. |

## 12.3.143 PG\_STAT\_ALL\_TABLES

PG\_STAT\_ALL\_TABLES is used to query one row for each table in the current database (including TOAST tables), showing statistics about accesses to that specific table.

**Table 12-232** PG\_STAT\_ALL\_TABLES columns

| Name             | Type                     | Description                                                          |
|------------------|--------------------------|----------------------------------------------------------------------|
| relid            | oid                      | OID of a table.                                                      |
| schemaname       | name                     | Name of the schema that the table is in.                             |
| relname          | name                     | Table name.                                                          |
| seq_scan         | bigint                   | Number of sequential scans initiated on the table.                   |
| seq_tup_read     | bigint                   | Number of live rows fetched by sequential scans.                     |
| idx_scan         | bigint                   | Number of index scans initiated on the table.                        |
| idx_tup_fetch    | bigint                   | Number of live rows fetched by index scans.                          |
| n_tup_ins        | bigint                   | Number of rows inserted.                                             |
| n_tup_upd        | bigint                   | Number of rows updated.                                              |
| n_tup_del        | bigint                   | Number of rows deleted.                                              |
| n_tup_hot_upd    | bigint                   | Number of rows HOT updated (with no separate index update required). |
| n_live_tup       | bigint                   | Estimated number of live rows.                                       |
| n_dead_tup       | bigint                   | Estimated number of inactive rows.                                   |
| last_vacuum      | timestamp with time zone | Last time when the table was cleared.                                |
| last_autovacuum  | timestamp with time zone | Last time when the table was vacuumed by the AUTOVACUUM daemon.      |
| last_analyze     | timestamp with time zone | Last time when the table was analyzed.                               |
| last_autoanalyze | timestamp with time zone | Last time when the table was analyzed by the AUTOVACUUM daemon.      |

| Name              | Type                     | Description                                                                                                                                                              |
|-------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vacuum_count      | bigint                   | Number of times the table is cleared.                                                                                                                                    |
| autovacuum_count  | bigint                   | Number of times the table has been vacuumed by the autovacuum daemon.                                                                                                    |
| analyze_count     | bigint                   | Number of times the table is analyzed.                                                                                                                                   |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon.                                                                                                    |
| last_data_changed | timestamp with time zone | Last time at which the table was updated (by INSERT/UPDATE/DELETE or EXCHANGE/TRUNCATE/DROP PARTITION). This column is recorded only on the local primary database node. |

### 12.3.144 PG\_STAT\_BAD\_BLOCK

PG\_STAT\_BAD\_BLOCK shows statistics about Page or CU verification failures after a node is started.

**Table 12-233** PG\_STAT\_BAD\_BLOCK columns

| Name         | Type     | Description                                                                                                                                                                    |
|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodename     | text     | Node name.                                                                                                                                                                     |
| databaseid   | integer  | OID of a database.                                                                                                                                                             |
| tablespaceid | integer  | Tablespace OID.                                                                                                                                                                |
| relfilenode  | integer  | File object ID.                                                                                                                                                                |
| bucketid     | smallint | ID of the bucket for consistent hashing.                                                                                                                                       |
| forknum      | integer  | File type. The values are as follows: <ul style="list-style-type: none"><li>• 0: main data file.</li><li>• 1: FSM file.</li><li>• 2: VM file.</li><li>• 3: BCM file.</li></ul> |
| error_count  | integer  | Number of verification failures.                                                                                                                                               |

| Name       | Type                     | Description                              |
|------------|--------------------------|------------------------------------------|
| first_time | timestamp with time zone | Time of the first verification failure.  |
| last_time  | timestamp with time zone | Time of the latest verification failure. |

## 12.3.145 PG\_STAT\_BGWRITER

PG\_STAT\_BGWRITER displays statistics about the activity of the background writer process.

**Table 12-234** PG\_STAT\_BGWRITER columns

| Name                  | Type             | Description                                                                                                |
|-----------------------|------------------|------------------------------------------------------------------------------------------------------------|
| checkpoints_timed     | bigint           | Number of scheduled checkpoints that have been performed.                                                  |
| checkpoints_req       | bigint           | Number of checkpoints that have been performed actively.                                                   |
| checkpoint_write_time | double precision | Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.         |
| checkpoint_sync_time  | double precision | Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.   |
| buffers_checkpoint    | bigint           | Number of buffers written by checkpoints.                                                                  |
| buffers_clean         | bigint           | Number of buffers written by the background writer process.                                                |
| maxwritten_clean      | bigint           | Number of times that cleanup scanning stops because the background writer process writes too many buffers. |
| buffers_backend       | bigint           | Number of buffers written directly by the backend.                                                         |

| Name                  | Type                     | Description                                                                                                                                                   |
|-----------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffers_backend_fsync | bigint                   | Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again). |
| buffers_alloc         | bigint                   | Number of buffers allocated.                                                                                                                                  |
| stats_reset           | timestamp with time zone | Time when these statistics were last reset.                                                                                                                   |

## 12.3.146 PG\_STAT\_DATABASE

PG\_STAT\_DATABASE contains database statistics for each database in GaussDB.

**Table 12-235** PG\_STAT\_DATABASE columns

| Name          | Type    | Description                                                                                                                                                                                                                             |
|---------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid         | oid     | OID of a database                                                                                                                                                                                                                       |
| datname       | name    | Database name.                                                                                                                                                                                                                          |
| numbackends   | integer | Number of backends currently connected to this database. This is the only column in the view that returns the status value. Other columns return the accumulated value since the last reset.                                            |
| xact_commit   | bigint  | Number of transactions in this database that have been committed.                                                                                                                                                                       |
| xact_rollback | bigint  | Number of transactions in this database that have been rolled back.                                                                                                                                                                     |
| blks_read     | bigint  | Number of disk blocks read in this database.                                                                                                                                                                                            |
| blks_hit      | bigint  | Number of times that disk blocks have been found in the buffer cache and therefore the disk blocks do not need to be read (only those found in the buffer cache are counted, excluding those found in the file system cache of the OS). |
| tup_returned  | bigint  | Number of rows returned by queries in this database                                                                                                                                                                                     |
| tup_fetched   | bigint  | Number of rows fetched by queries in this database                                                                                                                                                                                      |

| Name           | Type                     | Description                                                                                                                                                                                                                          |
|----------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tup_inserted   | bigint                   | Number of rows inserted by queries in this database                                                                                                                                                                                  |
| tup_updated    | bigint                   | Number of rows updated by queries in this database                                                                                                                                                                                   |
| tup_deleted    | bigint                   | Number of rows deleted by queries in this database                                                                                                                                                                                   |
| conflicts      | bigint                   | Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">PG_STAT_DATABASE_CONFLICTS</a> .                                                          |
| temp_files     | bigint                   | Number of temporary files created by queries in this database. Calculates all temporary files, regardless of why the temporary files are created (such as sorting or hashing) or the setting of the <b>log_temp_files</b> parameter. |
| temp_bytes     | bigint                   | Total amount of data written to temporary files by queries in this database. All temporary files are calculated regardless of why they are created or the setting of the <b>log_temp_files</b> parameter.                            |
| deadlocks      | bigint                   | Number of all deadlocks detected in the database since the last reset of statistics.                                                                                                                                                 |
| blk_read_time  | double precision         | Time spent in reading data file blocks by backends in this database (unit: ms).                                                                                                                                                      |
| blk_write_time | double precision         | Time spent in writing data file blocks by backends in this database (unit: ms).                                                                                                                                                      |
| stats_reset    | timestamp with time zone | Time when the status statistics are reset.                                                                                                                                                                                           |

## 12.3.147 PG\_STAT\_DATABASE\_CONFLICTS

**PG\_STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts.

**Table 12-236** PG\_STAT\_DATABASE\_CONFLICTS columns

| Name  | Type | Description |
|-------|------|-------------|
| datid | oid  | Database ID |

| Name             | Type   | Description                       |
|------------------|--------|-----------------------------------|
| datname          | name   | Database name                     |
| confl_tablespace | bigint | Number of conflicting tablespaces |
| confl_lock       | bigint | Number of conflicting locks       |
| confl_snapshot   | bigint | Number conflicting snapshots      |
| confl_bufferpin  | bigint | Number of conflicting buffers     |
| confl_deadlock   | bigint | Number of conflicting deadlocks   |

## 12.3.148 PG\_STAT\_USER\_FUNCTIONS

**PG\_STAT\_USER\_FUNCTIONS** shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

**Table 12-237** PG\_STAT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                                     |
|------------|------------------|---------------------------------------------------------------------------------|
| funcid     | oid              | OID of a function                                                               |
| schemaname | name             | Schema name                                                                     |
| funcname   | name             | Function name                                                                   |
| calls      | bigint           | Number of times the function has been called                                    |
| total_time | double precision | Total time spent in the function and all other functions called by it           |
| self_time  | double precision | Total time spent in the function itself, excluding other functions called by it |

## 12.3.149 PG\_STAT\_USER\_INDEXES

**PG\_STAT\_USER\_INDEXES** displays information about the index status of user-defined ordinary tables and TOAST tables.

**Table 12-238** PG\_STAT\_USER\_INDEXES columns

| Name       | Type | Description                    |
|------------|------|--------------------------------|
| relid      | oid  | OID of the table for an index. |
| indexrelid | oid  | OID of the index.              |

| Name          | Type   | Description                                                                                         |
|---------------|--------|-----------------------------------------------------------------------------------------------------|
| schemaname    | name   | Name of the schema that the index is in.                                                            |
| relname       | name   | Name of the table for the index.                                                                    |
| indexrelname  | name   | Index name.                                                                                         |
| idx_scan      | bigint | Number of index scans initiated on the index.                                                       |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index.                                             |
| idx_tup_fetch | bigint | Number of live table rows fetched in the original table by a simple index scan that uses the index. |

## 12.3.150 PG\_STAT\_USER\_TABLES

PG\_STAT\_USER\_TABLES displays status information about user-defined ordinary tables and TOAST tables in the namespaces.

**Table 12-239** PG\_STAT\_USER\_TABLES columns

| Name          | Type   | Description                                                          |
|---------------|--------|----------------------------------------------------------------------|
| relid         | oid    | OID of a table.                                                      |
| schemaname    | name   | Name of the schema that this table is in.                            |
| relname       | name   | Table name.                                                          |
| seq_scan      | bigint | Number of sequential scans initiated on this table.                  |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.                     |
| idx_scan      | bigint | Number of index scans initiated on this table.                       |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.                          |
| n_tup_ins     | bigint | Number of rows inserted.                                             |
| n_tup_upd     | bigint | Number of rows updated.                                              |
| n_tup_del     | bigint | Number of rows deleted.                                              |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required). |

| Name              | Type                     | Description                                                                               |
|-------------------|--------------------------|-------------------------------------------------------------------------------------------|
| n_live_tup        | bigint                   | Estimated number of live rows.                                                            |
| n_dead_tup        | bigint                   | Estimated number of inactive rows.                                                        |
| last_vacuum       | timestamp with time zone | Last time when this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).          |
| last_autovacuum   | timestamp with time zone | Last time when the table was vacuumed by the AUTOVACUUM daemon.                           |
| last_analyze      | timestamp with time zone | Last time when the table was manually analyzed.                                           |
| last_autoanalyze  | timestamp with time zone | Last time when the table was analyzed by the AUTOVACUUM daemon.                           |
| vacuum_count      | bigint                   | Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> ). |
| autovacuum_count  | bigint                   | Number of times this table has been vacuumed by the autovacuum daemon.                    |
| analyze_count     | bigint                   | Number of times this table has been manually analyzed.                                    |
| autoanalyze_count | bigint                   | Number of times this table has been analyzed by the autovacuum daemon.                    |
| last_data_changed | timestamp with time zone | Last modification time of the table data.                                                 |

## 12.3.151 PG\_STAT\_REPLICATION

PG\_STAT\_REPLICATION displays information about log synchronization status, such as the locations of the sender sending logs and the receiver receiving logs.

**Table 12-240** PG\_STAT\_REPLICATION columns

| Name     | Type   | Description        |
|----------|--------|--------------------|
| pid      | bigint | PID of the thread. |
| usesysid | oid    | User system ID.    |
| username | name   | Username.          |

| Name                     | Type                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application_name         | text                     | Program name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| client_addr              | inet                     | Client address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| client_hostname          | text                     | Client name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| client_port              | integer                  | Port of the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| backend_start            | timestamp with time zone | Start time of the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| state                    | text                     | Status of the log synchronization thread: <ul style="list-style-type: none"><li>• <b>startup</b>: The thread is being started.</li><li>• <b>catchup</b>: The thread is establishing a connection between the standby node and the primary node.</li><li>• <b>streaming</b>: The thread has established a connection between the standby node and the primary node and is replicating data streams.</li><li>• <b>backup</b>: The thread is sending a backup.</li><li>• <b>stopping</b>: The thread is being stopped.</li></ul> |
| sender_sent_location     | text                     | Location where the sender sends logs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| receiver_write_location  | text                     | Location where the receiver writes logs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| receiver_flush_location  | text                     | Location where the receive end flushes logs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| receiver_replay_location | text                     | Location where the receive end replays logs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| sync_priority            | integer                  | Priority of synchronous duplication ( <b>0</b> indicates asynchronization).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Name       | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sync_state | text | <p>Synchronization state:</p> <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous replication.</li><li>• <b>sync</b>: synchronous replication.</li><li>• <b>potential</b>: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous.</li><li>• <b>quorum</b>: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby nodes. Generally, the number of synchronous standby nodes is <math>(n+1)/2-1</math>, where <math>n</math> indicates the total number of copies. Whether the standby node is synchronous depends on whether logs are received first. For details, see the description of the <b>synchronous_standby_names</b> parameter.</li></ul> |

### 12.3.152 PG\_STAT\_SYS\_INDEXES

PG\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in pg\_catalog and information\_schema.

**Table 12-241** PG\_STAT\_SYS\_INDEXES columns

| Name          | Type   | Description                                                                                         |
|---------------|--------|-----------------------------------------------------------------------------------------------------|
| relid         | oid    | OID of the table for this index.                                                                    |
| indexrelid    | oid    | OID of the index.                                                                                   |
| schemaname    | name   | Name of the schema that the index is in.                                                            |
| relname       | name   | Name of the table for the index.                                                                    |
| indexrelname  | name   | Index name.                                                                                         |
| idx_scan      | bigint | Number of index scans initiated on the index.                                                       |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index.                                             |
| idx_tup_fetch | bigint | Number of live table rows fetched in the original table by a simple index scan that uses the index. |

### 12.3.153 PG\_STAT\_SYS\_TABLES

PG\_STAT\_SYS\_TABLES displays statistics about the system catalogs of all the namespaces in pg\_catalog and information\_schema.

**Table 12-242** PG\_STAT\_SYS\_TABLES columns

| Name          | Type   | Description                                        |
|---------------|--------|----------------------------------------------------|
| relid         | oid    | OID of a table.                                    |
| schemaname    | name   | Name of the schema that the table is in.           |
| relname       | name   | Table name.                                        |
| seq_scan      | bigint | Number of sequential scans initiated on the table. |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.   |
| idx_scan      | bigint | Number of index scans initiated on the table.      |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.        |
| n_tup_ins     | bigint | Number of rows inserted.                           |
| n_tup_upd     | bigint | Number of rows updated.                            |
| n_tup_del     | bigint | Number of rows deleted.                            |

| Name              | Type                     | Description                                                                      |
|-------------------|--------------------------|----------------------------------------------------------------------------------|
| n_tup_hot_upd     | bigint                   | Number of rows HOT updated (with no separate index update required).             |
| n_live_tup        | bigint                   | Estimated number of live rows.                                                   |
| n_dead_tup        | bigint                   | Estimated number of inactive rows.                                               |
| last_vacuum       | timestamp with time zone | Last time when this table was manually vacuumed (excluding VACUUM FULL).         |
| last_autovacuum   | timestamp with time zone | Last time when the table was vacuumed by the autovacuum daemon.                  |
| last_analyze      | timestamp with time zone | Last time when the table was manually analyzed.                                  |
| last_autoanalyze  | timestamp with time zone | Last time when the table was analyzed by the autovacuum daemon.                  |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting VACUUM FULL). |
| autovacuum_count  | bigint                   | Number of times the table has been vacuumed by the autovacuum daemon.            |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed.                            |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon.            |
| last_data_changed | timestamp with time zone | Last modification time of the table data.                                        |

### 12.3.154 PG\_STAT\_XACT\_ALL\_TABLES

**PG\_STAT\_XACT\_ALL\_TABLES** displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

**Table 12-243** PG\_STAT\_XACT\_ALL\_TABLES columns

| Name  | Type | Description      |
|-------|------|------------------|
| relid | oid  | OID of the table |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| schemaname    | name   | Name of the schema that the table is in                             |
| relname       | name   | Table name                                                          |
| seq_scan      | bigint | Number of sequential scans initiated on the table                   |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans                     |
| idx_scan      | bigint | Number of index scans initiated on the table                        |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans                          |
| n_tup_ins     | bigint | Number of rows inserted                                             |
| n_tup_upd     | bigint | Number of rows updated                                              |
| n_tup_del     | bigint | Number of rows deleted                                              |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 12.3.155 PG\_STAT\_XACT\_SYS\_TABLES

**PG\_STAT\_XACT\_SYS\_TABLES** displays transaction status information of the system catalog in the namespace.

**Table 12-244** PG\_STAT\_XACT\_SYS\_TABLES columns

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| relid         | oid    | OID of the table                                                    |
| schemaname    | name   | Name of the schema that the table is in                             |
| relname       | name   | Table name                                                          |
| seq_scan      | bigint | Number of sequential scans initiated on the table                   |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans                     |
| idx_scan      | bigint | Number of index scans initiated on the table                        |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans                          |
| n_tup_ins     | bigint | Number of rows inserted                                             |
| n_tup_upd     | bigint | Number of rows updated                                              |
| n_tup_del     | bigint | Number of rows deleted                                              |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

## 12.3.156 PG\_STAT\_XACT\_USER\_FUNCTIONS

**PG\_STAT\_XACT\_USER\_FUNCTIONS** contains statistics on the execution of each function.

**Table 12-245** PG\_STAT\_XACT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                                     |
|------------|------------------|---------------------------------------------------------------------------------|
| funcid     | oid              | OID of a function                                                               |
| schemaname | name             | Schema name                                                                     |
| funcname   | name             | Function name                                                                   |
| calls      | bigint           | Number of times the function has been called                                    |
| total_time | double precision | Total time spent in the function and all other functions called by it           |
| self_time  | double precision | Total time spent in the function itself, excluding other functions called by it |

## 12.3.157 PG\_STAT\_XACT\_USER\_TABLES

**PG\_STAT\_XACT\_USER\_TABLES** displays transaction status information of the user table in the namespace.

**Table 12-246** PG\_STAT\_XACT\_USER\_TABLES columns

| Name          | Type   | Description                                       |
|---------------|--------|---------------------------------------------------|
| relid         | oid    | OID of the table                                  |
| schemaname    | name   | Name of the schema that the table is in           |
| relname       | name   | Table name                                        |
| seq_scan      | bigint | Number of sequential scans initiated on the table |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans   |
| idx_scan      | bigint | Number of index scans initiated on the table      |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans        |
| n_tup_ins     | bigint | Number of rows inserted                           |
| n_tup_upd     | bigint | Number of rows updated                            |
| n_tup_del     | bigint | Number of rows deleted                            |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

## 12.3.158 PG\_STATIO\_ALL\_INDEXES

PG\_STATIO\_ALL\_INDEXES is used to query information about one row for each index in the current database, showing statistics about I/O on that specific index.

**Table 12-247** PG\_STATIO\_ALL\_INDEXES columns

| Name          | Type   | Description                                      |
|---------------|--------|--------------------------------------------------|
| relid         | oid    | OID of the table for the index.                  |
| indexrelid    | oid    | OID of the index.                                |
| schemaname    | name   | Name of the schema that the index is in.         |
| relname       | name   | Name of the table that the index is created for. |
| indexrelname  | name   | Index name.                                      |
| idx_blks_read | bigint | Number of disk blocks read from the index.       |
| idx_blks_hit  | bigint | Number of cache hits in the index.               |

## 12.3.159 PG\_STATIO\_ALL\_SEQUENCES

PG\_STATIO\_ALL\_SEQUENCES displays the I/O statistics of each sequence in the current database.

**Table 12-248** PG\_STATIO\_ALL\_SEQUENCES columns

| Name       | Type   | Description                                   |
|------------|--------|-----------------------------------------------|
| relid      | oid    | OID of this sequence.                         |
| schemaname | name   | Name of the schema that this sequence is in.  |
| relname    | name   | Name of the sequence.                         |
| blks_read  | bigint | Number of disk blocks read from the sequence. |

| Name     | Type   | Description                            |
|----------|--------|----------------------------------------|
| blks_hit | bigint | Number of cache hits in this sequence. |

### 12.3.160 PG\_STATIO\_ALL\_TABLES

PG\_STATIO\_ALL\_TABLES is used to query I/O statistics of each table (including TOAST tables) in the current database.

**Table 12-249** PG\_STATIO\_ALL\_TABLES columns

| Name            | Type   | Description                                                                    |
|-----------------|--------|--------------------------------------------------------------------------------|
| relid           | oid    | OID of a table.                                                                |
| schemaname      | name   | Name of the schema that this table is in.                                      |
| relname         | name   | Table name.                                                                    |
| heap_blks_read  | bigint | Number of disk blocks read from this table.                                    |
| heap_blks_hit   | bigint | Number of cache hits in this table.                                            |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in this table.                     |
| idx_blks_hit    | bigint | Number of cache hits of all indexes in this table.                             |
| toast_blks_read | bigint | Number of disk blocks read from TOAST tables (if any) in the table.            |
| toast_blks_hit  | bigint | Number of cache hits (if any) in the TOAST table of this table.                |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table indexes (if any) in the table. |
| tidx_blks_hit   | bigint | Number of cache hits (if any) in the TOAST table indexes of this table.        |

### 12.3.161 PG\_STATIO\_SYS\_INDEXES

PG\_STATIO\_SYS\_INDEXES displays I/O status information about all system catalog indexes in the namespaces.

**Table 12-250** PG\_STATIO\_SYS\_INDEXES columns

| Name          | Type   | Description                                      |
|---------------|--------|--------------------------------------------------|
| relid         | oid    | OID of the table for the index.                  |
| indexrelid    | oid    | OID of the index.                                |
| schemaname    | name   | Name of the schema that the index is in.         |
| relname       | name   | Name of the table that the index is created for. |
| indexrelname  | name   | Index name.                                      |
| idx_blks_read | bigint | Number of disk blocks read from the index.       |
| idx_blks_hit  | bigint | Number of cache hits in the index.               |

## 12.3.162 PG\_STATIO\_SYS\_SEQUENCES

PG\_STATIO\_SYS\_SEQUENCES displays I/O status information about all the sequences in the namespaces.

**Table 12-251** PG\_STATIO\_SYS\_SEQUENCES columns

| Name       | Type   | Description                                    |
|------------|--------|------------------------------------------------|
| relid      | oid    | OID of this sequence.                          |
| schemaname | name   | Name of the schema that this sequence is in.   |
| relname    | name   | Name of this sequence.                         |
| blks_read  | bigint | Number of disk blocks read from this sequence. |
| blks_hit   | bigint | Number of cache hits in this sequence.         |

## 12.3.163 PG\_STATIO\_SYS\_TABLES

PG\_STATIO\_SYS\_TABLES shows I/O status information about all the system catalogs in the namespaces.

**Table 12-252** PG\_STATIO\_SYS\_TABLES columns

| Name  | Type | Description     |
|-------|------|-----------------|
| relid | oid  | OID of a table. |

| Name            | Type   | Description                                                                    |
|-----------------|--------|--------------------------------------------------------------------------------|
| schemaname      | name   | Name of the schema that this table is in.                                      |
| relname         | name   | Table name.                                                                    |
| heap_blks_read  | bigint | Number of disk blocks read from this table.                                    |
| heap_blks_hit   | bigint | Number of cache hits in this table.                                            |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in this table.                     |
| idx_blks_hit    | bigint | Number of cache hits of all indexes in this table.                             |
| toast_blks_read | bigint | Number of disk blocks read from TOAST tables (if any) in the table.            |
| toast_blks_hit  | bigint | Number of cache hits (if any) in the TOAST table of this table.                |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table indexes (if any) in the table. |
| tidx_blks_hit   | bigint | Number of cache hits (if any) in the TOAST table indexes of this table.        |

## 12.3.164 PG\_STATIO\_USER\_INDEXES

PG\_STATIO\_USER\_INDEXES displays I/O status information about all the user relationship table indexes in the namespaces.

**Table 12-253** PG\_STATIO\_USER\_INDEXES columns

| Name          | Type   | Description                                |
|---------------|--------|--------------------------------------------|
| relid         | oid    | OID of the table for the index.            |
| indexrelid    | oid    | OID of the index.                          |
| schemaname    | name   | Name of the schema that the index is in.   |
| relname       | name   | Name of the table for the index.           |
| indexrelname  | name   | Index name.                                |
| idx_blks_read | bigint | Number of disk blocks read from the index. |
| idx_blks_hit  | bigint | Number of cache hits in the index.         |

## 12.3.165 PG\_STATIO\_USER\_SEQUENCES

PG\_STATIO\_USER\_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespaces.

**Table 12-254** PG\_STATIO\_USER\_SEQUENCES columns

| Name       | Type   | Description                                   |
|------------|--------|-----------------------------------------------|
| relid      | oid    | OID of this sequence.                         |
| schemaname | name   | Name of the schema where the sequence is in.  |
| relname    | name   | Name of the sequence.                         |
| blks_read  | bigint | Number of disk blocks read from the sequence. |
| blks_hit   | bigint | Number of cache hits in this sequence.        |

## 12.3.166 PG\_STATIO\_USER\_TABLES

PG\_STATIO\_USER\_TABLES displays I/O status information about all the user relationship tables in the namespaces.

**Table 12-255** PG\_STATIO\_USER\_TABLES columns

| Name            | Type   | Description                                                                    |
|-----------------|--------|--------------------------------------------------------------------------------|
| relid           | oid    | OID of a table.                                                                |
| schemaname      | name   | Name of the schema that this table is in.                                      |
| relname         | name   | Table name.                                                                    |
| heap_blks_read  | bigint | Number of disk blocks read from this table.                                    |
| heap_blks_hit   | bigint | Number of cache hits in this table.                                            |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in this table.                     |
| idx_blks_hit    | bigint | Number of cache hits of all indexes in this table.                             |
| toast_blks_read | bigint | Number of disk blocks read from TOAST tables (if any) in the table.            |
| toast_blks_hit  | bigint | Number of cache hits (if any) in the TOAST table of this table.                |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table indexes (if any) in the table. |

| Name          | Type   | Description                                                             |
|---------------|--------|-------------------------------------------------------------------------|
| tidx_blks_hit | bigint | Number of cache hits (if any) in the TOAST table indexes of this table. |

## 12.3.167 PG\_TABLES

PG\_TABLES is used to query useful information about each table in a database.

**Table 12-256** PG\_TABLES columns

| Name         | Type                     | Reference                                                    | Description                                                                                                                               |
|--------------|--------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| schemaname   | name                     | <b>nspname</b> in <a href="#">PG_NAMESPACE</a>               | Name of the schema that contains a table.                                                                                                 |
| tablename    | name                     | <b>relname</b> in <a href="#">PG_CLASS</a>                   | Table name.                                                                                                                               |
| tableowner   | name                     | <b>pg_get_userbyid(reowner)</b> in <a href="#">PG_CLASS</a>  | Table owner.                                                                                                                              |
| tablespace   | name                     | <b>spcname</b> in <a href="#">PG_TABLESPACE</a>              | Tablespace that contains the table (default value: <b>NULL</b> ).                                                                         |
| hasindexes   | boolean                  | <b>relhasindex</b> in <a href="#">PG_CLASS</a>               | Specifies whether the table has (or recently had) an index. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> . |
| hasrules     | boolean                  | <b>relhasrules</b> in <a href="#">PG_CLASS</a>               | Specifies whether the table has rules. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .                      |
| hastriggers  | boolean                  | <b>RELHASTRIGGERS</b> in <a href="#">PG_CLASS</a>            | Specifies whether the table has triggers. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .                   |
| tablecreator | name                     | <b>pg_get_userbyid(creator)</b> in <a href="#">PG_OBJECT</a> | Table creator.                                                                                                                            |
| created      | timestamp with time zone | <b>ctime</b> in <a href="#">PG_OBJECT</a>                    | Time when the table is created.                                                                                                           |

| Name          | Type                     | Reference                                 | Description                                                 |
|---------------|--------------------------|-------------------------------------------|-------------------------------------------------------------|
| last_ddl_time | timestamp with time zone | <b>mtime</b> in <a href="#">PG_OBJECT</a> | Time when the last DDL operation is performed on the table. |

## 12.3.168 PG\_TDE\_INFO

PG\_TDE\_INFO displays encryption information of the entire database.

**Table 12-257** PG\_TDE\_INFO columns

| Name       | Type    | Description                                                                                                                                                                  |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_encrypt | Boolean | Encryption status of the database. <ul style="list-style-type: none"><li>• <b>f</b>: The database is not encrypted.</li><li>• <b>t</b>: The database is encrypted.</li></ul> |
| g_tde_algo | text    | Encryption algorithm. <ul style="list-style-type: none"><li>• <b>SM4-CTR-128</b></li><li>• <b>AES-CTR-128</b></li></ul>                                                      |
| remain     | text    | Reserved column.                                                                                                                                                             |

## 12.3.169 PG\_TIMEZONE\_ABBREVS

PG\_TIMEZONE\_ABBREVS displays information about all available time zones.

**Table 12-258** PG\_TIMEZONE\_ABBREVS columns

| Name       | Type     | Description                                                                                                                          |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| abbrev     | text     | Abbreviation of the time zone name.                                                                                                  |
| utc_offset | interval | Offset from UTC.                                                                                                                     |
| is_dst     | Boolean  | Specifies whether the DST is being used. If the DST is being used, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> . |

## 12.3.170 PG\_TIMEZONE\_NAMES

PG\_TIMEZONE\_NAMES displays all time zone names that can be recognized by SET TIMEZONE, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

**Table 12-259** PG\_TIMEZONE\_NAMES columns

| Name       | Type     | Description                                                                                                                          |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| name       | text     | Name of the time zone.                                                                                                               |
| abbrev     | text     | Abbreviation of the time zone name.                                                                                                  |
| utc_offset | interval | Offset from UTC.                                                                                                                     |
| is_dst     | boolean  | Specifies whether the DST is being used. If the DST is being used, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> . |

## 12.3.171 PG\_TOTAL\_MEMORY\_DETAIL

PG\_TOTAL\_MEMORY\_DETAIL displays memory usage of a node in the database.

**Table 12-260** PG\_TOTAL\_MEMORY\_DETAIL columns

| Name        | Type    | Description                                |
|-------------|---------|--------------------------------------------|
| nodename    | text    | Specifies the node name.                   |
| memorytype  | text    | Memory name                                |
| memorybytes | integer | Size of the used memory in the unit of MB. |

## 12.3.172 PG\_TOTAL\_USER\_RESOURCE\_INFO

PG\_TOTAL\_USER\_RESOURCE\_INFO displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**. I/O monitoring items are valid only when **enable\_logical\_io\_statistics** is set to **on**.

**Table 12-261** PG\_TOTAL\_USER\_RESOURCE\_INFO columns

| Name        | Type    | Description         |
|-------------|---------|---------------------|
| username    | name    | Username.           |
| used_memory | integer | Used memory, in MB. |

| Name              | Type             | Description                                                                                                                                                                                                                                               |
|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| total_memory      | integer          | Available memory, in MB. The value 0 indicates that the available memory is not limited and depends on the maximum memory available in the database.                                                                                                      |
| used_cpu          | double precision | Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.                                                                                                                       |
| total_cpu         | integer          | Total number of CPU cores of the Cgroup associated with the user on the node.                                                                                                                                                                             |
| used_space        | bigint           | Used permanent table storage space, in KB.                                                                                                                                                                                                                |
| total_space       | bigint           | Available permanent table storage space, in KB (-1 if the storage space is not limited).                                                                                                                                                                  |
| used_temp_space   | bigint           | Used temporary storage space, in KB.                                                                                                                                                                                                                      |
| total_temp_space  | bigint           | Total available temporary space, in KB (-1 if the temporary space is not limited).                                                                                                                                                                        |
| used_spill_space  | bigint           | Size of the used operator-level data flushing space, in KB.                                                                                                                                                                                               |
| total_spill_space | bigint           | Total size of the available operator-level data flushing space, in KB (-1 if the space is not limited).                                                                                                                                                   |
| read_kbytes       | bigint           | Primary database node: total bytes read by the user's complex jobs on all database nodes in the last 5 seconds, in KB.<br><br>Database node: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB.       |
| write_kbytes      | bigint           | Primary database node: total bytes written by the user's complex jobs on all database nodes in the last 5 seconds, in KB.<br><br>Database node: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB. |
| read_counts       | bigint           | Primary database node: total number of read times of the user's complex jobs on all database nodes in the last 5 seconds.<br><br>Database node: total number of read times of the user's complex jobs from the instance startup time to the current time. |

| Name         | Type             | Description                                                                                                                                                                                                                                             |
|--------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| write_counts | bigint           | Primary database node: total number of write times of the user's complex jobs on all database nodes in the last 5 seconds.<br>Database node: total number of write times of the user's complex jobs from the instance startup time to the current time. |
| read_speed   | double precision | Primary database node: average read rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s.<br>Database node: average read rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s.       |
| write_speed  | double precision | Primary database node: average write rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s.<br>Database node: average write rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s.     |

### 12.3.173 PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID

PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 12-262** PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID columns

| Name         | Type             | Description                                                                                                                                                    |
|--------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userid       | oid              | User ID.                                                                                                                                                       |
| used_memory  | integer          | Size of the memory being used, in MB.                                                                                                                          |
| total_memory | integer          | Available memory (unit: MB) The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database. |
| used_cpu     | double precision | Number of CPU cores in use.                                                                                                                                    |
| total_cpu    | integer          | Total number of CPU cores of the Cgroup associated with the user on the node.                                                                                  |
| used_space   | bigint           | Used storage space, in KB.                                                                                                                                     |
| total_space  | bigint           | Available storage space, in KB (-1 if the space is not limited).                                                                                               |

| Name              | Type             | Description                                                                        |
|-------------------|------------------|------------------------------------------------------------------------------------|
| used_temp_space   | bigint           | Used temporary storage space, in KB.                                               |
| total_temp_space  | bigint           | Total available temporary space, in KB (-1 if the temporary space is not limited). |
| used_spill_space  | bigint           | Used disk space for spilling, in KB.                                               |
| total_spill_space | bigint           | Total available disk space for spilling, in KB (-1 if the space is not limited).   |
| read_kbytes       | bigint           | Amount of data read from the disk, in KB.                                          |
| write_kbytes      | bigint           | Amount of data written to the disk, in KB.                                         |
| read_counts       | bigint           | Number of disk read times.                                                         |
| write_counts      | bigint           | Number of disk write times.                                                        |
| read_speed        | double precision | Disk read rate, in B/ms.                                                           |
| write_speed       | double precision | Disk write rate, in B/ms.                                                          |

### 12.3.174 PG\_USER

PG\_USER displays information about database users. By default, only the initial user and users with the SYSADMIN attribute can view the information. Other users can view the information only after being granted permissions.

**Table 12-263** PG\_USER columns

| Name        | Type    | Description                                                                                                                                                                              |
|-------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username    | name    | Username.                                                                                                                                                                                |
| usesysid    | oid     | ID of this user.                                                                                                                                                                         |
| usecreatedb | boolean | Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>                |
| usesuper    | boolean | Specifies whether the user is the initial SYSADMIN with the highest permissions. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul> |

| Name            | Type                     | Description                                                                                                                                                                                                                                                                                                         |
|-----------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| usecatupd       | boolean                  | Specifies whether the user can directly update system catalogs. Only the initial SYSADMIN whose <b>usesysid</b> is set to <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul> |
| userepl         | boolean                  | Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                |
| passwd          | text                     | Encrypted user password. The value is displayed as <b>*****</b> .                                                                                                                                                                                                                                                   |
| valbegin        | timestamp with time zone | Start time for account validity ( <b>NULL</b> if start time is not specified).                                                                                                                                                                                                                                      |
| valuntil        | timestamp with time zone | End time for account validity ( <b>NULL</b> if end time is not specified).                                                                                                                                                                                                                                          |
| respool         | name                     | Resource pool where the user is in.                                                                                                                                                                                                                                                                                 |
| parent          | oid                      | Parent user OID.                                                                                                                                                                                                                                                                                                    |
| spacelimit      | text                     | Storage space of the permanent table, in KB.                                                                                                                                                                                                                                                                        |
| useconfig       | text[]                   | Default value of runtime configuration items. For details, see <b>setconfig</b> in <a href="#">PG_DB_ROLE_SETTING</a> .                                                                                                                                                                                             |
| nodegroup       | name                     | Name of the logical database associated with the user. If the user does not manage the logical database, this column is left blank.                                                                                                                                                                                 |
| tempspacelimit  | text                     | Storage space of the temporary table, in KB.                                                                                                                                                                                                                                                                        |
| spillspacelimit | text                     | Operator disk flushing space, in KB.                                                                                                                                                                                                                                                                                |
| usemonitoradmin | Boolean                  | Specifies whether the user is a MONADMIN. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>                                                                                                                                                                |

| Name             | Type    | Description                                                                                                                                        |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| useoperatoradmin | Boolean | Specifies whether the user is an OPRADMIN. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul> |
| usepolicyadmin   | Boolean | Specifies whether the user is a POLADMIN. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>  |

### 12.3.175 PG\_USER\_MAPPINGS

PG\_USER\_MAPPINGS displays user mapping information.

This is essentially a publicly readable view of [PG\\_USER\\_MAPPING](#) that leaves out the options column if the user has no rights to use the system catalog and query the view. Common users must be authorized to access this view.

**Table 12-264** PG\_USER\_MAPPINGS columns

| Name      | Type   | Reference                                           | Description                                                                                                                                                            |
|-----------|--------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| umid      | oid    | <b>oid</b> in <a href="#">PG_USER_MAPPING</a>       | OID of the user mapping.                                                                                                                                               |
| srvid     | oid    | <b>oid</b> in <a href="#">PG_FOREIGN_SERVER</a>     | OID of the foreign server that contains the mapping.                                                                                                                   |
| srvname   | name   | <b>srvname</b> in <a href="#">PG_FOREIGN_SERVER</a> | Name of the foreign server.                                                                                                                                            |
| umuser    | oid    | <b>oid</b> in <a href="#">PG_AUTHID</a>             | OID of the local role being mapped ( <b>0</b> if the user mapping is public)                                                                                           |
| username  | name   | -                                                   | Name of the local user to be mapped.                                                                                                                                   |
| umoptions | text[] | -                                                   | User mapping specific options. If the current user is the owner of the foreign server, it is a string in the format of "keyword=value". Otherwise, it is <b>NULL</b> . |

### 12.3.176 PG\_VARIABLE\_INFO

PG\_VARIABLE\_INFO records information about transaction IDs and OIDs of the current node in the database.

**Table 12-265** PG\_VARIABLE\_INFO columns

| Name                         | Type | Description                                                                |
|------------------------------|------|----------------------------------------------------------------------------|
| node_name                    | text | Node name                                                                  |
| next_oid                     | oid  | OID generated next time for the node                                       |
| next_xid                     | xid  | Transaction ID generated next time for the node                            |
| oldest_xid                   | xid  | Oldest transaction ID on the node                                          |
| xid_vac_limit                | xid  | Critical point (transaction ID) that triggers forcible autovacuum          |
| oldest_xid_db                | oid  | OID of the database that has the minimum datafrozensxid on the node        |
| last_extend_cs<br>n_logpage  | xid  | Number of the last extended cslog page                                     |
| start_extend_cs<br>n_logpage | xid  | Number of the page from which cslog extending starts                       |
| next_commit_s<br>eqno        | xid  | CSN generated next time for the node                                       |
| latest_comple<br>ted_xid     | xid  | Latest transaction ID on the node after the transaction commit or rollback |
| startup_max_xi<br>d          | xid  | Last transaction ID before the node is powered off                         |

## 12.3.177 PG\_VIEWS

PG\_VIEWS displays useful information about each view in the database.

**Table 12-266** PG\_VIEWS columns

| Name       | Type | Reference                                      | Description            |
|------------|------|------------------------------------------------|------------------------|
| schemaname | name | <b>nspname</b> in <a href="#">PG_NAMESPACE</a> | Schema name of a view. |
| viewname   | name | <b>relname</b> in <a href="#">PG_CLASS</a>     | View name              |
| viewowner  | name | <b>Erolname</b> in <a href="#">PG_AUTHID</a>   | Owner of the view      |
| definition | text | -                                              | Definition of the view |

## 12.3.178 PGXC\_PREPARED\_XACTS

PGXC\_PREPARED\_XACTS displays two-phase transactions in the prepared phase. Only users with the SYSADMIN or MONADMIN permissions can access this view.

**Table 12-267** PGXC\_PREPARED\_XACTS columns

| Name               | Type | Description                                                                |
|--------------------|------|----------------------------------------------------------------------------|
| pgxc_prepared_xact | text | Displays the two-phase transaction currently in the <b>prepared</b> phase. |

## 12.3.179 PGXC\_THREAD\_WAIT\_STATUS

This view is not supported in centralized scenarios.

## 12.3.180 PLAN\_TABLE

PLAN\_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users.

**Table 12-268** PLAN\_TABLE columns

| Name         | Type           | Description                                                                                                                       |
|--------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| statement_id | varchar2(30)   | Query tag specified by a user.                                                                                                    |
| plan_id      | bigint         | Query ID.                                                                                                                         |
| id           | int            | ID of each operator in a generated plan.                                                                                          |
| operation    | varchar2(30)   | Operation description of an operator in a plan.                                                                                   |
| options      | varchar2(255)  | Operation option.                                                                                                                 |
| object_name  | name           | Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users. |
| object_type  | varchar2(30)   | Object type.                                                                                                                      |
| object_owner | name           | Schema to which the object belongs. It is defined by users.                                                                       |
| projection   | varchar2(4000) | Returned column information.                                                                                                      |
| cost         | float8         | Execution cost estimated by the optimizer for an operator.                                                                        |
| cardinality  | float8         | Number of rows estimated by the optimizer for an operator.                                                                        |

 NOTE

- A valid **object\_type** value consists of a relkind type defined in **PG\_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, **COMPOSITE TYPE**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE\_QUERY**).
- For RangeTableEntry (RTE), **object\_owner** is the object description used in the plan. Non-user-defined objects do not have **object\_owner**.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN\_TABLE** supports only **SELECT** and **DELETE** and does not support other DML operations.

## 12.3.181 SYS\_DUMMY

SYS\_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. This view is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-269** SYS\_DUMMY columns

| Name  | Type | Description                   |
|-------|------|-------------------------------|
| dummy | text | Expression calculation result |

# 13 Schemas

The following table describes the schemas supported in GaussDB.

**Table 13-1** Schemas supported in GaussDB

| Schema         | Description                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbe_perf       | Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and users with the MONADMIN permission can access views and functions in the dbe_perf schema by default.                                                                                         |
| dbe_pldebugger | Debugs PL/SQL functions and stored procedures.                                                                                                                                                                                                                                                                                   |
| snapshot       | Manages data related to WDR snapshots. By default, the initial user or users with the MONADMIN permission can access the data.                                                                                                                                                                                                   |
| sys            | Provides the system information view APIs.                                                                                                                                                                                                                                                                                       |
| pg_catalog     | Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.                                                                                                                                                                                                           |
| pg_toast       | Stores large objects (for internal use).                                                                                                                                                                                                                                                                                         |
| public         | Public schema, which is used to store public objects. If <b>search_path</b> is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema. |
| pkg_service    | Manages information about the package service.                                                                                                                                                                                                                                                                                   |
| pkg_util       | Manages information about the package tool.                                                                                                                                                                                                                                                                                      |
| dbe_raw        | Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.                                                                                                                                                                                                               |

| Schema               | Description                                                                                                                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbe_session          | Advanced function package dbe_session, which is used to set the value of a specified attribute and support user query and verification.                                                                                                                                         |
| dbe_lob              | Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).                                                                                                                                                                              |
| dbe_match            | Advanced function package dbe_match, which is used to compare character string similarity.                                                                                                                                                                                      |
| dbe_task             | Advanced function package dbe_task, which is used to schedule job tasks, including committing tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.                                   |
| dbe_sql              | Advanced function package dbe_sql, which is used to execute dynamic SQL statements and construct query and other commands during application running.                                                                                                                           |
| dbe_file             | Advanced function package <b>dbe_file</b> , which is used to read, copy, write, delete, and rename external database files.                                                                                                                                                     |
| dbe_output           | Advanced function package dbe_output, which is used to print output information.                                                                                                                                                                                                |
| dbe_random           | Advanced function package dbe_random, which is used to generate random seeds and random numbers.                                                                                                                                                                                |
| dbe_application_info | Advanced function package dbe_application_info, which is used for recording client information.                                                                                                                                                                                 |
| dbe_utility          | Advanced function package <b>dbe_utility</b> , which is used to call the debugging tool in a stored procedure, for example, to print error stacks.                                                                                                                              |
| dbe_scheduler        | Advanced function package <b>dbe_scheduler</b> , which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates. |
| information_schema   | Stores information about objects defined in the current database.                                                                                                                                                                                                               |
| dbe_pldeveloper      | Compiles and debugs user stored procedures.                                                                                                                                                                                                                                     |
| dbe_sql_util         | SQL O&M function, including the O&M API of SQL patches.                                                                                                                                                                                                                         |

## 13.1 Information Schema

An information schema named INFORMATION\_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including: constraint\_table\_usage, domain\_constraints, domain\_udt\_usage, domains, enabled\_roles, key\_column\_usage, parameters, referential\_constraints, applicable\_roles, administrable\_role\_authorizations, attributes, character\_sets, check\_constraint\_routine\_usage, check\_constraints, collations, collation\_character\_set\_applicability, column\_domain\_usage, column\_privileges, column\_udt\_usage, columns, constraint\_column\_usage, role\_column\_grants, routine\_privileges, role\_routine\_grants, routines, schemata, sequences, table\_constraints, table\_privileges, role\_table\_grants, tables, triggered\_update\_columns, triggers, udt\_privileges, role\_udt\_grants, usage\_privileges, role\_usage\_grants, user\_defined\_types, view\_column\_usage, view\_routine\_usage, view\_table\_usage, views, data\_type\_privileges, element\_types, column\_options, foreign\_data\_wrapper\_options, foreign\_data\_wrappers, foreign\_server\_options, foreign\_servers, foreign\_table\_options, foreign\_tables, user\_mapping\_options, user\_mappings, sql\_features, sql\_implementation\_info, sql\_languages, sql\_packages, sql\_parts, sql\_sizing, and sql\_sizing\_profiles.

The following sections display only the views that are not listed in the preceding description.

### 13.1.1 \_PG\_FOREIGN\_DATA\_WRAPPERS

**\_PG\_FOREIGN\_DATA\_WRAPPERS** displays information about a foreign-data wrapper. Only users with the SYSADMIN permission can query this view.

**Table 13-2** \_PG\_FOREIGN\_DATA\_WRAPPERS columns

| Name                         | Type                              | Description                                                                                       |
|------------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------|
| oid                          | oid                               | OID of the foreign data wrapper.                                                                  |
| fdwowner                     | oid                               | OID of the owner of the foreign data wrapper.                                                     |
| fdwoptions                   | text[]                            | Foreign-data wrapper specific option, expressed in a string in the format of <i>keyword=value</i> |
| foreign_data_wrapper_catalog | information_schema.sql_identifier | Name of the database where the foreign-data wrapper is located (always the current database)      |

|                               |                                   |                                                  |
|-------------------------------|-----------------------------------|--------------------------------------------------|
| foreign_data_wrapper_name     | information_schema.sql_identifier | Name of the foreign-data wrapper                 |
| authorization_identifier      | information_schema.sql_identifier | Role of the owner of the foreign-data wrapper    |
| foreign_data_wrapper_language | information_schema.character_data | Programming language of the foreign-data wrapper |

## 13.1.2 \_PG\_FOREIGN\_SERVERS

**\_PG\_FOREIGN\_SERVERS** displays information about a foreign server. Only users with the SYSADMIN permission can query this view.

**Table 13-3** \_PG\_FOREIGN\_SERVERS columns

| Name                         | Type                              | Description                                                                                  |
|------------------------------|-----------------------------------|----------------------------------------------------------------------------------------------|
| oid                          | oid                               | OID of the foreign server.                                                                   |
| srvoptions                   | text[]                            | Foreign server specific options, expressed in a string in the format of <i>keyword=value</i> |
| foreign_server_catalog       | information_schema.sql_identifier | Name of the database where the foreign server is located (always the current database)       |
| foreign_server_name          | information_schema.sql_identifier | Name of the foreign server                                                                   |
| foreign_data_wrapper_catalog | information_schema.sql_identifier | Name of the database where the foreign-data wrapper is located (always the current database) |
| foreign_data_wrapper_name    | information_schema.sql_identifier | Name of the foreign-data wrapper                                                             |
| foreign_server_type          | information_schema.character_data | Type of the foreign server                                                                   |
| foreign_server_version       | information_schema.character_data | Version of the foreign server                                                                |
| authorization_identifier     | information_schema.sql_identifier | Role of the owner of the foreign server                                                      |

### 13.1.3 \_PG\_FOREIGN\_TABLE\_COLUMNS

**\_PG\_FOREIGN\_TABLE\_COLUMNS** displays column information about a foreign table. Only users with the SYSADMIN permission can query this view.

**Table 13-4** \_PG\_FOREIGN\_TABLE\_COLUMNS columns

| Name          | Type   | Description                                                                                               |
|---------------|--------|-----------------------------------------------------------------------------------------------------------|
| nspname       | name   | Schema name                                                                                               |
| relname       | name   | Table name                                                                                                |
| attname       | name   | Column name                                                                                               |
| attfdwoptions | text[] | Attribute-level foreign data wrapper options, expressed in a string in the format of <i>keyword=value</i> |

### 13.1.4 \_PG\_FOREIGN\_TABLES

**\_PG\_FOREIGN\_TABLES** stores information about all foreign tables defined in the current database, but it only displays the tables that the current user has access to. Only users with the SYSADMIN permission can query this view.

**Table 13-5** \_PG\_FOREIGN\_TABLES columns

| Name                     | Type                              | Description                                                                            |
|--------------------------|-----------------------------------|----------------------------------------------------------------------------------------|
| foreign_table_catalog    | information_schema.sql_identifier | Name of the database where the foreign table is located (always the current database)  |
| foreign_table_schema     | name                              | Name of the schema that the foreign table is in                                        |
| foreign_table_name       | name                              | Name of the foreign table                                                              |
| ftoptions                | text[]                            | Foreign table options                                                                  |
| foreign_server_catalog   | information_schema.sql_identifier | Name of the database where the foreign server is located (always the current database) |
| foreign_server_name      | information_schema.sql_identifier | Name of the foreign server                                                             |
| authorization_identifier | information_schema.sql_identifier | Role of the owner                                                                      |

### 13.1.5 \_PG\_USER\_MAPPINGS

Stores mappings from local users to remote users. Only users with the SYSADMIN permission can query this view.

**Table 13-6** \_PG\_USER\_MAPPINGS columns

| Name                     | Type                              | Description                                                                                  |
|--------------------------|-----------------------------------|----------------------------------------------------------------------------------------------|
| oid                      | oid                               | OID of the mapping from the local user to a remote user.                                     |
| umoptions                | text[]                            | User mapping specific options, expressed in a string in the format of <i>keyword=value</i> . |
| umuser                   | oid                               | OID of the local user being mapped ( <b>0</b> if the user mapping is public).                |
| authorization_identifier | information_schema.sql_identifier | Role of the local user.                                                                      |
| foreign_server_catalog   | information_schema.sql_identifier | Name of the database where the foreign server is defined in.                                 |
| foreign_server_name      | information_schema.sql_identifier | Name of the foreign server.                                                                  |
| srvowner                 | information_schema.sql_identifier | Owner of the foreign server.                                                                 |

### 13.1.6 INFORMATION\_SCHEMA\_CATALOG\_NAME

Displays the name of the current database.

**Table 13-7** INFORMATION\_SCHEMA\_CATALOG\_NAME columns

| Name         | Type                              | Description            |
|--------------|-----------------------------------|------------------------|
| catalog_name | information_schema.sql_identifier | Current database name. |

## 13.2 DBE\_PERF Schema

In the **DBE\_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After the database is installed, only the initial user has the permission for the **DBE\_PERF** schema by default. If the database is upgraded from an earlier version, permissions for the **DBE\_PERF**

schema are the same as those of the earlier version to ensure forward compatibility. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- Views starting with **GLOBAL\_**: Request data from database nodes and return the data without processing them.
- Views starting with **SUMMARY\_**: Summarize data in the database . In most cases, data from database nodes (sometimes only the primary database node) is processed and collected.
- Views that do not start with **GLOBAL\_** or **SUMMARY\_**: Local views that do not request data from other database nodes.

## 13.2.1 OS

### 13.2.1.1 OS\_RUNTIME

**OS\_RUNTIME** displays the running status of the current OS.

**Table 13-8** OS\_RUNTIME columns

| Name       | Type    | Description                                                         |
|------------|---------|---------------------------------------------------------------------|
| id         | integer | ID                                                                  |
| name       | text    | Name of the OS running status                                       |
| value      | numeric | Value of the OS running status                                      |
| comments   | text    | Remarks of the OS running status                                    |
| cumulative | boolean | Specifies whether the value of the OS running status is cumulative. |

### 13.2.1.2 GLOBAL\_OS\_RUNTIME

**GLOBAL\_OS\_RUNTIME** provides OS running status information about all normal nodes in the database.

**Table 13-9** GLOBAL\_OS\_RUNTIME columns

| Name      | Type    | Description                      |
|-----------|---------|----------------------------------|
| node_name | name    | Node name.                       |
| id        | integer | ID.                              |
| name      | text    | Name of the OS running status.   |
| value     | numeric | Value of the OS running status.  |
| comments  | text    | Remarks of the OS running status |

| Name       | Type    | Description                                                         |
|------------|---------|---------------------------------------------------------------------|
| cumulative | boolean | Specifies whether the value of the OS running status is cumulative. |

### 13.2.1.3 OS\_THREADS

Provides information about the status of all threads under the current node.

**Table 13-10** OS\_THREADS columns

| Name          | Type                     | Description                                                 |
|---------------|--------------------------|-------------------------------------------------------------|
| node_name     | text                     | Database process name                                       |
| pid           | bigint                   | ID of the thread running under the current database process |
| lwpid         | integer                  | ID of the lightweight thread corresponding to <b>pid</b> .  |
| thread_name   | text                     | Name of the thread corresponding to <b>pid</b> .            |
| creation_time | timestamp with time zone | Creation time of the thread corresponding to <b>pid</b> .   |

### 13.2.1.4 GLOBAL\_OS\_THREADS

GLOBAL\_OS\_THREADS provides status information about threads on all normal nodes in the database.

**Table 13-11** GLOBAL\_OS\_THREADS columns

| Name          | Type                     | Description                                             |
|---------------|--------------------------|---------------------------------------------------------|
| node_name     | text                     | Node name                                               |
| pid           | bigint                   | ID of the thread running under the current node process |
| lwpid         | integer                  | Lightweight thread ID corresponding to <b>pid</b>       |
| thread_name   | text                     | Name of the thread corresponding to <b>pid</b>          |
| creation_time | timestamp with time zone | Creation time of the thread corresponding to <b>pid</b> |

### 13.2.1.5 NODE\_NAME

Provide the names of all normal nodes in the database.

**Table 13-12** NODE\_NAME columns

| Name      | Type | Description |
|-----------|------|-------------|
| node_name | name | Node name   |

## 13.2.2 Instance

### 13.2.2.1 INSTANCE\_TIME

**INSTANCE\_TIME** records time consumption information on the current database node. The time consumption information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios
- CPU\_TIME: CPU time cost.
- EXECUTION\_TIME: time spent in the executor.
- PARSE\_TIME: time spent on parsing SQL statements
- PLAN\_TIME: time spent on generating plans
- REWRITE\_TIME: time spent on rewriting SQL statements
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure.
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure.
- NET\_SEND\_TIME: time spent on the network
- DATA\_IO\_TIME: time spent on I/Os.

**Table 13-13** INSTANCE\_TIME columns

| Name      | Type    | Description                |
|-----------|---------|----------------------------|
| stat_id   | integer | Statistics ID              |
| stat_name | text    | Type name                  |
| value     | bigint  | Time value (unit: $\mu$ s) |

### 13.2.2.2 GLOBAL\_INSTANCE\_TIME

**GLOBAL\_INSTANCE\_TIME** provides time consumption information about all normal nodes in the database. For details about the time types, see the **INSTANCE\_TIME** view.

**Table 13-14** GLOBAL\_INSTANCE\_TIME columns

| Name      | Type    | Description              |
|-----------|---------|--------------------------|
| node_name | name    | Node name                |
| stat_id   | integer | Statistics ID            |
| stat_name | text    | Type name                |
| value     | bigint  | Duration (unit: $\mu$ s) |

## 13.2.3 Memory

### 13.2.3.1 GS\_SHARED\_MEMORY\_DETAIL

Queries the usage information about shared memory contexts on the current node.

**Table 13-15** GS\_SHARED\_MEMORY\_DETAIL columns

| Name        | Type     | Description                                       |
|-------------|----------|---------------------------------------------------|
| contextname | text     | Name of the memory context.                       |
| level       | smallint | Level of the memory context.                      |
| parent      | text     | Name of the parent memory context.                |
| totalsize   | bigint   | Total size of the shared memory (unit: byte).     |
| freesize    | bigint   | Remaining size of the shared memory (unit: byte). |
| usedsize    | bigint   | Used size of the shared memory (unit: byte).      |

### 13.2.3.2 GLOBAL\_MEMORY\_NODE\_DETAIL

GLOBAL\_MEMORY\_NODE\_DETAIL displays the memory usage of all normal nodes in the database.

**Table 13-16** GLOBAL\_MEMORY\_NODE\_DETAIL columns

| Name     | Type | Description |
|----------|------|-------------|
| nodename | text | Node name.  |

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| memorytype  | text    | <p>Memory name.</p> <ul style="list-style-type: none"><li>• <b>max_process_memory</b>: maximum available memory of the database node.</li><li>• <b>process_used_memory</b>: memory occupied by a process.</li><li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li><li>• <b>dynamic_used_memory</b>: used dynamic memory.</li><li>• <b>dynamic_peak_memory</b>: dynamic memory peak.</li><li>• <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li><li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li><li>• <b>max_shared_memory</b>: maximum shared memory.</li><li>• <b>shared_used_memory</b>: used shared memory.</li><li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communications.</li><li>• <b>sctpcomm_used_memory</b>: used memory for TCP proxy communications.</li><li>• <b>sctpcomm_peak_memory</b>: memory peak of TCP proxy communications.</li><li>• <b>other_used_memory</b>: other used memory.</li><li>• <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li><li>• <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li><li>• <b>gpu_dynamic_peak_memory</b>: dynamic GPU memory peak.</li><li>• <b>pooler_conn_memory</b>: memory allocated to the connection pool.</li><li>• <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li><li>• <b>storage_compress_memory</b>: memory used by the storage module for compression.</li><li>• <b>udf_reserved_memory</b>: reserved memory for the user-defined functions.</li></ul> |
| memorybytes | integer | Size of the used memory (unit: MB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 13.2.3.3 GLOBAL\_SHARED\_MEMORY\_DETAIL

GLOBAL\_SHARED\_MEMORY\_DETAIL is used to query the usage of shared memory contexts on all normal nodes in the database.

**Table 13-17** GLOBAL\_SHARED\_MEMORY\_DETAIL columns

| Name        | Type     | Description                                      |
|-------------|----------|--------------------------------------------------|
| node_name   | name     | Node name                                        |
| contextname | text     | Name of the memory context                       |
| level       | smallint | Level of the memory context                      |
| parent      | text     | Name of the parent memory context                |
| totalsize   | bigint   | Total size of the shared memory (unit: byte)     |
| freesize    | bigint   | Remaining size of the shared memory (unit: byte) |
| usedsize    | bigint   | Used size of the shared memory (unit: byte)      |

### 13.2.3.4 MEMORY\_NODE\_DETAIL

MEMORY\_NODE\_DETAIL displays memory usage of a node in the database.

**Table 13-18** MEMORY\_NODE\_DETAIL columns

| Name     | Type | Description |
|----------|------|-------------|
| nodename | text | Node name.  |

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| memorybytes | integer | Size of the used memory (unit: MB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### 13.2.3.5 SHARED\_MEMORY\_DETAIL

**SHARED\_MEMORY\_DETAIL** queries the usage information about shared memory contexts on the current node.

**Table 13-19 Table 1** SHARED\_MEMORY\_DETAIL columns

| Name        | Type     | Description                                      |
|-------------|----------|--------------------------------------------------|
| contextname | text     | Name of the memory context                       |
| level       | smallint | Level of the memory context                      |
| parent      | text     | Name of the parent memory context                |
| totalsize   | bigint   | Total size of the shared memory (unit: byte)     |
| freesize    | bigint   | Remaining size of the shared memory (unit: byte) |
| usedsize    | bigint   | Used size of the shared memory (unit: byte)      |

## 13.2.4 File

### 13.2.4.1 FILE\_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 13-20** FILE\_IOSTAT columns

| Name      | Type   | Description                                          |
|-----------|--------|------------------------------------------------------|
| filenum   | oid    | File identifier                                      |
| dbid      | oid    | Database ID                                          |
| spcid     | oid    | Tablespace ID                                        |
| phyrds    | bigint | Number of times of reading physical files            |
| phywrts   | bigint | Number of times of writing into physical files       |
| phyblkrd  | bigint | Number of times of reading physical file blocks      |
| phyblkwrt | bigint | Number of times of writing into physical file blocks |

| Name     | Type   | Description                                             |
|----------|--------|---------------------------------------------------------|
| readtim  | bigint | Total duration of reading (unit: $\mu$ s)               |
| writetim | bigint | Total duration of writing (unit: $\mu$ s)               |
| avgiotim | bigint | Average duration of reading and writing (unit: $\mu$ s) |
| lstiotim | bigint | Duration of the last file reading (unit: $\mu$ s)       |
| miniotim | bigint | Minimum duration of reading and writing (unit: $\mu$ s) |
| maxiowtm | bigint | Maximum duration of reading and writing (unit: $\mu$ s) |

### 13.2.4.2 SUMMARY\_FILE\_IOSTAT

Records statistics about data file I/Os in the database to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 13-21** SUMMARY\_FILE\_IOSTAT columns

| Name      | Type    | Description                                              |
|-----------|---------|----------------------------------------------------------|
| filenum   | oid     | File ID.                                                 |
| dbid      | oid     | Database ID.                                             |
| spcid     | oid     | Tablespace ID.                                           |
| phyrds    | numeric | Number of times of reading physical files.               |
| phywrts   | numeric | Number of times of writing into physical files.          |
| phyblkrd  | numeric | Number of times of reading physical file blocks.         |
| phyblkwrt | numeric | Number of times of writing into physical file blocks.    |
| readtim   | numeric | Total duration of reading (unit: $\mu$ s).               |
| writetim  | numeric | Total duration of writing (unit: $\mu$ s).               |
| avgiotim  | bigint  | Average duration of reading and writing (unit: $\mu$ s). |
| lstiotim  | bigint  | Duration of the last file reading (unit: $\mu$ s).       |

| Name     | Type   | Description                                              |
|----------|--------|----------------------------------------------------------|
| miniotim | bigint | Minimum duration of reading and writing (unit: $\mu$ s). |
| maxiowtm | bigint | Maximum duration of reading and writing (unit: $\mu$ s). |

### 13.2.4.3 GLOBAL\_FILE\_IOSTAT

GLOBAL\_FILE\_IOSTAT displays statistics about data file I/Os on all nodes.

**Table 13-22** GLOBAL\_FILE\_IOSTAT columns

| Name      | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| node_name | name   | Node name.                                               |
| filenum   | oid    | File ID.                                                 |
| dbid      | oid    | Database ID.                                             |
| spcid     | oid    | Tablespace ID.                                           |
| phyrds    | bigint | Number of times of reading physical files.               |
| phywrts   | bigint | Number of times of writing into physical files.          |
| phyblkrd  | bigint | Number of times of reading physical file blocks.         |
| phyblkwrt | bigint | Number of times of writing into physical file blocks.    |
| readtim   | bigint | Total duration of reading (unit: $\mu$ s).               |
| writetim  | bigint | Total duration of writing (unit: $\mu$ s).               |
| avgiotim  | bigint | Average duration of reading and writing (unit: $\mu$ s). |
| lstiotim  | bigint | Duration of the last file reading (unit: $\mu$ s).       |
| miniotim  | bigint | Minimum duration of reading and writing (unit: $\mu$ s). |
| maxiowtm  | bigint | Maximum duration of reading and writing (unit: $\mu$ s). |

### 13.2.4.4 FILE\_REDO\_IOSTAT

**FILE\_REDO\_IOSTAT** records statistics about redo logs (WALs) on the current node.

**Table 13-23** FILE\_REDO\_IOSTAT columns

| Name      | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| phywrts   | bigint | Number of times writing into the WAL buffer                                                                     |
| phyblkwrt | bigint | Number of blocks written into the WAL buffer                                                                    |
| writetim  | bigint | Duration of writing into Xlog files (unit: $\mu$ s)                                                             |
| avgiotim  | bigint | Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim</b> = <b>writetim</b> / <b>phywrts</b> |
| lstiotim  | bigint | Duration of the last writing into Xlog files (unit: $\mu$ s)                                                    |
| miniotim  | bigint | Minimum duration of writing into Xlog files (unit: $\mu$ s)                                                     |
| maxiowtm  | bigint | Maximum duration of writing into Xlog files (unit: $\mu$ s)                                                     |

### 13.2.4.5 SUMMARY\_FILE\_REDO\_IOSTAT

**SUMMARY\_FILE\_REDO\_IOSTAT** records statistics about all redo logs and WALs in the database.

**Table 13-24** SUMMARY\_FILE\_REDO\_IOSTAT columns

| Name      | Type    | Description                                                                                                           |
|-----------|---------|-----------------------------------------------------------------------------------------------------------------------|
| phywrts   | numeric | Number of times writing into the WAL buffer.                                                                          |
| phyblkwrt | numeric | Number of blocks written into the WAL buffer.                                                                         |
| writetim  | numeric | Duration of writing into Xlog files (unit: $\mu$ s).                                                                  |
| avgiotim  | bigint  | Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>writetim</b> divided by <b>phywrts</b> . |
| lstiotim  | bigint  | Duration of the last writing into Xlog files (unit: $\mu$ s).                                                         |

| Name     | Type   | Description                                                  |
|----------|--------|--------------------------------------------------------------|
| miniotim | bigint | Minimum duration of writing into Xlog files (unit: $\mu$ s). |
| maxiowtm | bigint | Maximum duration of writing into Xlog files (unit: $\mu$ s). |

#### 13.2.4.6 GLOBAL\_FILE\_REDO\_IOSTAT

**GLOBAL\_FILE\_REDO\_IOSTAT** displays statistics about redo logs (WALs) on nodes in the database.

**Table 13-25** GLOBAL\_FILE\_REDO\_IOSTAT columns

| Name      | Type   | Description                                                                                     |
|-----------|--------|-------------------------------------------------------------------------------------------------|
| node_name | name   | Node name                                                                                       |
| phywrts   | bigint | Number of times writing into the WAL buffer                                                     |
| phyblkwrt | bigint | Number of blocks written into the WAL buffer                                                    |
| writetim  | bigint | Duration of writing into Xlog files (unit: $\mu$ s)                                             |
| avgiotim  | bigint | Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim = writetim/phywrts</b> |
| lstiotim  | bigint | Duration of the last writing into Xlog files (unit: $\mu$ s)                                    |
| miniotim  | bigint | Minimum duration of writing into Xlog files (unit: $\mu$ s)                                     |
| maxiowtm  | bigint | Maximum duration of writing into Xlog files (unit: $\mu$ s)                                     |

#### 13.2.4.7 LOCAL\_REL\_IOSTAT

Displays the accumulated I/O status of all data files on the current node.

**Table 13-26** LOCAL\_REL\_IOSTAT columns

| Name   | Type   | Description                               |
|--------|--------|-------------------------------------------|
| phyrds | bigint | Number of times of reading physical files |

| Name      | Type   | Description                                          |
|-----------|--------|------------------------------------------------------|
| phywrts   | bigint | Number of times of writing into physical files       |
| phyblkrd  | bigint | Number of times of reading physical file blocks      |
| phyblkwrt | bigint | Number of times of writing into physical file blocks |

#### 13.2.4.8 GLOBAL\_REL\_IOSTAT

Displays statistics about data file I/Os on all nodes.

**Table 13-27** GLOBAL\_REL\_IOSTAT columns

| Name      | Type   | Description                                          |
|-----------|--------|------------------------------------------------------|
| node_name | name   | Node name                                            |
| phyrds    | bigint | Number of times of reading physical files            |
| phywrts   | bigint | Number of times of writing into physical files       |
| phyblkrd  | bigint | Number of times of reading physical file blocks      |
| phyblkwrt | bigint | Number of times of writing into physical file blocks |

#### 13.2.4.9 SUMMARY\_REL\_IOSTAT

Obtains statistics about data file I/Os on all nodes.

**Table 13-28** SUMMARY\_REL\_IOSTAT columns

| Name      | Type    | Description                                           |
|-----------|---------|-------------------------------------------------------|
| phyrds    | numeric | Number of times of reading physical files.            |
| phywrts   | numeric | Number of times of writing into physical files.       |
| phyblkrd  | numeric | Number of times of reading physical file blocks.      |
| phyblkwrt | numeric | Number of times of writing into physical file blocks. |

## 13.2.5 Object

### 13.2.5.1 STAT\_USER\_TABLES

**STAT\_USER\_TABLES** displays the status information about user-defined ordinary tables in all namespaces on the current node.

**Table 13-29** STAT\_USER\_TABLES columns

| Name            | Type                     | Description                                                                            |
|-----------------|--------------------------|----------------------------------------------------------------------------------------|
| relid           | oid                      | Table OID                                                                              |
| schemaname      | name                     | Name of the schema that the table is in                                                |
| relname         | name                     | Table name                                                                             |
| seq_scan        | bigint                   | Number of sequential scans initiated on the table                                      |
| seq_tup_read    | bigint                   | Number of live rows fetched by sequential scans                                        |
| idx_scan        | bigint                   | Number of index scans initiated on the table                                           |
| idx_tup_fetch   | bigint                   | Number of live rows fetched by index scans                                             |
| n_tup_ins       | bigint                   | Number of rows inserted                                                                |
| n_tup_upd       | bigint                   | Number of rows updated                                                                 |
| n_tup_del       | bigint                   | Number of rows deleted                                                                 |
| n_tup_hot_upd   | bigint                   | Number of rows HOT updated (with no separate index update required)                    |
| n_live_tup      | bigint                   | Estimated number of live rows                                                          |
| n_dead_tup      | bigint                   | Estimated number of dead rows                                                          |
| last_vacuum     | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| last_autovacuum | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                    |
| last_analyze    | timestamp with time zone | Last time at which the table was manually analyzed                                     |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times this table has been vacuumed by the autovacuum daemon                   |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon                    |

### 13.2.5.2 SUMMARY\_STAT\_USER\_TABLES

SUMMARY\_STAT\_USER\_TABLES displays the status information about user-defined ordinary tables in all namespaces in the database.

**Table 13-30** SUMMARY\_STAT\_USER\_TABLES columns

| Name          | Type    | Description                                                         |
|---------------|---------|---------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that contains the table                          |
| relname       | name    | Table name                                                          |
| seq_scan      | numeric | Number of sequential scans initiated on this table                  |
| seq_tup_read  | numeric | Number of live rows fetched by sequential scans                     |
| idx_scan      | numeric | Number of index scans initiated on the table                        |
| idx_tup_fetch | numeric | Number of live rows fetched by index scans                          |
| n_tup_ins     | numeric | Number of rows inserted                                             |
| n_tup_upd     | numeric | Number of rows updated                                              |
| n_tup_del     | numeric | Number of rows deleted                                              |
| n_tup_hot_upd | numeric | Number of rows HOT updated (with no separate index update required) |
| n_live_tup    | numeric | Estimated number of live rows                                       |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| n_dead_tup        | numeric                  | Estimated number of dead rows                                                           |
| last_vacuum       | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )  |
| last_autovacuum   | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                     |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | numeric                  | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | numeric                  | Number of times the table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | numeric                  | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | numeric                  | Number of times the table has been analyzed by the autovacuum daemon                    |

### 13.2.5.3 GLOBAL\_STAT\_USER\_TABLES

GLOBAL\_STAT\_USER\_TABLES displays the status information about user-defined ordinary tables in all namespaces on each node.

**Table 13-31** GLOBAL\_STAT\_USER\_TABLES columns

| Name       | Type   | Description                                        |
|------------|--------|----------------------------------------------------|
| node_name  | name   | Node name                                          |
| relid      | oid    | OID of the table                                   |
| schemaname | name   | Name of the schema that this table is in.          |
| relname    | name   | Table name                                         |
| seq_scan   | bigint | Number of sequential scans initiated on this table |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| seq_tup_read      | bigint                   | Number of live rows fetched by sequential scans                                         |
| idx_scan          | bigint                   | Number of index scans initiated on the table                                            |
| idx_tup_fetch     | bigint                   | Number of live rows fetched by index scans                                              |
| n_tup_ins         | bigint                   | Number of rows inserted                                                                 |
| n_tup_upd         | bigint                   | Number of rows updated                                                                  |
| n_tup_del         | bigint                   | Number of rows deleted                                                                  |
| n_tup_hot_upd     | bigint                   | Number of rows HOT updated (with no separate index update required).                    |
| n_live_tup        | bigint                   | Estimated number of live rows                                                           |
| n_dead_tup        | bigint                   | Estimated number of dead rows.                                                          |
| last_vacuum       | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )  |
| last_autovacuum   | timestamp with time zone | Last time when the table was vacuumed by the AUTOVACUUM daemon.                         |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze  | timestamp with time zone | Last time when the table was analyzed by the AUTOVACUUM daemon.                         |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times the table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the AUTOVACUUM daemon.                   |

### 13.2.5.4 STAT\_USER\_INDEXES

**STAT\_USER\_INDEXES** displays the status information about the index of user-defined ordinary tables in the current database.

**Table 13-32** STAT\_USER\_INDEXES columns

| Name          | Type   | Description                                                             |
|---------------|--------|-------------------------------------------------------------------------|
| relid         | oid    | OID of the table for this index                                         |
| indexrelid    | oid    | OID of the index                                                        |
| schemaname    | name   | Name of the schema that the index is in                                 |
| relname       | name   | Name of the table for the index                                         |
| indexrelname  | name   | Index name                                                              |
| idx_scan      | bigint | Number of index scans initiated on the index                            |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index                  |
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index |

### 13.2.5.5 SUMMARY\_STAT\_USER\_INDEXES

**SUMMARY\_STAT\_USER\_INDEXES** displays the status information about the index of user-defined ordinary tables in all databases in the database.

**Table 13-33** SUMMARY\_STAT\_USER\_INDEXES columns

| Name          | Type    | Description                                                              |
|---------------|---------|--------------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in.                                 |
| relname       | name    | Name of the table for the index                                          |
| indexrelname  | name    | Index name                                                               |
| idx_scan      | numeric | Number of index scans initiated on the index.                            |
| idx_tup_read  | numeric | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | numeric | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.6 GLOBAL\_STAT\_USER\_INDEXES

GLOBAL\_STAT\_USER\_INDEXES displays the status information about the index of user-defined ordinary tables in all databases of each node.

**Table 13-34** GLOBAL\_STAT\_USER\_INDEXES columns

| Name          | Type   | Description                                                              |
|---------------|--------|--------------------------------------------------------------------------|
| node_name     | name   | Node name.                                                               |
| relid         | oid    | OID of the table for this index.                                         |
| indexrelid    | oid    | OID of the index.                                                        |
| schemaname    | name   | Name of the schema that the index is in.                                 |
| relname       | name   | Name of the table for the index.                                         |
| indexrelname  | name   | Index name.                                                              |
| idx_scan      | bigint | Number of index scans initiated on the index.                            |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.7 STAT\_SYS\_TABLES

STAT\_SYS\_TABLES displays statistics about all the system catalogs in the **pg\_catalog**, **information\_schema**, and **pg\_toast** schemas on a single node.

**Table 13-35** STAT\_SYS\_TABLES columns

| Name         | Type   | Description                                       |
|--------------|--------|---------------------------------------------------|
| relid        | oid    | Table OID                                         |
| schemaname   | name   | Name of the schema that the table is in           |
| relname      | name   | Table name                                        |
| seq_scan     | bigint | Number of sequential scans initiated on the table |
| seq_tup_read | bigint | Number of live rows fetched by sequential scans   |
| idx_scan     | bigint | Number of index scans initiated on the table      |

| Name              | Type                     | Description                                                                              |
|-------------------|--------------------------|------------------------------------------------------------------------------------------|
| idx_tup_fetch     | bigint                   | Number of live rows fetched by index scans                                               |
| n_tup_ins         | bigint                   | Number of rows inserted                                                                  |
| n_tup_upd         | bigint                   | Number of rows updated                                                                   |
| n_tup_del         | bigint                   | Number of rows deleted                                                                   |
| n_tup_hot_upd     | bigint                   | Number of rows HOT updated (with no separate index update required)                      |
| n_live_tup        | bigint                   | Estimated number of live rows                                                            |
| n_dead_tup        | bigint                   | Estimated number of dead rows                                                            |
| last_vacuum       | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )   |
| last_autovacuum   | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                      |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                      |
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                      |
| vacuum_count      | bigint                   | Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times this table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | bigint                   | Number of times this table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times this table has been analyzed by the autovacuum daemon                    |

### 13.2.5.8 SUMMARY\_STAT\_SYS\_TABLES

SUMMARY\_STAT\_SYS\_TABLES displays statistics about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas in the database.

**Table 13-36** SUMMARY\_STAT\_SYS\_TABLES columns

| Name             | Type                     | Description                                                                             |
|------------------|--------------------------|-----------------------------------------------------------------------------------------|
| schemaname       | name                     | Name of the schema that contains the table                                              |
| relname          | name                     | Table name                                                                              |
| seq_scan         | numeric                  | Number of sequential scans initiated on this table                                      |
| seq_tup_read     | numeric                  | Number of live rows fetched by sequential scans                                         |
| idx_scan         | numeric                  | Number of index scans initiated on the table                                            |
| idx_tup_fetch    | numeric                  | Number of live rows fetched by index scans                                              |
| n_tup_ins        | numeric                  | Number of rows inserted                                                                 |
| n_tup_upd        | numeric                  | Number of rows updated                                                                  |
| n_tup_del        | numeric                  | Number of rows deleted                                                                  |
| n_tup_hot_upd    | numeric                  | Number of rows HOT updated (with no separate index update required)                     |
| n_live_tup       | numeric                  | Estimated number of live rows                                                           |
| n_dead_tup       | numeric                  | Estimated number of dead rows                                                           |
| last_vacuum      | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )  |
| last_autovacuum  | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                     |
| last_analyze     | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count     | numeric                  | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count | numeric                  | Number of times the table has been vacuumed by the autovacuum daemon                    |

| Name              | Type    | Description                                                          |
|-------------------|---------|----------------------------------------------------------------------|
| analyze_count     | numeric | Number of times the table has been manually analyzed                 |
| autoanalyze_count | numeric | Number of times the table has been analyzed by the autovacuum daemon |

### 13.2.5.9 GLOBAL\_STAT\_SYS\_TABLES

**GLOBAL\_STAT\_SYS\_TABLES** displays statistics about all the system catalogs in the **pg\_catalog**, **information\_schema**, and **pg\_toast** schemas on each node.

**Table 13-37** GLOBAL\_STAT\_SYS\_TABLES columns

| Name          | Type                     | Description                                                                            |
|---------------|--------------------------|----------------------------------------------------------------------------------------|
| node_name     | name                     | Node name                                                                              |
| relid         | oid                      | Table OID                                                                              |
| schemaname    | name                     | Name of the schema that contains the table                                             |
| relname       | name                     | Table name                                                                             |
| seq_scan      | bigint                   | Number of sequential scans initiated on this table                                     |
| seq_tup_read  | bigint                   | Number of live rows fetched by sequential scans                                        |
| idx_scan      | bigint                   | Number of index scans initiated on the table                                           |
| idx_tup_fetch | bigint                   | Number of live rows fetched by index scans                                             |
| n_tup_ins     | bigint                   | Number of rows inserted                                                                |
| n_tup_upd     | bigint                   | Number of rows updated                                                                 |
| n_tup_del     | bigint                   | Number of rows deleted                                                                 |
| n_tup_hot_upd | bigint                   | Number of rows HOT updated (with no separate index update required)                    |
| n_live_tup    | bigint                   | Estimated number of live rows                                                          |
| n_dead_tup    | bigint                   | Estimated number of dead rows                                                          |
| last_vacuum   | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ) |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| last_autovacuum   | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                     |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times the table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon                    |

### 13.2.5.10 STAT\_SYS\_INDEXES

**STAT\_SYS\_INDEXES** displays index status information about all the system catalogs in the **pg\_catalog**, **information\_schema**, and **pg\_toast** schemas.

**Table 13-38** STAT\_SYS\_INDEXES columns

| Name          | Type   | Description                                                             |
|---------------|--------|-------------------------------------------------------------------------|
| relid         | oid    | OID of the table for this index                                         |
| indexrelid    | oid    | OID of the index                                                        |
| schemaname    | name   | Name of the schema that the index is in                                 |
| relname       | name   | Name of the table that the index is created for                         |
| indexrelname  | name   | Index name                                                              |
| idx_scan      | bigint | Number of index scans initiated on the index                            |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index                  |
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index |

### 13.2.5.11 SUMMARY\_STAT\_SYS\_INDEXES

SUMMARY\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas in the database.

**Table 13-39** SUMMARY\_STAT\_SYS\_INDEXES columns

| Name          | Type    | Description                                                              |
|---------------|---------|--------------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in.                                 |
| relname       | name    | Name of the table for the index                                          |
| indexrelname  | name    | Index name                                                               |
| idx_scan      | numeric | Number of index scans initiated on the index.                            |
| idx_tup_read  | numeric | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | numeric | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.12 GLOBAL\_STAT\_SYS\_INDEXES

GLOBAL\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on each node.

**Table 13-40** GLOBAL\_STAT\_SYS\_INDEXES columns

| Name         | Type   | Description                                             |
|--------------|--------|---------------------------------------------------------|
| node_name    | name   | Node name.                                              |
| relid        | oid    | OID of the table for this index.                        |
| indexrelid   | oid    | OID of the index.                                       |
| schemaname   | name   | Name of the schema that the index is in.                |
| relname      | name   | Name of the table for the index.                        |
| indexrelname | name   | Index name.                                             |
| idx_scan     | bigint | Number of index scans initiated on the index.           |
| idx_tup_read | bigint | Number of index entries returned by scans on the index. |

| Name          | Type   | Description                                                              |
|---------------|--------|--------------------------------------------------------------------------|
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.13 STAT\_ALL\_TABLES

**STAT\_ALL\_TABLES** displays statistics about one row for each table (including TOAST tables) in databases on this node.

**Table 13-41** STAT\_ALL\_TABLES columns

| Name            | Type                     | Description                                                                            |
|-----------------|--------------------------|----------------------------------------------------------------------------------------|
| relid           | oid                      | Table OID                                                                              |
| schemaname      | name                     | Name of the schema that the table is in                                                |
| relname         | name                     | Table name                                                                             |
| seq_scan        | bigint                   | Number of sequential scans initiated on the table                                      |
| seq_tup_read    | bigint                   | Number of live rows fetched by sequential scans                                        |
| idx_scan        | bigint                   | Number of index scans initiated on the table                                           |
| idx_tup_fetch   | bigint                   | Number of live rows fetched by index scans                                             |
| n_tup_ins       | bigint                   | Number of rows inserted                                                                |
| n_tup_upd       | bigint                   | Number of rows updated                                                                 |
| n_tup_del       | bigint                   | Number of rows deleted                                                                 |
| n_tup_hot_upd   | bigint                   | Number of rows HOT updated (with no separate index update required)                    |
| n_live_tup      | bigint                   | Estimated number of live rows                                                          |
| n_dead_tup      | bigint                   | Estimated number of dead rows                                                          |
| last_vacuum     | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| last_autovacuum | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                    |
| last_analyze    | timestamp with time zone | Last time at which the table was manually analyzed                                     |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times this table has been vacuumed by the autovacuum daemon                   |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon                    |

#### 13.2.5.14 SUMMARY\_STAT\_ALL\_TABLES

SUMMARY\_STAT\_ALL\_TABLES displays statistics about one row for each table (including TOAST tables) in a database in the entire database system.

**Table 13-42** SUMMARY\_STAT\_ALL\_TABLES columns

| Name          | Type    | Description                                                         |
|---------------|---------|---------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that contains the table                          |
| relname       | name    | Table name                                                          |
| seq_scan      | numeric | Number of sequential scans initiated on this table                  |
| seq_tup_read  | numeric | Number of live rows fetched by sequential scans                     |
| idx_scan      | numeric | Number of index scans initiated on the table                        |
| idx_tup_fetch | numeric | Number of live rows fetched by index scans                          |
| n_tup_ins     | numeric | Number of rows inserted                                             |
| n_tup_upd     | numeric | Number of rows updated                                              |
| n_tup_del     | numeric | Number of rows deleted                                              |
| n_tup_hot_upd | numeric | Number of rows HOT updated (with no separate index update required) |
| n_live_tup    | numeric | Estimated number of live rows                                       |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| n_dead_tup        | numeric                  | Estimated number of dead rows                                                           |
| last_vacuum       | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )  |
| last_autovacuum   | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                     |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | numeric                  | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | numeric                  | Number of times the table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | numeric                  | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | numeric                  | Number of times the table has been analyzed by the autovacuum daemon                    |

### 13.2.5.15 GLOBAL\_STAT\_ALL\_TABLES

**GLOBAL\_STAT\_ALL\_TABLES** displays statistics about one row for each table (including TOAST tables) in databases on each node.

**Table 13-43** GLOBAL\_STAT\_ALL\_TABLES columns

| Name         | Type   | Description                                        |
|--------------|--------|----------------------------------------------------|
| node_name    | name   | Node name                                          |
| relid        | oid    | OID of the table                                   |
| schemaname   | name   | Name of the schema that contains the table         |
| relname      | name   | Table name                                         |
| seq_scan     | bigint | Number of sequential scans initiated on this table |
| seq_tup_read | bigint | Number of live rows fetched by sequential scans    |

| Name              | Type                     | Description                                                                             |
|-------------------|--------------------------|-----------------------------------------------------------------------------------------|
| idx_scan          | bigint                   | Number of index scans initiated on the table                                            |
| idx_tup_fetch     | bigint                   | Number of live rows fetched by index scans                                              |
| n_tup_ins         | bigint                   | Number of rows inserted                                                                 |
| n_tup_upd         | bigint                   | Number of rows updated                                                                  |
| n_tup_del         | bigint                   | Number of rows deleted                                                                  |
| n_tup_hot_upd     | bigint                   | Number of rows HOT updated (with no separate index update required)                     |
| n_live_tup        | bigint                   | Estimated number of live rows                                                           |
| n_dead_tup        | bigint                   | Estimated number of dead rows                                                           |
| last_vacuum       | timestamp with time zone | Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )  |
| last_autovacuum   | timestamp with time zone | Last time at which this table was vacuumed by the autovacuum daemon                     |
| last_analyze      | timestamp with time zone | Last time at which this table was manually analyzed                                     |
| last_autoanalyze  | timestamp with time zone | Last time at which this table was analyzed by the autovacuum daemon                     |
| vacuum_count      | bigint                   | Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ) |
| autovacuum_count  | bigint                   | Number of times the table has been vacuumed by the autovacuum daemon                    |
| analyze_count     | bigint                   | Number of times the table has been manually analyzed                                    |
| autoanalyze_count | bigint                   | Number of times the table has been analyzed by the autovacuum daemon                    |

### 13.2.5.16 STAT\_ALL\_INDEXES

STAT\_ALL\_INDEXES contains every row of each index in databases on the current node, showing statistics about accesses to specific indexes.

**Table 13-44** STAT\_ALL\_INDEXES columns

| Name          | Type   | Description                                                              |
|---------------|--------|--------------------------------------------------------------------------|
| relid         | oid    | OID of the table for this index.                                         |
| indexrelid    | oid    | OID of the index.                                                        |
| schemaname    | name   | Name of the schema that the index is in.                                 |
| relname       | name   | Name of the table for the index.                                         |
| indexrelname  | name   | Index name.                                                              |
| idx_scan      | bigint | Number of index scans initiated on the index.                            |
| idx_tup_read  | bigint | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | bigint | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.17 SUMMARY\_STAT\_ALL\_INDEXES

SUMMARY\_STAT\_ALL\_INDEXES displays access statistics about each index in the GaussDB database.

**Table 13-45** SUMMARY\_STAT\_ALL\_INDEXES columns

| Name          | Type    | Description                                                              |
|---------------|---------|--------------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in.                                 |
| relname       | name    | Name of the table for the index.                                         |
| indexrelname  | name    | Index name.                                                              |
| idx_scan      | numeric | Number of index scans initiated on the index.                            |
| idx_tup_read  | numeric | Number of index entries returned by scans on the index.                  |
| idx_tup_fetch | numeric | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.18 GLOBAL\_STAT\_ALL\_INDEXES

Contains every row of each index in databases on each node, showing statistics about accesses to specific indexes.

**Table 13-46** GLOBAL\_STAT\_ALL\_INDEXES columns

| Name            | Type   | Description                                                              |
|-----------------|--------|--------------------------------------------------------------------------|
| node_name       | name   | Node name                                                                |
| relid           | oid    | OID of the table for this index                                          |
| indexrelid      | oid    | OID of the index                                                         |
| schemaname      | name   | Name of the schema that the index is in.                                 |
| relname         | name   | Name of the table for the index                                          |
| indexrelname    | name   | Index name                                                               |
| idx_scan        | bigint | Number of index scans initiated on the index.                            |
| idx_tup_read    | bigint | Number of index entries returned by scans on the index.                  |
| idx_tup_fetched | bigint | Number of live table rows fetched by simple index scans using the index. |

### 13.2.5.19 STAT\_DATABASE

**STAT\_DATABASE** contains statistics for each database on this node.

**Table 13-47** STAT\_DATABASE columns

| Name          | Type    | Description                                                                                                                                                                                                            |
|---------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid         | oid     | OID of a database                                                                                                                                                                                                      |
| datname       | name    | Database name                                                                                                                                                                                                          |
| numbackends   | integer | Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset. |
| xact_commit   | bigint  | Number of transactions in this database that have been committed                                                                                                                                                       |
| xact_rollback | bigint  | Number of transactions in this database that have been rolled back                                                                                                                                                     |
| blks_read     | bigint  | Number of disk blocks read in this database                                                                                                                                                                            |
| blks_hit      | bigint  | Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the database buffer cache)                                                                                 |

| Name           | Type                     | Description                                                                                                                                                                                                                              |
|----------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tup_returned   | bigint                   | Number of rows returned by queries in this database                                                                                                                                                                                      |
| tup_fetched    | bigint                   | Number of rows fetched by queries in this database                                                                                                                                                                                       |
| tup_inserted   | bigint                   | Number of rows inserted by queries in this database                                                                                                                                                                                      |
| tup_updated    | bigint                   | Number of rows updated by queries in this database                                                                                                                                                                                       |
| tup_deleted    | bigint                   | Number of rows deleted by queries in this database                                                                                                                                                                                       |
| conflicts      | bigint                   | Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .                                                                 |
| temp_files     | bigint                   | Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the <b>log_temp_files</b> setting. |
| temp_bytes     | bigint                   | Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the <b>log_temp_files</b> setting.                     |
| deadlocks      | bigint                   | Number of deadlocks detected in this database                                                                                                                                                                                            |
| blk_read_time  | double precision         | Time spent reading data file blocks by backends in this database (unit: ms)                                                                                                                                                              |
| blk_write_time | double precision         | Time spent writing data file blocks by backends in this database (unit: ms)                                                                                                                                                              |
| stats_reset    | timestamp with time zone | Time at which the current statistics were reset                                                                                                                                                                                          |

### 13.2.5.20 SUMMARY\_STAT\_DATABASE

SUMMARY\_STAT\_DATABASE contains every row of each database in the database, showing database-wide statistics.

**Table 13-48** SUMMARY\_STAT\_DATABASE columns

| Name          | Type    | Description                                                                                                                                                                                                                              |
|---------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datname       | name    | Database name.                                                                                                                                                                                                                           |
| numbackends   | bigint  | Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.                   |
| xact_commit   | numeric | Number of transactions in this database that have been committed.                                                                                                                                                                        |
| xact_rollback | numeric | Number of transactions in this database that have been rolled back.                                                                                                                                                                      |
| blks_read     | numeric | Number of disk blocks read in this database.                                                                                                                                                                                             |
| blks_hit      | numeric | Number of times disk blocks were found already in the cache, so that a read was not necessary (this only includes hits in the GaussDB cache, not the OS's file system cache).                                                            |
| tup_returned  | numeric | Number of rows returned by queries in this database.                                                                                                                                                                                     |
| tup_fetched   | numeric | Number of rows fetched by queries in this database.                                                                                                                                                                                      |
| tup_inserted  | bigint  | Number of rows inserted by queries in this database.                                                                                                                                                                                     |
| tup_updated   | bigint  | Number of rows updated by queries in this database.                                                                                                                                                                                      |
| tup_deleted   | bigint  | Number of rows deleted by queries in this database.                                                                                                                                                                                      |
| conflicts     | bigint  | Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .                                                                 |
| temp_files    | numeric | Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the <b>log_temp_files</b> setting. |

| Name           | Type                     | Description                                                                                                                                                                                                          |
|----------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| temp_bytes     | numeric                  | Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the <b>log_temp_files</b> setting. |
| deadlocks      | bigint                   | Number of deadlocks detected in this database.                                                                                                                                                                       |
| blk_read_time  | double precision         | Time spent in reading data file blocks by backends in this database (unit: ms).                                                                                                                                      |
| blk_write_time | double precision         | Time spent in writing data file blocks by backends in this database (unit: ms).                                                                                                                                      |
| stats_reset    | timestamp with time zone | Time at which the current statistics were reset.                                                                                                                                                                     |

### 13.2.5.21 GLOBAL\_STAT\_DATABASE

GLOBAL\_STAT\_DATABASE contains every row of each database on each node in the entire database system, showing database-wide statistics.

**Table 13-49** GLOBAL\_STAT\_DATABASE columns

| Name          | Type    | Description                                                                                                                                                                                                            |
|---------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name     | name    | Node name.                                                                                                                                                                                                             |
| datid         | oid     | Database OID.                                                                                                                                                                                                          |
| datname       | name    | Name of the database                                                                                                                                                                                                   |
| numbackends   | integer | Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset. |
| xact_commit   | bigint  | Number of transactions in this database that have been committed.                                                                                                                                                      |
| xact_rollback | bigint  | Number of transactions in this database that have been rolled back.                                                                                                                                                    |
| blks_read     | bigint  | Number of disk blocks read in this database.                                                                                                                                                                           |

| Name           | Type                     | Description                                                                                                                                                                                                                              |
|----------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blks_hit       | bigint                   | Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the database kernel buffer cache)                                                                                            |
| tup_returned   | bigint                   | Number of rows returned by queries in this database                                                                                                                                                                                      |
| tup_fetched    | bigint                   | Number of rows fetched by queries in this database                                                                                                                                                                                       |
| tup_inserted   | bigint                   | Number of rows inserted by queries in this database                                                                                                                                                                                      |
| tup_updated    | bigint                   | Number of rows updated by queries in this database                                                                                                                                                                                       |
| tup_deleted    | bigint                   | Number of rows deleted by queries in this database                                                                                                                                                                                       |
| conflicts      | bigint                   | Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .                                                                 |
| temp_files     | bigint                   | Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the <b>log_temp_files</b> setting. |
| temp_bytes     | bigint                   | Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the <b>log_temp_files</b> setting.                     |
| deadlocks      | bigint                   | Number of deadlocks detected in this database.                                                                                                                                                                                           |
| blk_read_time  | double precision         | Time spent in reading data file blocks by backends in this database (unit: ms).                                                                                                                                                          |
| blk_write_time | double precision         | Time spent in writing data file blocks by backends in this database (unit: ms).                                                                                                                                                          |
| stats_reset    | timestamp with time zone | Time at which the current statistics were reset.                                                                                                                                                                                         |

### 13.2.5.22 STAT\_DATABASE\_CONFLICTS

**STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts on the current node.

**Table 13-50** STAT\_DATABASE\_CONFLICTS columns

| Name             | Type   | Description                       |
|------------------|--------|-----------------------------------|
| datid            | oid    | Database ID                       |
| datname          | name   | Database name                     |
| confl_tablespace | bigint | Number of conflicting tablespaces |
| confl_lock       | bigint | Number of conflicting locks       |
| confl_snapshot   | bigint | Number of conflicting snapshots   |
| confl_bufferpin  | bigint | Number of conflicting buffers     |
| confl_deadlock   | bigint | Number of conflicting deadlocks   |

### 13.2.5.23 SUMMARY\_STAT\_DATABASE\_CONFLICTS

**SUMMARY\_STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts in the database.

**Table 13-51** SUMMARY\_STAT\_DATABASE\_CONFLICTS columns

| Name             | Type   | Description                       |
|------------------|--------|-----------------------------------|
| datname          | name   | Database name                     |
| confl_tablespace | bigint | Number of conflicting tablespaces |
| confl_lock       | bigint | Number of conflicting locks       |
| confl_snapshot   | bigint | Number of conflicting snapshots   |
| confl_bufferpin  | bigint | Number of conflicting buffers     |
| confl_deadlock   | bigint | Number of conflicting deadlocks   |

### 13.2.5.24 GLOBAL\_STAT\_DATABASE\_CONFLICTS

**GLOBAL\_STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts on each node.

**Table 13-52** GLOBAL\_STAT\_DATABASE\_CONFLICTS columns

| Name             | Type   | Description                       |
|------------------|--------|-----------------------------------|
| node_name        | name   | Node name                         |
| datid            | oid    | Database ID                       |
| datname          | name   | Database name                     |
| confl_tablespace | bigint | Number of conflicting tablespaces |
| confl_lock       | bigint | Number of conflicting locks       |
| confl_snapshot   | bigint | Number of conflicting snapshots   |
| confl_bufferpin  | bigint | Number of conflicting buffers     |
| confl_deadlock   | bigint | Number of conflicting deadlocks   |

### 13.2.5.25 STAT\_XACT\_ALL\_TABLES

**STAT\_XACT\_ALL\_TABLES** displays transaction status information about all ordinary tables and TOAST tables in the current namespace.

**Table 13-53** STAT\_XACT\_ALL\_TABLES columns

| Name            | Type   | Description                                       |
|-----------------|--------|---------------------------------------------------|
| relid           | oid    | Table OID                                         |
| schemaname      | name   | Name of the schema that the table is in           |
| relname         | name   | Table name                                        |
| seq_scan        | bigint | Number of sequential scans initiated on the table |
| seq_tup_read    | bigint | Number of live rows fetched by sequential scans   |
| idx_scan        | bigint | Number of index scans initiated on the table      |
| idx_tup_fetched | bigint | Number of live rows fetched by index scans        |
| n_tup_ins       | bigint | Number of rows inserted                           |
| n_tup_upd       | bigint | Number of rows updated                            |
| n_tup_del       | bigint | Number of rows deleted                            |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.26 SUMMARY\_STAT\_XACT\_ALL\_TABLES

SUMMARY\_STAT\_XACT\_ALL\_TABLES displays transaction status information about all ordinary tables and TOAST tables in all namespaces in the database.

**Table 13-54** SUMMARY\_STAT\_XACT\_ALL\_TABLES columns

| Name          | Type    | Description                                                         |
|---------------|---------|---------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that contains the table                          |
| relname       | name    | Table name.                                                         |
| seq_scan      | numeric | Number of sequential scans initiated on this table.                 |
| seq_tup_read  | numeric | Number of live rows fetched by sequential scans.                    |
| idx_scan      | numeric | Number of index scans initiated on the table                        |
| idx_tup_fetch | numeric | Number of live rows fetched by index scans.                         |
| n_tup_ins     | numeric | Number of rows inserted.                                            |
| n_tup_upd     | numeric | Number of rows updated.                                             |
| n_tup_del     | numeric | Number of rows deleted.                                             |
| n_tup_hot_upd | numeric | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.27 GLOBAL\_STAT\_XACT\_ALL\_TABLES

GLOBAL\_STAT\_XACT\_ALL\_TABLES displays transaction status information about all ordinary tables and TOAST tables in namespaces on each node.

**Table 13-55** GLOBAL\_STAT\_XACT\_ALL\_TABLES columns

| Name       | Type | Description                                |
|------------|------|--------------------------------------------|
| node_name  | name | Node name                                  |
| relid      | oid  | OID of the table                           |
| schemaname | name | Name of the schema that contains the table |
| relname    | name | Table name.                                |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| seq_scan      | bigint | Number of sequential scans initiated on this table.                 |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.                    |
| idx_scan      | bigint | Number of index scans initiated on the table                        |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.                         |
| n_tup_ins     | bigint | Number of rows inserted.                                            |
| n_tup_upd     | bigint | Number of rows updated.                                             |
| n_tup_del     | bigint | Number of rows deleted.                                             |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.28 STAT\_XACT\_SYS\_TABLES

**STAT\_XACT\_SYS\_TABLES** displays transaction status information about the system catalogs in namespaces on the current node.

**Table 13-56** STAT\_XACT\_SYS\_TABLES columns

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| relid         | oid    | Table OID                                                           |
| schemaname    | name   | Name of the schema that the table is in                             |
| relname       | name   | Table name.                                                         |
| seq_scan      | bigint | Number of sequential scans initiated on the table.                  |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.                    |
| idx_scan      | bigint | Number of index scans initiated on the table.                       |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.                         |
| n_tup_ins     | bigint | Number of rows inserted.                                            |
| n_tup_upd     | bigint | Number of rows updated.                                             |
| n_tup_del     | bigint | Number of rows deleted.                                             |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.29 SUMMARY\_STAT\_XACT\_SYS\_TABLES

SUMMARY\_STAT\_XACT\_SYS\_TABLES displays transaction status information about the system catalogs in namespaces in the database.

**Table 13-57** SUMMARY\_STAT\_XACT\_SYS\_TABLES columns

| Name          | Type    | Description                                                         |
|---------------|---------|---------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that contains the table                          |
| relname       | name    | Table name.                                                         |
| seq_scan      | numeric | Number of sequential scans initiated on this table.                 |
| seq_tup_read  | numeric | Number of live rows fetched by sequential scans.                    |
| idx_scan      | numeric | Number of index scans initiated on the table                        |
| idx_tup_fetch | numeric | Number of live rows fetched by index scans.                         |
| n_tup_ins     | numeric | Number of rows inserted.                                            |
| n_tup_upd     | numeric | Number of rows updated.                                             |
| n_tup_del     | numeric | Number of rows deleted.                                             |
| n_tup_hot_upd | numeric | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.30 GLOBAL\_STAT\_XACT\_SYS\_TABLES

GLOBAL\_STAT\_XACT\_SYS\_TABLES displays transaction status information about the system catalogs in namespaces on each node.

**Table 13-58** GLOBAL\_STAT\_XACT\_SYS\_TABLES columns

| Name         | Type   | Description                                         |
|--------------|--------|-----------------------------------------------------|
| node_name    | name   | Node name.                                          |
| relid        | oid    | OID of the table                                    |
| schemaname   | name   | Name of the schema that contains the table          |
| relname      | name   | Table name.                                         |
| seq_scan     | bigint | Number of sequential scans initiated on this table. |
| seq_tup_read | bigint | Number of live rows fetched by sequential scans.    |
| idx_scan     | bigint | Number of index scans initiated on the table        |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.                         |
| n_tup_ins     | bigint | Number of rows inserted.                                            |
| n_tup_upd     | bigint | Number of rows updated.                                             |
| n_tup_del     | bigint | Number of rows deleted.                                             |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.31 STAT\_XACT\_USER\_TABLES

**STAT\_XACT\_USER\_TABLES** displays transaction status information about the user tables in namespaces on the current node.

**Table 13-59** STAT\_XACT\_USER\_TABLES columns

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| relid         | oid    | Table OID                                                           |
| schemaname    | name   | Name of the schema that the table is in                             |
| relname       | name   | Table name.                                                         |
| seq_scan      | bigint | Number of sequential scans initiated on the table.                  |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.                    |
| idx_scan      | bigint | Number of index scans initiated on the table.                       |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.                         |
| n_tup_ins     | bigint | Number of rows inserted.                                            |
| n_tup_upd     | bigint | Number of rows updated.                                             |
| n_tup_del     | bigint | Number of rows deleted.                                             |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.32 SUMMARY\_STAT\_XACT\_USER\_TABLES

**SUMMARY\_STAT\_XACT\_USER\_TABLES** displays the transaction status information about the user tables in namespaces in the database.

**Table 13-60** SUMMARY\_STAT\_XACT\_USER\_TABLES columns

| Name          | Type    | Description                                                         |
|---------------|---------|---------------------------------------------------------------------|
| schemaname    | name    | Name of the schema that contains the table                          |
| relname       | name    | Table name.                                                         |
| seq_scan      | numeric | Number of sequential scans initiated on this table.                 |
| seq_tup_read  | numeric | Number of live rows fetched by sequential scans.                    |
| idx_scan      | numeric | Number of index scans initiated on the table                        |
| idx_tup_fetch | numeric | Number of live rows fetched by index scans.                         |
| n_tup_ins     | numeric | Number of rows inserted.                                            |
| n_tup_upd     | numeric | Number of rows updated.                                             |
| n_tup_del     | numeric | Number of rows deleted.                                             |
| n_tup_hot_upd | numeric | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.33 GLOBAL\_STAT\_XACT\_USER\_TABLES

**GLOBAL\_STAT\_XACT\_USER\_TABLES** displays transaction status information about the user tables in namespaces on each node.

**Table 13-61** GLOBAL\_STAT\_XACT\_USER\_TABLES columns

| Name          | Type   | Description                                         |
|---------------|--------|-----------------------------------------------------|
| node_name     | name   | Node name.                                          |
| relid         | oid    | OID of the table                                    |
| schemaname    | name   | Name of the schema that contains the table          |
| relname       | name   | Table name.                                         |
| seq_scan      | bigint | Number of sequential scans initiated on this table. |
| seq_tup_read  | bigint | Number of live rows fetched by sequential scans.    |
| idx_scan      | bigint | Number of index scans initiated on the table.       |
| idx_tup_fetch | bigint | Number of live rows fetched by index scans.         |
| n_tup_ins     | bigint | Number of rows inserted.                            |
| n_tup_upd     | bigint | Number of rows updated.                             |

| Name          | Type   | Description                                                         |
|---------------|--------|---------------------------------------------------------------------|
| n_tup_del     | bigint | Number of rows deleted.                                             |
| n_tup_hot_upd | bigint | Number of rows HOT updated (with no separate index update required) |

### 13.2.5.34 STAT\_XACT\_USER\_FUNCTIONS

**STAT\_XACT\_USER\_FUNCTIONS** displays statistics about function executions in the current transaction.

**Table 13-62** STAT\_XACT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                               |
|------------|------------------|---------------------------------------------------------------------------|
| funcid     | oid              | OID of a function                                                         |
| schemaname | name             | Schema name                                                               |
| funcname   | name             | Function name.                                                            |
| calls      | bigint           | Number of times the function has been called.                             |
| total_time | double precision | Total time spent in the function and all other functions called by it     |
| self_time  | double precision | Total time spent in this function, excluding other functions called by it |

### 13.2.5.35 SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS

**SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS** displays statistics about function executions in transactions in the database.

**Table 13-63** SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                           |
|------------|------------------|-----------------------------------------------------------------------|
| schemaname | name             | Schema name                                                           |
| funcname   | name             | Function name.                                                        |
| calls      | numeric          | Number of times that the function has been called.                    |
| total_time | double precision | Total time spent in the function and all other functions called by it |

| Name      | Type             | Description                                                                     |
|-----------|------------------|---------------------------------------------------------------------------------|
| self_time | double precision | Total time spent in the function itself, excluding other functions called by it |

### 13.2.5.36 GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS

**GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS** displays statistics about function executions in transactions on each node.

**Table 13-64** GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                                |
|------------|------------------|----------------------------------------------------------------------------|
| node_name  | name             | Node name.                                                                 |
| funcid     | oid              | OID of a function.                                                         |
| schemaname | name             | Schema name                                                                |
| funcname   | name             | Function name.                                                             |
| calls      | bigint           | Number of times that the function has been called.                         |
| total_time | double precision | Total time spent in this function and all other functions called by it.    |
| self_time  | double precision | Total time spent in this function, excluding other functions called by it. |

### 13.2.5.37 STAT\_BAD\_BLOCK

**STAT\_BAD\_BLOCK** displays information about table and index read failures on the current node.

**Table 13-65** STAT\_BAD\_BLOCK columns

| Name         | Type     | Description                             |
|--------------|----------|-----------------------------------------|
| nodename     | text     | Node name.                              |
| databaseid   | integer  | OID of the database                     |
| tablespaceid | integer  | OID of the tablespace                   |
| relfilenode  | integer  | File node of this relation              |
| bucketid     | smallint | ID of the bucket for consistent hashing |

| Name        | Type                     | Description                                          |
|-------------|--------------------------|------------------------------------------------------|
| forknum     | integer                  | Fork number                                          |
| error_count | integer                  | Number of errors                                     |
| first_time  | timestamp with time zone | Time when the page damage occurs for the first time. |
| last_time   | timestamp with time zone | Time when the page damage occurs for the last time.  |

### 13.2.5.38 SUMMARY\_STAT\_BAD\_BLOCK

Displays information about table and index read failures in the database.

**Table 13-66** SUMMARY\_STAT\_BAD\_BLOCK columns

| Name         | Type                     | Description                                            |
|--------------|--------------------------|--------------------------------------------------------|
| databaseid   | integer                  | OID of the database.                                   |
| tablespaceid | integer                  | OID of the tablespace.                                 |
| relfilenode  | integer                  | File node of this relation.                            |
| forknum      | bigint                   | Fork number.                                           |
| error_count  | bigint                   | Number of errors.                                      |
| first_time   | timestamp with time zone | Time when the page damage occurred for the first time. |
| last_time    | timestamp with time zone | Time when the page damage occurred for the last time.  |

### 13.2.5.39 GLOBAL\_STAT\_BAD\_BLOCK

Displays information about table and index read failures on each node.

**Table 13-67** GLOBAL\_STAT\_BAD\_BLOCK columns

| Name         | Type    | Description                 |
|--------------|---------|-----------------------------|
| node_name    | text    | Node name.                  |
| databaseid   | integer | OID of the database.        |
| tablespaceid | integer | OID of the tablespace.      |
| relfilenode  | integer | File node of this relation. |
| forknum      | integer | Fork number.                |

| Name        | Type                     | Description                                            |
|-------------|--------------------------|--------------------------------------------------------|
| error_count | integer                  | Number of errors.                                      |
| first_time  | timestamp with time zone | Time when the page damage occurred for the first time. |
| last_time   | timestamp with time zone | Time when the page damage occurred for the last time.  |

#### 13.2.5.40 STAT\_USER\_FUNCTIONS

**STAT\_USER\_FUNCTIONS** displays user-defined function status information in the current namespace. (The language of the function is non-internal language.)

**Table 13-68** STAT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                                           |
|------------|------------------|---------------------------------------------------------------------------------------|
| funcid     | oid              | Function ID.                                                                          |
| schemaname | name             | Schema name                                                                           |
| funcname   | name             | UDF name.                                                                             |
| calls      | bigint           | Number of times the function has been called.                                         |
| total_time | double precision | Total time spent in this function, including other functions called by it (unit: ms). |
| self_time  | double precision | Time spent in this function, excluding other functions called by it (unit: ms)        |

#### 13.2.5.41 SUMMARY\_STAT\_USER\_FUNCTIONS

**SUMMARY\_STAT\_USER\_FUNCTIONS** displays statistics about user-defined functions on all database nodes.

**Table 13-69** SUMMARY\_STAT\_USER\_FUNCTIONS columns

| Name       | Type    | Description                                   |
|------------|---------|-----------------------------------------------|
| schemaname | name    | Schema name.                                  |
| funcname   | name    | Function name.                                |
| calls      | numeric | Number of times the function has been called. |

| Name       | Type             | Description                                                                        |
|------------|------------------|------------------------------------------------------------------------------------|
| total_time | double precision | Total time spent in this function and all other functions called by it (unit: ms). |
| self_time  | double precision | Time spent in this function, excluding other functions called by it (unit: ms).    |

### 13.2.5.42 GLOBAL\_STAT\_USER\_FUNCTIONS

GLOBAL\_STAT\_USER\_FUNCTIONS displays statistics about user-defined functions on each node in the database.

**Table 13-70** GLOBAL\_STAT\_USER\_FUNCTIONS columns

| Name       | Type             | Description                                                                          |
|------------|------------------|--------------------------------------------------------------------------------------|
| node_name  | name             | Node name.                                                                           |
| funcid     | oid              | ID of the function.                                                                  |
| schemaname | name             | Schema name                                                                          |
| funcname   | name             | Function name                                                                        |
| calls      | bigint           | Number of times the function has been called.                                        |
| total_time | double precision | Total time spent in this function and all other functions called by it (unit: ms)    |
| self_time  | double precision | Total time spent in this function, excluding other functions called by it (unit: ms) |

## 13.2.6 Workload

### 13.2.6.1 WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on the current node. Common users can view only the distribution of SQL statements executed by themselves in workloads, whereas the initial user can view the overall load status of workloads.

**Table 13-71** WORKLOAD\_SQL\_COUNT columns

| Name     | Type | Description    |
|----------|------|----------------|
| workload | name | Workload name. |

| Name         | Type   | Description                  |
|--------------|--------|------------------------------|
| select_count | bigint | Number of SELECT statements. |
| update_count | bigint | Number of UPDATE statements. |
| insert_count | bigint | Number of INSERT statements. |
| delete_count | bigint | Number of DELETE statements. |
| ddl_count    | bigint | Number of DDL statements.    |
| dml_count    | bigint | Number of DML statements.    |
| dcl_count    | bigint | Number of DCL statements.    |

### 13.2.6.2 SUMMARY\_WORKLOAD\_SQL\_COUNT

SUMMARY\_WORKLOAD\_SQL\_COUNT displays the distribution of SQL statements in workloads on the primary database node in the database.

**Table 13-72** SUMMARY\_WORKLOAD\_SQL\_COUNT columns

| Name         | Type   | Description                  |
|--------------|--------|------------------------------|
| node_name    | name   | Node name.                   |
| workload     | name   | Workload name.               |
| select_count | bigint | Number of SELECT statements. |
| update_count | bigint | Number of UPDATE statements. |
| insert_count | bigint | Number of INSERT statements. |
| delete_count | bigint | Number of DELETE statements. |
| ddl_count    | bigint | Number of DDL statements.    |
| dml_count    | bigint | Number of DML statements.    |
| dcl_count    | bigint | Number of DCL statements.    |

### 13.2.6.3 WORKLOAD\_TRANSACTION

**WORKLOAD\_TRANSACTION** displays information about transactions loaded on the current node.

**Table 13-73** WORKLOAD\_TRANSACTION columns

| Name                | Type   | Description                                                      |
|---------------------|--------|------------------------------------------------------------------|
| workload            | name   | Workload name                                                    |
| commit_counter      | bigint | Number of user transactions committed                            |
| rollback_counter    | bigint | Number of user transactions rolled back                          |
| resp_min            | bigint | Minimum response time of user transactions (unit: $\mu$ s)       |
| resp_max            | bigint | Maximum response time of user transactions (unit: $\mu$ s)       |
| resp_avg            | bigint | Average response time of user transactions (unit: $\mu$ s)       |
| resp_total          | bigint | Total response time of user transactions (unit: $\mu$ s)         |
| bg_commit_counter   | bigint | Number of background transactions committed                      |
| bg_rollback_counter | bigint | Number of background transactions rolled back                    |
| bg_resp_min         | bigint | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | bigint | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | bigint | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | bigint | Total response time of background transactions (unit: $\mu$ s)   |

### 13.2.6.4 SUMMARY\_WORKLOAD\_TRANSACTION

**SUMMARY\_WORKLOAD\_TRANSACTION** displays information about transactions loaded in the database.

**Table 13-74** SUMMARY\_WORKLOAD\_TRANSACTION columns

| Name     | Type | Description   |
|----------|------|---------------|
| workload | name | Workload name |

| Name                | Type    | Description                                                      |
|---------------------|---------|------------------------------------------------------------------|
| commit_counter      | numeric | Number of user transactions committed                            |
| rollback_counter    | numeric | Number of user transactions rolled back                          |
| resp_min            | bigint  | Minimum response time of user transactions (unit: $\mu$ s)       |
| resp_max            | bigint  | Maximum response time of user transactions (unit: $\mu$ s)       |
| resp_avg            | bigint  | Average response time of user transactions (unit: $\mu$ s)       |
| resp_total          | numeric | Total response time of user transactions (unit: $\mu$ s)         |
| bg_commit_counter   | numeric | Number of background transactions committed                      |
| bg_rollback_counter | numeric | Number of background transactions rolled back                    |
| bg_resp_min         | bigint  | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | bigint  | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | bigint  | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | numeric | Total response time of background transactions (unit: $\mu$ s)   |

### 13.2.6.5 GLOBAL\_WORKLOAD\_TRANSACTION

**GLOBAL\_WORKLOAD\_TRANSACTION** displays load information about workloads on each node.

**Table 13-75** GLOBAL\_WORKLOAD\_TRANSACTION columns

| Name             | Type   | Description                                                |
|------------------|--------|------------------------------------------------------------|
| node_name        | name   | Node name                                                  |
| workload         | name   | Workload name                                              |
| commit_counter   | bigint | Number of user transactions committed                      |
| rollback_counter | bigint | Number of user transactions rolled back                    |
| resp_min         | bigint | Minimum response time of user transactions (unit: $\mu$ s) |

| Name                | Type   | Description                                                      |
|---------------------|--------|------------------------------------------------------------------|
| resp_max            | bigint | Maximum response time of user transactions (unit: $\mu$ s)       |
| resp_avg            | bigint | Average response time of user transactions (unit: $\mu$ s)       |
| resp_total          | bigint | Total response time of user transactions (unit: $\mu$ s)         |
| bg_commit_counter   | bigint | Number of background transactions committed                      |
| bg_rollback_counter | bigint | Number of background transactions rolled back                    |
| bg_resp_min         | bigint | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | bigint | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | bigint | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | bigint | Total response time of background transactions (unit: $\mu$ s)   |

### 13.2.6.6 WORKLOAD\_SQL\_ELAPSE\_TIME

**WORKLOAD\_SQL\_ELAPSE\_TIME** collects statistics about SUIDs in workloads.

**Table 13-76** WORKLOAD\_SQL\_ELAPSE\_TIME columns

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| workload            | name   | Workload name.                                              |
| total_select_elapse | bigint | Total response time of SELECT statements (unit: $\mu$ s).   |
| max_select_elapse   | bigint | Maximum response time of SELECT statements (unit: $\mu$ s). |
| min_select_elapse   | bigint | Minimum response time of SELECT statements (unit: $\mu$ s). |
| avg_select_elapse   | bigint | Average response time of SELECT statements (unit: $\mu$ s). |
| total_update_elapse | bigint | Total response time of UPDATE statements (unit: $\mu$ s).   |

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| max_update_elapse   | bigint | Maximum response time of UPDATE statements (unit: $\mu$ s). |
| min_update_elapse   | bigint | Minimum response time of UPDATE statements (unit: $\mu$ s). |
| avg_update_elapse   | bigint | Average response time of UPDATE statements (unit: $\mu$ s). |
| total_insert_elapse | bigint | Total response time of INSERT statements (unit: $\mu$ s).   |
| max_insert_elapse   | bigint | Maximum response time of INSERT statements (unit: $\mu$ s). |
| min_insert_elapse   | bigint | Minimum response time of INSERT statements (unit: $\mu$ s). |
| avg_insert_elapse   | bigint | Average response time of INSERT statements (unit: $\mu$ s). |
| total_delete_elapse | bigint | Total response time of DELETE statements (unit: $\mu$ s).   |
| max_delete_elapse   | bigint | Maximum response time of DELETE statements (unit: $\mu$ s). |
| min_delete_elapse   | bigint | Minimum response time of DELETE statements (unit: $\mu$ s). |
| avg_delete_elapse   | bigint | Average response time of DELETE statements (unit: $\mu$ s). |

### 13.2.6.7 SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME

SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME collects statistics about SUIDs in workloads on the primary database node.

**Table 13-77** SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME columns

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| node_name           | name   | Node name.                                                  |
| workload            | name   | Workload name.                                              |
| total_select_elapse | bigint | Total response time of SELECT statements (unit: $\mu$ s).   |
| max_select_elapse   | bigint | Maximum response time of SELECT statements (unit: $\mu$ s). |

| Name                | Type   | Description                                                 |
|---------------------|--------|-------------------------------------------------------------|
| min_select_elapse   | bigint | Minimum response time of SELECT statements (unit: $\mu$ s). |
| avg_select_elapse   | bigint | Average response time of SELECT statements (unit: $\mu$ s). |
| total_update_elapse | bigint | Total response time of UPDATE statements (unit: $\mu$ s).   |
| max_update_elapse   | bigint | Maximum response time of UPDATE statements (unit: $\mu$ s). |
| min_update_elapse   | bigint | Minimum response time of UPDATE statements (unit: $\mu$ s). |
| avg_update_elapse   | bigint | Average response time of UPDATE statements (unit: $\mu$ s). |
| total_insert_elapse | bigint | Total response time of INSERT statements (unit: $\mu$ s).   |
| max_insert_elapse   | bigint | Maximum response time of INSERT statements (unit: $\mu$ s). |
| min_insert_elapse   | bigint | Minimum response time of INSERT statements (unit: $\mu$ s). |
| avg_insert_elapse   | bigint | Average response time of INSERT statements (unit: $\mu$ s). |
| total_delete_elapse | bigint | Total response time of DELETE statements (unit: $\mu$ s).   |
| max_delete_elapse   | bigint | Maximum response time of DELETE statements (unit: $\mu$ s). |
| min_delete_elapse   | bigint | Minimum response time of DELETE statements (unit: $\mu$ s). |
| avg_delete_elapse   | bigint | Average response time of DELETE statements (unit: $\mu$ s). |

### 13.2.6.8 USER\_TRANSACTION

**USER\_TRANSACTION** collects statistics about transactions executed by users. Common users can view only transactions executed by themselves, whereas users with the MONADMIN permission can view transactions executed by all users.

**Table 13-78** USER\_TRANSACTION columns

| Name     | Type | Description |
|----------|------|-------------|
| username | name | Username    |

| Name                | Type   | Description                                                      |
|---------------------|--------|------------------------------------------------------------------|
| commit_counter      | bigint | Number of user transactions committed                            |
| rollback_counter    | bigint | Number of user transactions rolled back                          |
| resp_min            | bigint | Minimum response time of user transactions (unit: $\mu$ s)       |
| resp_max            | bigint | Maximum response time of user transactions (unit: $\mu$ s)       |
| resp_avg            | bigint | Average response time of user transactions (unit: $\mu$ s)       |
| resp_total          | bigint | Total response time of user transactions (unit: $\mu$ s)         |
| bg_commit_counter   | bigint | Number of background transactions committed                      |
| bg_rollback_counter | bigint | Number of background transactions rolled back                    |
| bg_resp_min         | bigint | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | bigint | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | bigint | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | bigint | Total response time of background transactions (unit: $\mu$ s)   |

### 13.2.6.9 GLOBAL\_USER\_TRANSACTION

**GLOBAL\_USER\_TRANSACTION** collects statistics about transactions executed by all users.

**Table 13-79** GLOBAL\_USER\_TRANSACTION columns

| Name             | Type   | Description                                                |
|------------------|--------|------------------------------------------------------------|
| node_name        | name   | Node name                                                  |
| username         | name   | Username                                                   |
| commit_counter   | bigint | Number of user transactions committed                      |
| rollback_counter | bigint | Number of user transactions rolled back                    |
| resp_min         | bigint | Minimum response time of user transactions (unit: $\mu$ s) |

| Name                | Type   | Description                                                      |
|---------------------|--------|------------------------------------------------------------------|
| resp_max            | bigint | Maximum response time of user transactions (unit: $\mu$ s)       |
| resp_avg            | bigint | Average response time of user transactions (unit: $\mu$ s)       |
| resp_total          | bigint | Total response time of user transactions (unit: $\mu$ s)         |
| bg_commit_counter   | bigint | Number of background transactions committed                      |
| bg_rollback_counter | bigint | Number of background transactions rolled back                    |
| bg_resp_min         | bigint | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | bigint | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | bigint | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | bigint | Total response time of background transactions (unit: $\mu$ s)   |

## 13.2.7 Session/Thread

### 13.2.7.1 SESSION\_STAT

**SESSION\_STAT** collects statistics about session status on the current node based on session threads or the **AutoVacuum** thread.

**Table 13-80** SESSION\_STAT columns

| Name     | Type    | Description                     |
|----------|---------|---------------------------------|
| sessid   | text    | Thread start time and ID        |
| statid   | integer | Statistics ID                   |
| statname | text    | Name of the statistics session  |
| statunit | text    | Unit of the statistics session  |
| value    | bigint  | Value of the statistics session |

### 13.2.7.2 GLOBAL\_SESSION\_STAT

**GLOBAL\_SESSION\_STAT** collects statistics about session status on each node based on session threads or the **AutoVacuum** thread.

**Table 13-81** GLOBAL\_SESSION\_STAT columns

| Name      | Type    | Description                     |
|-----------|---------|---------------------------------|
| node_name | name    | Node name                       |
| sessid    | text    | Thread start time and ID        |
| statid    | integer | Statistics ID                   |
| statname  | text    | Name of the statistics session  |
| statunit  | text    | Unit of the statistics session  |
| value     | bigint  | Value of the statistics session |

### 13.2.7.3 SESSION\_TIME

**SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on the current node.

**Table 13-82** SESSION\_TIME columns

| Name      | Type    | Description              |
|-----------|---------|--------------------------|
| sessid    | text    | Thread start time and ID |
| stat_id   | integer | Statistics ID            |
| stat_name | text    | Session type name        |
| value     | bigint  | Session value            |

### 13.2.7.4 GLOBAL\_SESSION\_TIME

**GLOBAL\_SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on each node, as shown in [Table 13-83](#).

**Table 13-83** GLOBAL\_SESSION\_TIME columns

| Name      | Type    | Description              |
|-----------|---------|--------------------------|
| node_name | name    | Node name                |
| sessid    | text    | Thread start time and ID |
| stat_id   | integer | Statistics ID            |

| Name      | Type   | Description   |
|-----------|--------|---------------|
| stat_name | text   | Session type  |
| value     | bigint | Session value |

### 13.2.7.5 SESSION\_MEMORY

SESSION\_MEMORY collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users, as shown in [Table 13-84](#).

**Table 13-84** SESSION\_MEMORY columns

| Name     | Type    | Description                                                                       |
|----------|---------|-----------------------------------------------------------------------------------|
| sessid   | text    | Thread start time and ID                                                          |
| init_mem | integer | Memory allocated to the currently executed job before the job enters the executor |
| used_mem | integer | Memory allocated to the currently executed job                                    |
| peak_mem | integer | Peak memory allocated to the currently executed job                               |

### 13.2.7.6 GLOBAL\_SESSION\_MEMORY

GLOBAL\_SESSION\_MEMORY collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users, as shown in [Table 13-85](#).

**Table 13-85** GLOBAL\_SESSION\_MEMORY columns

| Name      | Type    | Description                                                                       |
|-----------|---------|-----------------------------------------------------------------------------------|
| node_name | name    | Node name                                                                         |
| sessid    | text    | Thread start time and ID                                                          |
| init_mem  | integer | Memory allocated to the currently executed job before the job enters the executor |
| used_mem  | integer | Memory allocated to the currently executed job                                    |
| peak_mem  | integer | Peak memory allocated to the currently executed job                               |

### 13.2.7.7 SESSION\_MEMORY\_DETAIL

SESSION\_MEMORY\_DETAIL collects statistics on the memory usage of threads on the current node, in the unit specified by **MemoryContext**, as shown in [Table 13-86](#).

**Table 13-86** SESSION\_MEMORY\_DETAIL columns

| Name        | Type     | Description                               |
|-------------|----------|-------------------------------------------|
| sessid      | text     | Thread start time and ID                  |
| sesstype    | text     | Thread name                               |
| contextname | text     | Name of the memory context                |
| level       | smallint | Level of memory context importance        |
| parent      | text     | Name of the parent memory context         |
| totalsize   | bigint   | Size of the allocated memory (unit: byte) |
| freesize    | bigint   | Size of the idle memory (unit: byte)      |
| usedsize    | bigint   | Size of the used memory (unit: byte)      |

### 13.2.7.8 GLOBAL\_SESSION\_MEMORY\_DETAIL

GLOBAL\_SESSION\_MEMORY\_DETAIL collects statistics about thread memory usage on each node by MemoryContext node.

**Table 13-87** GLOBAL\_SESSION\_MEMORY\_DETAIL columns

| Name        | Type     | Description                               |
|-------------|----------|-------------------------------------------|
| node_name   | name     | Node name                                 |
| sessid      | text     | Thread start time and ID                  |
| sesstype    | text     | Thread name                               |
| contextname | text     | Name of the memory context                |
| level       | smallint | Level of memory context importance        |
| parent      | text     | Name of the parent memory context         |
| totalsize   | bigint   | Size of the allocated memory (unit: byte) |
| freesize    | bigint   | Size of the idle memory (unit: byte)      |
| usedsize    | bigint   | Size of the used memory (unit: byte)      |

### 13.2.7.9 SESSION\_STAT\_ACTIVITY

**SESSION\_STAT\_ACTIVITY** displays information about threads that are running on the current node.

**Table 13-88** SESSION\_STAT\_ACTIVITY columns

| Name             | Type                     | Description                                                                                                                                                                                                                                                              |
|------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid            | oid                      | OID of the database that the user session connects to in the backend                                                                                                                                                                                                     |
| datname          | name                     | Name of the database that the user session connects to in the backend                                                                                                                                                                                                    |
| pid              | bigint                   | Backend thread ID                                                                                                                                                                                                                                                        |
| usesysid         | oid                      | OID of the user logged in to the backend                                                                                                                                                                                                                                 |
| username         | name                     | Name of the user logged in to the backend                                                                                                                                                                                                                                |
| application_name | text                     | Name of the application connected to the backend                                                                                                                                                                                                                         |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected through a Unix socket on the server or this is an internal thread, for example, <b>autovacuum</b> is displayed for the thread autovacuum. |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                                                                        |
| client_port      | integer                  | TCP port number that the client uses for communication with this backend ( <b>-1</b> if a Unix socket is used).                                                                                                                                                          |
| backend_start    | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                                                                     |
| xact_start       | timestamp with time zone | Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.                                                 |

| Name         | Type                     | Description                                                                                                                                                                                                                                                                                |
|--------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query_start  | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure. |
| state_change | timestamp with time zone | Time when the <b>state</b> was last changed                                                                                                                                                                                                                                                |
| waiting      | boolean                  | Specifies whether the backend is currently waiting on a lock. If so, the value is <b>true</b> .                                                                                                                                                                                            |
| enqueue      | text                     | Unsupported currently.                                                                                                                                                                                                                                                                     |

| Name          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state         | text   | <p>Overall status of this backend. Its value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but is not currently executing a query.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b><br/>Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>openGauss=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname    username   usesysid   state    pid -----+-----+-----+-----+----- +-----+-----+-----+-----+----- +-----+-----+-----+-----+----- testdb   omm        10        idle    139968752121616 testdb   omm        10        idle    139968903116560 db_tpcds   judy       16398     active   139968391403280 testdb   omm        10        idle    139968643069712 testdb   omm        10        idle    139968680818448 testdb   joe        16390     idle    139968563377936 (6 rows)</pre> |

| datname          | text                     | Name of the database that the user session connects to in the backend                                                                                                                                                                                                    |
| pid              | bigint                   | Backend thread ID                                                                                                                                                                                                                                                        |
| usesysid         | oid                      | OID of the user logged in to the backend                                                                                                                                                                                                                                 |
| username         | text                     | Name of the user logged in to the backend                                                                                                                                                                                                                                |
| application_name | text                     | Name of the application connected to the backend                                                                                                                                                                                                                         |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected through a Unix socket on the server or this is an internal thread, for example, <b>autovacuum</b> is displayed for the thread autovacuum. |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                                                                        |
| client_port      | integer                  | TCP port number that the client uses for communication with this backend (-1 if a Unix socket is used).                                                                                                                                                                  |
| backend_start    | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                                                                     |

| Name         | Type                     | Description                                                                                                                                                                                                                                                                                             |
|--------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xact_start   | timestamp with time zone | Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.                                                                                |
| query_start  | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure. |
| state_change | timestamp with time zone | Time when the <b>state</b> was last changed                                                                                                                                                                                                                                                             |
| waiting      | Boolean                  | Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> .                                                                                                                                                               |
| enqueue      | text                     | Unsupported currently.                                                                                                                                                                                                                                                                                  |

| Name          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| query_id        | bigint  | Query ID. The value of this column is the same as that of <b>debug_query_id</b> .                                                                                                                 |
| tid             | bigint  | Thread ID of the current thread.                                                                                                                                                                  |
| sessionid       | bigint  | Session ID.                                                                                                                                                                                       |
| lwtid           | integer | Lightweight thread ID of the current thread.                                                                                                                                                      |
| psessionid      | bigint  | Parent thread of the streaming thread.                                                                                                                                                            |
| tlevel          | integer | Level of the streaming thread.                                                                                                                                                                    |
| smpid           | integer | Concurrent thread ID.                                                                                                                                                                             |
| wait_status     | text    | Waiting status of the current thread.                                                                                                                                                             |
| wait_event      | text    | If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty. |
| locktag         | text    | Information about the lock that the current thread is waiting for.                                                                                                                                |
| lockmode        | text    | Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.                                                           |
| block_sessionid | bigint  | ID of the session that blocks the current thread from obtaining the lock.                                                                                                                         |

| Name             | Type | Description        |
|------------------|------|--------------------|
| global_sessionid | text | Global session ID. |

### 13.2.7.12 GLOBAL\_THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of backend threads and auxiliary threads on all nodes.

In GLOBAL\_THREAD\_WAIT\_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the database, and the blocking status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL\_THREAD\_WAIT\_STATUS and THREAD\_WAIT\_STATUS are the same, because the essence of the GLOBAL\_THREAD\_WAIT\_STATUS view is the query summary of the THREAD\_WAIT\_STATUS view on each node in the database.

**Table 13-91** GLOBAL\_THREAD\_WAIT\_STATUS columns

| Name        | Type    | Description                                                                                                                                                                                       |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name   | text    | Node name.                                                                                                                                                                                        |
| db_name     | text    | Database name.                                                                                                                                                                                    |
| thread_name | text    | Thread name.                                                                                                                                                                                      |
| query_id    | bigint  | Query ID. The value of this column is the same as that of <b>debug_query_id</b> .                                                                                                                 |
| tid         | bigint  | Thread ID of the current thread.                                                                                                                                                                  |
| sessionid   | bigint  | Session ID.                                                                                                                                                                                       |
| lwtid       | integer | Lightweight thread ID of the current thread.                                                                                                                                                      |
| psessionid  | bigint  | Parent thread of the streaming thread.                                                                                                                                                            |
| tlevel      | integer | Level of the streaming thread.                                                                                                                                                                    |
| smpid       | integer | Concurrent thread ID.                                                                                                                                                                             |
| wait_status | text    | Waiting status of the current thread.                                                                                                                                                             |
| wait_event  | text    | If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty. |
| locktag     | text    | Information about the lock that the current thread is waiting for.                                                                                                                                |

| Name             | Type   | Description                                                                                                                             |
|------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| lockmode         | text   | Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes. |
| block_sessionid  | bigint | ID of the session that blocks the current thread from obtaining the lock.                                                               |
| global_sessionid | text   | Global session ID.                                                                                                                      |

### 13.2.7.13 LOCAL\_THREADPOOL\_STATUS

LOCAL\_THREADPOOL\_STATUS displays the status of worker threads and sessions in a thread pool. This view is valid only when **enable\_thread\_pool** is set to **on**.

**Table 13-92** LOCAL\_THREADPOOL\_STATUS columns

| Name            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name       | text    | Node name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| group_id        | integer | ID of the thread pool group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| bind_numa_id    | integer | NUMA ID to which the thread pool group is bound.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| bind_cpu_number | integer | Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is <b>NULL</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| listener        | integer | Number of listener threads in the thread pool group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| worker_info     | text    | Information about threads in the thread pool, including: <ul style="list-style-type: none"><li>• <b>default</b>: Number of initial threads in the thread pool group</li><li>• <b>new</b>: Number of new threads in the thread pool group</li><li>• <b>expect</b>: Expected number of threads in the thread pool group</li><li>• <b>actual</b>: Actual number of threads in the thread pool group</li><li>• <b>idle</b>: Number of idle threads in the thread pool group</li><li>• <b>pending</b>: Number of pending threads in the thread pool group</li></ul> |

| Name         | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| session_info | text | Information about sessions in the thread pool, including: <ul style="list-style-type: none"><li>● <b>total</b>: Total number of sessions in the thread pool group.</li><li>● <b>waiting</b>: Number of sessions pending scheduling in the thread pool group.</li><li>● <b>running</b>: Number of running sessions in the thread pool group.</li><li>● <b>idle</b>: Number of idle sessions in the thread pool group.</li></ul> |
| stream_info  | text | Stream pool information, including: <ul style="list-style-type: none"><li>● <b>total</b>: total number of threads in the stream pool group.</li><li>● <b>running</b>: number of threads that are being executed in the stream pool.</li><li>● <b>idle</b>: number of idle threads in the stream pool.</li></ul>                                                                                                                |

#### 13.2.7.14 GLOBAL\_THREADPOOL\_STATUS

**GLOBAL\_THREADPOOL\_STATUS** displays the status of worker threads and sessions in thread pools on all nodes. Columns in this view are the same as those in [Table 13-92](#).

#### 13.2.7.15 LOCAL\_ACTIVE\_SESSION

**LOCAL\_ACTIVE\_SESSION** displays samples in the **ACTIVE SESSION PROFILE** memory on the current node.

**Table 13-93** LOCAL\_ACTIVE\_SESSION columns

| Name              | Type                     | Description                                                |
|-------------------|--------------------------|------------------------------------------------------------|
| sampleid          | bigint                   | Sample ID.                                                 |
| sample_time       | timestamp with time zone | Sampling time.                                             |
| need_flush_sample | Boolean                  | Specifies whether the sample needs to be flushed to disks. |
| databaseid        | oid                      | Database ID.                                               |
| thread_id         | bigint                   | Thread ID.                                                 |
| sessionid         | bigint                   | Session ID.                                                |

| Name             | Type                     | Description                                                                                                                                                            |
|------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time       | timestamp with time zone | Start time of a session.                                                                                                                                               |
| event            | text                     | Event name.                                                                                                                                                            |
| lwtid            | integer                  | Lightweight thread ID of the current thread.                                                                                                                           |
| psessionid       | bigint                   | Parent thread of the streaming thread.                                                                                                                                 |
| tlevel           | integer                  | Level of the streaming thread, which corresponds to the level ( <b>id</b> ) of the execution plan.                                                                     |
| smpid            | integer                  | Concurrent thread ID in SMP execution mode.                                                                                                                            |
| userid           | oid                      | ID of a session user.                                                                                                                                                  |
| application_name | text                     | Name of an application.                                                                                                                                                |
| client_addr      | inet                     | IP address of a client.                                                                                                                                                |
| client_hostname  | text                     | Name of a client.                                                                                                                                                      |
| client_port      | integer                  | TCP port number used by a client to communicate with the backend.                                                                                                      |
| query_id         | bigint                   | Debug query ID.                                                                                                                                                        |
| unique_query_id  | bigint                   | Unique query ID.                                                                                                                                                       |
| user_id          | oid                      | User ID in the key of the unique query.                                                                                                                                |
| cn_id            | integer                  | CN ID. On a DN, this parameter indicates the ID of the node that delivers the unique SQL statement, that is, the value of <b>cn_id</b> in the key of the unique query. |
| unique_query     | text                     | Standardized text string of the unique SQL statement.                                                                                                                  |
| locktag          | text                     | Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b>                                                                      |
| lockmode         | text                     | Mode of a lock that the session waits for.                                                                                                                             |
| block_sessionid  | bigint                   | Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.                                                                       |

| Name                  | Type                     | Description                                                                                                                                                                                             |
|-----------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| final_block_sessionid | bigint                   | ID of the blocked session at the source end.                                                                                                                                                            |
| wait_status           | text                     | Provides more details about an event column.                                                                                                                                                            |
| global_sessionid      | text                     | Global session ID.                                                                                                                                                                                      |
| xact_start_time       | timestamp with time zone | Start time of the transaction.                                                                                                                                                                          |
| query_start_time      | timestamp with time zone | Time when the statement starts to be executed.                                                                                                                                                          |
| state                 | text                     | Current statement state.<br>The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> . |

## 13.2.8 Transaction

### 13.2.8.1 TRANSACTIONS\_PREPARED\_XACTS

TRANSACTIONS\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit.

**Table 13-94** TRANSACTIONS\_PREPARED\_XACTS columns

| Name        | Type                     | Description                                                        |
|-------------|--------------------------|--------------------------------------------------------------------|
| transaction | xid                      | Numeric transaction identifier of the prepared transaction         |
| gid         | text                     | Global transaction identifier that was assigned to the transaction |
| prepared    | timestamp with time zone | Time at which the transaction is prepared for commit               |
| owner       | name                     | Name of the user that executes the transaction                     |
| database    | name                     | Name of the database in which the transaction is executed          |

### 13.2.8.2 SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS

SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit on the primary database node in the database.

**Table 13-95** SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS columns

| Name        | Type                     | Description                                                        |
|-------------|--------------------------|--------------------------------------------------------------------|
| transaction | xid                      | Numeric transaction identifier of the prepared transaction         |
| gid         | text                     | Global transaction identifier that was assigned to the transaction |
| prepared    | timestamp with time zone | Time at which the transaction is prepared for commit               |
| owner       | name                     | Name of the user that executes the transaction                     |
| database    | name                     | Name of the database in which the transaction is executed          |

### 13.2.8.3 GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS

GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit on each node.

**Table 13-96** GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS columns

| Name        | Type                     | Description                                                        |
|-------------|--------------------------|--------------------------------------------------------------------|
| transaction | xid                      | Numeric transaction identifier of the prepared transaction         |
| gid         | text                     | Global transaction identifier that was assigned to the transaction |
| prepared    | timestamp with time zone | Time at which the transaction is prepared for commit               |
| owner       | name                     | Name of the user that executes the transaction                     |
| database    | name                     | Name of the database in which the transaction is executed          |

### 13.2.8.4 TRANSACTIONS\_RUNNING\_XACTS

Displays information about running transactions on the current node.

**Table 13-97** TRANSACTIONS\_RUNNING\_XACTS columns

| Name        | Type    | Description                                                                                                                                                                                       |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| handle      | integer | Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .                                                                                          |
| gxid        | xid     | Transaction ID.                                                                                                                                                                                   |
| state       | tinyint | Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).                                                                                                                                   |
| node        | text    | Node name.                                                                                                                                                                                        |
| xmin        | xid     | Minimum transaction ID on the node.                                                                                                                                                               |
| vacuum      | Boolean | Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no</li></ul> |
| timeline    | bigint  | Number of database restarts.                                                                                                                                                                      |
| prepare_xid | xid     | Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .                                                                                        |
| pid         | bigint  | Thread ID corresponding to the transaction.                                                                                                                                                       |
| next_xid    | xid     | Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .                                                                                                          |

### 13.2.8.5 SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS

SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS displays the summary of running transactions on the primary database node.

**Table 13-98** SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS columns

| Name   | Type    | Description                                                                                              |
|--------|---------|----------------------------------------------------------------------------------------------------------|
| handle | integer | Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> . |
| gxid   | xid     | Transaction ID.                                                                                          |
| state  | tinyint | Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).                                          |
| node   | text    | Node name.                                                                                               |
| xmin   | xid     | Minimum transaction ID on the node.                                                                      |
| vacuum | Boolean | Specifies whether the current transaction is lazy vacuum.                                                |

| Name        | Type   | Description                                                                                                                                                                                       |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeline    | bigint | Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no</li></ul> |
| prepare_xid | xid    | Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .                                                                                        |
| pid         | bigint | Thread ID corresponding to the transaction.                                                                                                                                                       |
| next_xid    | xid    | Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .                                                                                                          |

### 13.2.8.6 GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS

GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS displays the summary of running transactions on the primary database node.

**Table 13-99** GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS columns

| Name        | Type    | Description                                                                                                                                                                                       |
|-------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| handle      | integer | Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .                                                                                          |
| gxid        | xid     | Transaction ID.                                                                                                                                                                                   |
| state       | tinyint | Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).                                                                                                                                   |
| node        | text    | Node name.                                                                                                                                                                                        |
| xmin        | xid     | Minimum transaction ID on the node.                                                                                                                                                               |
| vacuum      | Boolean | Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no</li></ul> |
| timeline    | bigint  | Number of database restarts.                                                                                                                                                                      |
| prepare_xid | xid     | Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .                                                                                        |
| pid         | bigint  | Thread ID corresponding to the transaction.                                                                                                                                                       |
| next_xid    | xid     | Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .                                                                                                          |

## 13.2.9 Query

### 13.2.9.1 STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node. To query a view, you must have the SYSADMIN or MONADMIN permission. You can view all statistics about normalized SQL statements received by the primary database node and other database nodes, whereas you can view only the statistics about normalized SQL statements executed on other database nodes.

#### NOTE

**unique\_sql\_id** generated by different **savepoint\_name** values is different. When a large number of **savepoint\_name** is used, the number of **unique\_sql\_id** values generated in the system increases rapidly. If the number of **unique\_sql\_id** values is greater than the number of **instr\_unique\_sql\_count** values, the newly generated **unique\_sql\_id** information is not counted.

**Table 13-100** STATEMENT columns

| Name              | Type    | Description                                                                                       |
|-------------------|---------|---------------------------------------------------------------------------------------------------|
| node_name         | name    | Node name.                                                                                        |
| node_id           | integer | ID of a node.                                                                                     |
| user_name         | name    | Username.                                                                                         |
| user_id           | oid     | OID of the user.                                                                                  |
| unique_sql_id     | bigint  | ID of the normalized SQL statement.                                                               |
| query             | text    | Normalized SQL statement.<br>Note: The length is controlled by <b>track_activity_query_size</b> . |
| n_calls           | bigint  | Number of calls.                                                                                  |
| min_elapse_time   | bigint  | Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s).                        |
| max_elapse_time   | bigint  | Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s).                        |
| total_elapse_time | bigint  | Total execution time of the SQL statement in the kernel (unit: $\mu$ s).                          |
| n_returned_rows   | bigint  | Number of rows in the result set returned by the SELECT statement.                                |
| n_tuples_fetched  | bigint  | Number of rows randomly scanned.                                                                  |
| n_tuples_returned | bigint  | Number of rows sequentially scanned.                                                              |
| n_tuples_inserted | bigint  | Number of rows inserted.                                                                          |

| Name                | Type   | Description                                                                                                                                                                                                                           |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n_tuples_updated    | bigint | Number of rows updated.                                                                                                                                                                                                               |
| n_tuples_deleted    | bigint | Number of rows deleted.                                                                                                                                                                                                               |
| n_blocks_fetched    | bigint | Number of logical reads.                                                                                                                                                                                                              |
| n_blocks_hit        | bigint | Number of memory hits.                                                                                                                                                                                                                |
| n_soft_parse        | bigint | Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . |
| n_hard_parse        | bigint | Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . |
| db_time             | bigint | Valid internal database time, which is accumulated if multiple threads are involved (unit: $\mu$ s).                                                                                                                                  |
| cpu_time            | bigint | CPU time (unit: $\mu$ s).                                                                                                                                                                                                             |
| execution_time      | bigint | Execution time in the executor (unit: $\mu$ s).                                                                                                                                                                                       |
| parse_time          | bigint | SQL parsing time (unit: $\mu$ s).                                                                                                                                                                                                     |
| plan_time           | bigint | SQL plan generation time (unit: $\mu$ s).                                                                                                                                                                                             |
| rewrite_time        | bigint | SQL rewriting time (unit: $\mu$ s).                                                                                                                                                                                                   |
| pl_execution_time   | bigint | Execution time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                           |
| pl_compilation_time | bigint | Compilation time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                         |
| data_io_time        | bigint | I/O time (unit: $\mu$ s).                                                                                                                                                                                                             |
| net_send_info       | text   | Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.                                     |
| net_rcv_info        | text   | Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.                                 |

| Name                 | Type                     | Description                                                                                                                                                                                          |
|----------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| net_stream_send_info | text                     | Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.     |
| net_stream_rcv_info  | text                     | Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode. |
| sort_count           | bigint                   | Sorting count.                                                                                                                                                                                       |
| sort_time            | bigint                   | Sorting duration (unit: $\mu$ s).                                                                                                                                                                    |
| sort_mem_used        | bigint                   | Size of work memory used during sorting (unit: KB).                                                                                                                                                  |
| sort_spill_count     | bigint                   | Count of file writing when data is flushed to disks during sorting.                                                                                                                                  |
| sort_spill_size      | bigint                   | File size used when data is flushed to disks during sorting (unit: KB).                                                                                                                              |
| hash_count           | bigint                   | Hashing count.                                                                                                                                                                                       |
| hash_time            | bigint                   | Hashing duration (unit: $\mu$ s).                                                                                                                                                                    |
| hash_mem_used        | bigint                   | Size of work memory used during hashing (unit: KB).                                                                                                                                                  |
| hash_spill_count     | bigint                   | Number of file writes when data is flushed to disks during hashing.                                                                                                                                  |
| hash_spill_size      | bigint                   | File size used when data is flushed to disks during hashing (unit: KB).                                                                                                                              |
| last_updated         | timestamp with time zone | Last time when the statement was updated.                                                                                                                                                            |

### 13.2.9.2 SUMMARY\_STATEMENT

SUMMARY\_STATEMENT obtains full information about executed statements (normalized SQL statements) on the primary database node.

**Table 13-101** SUMMARY\_STATEMENT columns

| Name      | Type | Description |
|-----------|------|-------------|
| node_name | name | Node name.  |

| Name              | Type    | Description                                                                                          |
|-------------------|---------|------------------------------------------------------------------------------------------------------|
| node_id           | integer | ID of a node.                                                                                        |
| user_name         | name    | Username.                                                                                            |
| user_id           | oid     | OID of the user.                                                                                     |
| unique_sql_id     | bigint  | ID of the normalized SQL statement.                                                                  |
| query             | text    | Normalized SQL statement.<br>Note: The length is controlled by <b>track_activity_query_size</b> .    |
| n_calls           | bigint  | Number of calls.                                                                                     |
| min_elapse_time   | bigint  | Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s).                           |
| max_elapse_time   | bigint  | Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s).                           |
| total_elapse_time | bigint  | Total execution time of the SQL statement in the kernel (unit: $\mu$ s).                             |
| n_returned_rows   | bigint  | Number of rows in the result set returned by the SELECT statement.                                   |
| n_tuples_fetched  | bigint  | Number of rows randomly scanned.                                                                     |
| n_tuples_returned | bigint  | Number of rows sequentially scanned.                                                                 |
| n_tuples_inserted | bigint  | Number of rows inserted.                                                                             |
| n_tuples_updated  | bigint  | Number of rows updated.                                                                              |
| n_tuples_deleted  | bigint  | Number of rows deleted.                                                                              |
| n_blocks_fetched  | bigint  | Number of logical reads.                                                                             |
| n_blocks_hit      | bigint  | Number of memory hits.                                                                               |
| n_soft_parse      | bigint  | Number of soft parsing times.                                                                        |
| n_hard_parse      | bigint  | Number of hard parsing times.                                                                        |
| db_time           | bigint  | Valid internal database time, which is accumulated if multiple threads are involved (unit: $\mu$ s). |
| cpu_time          | bigint  | CPU time (unit: $\mu$ s).                                                                            |
| execution_time    | bigint  | Execution time in the executor (unit: $\mu$ s).                                                      |
| parse_time        | bigint  | SQL parsing time (unit: $\mu$ s).                                                                    |
| plan_time         | bigint  | SQL plan generation time (unit: $\mu$ s).                                                            |
| rewrite_time      | bigint  | SQL rewriting time (unit: $\mu$ s).                                                                  |

| Name                 | Type                     | Description                                                                                                                                                                                           |
|----------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pl_execution_time    | bigint                   | Execution time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                           |
| pl_compilation_time  | bigint                   | Compilation time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                         |
| data_io_time         | bigint                   | I/O time (unit: $\mu$ s).                                                                                                                                                                             |
| net_send_info        | text                     | Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.     |
| net_rcv_info         | text                     | Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode. |
| net_stream_send_info | text                     | Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.      |
| net_stream_rcv_info  | text                     | Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.  |
| last_updated         | timestamp with time zone | Last time when the statement was updated.                                                                                                                                                             |
| sort_count           | bigint                   | Sorting count.                                                                                                                                                                                        |
| sort_time            | bigint                   | Sorting duration (unit: $\mu$ s).                                                                                                                                                                     |
| sort_mem_used        | bigint                   | Size of work memory used during sorting (unit: KB).                                                                                                                                                   |
| sort_spill_count     | bigint                   | Count of file writing when data is flushed to disks during sorting.                                                                                                                                   |
| sort_spill_size      | bigint                   | File size used when data is flushed to disks during sorting (unit: KB).                                                                                                                               |
| hash_count           | bigint                   | Hashing count.                                                                                                                                                                                        |
| hash_time            | bigint                   | Hashing duration (unit: $\mu$ s).                                                                                                                                                                     |
| hash_mem_used        | bigint                   | Size of work memory used during hashing (unit: KB).                                                                                                                                                   |

| Name             | Type   | Description                                                             |
|------------------|--------|-------------------------------------------------------------------------|
| hash_spill_count | bigint | Number of file writes when data is flushed to disks during hashing.     |
| hash_spill_size  | bigint | File size used when data is flushed to disks during hashing (unit: KB). |

### 13.2.9.3 STATEMENT\_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database.

#### NOTE

By querying the STATEMENT\_COUNT view, a common user can view statistics only about this user on the current node, whereas an administrator can view statistics about all users on the current node. When the database or the node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including a query inside the database. For example, when the primary database node receives a query and the query contains multiple subqueries, the number of subqueries is counted on the database node.

**Table 13-102** STATEMENT\_COUNT columns

| Name                | Type   | Description                                                       |
|---------------------|--------|-------------------------------------------------------------------|
| node_name           | text   | Node name.                                                        |
| user_name           | text   | Username                                                          |
| select_count        | bigint | Statistical result of the <b>SELECT</b> statement                 |
| update_count        | bigint | Statistical result of the <b>UPDATE</b> statement                 |
| insert_count        | bigint | Statistical result of the <b>INSERT</b> statement                 |
| delete_count        | bigint | Statistical result of the <b>DELETE</b> statement                 |
| mergeinto_count     | bigint | Statistical result of the <b>MERGE INTO</b> statement             |
| ddl_count           | bigint | Number of DDL statements                                          |
| dml_count           | bigint | Number of DML statements                                          |
| dcl_count           | bigint | Number of DCL statements                                          |
| total_select_elapse | bigint | Total response time of <b>SELECT</b> statements (unit: $\mu$ s)   |
| avg_select_elapse   | bigint | Average response time of <b>SELECT</b> statements (unit: $\mu$ s) |

| Name                | Type   | Description                                                       |
|---------------------|--------|-------------------------------------------------------------------|
| max_select_elapse   | bigint | Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| min_select_elapse   | bigint | Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| total_update_elapse | bigint | Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)   |
| avg_update_elapse   | bigint | Average response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| max_update_elapse   | bigint | Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| min_update_elapse   | bigint | Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| total_insert_elapse | bigint | Total response time of <b>INSERT</b> statements (unit: $\mu$ s)   |
| avg_insert_elapse   | bigint | Average response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| max_insert_elapse   | bigint | Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| min_insert_elapse   | bigint | Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| total_delete_elapse | bigint | Total response time of <b>DELETE</b> statements (unit: $\mu$ s)   |
| avg_delete_elapse   | bigint | Average response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| max_delete_elapse   | bigint | Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| min_delete_elapse   | bigint | Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s) |

#### 13.2.9.4 GLOBAL\_STATEMENT\_COUNT

**GLOBAL\_STATEMENT\_COUNT** displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database.

**Table 13-103** GLOBAL\_STATEMENT\_COUNT columns

| Name      | Type | Description |
|-----------|------|-------------|
| node_name | text | Node name   |

| Name                | Type   | Description                                                       |
|---------------------|--------|-------------------------------------------------------------------|
| user_name           | text   | Username                                                          |
| select_count        | bigint | Statistical result of the <b>SELECT</b> statement                 |
| update_count        | bigint | Statistical result of the <b>UPDATE</b> statement                 |
| insert_count        | bigint | Statistical result of the <b>INSERT</b> statement                 |
| delete_count        | bigint | Statistical result of the <b>DELETE</b> statement                 |
| mergeinto_count     | bigint | Statistical result of the <b>MERGE INTO</b> statement             |
| ddl_count           | bigint | Number of DDL statements                                          |
| dml_count           | bigint | Number of DML statements                                          |
| dcl_count           | bigint | Number of DCL statements                                          |
| total_select_elapse | bigint | Total response time of <b>SELECT</b> statements (unit: $\mu$ s)   |
| avg_select_elapse   | bigint | Average response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| max_select_elapse   | bigint | Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| min_select_elapse   | bigint | Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| total_update_elapse | bigint | Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)   |
| avg_update_elapse   | bigint | Average response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| max_update_elapse   | bigint | Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| min_update_elapse   | bigint | Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| total_insert_elapse | bigint | Total response time of <b>INSERT</b> statements (unit: $\mu$ s)   |
| avg_insert_elapse   | bigint | Average response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| max_insert_elapse   | bigint | Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| min_insert_elapse   | bigint | Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s) |

| Name                | Type   | Description                                                       |
|---------------------|--------|-------------------------------------------------------------------|
| total_delete_elapse | bigint | Total response time of <b>DELETE</b> statements (unit: $\mu$ s)   |
| avg_delete_elapse   | bigint | Average response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| max_delete_elapse   | bigint | Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| min_delete_elapse   | bigint | Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s) |

### 13.2.9.5 SUMMARY\_STATEMENT\_COUNT

SUMMARY\_STATEMENT\_COUNT displays the summary statistics of five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) and DDL, DML, and DCL statements executed on each database node.

**Table 13-104** SUMMARY\_STATEMENT\_COUNT columns

| Name                | Type    | Description                                                       |
|---------------------|---------|-------------------------------------------------------------------|
| user_name           | text    | Username                                                          |
| select_count        | numeric | Statistical result of the <b>SELECT</b> statement                 |
| update_count        | numeric | Statistical result of the <b>UPDATE</b> statement                 |
| insert_count        | numeric | Statistical result of the <b>INSERT</b> statement                 |
| delete_count        | numeric | Statistical result of the <b>DELETE</b> statement                 |
| mergeinto_count     | numeric | Statistical result of the <b>MERGE INTO</b> statement             |
| ddl_count           | numeric | Number of DDL statements                                          |
| dml_count           | numeric | Number of DML statements                                          |
| dcl_count           | numeric | Number of DCL statements                                          |
| total_select_elapse | numeric | Total response time of <b>SELECT</b> statements (unit: $\mu$ s)   |
| avg_select_elapse   | bigint  | Average response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| max_select_elapse   | bigint  | Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s) |

| Name                | Type    | Description                                                       |
|---------------------|---------|-------------------------------------------------------------------|
| min_select_elapse   | bigint  | Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s) |
| total_update_elapse | numeric | Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)   |
| avg_update_elapse   | bigint  | Average response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| max_update_elapse   | bigint  | Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| min_update_elapse   | bigint  | Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s) |
| total_insert_elapse | numeric | Total response time of <b>INSERT</b> statements (unit: $\mu$ s)   |
| avg_insert_elapse   | bigint  | Average response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| max_insert_elapse   | bigint  | Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| min_insert_elapse   | bigint  | Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s) |
| total_delete_elapse | numeric | Total response time of <b>DELETE</b> statements (unit: $\mu$ s)   |
| avg_delete_elapse   | bigint  | Average response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| max_delete_elapse   | bigint  | Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s) |
| min_delete_elapse   | bigint  | Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s) |

### 13.2.9.6 STATEMENT\_RESPONSETIME\_PERCENTILE

STATEMENT\_RESPONSETIME\_PERCENTILE obtains the response times of 80% and 95% SQL statements in the database.

**Table 13-105** STATEMENT\_RESPONSETIME\_PERCENTILE columns

| Name | Type   | Description                                                         |
|------|--------|---------------------------------------------------------------------|
| p80  | bigint | Response time of 80% SQL statements in the database (unit: $\mu$ s) |
| p95  | bigint | Response time of 95% SQL statements in the database (unit: $\mu$ s) |

### 13.2.9.7 STATEMENT\_HISTORY

Displays information about statements executed on the current node. To query a view, you must have the SYSADMIN or MONADMIN permission. The result can be queried only in the system database but cannot be queried in the user database.

**Table 13-106** STATEMENT\_HISTORY columns

| Name               | Type                     | Description                                                                                                                                                                                                                           |
|--------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbname             | name                     | Database name.                                                                                                                                                                                                                        |
| schemaname         | name                     | Schema name.                                                                                                                                                                                                                          |
| origin_node        | integer                  | Node name.                                                                                                                                                                                                                            |
| user_name          | name                     | Username.                                                                                                                                                                                                                             |
| application_name   | text                     | Name of the application that sends a request.                                                                                                                                                                                         |
| client_addr        | text                     | IP address of the client that sends a request.                                                                                                                                                                                        |
| client_port        | integer                  | Port number of the client that sends a request.                                                                                                                                                                                       |
| unique_query_id    | bigint                   | ID of the normalized SQL statement.                                                                                                                                                                                                   |
| debug_query_id     | bigint                   | ID of the unique SQL statement.                                                                                                                                                                                                       |
| query              | text                     | Normalized SQL statement.                                                                                                                                                                                                             |
| start_time         | timestamp with time zone | Time when a statement starts.                                                                                                                                                                                                         |
| finish_time        | timestamp with time zone | Time when a statement ends.                                                                                                                                                                                                           |
| slow_sql_threshold | bigint                   | Standard for slow SQL statement execution.                                                                                                                                                                                            |
| transaction_id     | bigint                   | Transaction ID.                                                                                                                                                                                                                       |
| thread_id          | bigint                   | ID of an execution thread.                                                                                                                                                                                                            |
| session_id         | bigint                   | Session ID of a user.                                                                                                                                                                                                                 |
| n_soft_parse       | bigint                   | Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . |

| Name                | Type   | Description                                                                                                                                                                                                                           |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n_hard_parse        | bigint | Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> . |
| query_plan          | text   | Statement execution plan.                                                                                                                                                                                                             |
| n_returned_rows     | bigint | Number of rows in the result set returned by the SELECT statement.                                                                                                                                                                    |
| n_tuples_fetched    | bigint | Number of rows randomly scanned.                                                                                                                                                                                                      |
| n_tuples_returned   | bigint | Number of rows sequentially scanned.                                                                                                                                                                                                  |
| n_tuples_inserted   | bigint | Number of rows inserted.                                                                                                                                                                                                              |
| n_tuples_updated    | bigint | Number of rows updated.                                                                                                                                                                                                               |
| n_tuples_deleted    | bigint | Number of rows deleted.                                                                                                                                                                                                               |
| n_blocks_fetched    | bigint | Number of buffer block access times.                                                                                                                                                                                                  |
| n_blocks_hit        | bigint | Number of buffer block hits.                                                                                                                                                                                                          |
| db_time             | bigint | Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).                                                                                                                                                 |
| cpu_time            | bigint | CPU time (unit: $\mu$ s).                                                                                                                                                                                                             |
| execution_time      | bigint | Execution time in the executor (unit: $\mu$ s).                                                                                                                                                                                       |
| parse_time          | bigint | SQL parsing time (unit: $\mu$ s).                                                                                                                                                                                                     |
| plan_time           | bigint | SQL plan generation time (unit: $\mu$ s).                                                                                                                                                                                             |
| rewrite_time        | bigint | SQL rewriting time (unit: $\mu$ s).                                                                                                                                                                                                   |
| pl_execution_time   | bigint | Execution time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                           |
| pl_compilation_time | bigint | Compilation time of PL/pgSQL (unit: $\mu$ s).                                                                                                                                                                                         |
| data_io_time        | bigint | I/O time (unit: $\mu$ s).                                                                                                                                                                                                             |

| Name                 | Type   | Description                                                                                                                                                                                           |
|----------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| net_send_info        | text   | Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.     |
| net_rcv_info         | text   | Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode. |
| net_stream_send_info | text   | Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.      |
| net_stream_rcv_info  | text   | Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.  |
| lock_count           | bigint | Number of locks.                                                                                                                                                                                      |
| lock_time            | bigint | Time required for locking.                                                                                                                                                                            |
| lock_wait_count      | bigint | Number of lock waits.                                                                                                                                                                                 |
| lock_wait_time       | bigint | Time required for lock waiting.                                                                                                                                                                       |
| lock_max_count       | bigint | Maximum number of locks.                                                                                                                                                                              |
| lwlock_count         | bigint | Number of lightweight locks (reserved).                                                                                                                                                               |
| lwlock_wait_count    | bigint | Number of lightweight lock waits.                                                                                                                                                                     |
| lwlock_time          | bigint | Time required for lightweight locking (reserved).                                                                                                                                                     |
| lwlock_wait_time     | bigint | Time required for lightweight locking.                                                                                                                                                                |

| Name        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| details     | bytea   | List of statement lock events, which are recorded in time sequence. The number of records is affected by the <b>track_stmt_details_size</b> parameter.<br>Events include: <ul style="list-style-type: none"><li>• Start locking.</li><li>• Complete locking.</li><li>• Start lock waiting.</li><li>• Complete lock waiting.</li><li>• Start unlocking.</li><li>• Complete unlocking.</li><li>• Start lightweight lock waiting.</li><li>• Complete lightweight lock waiting.</li></ul>                                                                                                                                                                                        |
| is_slow_sql | Boolean | Specifies whether the SQL statement is a slow SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| trace_id    | text    | Driver-specific trace ID, which is associated with an application request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| advise      | text    | Risks which may cause slow SQL statements. (Multiple risks may exist at the same time.) <ul style="list-style-type: none"><li>• Cast Function Cause Index Miss. : Index matching may fail due to implicit conversion.</li><li>• Limit too much rows. : The SQL statement execution may slow down due to a large <b>limit</b> value.</li><li>• Proleakproof of function is false. : The <b>proleakproof</b> of the function is set to <b>false</b>. In this case, the function does not use statistics when generating a plan due to data leakage risks. As a result, the accuracy of the generated plan is affected and the SQL statement execution may slow down.</li></ul> |

### 13.2.9.8 GS\_SLOW\_QUERY\_INFO (Deprecated)

GS\_SLOW\_QUERY\_INFO displays the slow query information that has been dumped on the current node. The data is dumped from the kernel to the system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, the system imports the query information from the kernel to the GS\_WLM\_SESSION\_QUERY\_INFO\_ALL system catalog every 3 minutes. This operation occupies storage space and affects performance. You can check

GS\_SLOW\_QUERY\_INFO to view the slow query information that has been dumped. This view has been deprecated in this version.

**Table 13-107** GS\_SLOW\_QUERY\_INFO columns

| Name              | Type                     | Description                                                                                 |
|-------------------|--------------------------|---------------------------------------------------------------------------------------------|
| dbname            | text                     | Database name.                                                                              |
| schemaname        | text                     | Schema name.                                                                                |
| nodename          | text                     | Node name.                                                                                  |
| username          | text                     | Username.                                                                                   |
| queryid           | bigint                   | Normalization ID.                                                                           |
| query             | text                     | User statement.                                                                             |
| start_time        | timestamp with time zone | Execution start time.                                                                       |
| finish_time       | timestamp with time zone | Execution end time.                                                                         |
| duration          | bigint                   | Execution duration (unit: ms).                                                              |
| query_plan        | text                     | Plan information.                                                                           |
| n_returned_rows   | bigint                   | Number of rows in the result set returned by the SELECT statement.                          |
| n_tuples_fetched  | bigint                   | Number of rows randomly scanned.                                                            |
| n_tuples_returned | bigint                   | Number of rows sequentially scanned.                                                        |
| n_tuples_inserted | bigint                   | Number of rows inserted.                                                                    |
| n_tuples_updated  | bigint                   | Number of rows updated.                                                                     |
| n_tuples_deleted  | bigint                   | Number of rows deleted.                                                                     |
| n_blocks_fetched  | bigint                   | Number of cache loading times.                                                              |
| n_blocks_hit      | bigint                   | Number of cache hits.                                                                       |
| db_time           | bigint                   | Valid database time, which is accumulated if multiple threads are involved (unit: $\mu$ s). |
| cpu_time          | bigint                   | CPU time (unit: $\mu$ s).                                                                   |

| Name                | Type   | Description                                              |
|---------------------|--------|----------------------------------------------------------|
| execution_time      | bigint | Execution time in the executor (unit: $\mu$ s).          |
| parse_time          | bigint | SQL parsing time (unit: $\mu$ s).                        |
| plan_time           | bigint | SQL plan generation time (unit: $\mu$ s).                |

| pl_execution_time   | bigint | Execution time of PL/pgSQL statements (unit: $\mu$ s).   |
| pl_compilation_time | bigint | Compilation time of PL/pgSQL statements (unit: $\mu$ s). |
| net_send_time       | bigint | Network time (unit: $\mu$ s).                            |
| data_io_time        | bigint | I/O time (unit: $\mu$ s).                                |

### 13.2.9.9 GS\_SLOW\_QUERY\_HISTORY (Deprecated)

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on the current node. For details, see **GS\_SLOW\_QUERY\_INFO**. Only the **system admin** and **monitor admin** users have the permission to query this view. This view is deprecated in this version.

### 13.2.9.10 GLOBAL\_SLOW\_QUERY\_HISTORY (Deprecated)

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on all nodes. This view is deprecated in this version. For details, see **GS\_SLOW\_QUERY\_INFO**.

### 13.2.9.11 GLOBAL\_SLOW\_QUERY\_INFO (Deprecated)

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that has been dumped on all nodes. This view is deprecated in this version. For details, see **GS\_SLOW\_QUERY\_INFO**.

## 13.2.10 Cache/IO

### 13.2.10.1 STATIO\_USER\_TABLES

**STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in the namespace.

**Table 13-108** STATIO\_USER\_TABLES columns

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| relid           | oid    | Table OID                                                                   |
| schemaname      | name   | Name of the schema that the table is in                                     |
| relname         | name   | Table name                                                                  |
| heap_blks_read  | bigint | Number of disk blocks read from the table                                   |
| heap_blks_hit   | bigint | Number of cache hits in the table                                           |
| idx_blks_read   | bigint | Number of disk blocks read from indexes in the table                        |
| idx_blks_hit    | bigint | Number of cache hits in indexes in the table                                |
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.2 SUMMARY\_STATIO\_USER\_TABLES

SUMMARY\_STATIO\_USER\_TABLES displays a summary of I/O status information about user relationship tables of each node in the database.

**Table 13-109** SUMMARY\_STATIO\_USER\_TABLES columns

| Name           | Type    | Description                                              |
|----------------|---------|----------------------------------------------------------|
| schemaname     | name    | Name of the schema that contains the table               |
| relname        | name    | Table name.                                              |
| heap_blks_read | numeric | Number of disk blocks read from the table                |
| heap_blks_hit  | numeric | Number of cache hits in the table                        |
| idx_blks_read  | numeric | Number of disk blocks read from all indexes in the table |
| idx_blks_hit   | numeric | Number of cache hits in the table                        |

| Name            | Type    | Description                                                                 |
|-----------------|---------|-----------------------------------------------------------------------------|
| toast_blks_read | numeric | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | numeric | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | numeric | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | numeric | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.3 GLOBAL\_STATIO\_USER\_TABLES

**GLOBAL\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces on each node.

**Table 13-110** GLOBAL\_STATIO\_USER\_TABLES columns

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| node_name       | name   | Node name                                                                   |
| relid           | oid    | Table OID                                                                   |
| schemaname      | name   | Name of the schema that contains the table                                  |
| relname         | name   | Table name                                                                  |
| heap_blks_read  | bigint | Number of disk blocks read from the table                                   |
| heap_blks_hit   | bigint | Number of cache hits in the table                                           |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in the table                    |
| idx_blks_hit    | bigint | Number of cache hits in the table                                           |
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.4 STATIO\_USER\_INDEXES

**STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on the current node.

**Table 13-111** STATIO\_USER\_INDEXES columns

| Name          | Type   | Description                                     |
|---------------|--------|-------------------------------------------------|
| relid         | oid    | OID of the table that the index is created for  |
| indexrelid    | oid    | OID of the index                                |
| schemaname    | name   | Name of the schema that the index is in         |
| relname       | name   | Name of the table that the index is created for |
| indexrelname  | name   | Index name                                      |
| idx_blks_read | bigint | Number of disk blocks read from the index       |
| idx_blks_hit  | bigint | Number of cache hits in the index               |

### 13.2.10.5 SUMMARY\_STATIO\_USER\_INDEXES

**SUMMARY\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces in the database.

**Table 13-112** SUMMARY\_STATIO\_USER\_INDEXES columns

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |
| idx_blks_hit  | numeric | Number of cache hits in the index               |

### 13.2.10.6 GLOBAL\_STATIO\_USER\_INDEXES

**GLOBAL\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on each node.

**Table 13-113** GLOBAL\_STATIO\_USER\_INDEXES columns

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| node_name     | name    | Node name                                       |
| relid         | oid     | OID of the table that the index is created for  |
| indexrelid    | oid     | OID of the index                                |
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |
| idx_blks_hit  | numeric | Number of cache hits in the index               |

### 13.2.10.7 STATIO\_USER\_SEQUENCES

**STATIO\_USER\_SEQUENCE** displays I/O status information about all user relationship table sequences in namespaces on the current node.

**Table 13-114** STATIO\_USER\_SEQUENCE columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| relid      | oid    | OID of the sequence                          |
| schemaname | name   | Name of the schema that the sequence is in   |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Number of cache hits in the sequence         |

### 13.2.10.8 SUMMARY\_STATIO\_USER\_SEQUENCES

**SUMMARY\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces in the database.

**Table 13-115** SUMMARY\_STATIO\_USER\_SEQUENCES columns

| Name       | Type    | Description                                  |
|------------|---------|----------------------------------------------|
| schemaname | name    | Name of the schema that the sequence is in   |
| relname    | name    | Sequence name                                |
| blks_read  | numeric | Number of disk blocks read from the sequence |
| blks_hit   | numeric | Number of cache hits in the sequence         |

### 13.2.10.9 GLOBAL\_STATIO\_USER\_SEQUENCES

**GLOBAL\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces on each node.

**Table 13-116** GLOBAL\_STATIO\_USER\_SEQUENCES columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| node_name  | name   | Node name                                    |
| relid      | oid    | OID of the sequence                          |
| schemaname | name   | Name of the schema that the sequence is in   |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Number of cache hits in the sequence         |

### 13.2.10.10 STATIO\_SYS\_TABLES

**STATIO\_SYS\_TABLES** displays the I/O status information about all system catalogs in namespaces on the current node.

**Table 13-117** STATIO\_SYS\_TABLES columns

| Name           | Type   | Description                               |
|----------------|--------|-------------------------------------------|
| relid          | oid    | Table OID                                 |
| schemaname     | name   | Name of the schema that the table is in   |
| relname        | name   | Table name                                |
| heap_blks_read | bigint | Number of disk blocks read from the table |

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| heap_blks_hit   | bigint | Number of cache hits in the table                                           |
| idx_blks_read   | bigint | Number of disk blocks read from indexes in the table                        |
| idx_blks_hit    | bigint | Number of cache hits in indexes in the table                                |
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.11 SUMMARY\_STATIO\_SYS\_TABLES

SUMMARY\_STATIO\_SYS\_TABLES displays a summary of I/O status information about system catalogs of each node in the database.

**Table 13-118** SUMMARY\_STATIO\_SYS\_TABLES columns

| Name            | Type    | Description                                                                 |
|-----------------|---------|-----------------------------------------------------------------------------|
| schemaname      | name    | Name of the schema that contains the table                                  |
| relname         | name    | Table name.                                                                 |
| heap_blks_read  | numeric | Number of disk blocks read from the table                                   |
| heap_blks_hit   | numeric | Number of cache hits in the table                                           |
| idx_blks_read   | numeric | Number of disk blocks read from all indexes in the table                    |
| idx_blks_hit    | numeric | Number of cache hits in the table                                           |
| toast_blks_read | numeric | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | numeric | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | numeric | Number of disk blocks read from the TOAST table index (if any) in the table |

| Name          | Type    | Description                                                          |
|---------------|---------|----------------------------------------------------------------------|
| tidx_blks_hit | numeric | Number of buffer-hits in the TOAST table index (if any) in the table |

### 13.2.10.12 GLOBAL\_STATIO\_SYS\_TABLES

**GLOBAL\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces on each node.

**Table 13-119** GLOBAL\_STATIO\_SYS\_TABLES columns

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| node_name       | name   | Node name                                                                   |
| relid           | oid    | Table OID                                                                   |
| schemaname      | name   | Name of the schema that contains the table                                  |
| relname         | name   | Table name                                                                  |
| heap_blks_read  | bigint | Number of disk blocks read from the table                                   |
| heap_blks_hit   | bigint | Number of cache hits in the table                                           |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in the table                    |
| idx_blks_hit    | bigint | Number of cache hits in the table                                           |
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.13 STATIO\_SYS\_INDEXES

**STATIO\_SYS\_INDEXES** displays the I/O status information about all system catalog indexes in the current namespace.

**Table 13-120** STATIO\_SYS\_INDEXES columns

| Name          | Type   | Description                                     |
|---------------|--------|-------------------------------------------------|
| relid         | oid    | OID of the table that the index is created for  |
| indexrelid    | oid    | OID of the index                                |
| schemaname    | name   | Name of the schema that the index is in         |
| relname       | name   | Name of the table that the index is created for |
| indexrelname  | name   | Index name                                      |
| idx_blks_read | bigint | Number of disk blocks read from the index       |
| idx_blks_hit  | bigint | Number of cache hits in the index               |

#### 13.2.10.14 SUMMARY\_STATIO\_SYS\_INDEXES

SUMMARY\_STATIO\_SYS\_INDEXES displays I/O status information about all system catalog indexes in namespaces in the database.

**Table 13-121** SUMMARY\_STATIO\_SYS\_INDEXES columns

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |
| idx_blks_hit  | numeric | Number of cache hits in the index               |

#### 13.2.10.15 GLOBAL\_STATIO\_SYS\_INDEXES

GLOBAL\_STATIO\_SYS\_INDEXES displays I/O status information about all system catalog indexes in namespaces on each node.

**Table 13-122** GLOBAL\_STATIO\_SYS\_INDEXES columns

| Name      | Type | Description                                    |
|-----------|------|------------------------------------------------|
| node_name | name | Node name                                      |
| relid     | oid  | OID of the table that the index is created for |

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| indexrelid    | oid     | OID of the index                                |
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |
| idx_blks_hit  | numeric | Number of cache hits in the index               |

### 13.2.10.16 STATIO\_SYS\_SEQUENCES

**STATIO\_SYS\_SEQUENCES** shows the I/O status information about all the system sequences in the current namespace.

**Table 13-123** STATIO\_SYS\_SEQUENCES columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| relid      | oid    | OID of the sequence                          |
| schemaname | name   | Name of the schema that the sequence is in   |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Number of cache hits in the sequence         |

### 13.2.10.17 SUMMARY\_STATIO\_SYS\_SEQUENCES

**SUMMARY\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces in the database.

**Table 13-124** SUMMARY\_STATIO\_SYS\_SEQUENCES columns

| Name       | Type    | Description                                  |
|------------|---------|----------------------------------------------|
| schemaname | name    | Name of the schema that the sequence is in   |
| relname    | name    | Sequence name                                |
| blks_read  | numeric | Number of disk blocks read from the sequence |

| Name     | Type    | Description                          |
|----------|---------|--------------------------------------|
| blks_hit | numeric | Number of cache hits in the sequence |

### 13.2.10.18 GLOBAL\_STATIO\_SYS\_SEQUENCES

**GLOBAL\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces on each node.

**Table 13-125** GLOBAL\_STATIO\_SYS\_SEQUENCES columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| node_name  | name   | Node name                                    |
| relid      | oid    | OID of the sequence                          |
| schemaname | name   | Name of the schema that the sequence is in   |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Number of cache hits in the sequence         |

### 13.2.10.19 STATIO\_ALL\_TABLES

**STATIO\_ALL\_TABLES** displays the I/O status information about each table (including TOAST tables) of the current node in the database.

**Table 13-126** STATIO\_ALL\_TABLES columns

| Name           | Type   | Description                                              |
|----------------|--------|----------------------------------------------------------|
| relid          | oid    | Table OID                                                |
| schemaname     | name   | Name of the schema that the table is in                  |
| relname        | name   | Table name                                               |
| heap_blks_read | bigint | Number of disk blocks read from the table                |
| heap_blks_hit  | bigint | Number of cache hits in the table                        |
| idx_blks_read  | bigint | Number of disk blocks read from all indexes in the table |
| idx_blks_hit   | bigint | Number of cache hits in indexes in the table             |

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.20 SUMMARY\_STATIO\_ALL\_TABLES

SUMMARY\_STATIO\_ALL\_TABLES displays a summary of the I/O status information about each table (including TOAST tables) of each node in the database.

**Table 13-127** SUMMARY\_STATIO\_ALL\_TABLES columns

| Name            | Type    | Description                                                                 |
|-----------------|---------|-----------------------------------------------------------------------------|
| schemaname      | name    | Name of the schema that contains the table                                  |
| relname         | name    | Table name.                                                                 |
| heap_blks_read  | numeric | Number of disk blocks read from the table                                   |
| heap_blks_hit   | numeric | Number of cache hits in the table                                           |
| idx_blks_read   | numeric | Number of disk blocks read from all indexes in the table                    |
| idx_blks_hit    | numeric | Number of cache hits in the table                                           |
| toast_blks_read | numeric | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | numeric | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | numeric | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | numeric | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.21 GLOBAL\_STATIO\_ALL\_TABLES

**GLOBAL\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases on each node.

**Table 13-128** GLOBAL\_STATIO\_ALL\_TABLES columns

| Name            | Type   | Description                                                                 |
|-----------------|--------|-----------------------------------------------------------------------------|
| node_name       | name   | Node name                                                                   |
| relid           | oid    | Table OID                                                                   |
| schemaname      | name   | Name of the schema that contains the table                                  |
| relname         | name   | Table name                                                                  |
| heap_blks_read  | bigint | Number of disk blocks read from the table                                   |
| heap_blks_hit   | bigint | Number of cache hits in the table                                           |
| idx_blks_read   | bigint | Number of disk blocks read from all indexes in the table                    |
| idx_blks_hit    | bigint | Number of cache hits in the table                                           |
| toast_blks_read | bigint | Number of disk blocks read from the TOAST table (if any) in the table       |
| toast_blks_hit  | bigint | Number of buffer hits in the TOAST table (if any) in the table              |
| tidx_blks_read  | bigint | Number of disk blocks read from the TOAST table index (if any) in the table |
| tidx_blks_hit   | bigint | Number of buffer-hits in the TOAST table index (if any) in the table        |

### 13.2.10.22 STATIO\_ALL\_INDEXES

**STATIO\_ALL\_INDEXES** contains one row for each index in the current database, showing I/O statistics about specific indexes.

**Table 13-129** STATIO\_ALL\_INDEXES columns

| Name         | Type | Description                                     |
|--------------|------|-------------------------------------------------|
| relid        | oid  | OID of the table that the index is created for  |
| indexrelid   | oid  | OID of the index                                |
| schemaname   | name | Name of the schema that the index is in         |
| relname      | name | Name of the table that the index is created for |
| indexrelname | name | Index name                                      |

| Name          | Type   | Description                               |
|---------------|--------|-------------------------------------------|
| idx_blks_read | bigint | Number of disk blocks read from the index |
| idx_blks_hit  | bigint | Number of cache hits in the index         |

### 13.2.10.23 SUMMARY\_STATIO\_ALL\_INDEXES

SUMMARY\_STATIO\_ALL\_INDEXES contains one row for each index in the database, showing a summary of I/O statistics about specific indexes.

**Table 13-130** SUMMARY\_STATIO\_ALL\_INDEXES columns

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |
| idx_blks_hit  | numeric | Number of cache hits in the index               |

### 13.2.10.24 GLOBAL\_STATIO\_ALL\_INDEXES

GLOBAL\_STATIO\_ALL\_INDEXES contains one row for each index in databases on each node, showing I/O statistics about specific indexes.

**Table 13-131** GLOBAL\_STATIO\_ALL\_INDEXES columns

| Name          | Type    | Description                                     |
|---------------|---------|-------------------------------------------------|
| node_name     | name    | Node name                                       |
| relid         | oid     | OID of the table that the index is created for  |
| indexrelid    | oid     | OID of the index                                |
| schemaname    | name    | Name of the schema that the index is in         |
| relname       | name    | Name of the table that the index is created for |
| indexrelname  | name    | Index name                                      |
| idx_blks_read | numeric | Number of disk blocks read from the index       |

| Name         | Type    | Description                       |
|--------------|---------|-----------------------------------|
| idx_blks_hit | numeric | Number of cache hits in the index |

### 13.2.10.25 STATIO\_ALL\_SEQUENCES

**STATIO\_ALL\_SEQUENCES** contains one row for each sequence in the current database, showing I/O statistics about specific sequences.

**Table 13-132** STATIO\_ALL\_SEQUENCES columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| relid      | oid    | OID of this sequence                         |
| schemaname | name   | Name of the schema where the sequence is in  |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Cache hits in the sequence                   |

### 13.2.10.26 SUMMARY\_STATIO\_ALL\_SEQUENCES

**SUMMARY\_STATIO\_ALL\_SEQUENCES** contains one row for each sequence in a database in the entire database system, showing I/O statistics about specific sequences.

**Table 13-133** SUMMARY\_STATIO\_ALL\_SEQUENCES columns

| Name       | Type    | Description                                  |
|------------|---------|----------------------------------------------|
| schemaname | name    | Name of the schema that the sequence is in   |
| relname    | name    | Sequence name                                |
| blks_read  | numeric | Number of disk blocks read from the sequence |
| blks_hit   | numeric | Number of cache hits in the sequence         |

### 13.2.10.27 GLOBAL\_STATIO\_ALL\_SEQUENCES

**GLOBAL\_STATIO\_ALL\_SEQUENCES** contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences.

**Table 13-134** GLOBAL\_STATIO\_ALL\_SEQUENCES columns

| Name       | Type   | Description                                  |
|------------|--------|----------------------------------------------|
| node_name  | name   | Node name                                    |
| relid      | oid    | OID of the sequence                          |
| schemaname | name   | Name of the schema that the sequence is in   |
| relname    | name   | Sequence name                                |
| blks_read  | bigint | Number of disk blocks read from the sequence |
| blks_hit   | bigint | Number of cache hits in the sequence         |

### 13.2.10.28 GLOBAL\_STAT\_DB\_CU

GLOBAL\_STAT\_DB\_CU queries CU hits in each database in GaussDB. You can clear it using pg\_stat\_reset().

**Table 13-135** GLOBAL\_STAT\_DB\_CU columns

| Name           | Type   | Description                             |
|----------------|--------|-----------------------------------------|
| node_name<br>1 | text   | Node name.                              |
| db_name        | text   | Database name.                          |
| mem_hit        | bigint | Number of memory hits.                  |
| hdd_sync_read  | bigint | Number of synchronous hard disk reads.  |
| hdd_async_read | bigint | Number of asynchronous hard disk reads. |

### 13.2.10.29 GLOBAL\_STAT\_SESSION\_CU

GLOBAL\_STAT\_SESSION\_CU is used to query the CU hit rate of running sessions on each node in the database. This data about a session is cleared when you exit this session or restart the database.

**Table 13-136** GLOBAL\_STAT\_SESSION\_CU columns

| Name          | Type    | Description                           |
|---------------|---------|---------------------------------------|
| mem_hit       | integer | Number of memory hits                 |
| hdd_sync_read | integer | Number of synchronous hard disk reads |

| Name          | Type    | Description                            |
|---------------|---------|----------------------------------------|
| hdd_asyn_read | integer | Number of asynchronous hard disk reads |

## 13.2.11 Utility

### 13.2.11.1 REPLICATION\_STAT

REPLICATION\_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-137** REPLICATION\_STAT columns

| Name                     | Type                     | Description                                                                                                                    |
|--------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| pid                      | bigint                   | PID of the thread.                                                                                                             |
| usesysid                 | oid                      | User system ID.                                                                                                                |
| username                 | name                     | Username.                                                                                                                      |
| application_name         | text                     | Program name.                                                                                                                  |
| client_addr              | inet                     | Client address.                                                                                                                |
| client_hostname          | text                     | Client name.                                                                                                                   |
| client_port              | integer                  | Port of the client.                                                                                                            |
| backend_start            | timestamp with time zone | Start time of the program.                                                                                                     |
| state                    | text                     | Log replication state: <ul style="list-style-type: none"><li>• Catch-up state.</li><li>• Consistent streaming state.</li></ul> |
| sender_sent_location     | text                     | Location where the sender sends logs.                                                                                          |
| receiver_write_location  | text                     | Location where the receiver writes logs.                                                                                       |
| receiver_flush_location  | text                     | Location where the receiver flushes logs.                                                                                      |
| receiver_replay_location | text                     | Location where the receiver replays logs.                                                                                      |
| sync_priority            | integer                  | Priority of synchronous duplication. (0 indicates asynchronization.)                                                           |

| Name       | Type | Description                                                                                                                                                                |
|------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 13.2.11.2 GLOBAL\_REPLICATION\_STAT

GLOBAL\_REPLICATION\_STAT displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-138** GLOBAL\_REPLICATION\_STAT columns

| Name                     | Type                     | Description                                                                                                                    |
|--------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| node_name                | name                     | Node name.                                                                                                                     |
| pid                      | bigint                   | PID of the thread.                                                                                                             |
| usesysid                 | oid                      | User system ID.                                                                                                                |
| username                 | name                     | Username.                                                                                                                      |
| application_name         | text                     | Program name.                                                                                                                  |
| client_addr              | inet                     | Client address.                                                                                                                |
| client_hostname          | text                     | Client name.                                                                                                                   |
| client_port              | integer                  | Port of the client.                                                                                                            |
| backend_start            | timestamp with time zone | Start time of the program.                                                                                                     |
| state                    | text                     | Log replication state: <ul style="list-style-type: none"><li>• Catch-up state.</li><li>• Consistent streaming state.</li></ul> |
| sender_sent_location     | text                     | Location where the sender sends logs.                                                                                          |
| receiver_write_location  | text                     | Location where the receiver writes logs.                                                                                       |
| receiver_flush_location  | text                     | Location where the receiver flushes logs.                                                                                      |
| receiver_replay_location | text                     | Location where the receiver replays logs.                                                                                      |

| Name          | Type    | Description                                                                                                                                                                |
|---------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sync_priority | integer | Priority of synchronous duplication. (0 indicates asynchronization.)                                                                                                       |
| sync_state    | text    | Synchronization state: <ul style="list-style-type: none"><li>• Asynchronous replication.</li><li>• Synchronous replication.</li><li>• Potential synchronization.</li></ul> |

### 13.2.11.3 REPLICATION\_SLOTS

**REPLICATION\_SLOTS** displays replication slot information.

**Table 13-139** REPLICATION\_SLOTS columns

| Name         | Type    | Description                                                                                                                                                                                                         |
|--------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| slot_name    | text    | Replication slot name.                                                                                                                                                                                              |
| plugin       | text    | Name of the output plug-in corresponding to the logical replication slot.                                                                                                                                           |
| slot_type    | text    | Replication slot type. <ul style="list-style-type: none"><li>• <b>physical</b>: physical replication slot.</li><li>• <b>logical</b>: logical replication slot.</li></ul>                                            |
| datoid       | oid     | OID of the database where the replication slot resides.                                                                                                                                                             |
| database     | name    | Name of the database where the replication slot resides.                                                                                                                                                            |
| active       | boolean | Determines whether the replication slot is activated. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                                                         |
| xmin         | xid     | The earliest transaction that the database must reserve for the replication slot. VACUUM cannot remove a tuple that is deleted by its subsequent transactions.                                                      |
| catalog_xmin | xid     | The earliest transaction that affects the system catalog and must be reserved by the database for the replication slot. VACUUM cannot remove a system catalog tuple that is deleted by its subsequent transactions. |
| restart_lsn  | text    | Physical location of the earliest Xlog required by the replication slot.                                                                                                                                            |

| Name          | Type    | Description                           |
|---------------|---------|---------------------------------------|
| dummy_standby | boolean | Not supported in the current version. |

#### 13.2.11.4 GLOBAL\_REPLICATION\_SLOTS

GLOBAL\_REPLICATION\_SLOTS displays replication slot information of each node in the database.

**Table 13-140** GLOBAL\_REPLICATION\_SLOTS columns

| Name          | Type    | Description                                                                                                                                                                                                         |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name     | name    | Node name.                                                                                                                                                                                                          |
| slot_name     | text    | Replication slot name.                                                                                                                                                                                              |
| plugin        | text    | Name of the output plug-in corresponding to the logical replication slot.                                                                                                                                           |
| slot_type     | text    | Replication slot type. <ul style="list-style-type: none"><li>• <b>physical</b>: physical replication slot.</li><li>• <b>logical</b>: logical replication slot.</li></ul>                                            |
| datoid        | oid     | OID of the database where the replication slot resides.                                                                                                                                                             |
| database      | name    | Name of the database where the replication slot resides.                                                                                                                                                            |
| active        | boolean | Determines whether the replication slot is activated. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>                                                         |
| x_min         | xid     | The earliest transaction that the database must reserve for the replication slot. VACUUM cannot remove a tuple that is deleted by its subsequent transactions.                                                      |
| catalog_xmin  | xid     | The earliest transaction that affects the system catalog and must be reserved by the database for the replication slot. VACUUM cannot remove a system catalog tuple that is deleted by its subsequent transactions. |
| restart_lsn   | text    | Physical location of the earliest Xlog required by the replication slot.                                                                                                                                            |
| dummy_standby | boolean | Not supported in the current version.                                                                                                                                                                               |

### 13.2.11.5 BGWRITER\_STAT

**BGWRITER\_STAT** displays statistics about the background writer process's activities.

**Table 13-141** BGWRITER\_STAT columns

| Name                  | Type                     | Description                                                                                                                          |
|-----------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| checkpoints_timed     | bigint                   | Number of scheduled checkpoints that have been performed                                                                             |
| checkpoints_req       | bigint                   | Number of requested checkpoints that have been performed                                                                             |
| checkpoint_write_time | double precision         | Total time spent on performing write operations during checkpointing (unit: ms).                                                     |
| checkpoint_sync_time  | double precision         | Total time spent on performing sync operations during checkpointing (unit: ms).                                                      |
| buffers_checkpoint    | bigint                   | Number of buffers written during checkpointing.                                                                                      |
| buffers_clean         | bigint                   | Number of buffers that have been written to a disk by the BGWRITER thread.                                                           |
| maxwritten_clean      | bigint                   | Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large. |
| buffers_backend       | bigint                   | Number of buffers written directly by the backend.                                                                                   |
| buffers_backend_fsync | bigint                   | Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.             |
| buffers_alloc         | bigint                   | Number of buffers allocated                                                                                                          |
| stats_reset           | timestamp with time zone | Time when the statistics of the current row were reset last time.                                                                    |

### 13.2.11.6 GLOBAL\_BGWRITER\_STAT

**GLOBAL\_BGWRITER\_STAT** displays statistics about the bgwriter thread's activities on all instances.

**Table 13-142** GLOBAL\_BGWRITER\_STAT columns

| Name                  | Type                     | Description                                                                                                                          |
|-----------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| node_name             | name                     | Instance name.                                                                                                                       |
| checkpoints_timed     | bigint                   | Number of scheduled checkpoints that have been performed                                                                             |
| checkpoints_req       | bigint                   | Number of requested checkpoints that have been performed                                                                             |
| checkpoint_write_time | double precision         | Total time spent on performing write operations during checkpointing (unit: ms).                                                     |
| checkpoint_sync_time  | double precision         | Total time spent on performing sync operations during checkpointing (unit: ms).                                                      |
| buffers_checkpoint    | bigint                   | Number of buffers written during checkpointing.                                                                                      |
| buffers_clean         | bigint                   | Number of buffers that have been written to a disk by the BGWRITER thread.                                                           |
| maxwritten_clean      | bigint                   | Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large. |
| buffers_backend       | bigint                   | Number of buffers written directly by the backend.                                                                                   |
| buffers_backend_fsync | bigint                   | Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.             |
| buffers_alloc         | bigint                   | Number of buffers allocated                                                                                                          |
| stats_reset           | timestamp with time zone | Time when the statistics of the current row were reset last time.                                                                    |

### 13.2.11.7 GLOBAL\_CKPT\_STATUS

GLOBAL\_CKPT\_STATUS displays the information about checkpoints and flushing pages of all instances in the database.

**Table 13-143** GLOBAL\_CKPT\_STATUS columns

| Name                     | Type   | Description                                                                   |
|--------------------------|--------|-------------------------------------------------------------------------------|
| node_name                | text   | Instance name.                                                                |
| ckpt_redo_point          | text   | Checkpoint of the current instance.                                           |
| ckpt_clog_flush_num      | bigint | Number of Clog flushing pages from the startup time to the current time.      |
| ckpt_csnlog_flush_num    | bigint | Number of CSN log flushing pages from the startup time to the current time.   |
| ckpt_multixact_flush_num | bigint | Number of MultiXact flushing pages from the startup time to the current time. |
| ckpt_predicate_flush_num | bigint | Number of predicate flushing pages from the startup time to the current time. |
| ckpt_twophase_flush_num  | bigint | Number of two-phase flushing pages from the startup time to the current time. |

### 13.2.11.8 GLOBAL\_DOUBLE\_WRITE\_STATUS

GLOBAL\_DOUBLE\_WRITE\_STATUS displays doublewrite file status of all instances in the database.

**Table 13-144** GLOBAL\_DOUBLE\_WRITE\_STATUS columns

| Name                 | Type   | Description                                              |
|----------------------|--------|----------------------------------------------------------|
| node_name            | text   | Instance name.                                           |
| curr_dwn             | bigint | Sequence number of the doublewrite file                  |
| curr_start_page      | bigint | Start page for restoring the doublewrite file            |
| file_trunc_num       | bigint | Number of times that the doublewrite file is reused      |
| file_reset_num       | bigint | Number of reset times after the doublewrite file is full |
| total_writes         | bigint | Total number of I/Os of the doublewrite file             |
| low_threshold_writes | bigint | Number of I/Os for inefficient doublewrite files.        |

| Name                  | Type   | Description                                                         |
|-----------------------|--------|---------------------------------------------------------------------|
| high_threshold_writes | bigint | Number of I/Os for efficient doublewrite files.                     |
| total_pages           | bigint | Total number of pages that are flushed to the doublewrite file area |
| low_threshold_pages   | bigint | Number of pages that are flushed with low efficiency                |
| high_threshold_pages  | bigint | Number of pages that are flushed with high efficiency               |
| file_id               | bigint | ID of the current doublewrite file                                  |

### 13.2.11.9 GLOBAL\_PAGEWRITER\_STATUS

GLOBAL\_PAGEWRITER\_STATUS displays the page flushing information and checkpoint information about all instances in the database.

**Table 13-145** GLOBAL\_PAGEWRITER\_STATUS columns

| Name                        | Type    | Description                                                                                 |
|-----------------------------|---------|---------------------------------------------------------------------------------------------|
| node_name                   | text    | Instance name.                                                                              |
| pgwr_actual_flush_total_num | bigint  | Total number of dirty pages flushed from the startup time to the current time               |
| pgwr_last_flush_num         | integer | Number of dirty pages flushed in the previous batch                                         |
| remain_dirty_page_num       | bigint  | Estimated number of dirty pages that are not flushed                                        |
| queue_head_page_rec_lsn     | text    | <b>recovery_lsn</b> of the first dirty page in the dirty page queue of the current instance |
| queue_rec_lsn               | text    | <b>recovery_lsn</b> of the dirty page queue of the current instance                         |
| current_xlog_ckpt_lsn       | text    | The write position of Xlogs in the current instance                                         |
| ckpt_redo_point             | text    | Checkpoint of the current instance                                                          |

### 13.2.11.10 GLOBAL\_RECORD\_RESET\_TIME

GLOBAL\_RECORD\_RESET\_TIME is used to obtain statistics about the reset (restart, primary/standby switchover, and database deletion) time of each node in the database.

**Table 13-146** GLOBAL\_RECORD\_RESET\_TIME columns

| Name       | Type                     | Description       |
|------------|--------------------------|-------------------|
| node_name  | text                     | Node name.        |
| reset_time | timestamp with time zone | Time to be reset. |

### 13.2.11.11 GLOBAL\_REDO\_STATUS

GLOBAL\_REDO\_STATUS displays the log replay status of all instances in the database.

**Table 13-147** GLOBAL\_REDO\_STATUS columns

| Name                   | Type   | Description                                                                                    |
|------------------------|--------|------------------------------------------------------------------------------------------------|
| node_name              | text   | Instance name.                                                                                 |
| redo_start_ptr         | bigint | Start point for replaying the instance logs.                                                   |
| redo_start_time        | bigint | Start time (UTC) when the instance logs are replayed.                                          |
| redo_done_time         | bigint | End time (UTC) when the instance logs are replayed.                                            |
| curr_time              | bigint | Current time (UTC) of the instance.                                                            |
| min_recovery_point     | bigint | Minimum barrier for the current instance log to provide services after the replay is complete. |
| read_ptr               | bigint | Position for reading the instance logs.                                                        |
| last_replayed_read_ptr | bigint | Position for replaying the instance logs.                                                      |
| recovery_done_ptr      | bigint | Replay position after the instance is started.                                                 |
| read_xlog_io_counter   | bigint | Number of I/Os when the current instance reads and replays logs.                               |
| read_xlog_io_total_dur | bigint | Total I/O duration when the current instance reads and replays logs.                           |
| read_data_io_counter   | bigint | Number of data page I/O reads during log replay in the current instance.                       |
| read_data_io_total_dur | bigint | Total I/O duration reads during log replay in the current instance.                            |
| write_data_io_counter  | bigint | Number of data page I/O writes during log replay in the current instance.                      |

| Name                      | Type   | Description                                                                                                                                                                                                                                           |
|---------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| write_data_io_total_dur   | bigint | Total I/O duration writes during log replay in the current instance.                                                                                                                                                                                  |
| process_pending_counter   | bigint | Number of synchronization times of log distribution threads during log replay in the current instance.                                                                                                                                                |
| process_pending_total_dur | bigint | Synchronization duration of log distribution threads during log replay in the current instance.                                                                                                                                                       |
| apply_counter             | bigint | Number of synchronization times of replay threads during log replay in the current instance.                                                                                                                                                          |
| apply_total_dur           | bigint | Synchronization duration of replay threads during log replay in the current instance.                                                                                                                                                                 |
| speed                     | bigint | Log replay rate of the current instance. The value is updated every time when a 256-MB log is replayed. The unit is byte/s.<br>You are advised to run the <b>cm_ctl query -rv</b> command to obtain a more accurate replay speed of the standby node. |
| local_max_ptr             | bigint | Maximum number of replay logs received by the localhost after the instance is started.                                                                                                                                                                |
| primary_flush_ptr         | bigint | Log point where the host flushes logs to a disk.                                                                                                                                                                                                      |
| worker_info               | text   | Replay thread information of the instance. If parallel replay is not enabled, the value is <b>NULL</b> .                                                                                                                                              |

### 13.2.11.12 GLOBAL\_RECOVERY\_STATUS

GLOBAL\_RECOVERY\_STATUS displays log flow control information about the primary and standby nodes.

**Table 13-148** GLOBAL\_RECOVERY\_STATUS columns

| Name              | Type | Description                                          |
|-------------------|------|------------------------------------------------------|
| node_name         | text | Node name (including the primary and standby nodes). |
| standby_node_name | text | Name of the standby node.                            |
| source_ip         | text | IP address of the primary node.                      |

| Name               | Type    | Description                                                                                            |
|--------------------|---------|--------------------------------------------------------------------------------------------------------|
| source_port        | integer | Port number of the primary node.                                                                       |
| dest_ip            | text    | IP address of the standby node.                                                                        |
| dest_port          | integer | Port number of the standby node.                                                                       |
| current_rto        | bigint  | Current log flow control time of the standby node (unit: s).                                           |
| target_rto         | bigint  | Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s). |
| current_sleep_time | bigint  | Sleep time (in microseconds) required by the host to achieve the expected RTO.                         |

### 13.2.11.13 CLASS\_VITAL\_INFO

**CLASS\_VITAL\_INFO** is used to check whether the OIDs of the same table or index are consistent for WDR snapshots.

**Table 13-149** CLASS\_VITAL\_INFO columns

| Name       | Type   | Description                                                                                                                                                            |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relid      | oid    | Table OID.                                                                                                                                                             |
| schemaname | name   | Schema name.                                                                                                                                                           |
| relname    | name   | Table name.                                                                                                                                                            |
| relkind    | "char" | Object type. Its value can be: <ul style="list-style-type: none"><li>• <b>r</b>: ordinary table.</li><li>• <b>t</b>: TOAST table.</li><li>• <b>i</b>: index.</li></ul> |

### 13.2.11.14 USER\_LOGIN

**USER\_LOGIN** records the number of user logins and logouts.

**Table 13-150** USER\_LOGIN columns

| Name      | Type | Description           |
|-----------|------|-----------------------|
| node_name | text | Database process name |
| user_name | text | Username.             |

| Name           | Type    | Description                                                                   |
|----------------|---------|-------------------------------------------------------------------------------|
| user_id        | integer | User OID. (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .) |
| login_counter  | bigint  | Number of logins.                                                             |
| logout_counter | bigint  | Number of logouts.                                                            |

### 13.2.11.15 SUMMARY\_USER\_LOGIN

SUMMARY\_USER\_LOGIN records information about user logins and logouts on the primary database node.

**Table 13-151** SUMMARY\_USER\_LOGIN columns

| Name           | Type    | Description                                                                   |
|----------------|---------|-------------------------------------------------------------------------------|
| node_name      | text    | Database process name                                                         |
| user_name      | text    | Username.                                                                     |
| user_id        | integer | User OID. (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .) |
| login_counter  | bigint  | Number of logins.                                                             |
| logout_counter | bigint  | Number of logouts.                                                            |

### 13.2.11.16 GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS

GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS displays information about doublewrite files eliminated on a single page of all instances in the database. In the displayed information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version.

**Table 13-152** GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS columns

| Name            | Type | Description                                                       |
|-----------------|------|-------------------------------------------------------------------|
| node_name       | text | Instance name.                                                    |
| curr_dwn        | text | Sequence number of the doublewrite file.                          |
| curr_start_page | text | Start position of the current doublewrite file.                   |
| total_writes    | text | Total number of data write pages in the current doublewrite file. |
| file_trunc_num  | text | Number of times that the doublewrite file is reused.              |

| Name           | Type | Description                                               |
|----------------|------|-----------------------------------------------------------|
| file_reset_num | text | Number of reset times after the doublewrite file is full. |

### 13.2.11.17 GLOBAL\_CANDIDATE\_STATUS

GLOBAL\_CANDIDATE\_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database.

**Table 13-153** GLOBAL\_GET\_BGWRITER\_STATUS columns

| Name                    | Type    | Description                                                                                                                            |
|-------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------|
| node_name               | text    | Instance name.                                                                                                                         |
| candidate_slots         | integer | Number of pages in the candidate buffer chain of the current normal buffer pool.                                                       |
| get_buf_from_list       | bigint  | Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool.      |
| get_buf_clock_sweep     | bigint  | Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool.  |
| seg_candidate_slots     | integer | Number of pages in the candidate buffer chain of the current segment buffer pool.                                                      |
| seg_get_buf_from_list   | bigint  | Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool.     |
| seg_get_buf_clock_sweep | bigint  | Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool. |

## 13.2.12 Lock

### 13.2.12.1 LOCKS

LOCKS displays information about locks held by each open transaction.

**Table 13-154** LOCKS columns

| Name               | Type     | Description                                                                                                                                                                                                                        |
|--------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| locktype           | text     | Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b>                                          |
| database           | oid      | OID of the database in which the locked object exists. <ul style="list-style-type: none"><li>• The OID is <b>0</b> if the object is a shared object.</li><li>• The OID is <b>NULL</b> if the object is a transaction ID.</li></ul> |
| relation           | oid      | OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.                                                                                              |
| page               | integer  | Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.                                                                                           |
| tuple              | smallint | Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.                                                                                                                              |
| bucket             | integer  | Hash bucket ID.                                                                                                                                                                                                                    |
| virtualxid         | text     | Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.                                                                                                        |
| transactionid      | xid      | ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.                                                                                                                        |
| classid            | oid      | OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.                                                                                                       |
| objid              | oid      | OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.                                                                                                       |
| objsubid           | smallint | Column number for a column in the table ( <b>0</b> if the object is of other object type and <b>NULL</b> if the object is not a general database object)                                                                           |
| virtualtransaction | text     | Virtual ID of the transaction holding or awaiting this lock                                                                                                                                                                        |
| pid                | bigint   | Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.                                                                                             |

| Name             | Type    | Description                                                                                                                                                            |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sessionid        | bigint  | ID of the session holding or awaiting this lock<br>The value is <b>NULL</b> if the lock is held by a prepared transaction.                                             |
| mode             | text    | Lock mode held or desired by this thread                                                                                                                               |
| granted          | Boolean | <ul style="list-style-type: none"><li>The value is <b>TRUE</b> if the lock is a held lock.</li><li>The value is <b>FALSE</b> if the lock is an awaited lock.</li></ul> |
| fastpath         | Boolean | The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.                   |
| locktag          | text    | Lock information that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.                                                              |
| global_sessionid | text    | Global session ID                                                                                                                                                      |

### 13.2.12.2 GLOBAL\_LOCKS

**GLOBAL\_LOCKS** displays information about locks held by open transactions on each node.

**Table 13-155** GLOBAL\_LOCKS columns

| Name      | Type    | Description                                                                                                                                                                                                                    |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name | name    | Node name.                                                                                                                                                                                                                     |
| locktype  | text    | Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b>                                      |
| database  | oid     | OID of the database in which the locked object exists. <ul style="list-style-type: none"><li>The OID is <b>0</b> if the object is a shared object.</li><li>The OID is <b>NULL</b> if the object is a transaction ID.</li></ul> |
| relation  | oid     | OID of the relationship targeted by the lock.<br>The value is <b>NULL</b> if the object is not a relationship or part of a relationship.                                                                                       |
| page      | integer | Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.                                                                                       |

| Name               | Type     | Description                                                                                                                                                                |
|--------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tuple              | smallint | Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.                                                                      |
| virtualxid         | text     | Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.                                                |
| transactionid      | xid      | ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.                                                                |
| classid            | oid      | OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.                                               |
| objid              | oid      | OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.                                               |
| objsubid           | smallint | Column number for a column in the table ( <b>0</b> if the target is of other object type and <b>NULL</b> if the object is not a general database object)                   |
| virtualtransaction | text     | Virtual ID of the transaction holding or awaiting this lock                                                                                                                |
| pid                | bigint   | Logical ID of the server thread holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.                                      |
| mode               | text     | Lock mode held or desired by this thread                                                                                                                                   |
| granted            | Boolean  | <ul style="list-style-type: none"><li>• The value is <b>TRUE</b> if the lock is a held lock.</li><li>• The value is <b>FALSE</b> if the lock is an awaited lock.</li></ul> |
| fastpath           | Boolean  | The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.                       |

## 13.2.13 Wait Events

### 13.2.13.1 WAIT\_EVENTS

**WAIT\_EVENTS** displays statistics about wait events on the current node. For details about the impact of each transaction lock on services, see [LOCK](#).

**Table 13-156** WAIT\_EVENTS columns

| Name            | Type                     | Description                           |
|-----------------|--------------------------|---------------------------------------|
| nodename        | text                     | Database process name.                |
| type            | text                     | Event type.                           |
| event           | text                     | Event name.                           |
| wait            | bigint                   | Number of waiting times.              |
| failed_wait     | bigint                   | Number of waiting failures.           |
| total_wait_time | bigint                   | Total waiting time (unit: $\mu$ s).   |
| avg_wait_time   | bigint                   | Average waiting time (unit: $\mu$ s). |
| max_wait_time   | bigint                   | Maximum waiting time (unit: $\mu$ s). |
| min_wait_time   | bigint                   | Minimum waiting time (unit: $\mu$ s). |
| last_updated    | timestamp with time zone | Last time when the event was updated. |

### 13.2.13.2 GLOBAL\_WAIT\_EVENTS

**GLOBAL\_WAIT\_EVENTS** displays statistics about wait events on each node.

**Table 13-157** GLOBAL\_WAIT\_EVENTS columns

| Name            | Type                     | Description                          |
|-----------------|--------------------------|--------------------------------------|
| nodename        | text                     | Database process name                |
| type            | text                     | Event type                           |
| event           | text                     | Event name                           |
| wait            | bigint                   | Number of waiting times              |
| failed_wait     | bigint                   | Number of waiting failures           |
| total_wait_time | bigint                   | Total waiting time (unit: $\mu$ s)   |
| avg_wait_time   | bigint                   | Average waiting time (unit: $\mu$ s) |
| max_wait_time   | bigint                   | Maximum waiting time (unit: $\mu$ s) |
| min_wait_time   | bigint                   | Minimum waiting time (unit: $\mu$ s) |
| last_updated    | timestamp with time zone | Last time when the event was updated |

## 13.2.14 Configuration

### 13.2.14.1 CONFIG\_SETTINGS

**CONFIG\_SETTINGS** displays information about parameters of the running database.

**Table 13-158** CONFIG\_SETTINGS columns

| Name       | Type   | Description                                                                                                                                                      |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name       | text   | Parameter name                                                                                                                                                   |
| setting    | text   | Current parameter value                                                                                                                                          |
| unit       | text   | Implicit unit of the parameter                                                                                                                                   |
| category   | text   | Logical group of the parameter                                                                                                                                   |
| short_desc | text   | Brief description of the parameter                                                                                                                               |
| extra_desc | text   | Detailed description of the parameter                                                                                                                            |
| context    | text   | Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> |
| vartype    | text   | Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>                                                            |
| source     | text   | Method of assigning the parameter value                                                                                                                          |
| min_val    | text   | Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                  |
| max_val    | text   | Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                  |
| enumvals   | text[] | Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .                                             |
| boot_val   | text   | Default parameter value used upon the database startup                                                                                                           |
| reset_val  | text   | Default parameter value used upon the database reset                                                                                                             |
| sourcefile | text   | Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .  |

| Name       | Type    | Description                                                                                                                                                                       |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sourceline | integer | Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> . |

### 13.2.14.2 GLOBAL\_CONFIG\_SETTINGS

**GLOBAL\_CONFIG\_SETTINGS** displays information about parameters of running databases on each node.

**Table 13-159** GLOBAL\_CONFIG\_SETTINGS columns

| Name       | Type   | Description                                                                                                                                                      |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name  | text   | Node name                                                                                                                                                        |
| name       | text   | Parameter name                                                                                                                                                   |
| setting    | text   | Current parameter value                                                                                                                                          |
| unit       | text   | Implicit unit of the parameter                                                                                                                                   |
| category   | text   | Logical group of the parameter                                                                                                                                   |
| short_desc | text   | Brief description of the parameter                                                                                                                               |
| extra_desc | text   | Detailed description of the parameter                                                                                                                            |
| context    | text   | Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> |
| vartype    | text   | Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>                                                            |
| source     | text   | Method of assigning the parameter value                                                                                                                          |
| min_val    | text   | Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                  |
| max_val    | text   | Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .                                                  |
| enumvals   | text[] | Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .                                             |
| boot_val   | text   | Default parameter value used upon the database startup                                                                                                           |

| Name       | Type    | Description                                                                                                                                                                       |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reset_val  | text    | Default parameter value used upon the database reset                                                                                                                              |
| sourcefile | text    | Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .                   |
| sourceline | integer | Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> . |

## 13.2.15 Operator

### 13.2.15.1 OPERATOR\_HISTORY\_TABLE

OPERATOR\_HISTORY\_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system view.

**Table 13-160** OPERATOR\_HISTORY\_TABLE columns

| Name            | Type                     | Description                                                            |
|-----------------|--------------------------|------------------------------------------------------------------------|
| queryid         | bigint                   | Internal query ID used for statement execution.                        |
| pid             | bigint                   | Backend thread ID.                                                     |
| plan_node_id    | integer                  | Plan node ID of the execution plan of a query.                         |
| plan_node_name  | text                     | Name of the operator corresponding to the plan node ID.                |
| start_time      | timestamp with time zone | Time when the operator starts to process the first data record.        |
| duration        | bigint                   | Total execution time of the operator (unit: ms).                       |
| query_dop       | integer                  | DOP of the operator.                                                   |
| estimated_rows  | bigint                   | Number of rows estimated by the optimizer.                             |
| tuple_processed | bigint                   | Number of elements returned by the operator.                           |
| min_peak_memory | integer                  | Minimum peak memory used by the operator on database nodes (unit: MB). |
| max_peak_memory | integer                  | Maximum peak memory used by the operator on database nodes (unit: MB). |

| Name                | Type    | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| average_peak_memory | integer | Average peak memory used by the operator on database nodes (unit: MB).                                                                                                                                                                                                                                                                                 |
| memory_skew_percent | integer | Memory usage skew of the operator among database nodes.                                                                                                                                                                                                                                                                                                |
| min_spill_size      | integer | Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).                                                                                                                                                                                                                                                           |
| max_spill_size      | integer | Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).                                                                                                                                                                                                                                                           |
| average_spill_size  | integer | Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).                                                                                                                                                                                                                                                           |
| spill_skew_percent  | integer | Database node spill skew when a spill occurs.                                                                                                                                                                                                                                                                                                          |
| min_cpu_time        | bigint  | Minimum execution time of the operator on database nodes (unit: ms).                                                                                                                                                                                                                                                                                   |
| max_cpu_time        | bigint  | Maximum execution time of the operator on database nodes (unit: ms).                                                                                                                                                                                                                                                                                   |
| total_cpu_time      | bigint  | Total execution time of the operator on database nodes (unit: ms).                                                                                                                                                                                                                                                                                     |
| cpu_skew_percent    | integer | Execution time skew among database nodes.                                                                                                                                                                                                                                                                                                              |
| warning             | text    | Warning. The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul> |

### 13.2.15.2 OPERATOR\_HISTORY

OPERATOR\_HISTORY displays records of operators in jobs that have been executed by the current user on the current primary database node. Columns in this view are the same as those in GS\_WLM\_OPERATOR\_INFO.

### 13.2.15.3 OPERATOR\_RUNTIME

**OPERATOR\_RUNTIME** displays information about operators of the jobs that are being executed by the current user.

**Table 13-161** OPERATOR\_RUNTIME columns

| Name                | Type                     | Description                                                                                 |
|---------------------|--------------------------|---------------------------------------------------------------------------------------------|
| queryid             | bigint                   | Internal query ID used for statement execution                                              |
| pid                 | bigint                   | Thread ID of the backend                                                                    |
| plan_node_id        | integer                  | Plan node ID of the execution plan of a query                                               |
| plan_node_name      | text                     | Name of the operator corresponding to the plan node ID                                      |
| start_time          | timestamp with time zone | Time when the operator starts to process the first data record                              |
| duration            | bigint                   | Total execution time of the operator, in ms                                                 |
| status              | text                     | Execution status of the current operator, which can be <b>finished</b> or <b>running</b> .  |
| query_dop           | integer                  | DOP of the operator                                                                         |
| estimated_rows      | bigint                   | Number of rows estimated by the optimizer                                                   |
| tuple_processed     | bigint                   | Number of elements returned by the operator                                                 |
| min_peak_memory     | integer                  | Minimum peak memory used by the operator on database nodes (unit: MB)                       |
| max_peak_memory     | integer                  | Maximum peak memory used by the operator on database nodes (unit: MB)                       |
| average_peak_memory | integer                  | Average peak memory used by the operator on database nodes (unit: MB)                       |
| memory_skew_percent | integer                  | Memory usage skew of the operator among database nodes                                      |
| min_spill_size      | integer                  | Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |
| max_spill_size      | integer                  | Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |
| average_spill_size  | integer                  | Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |

| Name               | Type    | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spill_skew_percent | integer | Database node spill skew when a spill occurs                                                                                                                                                                                                                                                                                                           |
| min_cpu_time       | bigint  | Minimum execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                    |
| max_cpu_time       | bigint  | Maximum execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                    |
| total_cpu_time     | bigint  | Total execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                      |
| cpu_skew_percent   | integer | Execution time skew among database nodes                                                                                                                                                                                                                                                                                                               |
| warning            | text    | Warning. The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul> |

#### 13.2.15.4 GLOBAL\_OPERATOR\_HISTORY

**GLOBAL\_OPERATOR\_HISTORY** displays records of operators in jobs that have been executed by the current user on the primary database node.

**Table 13-162** GLOBAL\_OPERATOR\_HISTORY columns

| Name           | Type                     | Description                                                    |
|----------------|--------------------------|----------------------------------------------------------------|
| queryid        | bigint                   | Internal query ID used for statement execution                 |
| pid            | bigint                   | Thread ID of the backend                                       |
| plan_node_id   | integer                  | Plan node ID of the execution plan                             |
| plan_node_name | text                     | Name of the operator corresponding to the plan node ID         |
| start_time     | timestamp with time zone | Time when the operator starts to process the first data record |
| duration       | bigint                   | Total execution time of the operator, in ms                    |
| query_dop      | integer                  | DOP of the operator                                            |

| Name                | Type    | Description                                                                                 |
|---------------------|---------|---------------------------------------------------------------------------------------------|
| estimated_rows      | bigint  | Number of rows estimated by the optimizer                                                   |
| tuple_processed     | bigint  | Number of elements returned by the operator                                                 |
| min_peak_memory     | integer | Minimum peak memory used by the operator on database nodes (unit: MB)                       |
| max_peak_memory     | integer | Maximum peak memory used by the operator on database nodes (unit: MB)                       |
| average_peak_memory | integer | Average peak memory used by the operator on database nodes (unit: MB)                       |
| memory_skew_percent | integer | Memory usage skew of the operator among database nodes                                      |
| min_spill_size      | integer | Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |
| max_spill_size      | integer | Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |
| average_spill_size  | integer | Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0) |
| spill_skew_percent  | integer | Database node spill skew when a spill occurs                                                |
| min_cpu_time        | bigint  | Minimum execution time of the operator on database nodes (unit: ms)                         |
| max_cpu_time        | bigint  | Maximum execution time of the operator on database nodes (unit: ms)                         |
| total_cpu_time      | bigint  | Total execution time of the operator on database nodes (unit: ms)                           |
| cpu_skew_percent    | integer | Execution time skew among database nodes                                                    |

| Name    | Type | Description                                                                                                                                                                                                                                                                        |
|---------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| warning | text | Warning. The following warnings are displayed:<br>1. Sort/SetOp/HashAgg/HashJoin spill<br>2. Spill file size large than 256MB<br>3. Broadcast size large than 100MB<br>4. Early spill<br>5. Spill times is greater than 3<br>6. Spill on memory adaptive<br>7. Hash table conflict |

### 13.2.15.5 GLOBAL\_OPERATOR\_HISTORY\_TABLE

**GLOBAL\_OPERATOR\_HISTORY\_TABLE** displays the records about operators of completed jobs on the primary database node. Data is dumped from the kernel to the system catalog **GS\_WLM\_OPERATOR\_INFO**.

**GLOBAL\_OPERATOR\_HISTORY\_TABLE** is a collection view for querying the system catalog **GS\_WLM\_OPERATOR\_INFO** on the primary database node. Columns in this view are the same as those in [Table 13-162](#).

### 13.2.15.6 GLOBAL\_OPERATOR\_RUNTIME

**GLOBAL\_OPERATOR\_RUNTIME** displays information about operators of the jobs that are being executed by the current user on the primary database node.

**Table 13-163** GLOBAL\_OPERATOR\_RUNTIME columns

| Name           | Type                     | Description                                                                                |
|----------------|--------------------------|--------------------------------------------------------------------------------------------|
| queryid        | bigint                   | Internal query ID used for statement execution                                             |
| pid            | bigint                   | Thread ID of the backend                                                                   |
| plan_node_id   | integer                  | Plan node ID of the execution plan                                                         |
| plan_node_name | text                     | Name of the operator corresponding to the plan node ID                                     |
| start_time     | timestamp with time zone | Time when the operator starts to process the first data record                             |
| duration       | bigint                   | Total execution time of the operator, in ms                                                |
| status         | text                     | Execution status of the current operator, which can be <b>finished</b> or <b>running</b> . |
| query_dop      | integer                  | DOP of the operator                                                                        |
| estimated_rows | bigint                   | Number of rows estimated by the optimizer                                                  |

| Name                | Type    | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tuple_processed     | bigint  | Number of elements returned by the operator                                                                                                                                                                                                                                                                                                            |
| min_peak_memory     | integer | Minimum peak memory used by the operator on database nodes (unit: MB)                                                                                                                                                                                                                                                                                  |
| max_peak_memory     | integer | Maximum peak memory used by the operator on database nodes (unit: MB)                                                                                                                                                                                                                                                                                  |
| average_peak_memory | integer | Average peak memory used by the operator on database nodes (unit: MB)                                                                                                                                                                                                                                                                                  |
| memory_skew_percent | integer | Memory usage skew of the operator among database nodes                                                                                                                                                                                                                                                                                                 |
| min_spill_size      | integer | Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)                                                                                                                                                                                                                                                            |
| max_spill_size      | integer | Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)                                                                                                                                                                                                                                                            |
| average_spill_size  | integer | Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)                                                                                                                                                                                                                                                            |
| spill_skew_percent  | integer | Database node spill skew when a spill occurs                                                                                                                                                                                                                                                                                                           |
| min_cpu_time        | bigint  | Minimum execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                    |
| max_cpu_time        | bigint  | Maximum execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                    |
| total_cpu_time      | bigint  | Total execution time of the operator on database nodes (unit: ms)                                                                                                                                                                                                                                                                                      |
| cpu_skew_percent    | integer | Execution time skew among database nodes                                                                                                                                                                                                                                                                                                               |
| warning             | text    | Warning. The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul> |

## 13.2.16 Workload Manager

### 13.2.16.1 WLM\_USER\_RESOURCE\_CONFIG

**WLM\_USER\_RESOURCE\_CONFIG** displays the resource configuration information of a user.

**Table 13-164** WLM\_USER\_RESOURCE\_CONFIG columns

| Name       | Type    | Description                                             |
|------------|---------|---------------------------------------------------------|
| userid     | oid     | OID of the user                                         |
| username   | name    | Username                                                |
| sysadmin   | boolean | Specifies whether the user has the SYSADMIN permission. |
| rpoid      | oid     | OID of the resource pool                                |
| respool    | name    | Name of a resource pool                                 |
| parentid   | oid     | OID of the parent user                                  |
| totalspace | bigint  | Size of the occupied space                              |
| spacelimit | bigint  | Upper limit of the space size                           |
| childcount | integer | Number of child users                                   |
| childlist  | text    | Child user list                                         |

### 13.2.16.2 WLM\_USER\_RESOURCE\_RUNTIME

**WLM\_USER\_RESOURCE\_RUNTIME** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 13-165** WLM\_USER\_RESOURCE\_RUNTIME columns

| Name         | Type    | Description                                                                                                                                                    |
|--------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username     | name    | Username                                                                                                                                                       |
| used_memory  | integer | Used memory (unit: MB)                                                                                                                                         |
| total_memory | integer | Available memory (unit: MB) The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database. |
| used_cpu     | integer | Number of CPU cores in use                                                                                                                                     |

| Name              | Type    | Description                                                                                                                                         |
|-------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| total_cpu         | integer | Total number of CPU cores of the Cgroup associated with the user on the node                                                                        |
| used_space        | bigint  | Used storage space (unit: KB)                                                                                                                       |
| total_space       | bigint  | Available storage space (unit: KB) The value -1 indicates that the maximum storage space is not limited.                                            |
| used_temp_space   | bigint  | Used temporary space (reserved column; unit: KB)                                                                                                    |
| total_temp_space  | bigint  | Available temporary storage space (reserved column; unit: KB) The value -1 indicates that the maximum temporary storage space is not limited.       |
| used_spill_space  | bigint  | Used space for storing spilled data (reserved column; unit: KB)                                                                                     |
| total_spill_space | bigint  | Available storage space for spilled data (reserved column; unit: KB) The value -1 indicates that the maximum space for spilled data is not limited. |

## 13.2.17 Global Plancache

Global plan cache (GPC) views are valid only when **enable\_global\_plancache** and the thread pool are enabled.

### 13.2.17.1 GLOBAL\_PLANCACHE\_STATUS

**GLOBAL\_PLANCACHE\_STATUS** displays the GPC status information.

**Table 13-166** GLOBAL\_PLANCACHE\_STATUS columns

| Name        | Type    | Description                                       |
|-------------|---------|---------------------------------------------------|
| nodename    | text    | Name of the node that the plan cache belongs to   |
| query       | text    | Text of query statements                          |
| refcount    | integer | Number of times that the plan cache is referenced |
| valid       | bool    | Specifies whether it is valid.                    |
| databaseid  | oid     | ID of the database that the plan cache belongs to |
| schema_name | text    | Schema that the plan cache belongs to             |

| Name       | Type    | Description                                                                                                                                    |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------|
| params_num | integer | Number of parameters                                                                                                                           |
| func_id    | oid     | OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is <b>0</b> . |

### 13.2.17.2 GLOBAL\_PLANCACHE\_CLEAN

**GLOBAL\_PLANCACHE\_CLEAN** clears the global plan cache that is not used on all nodes. The return value is of the Boolean type.

## 13.2.18 RTO & RPO

### 13.2.18.1 global\_rto\_status

Displays log flow control information about the primary and standby nodes (except the current node and standby DN).

**Table 13-167** global\_rto\_status columns

| Parameter | Type | Description                                                                                                                                                                                                                                                               |
|-----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name | text | Node name (including the primary and standby nodes)                                                                                                                                                                                                                       |
| rto_info  | text | Flow control information, including the current log flow control time (unit: second) of the standby node, the expected flow control time (unit: second) specified by the GUC parameter, and the primary node sleep time (unit: $\mu$ s) required to reach the expectation |

### 13.2.18.2 global\_streaming\_hadr\_rto\_and\_rpo\_stat

**global\_streaming\_hadr\_rto\_and\_rpo\_stat** displays the log flow control information about the primary and standby database instances in the streaming DR scenario. (This schema can be used only on the primary DN of the primary database instance. Statistics cannot be obtained from the standby DN or the standby database instance.)

**Table 13-168** Parameters

| Parameter               | Type | Description                                                                                                                                   |
|-------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| hadr_sender_node_name   | text | Node name, including the primary database instance and the main standby node of the standby database instance.                                |
| hadr_receiver_node_name | text | Name of the main standby node of the standby database instance.                                                                               |
| current_rto             | int  | Flow control information, that is, log RTO time of the current primary and standby database instances (unit: second).                         |
| target_rto              | int  | Flow control information, that is, the RTO time between the target primary and standby database instances (unit: second).                     |
| current_rpo             | int  | Flow control information, that is, log RPO time of the current primary and standby database instances (unit: second).                         |
| target_rpo              | int  | Flow control information, that is, the RPO time between the target primary and standby database instances (unit: second).                     |
| rto_sleep_time          | int  | RTO flow control information, that is, the expected sleep time (unit: $\mu$ s) required by walsender on the host to reach the specified RTO.  |
| rpo_sleep_time          | int  | RPO flow control information, that is, the expected sleep time (unit: $\mu$ s) required by xlogInsert on the host to reach the specified RPO. |

## 13.3 DBE\_PLDEBUGGER Schema

DBE\_PLDEBUGGER Schema system functions are used to debug stored procedures. This chapter describes the APIs supported by DBE\_PLDEBUGGER Schema. Only the administrator has the permission to execute these debugging APIs, but does not have the permission to modify or create functions in this schema. You can debug only non-system functions in the public schema or user-created schema. You are not allowed to debug system functions.

### NOTICE

When a user is created in the function body, the plaintext password is returned when attach, next, continue, info\_code, step, info\_breakpoint, backtrace or finish is called. You are advised not to create a user in the function body.

The administrator can run the following command to grant the **gs\_role\_pldebugger** role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. Example:

- Prepare for debugging.

Use PG\_PROC to find the OID of the stored procedure to be debugged and execute DBE\_PLDEBUGGER.turn\_on(oid). In this case, the client functions as the server.

```
openGauss=# CREATE OR REPLACE PROCEDURE test_debug (IN x INT)
AS
BEGIN
 INSERT INTO t1 (a) VALUES (x);
 DELETE FROM t1 WHERE a = x;
END;
/
CREATE PROCEDURE
openGauss=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
oid

16389
(1 row)
openGauss=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
nodename | port
-----+-----
datanode | 0
(1 row)
```

- Start debugging.

When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by calling an executed stored procedure through a trigger.

```
openGauss=# call test_debug(1);
```

Start another client as the debug end and call DBE\_PLDEBUGGER.attach to attach with the stored procedure for debugging based on the data returned by **turn\_on**.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 3 | INSERT INTO t1 (a) VALUES (x);
(1 row)
```

Execute the next statement on the client where the attach operation is performed.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.next();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

Execute the following variable operations on the client where the attach command is performed.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
varname | vartype | value | package_name | isconst
-----+-----+-----+-----+-----
x | int4 | 1 | | f
(1 row)
openGauss=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
```

```
set_var

t
(1 row)
openGauss=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
varname | vartype | value | package_name | isconst
-----+-----+-----+-----+-----
x | int4 | 2 | | f
(1 row)
```

Directly execute the stored procedure that is being debugged.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

Exit the stored procedure that is being debugged and do not execute statements that have not been executed before.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.abort();
abort

t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
lineno | query | canbreak
-----+-----+-----
1 | CREATE OR REPLACE PROCEDURE public.test_debug(IN x INT) | f
2 | AS DECLARE | f
3 | BEGIN | f
4 | INSERT INTO t1 (a) VALUES (x); | t
5 | DELETE FROM t1 WHERE a = x; | t
6 | END; | f
7 | / | f
(7 rows)
```

Sets a breakpoint.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
lineno | query | canbreak
-----+-----+-----
1 | CREATE OR REPLACE PROCEDURE public.test_debug(IN x INT) | f
2 | AS DECLARE | f
3 | BEGIN | f
4 | INSERT INTO t1 (a) VALUES (x); | t
5 | DELETE FROM t1 WHERE a = x; | t
6 | END; | f
7 | / | f
(7 rows)
```

View the breakpoint information.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
breakpointno | funcoid | lineno | query | enable
-----+-----+-----+-----+-----
0 | 16389 | 4 | DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
openGauss=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 4 | DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server

does not need to be debugged, run the **turn\_off** command to disable the debugging or exit the session. For details about the debugging APIs, see the following table.

**Table 13-169** DBE\_PLDEBUGGER

| API                                                    | Description                                                                                                                                                          |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_PLDEBUGGER.turn_on</a>                 | Called by the server, indicating that the stored procedure can be debugged. After the API is called, the stored procedure is hung to wait for debugging information. |
| <a href="#">DBE_PLDEBUGGER.turn_off</a>                | Called by the server, indicating that debugging the stored procedure is disabled.                                                                                    |
| <a href="#">DBE_PLDEBUGGER.local_debug_server_info</a> | Called by the server to print all stored procedures that have been turned on in the current session.                                                                 |
| <a href="#">DBE_PLDEBUGGER.attach</a>                  | Called by the debug end to attach with the stored procedure that is being debugged.                                                                                  |
| <a href="#">DBE_PLDEBUGGER.info_locals</a>             | Called by the debug end to print the current values of variables in the stored procedure that is being debugged.                                                     |
| <a href="#">DBE_PLDEBUGGER.next</a>                    | Called by the debug end to execute the next step.                                                                                                                    |
| <a href="#">DBE_PLDEBUGGER.continue</a>                | Called by the debug end to continue the execution until the breakpoint or stored procedure ends.                                                                     |
| <a href="#">DBE_PLDEBUGGER.abort</a>                   | Called by the debug end to stop debugging. The server reports a long jump error.                                                                                     |
| <a href="#">DBE_PLDEBUGGER.print_var</a>               | Called by the debug end to print the current values of specified variables in the stored procedure that is being debugged.                                           |
| <a href="#">DBE_PLDEBUGGER.info_code</a>               | Called by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.                      |
| <a href="#">DBE_PLDEBUGGER.step</a>                    | Called by the debug end to execute step by step.                                                                                                                     |
| <a href="#">DBE_PLDEBUGGER.add_breakpoint</a>          | Called by the debug end to add a breakpoint.                                                                                                                         |
| <a href="#">DBE_PLDEBUGGER.delete_breakpoint</a>       | Called by the debug end to delete a breakpoint.                                                                                                                      |
| <a href="#">DBE_PLDEBUGGER.info_breakpoints</a>        | Called by the debug end to view all breakpoints.                                                                                                                     |

| API                                                    | Description                                                                                                                  |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_PLDEBUGGER.bac<br/>ktrace</a>          | Called by the debug end to check the current call stack.                                                                     |
| <a href="#">DBE_PLDEBUGGER.ena<br/>ble_breakpoint</a>  | Called by the debug end to enable breakpoints.                                                                               |
| <a href="#">DBE_PLDEBUGGER.disa<br/>ble_breakpoint</a> | Called by the debug end to disable breakpoints.                                                                              |
| <a href="#">DBE_PLDEBUGGER.finis<br/>h</a>             | Called by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned. |
| <a href="#">DBE_PLDEBUGGER.set_<br/>var</a>            | Called by the debug end to assign a value to a variable.                                                                     |

### 13.3.1 DBE\_PLDEBUGGER.turn\_on

This function is used to mark a stored procedure as debuggable. After **turn\_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG\_PROC system catalog and transfer it to the function. After **turn\_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

**Table 13-170** turn\_on input parameters and return values

| Name     | Type        | Description                  |
|----------|-------------|------------------------------|
| func_oid | IN oid      | Function OID                 |
| nodename | OUT text    | Node name                    |
| port     | OUT integer | Number of the connected port |

### 13.3.2 DBE\_PLDEBUGGER.turn\_off

This function is used to remove the debugging flag added by **turn\_on**. The return value indicates success or failure. You can run the **DBE\_PLDEBUGGER.local\_debug\_server\_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

**Table 13-171** turn\_off input parameters and return values

| Name     | Type        | Description                               |
|----------|-------------|-------------------------------------------|
| func_oid | IN oid      | Function OID                              |
| turn_off | OUT boolean | Specifies whether turn-off is successful. |

### 13.3.3 DBE\_PLDEBUGGER.local\_debug\_server\_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use **funcoid** and **pg\_proc** together to determine which stored procedures are to be debugged.

**Table 13-172** local\_debug\_server\_info returned input parameters and return values

| Name     | Type       | Description          |
|----------|------------|----------------------|
| nodename | OUT text   | Node name            |
| port     | OUT bigint | Port number          |
| funcoid  | OUT oid    | Stored procedure OID |

### 13.3.4 DBE\_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end calls the attach function and transfers node name and port number to attach with the specified stored procedure.

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid.

**Table 13-173** attach input parameters and return values

| Name     | Type       | Description                  |
|----------|------------|------------------------------|
| nodename | IN text    | Node name                    |
| port     | IN integer | Number of the connected port |
| funcoid  | OUT oid    | Function ID                  |

| Name     | Type        | Description                                                         |
|----------|-------------|---------------------------------------------------------------------|
| funcname | OUT text    | Function name                                                       |
| lineno   | OUT integer | Number of the next line in the current debugging process            |
| query    | OUT text    | Source code of the next line of the function that is being debugged |

### 13.3.5 DBE\_PLDEBUGGER.info\_locals

During debugging on the debug end, **info\_locals** is called to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without input parameters. By default, the top-layer stack variable is queried.

**Table 13-174** info\_locals input parameters and return values

| Name         | Type                  | Description                                                                                             |
|--------------|-----------------------|---------------------------------------------------------------------------------------------------------|
| frameno      | IN integer (optional) | Specified stack layer. The default value is the top layer.                                              |
| varname      | OUT text              | Variable name                                                                                           |
| vartype      | OUT text              | Variable type                                                                                           |
| value        | OUT text              | Variable value                                                                                          |
| package_name | OUT text              | Name of the package corresponding to the variable. If the variable is not a package, the value is null. |
| isconst      | OUT boolean           | Specifies whether it is a constant.                                                                     |

### 13.3.6 DBE\_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query.

**Table 13-175** next input parameters and return values

| Name     | Type        | Description                                                         |
|----------|-------------|---------------------------------------------------------------------|
| funcoid  | OUT oid     | Function ID                                                         |
| funcname | OUT text    | Function name                                                       |
| lineno   | OUT integer | Number of the next line in the current debugging process            |
| query    | OUT text    | Source code of the next line of the function that is being debugged |

### 13.3.7 DBE\_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query.

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

**Table 13-176** continue input parameters and return values

| Name     | Type        | Description                                                         |
|----------|-------------|---------------------------------------------------------------------|
| funcoid  | OUT oid     | Function ID                                                         |
| funcname | OUT text    | Function name                                                       |
| lineno   | OUT integer | Number of the next line in the current debugging process            |
| query    | OUT text    | Source code of the next line of the function that is being debugged |

### 13.3.8 DBE\_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value specifies whether the abort message is successfully sent.

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()
RETURN boolean;
```

**Table 13-177** abort input parameters and return values

| Name  | Type        | Description        |
|-------|-------------|--------------------|
| abort | OUT boolean | Success or failure |

### 13.3.9 DBE\_PLDEBUGGER.print\_var

During debugging on the debug end, **print\_var** is called to print the name and value of the specified variable in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried.

**Table 13-178** print\_var input parameters and return values

| Name         | Type                  | Description                                                                                         |
|--------------|-----------------------|-----------------------------------------------------------------------------------------------------|
| var_name     | IN text               | Variable                                                                                            |
| frameno      | IN integer (optional) | Specified stack layer. The default value is the top layer.                                          |
| varname      | OUT text              | Variable name                                                                                       |
| vartype      | OUT text              | Variable type                                                                                       |
| value        | OUT text              | Variable value                                                                                      |
| package_name | OUT text              | Package name corresponding to the variable. This parameter is reserved and is left empty currently. |
| isconst      | OUT boolean           | Specifies whether it is a constant.                                                                 |

### 13.3.10 DBE\_PLDEBUGGER.info\_code

During debugging on the debug end, **info\_code** is called to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty.

**Table 13-179** info\_code input parameters and return values

| Name    | Type   | Description |
|---------|--------|-------------|
| funcoid | IN oid | Function ID |

| Name     | Type        | Description                                              |
|----------|-------------|----------------------------------------------------------|
| lineno   | OUT integer | Line number                                              |
| query    | OUT text    | Source statement                                         |
| canbreak | OUT bool    | Specifies whether the current line supports breakpoints. |

### 13.3.11 DBE\_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned.

**Table 13-180** step input parameters and return values

| Name     | Type        | Description                                                         |
|----------|-------------|---------------------------------------------------------------------|
| funcoid  | OUT oid     | Function ID                                                         |
| funcname | OUT text    | Function name                                                       |
| lineno   | OUT integer | Number of the next line in the current debugging process            |
| query    | OUT text    | Source code of the next line of the function that is being debugged |

### 13.3.12 DBE\_PLDEBUGGER.add\_breakpoint

During debugging on the debug end, call **add\_breakpoint** to add a breakpoint. If -1 is returned, the specified breakpoint is invalid. Determine the proper position of the breakpoint based on the **canbreak** column in [DBE\\_PLDEBUGGER.info\\_code](#).

**Table 13-181** add\_breakpoint input parameters and return values

| Name         | Type        | Description       |
|--------------|-------------|-------------------|
| funcoid      | IN text     | Function ID       |
| lineno       | IN integer  | Line number       |
| breakpointno | OUT integer | Breakpoint number |

### 13.3.13 DBE\_PLDEBUGGER.delete\_breakpoint

During debugging on the debug end, call **delete\_breakpoint** to delete the existing breakpoint.

**Table 13-182** delete\_breakpoint input parameters and return values

| Name         | Type       | Description                                     |
|--------------|------------|-------------------------------------------------|
| breakpointno | IN integer | Breakpoint number                               |
| result       | OUT bool   | Specifies whether this operation is successful. |

### 13.3.14 DBE\_PLDEBUGGER.info\_breakpoints

During debugging on the debug end, call **info\_breakpoints** to view the current function breakpoint.

**Table 13-183** info\_breakpoints input parameters and return values

| Name         | Type        | Description        |
|--------------|-------------|--------------------|
| breakpointno | OUT integer | Breakpoint number  |
| funcoid      | OUT oid     | Function ID        |
| lineno       | OUT integer | Line number        |
| query        | OUT text    | Breakpoint content |
| enable       | OUT boolean | Valid or not       |

### 13.3.15 DBE\_PLDEBUGGER.backtrace

During debugging on the debug end, call **backtrace** to view the current call stack.

**Table 13-184** backtrace input parameters and return values

| Name     | Type        | Description        |
|----------|-------------|--------------------|
| frameno  | OUT integer | Call stack ID      |
| funcname | OUT text    | Function name      |
| lineno   | OUT integer | Line number        |
| query    | OUT text    | Breakpoint content |
| funcoid  | OUT oid     | Function OID       |

### 13.3.16 DBE\_PLDEBUGGER.enable\_breakpoint

During debugging on the debug end, calls enable\_breakpoint to enable breakpoints.

**Table 13-185** enable\_breakpoint input parameters and return values

| Name         | Type       | Description                                     |
|--------------|------------|-------------------------------------------------|
| breakpointno | IN integer | Breakpoint number                               |
| result       | OUT bool   | Specifies whether this operation is successful. |

### 13.3.17 DBE\_PLDEBUGGER.disable\_breakpoint

During debugging on the debug end, call disable\_breakpoint to disable breakpoints.

**Table 13-186** disable\_breakpoint input parameters and return values

| Name         | Type       | Description                                     |
|--------------|------------|-------------------------------------------------|
| breakpointno | IN integer | Breakpoint number                               |
| result       | OUT bool   | Specifies whether this operation is successful. |

### 13.3.18 DBE\_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed.

**Table 13-187** finish input parameters and return values

| Name     | Type        | Description                                                         |
|----------|-------------|---------------------------------------------------------------------|
| funcoid  | OUT oid     | Function ID                                                         |
| funcname | OUT text    | Function name                                                       |
| lineno   | OUT integer | Number of the next line in the current debugging process            |
| query    | OUT text    | Source code of the next line of the function that is being debugged |

### 13.3.19 DBE\_PLDEBUGGER.set\_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter. If a stored procedure contains variables with the same name, set\_var supports only the setting of the first variable value.

**Table 13-188** set\_var input parameters and return values

| Name     | Type        | Description                 |
|----------|-------------|-----------------------------|
| var_name | IN text     | Variable name               |
| value    | IN text     | New value                   |
| result   | OUT boolean | Result (success or failure) |

## 13.4 DBE\_PLDEVELOPER

The DBE\_PLDEVELOPER system catalog records information required for compiling PL/SQL packages, functions, and stored procedures.

### 13.4.1 DBE\_PLDEVELOPER.gs\_source

Records PL/SQL object (stored procedure, function, package, and package body) compilation information. For details, see the following column description.

When the **plsql\_show\_all\_error** parameter is enabled, information about PL/SQL object compilation success or failure is recorded in this table. When the **plsql\_show\_all\_error** parameter is disabled, only information about correct compilation is inserted into this table.

---

**CAUTION**

1. The gs\_source table records only user-defined original object statements. Even if a user uses ALTER to change the created schema or name, the information in the gs\_source table does not change. If the user changes the schema or name of an object, the deleted object still exists in the gs\_source table.
2. The owner in the gs\_source table is the user who creates the table, not the user specified when the user creates the stored procedure or package.
3. By default, row-level security is not configured for the gs\_source table in the database. If you want to use the database isolation feature, run the following statement to add row-level security:  

```
ALTER TABLE dbe_pldeveloper.gs_source ENABLE ROW LEVEL SECURITY;
CREATE ROW LEVEL SECURITY POLICY all_data_rls ON dbe_pldeveloper.gs_source USING(owner =
(select oid from pg_roles where rolname=current_user));
```

**Table 13-189** DBE\_PLDEVELOPER.gs\_source columns

| Name   | Type    | Description                                                     |
|--------|---------|-----------------------------------------------------------------|
| id     | oid     | Object ID.                                                      |
| owner  | bigint  | ID of the user who creates the object.                          |
| nspid  | oid     | Schema ID of an object.                                         |
| name   | name    | Object name.                                                    |
| type   | text    | Object type ( <b>procedure/function/package/package body</b> ). |
| status | boolean | Determines whether the creation is successful.                  |
| src    | text    | Original statement for creating an object.                      |

### 13.4.2 DBE\_PLDEVELOPER.gs\_errors

Records errors that occur during PL/SQL object (stored procedure, function, package, and package body) compilation. For details, see the following column description.

After the **plsql\_show\_all\_error** parameter is enabled, if an error occurs during compilation, the error is skipped and the compilation continues, and the error information is recorded in **gs\_errors**. If the **plsql\_show\_all\_error** parameter is disabled, related information is not inserted into this table.

The owner of the table is the user who creates the table. Modifying the owner of the stored procedure or package does not modify the table information.

**Table 13-190** DBE\_PLDEVELOPER.gs\_errors columns

| Name  | Type    | Description                                                     |
|-------|---------|-----------------------------------------------------------------|
| id    | oid     | Object ID.                                                      |
| owner | bigint  | ID of the user who creates the object.                          |
| nspid | oid     | Schema ID of an object.                                         |
| name  | name    | Object name.                                                    |
| type  | text    | Object type ( <b>procedure/function/package/package body</b> ). |
| line  | integer | Line number.                                                    |
| src   | text    | Error message.                                                  |

## 13.5 DBE\_SQL\_UTIL Schema

The DBE\_SQL\_UTIL schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

### 13.5.1 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

create\_hint\_sql\_patch is a function used to create SQL patches for hints. It returns whether the execution is successful.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-191** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

| Parameter     | Type      | Description                                                                  |
|---------------|-----------|------------------------------------------------------------------------------|
| patch_name    | IN name   | Patch name.                                                                  |
| unique_sql_id | IN bigint | Global unique query ID.                                                      |
| hint_string   | IN text   | Hint text.                                                                   |
| description   | IN text   | Patch description. The default value is <b>NULL</b> .                        |
| enabled       | IN bool   | Specifies whether the patch takes effect. The default value is <b>true</b> . |
| result        | OUT bool  | Specifies whether this operation is successful.                              |

### 13.5.2 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

create\_abort\_sql\_patch is a function used to create abort SQL patches. It returns whether the execution is successful.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-192** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

| Parameter  | Type    | Description |
|------------|---------|-------------|
| patch_name | IN name | Patch name. |

| Parameter     | Type      | Description                                                                  |
|---------------|-----------|------------------------------------------------------------------------------|
| unique_sql_id | IN bigint | Global unique ID.                                                            |
| description   | IN text   | Patch description. The default value is <b>NULL</b> .                        |
| enabled       | IN bool   | Specifies whether the patch takes effect. The default value is <b>true</b> . |
| result        | OUT bool  | Specifies whether this operation is successful.                              |

### 13.5.3 DBE\_SQL\_UTIL.drop\_sql\_patch

drop\_sql\_patch is a function used to delete SQL patches. It returns whether the execution is successful.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-193** DBE\_SQL\_UTIL.drop\_sql\_patch input parameters and return values

| Parameter  | Type     | Description                                     |
|------------|----------|-------------------------------------------------|
| patch_name | IN name  | Patch name.                                     |
| result     | OUT bool | Specifies whether this operation is successful. |

### 13.5.4 DBE\_SQL\_UTIL.enable\_sql\_patch

enable\_sql\_patch is a function used to enable SQL patches. It returns whether the execution is successful.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-194** DBE\_SQL\_UTIL.enable\_sql\_patch input parameters and return values

| Parameter  | Type     | Description                                     |
|------------|----------|-------------------------------------------------|
| patch_name | IN name  | Patch name.                                     |
| result     | OUT bool | Specifies whether this operation is successful. |

### 13.5.5 DBE\_SQL\_UTIL.disable\_sql\_patch

disable\_sql\_patch is a function used to disable SQL patches. It returns whether the execution is successful.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-195** DBE\_SQL\_UTIL.disable\_sql\_patch input parameters and return values

| Parameter  | Type     | Description                                     |
|------------|----------|-------------------------------------------------|
| patch_name | IN name  | Patch name.                                     |
| result     | OUT bool | Specifies whether this operation is successful. |

### 13.5.6 DBE\_SQL\_UTIL.show\_sql\_patch

show\_sql\_patch is a function used to display the SQL patch corresponding to a specified patch name and return the running result.

Only the initial user, SYSADMIN, OPRADMIN, and MONADMIN have the permission to call it.

**Table 13-196** DBE\_SQL\_UTIL.show\_sql\_patch input parameters and return values

| Parameter     | Type       | Description                                   |
|---------------|------------|-----------------------------------------------|
| patch_name    | IN name    | Patch name.                                   |
| unique_sql_id | OUT bigint | Global unique ID.                             |
| enabled       | OUT bool   | Specifies whether the patch takes effect.     |
| abort         | OUT bool   | Specifies whether the patch is an abort hint. |
| hint_str      | OUT text   | Hint text.                                    |

# 14 Logical Replication

## 14.1 Logical Decoding

The data replication capabilities supported by GaussDB are as follows:

Data is periodically synchronized to heterogeneous databases (such as database A) using a data migration tool. Real-time data replication is not supported. Therefore, the requirements for real-time data synchronization to heterogeneous databases are not satisfied.

GaussDB provides the logical decoding function to generate logical logs by decoding Xlogs. A target database parses logical logs to replicate data in real time. For details, see [Figure 14-1](#). Logical replication reduces the restrictions on target databases, allowing for data synchronization between heterogeneous databases and homogeneous databases with different forms. It allows data to be read and written during data synchronization on a target database, reducing the data synchronization latency.

**Figure 14-1** Logical replication

Logical replication consists of logical decoding and data replication. Logical decoding outputs logical logs by transaction. The database service or middleware parses the logical logs to implement data replication. Currently, GaussDB supports only logical decoding. Therefore, this section involves only logical decoding.

## 14.1.1 Overview

### Function

Logical decoding provides basic transaction decoding capabilities for logical replication. GaussDB uses SQL functions for logical decoding. This method features easy function calling, requires no tools to obtain logical logs, and provides specific APIs for interconnecting with external replay tools, saving the need of additional adaptation.

Logical logs are output only after transactions are committed because they use transactions as the unit and logical decoding is driven by users. Therefore, to prevent Xlogs from being recycled by the system when transactions start and prevent required transaction information from being recycled by VACUUM, GaussDB introduces logical replication slots to block Xlog recycling.

A logical replication slot represents a stream of changes that can be re-executed in other databases in the order they were generated in the original database. Each logical replication slot is maintained by the person who obtains the corresponding logical logs.

### Prerequisites

- Currently, logical logs are extracted from DNs. If logical replication is performed, SSL connections must be used. Therefore, ensure that the **ssl** parameter on the corresponding DN is set to **on**.

#### NOTE

For security purposes, ensure that SSL connections are enabled.

- The GUC parameter **wal\_level** is set to **logical**.
- The GUC parameter **max\_replication\_slots** is set to a value greater than or equal to the sum of physical replication slots, backup slots, and logical replication slots required by each DN.

#### NOTE

Plan the number of logical replication slots as follows:

- A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
- If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.
- A user needs to connect to a database through a DN port before using SQL functions to perform logical decoding. If a CN port is used to connect to the database, **EXECUTE DIRECT ON (datanode\_name) 'statement'** is needed to execute SQL functions.
- Only the initial user and users with the REPLICATION permission can perform this operation. When separation of duties is disabled, database administrators can perform logical replication operations. When separation of duties is enabled, database administrators are not allowed to perform logical replication operations.
- Sufficient memory resources must be configured for parallel decoding. The memory usage consists of the following parts:

- Memory for concatenating TOAST tuples and hash tables = Number of concurrent transactions x Average tuple size. The current version is not controlled by the flushing logic. A large amount of memory may be occupied when TOAST tuples are processed.
- Queue memory = Queue length x Decoding parallelism degree x Average tuple size x 2 (including the read log queue and decoding result queue). The queue memory is controlled by the queue length and decoding parallelism degree.
- Memory for sending and re-ordering parallel decoding logs = Number of concurrent transactions x Number of tuples modified by transactions x Average tuple size. The upper limit can be controlled by the decoding configuration options **max-txn-in-memory** and **max-reorderbuffer-in-memory**.
- Memory for storing transaction metadata = Number of concurrent transactions x Metadata size of each transaction (about 300 bytes).

## Precautions

- Logical decoding does not support DDL statements.
- Decoded data may be lost when a specific DDL statement (for example, to truncate an ordinary table or exchange data between partitioned tables) is executed.
- Decoding of DML operations on data page replication is not supported.
- After a DDL statement (for example, ALTER TABLE) is executed, the physical logs that are not decoded before the DDL statement execution may be lost.
- The size of a single tuple cannot exceed 1 GB, and decoded data may be larger than inserted data. Therefore, it is recommended that the size of a single tuple be less than or equal to 500 MB.
- GaussDB supports the following data types for decoding: INTEGER, BIGINT, SMALLINT, TINYINT, SERIAL, SMALLSERIAL, BIGSERIAL, FLOAT, DOUBLE PRECISION, DATE, TIME[WITHOUT TIME ZONE], TIMESTAMP[WITHOUT TIME ZONE], CHAR(n), VARCHAR(n), and TEXT.
- The name of a logical replication slot can contain no more than 64 characters, including lowercase letters, digits, underscores (\_), question marks (?), hyphens (-), and periods (.). In addition, periods (. or ..) cannot be used as the name of a logical replication slot independently.
- After the database where a logical replication slot resides is deleted, the replication slot becomes unavailable and needs to be manually deleted.
- To decode multiple databases, you need to create a streaming replication slot in each database and start decoding. Logs need to be scanned for decoding of each database.
- Forcible switchover is not supported. After forcible switchover, you need to export all data again.
- To perform decoding on the standby node, set the GUC parameter **enable\_slot\_log** to **on** on the corresponding host.
- During decoding on the standby node, the decoded data may increase during switchover and failover, which needs to be manually filtered out. When the quorum protocol is used, switchover and failover should be performed on the standby node that is to be promoted to primary, and logs must be synchronized from the primary node to the standby node.

- The same replication slot for decoding cannot be used between the primary node and standby node or between different standby nodes at the same time. Otherwise, data inconsistency occurs.
- Replication slots can only be created or deleted on hosts.
- After the database is restarted due to a fault or the logical replication process is restarted, duplicate decoded data may exist. You need to filter out the duplicate data.
- If the computer kernel is faulty, garbled characters may be displayed during decoding, which need to be manually or automatically filtered out.
- Currently, the logical decoding on the standby node does not support enabling the ultimate RTO.
- Ensure that the long transaction is not started during the creation of the logical replication slot. If the long transaction is started, the creation of the logical replication slot will be blocked.
- Interval partitioned tables cannot be replicated.
- Decoding of DML operations on global temporary tables is not supported.
- After a DDL statement is executed in a transaction, the DDL statement and subsequent statements are not decoded.
- Do not perform operations on the replication slot on other nodes when the logical replication slot is in use. To delete a replication slot, stop decoding in the replication slot first.
- To parse the UPDATE and DELETE statements of an Astore table, you need to configure the **REPLICA IDENTITY** attribute for the table. If the table does not have a primary key, set the **REPLICA IDENTITY** attribute to **FULL**.
- Do not perform operations on the replication slot on other nodes when the logical replication slot is in use. To delete a replication slot, stop decoding in the replication slot first.
- Considering that the target database may require the system status information of the source database, logical decoding automatically filters only logical logs of system catalogs whose OIDs are less than 16384 in pg\_catalog and pg\_toast schemas. If the target database does not need to copy the content of other related system catalogs, the related system catalogs need to be filtered during logical log replay.
- When logical replication is enabled, if you need to create a primary key index that contains system columns, you must set the **REPLICA IDENTITY** attribute of the table to **FULL** or use USING INDEX to specify a unique, non-local, non-deferrable index that does not contain system columns and contains only columns marked **NOT NULL**.
- After a logical replication slot is used up, delete it in time. Otherwise, Xlog recycling will be blocked.
- If a transaction has too many sub-transactions, too many files are flushed to disks. To exit decoding, you need to run the SQL function pg\_terminate\_backend (walsender thread ID for logical decoding) to manually stop decoding. In addition, the exit delay increases by about 1 minute per 300,000 sub-transactions. Therefore, when logical decoding is enabled, if the number of sub-transactions of a transaction reaches 50,000, a WARNING log is generated.
- When a transaction generates a large number of sub-transactions that need to be flushed to disks, the number of opened file handles may exceed the

upper limit. In this case, set **max\_files\_per\_process** to a value greater than twice the upper limit of sub-transactions.

## SQL Function Decoding Performance

In the Benchmarksql-5.0 with 100 warehouses, when `pg_logical_slot_get_changes` is used:

- If 4000 lines of data (about 5 MB to 10 MB logs) are decoded at a time, the decoding performance ranges from 0.3 MB/s to 0.5 MB/s.
- If 32000 lines of data (about 40 MB to 80 MB logs) are decoded at a time, the decoding performance ranges from 3 MB/s to 5 MB/s.
- If 256000 lines of data (about 320 MB to 640 MB logs) are decoded at a time, the decoding performance ranges from 3 MB/s to 5 MB/s.
- If the amount of data to be decoded at a time still increases, the decoding performance is not significantly improved.

If `pg_logical_slot_peek_changes` and `pg_replication_slot_advance` are used, the decoding performance is 30% to 50% lower than that when `pg_logical_slot_get_changes` is used.

### 14.1.2 Logical Decoding Options

Logical decoding options can provide a restriction on or additional functions for the current logical decoding, for example, specifying whether the decoding result includes a transaction number or whether empty transactions are ignored during decoding. For details about the configuration method and SQL function decoding, see the optional input parameters **options\_name** and **options\_value** of the `pg_logical_slot_peek_changes` function in [Logical Replication Functions](#). For details about JDBC streaming decoding, see the usage of the `withSlotOption` function in the sample code in [Logical Replication](#).

**General Options (Both serial decoding and parallel decoding can be configured, but the settings may be invalid. For details, see the description of related options.)**

- **include-xids:**  
Specifies whether the decoded **data** column contains XID information.  
Valid value: **0** and **1**. The default value is **1**.
  - **0**: The decoded **data** column does not contain XID information.
  - **1**: The decoded **data** column contains XID information.
- **skip-empty-xacts:**  
Specifies whether to ignore empty transaction information during decoding.  
Valid value: **0** and **1**. The default value is **0**.
  - **0**: The empty transaction information is not ignored during decoding.
  - **1**: The empty transaction information is ignored during decoding.
- **include-timestamp:**  
Specifies whether decoded information contains the **commit** timestamp.  
Valid value: **0** and **1**. The default value is **0**.

- **0**: The decoded information does not contain the **commit** timestamp.
  - **1**: The decoded information contains the **commit** timestamp.
- **only-local**:  
Specifies whether to decode only local logs.  
Valid value: **0** and **1**. The default value is **1**.
  - **0**: Non-local logs and local logs are decoded.
  - **1**: Only local logs are decoded.
- **white-table-list**:  
Whitelist parameter, including the schema and table name to be decoded.  
Value range: a string that contains table names in the whitelist. Different tables are separated by commas (,). An asterisk (\*) is used to fuzzily match all tables. Schema names and table names are separated by periods (.). No space character is allowed. For example:

```
select * from pg_logical_slot_peek_changes('slot1', NULL, 4096, 'white-table-list',
'public.t1,public.t2,*,t3,my_schema.*');
```
- **max-txn-in-memory**:  
Memory control parameter. The unit is MB. If the memory occupied by a single transaction is greater than the value of this parameter, data is flushed to disks.  
Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.
- **max-reorderbuffer-in-memory**:  
Memory control parameter. The unit is GB. If the total memory (including the cache) of transactions being concatenated in the sender thread is greater than the value of this parameter, the current decoding transaction is flushed to disks.  
Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.
- **include-user**:  
Specifies whether the BEGIN logical log of a transaction records the username of the transaction. The username of a transaction refers to the authorized user, that is, the login user who executes the session corresponding to the transaction. The username does not change during the execution of the transaction.  
Valid value: **0** and **1**. The default value is **0**.
  - **0**: The BEGIN logical log of a transaction does not contain the username of the transaction.
  - **1**: The BEGIN logical log of a transaction records the username of the transaction.
- **exclude-userids**:  
Specifies the OID of a blacklisted user.  
Value range: a string, which specifies the OIDs of blacklisted users. Multiple OIDs are separated by commas (,). The system does not check whether the OIDs exist.
- **exclude-users**:  
Name list of blacklisted users.

Value range: a string, which specifies the names of blacklisted users. Multiple names are separated by commas (,). The system does not check whether the names exist.

- **dynamic-resolution:**

Specifies whether to dynamically parse the names of blacklisted users.

Valid value: **0** and **1**. The default value is **1**.

- **0**: If the parameter is set to **0**, an error is reported and the logical decoding exits when the decoding detects that the user does not exist in blacklist **exclude-users**.
- **1**: If the parameter is set to **1**, decoding continues when it detects that the user does not exist in blacklist **exclude-users**.

- **standby-connection:**

Specifies whether to restrict decoding only on the standby node. This option is valid only for streaming decoding.

Value range: Boolean. The default value is **false**.

- **true**: Only the standby node can be connected for decoding. When the primary node is connected for decoding, an error is reported and the system exits.
- **false**: The primary or standby node can be connected for decoding.

- **sender-timeout:**

Specifies the heartbeat timeout threshold between the kernel and the client. This option is valid only for streaming decoding. If no message is received from the client within the period, the logical decoding stops and disconnects from the client. The unit is ms.

Value range: an integer ranging from 0 to 2147483647. The default value depends on the value of the GUC parameter **logical\_sender\_timeout**.

- **parallel-decode-num:**

Specifies the number of decoder threads for parallel decoding. This option is valid only for streaming decoding. When the system function is called, this option is invalid and only the value range is verified.

Value range: The value **1** indicates that decoding is performed based on the original serial logic. Other values indicate that parallel decoding is enabled. The default value is **1**.

---

**NOTICE**

If **parallel-decode-num** is not set (the default value is **1**) or is explicitly set to **1**, the options in the following "Parallel decoding" cannot be configured.

---

## Serial Decoding

- **force-binary:**

Specifies whether to output the decoding result in binary format and display different behaviors in different scenarios.

- For system functions `pg_logical_slot_get_binary_changes` and `pg_logical_slot_peek_binary_changes`:

- Value range: Boolean. The default value is **false**. The value is meaningless. The decoding result is always output in binary format.
- For system functions `pg_logical_slot_get_changes`, `pg_logical_slot_peek_changes`, and `pg_logical_get_area_changes`:  
Value range: Boolean. The value is fixed to **false**. The decoding result is always output in text format.
  - For streaming decoding:  
Value range: Boolean. The default value is **false**. The value is meaningless. The decoding result is always output in text format.

## Parallel Decoding

The following configuration options are set only for streaming decoding.

- **decode-style:**

Specifies the decoding format.

Valid value: **'j'**, **'t'**, or **'b'** of the char type, indicating the JSON, TEXT, or binary format, respectively. The default value is **'b'**, indicating binary decoding.

For the JSON and TEXT formats, in the decoding result sent in batches, the uint32 consisting of the first four bytes of each decoding statement indicates the total number of bytes of the statement (the four bytes occupied by the uint32 are excluded, and **0** indicates that the decoding of this batch ends). The 8-byte uint64 indicates the corresponding LSN (**begin** corresponds to **first\_lsn**, **commit** corresponds to **end\_lsn**, and other values correspond to the LSN of the statement).

 NOTE

The binary encoding rules are as follows:

1. The first four bytes represent the total number of bytes of the decoding result of statements following the statement-level delimiter letter P (excluded) or the batch end character F (excluded). If the value is 0, the decoding of this batch ends.
2. The next eight bytes (uint64) indicate the corresponding LSN (**begin** corresponds to **first\_lsn**, **commit** corresponds to **end\_lsn**, and other values correspond to the LSN of the statement).
3. The next one-byte letter can be **B**, **C**, **I**, **U**, or **D**, representing BEGIN, COMMIT, INSERT, UPDATE, or DELETE.
4. If the letter described in 3 is **B**:
  1. The next eight bytes (uint64) indicate the CSN.
  2. The next eight bytes (uint64) indicate **first\_lsn**.
  3. (Optional) If the next one-byte letter is **T**, the following four bytes (uint32) indicate the timestamp length for committing the transaction. The following characters with the same length are the timestamp character string.
  4. (Optional) If the next one-byte letter is **N**, the following four bytes (uint32) indicate the length of the transaction username. The following characters with the same length are the transaction username.
  5. Because there may still be a decoding statement subsequently, a one-byte letter **P** or **F** is used as a separator between statements. **P** indicates that there are still decoded statements in this batch, and **F** indicates that this batch is completed.
5. If the letter described in 3 is **C**:
  1. (Optional) If the next one-byte letter is **X**, the following eight bytes (uint64) indicate the XID.
  2. (Optional) If the next one-byte letter is **T**, the following four bytes (uint32) indicate the timestamp length. The following characters with the same length are the timestamp character string.
  3. When logs are sent in batches, decoding results of other transactions may still exist after a COMMIT log is decoded. If the next one-byte letter is **P**, the batch still needs to be decoded. If the letter is **F**, the batch decoding ends.
6. If the letter described in 3 is **I**, **U**, or **D**:
  1. The next two bytes (uint16) indicate the length of the schema name.
  2. The schema name is read based on the preceding length.
  3. The next two bytes (uint16) indicate the length of the table name.
  4. The table name is read based on the preceding length.
  5. (Optional) If the next 1-byte letter is **N**, it indicates a new tuple. If the letter is **O**, it indicates an old tuple. In this case, the new tuple is sent first.
    1. The following two bytes (uint16) indicate the number of columns to be decoded for the tuple, which is recorded as **attrnum**.
    2. The following procedure is repeated for *attrnum* times.
      1. The next two bytes (uint16) indicate the length of the column name.
      2. The column name is read based on the preceding length.
      3. The next four bytes (uint32) indicate the OID of the current column type.
      4. The next four bytes (uint32) indicate the length of the value (stored in the character string format) in the current column. If the value is **0xFFFFFFFF**, it indicates null. If the value is 0, it indicates a character string whose length is 0.
      5. The column value is read based on the preceding length.

6. Because there may still be a decoding statement after, if the next one-byte letter is **P**, it indicates that the batch still needs to be decoded, and if the next one-byte letter is **F**, it indicates that decoding of the batch ends.

- **sending-batch:**

Specifies whether to send messages in batches.

Valid value: **0** or **1** of the int type. The default value is **0**.

- **0**: The decoding results are sent one by one.
- **1**: When the accumulated size of decoding results reaches 1 MB, decoding results are sent in batches.

In the scenario where batch sending is enabled, if the decoding format is 'j' or 't', before each original decoding statement, a uint32 number is added indicating the length of the decoding result (excluding the current uint32 number), and a uint64 number is added indicating the LSN corresponding to the current decoding result.

- **parallel-queue-size:**

Specifies the length of the queue for interaction between parallel logical decoding threads.

Value range: an integer ranging from 2 to 1024. The value must be an integer power of 2. The default value is **128**.

The queue length is positively correlated with the memory usage during decoding.

### 14.1.3 Logical Decoding by SQL Functions

In GaussDB, you can call SQL functions to create, delete, and push logical replication slots, as well as obtain decoded transaction logs.

#### Procedure

**Step 1** Log in to the primary node of the GaussDB database as a user who has the REPLICATION permission.

**Step 2** Run the following command to connect to the database.

```
gsql -U user1 -d gaussdb -p 16000 -r
```

In the preceding command, **user1** indicates the username, **gaussdb** indicates the name of the database to be connected, and **16000** indicates the database port number. You can replace them as required.

**Step 3** Create a logical replication slot named **slot1**.

```
openGauss=# SELECT * FROM pg_create_logical_replication_slot('slot1', 'mppdb_decoding');
slotname | xlog_position
-----+-----
slot1 | 0/601C150
(1 row)
```

**Step 4** Create a table **t** in the database and insert data into it.

```
openGauss=# CREATE TABLE t(a int PRIMARY KEY, b int);
openGauss=# INSERT INTO t VALUES(3,3);
```

**Step 5** Read the decoding result of **slot1**. The number of decoded records is 4096.

```
openGauss=# SELECT * FROM pg_logical_slot_peek_changes('slot1', NULL, 4096);
location | xid | data
-----+-----
```

```
+-----+
0/601C188	1010023	BEGIN 1010023
0/601ED60	1010023	COMMIT 1010023 CSN 1010022
0/601ED60	1010024	BEGIN 1010024
0/601ED60	1010024	{"table_name":"public.t","op_type":"INSERT","columns_name":
["a","b"],"columns_type":["integer","integer"],"columns_val":["3","3"],"old_keys_name":[""],"old_keys_type":		
[""],"old_keys_val":[""]}		
0/601EED8	1010024	COMMIT 1010024 CSN 1010023
(5 rows)
```

**Step 6** Delete the logical replication slot **slot1**.

```
openGauss=# SELECT * FROM pg_drop_replication_slot('slot1');
pg_drop_replication_slot

(1 row)
```

----End

## 14.1.4 Replicating Data Using the Logical Replication Tool

Currently, SDR and DRS support GaussDB logical replication. The replication tool extracts logical logs from GaussDB and replays them in the peer database. For details about the code of the replication tool that uses JDBC to connect to the database, see [Logical Replication](#).

# 15 Materialized View

A materialized view is a special physical table, which is relative to an ordinary view. An ordinary view is a virtual table and has many application limitations. Any query on a view is actually converted into a query on an SQL statement, and performance is not actually improved. The materialized view actually stores the results of the statements executed by the SQL statement, and is used to cache the results.

Currently, Ustore does not support the creation and use of materialized views.

## 15.1 Complete-refresh Materialized View

### 15.1.1 Overview

Complete-refresh materialized views can be completely refreshed only. The syntax for creating a complete-refresh materialized view is similar to the CREATE TABLE AS syntax.

### 15.1.2 Usage

#### Syntax

- Create a complete-refresh materialized view.  
`CREATE MATERIALIZED VIEW [ view_name ] AS { query_block };`
- Completely refresh a materialized view.  
`REFRESH MATERIALIZED VIEW [ view_name ];`
- Delete a materialized view.  
`DROP MATERIALIZED VIEW [ view_name ];`
- Query a materialized view.  
`SELECT * FROM [ view_name ];`

#### Examples

```
-- Prepare data.
openGauss=# CREATE TABLE t1(c1 int, c2 int);
openGauss=# INSERT INTO t1 VALUES(1, 1);
openGauss=# INSERT INTO t1 VALUES(2, 2);

-- Create a complete-refresh materialized view.
```

```
openGauss=# CREATE MATERIALIZED VIEW mv AS select count(*) from t1;
CREATE MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
count

 2
(1 row)

-- Insert data into the base table in the materialized view.
openGauss=# INSERT INTO t1 VALUES(3, 3);
INSERT 0 1

-- Completely refresh the complete-refresh materialized view.
openGauss=# REFRESH MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
count

 3
(1 row)

-- Delete the materialized view.
openGauss=# DROP MATERIALIZED VIEW mv;
DROP MATERIALIZED VIEW
```

## 15.1.3 Support and Constraints

### Supported Scenarios

- Supports the same query scope as the CREATE TABLE AS statement does.
- Supports index creation in complete-refresh materialized views.
- Supports ANALYZE and EXPLAIN.

### Unsupported Scenarios

Materialized views cannot be added, deleted, or modified. They support only query statements.

### Constraints

When a complete-refresh materialized view is refreshed or deleted, a high-level lock is added to the base table. If the definition of a materialized view involves multiple tables, pay attention to the service logic to avoid deadlock.

## 15.2 Fast-refresh Materialized View

### 15.2.1 Overview

Fast-refresh materialized views can be fastly refreshed. You need to manually execute statements to fastly refresh materialized views in a period of time. The difference between the fast-refresh and the complete-refresh materialized views is that the fast-refresh materialized views support only a small number of scenarios. Currently, only base table scanning statements or UNION ALL can be used to create materialized views.

## 15.2.2 Usage

### Syntax

- Create a fast-refresh materialized view.  
`CREATE INCREMENTAL MATERIALIZED VIEW [ view_name ] AS { query_block };`
- Completely refresh a materialized view.  
`REFRESH MATERIALIZED VIEW [ view_name ];`
- Fastly refresh a materialized view.  
`REFRESH INCREMENTAL MATERIALIZED VIEW [ view_name ];`
- Delete a materialized view.  
`DROP MATERIALIZED VIEW [ view_name ];`
- Query a materialized view.  
`SELECT * FROM [ view_name ];`

### Examples

```
-- Prepare data.
openGauss=# CREATE TABLE t1(c1 int, c2 int);
openGauss=# INSERT INTO t1 VALUES(1, 1);
openGauss=# INSERT INTO t1 VALUES(2, 2);

-- Create a fast-refresh materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW mv AS SELECT * FROM t1;
CREATE MATERIALIZED VIEW

-- Insert data.
openGauss=# INSERT INTO t1 VALUES(3, 3);
INSERT 0 1

-- Fastly refresh the materialized view.
openGauss=# REFRESH INCREMENTAL MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
c1 | c2
----+----
 1 | 1
 2 | 2
 3 | 3
(3 rows)

-- Insert data.
openGauss=# INSERT INTO t1 VALUES(4, 4);
INSERT 0 1

-- Completely refresh the materialized view.
openGauss=# REFRESH MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# select * from mv;
c1 | c2
----+----
 1 | 1
 2 | 2
 3 | 3
 4 | 4
(4 rows)

-- Delete the materialized view.
openGauss=# DROP MATERIALIZED VIEW mv;
DROP MATERIALIZED VIEW
```

## 15.2.3 Support and Constraints

### Supported Scenarios

- Supports statements for querying a single table.
- Supports UNION ALL for querying multiple single tables.
- Supports index creation in materialized views.
- Supports the Analyze operation in materialized views.

### Unsupported Scenarios

- Multi-table join plans and subquery plans are not supported in materialized views.
- Except for a few ALTER operations, most DDL operations cannot be performed on base tables in materialized views.
- Materialized views cannot be added, deleted, or modified. They support only query statements.
- Temporary, hash bucket, unlogged, or partitioned tables cannot be used to create materialized views.
- Materialized views cannot be created in nested mode (that is, a materialized view cannot be created in another materialized view).
- Only row-store tables are supported.
- Materialized views of the UNLOGGED type are not supported, and the WITH syntax is not supported.

### Constraints

- If the materialized view definition is UNION ALL, each subquery needs to use a different base table.
- When a fast-refresh materialized view is created, completely refreshed, or deleted, a high-level lock is added to the base table. If the materialized view is defined as UNION ALL, pay attention to the service logic to avoid deadlock.

# 16 Error Log Reference

---

## 16.1 Kernel Error Information

ERRMSG: "unsupported syntax: ENCRYPTED WITH in this operation"

# 17

## Configuring GUC Parameters

### 17.1 Viewing Parameter Values

GaussDB uses a set of default running parameters after it is installed. You can modify the parameters to better fit the current service scenarios and data volume.

#### Procedure

**Step 1** Connect to the database.

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database to be connected, and **8000** is the port number of the database primary node.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr
6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
openGauss=#
```

**Step 2** View the parameter values in the database.

- Method 1: Run the **SHOW** command.
  - Run the following command to view the value of a certain parameter:  
openGauss=# **SHOW** *server\_version*;  
*server\_version* indicates the database version.
  - Run the following command to view values of all parameters:  
openGauss=# **SHOW ALL**;
- Method 2: Query the **pg\_settings** view.
  - Run the following command to view the value of a certain parameter:  
openGauss=# **SELECT \* FROM pg\_settings WHERE NAME='server\_version'**;
  - Run the following command to view values of all parameters:  
openGauss=# **SELECT \* FROM pg\_settings**;

----End

## Example

Check the character encoding type of the client.

```
openGauss=# SHOW client_encoding;
client_encoding

UTF8
(1 row)
```

## 17.2 Resetting Parameters

You are advised to modify some parameters on the GaussDB console. If the parameters cannot be modified on the console, evaluate the risks and contact customer service.

### Background

GaussDB provides multiple methods to set the GUC parameters of databases, users, or sessions.

- Parameter names are case-insensitive.
- A parameter value can be an integer, floating point value, string, Boolean value, or enumerated value.
  - The Boolean values can be **on/off**, **true/false**, **yes/no**, or **1/0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the **pg\_settings** system catalog.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of **pg\_settings**.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.

For details about parameters in the hosts configuration template, see [GUC Parameters](#).

### Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see [Table 17-1](#).

**Table 17-1** GUC parameters

| Category | Description                                                                                                                                                                         | How to Set |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| INTERNAL | Fixed parameter. It is set during database creation and cannot be modified. Users can only view the parameter by running the <b>SHOW</b> command or in the <b>pg_settings</b> view. | None       |

| Category   | Description                                                                                                                                                                                                                                                        | How to Set                                                                                                                           |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| POSTMASTER | Database server parameter. It can be set when the database is started or in the configuration file.                                                                                                                                                                | Method 1 in <a href="#">Table 17-2</a> .                                                                                             |
| SIGHUP     | Global database parameter. It can be set when the database is started or be modified later.                                                                                                                                                                        | Method 1 or 2 in <a href="#">Table 17-2</a> .                                                                                        |
| BACKEND    | Session connection parameter. It is specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. This is an internal parameter and not recommended for users to set it. | Method 1 or 2 in <a href="#">Table 17-2</a> .<br><b>NOTE</b><br>The parameter setting takes effect when the next session is created. |
| SUSET      | Database administrator parameter. It can be set by common users when or after the database is started. It can also be set by database administrators using SQL statements.                                                                                         | Method 1 or 2 by a common user, or method 3 by a database administrator in <a href="#">Table 17-2</a> .                              |
| USERSET    | Common user parameter. It can be set by any user at any time.                                                                                                                                                                                                      | Method 1, 2, or 3 in <a href="#">Table 17-2</a> .                                                                                    |

You can set GUC parameters in GaussDB using the three methods listed in [Table 17-2](#).

**Table 17-2** Methods for setting GUC parameters

| No.      | How to Set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters.<br/>If the parameters cannot be modified on the console, evaluate the risks in advance and contact customer service for modification.</li></ol> |
| Method 3: | <ol style="list-style-type: none"><li>1. Log in to the console.</li><li>2. On the <b>Instances</b> page, click the instance name to go to the <b>Basic Information</b> page.</li><li>3. In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters.<br/>If the parameters cannot be modified on the console, evaluate the risks in advance and contact customer service for modification.</li></ol> |

---

**CAUTION**

- If you use method 1 or 2 to set a parameter that does not belong to the current environment, the database displays a message indicating that the parameter is not supported.
  - When you use method 3 to set a parameter, if the parameter value is an integer, leading zeros will be filtered out. For example, **SET *paraname* TO 008192** and **SET *paraname* TO 8192** have the same effect.
- 

## Procedure

The following example shows how to set **hot\_standby** on the primary node of the database using method 1.

**Step 1** Log in as the OS user **omm** to the primary node of the database.

**Step 2** View the value of **hot\_standby**.

```
cat /gaussdb/data/dbnode/postgresql.conf | grep "hot_standby"
hot_standby = on
```

**on** indicates logs are archived.

**Step 3** Set **hot\_standby** to **off** to disable log archiving.

```
gs_guc set -Z datanode -D /gaussdb/data/dbnode -c "hot_standby=off"
```

**NOTE**

You can set **hot\_standby** to **off** for the database nodes.

```
gs_guc set -Z datanode -N all -I all -c "hot_standby=off"
```

**Step 4** Restart the database to make the setting take effect.

```
gs_om -t stop && gs_om -t start
```

**Step 5** Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr
6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.

openGauss=#
```

**Step 6** Check whether the parameter is correctly set.

```
openGauss=# SHOW hot_standby;
hot_standby

off
(1 row)
```

----End

The following example shows how to set **authentication\_timeout** on the primary node of the database using method 2.

**Step 1** Log in as the OS user **omm** to the primary node of the database.

**Step 2** View the value of **authentication\_timeout**.

```
cat /gaussdb/data/dbnode/postgresql.conf | grep authentication_timeout
authentication_timeout = 1min
```

**Step 3** Set **authentication\_timeout** to **59s**.

```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"

Total instances: 2. Failed instances: 0.
Success to perform gs_guc!
```

#### NOTE

You can run the following command to set **authentication\_timeout** to **59s** for the database nodes:

```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"
```

**Step 4** Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr
6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.

openGauss=#
```

**Step 5** Check whether the parameter is correctly set.

```
openGauss=# SHOW authentication_timeout;
authentication_timeout
```

```

59s
(1 row)
```

----End

The following example shows how to set **explain\_perf\_mode** using method 3.

**Step 1** Log in as the OS user **omm** to the primary node of the database.

**Step 2** Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr
6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
openGauss=#
```

**Step 3** View the value of **explain\_perf\_mode**.

```
openGauss=# SHOW explain_perf_mode;
explain_perf_mode

normal
(1 row)
```

**Step 4** Set **explain\_perf\_mode**.

Perform one of the following operations:

- Set a database-level parameter.  
openGauss=# **ALTER DATABASE postgres SET explain\_perf\_mode TO pretty;**

If the following information is displayed, the setting succeeds:

```
ALTER DATABASE
```

The setting takes effect in the next session.

- Set a user-level parameter.  
openGauss=# **ALTER USER omm SET explain\_perf\_mode TO pretty;**

If the following information is displayed, the setting succeeds:

```
ALTER ROLE
```

The setting takes effect in the next session.

- Set a session-level parameter.  
openGauss=# **SET explain\_perf\_mode TO pretty;**

If the following information is displayed, the setting succeeds:

```
SET
```

**Step 5** Check whether the parameter is correctly set.

```
openGauss=# SHOW explain_perf_mode;
explain_perf_mode

pretty
(1 row)
```

----End

## Examples

- Example 1: modifying the maximum connections for the primary database node in GaussDB using method 1

a. Log in as the OS user **omm** to the primary node of the database.

b. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

c. View the allowed maximum connections.

```
openGauss=# SHOW max_connections;
max_connections
```

```

200
(1 row)
```

d. Run the following command to exit the database:

```
openGauss=# \q
```

e. Change the maximum connections for the primary database node in GaussDB.

```
gs_guc set -Z datanode -N all -I all -c "max_connections = 800"
```

f. Restart the database.

```
gs_om -t stop && gs_om -t start
```

g. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

h. View the allowed maximum connections.

```
openGauss=# SHOW max_connections;
max_connections
```

```

800
(1 row)
```

- Example 2: setting **authentication\_timeout** (the allowed longest client authentication duration) for the primary database node using method 2

a. Log in as the OS user **omm** to the primary node of the database.

b. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit
2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

- c. View the value of **authentication\_timeout**.

```
openGauss=# SHOW authentication_timeout;
authentication_timeout

1min
(1 row)
```

- d. Run the following command to exit the database:

```
openGauss=# \q
```

- e. Change the allowed longest client authentication duration of the primary database node.

```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"
```

- f. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit
2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

- g. View the value of **authentication\_timeout**.

```
openGauss=# SHOW authentication_timeout;
authentication_timeout

59s
(1 row)
```

- Example 3: Change the maximum number of connections between GaussDB database nodes.

- a. Log in as the OS user **omm** to the primary node of the database.

- b. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit
2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

- c. View the allowed maximum connections.

```
openGauss=# SHOW max_connections;
max_connections

```

- ```
200
(1 row)
```
- d. Run the following command to exit the database:
- ```
openGauss=# \q
```
- e. Change the maximum number of connections between GaussDB database nodes.
- ```
gs_guc set -Z datanode -N all -I all -c "max_connections = 500"
```
- f. Restart the database.
- ```
gs_om -t stop
gs_om -t start
```
- g. Run the following command to connect to the database:
- ```
gsql -d postgres -p 8000
```
- postgres** is the name of the database, and 8000 is the port number of the primary node of the database.
- If information similar to the following is displayed, the connection succeeds:
- ```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit
2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.

openGauss=#
```
- h. View the allowed maximum connections.
- ```
openGauss=# SHOW max_connections;
max_connections
-----
500
(1 row)
```
- Example 4: setting authentication_timeout (the allowed longest client authentication duration) for database nodes
- a. Log in as the OS user **omm** to the primary node of the database.
- b. Run the following command to connect to the database:
- ```
gsql -d postgres -p 8000
```
- postgres** is the name of the database, and 8000 is the port number of the primary node of the database.
- If information similar to the following is displayed, the connection succeeds:
- ```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit
2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.

openGauss=#
```
- c. View the value of **authentication_timeout**.
- ```
openGauss=# SHOW authentication_timeout;
authentication_timeout

1min
(1 row)
```
- d. Run the following command to exit the database:
- ```
openGauss=# \q
```
- e. Change the allowed longest client authentication duration of GaussDB database nodes.
- ```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 30s"
```
- f. Run the following command to connect to the database:

```
gsql -d postgres -p 8000
```

**postgres** is the name of the database, and 8000 is the port number of the primary node of the database.

If information similar to the following is displayed, the connection succeeds:

```
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.
```

```
openGauss=#
```

g. View the value of **authentication\_timeout**.

```
openGauss=# SHOW authentication_timeout;
authentication_timeout

30s
(1 row)
```

## 17.3 GUC Parameters

### 17.3.1 GUC Parameter Usage

A database provides many operation parameters. Configurations of these parameters affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

#### Precautions

- If the value range of a parameter is a string, the string should comply with the naming conventions of the path and file name in the OS running the target database.
- If the maximum value of a parameter is *INT\_MAX*, the maximum parameter value varies by OS.
- If the maximum value of a parameter is *DBL\_MAX*, the maximum parameter value varies by OS.

### 17.3.2 File Location

After a database has been installed, three configuration files (**postgresql.conf**, **pg\_hba.conf**, and **pg\_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data\_directory** in **postgresql.conf** to the actual data directory.

---

#### NOTICE

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

---

## data\_directory

**Parameter description:** Specifies the GaussDB **data** directory. Only users with the **sysadmin** permission can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

## config\_file

**Parameter description:** Specifies the configuration file (**postgresql.conf**) of the primary server.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** **postgresql.conf** (The absolute directory of this file may be displayed in the actual situation.)

## hba\_file

**Parameter description:** Specifies the configuration file (**pg\_hba.conf**) for host-based authentication (HBA). This parameter can be specified only in the **postgresql.conf** file and can be accessed only by users with the **sysadmin** permission.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** **pg\_hba.conf** (The absolute directory of this file may be displayed in the actual situation.)

## ident\_file

**Parameter description:** Specifies the name of the configuration file (**pg\_ident.conf**) for client authentication. Only users with the **sysadmin** permission can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** **pg\_ident.conf** (The absolute directory of this file may be displayed in the actual situation.)

## external\_pid\_file

**Parameter description:** Specifies the extra PID file that can be used by the server management program. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

This parameter takes effect only after the database restarts.

---

**Value range:** a string

**Default value:** empty

## 17.3.3 Connection and Authentication

### 17.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

#### **listen\_addresses**

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, IPv4. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP address specified by this parameter to connect to or send requests to GaussDB.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:**

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (\*) or **0.0.0.0**, indicating that all IP addresses will be listened to, which is not recommended due to potential security risks. This parameter must be used together with valid addresses (for example, the local IP address). Otherwise, the build may fail. In primary/standby mode, if the value is set to \\* or **0.0.0.0**, the value of **localport** in the **postgresql.conf** file of the database on the primary node cannot be the value of **dataPortBase + 1**. Otherwise, the database cannot be started.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

**Default value:** After the database instance is installed, the default value is configured according to the IP address of different instances in the **public\_cloud.conf** configuration file. The default value for the DN instance is the IP address of the **data.net** NIC.

 **NOTE**

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

## local\_bind\_address

**Parameter description:** Specifies the host IP address bound to the current node for connecting to other nodes in the database.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Default value:** After the database instance is installed, the default value is configured according to the IP address of different instances in the **public\_cloud.conf** configuration file. The default value for the DN instance is the IP address of the **data.net** NIC.

### NOTE

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

## port

**Parameter description:** Specifies the TCP port listened on by the GaussDB.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535

### NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the operating system. Do not use them.
- When the database instance is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, *dataPortBase* + 1 needs to be reserved as the port used by internal tools, and *dataPortBase* + 6 needs to be reserved as the communication port of the streaming engine message queue. (Due to specification changes, the current version no longer supports this feature. Do not use it.) Therefore, during database instance installation, the maximum port number is **65529** for DNs. Ensure that the port number does not conflict with each other.

**Default value:** **5432** (The actual value is specified in the configuration file during installation.)

## max\_connections

**Parameter description:** Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the database.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer The minimum value is **10** (greater than **max\_wal\_senders**). The theoretical maximum value is **262143**. The actual

maximum value is a dynamic value, which is calculated using the formula:  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS} - \text{max\_inner\_tool\_connections} - \min(\max(\text{newValue}/4, 64), 1024)$ . The values of [job\\_queue\\_processes](#), [autovacuum\\_max\\_workers](#), and [max\\_inner\\_tool\\_connections](#) depend on the settings of the corresponding GUC parameters. **AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV\_LAUNCHER\_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In  $\min(\max(\text{newValue}/4, 64), 1024)$ , **newValue** indicates the new value.

For different memory specifications, the value range of this parameter in different instances is as follows:

**Table 17-3** Value ranges of memory specifications for different instances

| Memory Specifications | Value Range in DN |
|-----------------------|-------------------|
| < 32GB                | [10, 100]         |
| [32GB, 64GB)          | [10, 200]         |
| [64GB, 128GB)         | [10, 2048]        |
| [128GB, 256GB)        | [10, 5000]        |
| [256GB, 480GB)        | [10, 11000]       |
| [480GB, 512GB)        | [10, 24000]       |
| [512GB, 640GB)        | [10, 25000]       |
| [640GB, 768GB)        | [10, 34000]       |
| [768GB, 1024GB)       | [10, 40000]       |
| [1024GB, 1536GB)      | [10, 55000]       |
| [1536GB, 2048GB)      | [10, 85000]       |
| >= 2048GB             | [10, 110000]      |

**Default value:**

**55000** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **40000** (96-core CPU/768 GB memory); **25000** (64-core CPU/512 GB memory); **24000** (60-core CPU/480 GB memory); **11000** (32-core CPU/256 GB memory); **5000** (16-core CPU/128 GB memory); **2048** (8-core CPU/64 GB memory);

**Setting suggestions:**

Retain the default value of this parameter on the primary node of the databases.

**Impact of incorrect configuration:**

- If the value of **max\_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid

value for parameter "max\_connections". Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory".

- If only the value of *max\_connections* is increased while the memory parameter is not adjusted in proportion according to the external egress specifications, when the service load is heavy, the memory may be insufficient, and the error message "memory is temporarily unavailable" is displayed.

#### NOTE

- If the number of connections of the administrator exceeds the value of *max\_connections*, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of *sysadmin\_reserved\_connections*, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of *max\_connections*. The value depends on the number of internal connections.

## max\_inner\_tool\_connections

**Parameter description:** Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to *MIN* (which takes the smaller value between **262143** and *max\_connections*). For details about how to calculate the value of *max\_connections*, see the preceding description.

**Default value:** 50 for each database node. If the default value is greater than the maximum value supported by the kernel (determined when the **gs\_initdb** command is executed), an error message is displayed.

#### Setting suggestions:

Retain the default value of this parameter on the primary node of the databases.

If this parameter is set to a large value, GaussDB requires more System V shared memory or semaphores, which may exceed the default maximum configuration of the OS. In this case, modify the value as needed.

## sysadmin\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the *max\_connections* parameter. The maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *MIN* (which takes the smaller value between **262143** and *max\_connections*). For details about how to calculate the value of *max\_connections*, see the preceding description.

**Default value:** 3

**Note:** When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use `gsql` to establish connections through the primary port number + 1 to clear useless sessions.

## unix\_socket\_directory

**Parameter description:** Specifies the Unix domain socket directory for the GaussDB server to listen to connections from the client.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

The parameter length limit varies by OS. If the length is exceeded, the error "Unix-domain socket path xxx is too long" will be reported.

**Value range:** a string

**Default value:** empty. The actual value is specified by the configuration file during installation.

## unix\_socket\_group

**Parameter description:** Specifies the group of the Unix domain socket (the user of a socket is the user that starts the server). This parameter can work with [unix\\_socket\\_permissions](#) to control socket access.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. If this parameter is set to an empty string, the default group of the current user is used.

**Default value:** empty

## unix\_socket\_permissions

**Parameter description:** Specifies access permissions for the Unix domain socket.

The Unix domain socket uses the common permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0000 to 0777

**Default value:** 0700

#### NOTE

In the Linux OS, a document has one document attribute and nine permission attributes, which consists of the read (r), write (w), and execute (x) permissions of the Owner, Group, and Others groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

## application\_name

**Parameter description:** Specifies the client name used in the current connection request.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

**Value range:** a string

**Default value:** empty (The actual value is the name of the application connected to the backend.)

## connection\_info

**Parameter description:** Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This is a USERSET parameter used for O&M. You are advised not to change the parameter value.

**Value range:** a string

**Default value:** empty

 NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection\_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection\_info**:  

```
{"driver_name":"ODBC","driver_version": "(GaussDB Kernel VxxxRxxxCxx build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/psqlodbcw.so","os_user":"omm"}
```

**driver\_name** and **driver\_version** are displayed by default. Whether **driver\_path** and **os\_user** are displayed is determined by users.

## check\_disconnect\_query

**Parameter description:** Specifies whether to terminate the execution of statements on the GaussDB server after the client is disconnected abnormally (for example, socketTimeout is triggered by JDBC, rwttimeout is triggered by libpq and the connection is closed, or the client process is terminated during service running).

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on:** indicates that the GaussDB server stops running the corresponding statements after the client is disconnected unexpectedly.
- **off:** indicates that the GaussDB server does not stop running the corresponding statements after the client is disconnected unexpectedly.

**Default value:** on

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Setting suggestion:** Retain the default value.

---

 CAUTION

If this parameter is set and an upgrade is required, check whether the target version supports this parameter before the upgrade. If this parameter is not supported, delete it from the configuration file first before proceeding with the upgrade.

---

### 17.3.3.2 Security and Authentication (postgresql.conf)

This section describes parameters about client-to-server authentication.

## authentication\_timeout

**Parameter description:** Specifies the longest duration to wait before the client authentication times out. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 600. The smallest unit is s.

**Default value:** 1min

## auth\_iteration\_count

**Parameter description:** Specifies the number of iterations during the generation of encryption information for authentication.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 2048 to 134217728

**Default value:** 10000

---

### NOTICE

If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

---

## session\_authorization

**Parameter description:** Specifies the user ID of the current session.

This is a USERSET parameter and can be set only using the SET SESSION AUTHORIZATION syntax.

**Value range:** a string

**Default value:** NULL

## session\_timeout

**Parameter description:** Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 86400. The smallest unit is s. **0** indicates that the timeout is disabled.

**Default value:** 1800s

---

### NOTICE

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

---

## ssl

**Parameter description:** Specifies whether SSL connections are enabled.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that SSL connections are enabled.
- **off** indicates that SSL connections are not enabled.

---

### NOTICE

To enable SSL connections, you also need to configure parameters such as **ssl\_cert\_file**, **ssl\_key\_file**, and **ssl\_ca\_file** and the corresponding files. Incorrect configurations may cause startup failure of the database.

---

**Default value:** on

## require\_ssl

**Parameter description:** Specifies whether the server requires the SSL connection. This parameter is valid only when **ssl** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the server requires SSL connections.
- **off** indicates that the server does not require SSL connections.

---

### NOTICE

GaussDB supports SSL when a client connects to a the primary node of the database. It is recommended that the SSL connection be enabled only on the primary node of the databases.

---

**Default value:** off

## ssl\_ciphers

**Parameter description:** Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. Separate multiple encryption algorithms by semicolons (;).

**Default value:** ALL

---

### NOTICE

If **ssl\_ciphers** is set incorrectly, the database cannot be started properly.

---

## ssl\_renegotiation\_limit

**Parameter description:** Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

**Default value:** 0

## ssl\_cert\_file

**Parameter description:** Specifies the name of the file that contains the SSL server certificate. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** server.crt

## ssl\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** server.key

## ssl\_ca\_file

**Parameter description:** Specifies the name of a file that contains CA information. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

**Default value:** cacert.pem

## ssl\_crl\_file

**Parameter description:** Specifies the certificate revocation list (CRL). If the certificate of a client is in the list, the certificate is invalid. A relative path must be used. The path depends on the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that there is no CRL.

**Default value:** empty

## krb\_server\_keyfile

**Parameter description:** Specifies the location of the main configuration file of the Kerberos service. Only the sysadmin user can access the file.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** empty

## krb\_srvname

**Parameter description:** Specifies the Kerberos service name.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** postgres

## krb\_caseins\_users

**Parameter description:** Specifies whether the Kerberos username is case-sensitive.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the Kerberos username is case-insensitive.
- **off** indicates that the Kerberos username is case-sensitive.

**Default value:** off

## modify\_initial\_password

**Parameter description:** After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

---

**Value range:** Boolean

- **on** indicates that the password of the initial user needs to be modified upon the first login after the database is successfully installed.
- **off** indicates that the password of the initial user does not need to be modified upon the first login after the database is successfully installed.

**Default value:** off

## password\_policy

**Parameter description:** Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify a GaussDB account.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

For security purposes, do not disable the password complexity policy.

---

**Value range:** 0 and 1

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

**Default value:** 1

## password\_reuse\_time

**Parameter description:** Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
  - If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
  - If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
  - If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.
- 

**Value range:** a floating-point number ranging from 0 to 3650. The unit is day.

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

**Default value:** 0

## password\_reuse\_max

**Parameter description:** Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.

---

**Value range:** an integer ranging from 0 to 1000

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

**Default value:** 0

## password\_lock\_time

**Parameter description:** Specifies the duration before a locked account is automatically unlocked.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

The locking and unlocking functions take effect only when the values of [password\\_lock\\_time](#) and [failed\\_login\\_attempts](#) are positive numbers.

---

**Value range:** a floating-point number ranging from 0 to 365. The unit is day.

- **0** indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

**Default value:** 1

## failed\_login\_attempts

**Parameter description:** Specifies the maximum number of incorrect password attempts before an account is locked. The account will be automatically unlocked after the time specified by **password\_lock\_time**. Only the **sysadmin** user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the **ALTER USER** command.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

The locking and unlocking functions take effect only when the values of **failed\_login\_attempts** and **password\_lock\_time** are positive numbers.

---

**Value range:** an integer ranging from 0 to 1000

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

**Default value:** 10

## password\_encryption\_type

**Parameter description:** Specifies the encryption type of a user password. Changing the value of this parameter does not change the password encryption type of existing users. The new encryption type is applied to passwords of new users or passwords modified after the parameter value is changed.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0, 1, 2, or 3

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted in sm3 mode.

---

### NOTICE

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

---

**Default value:** 2

## password\_min\_length

**Parameter description:** Specifies the minimum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 8

## password\_max\_length

**Parameter description:** Specifies the maximum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 32

## password\_min\_uppercase

**Parameter description:** Specifies the minimum number of uppercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of uppercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_lowercase

**Parameter description:** Specifies the minimum number of lowercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of lowercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_digital

**Parameter description:** Specifies the minimum number of digits that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of digits required in a password when you create an account.

**Default value:** 0

## password\_min\_special

**Parameter description:** Specifies the minimum number of special characters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of special characters required in a password when you create an account.

**Default value:** 0

## password\_effect\_time

**Parameter description:** Specifies the validity period of an account password.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating-point number ranging from 0 to 999. The unit is day.

- 0 indicates that the validity period restriction is disabled.
- A floating-point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

**Default value:** 0

## password\_notify\_time

**Parameter description:** Specifies how many days in advance a user is notified before a password expires.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 999. The unit is day.

- 0 indicates that the reminder is disabled.
- An integer ranging from 1 to 999 indicates the number of days prior to password expiration that a user will receive a reminder.

**Default value:** 7

## ssl\_cert\_notify\_time

**Parameter description:** Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 7 to 180. The unit is day.

**Default value:** 90

### 17.3.3.3 Communication Library Parameters

This section describes parameter settings and value ranges for communication libraries.

## tcp\_keepalives\_idle

**Parameter description:** Specifies the interval for transmitting keepalive signals on an OS that supports the TCP\_KEEPIDLE socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

- If the OS does not support TCP\_KEEPIDLE, set this parameter to 0.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
  - If this parameter is set to 0, the system value is used.
  - This parameter is not shared among different sessions. That is, different session connections may have different values.
  - The parameter value in the current session connection, not the value of the GUC copy, is displayed.
- 

**Value range:** 0 to 3600. The unit is s.

**Default value:** 60

## tcp\_keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the TCP\_KEEPINTVL socket option.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 to 180. The unit is s.

**Default value:**

---

**NOTICE**

- If the OS does not support TCP\_KEEPINTVL, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
  - If this parameter is set to **0**, the system value is used.
  - This parameter is not shared among different sessions. That is, different session connections may have different values.
  - The parameter value in the current session connection, not the value of the GUC copy, is displayed.
- 

## tcp\_keepalives\_count

**Parameter description:** Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the TCP\_KEEPCNT socket option.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- If the OS does not support TCP\_KEEPCNT, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
  - If this parameter is set to **0**, the system value is used.
  - This parameter is not shared among different sessions. That is, different session connections may have different values.
  - The parameter value in the current session connection, not the value of the GUC copy, is displayed.
- 

**Value range:** 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalive signal from the client.

**Default value:** 20

## tcp\_user\_timeout

**Parameter description:** Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the TCP\_USER\_TIMEOUT socket option.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**NOTICE**

- If the OS does not support the TCP\_USER\_TIMEOUT option, the value of this parameter does not take effect. The default value is 0.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

**Value Range:** 0 to 3600000. The unit is ms. The value 0 indicates that the value is set based on the OS.

**Default value:** 0

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 EulerOS 2.5 (Linux kernel version: 3.10), the timeout interval is not the set value of this parameter but the maximum value in different ranges. That is, the maximum value of the total Linux TCP retransmission duration range to which the set value of **tcp\_user\_timeout** belongs. For example, if **tcp\_user\_timeout** is set to 40000, the actual total retransmission duration is 51 seconds.

**Table 17-4** Value of tcp\_user\_timeout for x86 EulerOS 2.5 (Linux kernel version: 3.10)

| Number of Linux TCP Retransmission Times | Total Linux TCP Retransmission Duration Range (s) | Example of tcp_user_timeout (ms) | Actual Linux TCP Retransmission Duration (s) |
|------------------------------------------|---------------------------------------------------|----------------------------------|----------------------------------------------|
| 1                                        | (0.2,0.6]                                         | 400                              | 0.6                                          |
| 2                                        | (0.6,1.4]                                         | 1000                             | 1.4                                          |
| 3                                        | (1.4,3]                                           | 2000                             | 3                                            |
| 4                                        | (3,6.2]                                           | 4000                             | 6.2                                          |
| 5                                        | (6.2,12.6]                                        | 10000                            | 12.6                                         |
| 6                                        | (12.6,25.4]                                       | 20000                            | 25.4                                         |
| 7                                        | (25.4,51]                                         | 40000                            | 51                                           |
| 8                                        | (51,102.2]                                        | 80000                            | 102.2                                        |
| 9                                        | (102.2,204.6]                                     | 150000                           | 204.6                                        |
| 10                                       | (204.6,324.6]                                     | 260000                           | 324.6                                        |
| 11                                       | (324.6,444.6]                                     | 400000                           | 444.6                                        |

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times until it reaches 120s. When the duration of a TCP retransmission reaches 120s, the duration of each subsequent retransmission remains 120s.

## comm\_proxy\_attr

**Parameter description:** Specifies the parameters related to the communication proxy library.

### NOTE

- This parameter applies only to the centralized Arm-based standalone system running EulerOS 2.9.
- This function takes effect when the thread pool is enabled, that is, **enable\_thread\_pool** is set to **on**.
- When setting this parameter, you need to set the GUC parameter **local\_bind\_address** to the IP address of the NIC of the **libos\_kni**.
- **Parameter template:** `comm_proxy_attr = '{enable_libnet:true, enable_dfx:false, numa_num:4, numa_bind:[[30,31],[62,63],[94,95],[126,127]]}'`
- Parameters that need to be configured include:
  - **enable\_libnet:** whether to enable the user-mode protocol. The options are as follows: **true** and **false**.
  - **enable\_dfx:** whether to enable the communication proxy library view. The options are as follows: **true** and **false**.
  - **numa\_num:** number of NUMA nodes in the system. 2P and 4P servers are supported. The value can be: **4** or **8**.
  - **numa\_bind:** core binding parameter of the agent thread. Each numa has two CPUs. There are a total of **numa\_num** groups. The value range is as follows: [0, Number of CPUs – 1].

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** none

## 17.3.4 Resource Consumption

### 17.3.4.1 Memory

This section describes memory parameters.

#### NOTICE

These parameters, except **local\_syscache\_threshold**, take effect only after the database restarts.

## memorypool\_enable

**Parameter description:** Specifies whether to enable a memory pool.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

**Default value:** off

## memorypool\_size

**Parameter description:** Specifies the memory pool size.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 128 x 1024 to *INT\_MAX*/2. The unit is KB.

**Default value:** 512 MB

## enable\_memory\_limit

**Parameter description:** Specifies whether to enable the logical memory management module.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

**Default value:** on

---

### CAUTION

- If the value of **max\_process\_memory** minus **shared\_buffer** minus **cstore\_buffers** minus metadata size is less than 2 GB, GaussDB forcibly sets **enable\_memory\_limit** to **off**. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as **max\_connections**, **thread\_pool\_attr** and **max\_prepared\_transactions**.
  - If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.
- 

## max\_process\_memory

**Parameter description:** Specifies the maximum physical memory of a database node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 2 x 1024 x 1024 to *INT\_MAX*. The unit is KB.

**Default value:**

**900 GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **680 GB** (96-core CPU/768 GB memory); **450 GB** (64-core

CPU/512 GB memory); **420 GB** (60-core CPU/480 GB memory); **200 GB** (32-core CPU/256 GB memory); **90 GB** (16-core CPU/128 GB memory); **40 GB** (8-core CPU/64 GB memory);

**Setting suggestions:**

The value on the database node is determined based on the physical memory of the system and the number of master database nodes deployed on a single node. The recommended calculation formula is as follows:  $(\text{Physical memory} - \text{vm.min\_free\_kbytes}) \times 0.7 / (1 + \text{Number of primary nodes})$ . This parameter is used to prevent node OOM caused by memory usage increase, ensuring system reliability. **vm.min\_free\_kbytes** indicates the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. That is,  $\text{max\_process\_memory} = \text{Physical memory} \times 0.665 / (1 + \text{Number of primary nodes})$

---

 **CAUTION**

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

---

## enable\_memory\_context\_control

**Parameter description:** Specifies whether to enable the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the function of checking the number of memory contexts is enabled.
- **off** indicates that the function of checking the number of memory contexts is disabled.

**Default value:** off

## uncontrolled\_memory\_context

**Parameter description:** Specifies which memory context will not be checked when the function of checking whether the number of memory contexts exceeds the specified limit is enabled. This parameter applies only to the DEBUG version.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

During the query, the title meaning string "MemoryContext white list:" is added to the beginning of the parameter value.

**Value range:** a string

**Default value:** empty

## shared\_buffers

**Parameter description:** Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 16 to 1073741823. The unit is 8 KB.

The value of **shared\_buffers** must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8 KB**. That is, the value of **shared\_buffers** must be an integer multiple of 8 KB. The minimum value changes according to the value of **BLCKSZ**.

**Default value:**

**360 GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **270 GB** (96-core CPU/768 GB memory); **180 GB** (64-core CPU/512 GB memory); **160 GB** (60-core CPU/480 GB memory); **80 GB** (32-core CPU/256 GB memory); **36 GB** (16-core CPU/128 GB memory); **16 GB** (8-core CPU/64 GB memory);

**Setting suggestions:**

1. Set **shared\_buffers** to a value less than 40% of the memory.
2. If **shared\_buffers** is set to a larger value, increase the value of **checkpoint\_segments** because a longer period of time is required to write a large amount of new or changed data.
3. If the process fails to be restarted after the value of **shared\_buffers** is changed, perform either of the following operations based on the error information:
  - a. Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Preparing for Installation" > "Modifying OS Configuration" > "Configuring Other OS Parameters" in *Installation Guide*.
  - b. Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.
  - c. Do not set **shared\_buffers** to an excessively large or small value.

## segment\_buffers

**Parameter description:** Specifies the memory size of a GaussDB segment-paged metadata page.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 16 to 1073741823. The unit is 8 KB.

The value of **segment\_buffers** must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8 KB**. That is, the value of **segment\_buffers** must be an integer multiple of 8 KB. The minimum value changes according to the value of **BLCKSZ**.

**Default value:** 8 MB

**Setting suggestions:**

**segment\_buffers** is used to cache the content of segment-paged headers, which is key metadata information. To improve performance, it is recommended that the segment headers of common tables be cached in the buffer and not be replaced. You are advised to set this parameter based on the following formula: Number of tables (including indexes and toast tables) x Number of partitions x 3 + 128. This is because each table (partition) has some extra metadata segments. Generally, a table has three segments. At last, + 128 is added because segment- and page-based tablespace management requires a certain number of buffers.

If this parameter is set to a small value, it takes a long time to create a segment-paged table for the first time. Therefore, you are advised to set this parameter to the recommended value.

## bulk\_write\_ring\_size

**Parameter description:** Specifies the size of the ring buffer used by the operation when a large amount of data is written (for example, the copy operation).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 16384 to 2147483647. The unit is KB.

**Default value:** 2 GB

**Setting suggestions:** Increase the value of this parameter on database nodes if a huge amount of data will be imported.

## standby\_shared\_buffers\_fraction

**Parameter description:** Specifies the **shared\_buffers** proportion used on the server where a standby instance is deployed.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a double-precision floating-point number ranging from 0.1 to 1.0

**Default value:** 1

## temp\_buffers

**Parameter description:** Specifies the maximum size of local temporary buffers used by a database session.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**temp\_buffers** can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp\_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

**Value range:** an integer ranging from 100 to 1073741823. The unit is 8 KB.

**Default value:** 1 MB

## max\_prepared\_transactions

**Parameter description:** Specifies the maximum number of transactions that can stay in the **prepared** state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby servers to a value equal to or greater than that on primary servers. Otherwise, queries will fail on the standby servers.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 262143

**Default value:** 200

### NOTE

Generally, explicit PREPARE operations are not required for transactions. If explicit PREPARE operations are performed for transactions, increase the value of this parameter to be greater than the number of concurrent services that require PREPARE to prevent preparation failures.

## work\_mem

**Parameter description:** Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of **IN** subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work\_mem**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 64 to 2147483647. The unit is KB.

**Default value:**

**256 MB** (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory, and 96-core CPU/768-GB memory); **128 MB** (64-core CPU/512-GB memory, 60-core CPU/480-GB memory, 32-core CPU/256-GB memory, and 16-core CPU/128-GB memory); **64 MB** (8-core CPU/64-GB memory);

**NOTICE****Setting suggestions:**

If the physical memory specified by **work\_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/10.
- For simple serial queries, each query requires two to five associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/5.
- For concurrent queries, set **work\_mem** using the following formula: **work\_mem** = **work\_mem** for serial queries/Number of concurrent SQL statements.
- BitmapScan hash tables are also restricted by **work\_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1 MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan (32 GB for Ustore). After the upper limit of **work\_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.

## query\_mem

**Parameter description:** Specifies the memory used by a query.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

**NOTICE**

- If the value of **query\_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
- If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not adjust the estimated query memory.

## query\_max\_mem

**Parameter description:** Specifies the maximum memory that can be used by a query.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

**NOTICE**

- If the value of **query\_max\_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value **0** is used. In this case, the optimizer does not limit the query memory.
- 

## **maintenance\_work\_mem**

**Parameter description:** Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM**, **CREATE INDEX**, and **ALTER TABLE ADD FOREIGN KEY**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1024 to *INT\_MAX*. The unit is KB.

**Default value:**

**2 GB** (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory, 96-core CPU/768-GB memory, 64-core CPU/512-GB memory, and 60-core CPU/480-GB memory); **1 GB** (32-core CPU/256-GB memory); **512 MB** (16-core CPU/128-GB memory); **256 MB** (8-core CPU/64-GB memory);

---

**NOTICE**

**Setting suggestions:**

- The value of this parameter must be greater than that of **work\_mem** so that database dumps can be cleared or restored more quickly. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
  - When **Automatic Vacuuming** threads are running, the memory equal to a multiple of the value of **autovacuum\_max\_workers** is allocated. In this case, set **maintenance\_work\_mem** to a value equal to or greater than that of **work\_mem**.
  - If a large amount of data is to be clustered, increase the value of this parameter in the session.
- 

## **max\_stack\_depth**

**Parameter description:** Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 100 to *INT\_MAX*. The unit is KB.

**Default value:**

- If the value of **ulimit -s** minus 640 KB is equal to or greater than 2 MB, the default value of this parameter is **2 MB**.
- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

---

**NOTICE**

When setting this parameter, comply with the following principles:

- The database needs to reserve 640 KB stack depth. Therefore, the ideal value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
  - If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
  - If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
  - Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
  - Since not all OSs provide this function, you are advised to set a specific value for this parameter.
  - The default value is **2 MB**, which is relatively small and does not easily cause system breakdown.
- 

## bulk\_read\_ring\_size

**Parameter description:** Specifies the size of the ring buffer used by the operation when a large amount of data is queried (for example, during large table scanning).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is KB.

**Default value:** 16 MB

## enable\_early\_free

**Parameter description:** Specifies whether the operator memory can be released in advance.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

**Default value:** on

## memory\_trace\_level

**Parameter description:** Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **none:** indicates that memory allocation information is not recorded.
- **level1:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
  - Detailed information about all memory allocations in each memory context, including the file where the allocated memory is located, line number, and size.

**Default value:** level1

---

### NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
  - The recorded memory snapshot information can be queried by using the system function **gs\_get\_history\_memory\_detail(cstring)**.
  - The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.
- 

## resilience\_memory\_reject\_percent

**Parameter description:** Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of **recover\_memory\_percent** and **overload\_memory\_percent**. The meanings of the two parts are as follows:

- **recover\_memory\_percent**: Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload\_memory\_percent**: Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

**Default value:** '0,0', indicating that the escape from memory overload function is disabled.

**Example:**

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

---

**NOTICE**

- You can query the maximum dynamic memory and used dynamic memory in the **gs\_total\_memory\_detail** view. **max\_dynamic\_memory** indicates the maximum dynamic memory, and **dynamic\_used\_memory** indicates the used dynamic memory.
  - If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
  - The values of **recover\_memory\_percent** and **overload\_memory\_percent** can be 0 at the same time. In addition, the value of **recover\_memory\_percent** must be smaller than that of **overload\_memory\_percent**. Otherwise, the setting does not take effect.
- 

### 17.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

#### sql\_use\_spacelimit

**Parameter description:** Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single database node. The

managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

## temp\_file\_limit

**Parameter description:** Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor.

This is a session-level setting.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

This parameter does not apply to disk space used for temporary tables during the SQL query process.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

## 17.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

## max\_files\_per\_process

**Parameter description:** Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement:  
Number of file descriptors  $\geq$  Maximum number of concurrent statements  $\times$   
Number of database nodes  $\times$  **max\_files\_per\_process**  $\times$  3

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 25 to 2147483647

**Default value:** 1024

## shared\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (,). Only the sysadmin user can access this parameter. For example, **\$libdir/mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB's stored procedure library using the **\$libdir/plXXX** syntax as described in the preceding text. **XXX** can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

- If a specified library is not found, the GaussDB service will fail to start.
  - Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.
- 

**Value range:** a string

**Default value:** **security\_plugin**

### 17.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the VACUUM and ANALYZE statements on concurrent database activities. It is often more important to prevent maintenance statements, such as VACUUM and ANALYZE, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

---

### NOTICE

Certain vacuum operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- **vacuum\_cost\_delay** x **accumulated\_balance/vacuum\_cost\_limit**
  - **vacuum\_cost\_delay** x 4
- 

## Background

During the execution of the ANALYZE | ANALYSE and VACUUM statements, the system maintains an internal counter that keeps track of the estimated cost of the

various I/O operations that are performed. When the accumulated cost reaches a limit (specified by **vacuum\_cost\_limit**), the process performing the operation will sleep for a short period of time (specified by **vacuum\_cost\_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum\_cost\_delay** to a non-zero value.

## **vacuum\_cost\_delay**

**Parameter description:** Specifies the length of time that a process will sleep when **vacuum\_cost\_limit** has been exceeded.

On many systems, the effective resolution of the sleep length is 10 milliseconds. Therefore, setting **vacuum\_cost\_delay** to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is usually set to a small value, such as 10 or 20 milliseconds. To adjust the resource usage of this feature, you are advised to adjust other parameters instead of this parameter.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 100. A positive number enables cost-based vacuum delay and **0** disables cost-based vacuum delay.

**Default value:** 1

## **vacuum\_cost\_page\_hit**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 1

## **vacuum\_cost\_page\_miss**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 10

## **vacuum\_cost\_page\_dirty**

**Parameter description:** Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 20

## **vacuum\_cost\_limit**

**Parameter description:** Specifies the cost limit. The vacuuming process will sleep if this limit is exceeded.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 10000

**Default value:** 1000

## **17.3.4.5 Background Writer**

This section describes background writer parameters. The background writer process is used to write dirty data (new or modified data) in shared buffers to disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because only a few of dirty pages need to be flushed to the disk when the checkpoints arrive. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

## **bgwriter\_delay**

**Parameter description:** Specifies the interval at which the background writer writes dirty shared buffers. Each time, the background writer process initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter\_lru\_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after *bgwriter\_delay* ms hibernation. In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate\_buf\_percent\_target**. If the number of idle buffer pages is insufficient, a batch of pages is flushed to disks every *bgwriter\_delay* ms. The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max\_io\_capacity**.

In many systems, the effective resolution of sleep delays is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 10000. The unit is millisecond.

**Default value:** 2s

**Setting suggestion:** Reduce this value in slow data writing scenarios to reduce the checkpoint load.

## candidate\_buf\_percent\_target

**Parameter description:** Specifies the expected percentage of available buffers in the **shared\_buffer** memory buffer in the candidate buffer chain when the incremental checkpoint is enabled. If the number of available buffers in the current candidate chain is less than the target value, the bgwriter thread starts flushing dirty pages that meet the requirements.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a double-precision floating point number ranging from 0.1 to 0.85

**Default value:** 0.3

## bgwriter\_lru\_maxpages

**Parameter description:** Specifies the number of dirty buffers the background writer can write in each round.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000

### NOTE

When this parameter is set to **0**, the background writer is disabled. This setting does not affect checkpoints.

**Default value:** 100

## bgwriter\_lru\_multiplier

**Parameter description:** Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter\_lru\_multiplier**. The background writer writes dirty buffers until sufficient, clean and reusable buffers are available. The number of buffers the background writer writes in each round is always less than or equal to the value of **bgwriter\_lru\_maxpages**.

Therefore, the value **1.0** of **bgwriter\_lru\_multiplier** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter\_lru\_maxpages** and **bgwriter\_lru\_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying interactive queries.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to 10

**Default value:** 2

## pagewriter\_thread\_num

**Parameter description:** Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, promoting recovery points.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 4

## dirty\_page\_percent\_max

**Parameter description:** Specifies the percentage of dirty pages to **shared\_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the maximum value of **max\_io\_capacity**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0.1 to 1

**Default value:** 0.9

## pagewriter\_sleep

**Parameter description:** Specifies the interval for the pagewriter thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to **shared\_buffers** reaches **dirty\_page\_percent\_max**, the number of pages in each batch is calculated based on the value of **max\_io\_capacity**. In other cases, the number of pages in each batch decreases proportionally.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600000. The unit is ms.

**Default value:** 2000ms(2s)

## max\_io\_capacity

**Parameter description:** Specifies the maximum I/O per second for the background writer process to flush pages in batches. Set this parameter based on the service scenario and disk I/O capability of the host. If the RTO is short or the data volume is much larger than the shared memory, and the service access data volume is random, the value of this parameter cannot be too small. A small parameter value reduces the number of pages flushed by the background writer process. If a large number of pages are eliminated due to service triggering, the services are affected.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 30720 to 10485760. The unit is KB.

**Default value:** 512000 KB (500 MB)

## **enable\_consider\_usecount**

**Parameter description:** Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on/true:** The page popularity is considered.
- **off/false:** The page popularity is not considered.

**Default value:** off

## **dw\_file\_num**

**Parameter description:** Specifies the number of doublewrite files to be written in batches. The value is related to **pagewriter\_thread\_num** and cannot be greater than **pagewriter\_thread\_num**. If the value is too large, it will be corrected to the value of **pagewriter\_thread\_num**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 1

## **dw\_file\_size**

**Parameter description:** Specifies the size of each doublewrite file.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer, in the range [32,256]

**Default value:** 256

### **17.3.4.6 Asynchronous I/O**

## **checkpoint\_flush\_after**

**Parameter description:** Specifies the threshold for the number of pages flushed by the checkpoint thread. If the threshold is exceeded, the operating system is instructed to flush the pages cached in the operating system asynchronously. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. For example, if the value is **32**, the checkpoint thread continuously writes 32 disk pages (that is, 32 x 8 = 256 KB) before asynchronous flush.

**Default value:** 256 KB

## bgwriter\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the background writer thread. If the threshold is exceeded, the background writer thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the background writer thread continuously writes 64 disk pages (that is,  $64 \times 8 = 512$  KB) before asynchronous flush.

**Default value:** 512 KB (64 pages)

## backend\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the backend thread continuously writes 64 disk pages (that is,  $64 \times 8 = 512$  KB) before asynchronous flush.

**Default value:** 0

## 17.3.5 Data Import and Export

This section describes the parameters for importing and exporting data.

### raise\_errors\_if\_no\_files

**Parameter description:** Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist". If this parameter is set to **TRUE** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist".

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **off** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are the same when files are imported.

**Default value:** off

## safe\_data\_path

**Parameter description:** Specifies the path prefix restriction except for the initial user. Currently, the restrictions are posed on COPY and advanced package paths. The path cannot end with a slash (/) or contain periods (..).

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string of up to 4096 characters

**Default value:** NULL

## enable\_copy\_server\_files

**Parameter description:** Specifies whether to enable the permission to copy server files.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

**Default value:** off

---

### NOTICE

When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the SYSADMIN permission or users who inherit the **gs\_role\_copy\_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

---

## 17.3.6 Write Ahead Log

### 17.3.6.1 Settings

#### wal\_level

**Parameter description:** Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**NOTICE**

- To enable WAL archiving and data streaming replication between primary and standby servers, set this parameter to **archive**, **hot\_standby**, or **logical**.
- If this parameter is set to **minimal**, **hot\_standby** must be set to **off** and **max\_wal\_senders** must be set to **0**. In addition, the database must be deployed in a standalone system. Otherwise, the database cannot be started.
- If this parameter is set to **archive**, **hot\_standby** must be set to **off**. Otherwise, the database startup fails. However, **hot\_standby** cannot be set to **off** in a primary-standby deployment. For details, see the description of the **hot\_standby** parameter.

**Value range:** enumerated values

- **minimal**  
Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.  
Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.
- **archive**  
Adds logging required for WAL archiving, supporting the database restoration from archives.
- **hot\_standby**
  - Further adds information required to run SQL queries on a standby server and takes effect after a server restart.
  - To enable read-only queries on a standby server, the **wal\_level** parameter must be set to **hot\_standby** on the primary server and the same value must be set on the standby server. There are few measurable differences in performance between using **hot\_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.
- **logical**  
This parameter indicates that WALs support logical replication.

**Default value:** **hot\_standby**

## **fsync**

**Parameter description:** Specifies whether the GaussDB server uses the **fsync()** function (see [wal\\_sync\\_method](#)) to ensure that updates can be written to disks in a timely manner.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- Using the **fsync()** function ensures that the data can be recovered to a known state when an OS or a hardware crashes.
  - Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.
- 

**Value range:** Boolean

- **on** indicates that the **fsync()** function is used.
- **off** indicates that the **fsync()** function is not used.

**Default value:** on

## synchronous\_commit

**Parameter description:** Specifies the synchronization mode of the current transaction.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the log content to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes logs in the local file system to disks.
4. The primary node sends the log content to the standby node.
5. The standby node receives the logs and saves them to the local memory.
6. The standby node writes logs in the local memory to the local file system.
7. The standby node flushes logs in the local file system to disks.
8. The standby node replays logs to complete the incremental update of data files.

**Value range:** enumerated values

- **on:** The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off:** The primary node commits transactions without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local:** The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote\_write:** The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote\_receive:** The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)
- **remote\_apply:** The primary node waits for the standby node to complete log replay before committing a transaction.

- **true**: same as **on**.
- **false**: same as **off**.
- **yes**: same as **on**.
- **no**: same as **off**.
- **1**: same as **on**.
- **0**: same as **off**.
- **2**: same as **remote\_apply**.

**Default value:** on

## wal\_sync\_method

**Parameter description:** Specifies the method used for forcing WAL updates out to disk.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL updates will not be forcibly written to disks.

---

**Value range:** enumerated values

- **open\_datasync** indicates that WAL files are opened with the O\_DSYNC option.
- **fdasync** indicates that **fdasync()** is called at each commit. (SUSE 10 and SUSE 11 are supported.)
- **fsync\_writethrough** indicates that **fsync()** is called at each commit to force data in the buffer to be written to the disk.

### NOTE

**wal\_sync\_method** can be set to **fsync\_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync**.

- **fsync** indicates that **fsync()** is invoked at each commit (SUSE 10 and SUSE 11 are supported).
- **open\_sync** indicates that the **open()** with the O\_SYNC option is used to write WAL files (SUSE 10 and SUSE 11 are supported).

### NOTE

Not all platforms support the preceding parameters.

**Default value:** fdasync

## full\_page\_writes

**Parameter description:** Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint. When the incremental checkpoint function and **enable\_double\_write** are enabled at the same time, **full\_page\_writes** is not used.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
  - Setting this parameter to **off** might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.
- 

**Value range:** Boolean

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

**Default value:** on

## wal\_log\_hints

**Parameter description:** Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

**Default value:** on

## wal\_buffers

**Parameter description:** Specifies the number of **XLOG\_BLCKSZ** used for storing WAL data. The size of each **XLOG\_BLCKSZ** is 8 KB.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** -1 to  $2^{18}$ . The minimum value is -1 and the maximum value is 262144. The unit is 8 KB.

- If this parameter is set to -1, the value of **wal\_buffers** is automatically adjusted to 1/64 of **shared\_buffers**. The minimum value is 8 **XLOG\_BLCKSZ** and the maximum value is 2048 **XLOG\_BLCKSZ**, if the automatically adjusted value is less than the minimum value, the value is adjusted to the minimum value. If the automatically adjusted value is greater than the maximum value, the value is adjusted to the maximum value.

- If this parameter is set to a value other than **-1** and smaller than **4**, the value **4** is used.

**Default value:**

**1 GB** (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory, 96-core CPU/768-GB memory, 64-core CPU/512-GB memory, 60-core CPU/480-GB memory, and 32-core CPU/256-GB memory); **512 MB** (16-core CPU/128-GB memory); **256 MB** (8-core CPU/64-GB memory);

**Setting suggestions:** The content of the WAL buffers is written to disks at every transaction commit, so extremely large values are unlikely to provide a significant increase in system performance. However, setting this parameter to hundreds of megabytes can improve the disk write performance on a server to which a large number of transactions are committed at the same time. The default value meets user requirements in most cases.

## wal\_writer\_delay

**Parameter description:** Specifies the delay between activity rounds for the WAL writer.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

---

**Value range:** an integer ranging from 1 to 10000. The unit is millisecond.

**Default value:** 200ms

## commit\_delay

**Parameter description:** Specifies the duration for committed data to be stored in the WAL buffer.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer process flushes the buffer out to disks periodically.
  - If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.
- 

**Value range:** an integer ranging from 0 to 100000. The unit is microsecond. **0** indicates no delay.

**Default value:** 0

## commit\_siblings

**Parameter description:** Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by [commit\\_delay](#). Otherwise, this transaction is written into WALs immediately.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000

**Default value:** 5

## wal\_block\_size

**Parameter description:** Specifies the size of a WAL disk block.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer. The unit is byte.

**Default value:** 8192

## wal\_segment\_size

**Parameter description:** Specifies the size of a WAL segment file.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer. The unit is 8 KB.

**Default value:** 16 MB (2048 x 8 KB)

## walwriter\_cpu\_bind

**Parameter description:** Specifies the CPU core bound to the WAL write thread. This parameter is used together with the thread pool parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to the number of cores minus 1

**Default value:** -1

## walwriter\_sleep\_threshold

**Parameter description:** Specifies the number of times that idle Xlogs are refreshed before the xlogflusher enters the sleep state. If the number of times reaches the threshold, the xlogflusher enters the sleep state.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 50000

**Default value:** 500 (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory, 96-core CPU/768-GB memory, 64-core CPU/512-GB memory, and 60-core CPU/480-GB memory); 50 (32-core CPU/256-GB memory, 16-core CPU/128-GB memory, 8-core CPU/64-GB memory, )

## wal\_file\_init\_num

**Parameter description:** Specifies the number of Xlog segment files to be created by the WAL writer.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000

**Default value:** **10** (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory, 96-core CPU/768-GB memory, 64-core CPU/512-GB memory, and 60-core CPU/480-GB memory); **0** (32-core CPU/256-GB memory, 16-core CPU/128-GB memory, 8-core CPU/64-GB memory, )

## xlog\_file\_path

**Parameter description:** Specifies the path of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** NULL

## xlog\_file\_size

**Parameter description:** Specifies the size of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a long integer ranging from 5053733504 to 576460752303423487. The unit is byte.

**Default value:** 549755813888

## xlog\_lock\_file\_path

**Parameter description:** Specifies the path of the lock file preempted by the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** NULL

## force\_promote

**Parameter description:** Specifies whether to enable the forcible switchover function on the standby node.

When a database instance is faulty, the forcible switchover enables the database instance to recover services as soon as possible at the cost of losing some data. This is an escape method used when the database instance is unavailable. You are not advised to trigger this method frequently. You are not advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the database instance for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling" > "Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

**Value range:** 0 or 1

The value **0** indicates that the function is disabled, and the value **1** indicates that the function is enabled.

**Default value:** 0

## wal\_debug

**Parameter description:** Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL\_DEBUG** is enabled during compilation.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** false

## wal\_flush\_timeout

**Parameter description:** Specifies the timeout interval for traversing **WalInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WalInsertStatusEntryTbl**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

---

**Value range:** an integer ranging from 0 to 900000000. The unit is microsecond.

**Default value:** 2

## wal\_flush\_delay

**Parameter description:** Specifies the wait interval when an entry in the **WAL\_NOT\_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 900000000. The unit is microsecond.

**Default value:** 1

## 17.3.6.2 Checkpoints

### checkpoint\_segments

**Parameter description:** Specifies the minimum number of WAL segment files in the period specified by [checkpoint\\_timeout](#). The size of each log file is 16 MB.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. The minimum value is 1.

Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on [checkpoint\\_timeout](#) and [shared\\_buffers](#). This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the **pg\_xlog** folder is twice the number of **checkpoint\_segments**. The reused files are not deleted and are renamed to the WAL segment files which will be later used.

**Default value:** 1024

### checkpoint\_timeout

**Parameter description:** Specifies the maximum time between automatic WAL checkpoints.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 30 to 3600. The unit is s.

If the value of [checkpoint\\_segments](#) is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of [shared\\_buffers](#). Consider all these parameters during setting.

**Default value:** 15min

### checkpoint\_completion\_target

**Parameter description:** Specifies the completion target of each checkpoint, as a fraction of total time between checkpoints.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a double-precision floating point number ranging from 0.0 to 1.0

**Default value:** 0.5

#### NOTE

**0.5** indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

## checkpoint\_warning

**Parameter description:** Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the value of [checkpoint\\_segments](#).

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is second. **0** indicates that the warning is disabled.

**Default value:** 5min

**Recommended value:** 5min

## checkpoint\_wait\_timeout

**Parameter description:** Sets the longest time that the checkpoint waits for the checkpoint thread to start.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 2 to 3600. The unit is s.

**Default value:** 1min

## enable\_incremental\_checkpoint

**Parameter description:** Specifies whether to enable incremental checkpointing.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** on

## enable\_double\_write

**Parameter description:** Specifies whether to enable double writing. When the incremental checkpoint function is enabled and **enable\_double\_write** is enabled, the **enable\_double\_write** dual-write feature is used for protection, and **full\_page\_writes** is not used to prevent half-page write.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** on

## incremental\_checkpoint\_timeout

**Parameter description:** Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpointing is enabled.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 3600. The unit is s.

**Default value:** 1min

## enable\_xlog\_prune

**Parameter description:** Specifies whether the primary node recycles logs if the size of Xlogs exceeds the value of **max\_size\_for\_xlog\_prune** when any standby node is disconnected.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the primary node recycles logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not recycle logs when any standby node is disconnected.

**Default value:** on

## max\_size\_for\_xlog\_prune

**Parameter description:** This parameter takes effect when **enable\_xlog\_prune** is enabled. The working mechanism is as follows:

1. If all standby nodes specified by the **replconninfo** series GUC parameters are connected to the primary node, this parameter does not take effect.
2. If any standby node specified by the **replconninfo** series GUC parameters is not connected to the primary node, this parameter takes effect. When the number of historical logs on the primary node is greater than the value of this parameter, the logs are forcibly recycled. Exception: In synchronous commit mode (that is, the value of **synchronous\_commit** is not **local** or **off**), if there are connected standby nodes, the primary node retains the logs that meet the minimum log receiving requirements on the majority of standby nodes. In this case, the number of reserved logs may exceed the value of **max\_size\_for\_xlog\_prune**.
3. If any standby node is being built, this parameter does not take effect. All logs of the primary node are retained to prevent build failures due to log recycling.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB.

**Default value:** 256 GB

### 17.3.6.3 Log Replay

## recovery\_time\_target

**Parameter description:** Specifies the time for a standby server to write and replay logs.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**0** indicates that log flow control is disabled. A value from **1** to **3600** indicates that a standby server can write and replay logs within the period specified by the value, so that the standby server can quickly assume the primary role. If this parameter

is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60

## recovery\_max\_workers

**Parameter description:** Specifies the maximum number of concurrent replay threads.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 20

**Default value:** 4 (For better performance, the default value in tool installation is 4.)

## recovery\_parse\_workers

**Parameter description:** Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 16

**recovery\_parse\_workers** can be set to a value greater than 1 only when the ultimate RTO feature is enabled. In addition, it must be used together with **recovery\_redo\_workers**. If both **recovery\_parse\_workers** and **recovery\_max\_workers** are enabled, the setting of **recovery\_parse\_workers** prevails and the concurrent replay function is disabled. The ultimate RTO feature does not support the hot standby mode. Therefore, **recovery\_parse\_workers** can be set to a value greater than 1 only when **hot\_standby** is set to **off** and **replication\_type** to 1.

**Default value:** 1

## recovery\_redo\_workers

**Parameter description:** Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 8

This parameter must be used together with **recovery\_parse\_workers**. The setting of **recovery\_redo\_workers** takes effect only when **recovery\_parse\_workers** is set to a value greater than 0.

**Default value:** 1

## recovery\_parallelism

**Parameter description:** Specifies the actual number of replay threads. This parameter is read-only.

This is a POSTMASTER parameter and is affected by **recovery\_max\_workers** and **recovery\_parse\_workers**. If any value is greater than 0, **recover\_parallelism** will be recalculated.

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1

## enable\_page\_lsn\_check

**Parameter description:** Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** on

## recovery\_min\_apply\_delay

**Parameter description:** Specifies the replay delay of the standby node.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

- This parameter does not take effect on the primary node. It must be set on the standby node that requires a delay. You are advised to set this parameter on the asynchronous standby node. If the delay is set on the asynchronous standby node, the RTO will be long after the node is promoted to primary.
  - The delay time is calculated based on the transaction commit timestamp on the primary server and the current time on the standby server. Therefore, ensure that the clocks of the primary and standby servers are synchronized.
  - If the delay time is too long, the disk where the Xlog file is located on the standby node may be full. Therefore, you need to set the delay time based on the disk size.
  - Operations without transactions are not delayed.
  - After the primary/standby switchover, if the original primary node needs to be delayed, you need to manually set this parameter.
  - When **synchronous\_commit** is set to **remote\_apply**, synchronous replication is affected by the delay. Each commit message is returned only after the replay on the standby server is complete.
  - Using this feature also delays **hot\_standby\_feedback**, which may cause the primary server to bloat, so be careful when using both.
  - If a DDL operation (such as DROP or TRUNCATE) that holds an AccessExclusive lock is performed on the primary node, the query operation on the operation object on the standby node will be returned only after the lock is released during the delayed replay of the record on the standby node.
  - The MOT table is not supported.
-

**Value range:** an integer ranging from 0 to INT\_MAX. The unit is ms.

**Default value:** 0 (no delay added)

## redo\_bind\_cpu\_attr

**Parameter description:** Specifies the core binding operation of the replayer thread. Only the **sysadmin** user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string of more than 0 characters. The value is case-insensitive.

- **'nobind'**: The thread is not bound to a core.
- **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads.
- **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads.

**Default value:** 'nobind'

## 17.3.6.4 Archiving

### archive\_timeout

**Parameter description:** Specifies the archiving period.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive\_timeout** will bloat the archive storage. You are advised to set **archive\_timeout** to 60s.

---

**Value range:** an integer ranging from 0 to 1073741823. The unit is s. 0 indicates that archiving timeout is disabled.

**Default value:** 0

### archive\_interval

**Parameter description:** Specifies the archiving interval.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

- Log files are forcibly archived when the period specified by this parameter has elapsed.
  - Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.
-

**Value range:** an integer ranging from 1 to 1000. The unit is s.

**Default value:** 1

## time\_to\_target\_rpo

### Parameter description:

In the remote DR mode of dual database instances, set the allowed *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary database instance to the time when data is archived to the OBS recovery point.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

In remote DR mode of dual database instances, logs of the primary database instance are archived to OBS. **0** indicates that log flow control is disabled. 1 to 3600 indicates the maximum *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary database instance to the time when data is archived to the recovery point of OBS. This ensures that the maximum duration of data loss is within the allowed range when the primary database instance breaks down due to a disaster. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 0

## 17.3.7 HA Replication

### 17.3.7.1 Sending Server

#### max\_wal\_senders

**Parameter description:** Specifies the maximum number of simultaneously running WAL sender processes. The value cannot be equal to or greater than that of [max\\_connections](#).

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

[wal\\_level](#) must be set to **archive**, **hot\_standby**, or **logical** to allow the connection from standby servers.

---

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

#### NOTE

This parameter can be set to 0 only when a single DN is used and there is no primary/standby instance.

**Default value:** 20

## wal\_keep\_segments

**Parameter description:** Specifies the number of Xlog file segments. Specifies the minimum number of transaction log files stored in the **pg\_xlog** directory. The standby node obtains log files from the primary node for streaming replication.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 2 to *INT\_MAX*

**Default value:** 1024

**Setting suggestions:**

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal\_keep\_segments**.
- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby server. As a result, the request fails and the connection between the primary and standby servers is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal\_keep\_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the WAL synchronization is proper.
- If the synchronous commit level is lower than **LOCAL\_FLUSH**, you are advised to set this parameter to **1000** when rebuilding the standby node to prevent rebuilding failures caused by primary node log recycling during the rebuilding.

## wal\_sender\_timeout

**Parameter description:** Specifies the maximum duration that the sending server waits for the WAL reception in the receiver.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for the database rebuilding on a standby node. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
  - This parameter cannot be set to a value larger than the value of **wal\_receiver\_timeout** or the timeout parameter for database rebuilding.
- 

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 6s

## max\_replication\_slots

**Parameter description:** Specifies the number of log replication slots on the primary node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

**Default value:** 20

### Setting suggestions:

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to: Number of current physical replication slots + Number of backup slots + Number of required logical replication slots. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

- Physical streaming replication slots provide an automatic method to ensure that Xlogs are not removed from a primary node before they are received by all the standby nodes. That is, physical replication slots are used to support primary/standby HA. The number of physical streaming replication slots required by a database is equal to the ratio of standby nodes to the primary node. For example, if an HA database has 1 primary node and 2 standby nodes, the number of required physical replication slots will be 2. If an HA database has 1 primary node and 3 standby nodes, the number of required physical replication slots will be 3.
- Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.
- Plan the number of logical replication slots as follows:
  - A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
  - If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.

## enable\_slot\_log

**Parameter description:** Specifies whether to enable primary/standby synchronization for logical replication slots.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that primary/standby synchronization is enabled for logical replication slots.
- **off** indicates that primary/standby synchronization is disabled for logical replication slots.

**Default value:** on

## max\_changes\_in\_memory

**Parameter description:** Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 4096

## max\_cached\_tuplebufs

**Parameter description:** Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value equal to or greater than twice of [max\\_changes\\_in\\_memory](#).

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 8192

## logical\_decode\_options\_default

**Parameter description:** Specifies the global default value for unspecified decoding options when logical decoding starts.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, and **exclude-users**.

**Value range:** a string of key=value characters separated by commas (,), for example, '**parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA**'. An empty string indicates that the default value hardcoded by the program is used.

**Default value:** empty

---

### NOTICE

The SIGHUP parameter does not affect the started logic decoding process. The options specified by this parameter are used as the default settings for subsequent logic decoding startup, and the settings specified in the startup command are preferentially used.

The **exclude-users** option is different from the logic decoding startup option. You are not allowed to specify multiple blacklisted users.

---

## logical\_sender\_timeout

**Parameter description:** Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 30s

## enable\_wal\_shipping\_compression

**Parameter description:** Specifies whether to enable cross-database instance log compression in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

This parameter applies only to a pair of walsender and walreceiver for cross-database instance transmission in streaming DR and is configured on the primary database instance.

---

**Value range:** Boolean

- **true** indicates that cross-database instance log compression is enabled for streaming DR.
- **false** indicates that cross-database instance log compression is disabled for streaming DR.

**Default value:** false

## repl\_auth\_mode

**Parameter description:** Specifies the validation mode for primary/standby replication and standby node rebuilding.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- If UUID validation is enabled on the primary node and a non-null **repl\_uuid** validation code is configured, UUID validation must also be enabled on the standby node and the same **repl\_uuid** validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** enumerated values

- **off:** indicates that UUID validation is disabled.
- **default:** indicates that UUID validation is disabled.
- **uuid:** indicates that UUID validation is enabled.

**Default value:** default

## repl\_uuid

**Parameter description:** Specifies the UUID used for primary/standby UUID validation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**NOTICE**

- If UUID validation is enabled on the primary node and a non-null **repl\_uuid** validation code is configured, UUID validation must also be enabled on the standby node and the same **repl\_uuid** validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

**Value range:** a string. The value is a string of 0 to 63 case-insensitive letters and digits. It is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

**Default value:** empty

## replconninfo1

**Parameter description:** Specifies the information about the first node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** empty

## replconninfo2

**Parameter description:** Specifies the information about the second node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** empty

## replconninfo3

**Parameter description:** Specifies the information about the third node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** empty

## replconninfo4

**Parameter description:** Specifies the information about the fourth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** empty

## replconninfo5

**Parameter description:** Specifies the information about the fifth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** empty

## replconninfo6

**Parameter description:** Specifies the information about the sixth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** empty

## replconninfo7

**Parameter description:** Specifies the information about the seventh node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** empty

## replconninfo8

**Parameter description:** Specifies the information about the eighth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the eighth node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo1

**Parameter description:** Specifies the information about the local first node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo2

**Parameter description:** Specifies the information about the local second node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo3

**Parameter description:** Specifies the information about the local third node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo4

**Parameter description:** Specifies the information about the local fourth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo5

**Parameter description:** Specifies the information about the local fifth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo6

**Parameter description:** Specifies the information about the local sixth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo7

**Parameter description:** Specifies the information about the local seventh node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo8

**Parameter description:** Specifies the information about the local eighth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the eighth node is configured.

**Default value:** empty

## available\_zone

**Parameter description:** Specifies the region where the local node is located.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that no information about the node is configured.

**Default value:** empty

## enable\_availablezone

**Parameter description:** Specifies whether the local cascaded standby node can connect to standby nodes across AZs.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **true** indicates that the cascaded standby node can only connect to standby nodes in the same AZ.
- **false** indicates that the cascaded standby node can connect to standby nodes across AZs.

**Default value:** false

## max\_keep\_log\_seg

**Parameter description:** Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value **0** indicates that the stream control function is disabled.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

### 17.3.7.2 Primary Server

## synchronous\_standby\_names

**Parameter description:** Specifies a comma-separated list of names of potential standby nodes that support synchronous replication.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

#### NOTICE

- The current synchronous standby node is on the top of the list. If the current synchronous standby node is disconnected, it will be replaced immediately with the next-highest-priority standby node. Name of the next-highest-priority standby node is added to the list.
- The standby node name can be specified by setting the environment variable *PGAPPNAME*.

**Value range:** a string If this parameter is set to \*, the name of any standby node that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num\_sync* (*standby\_name* [, ...]) [, ANY *num\_sync* (*standby\_name* [, ...])]
- [FIRST] *num\_sync* (*standby\_name* [, ...])

- *standby\_name* [, ...]

 **NOTE**

- *num\_sync* indicates the number of synchronous standby nodes that need to wait for responses before the transaction is committed, *standby\_name* indicates the name of the standby node, and **FIRST** and **ANY** specify the policies for selecting standby nodes for synchronous replication from the listed servers.
- **ANY N (dn\_instanceld1, dn\_instanceld2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1 (dn\_instanceld1, dn\_instanceld2)** indicates that any one of **dn\_instanceld1** and **dn\_instanceld2** is used as the standby node for synchronous replication.
- **FIRST N (dn\_instanceld1, dn\_instanceld2, ...)** indicates that the first *N* primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn\_instanceld1, dn\_instanceld2)** indicates that **dn\_instanceld1** is selected as the standby node for synchronous replication.
- The meanings of *dn\_instanceld1*, *dn\_instanceld2*, ... are the same as those of **FIRST 1 (dn\_instanceld1, dn\_instanceld2, ...)**.

If you use the *gs\_guc* tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
NODE 1(dn_instanceld1, dn_instanceld2)';"
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
1(AZ1, AZ2)';"
```

**Default value:** \*

## most\_available\_sync

**Parameter description:** Specifies whether transactions on the primary node are not blocked due to faults on synchronous standby nodes. For example, if one of the two synchronous standby nodes is faulty and the other is normal, the primary node waits for the normal synchronous standby node instead of being blocked by the faulty synchronous standby node.

For another example, when the quorum protocol is executed, one primary node and three synchronous standby nodes are configured. **ANY 2 (node1, node2, and node3)** is configured. When node1 and node3 are faulty and node2 is normal, host services are not blocked.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the primary node is not blocked when all synchronous standby nodes are faulty.
- **off** indicates that the primary node is blocked when all synchronous standby nodes are faulty.

**Default value:** off

## keep\_sync\_window

**Parameter description:** Specifies the delay for entering the maximum availability mode.

- If **most\_available\_sync** is set to **on**, when synchronous standby nodes are faulty in primary/standby scenarios and the number of configured synchronous standby nodes is insufficient (for details, see the meaning of **synchronous\_standby\_name**), setting **keep\_sync\_window** will retain the maximum protection mode within the time window specified by **keep\_sync\_window**. That is, committing transactions on the primary node is blocked, delay the primary node to enter the maximum availability mode.
- If synchronous standby nodes recover from faults and the number of synchronous standby nodes meets the configuration requirements, transactions are not blocked.
- You are advised to set **keep\_sync\_window** to 5s. This prevents the monitoring system from incorrectly reporting network instability.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is s.

- The value **0** indicates that the **keep\_sync\_window** is not set, that is, the maximum availability mode is entered directly.
- Other values indicate the size of the timeout window.

**Default value:** 0

### NOTE

Setting this parameter may affect the RPO. If the primary node is faulty within the configured timeout window, the data generated from the time when the primary node is blocked to the time when the primary node is faulty may be lost.

## enable\_stream\_replication

**Parameter description:** Specifies whether data and logs are synchronized between the primary and standby nodes.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

- This parameter is used for performance testing in scenarios where data synchronization to standby nodes is enabled and where it is disabled. After this parameter is set to **off**, tests for abnormal scenarios such as switchovers and fault rectifications cannot be performed.
- This parameter is a restricted parameter, and you are advised not to set it to **off** in normal service scenarios.

---

**Value range:** Boolean

- **on** indicates that data and log synchronization between primary and standby nodes is enabled.

- **off** indicates that data and log synchronization between the primary and standby nodes is disabled.

**Default value:** on

## enable\_mix\_replication

**Parameter description:** Specifies how WAL files and data are replicated between primary and standby nodes.

This parameter is an INTERNAL parameter. Its default value is **off** and cannot be modified.

---

### NOTICE

- This parameter cannot be modified in normal service scenarios. That is, mixed replication of the WAL files and data pages is disabled.
- 

**Value range:** Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

**Default value:** off

## vacuum\_defer\_cleanup\_age

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records, so that **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay.

**Default value:** 0

## data\_replicate\_buffer\_size

**Parameter description:** Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary node to the standby node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 4096 to 1072693248. The unit is KB.

**Default value:** 16 MB (that is, 16384 KB)

## walsender\_max\_send\_size

**Parameter description:** Specifies the size of the WAL or Sender buffers on the primary node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 8 to *INT\_MAX*. The unit is KB.

**Default value:** 8192 KB (8 MB)

## enable\_data\_replicate

**Parameter description:** Specifies how data is synchronized between primary and standby nodes when the data is imported to a row-store table.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the primary and standby nodes synchronize data using data pages when the data is imported to a row-store table. When **replication\_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby servers synchronize data using Xlogs when the data is imported to a row-store table.

**Default value:** off

## ha\_module\_debug

**Parameter description:** Specifies the replication status log of a specific data block during data replication.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

**Default value:** off

## catchup2normal\_wait\_time

**Parameter description:** Specifies the maximum duration for the standby node to catch up with the primary node when **most\_available\_sync** is enabled in primary/standby scenarios. The value of this parameter is an estimate and may be different from the actual value.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to 10000. The unit is ms.

- The value **-1** indicates that the primary node is blocked until the data catchup on the standby node is complete.

- The value **0** indicates that the primary node is not blocked during the data catchup on the standby node.
- Other values indicate the maximum duration that the primary node is blocked during the data catchup on the standby node. For example, if this parameter is set to **5000**, the primary node is blocked until the data catchup on the standby node is complete in 5s.

**Default value:** -1

## check\_sync\_standby

**Parameter description:** Specifies whether to enable the standby node check function. After the **synchronous\_standby\_names** parameter is correctly configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** on or off

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

**Default value:** off

### NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

## sync\_config\_strategy

**Parameter description:** Specifies the policy for synchronizing configuration files between the primary node and standby node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **all\_node:** If this parameter is set to **all\_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node.
- **only\_sync\_node:** If this parameter is set to **only\_sync\_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only\_sync\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node.

- **none\_node**: If this parameter is set to **none\_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none\_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node.

**Default value:** all\_node

## hadr\_recovery\_time\_target

**Parameter description:** Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by the value of **hadr\_recovery\_time\_target**. This ensures that the logs can be written and replayed within the period specified by the value of **hadr\_recovery\_time\_target** and the standby database instance can be promoted to primary quickly. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 0

## hadr\_recovery\_point\_target

**Parameter description:** Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by the value of **hadr\_recovery\_point\_target**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by the value of **hadr\_recovery\_point\_target** during the switchover and the standby database instance can be promoted to primary. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 0

## hadr\_super\_user\_record\_path

**Parameter description:** Specifies the path for storing encrypted files of the **hadr\_disaster** user in the standby database instance in streaming DR mode. This is a SIGHUP parameter.

Set it based on instructions in [Table 17-1](#).

**Modification suggestion:** The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

**Value range:** a string

**Default value:** NULL

---

**NOTICE**

- In a database instance that contains a primary node and a standby node, the primary node is a sender relative to the standby node and the standby node is a receiver relative to the primary node.
  - The sender actively synchronizes the configuration file to the receiver, and the receiver requests the sender to synchronize the configuration file, which are two independent events, so that the configuration files are synchronized. If you do not want to synchronize configuration files, set this parameter to **none\_node** on the receiver. If the sender is a standby node, set this parameter to **none\_node** only. If the sender is a primary node, set this parameter to **none\_node** when the primary node does not synchronize with any standby node; or set this parameter to **only\_sync\_node** when the primary node synchronizes with synchronous standby nodes only and does not synchronize with asynchronous standby nodes.
  - To be specific, the sender sends a configuration file which directly overwrites the corresponding parameter in the configuration file of the receiver. After the policy for synchronizing configuration files is set, even if you modify configuration parameters of the receiver, the modification does not take effect because the sender immediately overwrites these parameters.
  - The following configuration parameters are not synchronized even if the policy for synchronizing configuration files is set: **application\_name**, **audit\_directory**, **available\_zone**, **comm\_control\_port**, **comm\_sctp\_port**, **listen\_addresses**, **log\_directory**, **port**, **replconninfo1**, **replconninfo2**, **replconninfo3**, **replconninfo4**, **replconninfo5**, **replconninfo6**, **replconninfo7**, **replconninfo8**, **replconninfo9**, **replconninfo10**, **replconninfo11**, **replconninfo12**, **replconninfo13**, **replconninfo14**, **replconninfo15**, **replconninfo16**, **replconninfo17**, **replconninfo18**, **ssl**, **ssl\_ca\_file**, **ssl\_cert\_file**, **ssl\_ciphers**, **ssl\_crl\_file**, **ssl\_key\_file**, **ssl\_renegotiation\_limit**, **ssl\_cert\_notify\_time**, **synchronous\_standby\_names**, **local\_bind\_address**, **perf\_directory**, **query\_log\_directory**, **asp\_log\_directory**, **streaming\_router\_port**, **enable\_upsert\_to\_merge**, **recovery\_min\_apply\_delay**, and **sync\_config\_strategy**.
- 

### 17.3.7.3 Standby Server

#### hot\_standby

**Parameter description:** Specifies whether to allow connections and queries on a standby node during its recovery.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**NOTICE**

- If this parameter is set to **on**, **wal\_level** must be set to **hot\_standby** or higher. Otherwise, the database startup fails.
- In an HA system, **hot\_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot\_standby** parameter was disabled and the **wal\_level** parameter was set to a value lower than **hot\_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot\_standby** parameter again:
  1. Change the **wal\_level** value of the primary and standby nodes to **hot\_standby** or higher, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the **pg\_stat\_get\_wal\_senders()** function to ensure that the **receiver\_replay\_location** value of each standby node is the same as the **sender\_flush\_location** value of the primary node. Ensure that the value adjustment of **wal\_level** is synchronized to standby nodes and takes effect, and standby nodes do not need to replay low-level logs.
  3. Set the **hot\_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.

**Value range:** Boolean

- **on** indicates that connections and queries are allowed on the standby node during the recovery.
- **off** indicates that connections and queries are not allowed on the standby node during the recovery.

**Default value:** on

## max\_standby\_archive\_delay

**Parameter description:** Specifies the wait period before queries on a standby node are canceled when the queries conflict with WAL processing and archiving in hot standby mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**NOTICE**

-1 indicates that the standby node waits until the conflicting queries are complete.

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms.

**Default value:** 3s (3000 ms)

## max\_standby\_streaming\_delay

**Parameter description:** Specifies the wait period before queries on a standby node are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#). If this parameter is set to a large value or the service load is heavy, an error may be reported for waiting for transaction replay and flushing to disks.

---

### NOTICE

-1 indicates that the standby node waits until the conflicting queries are complete.

---

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms.

**Default value:** 3s (3000 ms)

## wal\_receiver\_status\_interval

**Parameter description:** Specifies the maximum interval for notifying the primary node of the WAL Receiver status.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 5s (5000 ms)

---

### NOTICE

If this parameter is set to 0, the standby node does not send information, such as the log receiving location, to the primary node. As a result, the transaction commit on the primary node may be blocked, and the switchover may fail. In normal service scenarios, you are not advised to set this parameter to 0.

---

## hot\_standby\_feedback

**Parameter description:** Specifies whether a standby node is allowed to send the result of a query performed on it to the primary node, preventing a query conflict.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the ID of the oldest transaction active on standby nodes will be sent to the primary node.
- **off** indicates that the ID of the oldest transaction active on standby nodes will not be sent to the primary node.

**Default value:** off

#### NOTICE

If this parameter is set to **on**, VACUUM on the primary node will not clean up tuples modified in transactions later than the oldest transaction active on standby nodes.

Therefore, the performance of the primary node will be affected. If replay conflicts with query on the standby node and a query error is reported, you are advised to increase the value of **max\_standby\_streaming\_delay**.

### wal\_receiver\_timeout

**Parameter description:** Specifies the maximum wait period for a standby node to receive data from the primary node.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 6s (6000 ms)

### wal\_receiver\_connect\_timeout

**Parameter description:** Specifies the timeout period for a standby node to connect to the primary node.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*/1000. The unit is s.

**Default value:** 2s

### wal\_receiver\_connect\_retries

**Parameter description:** Specifies the maximum attempts that a standby node connects to the primary node

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

**Default value:** 1

### wal\_receiver\_buffer\_size

**Parameter description:** Specifies the memory buffer size for the standby nodes to store the received Xlog files.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 4096 to 1047552. The unit is KB.

**Default value:** 64 MB (65536 KB)

## primary\_slotname

**Parameter description:** Specifies the slot name of the primary node corresponding to a standby node. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** empty

## max\_logical\_replication\_workers

**Parameter description:** Specifies the maximum number of apply worker threads on the subscriber side.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 262143

**Default value:** 4

## 17.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

### NOTE

Two parameters are involved in the optimizer:

- *INT\_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
- *DBL\_MAX* indicates the maximum value of the FLOAT data type.

In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

### 17.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default\_statistics\_target** parameter, or increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

## enable\_broadcast

**Parameter description:** Controls whether the query optimizer uses the broadcast distribution method when it evaluates the cost of stream.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

 **NOTE**

This parameter does not take effect in the current version.

## enable\_bitmapscan

**Parameter description:** Specifies the query optimizer's use of bitmap-scan plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## force\_bitmapand

**Parameter description:** Specifies the query optimizer's use of BitmapAnd plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** off

## enable\_hashagg

**Parameter description:** Specifies the query optimizer's use of Hash aggregation plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_hashjoin

**Parameter description:** Specifies the query optimizer's use of hash-join plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_indexscan

**Parameter description:** Specifies the query optimizer's use of index-scan plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_indexonlyscan

**Parameter description:** Specifies the query optimizer's use of index-only-scan plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_material

**Parameter description:** Specifies the query optimizer's use of materialization.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_mergejoin

**Parameter description:** Specifies the query optimizer's use of merge-join plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.

- **off**: disabled.

**Default value:** off

## enable\_nestloop

**Parameter description:** Specifies whether the query optimizer uses the nested-loop join plan type to fully scan internal tables. If this variable is disabled, the optimizer preferentially selects another method when another method exists.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** off

## enable\_index\_nestloop

**Parameter description:** Specifies whether the query optimizer uses the nested-loop join plan type to scan the parameterized indexes of internal tables.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_seqscan

**Parameter description:** Specifies the query optimizer's use of sequential scan plan types. If this variable is disabled, the optimizer preferentially selects another method when another method exists.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_sort

**Parameter description:** Specifies the query optimizer's choice of sort methods. If this variable is disabled, the optimizer preferentially selects another method when another method exists.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_tidscan

**Parameter description:** Specifies the query optimizer's use of Tuple ID (TID) scan plan types.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_kill\_query

**Parameter description:** In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

**Default value:** off

## max\_recursive\_times

**Parameter description:** Specifies the maximum number of **WITH RECURSIVE** iterations.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 200

## enable\_change\_hjcost

**Parameter description:** Specifies whether the optimizer excludes internal table running costs when selecting the Hash Join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** off

## **enable\_absolute\_tablespace**

**Parameter description:** Specifies whether the tablespace can use the absolute path.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that an absolute path can be used.
- **off** indicates that an absolute path cannot be used.

**Default value:** on

## **enable\_valuepartition\_pruning**

**Parameter description:** Specifies whether the DFS partitioned table is dynamically or statically optimized.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the DFS partitioned table is dynamically or statically optimized.
- **off** indicates that the DFS partitioned table is not dynamically or statically optimized.

**Default value:** on

## **qrw\_inlist2join\_optmode**

**Parameter description:** Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost\_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule\_base** indicates that the forcible rule-based inlist2join query rewriting is enabled.
- A positive integer indicates the threshold of inlist2join query rewriting. If the number of list elements in the IN clause is greater than the threshold, the rewriting is performed.

**Default value:** cost\_base

## **skew\_option**

**Parameter description:** Specifies whether an optimization policy is used.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

**Default value:** normal

## default\_limit\_rows

**Parameter description:** Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a positive value, the positive value is used as the estimated number of limit rows. If the positive value is a decimal, the value is rounded up automatically. If this parameter is set to a negative value, the negative value is converted to a percentage and used as default estimated value, that is, -5 indicates 5%.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating-point number ranging from -100 to *DBL\_MAX*

**Default value:** -10

## check\_implicit\_conversions

**Parameter description:** Specifies whether to check that candidate index paths are generated for index columns with implicit type conversion in a query.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the system checks whether candidate index paths are generated for index columns with implicit type conversion in a query.
- **off** indicates that a check will not be performed.

**Default value:** off

## cost\_weight\_index

**Parameter description:** Specifies the cost weight of **index\_scan**.

- If this parameter is set to **1**, no adjustment is performed.
- If this parameter is set to a value less than 1, the cost of **index\_scan** is reduced and **index\_scan** is more likely to be selected by the optimizer.
- If this parameter is set to a value greater than 1, the cost of **index\_scan** increases.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating-point number ranging from 1e-10 to 1e+10.

**Default value:** 1

### 17.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, these cost variables are based on the cost of sequential page fetches, that is, **seq\_page\_cost** is conventionally set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

#### seq\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 1

#### random\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

Although the server allows you to set **random\_page\_cost** to a value less than that of **seq\_page\_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

---

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 4

#### NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq\_page\_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

#### cpu\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each row during a query.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.01

## cpu\_index\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each index entry during an index scan.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.005

## cpu\_operator\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.0025

## effective\_cache\_size

**Parameter description:** Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

When setting this parameter you should consider both GaussDB's shared buffers and the kernel's disk cache. Also, take into account the expected number of concurrent queries on different tables, since they will have to share the available space.

This parameter has no effect on the size of shared memory allocated by GaussDB. It is used only for estimation purposes and does not reserve kernel disk cache. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is 8 KB.

A value greater than the default one makes index scans more likely to be used, whereas a value less than the default one makes sequential scans more likely to be used.

**Default value:**

**180 GB** (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, 96-core CPU/1024-GB memory); **135 GB** (96-core CPU/768-GB memory); **90 GB** (64-core CPU/512-GB memory); **80 GB** (60-core CPU/480-GB memory); **40 GB** (32-core CPU/256-GB memory); **18 GB** (16-core CPU/128-GB memory); **8 GB** (8-core CPU/64-GB memory); )

## allocate\_mem\_cost

**Parameter description:** Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0

### 17.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

## geqo

**Parameter description:** Specifies whether to enable the genetic query optimization.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

It is best not to turn it off in execution. **geqo\_threshold** provides more subtle control of GEQO.

---

**Value range:** Boolean

- **on** indicates that the genetic query optimization is enabled.
- **off** indicates that the genetic query optimization is disabled.

**Default value:** on

## geqo\_threshold

**Parameter description:** Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

- For simpler queries, it is best to use the regular, exhaustive-search planner; but for queries with many tables, it is better to use GEQO to manage the queries.
  - A **FULL OUTER JOIN** construct counts as only one **FROM** item.
-

**Value range:** an integer ranging from 2 to *INT\_MAX*

**Default value:** 12

## geqo\_effort

**Parameter description:** Controls the trade-off between planning time and query plan quality in GEQO.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

**geqo\_effort** does not do anything directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.

---

**Value range:** an integer ranging from 1 to 10

---

### NOTICE

Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

---

**Default value:** 5

## geqo\_pool\_size

**Parameter description:** Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

---

### NOTICE

The value of this parameter must be at least **2**, and useful values are typically from **100** to **1000**. If this parameter is set to **0**, GaussDB selects a proper value based on **geqo\_effort** and the number of tables.

---

**Default value:** 0

## geqo\_generations

**Parameter description:** Specifies the number of iterations of the GEQO.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

---

**NOTICE**

The value of this parameter must be at least **1**, and useful values are typically from **100** to **1000**. If it is set to **0**, a suitable value is chosen based on **geqo\_pool\_size**.

---

**Default value:** 0

### geqo\_selection\_bias

**Parameter description:** Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 1.5 to 2.0

**Default value:** 2

### geqo\_seed

**Parameter description:** Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

---

**NOTICE**

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

---

**Default value:** 0

## 17.3.8.4 Other Optimizer Options

### explain\_dna\_file

**Parameter description:** Sets [explain\\_perf\\_mode](#) to **run** to export object files in CSV format.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

The value of this parameter must be an absolute path plus a file name with the extension **.csv**.

---

**Value range:** a string

**Default value:** empty

## **explain\_perf\_mode**

**Parameter description:** Specifies the display format of the **explain** command.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** **normal**, **pretty**, **summary**, and **run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

**Default value:** **pretty** (In the current version, only the value **normal** takes effect. If the value is not **normal**, **normal** is still displayed.)

 **NOTE**

In pretty mode, only one plan is displayed. After you run **CREATE RULE** to create a rule, the SQL statement executed may generate multiple plans. In this case, you are advised to use the normal mode.

The following is an example:

```
openGauss=# CREATE TABLE another_table (id int, name text);
CREATE TABLE
openGauss=# CREATE TABLE my_table (id int, name text);
CREATE TABLE
openGauss=# CREATE RULE my_rule AS ON INSERT TO my_table
openGauss=# WHERE NEW.id > 5
openGauss=# DO INSTEAD (INSERT INTO another_table VALUES (NEW.id, 'Some Data'));
CREATE RULE
openGauss=# explain INSERT INTO my_table VALUES (5, 'Test Name');
QUERY PLAN

Insert on my_table (cost=0.00..0.01 rows=1 width=0)
-> Result (cost=0.00..0.01 rows=1 width=0)

Insert on another_table (cost=0.00..0.01 rows=1 width=0)
-> Result (cost=0.00..0.01 rows=1 width=0)
 One-Time Filter: false
(6 rows)

openGauss=# set explain_perf_mode=pretty;
SET
openGauss=# explain INSERT INTO my_table VALUES (5, 'Test Name');
id | operation | E-rows | E-width | E-costs
-----+-----+-----+-----+-----
1 | -> Insert on another_table | 1 | 0 | 0.000..0.010
2 | -> Result | 1 | 0 | 0.000..0.010
(2 rows)

Predicate Information (identified by plan id)

2 --Result
 One-Time Filter: false
(2 rows)

openGauss=# drop table my_table;
DROP TABLE
openGauss=# drop table another_table;
DROP TABLE
```

## analysis\_options

**Parameter description:** Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the options in the value range.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- **HASH\_CONFLICT** indicates that the log in the **pg\_log** directory of the database node process displays the statistics of the hash table, including the hash table size, hash link length, and hash conflict.
- **STREAM\_DATA\_CHECK** indicates that a CRC check is performed on data before and after network data transmission.

**Default value:** **ALL,on(),off(HASH\_CONFLICT,STREAM\_DATA\_CHECK)**, which indicates that no location function is enabled.

## cost\_param

**Parameter description:** Specifies use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not 0.

When **cost\_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selection rate of non-equi-joins. This method is more accurate for estimating the selection rate of joins between two identical tables. At present, **cost\_param & 1=0** is not used. That is, a better formula is selected for calculation.

When **cost\_param & 2** is set to a value other than 0, the selection rate is estimated based on multiple filter criteria. The lowest selection rate among all filter criteria, but not the product of the selection rates for two tables under a specific filter criterion, is used as the total selection rate. This method is more accurate when a close correlation exists between the columns to be filtered.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 0

## enable\_partitionwise

**Parameter description:** Specifies whether to select an intelligent algorithm for joining partition tables.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

**Default value:** off

## rewrite\_rule

**Parameter description:** Specifies the optional query rewriting rules that have been enabled. Some query rewrite rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there are over one override rules: rule1, rule2, rule3, and rule4. You can perform the following settings:

```
set rewrite_rule=rule1; -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3; -- Enable the query rewriting rules rule2 and rule3
set rewrite_rule=none; -- Disable all optional query rewriting rules
```

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- **none**: Does not use any optional query rewriting rules.
- **lazyagg**: Uses the Lazy Agg query rewriting rules for eliminating aggregation operations in subqueries.
- **magicset**: The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **uniquecheck**: Uses the Unique Check query rewriting rules. Optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **intargetlist**: Uses the In Target List query rewriting rules (subquery optimization in the target column).
- **predpushnormal**: Uses the Predicate Push query rewriting rule (push the predicate condition to the subquery).
- **predpushforce**: Uses the Predicate Push query rewriting rules. Push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: Selects the optimal plan based on the cost in **predpushnormal** and **predpushforce**.
- **disable\_pullup\_expr\_sublink**: The optimizer is not allowed to pull up sublinks of the expr\_sublink type. For details about sublink classification and pull-up principles, see "SQL Optimization" > "Typical SQL Optimization Methods" > "Optimizing Subqueries" in *Developer Guide*.
- **disable\_pullup\_not\_in\_sublink**: The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see "SQL Optimization" > "Typical SQL Optimization Methods" > "Optimizing Subqueries" in *Developer Guide*.
- **enable\_sublink\_pullup\_rownum**: The optimizer can be used to promote subjoins when the SQL statement contains the ROWNUM pseudocolumn.

**Default value:** magicset

 **NOTE**

In the current version, the **partialpush** and **disablerep** parameters can be set but do not take effect.

## enable\_pbe\_optimization

**Parameter description:** Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the optimizer optimizes the query plan of the PBE statement.
- **off** indicates that the optimization is not used.

**Default value:** on

## enable\_global\_stats

**Parameter description:** Specifies the current statistics collection mode, which can be global statistics collection or single-node statistics collection. By default, the global statistics collection mode is used. If this parameter is set to **off**, the statistics of the first node in the database are collected by default. In this case, the quality of the generated query plan may be affected. However, the information collection performance is optimal. Therefore, exercise caution when setting this parameter.

This is a **SUSET** parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** or **true** indicates the global statistics mode.
- **off** or **false** indicates the database node statistics.

**Default value:** on

### NOTE

This parameter does not take effect in centralized mode.

## enable\_opfusion

**Parameter description:** Specifies whether to optimize simple addition, deletion, modification, and query operations.

This is a **USERSET** parameter. Set it based on instructions in [Table 17-1](#).

The restrictions on simple query are as follows:

- Only indexscan and indexonlyscan are supported, and the filter criteria of all WHERE statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. Join and using are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features such as active sql and QPS are not supported.
- Tables that are being scaled out or in are not supported.
- The system column cannot be queried or modified.

- Only simple **SELECT** statements are supported. For example:

```
SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
```

Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.

- Only simple **INSERT** statements are supported. For example:

```
INSERT INTO t1 VALUES (?,10,?);
```

Only one **VALUES** is supported. The type in **VALUES** can be a constant or a parameter. **RETURNING** is not supported.

- Only simple **DELETE** statements are supported. For example:

```
DELETE FROM t1 WHERE c1 = ? and c2 = 10;
```

Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

- Only simple **UPDATE** statements are supported. For example:

```
UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
```

The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

**Value range:** Boolean

- on:** enabled.
- off:** disabled.

**Default value:** on

## sql\_beta\_feature

**Parameter description:** Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation.

These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4. You can perform the following settings:

```
-- Enable beta feature feature1 of the SQL engine.
set sql_beta_feature=feature1;
-- Enable beta features feature2 and feature3 of the SQL engine.
set sql_beta_feature=feature2,feature3;
-- Disable all optional beta features of the SQL engine.
set sql_beta_feature=none;
```

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- none:** None of the beta optimizer features is used.
- sel\_semi\_poisson:** Uses poisson distribution to calibrate the equivalent semi-join and anti-join selection rates.
- sel\_expr\_instr:** Uses the matching row count to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- param\_path\_gen:** Generates more possible parameterized paths.
- rand\_cost\_opt:** Optimizes the random read cost of tables that have a small amount of data.
- param\_path\_opt:** Uses the bloat ratio of the table to optimize the analysis information of indexes.
- page\_est\_opt:** optimizes the **relpages** estimation for the analysis information of table indexes.
- no\_unique\_index\_first:** Disables optimization of the primary key index scanning path first.
- join\_sel\_with\_cast\_func:** Type conversion functions are supported when the number of join rows is estimated.

- **canonical\_pathkey**: The regular path key is generated in advance. (**pathkey**: a set of ordered key values of data.)
- **index\_cost\_with\_leaf\_pages\_only**: Considers index leaf nodes when the index cost is estimated.
- **a\_style\_coerce**: enables the Decode type conversion rule to be compatible with ORA. For details, see case processing in O-compatible mode in "SQL Reference" > "Type Conversion" > "UNION, CASE, and Related Constructs" in *Developer Guide*.
- **predpush\_same\_level**: Enables the **predpush** hint to control parameterized paths at the same layer.
- **enable\_plsql\_smp**: Enables parallel execution of queries in stored procedures. Currently, only one query can be executed in parallel at a time, and no parallel execution plan is generated for cursor-related operations, autonomous transactions, and queries in exceptions.
- **disable\_bitmap\_cost\_with\_lossy\_pages**: Disables the computation of the cost of lossy pages in the bitmap path cost.

**Default value:**

"sel\_semi\_poisson,sel\_expr\_instr,rand\_cost\_opt,param\_path\_opt,page\_est\_opt"

## default\_statistics\_target

**Parameter description:** Specifies the default statistics target for table columns without a column-specific target set via **ALTER TABLE SET STATISTICS**. The number of rows sampled during statistics collection is affected.

If this parameter is set to a positive number, the number of rows sampled in the statistics histogram is **default\_statistics\_target** x 300. If the parameter is set to a negative number, it indicates the percentage of statistics collected. The negative number converts to its corresponding percentage, for example, **-5** means 5%. The number of sampled rows is the total number of rows multiplied by 5%. This parameter affects only the target number of sampled rows in the statistics. The actual number of sampled rows is also affected by the memory parameter [work\\_mem](#).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -100 to 10000

---

**NOTICE**

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
  - Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
    1. Restore to the default statistics.
    2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization" > "Hint-based Tuning" in *Developer Guide*.
  - If this parameter is set to a negative value, the number of samples is equal to or greater than 2% of the total data volume, and the number of records in user tables is less than 1.6 million, the time taken by running **ANALYZE** will be longer than when this parameter uses its default value.
  - If this parameter is set to a negative value, the auto-analyze function is disabled.
- 

**Default value:** 100

## constraint\_exclusion

**Parameter description:** Specifies the query optimizer's use of table constraints to optimize queries.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **on** indicates that constraints for all tables are examined.
- **off** indicates that constraints for any table are not examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

---

**NOTICE**

When **constraint\_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

---

**Default value:** partition

 **NOTE**

Currently, **constraint\_exclusion** is enabled by default only for cases that are often used to implement table partitioning. If this parameter is enabled for all tables, extra planning is imposed on simple queries, which has no benefits. If you have no partitioned tables, set it to **off**.

## cursor\_tuple\_fraction

**Parameter description:** Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating-point number ranging from 0.0 to 1.0

---

#### NOTICE

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

---

**Default value:** 0.1

## from\_collapse\_limit

**Parameter description:** Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries into upper queries if the resulting FROM list would have no more than this many items.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

---

#### NOTICE

Smaller values reduce planning time but may lead to inferior execution plans.

---

**Default value:** 8

## join\_collapse\_limit

**Parameter description:** Specifies whether the optimizer rewrites **JOIN** constructs (except **FULL JOIN**) into lists of **FROM** items based on the number of the items in the result list.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

---

#### NOTICE

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
  - Smaller values reduce planning time but lead to inferior execution plans.
-

**Default value:** 8

## plan\_mode\_seed

**Parameter description:** This is a commissioning parameter. Currently, it supports only **OPTIMIZE\_PLAN** and **RANDOM\_PLAN**. The value **0** (for **OPTIMIZE\_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM\_PLAN**, which indicates that the plan is randomly generated. **-1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from **1** to **2147483647** and a random execution plan based on the generated integer. A value from **1** to **2147483647** is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** 0

---

### NOTICE

- If this parameter is set to a random execution plan, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
  - If this parameter is not set to **0**, the specified plan hint will not be used.
- 

## hashagg\_table\_size

**Parameter description:** Specifies the hash table size during the execution of the HASH JOIN operation.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to  $INT\_MAX/2$

**Default value:** 0

## enable\_bloom\_filter

**Parameter description:** Specifies whether the BloomFilter optimization is used.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

**Default value:** on

## enable\_extrapolation\_stats

**Parameter description:** Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of

estimation for tables whose statistics are not collected in time, but will possibly provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the extrapolation logic is used for data of DATE type based on historical statistics.
- **off** indicates that the extrapolation logic is not used for data of DATE type based on historical statistics.

**Default value:** off

## autoanalyze

**Parameter description:** Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

**Default value:** off

### NOTE

This parameter is irrelevant to autoanalyze in the autovacuum thread. This parameter does not take effect in centralized mode.

## enable\_analyze\_check

**Parameter description:** Checks whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as 0 in **pg\_class** during plan generation.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

**Default value:** off

## enable\_sonic\_hashagg

**Parameter description:** Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

### NOTE

- If **enable\_sonic\_hashagg** is enabled and the Hash Agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the memory usage of the Hash Agg operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashagg** is enabled and the hash aggregation operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see "SQL Optimization" > "Introduction to the SQL Execution Plan" > "Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_hashjoin

**Parameter description:** Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

### NOTE

- Currently, the parameter can be used only for Inner Join.
- If **enable\_sonic\_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashjoin** is enabled and the hash join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as **Sonic Hash Join** in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as **Hash Join**. For details, see "SQL Optimization" > "Introduction to the SQL Execution Plan" > "Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_optspill

**Parameter description:** Specifies whether to optimize the number of files to be written to disks for the Hash Join operator designed for column-oriented hash tables. If this parameter is set to **on**, the number of files written to disks does not increase significantly when the Hash Join operator writes a large number of files to disks.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the optimization is enabled.
- **off** indicates that the optimization is disabled.

**Default value:** on

## plan\_cache\_mode

**Parameter description:** Specifies the policy for generating an execution plan in the **prepare** statement.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force\_generic\_plan** indicates that the generic plan is forcibly used (soft parsing). **generic plan** is a plan generated after you run the **prepare** statement. The plan policy binds parameters to the plan when you run the **execute** statement and execute the plan. The advantage of this scheme is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance.
- **force\_custom\_plan** indicates that the custom plan is forcibly used (hard parse). **custom plan** is a plan generated after you run the **prepare** statement where parameters in the **execute** statement is embedded. The **custom plan** generates a plan based on specific parameters in the **execute** statement. This scheme generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

### NOTE

This parameter is valid only for the **prepare** statement. It is used when the parameterized field in the **prepare** statement has severe data skew.

**Default value:** auto

## enable\_hypo\_index

**Parameter description:** Determines whether the optimizer considers virtual indexes when executing the **EXPLAIN** command.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_auto\_explain

**Parameter description:** Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected primary database node.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean. The value **true** indicates that the function is enabled, and the value **false** indicates that the function is disabled.

**Default value:** false

## auto\_explain\_level

**Parameter description:** Specifies the log level for automatically printing execution plans.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated type. The value can be **LOG** or **NOTICE**. **LOG** indicates that the execution plan is printed in logs. **NOTICE** indicates that the execution plan is printed in notification mode.

**Default value:** LOG

## auto\_explain\_log\_min\_duration

**Parameter description:** Specifies how long execution plans are automatically printed for. Plans can be printed only when the time required to execute the plans is greater than the value of **auto\_explain\_log\_min\_duration**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

- **0:** All executed plans are generated.
- **3000:** All execution plans will be generated after the execution of a statement takes more than 3000 ms.

**Default value:** 0

## query\_dop

**Parameter description:** Specifies the user-defined degree of parallelism (DOP). This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 64. If the fixed SMP function is enabled, the system uses the fixed DOP.

 **NOTE**

After enabling concurrent queries, ensure you have sufficient CPU, memory, and network to achieve the optimal performance.

**Default value:** 1

## **enable\_startwith\_debug**

**Parameter description:** Specifies whether to enable the **start with** or **connect by** parameter for debugging. If this parameter is enabled, information about all tail columns related to the **start with** feature is displayed.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean. The value **true** indicates that the function is enabled, and the value **false** indicates that the function is disabled.

**Default value:** false

## **enable\_global\_plancache**

**Parameter description:** Specifies whether to share the cache of the PBE query execution plan. Enabling this function can reduce the memory usage of database nodes in high concurrency scenarios.

When **enable\_global\_plancache** is enabled, the default value of **local\_syscache\_threshold** is equal to or greater than 16 MB to ensure that GPC takes effect. If the value of **local\_syscache\_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, do not change it.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the execution plan of the PBE query is shared in the cache.
- **off** indicates no sharing.

**Default value:** off

## **gpc\_clean\_timeout**

**Parameter description:** When **enable\_global\_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc\_clean\_timeout**, the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 300 to 86400. The unit is s.

**Default value:** 1800, that is, 30 minutes

## **17.3.9 Error Reporting and Logging**

### 17.3.9.1 Logging Destination

#### log\_destination

**Parameter description:** GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, **log\_destination** can be set to "**stderr, csvlog**".)

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

The valid values are **stderr**, **csvlog**, **syslog**, and **eventlog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging\_collector** must be set to **on**. For details, see [Using CSV Log Output](#).
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see [syslog\\_facility](#). To record logs using syslog, add the following information to syslog daemon's configuration file:  
`local0.* /var/log/bmm`

**Default value:** **stderr**

#### logging\_collector

**Parameter description:** Specifies whether to enable the logger process to collect logs. This process captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

It is possible to log to **stderr** without using the logging collector and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

---

**Value range:** Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

**Default value:** **on**

#### log\_directory

**Parameter description:** Specifies the directory for storing log files when **logging\_collector** is set to **on**. The value can be an absolute path, or relative to

the data directory. The **log\_directory** parameter can be dynamically modified using the **gs\_guc reload** command. Only users with the **sysadmin** permission can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- If this parameter is set to an invalid path, the database cannot be started.
- If you modify the **log\_directory** parameter using the **gs\_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value is still written into the configuration file.
- In the sandbox environment, the path cannot contain **/var/chroot**. For example, if the absolute path of log is **/var/chroot/var/lib/log/Ruby/pg\_log/cn\_log**, you only need to set the path to **/var/lib/log/Ruby/pg\_log/cn\_log**.

---

 **NOTE**

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## log\_filename

**Parameter description:** Specifies the names of generated log files when **logging\_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only users with the **sysadmin** permission can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log\_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server\_log.1093827753.csv**.

---

**Value range:** a string

**Default value:** postgresql-%Y-%m-%d\_%H%M%S.log

## log\_file\_mode

**Parameter description:** Specifies the permissions of log files when **logging\_collector** is set to **on**. The parameter value is usually a number in the format acceptable to the **chmod** and **umask** system calls.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

- Before setting this parameter, set **log\_directory** to store the logs to a directory other than the data directory.
  - Do not make the log files world-readable because they might contain sensitive data.
- 

**Value range:** an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format)

#### NOTE

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

**Default value:** 0600

## log\_truncate\_on\_rotation

**Parameter description:** Specifies the writing mode of the log files when **logging\_collector** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

A setting example is as follows:

Assume that you want logs to be kept for 7 days, a log file generated each day to be named **server\_log.Mon** on Monday, **server\_log.Tue** on Tuesday, and so forth, and this week's log files to be overwritten by next week's log files. Then you can set **log\_filename** to **server\_log.%a**, **log\_truncate\_on\_rotation** to **on**, and **log\_rotation\_age** to **1440** (indicating that the valid duration of the log file is 24 hours).

**Value range:** Boolean

- **on** indicates that GaussDB overwrites the existing log files of the same name on the server.
- **off** indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

**Default value:** off

## log\_rotation\_age

**Parameter description:** Specifies the interval for creating a log file when **logging\_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log\_rotation\_age**, a new log file will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

**Default value:** 1440

## log\_rotation\_size

**Parameter description:** Specifies the maximum size of a server log file when **logging\_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to  $INT\_MAX/1024$ . The unit is KB.

**0** indicates that the capacity-based creation of new log files is disabled.

It is recommended that the unit of the value be MB or bigger, so that log files can be of proper size.

**Default value:** 20 MB

## syslog\_facility

**Parameter description:** Specifies the syslog facility to be used when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

**Default value:** local0

## syslog\_ident

**Parameter description:** Specifies the identifier of GaussDB messages in syslog logs when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** postgres

## event\_source

**Parameter description:** This parameter takes effect only in a Windows environment and is not supported in GaussDB. It specifies the identifier of GaussDB messages in logs when **log\_destination** is set to **eventlog**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** PostgreSQL

## 17.3.9.2 Logging Time

### client\_min\_messages

**Parameter description:** Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 17-5](#). If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

**Default value:** notice

### log\_min\_messages

**Parameter description:** Specifies which level of messages will be written into the server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level. For some log information, after this parameter is enabled, you also need to set **logging\_module** to enable log printing for the corresponding module.

---

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 17-5](#).

**Default value:** warning

### log\_min\_error\_statement

**Parameter description:** Controls which SQL statements that cause an error condition are recorded in the server log.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 17-5](#).

---

 NOTE

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that this feature is disabled.

**Default value:** error

## log\_min\_duration\_statement

**Parameter description:** Specifies the threshold for logging the duration of a completed statement. If a statement runs for a period equal to or greater than the specified value, its duration will be logged.

Setting **log\_min\_duration\_statement** makes it easy to trace query statements that need to be optimized. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

---

NOTICE

When using this option together with [log\\_statement](#), the text of statements that are logged because of **log\_statement** will not be repeated in the duration log message. If you are not using **syslog**, it is recommended that you log the process ID (PID) or session ID using [log\\_line\\_prefix](#) so that you can link the statement message to the later duration message.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **-1** indicates that the duration logging is disabled.

**Default value:** 3s (that is, 3000 ms)

## backtrace\_min\_messages

**Parameter description:** Prints the function's stack information to the server's log file if the information generated is equal to or greater than the level specified by this parameter.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

---

NOTICE

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, you are advised not to set **backtrace\_min\_messages** to a level other than fatal and panic when locating problems.

---

**Value range:** enumerated values

Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 17-5](#).

**Default value:** panic

[Table 17-5](#) explains message severities used by GaussDB. If logging output is sent to **syslog** or **eventlog**, the severities are translated as shown in the table. (Note that the translation takes effect only in a Windows environment where GaussDB does not involve this parameter.)

**Table 17-5** Message severity levels

| Severity   | Description                                                                                                                                    | System Log | Event Log       |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------------|
| debug[1-5] | Provides detailed debug information.                                                                                                           | DEBUG      | INFORMATIO<br>N |
| log        | Reports information of interest to administrators, for example, checkpoint activity.                                                           | INFO       | INFORMATIO<br>N |
| info       | Provides information implicitly requested by users, for example, output from <b>VACUUM VERBOSE</b> .                                           | INFO       | INFORMATIO<br>N |
| notice     | Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key. | NOTICE     | INFORMATIO<br>N |
| warning    | Provides warnings of likely problems, for example, <b>COMMIT</b> outside a transaction block.                                                  | NOTICE     | WARNING         |
| error      | Reports an error that causes a command to terminate.                                                                                           | WARNING    | ERROR           |
| fatal      | Reports the reason that causes a session to terminate.                                                                                         | ERR        | ERROR           |
| panic      | Reports an error that caused all database sessions to terminate.                                                                               | CRIT       | ERROR           |

### 17.3.9.3 Logging Content

#### debug\_print\_parse

**Parameter description:** Specifies whether to print parsing tree results.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_rewritten

**Parameter description:** Specifies whether to print query rewriting results.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_plan

**Parameter description:** Specifies whether to print the query execution plan to logs.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### NOTICE

- Debugging information about **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan** are printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client\_min\_messages** and **log\_min\_messages**.
- Do not invoke the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions when **debug\_print\_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions in the log files generated when **debug\_print\_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

## debug\_pretty\_print

**Parameter description:** Indents the logs produced by **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

**Default value:** on

## log\_checkpoints

**Parameter description:** Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

**Default value:** off

## log\_connections

**Parameter description:** Specifies whether to record connection request information of the client.

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

#### NOTICE

Some client programs, such as gsql, attempt to connect twice while determining if a password is required. In this case, duplicate "connection receive" messages do not necessarily indicate a problem.

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_disconnections

**Parameter description:** Specifies whether to record disconnection request information of the client.

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_duration

**Parameter description:** Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **off:** Compared with this option, [log\\_min\\_duration\\_statement](#) forcibly records the query text.
- If this parameter is set to **on** and [log\\_min\\_duration\\_statement](#) is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

**Default value:** off

## log\_error\_verbosity

**Parameter description:** Specifies the amount of detail written in the server log for each message that is logged.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.

- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

**Default value:** default

## log\_hostname

**Parameter description:** By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

**Default value:** off

## log\_line\_prefix

**Parameter description:** Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log. The "escape sequences" which begin with **%** are replaced with status information as listed in [Table 17-6](#).

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Table 17-6** Escape characters

| Escape Character | Effect                                                                                                                                           |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| %a               | Application name                                                                                                                                 |
| %u               | Username                                                                                                                                         |
| %d               | Database name                                                                                                                                    |
| %r               | Remote host name or IP address and remote port. If <b>log_hostname</b> is set to <b>off</b> , only the IP address and remote port are displayed. |
| %h               | Remote host name or IP address. If <b>log_hostname</b> is set to <b>off</b> , only the IP address is displayed.                                  |
| %p               | Thread ID                                                                                                                                        |
| %t               | Time stamp without milliseconds                                                                                                                  |

| Escape Character | Effect                                                                                                                                                                                                                         |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %m               | Timestamp with milliseconds                                                                                                                                                                                                    |
| %n               | Node from which an error is reported                                                                                                                                                                                           |
| %i               | Command tag: type of command executed in the current session                                                                                                                                                                   |
| %e               | SQLSTATE error code                                                                                                                                                                                                            |
| %c               | Session ID: For details, see the note below the table.                                                                                                                                                                         |
| %l               | Number of the log line for each session or thread, starting at 1                                                                                                                                                               |
| %s               | Process startup time                                                                                                                                                                                                           |
| %v               | Virtual transaction ID (backendID/ localXID)                                                                                                                                                                                   |
| %x               | Transaction ID ( <b>0</b> indicates that no transaction ID is assigned)                                                                                                                                                        |
| %q               | Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored. |
| %S               | Session ID                                                                                                                                                                                                                     |
| %T               | Trace ID                                                                                                                                                                                                                       |
| %%               | The character %                                                                                                                                                                                                                |

 **NOTE**

The %c escape character prints a session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the process startup time and the process ID. Therefore, %c can also be used as a space saving way of printing those items. For example, run the following query to generate the session ID from **pg\_stat\_activity**:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
 to_hex(pid)
FROM pg_stat_activity;
```

- If you set a nonempty value for **log\_line\_prefix**, you should usually make its last character be a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and process ID information. Therefore, you do not need to include those escapes characters when you are logging in to syslog.

**Value range:** a string

**Default value:** %m %n %u %d %h %p %S %x %a

 **NOTE**

**%m %n %u %d %h %p %S %x %a** indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

## log\_lock\_waits

**Parameter description:** If the time for which a session waits to acquire a lock is longer than the value of [deadlock\\_timeout](#), this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

**Default value:** off

## log\_statement

**Parameter description:** Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an Execute message is received, and values of the Bind parameters are included (with any embedded single quotation marks doubled).

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

Statements that contain simple syntax errors are not logged even if **log\_statement** is set to **all**, because the log message is emitted only after basic parsing has been completed to determine the statement type. If an extended query protocol is used, statements that fail before the execution phase (during parse analysis or planning) are not logged, either. Set **log\_min\_error\_statement** to **ERROR** or lower to log such statements.

---

**Value range:** enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

**Default value:** none

## log\_temp\_files

**Parameter description:** Specifies whether to record the deletion information of temporary files. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB.

- A positive value indicates that the deletion information of temporary files whose size is larger than the specified value of **log\_temp\_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **-1** indicates that the delete information of any temporary files is not recorded.

**Default value:** -1

## log\_timezone

**Parameter description:** Specifies the time zone used for timestamps written in the server log. Different from **TimeZone**, this parameter takes effect for all sessions in the database.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. You can obtain it by querying the PG\_TIMEZONE\_NAMES view.

**Default value:** Set this parameter based on the OS time zone.

### NOTE

The default value will be changed when **gs\_initdb** is used to set system environments.

## logging\_module

**Parameter description:** Specifies whether module logs are output on the server. This parameter is a session-level parameter, and you are advised not to use the gs\_guc tool to set it.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** **off**. All the module logs are not output on the server. You can view the logs by running **SHOW logging\_module**.

```
ALL,on(),off(COMMAND,GUC,GSCLEAN,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,I
NDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT
_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,M
OT,PLANHINT,PARQUET,PGSTAT,
SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,I
NSTR,WDR,SNAPSHOT,INCR_CHKPT,INCR_BG_WRITER,DBL_WRT,RTO_RPO,
HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREA
D_POOL,OPT_AI,WALRECEIVER,USTORE,UNDO,TIMECAPSULE,GEN_COL,DCF,PLDEBUGGER,ADVIS
OR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,
NEST_COMPILE,RESOWNER,LOGICAL_DECODE,GPRC,DISASTER_READ,REPSYNC,ENCODING_CHECK)
```

**Setting method:** Run **show logging\_module** to view which modules are controllable. For example, the query output result is as follows:

```
openGauss=# show logging_module;
logging_module
```

```
ALL,on(),off(COMMAND,GUC,GSCLEAN,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,I
NDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT
```

```
_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,M
OT,PLANHINT,PARQUET,PGSTAT,
SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,I
NSTR,WDR_SNAPSHOT,INCR_CHKPT,INCR_BG_WRITER,DBL_WRT,RTO_RPO,
HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREA
D_POOL,OPT_AI,WALRECEIVER,USTORE,UNDO,TIMECAPSULE,GEN_COL,DCF,PLDEBUGGER,ADVIS
OR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,
NEST_COMPILE,RESOWNER,LOGICAL_DECODE,GPRC,DISASTER_READ,REPSYNC,ENCODING_CHECK)
(1 row)
```

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting **logging\_module** to **on** or **off**. Enable log output for SSL:

```
openGauss=# set logging_module='on(SSL)';
SET
openGauss=# show
logging_module;
 logging_module

(1 row)

ALL,on(SSL),off(COMMAND,GUC,GSCLEAN,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,GDS,TBLSPC,WLM,OBS,I
NDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT
_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,M
OT,PLANHINT,PARQUET,PGSTAT,
SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,I
NSTR,WDR_SNAPSHOT,INCR_CHKPT,INCR_BG_WRITER,DBL_WRT,RTO_RPO,H
EARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREA
D_POOL,OPT_AI,WALRECEIVER,USTORE,UNDO,TIMECAPSULE,GEN_COL,DCF,PLDEBUGGER,ADVISO
R,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,N
EST_COMPILE,RESOWNER,LOGICAL_DECODE,GPRC,DISASTER_READ,REPSYNC,ENCODING_CHECK)
(1 row)
```

SSL log output is enabled.

The **ALL** identifier can be used to quickly enable or disable log output for all modules.

```
openGauss=# set logging_module='off(ALL)';
SET
openGauss=# show
logging_module;
 logging_module

(1 row)

ALL,on(),off(COMMAND,GUC,GSCLEAN,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,I
NDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT
_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,M
OT,PLANHINT,PARQUET,PGSTAT,
SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,I
NSTR,WDR_SNAPSHOT,INCR_CHKPT,INCR_BG_WRITER,DBL_WRT,RTO_RPO,
HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREA
D_POOL,OPT_AI,WALRECEIVER,USTORE,UNDO,TIMECAPSULE,GEN_COL,DCF,PLDEBUGGER,ADVIS
OR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,

OMPILE,RESOWNER,LOGICAL_DECODE,GPRC,DISASTER_READ,REPSYNC,ENCODING_CHECK),off()
(1 row)
```

**Dependency:** The value of this parameter depends on the settings of **log\_min\_messages**.

## opfusion\_debug\_mode

**Parameter description:** Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the database node execution plans.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **off** indicates that reasons why queries are not optimized are not included.
- **log** indicates that reasons why queries are not optimized are included in the database node execution plan.

### NOTICE

To view the reasons why queries are not optimized in the log, set **opfusion\_debug\_mode** to **log**, **log\_min\_messages** to **debug4**, and **logging\_module** to **on(OPFUSION)**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

**Default value:** off

## enable\_debug\_vacuum

**Parameter description:** Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** or **true** indicates that generation of ADIO logs is allowed.
- **off** or **false** indicates that generation of ADIO logs is not allowed.

**Default value:** off

### 17.3.9.4 Using CSV Log Output

#### Prerequisites

- The **log\_destination** parameter is set to **csvlog**.
- The **logging\_collector** parameter is set to **on**.

#### Definition of csvlog

Log lines are emitted in comma separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE gaussdb_log
(
 log_time timestamp(3) with time zone,
 node_name text,
 user_name text,
 database_name text,
 process_id bigint,
 connection_from text,
 "session_id" text,
 session_line_num bigint,
 command_tag text,
 session_start_time timestamp with time zone,
 virtual_transaction_id text,
 transaction_id bigint,
 query_id bigint,
 module text,
 error_severity text,
 sql_state_code text,
 message text,
 detail text,
 hint text,
 internal_query text,
 internal_query_pos integer,
 context text,
 query text,
 query_pos integer,
 location text,
 application_name text
);
```

For details, see [Table 17-7](#).

**Table 17-7** Meaning of each csvlog field

| Column    | Description               | Column         | Description                     |
|-----------|---------------------------|----------------|---------------------------------|
| log_time  | Timestamp in milliseconds | module         | Module to which the log belongs |
| node_name | Node name                 | error_severity | ERRORSTATE code                 |
| user_name | Username                  | sql_state_code | SQLSTATE code                   |

| Column                 | Description                     | Column             | Description                                                                                                   |
|------------------------|---------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------|
| database_name          | Database name                   | message            | Error message                                                                                                 |
| process_id             | Process ID                      | detail             | Detailed error message                                                                                        |
| connection_from        | Port number of the client host  | hint               | Prompt message                                                                                                |
| session_id             | Session ID                      | internal_query     | Internal query (This field is used to query the information leading to errors if any.)                        |
| session_line_num       | Number of lines in each session | internal_query_pos | Pointer for an internal query                                                                                 |
| command_tag            | Command tag                     | context            | Environment                                                                                                   |
| session_start_time     | Start time of a session         | query              | Character count at the position where errors occur                                                            |
| virtual_transaction_id | Regular transaction             | query_pos          | Pointer at the position where errors occur                                                                    |
| transaction_id         | Transaction ID                  | location           | Position where errors occur in the GaussDB source code if <b>log_error_verbosity</b> is set to <b>verbose</b> |
| query_id               | Query ID                        | application_name   | Application name                                                                                              |

Run the following command to import a log file to this table:

```
COPY gaussdb_log FROM '/opt/data/pg_log/logfile.csv' WITH csv;
```

#### NOTE

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

## Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log\_filename** and **log\_rotation\_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log\_rotation\_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.

- Set **log\_truncate\_on\_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

## 17.3.10 Alarm Detection

During the running of the database, error scenarios can be detected so that users are informed of the errors in time. You can view the **system\_alarm** log written by the alarm in the *\$GAUSSLOG/cm* directory.

### enable\_alarm

**Parameter description:** Specifies whether to enable the alarm detection thread to detect fault scenarios that may occur in the database.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the alarm detection thread is enabled.
- **off** indicates that the alarm detection thread is disabled.

**Default value:** on

 **NOTE**

This parameter takes effect only on DNs.

### connection\_alarm\_rate

**Parameter description:** Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max\_connections** x **connection\_alarm\_rate**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

**Default value:** 0.9

### alarm\_report\_interval

**Parameter description:** specifies the interval at which an alarm is reported.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. The unit is s.

**Default value:** 10

### alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm\_report\_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## table\_skewness\_warning\_threshold

**Parameter description:** Specifies the threshold for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a floating point number ranging from 0 to 1

**Default value:** 1

## table\_skewness\_warning\_rows

**Parameter description:** Specifies the number of rows for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 100000

## 17.3.11 Statistics During the Database Running

### 17.3.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system view families **pg\_stats** and **pg\_statistic**. The following parameters are used to set the statistics collection feature in the server scope.

## track\_activities

**Parameter description:** Collects statistics about the commands that are being executed in session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the **pg\_stat\_activity** view.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** on

## track\_counts

**Parameter description:** Collects statistics about database activities.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

### NOTE

Database statistics are required when the autovacuum process checks for databases that need to be vacuumed. Therefore, the default value is set to **on**.

**Default value:** on

## track\_io\_timing

**Parameter description:** Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg\_stat\_database** parameter.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the operating system at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## track\_functions

**Parameter description:** Collects statistics of the number and duration of function invocations.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

---

**Value range:** enumerated values

- **pl** indicates that only procedural language functions are traced.
- **all** indicates that SQL language functions area traced.
- **none** indicates that the function tracing function is disabled.

**Default value:** none

## track\_activity\_query\_size

**Parameter description:** Specifies byte counts of the current running commands used to trace each active session.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 100 to 102400

**Default value:** 1024

## track\_procedure\_sql

**Parameter description:** Specifies whether the SQL statements that are being executed in the stored procedure are printed in the **query** column in the **pg\_stat\_activity** system catalog.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on**: indicates that when a stored procedure is called, the statements that are being executed by the stored procedure are printed in the query column of **pg\_stat\_activity**.
- **off**: indicates that when a stored procedure is called, only statements for invoking the stored procedure are printed in the **query** column of **pg\_stat\_activity**.

**Default value:** on

## update\_process\_title

**Parameter description:** Collects statistics updated with a process name each time the server receives a new SQL statement.

The process name can be viewed by running the **ps** command.

This is an INTERNAL parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## stats\_temp\_directory

**Parameter description:** Specifies the directory for storing temporary statistics. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

---

**Value range:** a string

**Default value:** pg\_stat\_tmp

## track\_thread\_wait\_status\_interval

**Parameter description:** Specifies the interval of collecting the thread status information.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 to 1 day. The unit is min.

**Default value:** 30 min

## enable\_save\_datachanged\_timestamp

**Parameter description:** Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE/TRUNCATE/DROP PARTITION** is performed on table data.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.
- **off** indicates that the time when an operation is performed on table data will not be recorded.

**Default value:** on

## track\_sql\_count

**Parameter description:** Collects statistics about the statements (**SELECT**, **INSERT**, **UPDATE**, **MERGE INTO**, and **DELETE**) that are being executed in a session.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 0.8% by enabling or disabling this parameter.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** on

 **NOTE**

- The **track\_sql\_count** parameter is restricted by the **track\_activities** parameter when the **gs\_sql\_count** or **pgxc\_sql\_count** view is queried.
  - If **track\_activities** is set to **on** and **track\_sql\_count** is set to **off**, a warning message indicating that **track\_sql\_count** is disabled will be displayed in logs when the **gs\_sql\_count** view is queried.
  - If both **track\_activities** and **track\_sql\_count** are set to **off**, two warning messages indicating that **track\_activities** is disabled and **track\_sql\_count** is disabled will be displayed in logs when the views are queried.
  - If **track\_activities** is set to **off** and **track\_sql\_count** is set to **on**, a warning message indicating that **track\_activities** is disabled will be displayed in logs when the views are queried.
- If **track\_sql\_count** is set to **off**, querying the **gs\_sql\_count** or **pgxc\_sql\_count** view returns 0.

### 17.3.11.2 Performance Statistics

During the running of the database, the lock access, disk I/O operation, and invalid message processing are involved. All these operations are the bottleneck of the database performance. The performance statistics provided by GaussDB can facilitate the performance fault location.

### Generating Performance Statistics Logs

**Parameter description:** For each query, the following four parameters record the performance statistics of corresponding modules in the server log:

- The **log\_parser\_stats** parameter records the performance statistics of a parser in the server log.
- The **log\_planner\_stats** parameter records the performance statistics of a query optimizer in the server log.
- The **log\_executor\_stats** parameter records the performance statistics of an executor in the server log.
- The **log\_statement\_stats** parameter records the performance statistics of the whole statement in the server log.

All these parameters can only provide assistant analysis for administrators, which are similar to the `getrusage()` of the Linux OS.

These are SUSE parameters. Set them based on instructions in [Table 17-1](#).

---

**NOTICE**

- The **log\_statement\_stats** records the total statement statistics whereas other parameters record statistics only about their corresponding modules.
- The **log\_statement\_stats** parameter cannot be enabled together with any parameter recording statistics about a module.

---

**Value range:** Boolean

- **on** indicates that performance statistics are recorded.
- **off** indicates that performance statistics are not recorded.

**Default value:** off

## 17.3.12 Automatic Vacuuming

The **autovacuum** process automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

### autovacuum

**Parameter description:** Specifies whether to start the **autovacuum** process in the database. Ensure that the **track\_counts** parameter is set to **on** before starting the automatic vacuuming process.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

#### NOTE

- Set the **autovacuum** parameter to **on** if you want to start the automatic vacuuming of abnormal two-phase transactions when the system recovers from faults.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to 0, the autovacuum process is started only when the system recovers from faults to clean up abnormal two-phase transactions.
- If **autovacuum** is set to **on** and the value of **autovacuum\_max\_workers** is greater than 0, the system will automatically vacuum the two-phase transactions and processes after recovering from faults.

**Value range:** Boolean

- **on** indicates that the **autovacuum** process is started.
- **off** indicates that the **autovacuum** process is not started.

**Default value:** on

### autovacuum\_mode

**Parameter description:** Specifies whether the autoanalyze or autovacuum function is started. This parameter is valid only when **autovacuum** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** enumerated values

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither of them is performed.

**Default value:** mix

## autoanalyze\_timeout

**Parameter description:** Specifies the timeout period of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze\_timeout**, the autoanalyze is automatically canceled.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 5 min (300s)

## autovacuum\_io\_limits

**Parameter description:** Specifies the upper limit of I/Os triggered by the autovacuum process per second.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer. The value can be **-1** or a number ranging from 0 to 1073741823. **-1** indicates that the default cgroup is used.

**Default value:** -1

## log\_autovacuum\_min\_duration

**Parameter description:** Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is equal to or greater than a certain value. This parameter helps track the autovacuum behavior.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

A setting example is as follows:

Set the **log\_autovacuum\_min\_duration** parameter to 250 ms to record the actions of autovacuum if it runs for 250 ms or longer.

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

- **0** indicates that all autovacuum actions are recorded in the log.
- **-1** indicates that all autovacuum actions are not recorded in the log.
- A value greater than 0 indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict.

**Default value:** -1

## autovacuum\_max\_workers

**Parameter description:** Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max\_connections** and **job\_queue\_processes**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer. The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula: 262143 -

**max\_connections - job\_queue\_processes** - Number of auxiliary threads - Number of autovacuum launcher threads - 1. The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

**Default value:** 3

## autovacuum\_naptime

**Parameter description:** Specifies the interval between activity rounds for the autovacuum process.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 1 to 2147483. The unit is s.

**Default value:** 10 min (600s)

## autovacuum\_vacuum\_threshold

**Parameter description:** Specifies the threshold for triggering the **VACUUM** operation. When the number of deleted or updated records in a table exceeds the specified threshold, the VACUUM operation is executed on this table.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_analyze\_threshold

**Parameter description:** Specifies the threshold for triggering the **ANALYZE** operation. When the number of deleted, inserted, or updated records in a table exceeds the specified threshold, the **ANALYZE** operation is executed on this table.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_vacuum\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_vacuum\_threshold** parameter when deciding whether to vacuum a table.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.2

## autovacuum\_analyze\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_analyze\_threshold** parameter when deciding whether to analyze a table.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.1

## autovacuum\_freeze\_max\_age

**Parameter description:** Specifies the maximum age (in transactions) that a table's **pg\_class.relfrozenxid** field can attain before a VACUUM operation is performed.

- The old files under the subdirectory of **pg\_clog/** can also be deleted by the **VACUUM** operation.
- Even if the **autovacuum** process is not started, the system will invoke the process to prevent transaction ID wraparound.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 100000 to 576460752303423487

**Default value:** 4000000000

## autovacuum\_vacuum\_cost\_delay

**Parameter description:** Specifies the value of the cost delay used in the **autovacuum** operation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from -1 to 100. The unit is ms. -1 indicates that the normal vacuum cost delay is used.

**Default value:** 20ms

## autovacuum\_vacuum\_cost\_limit

**Parameter description:** Sets the value of the cost limit used in the **autovacuum** operation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from -1 to 10000 -1 indicates that the normal vacuum cost limit is used.

**Default value:** -1

## defer\_csn\_cleanup\_time

**Parameter description:** Specifies the local recycling interval, in ms.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 5s (5000 ms)

## 17.3.13 Default Settings of Client Connection

### 17.3.13.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

#### search\_path

**Parameter description:** Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter consists of one or more schema names. Different schema names are separated by commas (,).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

- If the schema of temporary tables exists in the current session, the schema can be listed in the search path by using the alias **pg\_temp**, for example, '**pg\_temp,public**'. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg\_catalog** and **search\_path**. Therefore, do not explicitly specify **pg\_temp** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed. If the alias **pg\_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, **pg\_catalog**, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg\_temp**, specified in **search\_path**. Therefore, do not explicitly specify **pg\_catalog** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search\_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function **current\_schema**. This is different from examining the value of **search\_path**, because the **current\_schema** function displays the first valid schema name in **search\_path**.

**Value range:** a string

 NOTE

- When this parameter is set to "**\$user**", **public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (""), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

**Default value:** "**\$user**",**public**

 NOTE

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## current\_schema

**Parameter description:** Specifies the current schema.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** "**\$user**",**public**

 NOTE

- **\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.
- If you need to obtain a schema during GaussDB development, use the value of **search\_path** because the schema is determined by **search\_path**. To be compatible with database A, **current\_schema** is used only to modify the value of **search\_path**.

## default\_tablespace

**Parameter description:** Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, the [temp\\_tablespaces](#) is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. An empty string indicates that the default tablespace is used.

**Default value:** empty

## temp\_tablespaces

**Parameter description:** Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see [default\\_tablespace](#).

**Default value:** empty

## check\_function\_bodies

**Parameter description:** Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the word syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the CREATE phase. Instead, they are checked during running.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

**Default value:** on

## default\_transaction\_isolation

**Parameter description:** Specifies the default isolation level of each transaction.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

### NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

**Value range:** enumerated values

- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the data that has been read by the current transaction cannot be modified by other transactions until the current transaction completes, thereby preventing unrepeatable reads.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

**Default value:** read committed

## default\_transaction\_read\_only

**Parameter description:** Specifies whether each new transaction is in read-only state.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

### CAUTION

If this parameter is set to **on**, the DML and write transactions cannot be executed.

---

**Value range:** Boolean

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is in read/write state.

**Default value:** off

## default\_transaction\_deferrable

**Parameter description:** Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

**Default value:** off

## session\_replication\_role

**Parameter description:** Specifies the behavior of replication-related triggers and rules for the current session.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

Setting this parameter will discard all the cached execution plans.

---

**Value range:** enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

**Default value:** origin

## statement\_timeout

**Parameter description:** If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#). The default value is **0**, indicating that the parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 0

## vacuum\_freeze\_min\_age

**Parameter description:** Specifies whether VACUUM replaces the **xmin** column of a record with **FrozenXID** when scanning a table (in the same transaction).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 **NOTE**

Although you can set this parameter to any value, VACUUM will limit the effective value to half the value of [autovacuum\\_freeze\\_max\\_age](#) by default.

**Default value:** 2000000000

## vacuum\_freeze\_table\_age

**Parameter description:** Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of **pg\_class.relfrozenxid64** is greater than the specified time.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 NOTE

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum\_freeze\_max\_age** by default. Therefore, a periodic manual **VACUUM** has a chance to run before an anti-wraparound autovacuum is launched for the table.

**Default value:** 4000000000

## bytea\_output

**Parameter description:** Specifies the output format for values of the bytea type.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **hex** indicates that the binary data is converted to hexadecimal format.
- **escape** indicates that the traditional PostgreSQL format is used. It takes the approach of representing a binary string as a sequence of ASCII characters, while converting those bytes that cannot be represented as an ASCII character into special escape sequences.

**Default value:** hex

## xmlbinary

**Parameter description:** Specifies how binary values are to be encoded in XML.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- base64
- hex

**Default value:** base64

## xmloption

**Parameter description:** Specifies whether DOCUMENT or CONTENT is implicit when converting between XML and string values.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

**Default value:** content

## max\_compile\_functions

**Parameter description:** Specifies the maximum number of function compilation results stored in the server. Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1000

### 17.3.13.2 Locale and Formatting

This section describes parameters related to the time format setting.

#### DateStyle

**Parameter description:** Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format specifications (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, or YMD). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY. The keywords US, NonEuro, and NonEuropean are synonyms for MDY.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** ISO, MDY

#### NOTE

**gs\_initdb** will initialize this parameter so that its value is the same as that of [lc\\_time](#).

**Setting Suggestions:** The ISO format is recommended. Postgres, SQL, and German use abbreviations for time zones, such as **EST**, **WST**, and **CST**. These abbreviations can be ambiguous. For example, **CST** can represent Central Standard Time (USA) UT-6:00, Central Standard Time (Australia) UT+9:30, and China Standard Time UT+8:00. This may lead to incorrect time zone conversion and cause errors.

#### IntervalStyle

**Parameter description:** Specifies the display format for interval values.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **sql\_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the [DateStyle](#) parameter is set to **ISO**.
- **postgres\_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the [DateStyle](#) parameter is set to **non\_ISO**.
- **iso\_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **a** indicates the output result that matches the numtodsinterval function.

---

**NOTICE**

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

---

**Default value:** postgres

## TimeZone

**Parameter description:** Specifies the time zone for displaying and interpreting timestamps.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. You can obtain it by querying the **pg\_timezone\_names** view.

**Default value:** PRC

 **NOTE**

**gs\_initdb** will set a time zone value that is consistent with the system environment.

## timezone\_abbreviations

**Parameter description:** Specifies the time zone abbreviations that will be accepted by the server.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. You can obtain it by querying the **pg\_timezone\_names** view.

**Default value:** Default

 **NOTE**

**Default** indicates an abbreviation that works in most of the world, which is applicable to most cases. There are also other abbreviations, such as **Australia** and **India** that can be defined for a particular installation. For other time zone abbreviations, you need to set them in the corresponding configuration files before creating the database.

## extra\_float\_digits

**Parameter description:** Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT\_DIG or DBL\_DIG as appropriate).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -15 to 3

 NOTE

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

**Default value:** 0

## client\_encoding

**Parameter description:** Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the database, you are advised to retain the default value of **client\_encoding**. Modification to this parameter in the **postgresql.conf** file (by using the **gs\_guc** tool, for example) does not take effect.

**Default value:** UTF8

**Recommended value:** SQL\_ASCII or UTF8

## lc\_messages

**Parameter description:** Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_monetary

**Parameter description:** Specifies the display format of monetary values. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_numeric

**Parameter description:** Specifies the display format of numbers. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_time

**Parameter description:** Specifies the display format of time and locale. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

### 17.3.13.3 Other Default Parameters

This section describes the default database loading parameters.

#### dynamic\_library\_path

**Parameter description:** Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not have a directory component, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic\_library\_path** must be a list of absolute paths separated by colons (:). When the name of a path starts with the special variable \$libdir, the variable will be replaced with the directory in which the module provided by the GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/gaussdb:/opt/testgs/lib:$libdir'
```

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

#### NOTE

If the value of this parameter is set to an empty character string, the automatic path search is turned off.

**Default value:** \$libdir

#### local\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (,). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local\_preload\_libraries** can specify the library directory explicitly, for example, **\$libdir/plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to **\$libdir/plugins/mylib**.)
- Unlike **shared\_preload\_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit **LOAD** command. For example, debugging can be enabled under a given username by setting this parameter to **ALTER USER SET**.
- If a specified library is not found, the connection attempt will fail.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** empty

## 17.3.14 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

### deadlock\_timeout

**Parameter description:** Specifies the time, in milliseconds, to wait on a lock before checking whether there is a deadlock condition. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks do not frequently occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for a deadlock. Increasing this value reduces the time wasted in needless deadlock checks, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to raise it. The value you have set needs to exceed the transaction time. By doing this, the possibility that a lock will be checked for deadlocks before it is released will be reduced.
- When [log\\_lock\\_waits](#) is set to **on**, **deadlock\_timeout** determines a waiting time to write the lock waiting time information during query execution to logs. To study the lock delay, you can set **deadlock\_timeout** to a value smaller than the normal value.

This is a **SUSET** parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is ms.

**Default value:** 1s

### lockwait\_timeout

**Parameter description:** Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This is a **USERSET** parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 20 min

### update\_lockwait\_timeout

**Parameter description:** Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 2 min (120000 ms)

## max\_locks\_per\_transaction

**Parameter description:** Determines the average number of object locks allocated to each transaction.

**Parameter type:** integer

**Unit:** none

**Value range:** 10 to 2147483647

**Default value:** 256

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Setting suggestions:**

- The maximum number of hash tables that can be locked by a shared lock at any time is calculated based on an assumption: **max\_locks\_per\_transaction** x (**max\_connections** + **max\_prepared\_transactions**) and **max\_locks\_per\_transaction** ≥ Number of concurrent service transactions x Number of object locks added by each service transaction/(**max\_connections** + **max\_prepared\_transactions**). In this case an upper limit is determined for this parameter.
- Within the specified range, objects can be locked simultaneously at any time. You may need to increase the value of this parameter if many different tables are modified in a single transaction.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows, leading to database startup failure.
- When running a standby node, you must set this parameter to a value that is no less than that on the primary node. Otherwise, queries will not be allowed on the standby node.

## max\_pred\_locks\_per\_transaction

**Parameter description:** Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of *N* independent objects need to be locked at any time. *N* = **max\_pred\_locks\_per\_transaction** x (**max\_connections** + **max\_prepared\_transactions**). Within the specified range, objects can be locked simultaneously at any time. You may need to increase the value if many different tables are modified in a single transaction. This parameter can only be set at server start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to *INT\_MAX*

**Default value:** 64

## gs\_clean\_timeout

**Parameter description:** Specifies the average interval for clearing temporary tables on the primary node.

- When the database connection is terminated abnormally, temporary tables may exist. In this case, you need to call the **gs\_clean** tool to clear the temporary tables in the database.
- If this parameter is set to a larger value, the time for clearing GaussDB temporary tables may be prolonged.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 1 min

## partition\_lock\_upgrade\_timeout

**Parameter description:** Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. This parameter sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.
- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the [lockwait\\_timeout](#) parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition\_lock\_upgrade\_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If this parameter is set to **-1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from -1 to 3000. The unit is s.

**Default value:** 1800

## fault\_mon\_timeout

**Parameter description:** Specifies the period for detecting lightweight deadlocks. This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is minute.

**Default value:** 5min

## enable\_online\_ddl\_waitlock

**Parameter description:** Specifies whether to block DDL operations to wait for the release of database locks, such as **pg\_advisory\_lock**. This parameter is mainly used in online OM operations and you are not advised to modify the settings.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that DDL operations will be blocked to wait for the lock release.
- **off** indicates that DDL operations will not be blocked.

**Default value:** off

## xloginsert\_locks

**Parameter description:** Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 16

## num\_internal\_lock\_partitions

**Parameter description:** Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (.). The sequence does not affect the setting result. For example, **CLOG\_PART=256,CSNLOG\_PART=512** is equivalent to **CSNLOG\_PART=512,CLOG\_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG\_PART** to **256** and **CLOG\_PART** to **2**, the value of **CLOG\_PART** is **2**. If no keyword is set, the default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

- **CLOG\_PART:** number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG\_PART:** number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG log writing efficiency and transaction

submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOG logs and affect the performance. The value ranges from 1 to 512.

- **LOG2\_LOCKTABLE\_PART**: two logarithms of the number of common table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When waiting events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE\_PART**: number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH\_PART**: maximum number of locks that each thread can obtain without using the main lock table. When a partitioned table is read, updated, inserted, or deleted and the waiting event is LockMgrLock, you can increase the value of this parameter to prevent **LockMgrLock** from being obtained and improve performance. It is recommended that the value be equal to or greater than **Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10**. Increasing the value will increase the memory usage. The value ranges from 20 to 10000.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:**

- **CLOG\_PART**: 256
- **CSNLOG\_PART**: 512
- **LOG2\_LOCKTABLE\_PART**: 4
- **TWOPHASE\_PART**: 1
- **FASTPATH\_PART**: 20

## 17.3.15 Version and Platform Compatibility

### 17.3.15.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

#### array\_nulls

**Parameter description:** Controls whether the array input parser recognizes unquoted NULL as a null array element.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

**Default value:** on

## backslash\_quote

**Parameter description:** Controls whether a single quotation mark can be represented by \ in a string text.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

### NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

**Value range:** enumerated values

- **on** indicates that the use of \ is always allowed.
- **off** indicates that the use of \ is rejected.
- **safe\_encoding** indicates that the use of \ is allowed only when client encoding does not allow **ASCII** \ within a multibyte character.

**Default value:** safe\_encoding

## escape\_string\_warning

**Parameter description:** Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate codes that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** on

## lo\_compat\_privileges

**Parameter description:** Specifies whether to enable backward compatibility for the privilege check of large objects.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**on** indicates that the privilege check is disabled when users read or modify large objects. This setting is compatible with versions earlier than PostgreSQL 9.0.

**Default value:** off

## quote\_all\_identifiers

**Parameter description:** Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as `pg_get_viewdef`. For details, see the `--quote-all-identifiers` parameter of `gs_dump`.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the forcible quoting is enabled.
- **off** indicates that the forcible quoting is disabled.

**Default value:** off

## sql\_inheritance

**Parameter description:** Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the **ONLY** keyword is used by default. This setting is compatible with earlier versions.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

**Default value:** on

## standard\_conforming\_strings

**Parameter description:** Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that backslashes are treated as ordinary texts.
- **off** indicates that backslashes are not treated as ordinary texts.

**Default value:** on

## synchronize\_seqscans

**Parameter description:** Controls sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O workload.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.
- **off** indicates that the scan always starts from the table heading.

**Default value:** on

## enable\_beta\_features

**Parameter description:** Specifies whether to enable some features that are not officially released and are used only for POC verification. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

**Default value:** off

## default\_with\_oids

**Parameter description:** Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any **OID** field in newly-created tables.

**Default value:** off

### 17.3.15.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides a lot of convenience for platforms.

#### convert\_string\_to\_digit

**Parameter description:** Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

**Default value:** on

---

#### NOTICE

Adjusting this parameter will change the internal data type conversion rule and cause unexpected behaviors. Exercise caution when performing this operation.

---

#### nls\_timestamp\_format

**Parameter description:** Specifies the default timestamp format.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

#### max\_function\_args

**Parameter description:** Specifies the maximum number of parameters allowed for a function.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Value range:** an integer

**Default value:** 8192

#### transform\_null\_equals

**Parameter description:** Specifies whether expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`. They return true if `expr` evaluates to the **NULL** value, and false otherwise.

- The correct SQL-standard-compliant behavior of **expr = NULL** is to always return **NULL** (unknown).

- Filtered forms in Microsoft Access generate queries that appear to use **expr = NULL** to test for null values. If you turn this option on, you can use this interface to access the database.

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that expressions of the form **expr = NULL** (or **NULL = expr**) are treated as **expr IS NULL**.
- **off** indicates that **expr = NULL** always returns **NULL** (unknown).

**Default value:** off

 **NOTE**

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

## support\_extended\_features

**Parameter description:** Specifies whether extended database features are supported.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

**Default value:** off

## sql\_compatibility

**Parameter description:** Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This parameter is an INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** enumerated type

- **A** indicates that the database is compatible with the Oracle database.
- **B** indicates that the database is compatible with the MySQL database.
- **C** indicates that the database is compatible with the Teradata database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

**Default value:** A

---

**NOTICE**

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database.
  - In the database, this parameter must be set to a specific value. It can be set to **A** or **B** and cannot be changed randomly. Otherwise, the setting is not consistent with the database behavior.
-

## behavior\_compat\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** ""

### NOTE

- Currently, only items in [Table 17-8](#) are supported.
- Multiple items are separated by commas (,), for example, **set behavior\_compat\_options='end\_month\_calculate,display\_leading\_zero';**

**Table 17-8** Compatibility configuration items

| Configuration Item   | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| display_leading_zero | <p>Specifies how floating point numbers are displayed. It controls the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and any precision types (such as float4, float8, and numeric) in the numeric type. In addition, the length of the calculated number is displayed synchronously.</p> <ul style="list-style-type: none"><li>If this item is not specified, for a decimal number between -1 and 1, the 0 before the decimal point is not displayed. For example:<br/>openGauss=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;<br/>a   b   c   d<br/>-----+-----+-----+---<br/>.1231243   .1231243   .123   8<br/>(1 row)</li><li>If this item is specified, for a decimal number between -1 and 1, the 0 before the decimal point is displayed. For example:<br/>openGauss=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;<br/>a   b   c   d<br/>-----+-----+-----+---<br/>0.1231243   0.1231243   0.123   9<br/>(1 row)</li></ul> |

| Configuration Item        | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_month_calculate       | <p>Specifies the calculation logic of the add_months function. Assume that the two parameters of the add_months function are <b>param1</b> and <b>param2</b>, and that the month of <b>param1</b> and <b>param2</b> is <b>result</b>.</p> <ul style="list-style-type: none"> <li>If this item is not specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>param1</b>. For example:<br/> <pre>openGauss=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-28 00:00:00 (1 row)</pre> </li> <li>If this item is specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>result</b>. For example:<br/> <pre>openGauss=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-31 00:00:00 (1 row)</pre> </li> </ul> |
| compat_analyze_sample     | <p>Specifies the sampling behavior of the <b>ANALYZE</b> operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling database node memory consumption and maintaining the stability of ANALYZE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| bind_schema_tablespace    | <p>Binds a schema with the tablespace with the same name. If a tablespace name is the same as <i>sche_name</i>, <b>default_tablespace</b> will also be set to <i>sche_name</i> if <b>search_path</b> is set to <i>sche_name</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| bind_procedure_searchpath | <p>Specifies the search path of the database object in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the search is performed in the schema to which the stored procedure belongs. If the stored procedure is not found, the following operations are performed:</p> <ul style="list-style-type: none"> <li>If this item is not specified, the system reports an error and exits.</li> <li>If this item is specified, the search continues based on the settings of <b>search_path</b>. If the issue persists, the system reports an error and exits.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

| Configuration Item              | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## plsql\_compile\_check\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,).

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** ""

### NOTE

- Currently, only items in [Table 17-8](#) are supported.
- Multiple items are separated by commas (,), for example, **set plsql\_compile\_check\_options='for\_loop,outparam';**

**Table 17-9** Compatibility configuration items

| Configuration Item | Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| for_loop           | Determines the behavior of the <b>FOR_LOOP</b> query statement in a stored procedure. When this parameter is set, if <b>rec</b> has been defined in the <b>FOR rec IN query LOOP</b> statement, the defined <b>rec</b> variable is not reused and a new variable is created. Otherwise, the defined <b>rec</b> variable is reused and no new variable is created. (It is the same as <b>proc_implicit_for_loop_variable</b> and will be incorporated later.) |
| outparam           | When the output parameter overloading condition is met, the output parameters are checked. The output parameters cannot be constant.                                                                                                                                                                                                                                                                                                                         |

## a\_format\_version

**Parameter description:** Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** ""

### NOTE

- Currently, only items in [Table 17-8](#) are supported.
- Set a character string for the compatibility configuration item, for example, **set a\_format\_version='10c'**.

**Table 17-10** Compatibility configuration items

| Configuration Item | Compatibility Behavior Control   |
|--------------------|----------------------------------|
| 10c                | Compatible version of platform A |

## a\_format\_dev\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** ""

 NOTE

- Currently, only items in [Table 17-8](#) are supported.
- Set a character string for the compatibility configuration item, for example, **set a\_format\_dev\_version='s1'**.

**Table 17-11** Compatibility configuration items

| Configuration Item | Compatibility Behavior Control                                                |
|--------------------|-------------------------------------------------------------------------------|
| s1                 | After this parameter is enabled, the int casted from text can be rounded off. |

## plpgsql.variable\_conflict

**Parameter description:** Sets the priority of using stored procedure variables and table columns with the same name.

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** a string

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- **use\_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use\_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

**Default value:** error

## td\_compatible\_truncation

**Parameter description:** Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the **INSERT** operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

 NOTE

The string truncation function cannot be used if the **INSERT** statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL\_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

**Default value:** off

## uppercase\_attribute\_name

**Parameter description:** Specifies whether to return column names in uppercase to the client. This parameter is used only in the ORA-compatible mode and centralized environment.

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that column names are returned to the client in uppercase.
- **off** indicates that column names are not returned to the client in uppercase.

**Default value:** off

## lastval\_supported

**Parameter description:** Specifies whether the lastval function can be used.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

**Default value:** off

## 17.3.16 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

### exit\_on\_error

**Parameter description:** If this function is enabled, errors of the ERROR level will be upgraded to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that errors of the ERROR level will be upgraded to PANIC errors.
- **off** indicates that errors of the ERROR level will not be upgraded.

**Default value:** off

## restart\_after\_crash

**Parameter description:** If this parameter is set to **on** and a backend process crashes, GaussDB automatically reinitializes the backend process.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** maximizes the availability of the database.  
In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off** indicates that a management tool is enabled to obtain control permission and take proper measures when a backend process crashes.

**Default value:** on

## omit\_encoding\_error

**Parameter description:** If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This is a USERSET parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off** indicates that characters that have conversion errors cannot be converted and error information will be directly displayed.

**Default value:** off

## cn\_send\_buffer\_size

**Parameter description:** Specifies the size of the data buffer used for data transmission on the primary database node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 8 to 128. The unit is KB.

**Default value:** 8 KB

## data\_sync\_retry

**Parameter description:** Specifies whether to keep running the database when updated data fails to be written into disks by using the **fsync** function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that the database keeps running and **fsync** is executed again after **fsync** fails.
- **off** indicates that a PANIC-level error is reported and the database is stopped after **fsync** fails.

**Default value:** off

## remote\_read\_mode

**Parameter description:** Specifies whether to enable the remote read function.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **off** indicates that the remote read function is disabled.
- **non\_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

**Default value:** authentication

## 17.3.17 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

## cache\_connection

**Parameter description:** Specifies whether to recycle the connections of a connection pool.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that the connections of a connection pool will be recycled.
- **off** indicates that the connections of a connection pool will not be recycled.

**Default value:** on

## 17.3.18 Transaction

This section describes the settings and value ranges of database transaction parameters.

## transaction\_isolation

**Parameter description:** specifies the isolation level of the current transaction.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string of case-sensitive characters. The values include:

- **serializable:** This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions will be read.
- **repeatable read** indicates that only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **default:** The value is the same as that of **default\_transaction\_isolation**.

**Default value:** read committed

## transaction\_read\_only

**Parameter description:** Specifies whether the current transaction is a read-only transaction.

This parameter has a fixed value **on** during database restoration or on the standby node. Otherwise, set this parameter to the value of **default\_transaction\_read\_only**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

**Default value:** off

## xc\_maintenance\_mode

**Parameter description:** Specifies whether the system is in maintenance mode.

This is a SUSERSET parameter. Set it based on method 3 in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the system is in maintenance mode.
- **off** indicates that the system is not in maintenance mode.

---

### NOTICE

Enable the maintenance mode with caution to avoid database data inconsistencies.

---

**Default value:** off

## allow\_concurrent\_tuple\_update

**Parameter description:** Specifies whether to allow concurrent update.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the concurrent update is allowed.
- **off** indicates that the system is not in maintenance mode.

**Default value:** on

## transaction\_deferrable

**Parameter description:** Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the [default\\_transaction\\_deferrable](#) parameter is used to specify whether to allow delayed execution of a transaction.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the execution of a read-only serial transaction can be delayed.
- **off** indicates that the execution of a read-only serial transaction cannot be delayed.

**Default value:** off

## enable\_show\_any\_tuples

**Parameter description:** This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

**Default value:** off

## replication\_type

**Parameter description:** Specifies whether the current HA database is deployed in standalone or one-primary-multiple-standby mode.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

This parameter is an internal parameter. Do not set it.

**Value range:** 0 to 2

- **2** indicates the standalone mode. In this mode, no standby node can be added.
- **1** indicates the one-primary-multiple-standby mode, covering all scenarios. This mode is recommended.
- **0** indicates that the mode is not available currently.

**Default value:** 1

## pgxc\_node\_name

**Parameter description:** Specifies the name of a node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

When a standby node requests to replicate logs on the primary node, if the **application\_name** parameter is not set, the **pgxc\_node\_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter\_IP address of the standby node\_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc\_node\_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

---

### CAUTION

After this parameter is modified, the database instance will fail to be connected. You are advised not to modify this parameter.

---

**Value range:** a string

**Default value:** current node name

## enable\_defer\_calculate\_snapshot

**Parameter description:** Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshot **xmin** and **oldestxmin** are calculated in real time.

**Default value:** on

## 17.3.19 Replication Parameters of Two Database Instances

### RepOriginId

**Parameter description:** This parameter is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This is a USERSET parameter. Set it based on method 3 in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

### stream\_cluster\_run\_mode

**Parameter description:** Specifies whether a DN is in the primary or standby instance in dual-instance streaming DR scenarios. For single-instance scenarios, the DN is in the primary instance by default.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates that the node is in the primary instance.
- **cluster\_standby** indicates that the node is in the standby instance.

**Default value:** cluster\_primary

### enable\_roach\_standby\_cluster

**Parameter description:** Sets the standby database instances to read-only in dual-database instance mode. Only users with the sysadmin permission can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the read-only mode is enabled for the standby database instances.
- **off** indicates that the read-only mode is disabled for the standby database instances. In this case, the standby database instances can be read and written.

**Default value:** off

### hadr\_process\_type

**Parameter description:** Specifies the process type in dual-instance streaming DR scenarios.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** enumerated values

- **none** indicates that there is no process.
- **failover** indicates that the DR database instance is being upgraded.
- **switchover\_promote** indicates the process of upgrading the DR database instance to the primary database instance during the primary/standby database instance switchover.
- **switchover\_demote** indicates the process of demoting the primary database instance to the DR database instance during the primary/standby database instance switchover.

**Default value:** none

## 17.3.20 Developer Options

### allow\_system\_table\_mods

**Parameter description:** Specifies whether the structure of a system catalog or the name of a system schema can be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

**Default value:** off

#### NOTE

You are not advised to change the default value of this parameter. If this parameter is set to **on**, system tables may be damaged and the database may fail to be started.

### allow\_create\_sysobject

**Parameter description:** Specifies whether objects such as functions, stored procedures, synonyms, aggregate functions, and operators can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the initial user and system administrator can create or modify objects such as functions, stored procedures, synonyms, and aggregate functions in the system schema, and the initial user can create operators in the system schema. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, synonyms, aggregate functions, and operators in the system schema.

**Default value:** on

## debug\_assertions

**Parameter description:** Specifies whether to enable various assertion checks. This parameter assists in debugging. If you are experiencing strange problems or crashes, set this parameter to **on** to identify programming defects. To use this parameter, the macro USE\_ASSERT\_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that various assertion checks are enabled.
- **off** indicates that various assertion checks are disabled.

### NOTE

If you compile GaussDB with the assertion check enabled, **debug\_assertions** is set to **on** by default.

**Default value:** off

## ignore\_checksum\_failure

**Parameter description:** If this parameter is enabled, the system ignores the failure (but still generates an alarm). Continuing execution may result in breakdown, damaged data being transferred or hidden, failure of data recovery from remote nodes, or other serious problems. You are not advised to modify the settings.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

**Default value:** off

## ignore\_system\_indexes

**Parameter description:** Specifies whether to ignore system indexes when reading system catalog (but still update the indexes when modifying the tables).

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

---

### NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

---

**Value range:** Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

**Default value:** off

## post\_auth\_delay

**Parameter description:** Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## pre\_auth\_delay

**Parameter description:** Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 60. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## trace\_notify

**Parameter description:** Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of [client\\_min\\_messages](#) or [log\\_min\\_messages](#) must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## trace\_recovery\_messages

**Parameter description:** Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of [log\\_min\\_messages](#), but only for specific messages. This is intended for the use in debugging the standby node.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see [log\\_min\\_messages](#).

**Default value:** log

### NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of **log\_min\_messages** enable logs to be unconditionally recorded into server logs.

## trace\_sort

**Parameter description:** Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro **trace\_sort** is defined during the GaussDB compilation. However, **trace\_sort** is currently defined by default.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## zero\_damaged\_pages

**Parameter description:** Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.

**Default value:** off

## remotetype

**Parameter description:** Specifies the remote connection type.

This is a BACKEND parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values. Valid values are **application**, **datanode**, and **internaltool**.

**Default value:** **application**

## max\_user\_defined\_exception

**Parameter description:** Specifies the maximum number of exceptions. The default value cannot be changed.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. Currently, only the fixed value **1000** is supported.

**Default value:** **1000**

## enable\_fast\_numeric

**Parameter description:** Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This is a SUSER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

**Default value:** **on**

## enable\_compress\_spill

**Parameter description:** Specifies whether to enable the compression function of writing data to disk.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.
- **off** or **false** indicates that optimization for writing data to a disk is disabled.

**Default value:** **on**

## support\_batch\_bind

**Parameter description:** Specifies whether to batch bind and execute PBE statements through interfaces such as JDBC, ODBC, and libpq.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

**Default value:** on

## numa\_distribute\_mode

**Parameter description:** Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale Arm servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. The valid values are **none** and **all**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to Arm servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

### NOTE

In the current version, **numa\_distribute\_mode** cannot be set to **all** on the x86 architecture.

**Default value:** none

## log\_pagewriter

**Parameter description:** Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are not advised to set this parameter to **true** because a large amount of information will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** on

## advance\_xlog\_file\_num

**Parameter description:** Specifies the number of Xlog files that are periodically initialized in advance in the backend. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction commission. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that

the backend thread periodically initializes 10 Xlog files in advance based on the write location of the current Xlog.

**Default value:** 0

## enable\_beta\_opfusion

**Parameter description:** Specifies whether to accelerate the execution of SQL statements, such as aggregate functions and sorting in TPC-C when **enable\_opfusion** is set to **on**.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_csqual\_pushdown

**Parameter description:** Specifies whether to deliver filter criteria for a rough check during query.

This is a SUSERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that a rough check is performed with filter criteria delivered during query.
- **off** indicates that a rough check is performed without filter criteria delivered during query.

**Default value:** on

## string\_hash\_compatible

**Parameter description:** Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution key is converted from a char-type data distribution into a varchar- or text-type data distribution.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

 NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

**Default value:** off

## pldebugger\_timeout

**Parameter description:** Specifies the timeout interval for the pldebugger server to wait for a response from the debug end.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 86400. The unit is second.

**Default value:** 15min

## plsql\_show\_all\_error

**Parameter description:** Specifies whether to skip errors and continue compiling PL/SQL objects. For details about the impact, see the description of DBE\_PLDEVELOPER.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** off

## ustore\_attr

**Parameter description:** This parameter is used to control the information statistics of Ustore tables, rollback type, and data verification during the running of key modules (including data, indexes, rollback segments, and replay). This parameter helps R&D engineers locate faults.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string. This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use semicolons (;) to separate them. For example:

**ustore\_attr='ustore\_verify\_level=NORMAL;ustore\_verify\_module=UPAGE:UBTR  
EE:UNDO:REDO'.**

 NOTE

When setting **ustore\_attr**, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, **ustore\_attr='ustore\_verify\_level = NORMAL**. Otherwise, the parameter is invalid during kernel code verification and the parameter setting fails.

- **ustore\_verify\_level:** verification level.

**Value range:** a string. For details, see the following table.

**Table 17-12** Parameter value meaning of `ustore_verify_level`

| Parameter Value | Description                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAST            | <b>FAST</b> indicates fast verification. A few content is verified and the impact on performance is minimized.                                                                                   |
| NORMAL          | <b>NORMAL</b> indicates that the verification is routinely performed. Compared with the fast verification, this verification involves more content, and the impact on the performance is medium. |
| SLOW            | <b>SLOW</b> indicates slow verification. The verification content is the largest, and the performance is greatly affected.                                                                       |

**Default value:** an empty string

- **ustore\_verify\_module:** module that controls verification.

**Value range:** a string of case-insensitive characters. The value can be one or more of **UPAGE**, **UBTREE**, **UNDO**, and **REDO**, or it can be **ALL** or **NULL**. When multiple values of **UPAGE**, **UBTREE**, **UNDO**, and **REDO** are used, separate them with colons (:).

For example, **ustore\_verify\_module=UPAGE:UBTREE:UNDO:REDO**.

**Table 17-13** Parameter value meaning of `ustore_verify_module`

| Parameter Value | Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------|
| UPAGE           | Indicates that data page verification is enabled.                                           |
| UBTREE          | Indicates that UBtree index verification is enabled.                                        |
| UNDO            | Indicates that rollback segment data verification is enabled.                               |
| REDO            | Indicates that data page verification for the REDO process is enabled.                      |
| ALL             | Indicates that data verification is enabled for the UPAGE, UBTREE, UNDO, and REDO modules.  |
| NULL            | Indicates that data verification for the UPAGE, UBTREE, UNDO, and REDO modules is disabled. |

**Default value:** an empty string

- **index\_trace\_level:** specifies whether to enable index tracing and control the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scanning.

**Value range:** a string. The values are described in the following table.

**Default value: NO**

**Table 17-14** Parameter value meaning of index\_trace\_level

| Parameter Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NO              | No additional information is printed.                                                                                                                                                                                                                                                                                                                                                                                                          |
| NORMAL          | Information about visible index tuples are printed, including: <ul style="list-style-type: none"><li>• ID and offset of the index page where the current index tuple is located</li><li>• Current tuple status</li><li>• TID and partOid corresponding to the current tuple</li><li>• xmin and xmax information corresponding to the current tuple</li><li>• Current tuple content (if <b>enable_log_tuple</b> is set to <b>on</b>).</li></ul> |
| VISIBILITY      | On the basis of <b>NORMAL</b> , the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.                                                                                                                                                                                                                                                                    |
| SHOWHIKEY       | On the basis of <b>VISIBILITY</b> , the system tries to print the information about the HIKEY tuple on the page.                                                                                                                                                                                                                                                                                                                               |
| ALL             | Information about all tuples on the scanned index page is printed.                                                                                                                                                                                                                                                                                                                                                                             |

- **enable\_log\_tuple**: specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.

**Value range:** on or off (case-insensitive)

**Default value:** off

Note: This parameter has been discarded.

- **enable\_ustore\_sync\_rollback**: indicates whether to enable synchronous rollback for Ustore tables.

**Value range:** Boolean

**Default value:** true

- **enable\_ustore\_async\_rollback**: indicates whether to enable asynchronous rollback for Ustore tables.

**Value range:** Boolean

**Default value:** true

- **enable\_ustore\_page\_rollback**: indicates whether to enable page rollback for Ustore tables.

**Value range:** Boolean

**Default value:** true

- **enable\_ustore\_partial\_seqscan**: indicates whether to enable partial scan for Ustore tables.

**Value range:** Boolean

**Default value:** false

- **enable\_candidate\_buf\_usage\_count:** indicates whether to enable buffer usage statistics.

**Value range:** Boolean

**Default value:** false

- **ustats\_tracker\_naptime:** specifies the interval for collecting statistics on Ustore tables.

**Value range:** [1,INT\_MAX/1000]

**Default value:** 20, in seconds

- **umax\_search\_length\_for\_prune:** specifies the maximum search depth of the prune operation on the Ustore table.

**Value range:** [1,INT\_MAX/1000]

**Default value:** 10 (times)

**Default value:** an empty string

 **NOTE**

This parameter applies only to Ustore tables in a centralized system.

## 17.3.21 Auditing

### 17.3.21.1 Audit Switch

#### **audit\_enabled**

**Parameter description:** Specifies whether to enable or disable the audit process. After the audit process is enabled, the auditing information written by the background process can be read from the pipe and written into audit files.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

#### **audit\_directory**

**Parameter description:** Specifies the storage directory of audit files. A path relative to the **data** directory. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** **pg\_audit** If **om** is used for database deployment, audit logs are stored in *\$GAUSSLOG/pg\_audit/Instance name*.

---

**NOTICE**

- You need to set different audit file directories for different DNs. Otherwise, audit logs will be abnormal.
  - If the value of **audit\_directory** in the configuration file is an invalid path, the audit function cannot be used.
- 

 **NOTE**

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

## audit\_data\_format

**Parameter description:** Audits the format of log files. Currently, only the binary format is supported. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** binary

## audit\_rotation\_interval

**Parameter description:** Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of this parameter, a new audit log file will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*/60. The unit is min.

**Default value:** 1d

---

**NOTICE**

Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the [audit\\_resource\\_policy](#), [audit\\_space\\_limit](#), and [audit\\_file\\_remain\\_time](#) parameters.

---

## audit\_rotation\_size

**Parameter description:** Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of this parameter, the server will generate a new audit log file.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1024 to 1048576. The unit is KB.

**Default value:** 10 MB

---

**NOTICE**

- Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.
- 

## audit\_resource\_policy

**Parameter description:** Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of [audit\\_space\\_limit](#) logs can be stored.
- **off** indicates that audit logs are preferentially stored by time. A minimum duration of [audit\\_file\\_remain\\_time](#) logs must be stored.

**Default value:** on

## audit\_file\_remain\_time

**Parameter description:** Specifies the minimum duration required for recording audit logs. This parameter is valid only when [audit\\_resource\\_policy](#) is set to **off**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

**Default value:** 90

## audit\_space\_limit

**Parameter description:** Specifies the total disk space occupied by audit files.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1024 KB to 1024 GB. The unit is KB.

**Default value:** 1GB

---

**NOTICE**

In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit\_thread\_num** and **audit\_rotation\_size**. Ensure that the value of **audit\_space\_limit** is greater than the product of values of **audit\_thread\_num** and **audit\_rotation\_size**.

---

## audit\_file\_remain\_threshold

**Parameter description:** Specifies the maximum number of audit files in the audit directory.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 100 to 1048576

**Default value:** 1048576

---

### NOTICE

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is equal to or greater than the value of **audit\_thread\_num**. Otherwise, the audit function cannot be used and the database is abnormal.
- 

## audit\_thread\_num

**Parameter description:** Specifies the number of audit threads.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 48

**Default value:** 1

---

### NOTICE

- When **audit\_dml\_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.
  - Ensure that the value of this parameter is less than or equal to the maximum number of audit files in the audit directory (**audit\_file\_remain\_threshold**). Otherwise, the audit function cannot be used and the database is abnormal.
- 

## 17.3.21.2 User and Permission Audit

### audit\_login\_logout

**Parameter description:** Specifies whether to audit the GaussDB user's login (including login success and failure) and logout.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 7

- **0** indicates that the function of auditing users' logins and logouts is disabled.
- **1** indicates that only successful user logins are audited.
- **2** indicates that only failed user logins are audited.
- **3** indicates that successful and failed user logins are audited.
- **4** indicates that only user logouts are audited.
- **5** indicates that successful user logouts and logins are audited.
- **6** indicates that failed user logouts and logins are audited.
- **7** indicates that successful user logins, failed user logins, and logouts are audited.

**Default value:** 7

## audit\_database\_process

**Parameter description:** Specifies whether to audit GaussDB start, stop, recovery, and switchover operations.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing GaussDB start, stop, recovery, and switchover operations is disabled.
- **1** indicates that the function of auditing GaussDB start, stop, recovery, and switchover operations is enabled.

**Default value:** 1

---

### NOTICE

When the database is started, the standby DN is promoted to primary. Therefore, the DN type in the audit log is **system\_switch** when the DN is started.

---

## audit\_user\_locked

**Parameter description:** Specifies whether to audit the GaussDB user's locking and unlocking.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing user's locking and unlocking is disabled.
- **1** indicates that the function of auditing user's locking and unlocking is enabled.

**Default value:** 1

## audit\_user\_violation

**Parameter description:** Specifies whether to audit the access violation operations of a user.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the access violation operations of a user is disabled.
- **1** indicates that the function of auditing the access violation operations of a user is enabled.

**Default value:** 0

## audit\_grant\_revoke

**Parameter description:** Specifies whether to audit the granting and reclaiming of the GaussDB user's permission.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the granting and reclaiming of a user's permission is disabled.
- **1** indicates that the function of auditing the granting and reclaiming of a user's permission is enabled.

**Default value:** 1

### 17.3.21.3 Operation Audit

## audit\_system\_object

**Parameter description:** Specifies whether to audit the CREATE, DROP, and ALTER operations on the GaussDB database object. The GaussDB database objects include databases, users, schemas, and tables. The operations on the database object can be audited by changing the value of this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 134217727

- **0** indicates that the function of auditing the CREATE, DROP, and ALTER operations on the GaussDB database object can be disabled.
- Other values indicate that the CREATE, DROP, and ALTER operations on a certain or some GaussDB database objects are audited.

**Value description:**

The value of this parameter is calculated by 27 binary bits. The 27 binary bits represent 27 types of GaussDB objects. If the corresponding binary bit is set to **0**, the CREATE, DROP, and ALTER operations on corresponding database objects are not audited. If it is set to **1**, the CREATE, DROP, and ALTER operations are audited.

For details about the audit contents represented by these 27 binary bits, see [Table 17-15](#).

When SQL patches are audited and **audit\_dml\_state\_select** are enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in the audit log, respectively.

**Default value: 67121159**

**Table 17-15** Meaning of each value for the **audit\_system\_object** parameter

| Binary Bit | Description                                                                  | Value Description                                                                                                                                                                                                                                                             |
|------------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 0      | Whether to audit the CREATE, DROP, and ALTER operations on databases.        | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li></ul>                     |
| Bit 1      | Whether to audit the CREATE, DROP, and ALTER operations on schemas.          | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li></ul>                     |
| Bit 2      | Whether to audit the CREATE, DROP, and ALTER operations on users.            | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li></ul>                     |
| Bit 3      | Whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables. | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.</li></ul> |
| Bit 4      | Whether to audit the CREATE, DROP, and ALTER operations on indexes.          | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li></ul>                     |

| Binary Bit | Description                                                                                                                                                                 | Value Description                                                                                                                                                                                                                                            |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 5      | Whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.                                                                                                | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>                 |
| Bit 6      | Whether to audit the CREATE, DROP, and ALTER operations on triggers.                                                                                                        | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul> |
| Bit 7      | Whether to audit the CREATE, DROP, and ALTER operations on procedures/ functions.                                                                                           | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul> |
| Bit 8      | Whether to audit the CREATE, DROP, and ALTER operations on tablespaces.                                                                                                     | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul> |
| Bit 9      | Whether to audit the CREATE, DROP, and ALTER operations on resource pools. For details, see section "Resource Load Management" in <i>Lab Feature Description</i> .          | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul> |
| Bit 10     | Whether to audit the CREATE, DROP, and ALTER operations on the WORKLOAD object. For details, see section "Resource Load Management" in the <i>Lab Feature Description</i> . | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul> |
| Bit 11     | Reserved.                                                                                                                                                                   | -                                                                                                                                                                                                                                                            |

| Binary Bit | Description                                                                                                    | Value Description                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 12     | Whether to audit the CREATE, DROP, and ALTER operations on data sources. You are advised not to use it.        | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>             |
| Bit 13     | Reserved.                                                                                                      | -                                                                                                                                                                                                                                                                        |
| Bit 14     | Whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.                         | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>             |
| Bit 15     | Whether to audit the CREATE, DROP, and ALTER operations on types.                                              | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on types are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on types are audited.</li> </ul>                             |
| Bit 16     | Whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY). | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.</li> </ul> |
| Bit 17     | Whether to audit the CREATE, DROP, and ALTER operations on directories.                                        | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on directories are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on directories are audited.</li> </ul>                 |
| Bit 18     | Whether to audit the CREATE, DROP, and ALTER operations on synonyms.                                           | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li> </ul>                                               |
| Bit 19     | Whether to audit the CREATE, DROP, and ALTER operations on sequences.                                          | <ul style="list-style-type: none"> <li>• <b>0</b> indicates that the operations are not audited.</li> <li>• <b>1</b> indicates that the operations are audited.</li> </ul>                                                                                               |
| Bit 20     | Reserved.                                                                                                      | -                                                                                                                                                                                                                                                                        |

| Binary Bit | Description                                                                                          | Value Description                                                                                                                                                                                                                                                         |
|------------|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bit 21     | Specifies whether to audit the CREATE, DROP, and ALTER operations on packages.                       | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the operations are not audited.</li><li>• <b>1</b> indicates that the operations are audited.</li></ul>                                                                                                   |
| Bit 22     | Specifies whether to audit the CREATE and DROP operations on models.                                 | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE and ALTER operations are not audited.</li><li>• <b>1</b> indicates that the CREATE and DROP operations are audited.</li></ul>                                                                  |
| Bit 23     | Specifies whether to audit the CREATE, DROP, and ALTER operations on publications and subscriptions. | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li></ul>                                                   |
| Bit 24     | Whether to audit the ALTER and DROP operations on the <b>gs_global_config</b> objects.               | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the ALTER and DROP operations are not audited.</li><li>• <b>1</b> indicates that the ALTER and DROP operations are audited.</li></ul>                                                                     |
| Bit 25     | Specifies whether to audit the CREATE, DROP, and ALTER operations on foreign data wrappers.          | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations are not audited.</li><li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li></ul>                                                   |
| Bit 26     | Whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.                    | <ul style="list-style-type: none"><li>• <b>0</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited.</li><li>• <b>1</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.</li></ul> |

## audit\_dml\_state

**Parameter description:** Specifies whether to audit the INSERT, UPDATE, and DELETE operations on a specific table.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the DML operations (except SELECT) is disabled.

- **1** indicates that the function of auditing the DML operations (except SELECT) is enabled.

**Default value:** 0

## audit\_dml\_state\_select

**Parameter description:** Specifies whether to audit the SELECT operation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the SELECT auditing function is disabled.
- **1** indicates that the SELECT auditing function is enabled.

**Default value:** 0

## audit\_function\_exec

**Parameter description:** Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the procedure or function execution is disabled.
- **1** indicates that the function of auditing the procedure or function execution is enabled.

**Default value:** 0

## audit\_copy\_exec

**Parameter description:** Specifies whether to audit the COPY operation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the COPY auditing function is disabled.
- **1** indicates that the COPY auditing function is enabled.

**Default value:** 1

## audit\_set\_parameter

**Parameter description:** Specifies whether to audit the SET operation.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the SET auditing function is disabled.

- **1** indicates that the SET auditing function is enabled.

**Default value:** 0

## audit\_xid\_info

**Parameter description:** Specifies whether to record the transaction ID of the SQL statement in the **detail\_info** column of the audit log.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of recording transaction IDs in audit logs is disabled.
- **1** indicates that the function of recording transaction IDs in audit logs is enabled.

**Default value:** 0

### NOTICE

If this function is enabled, the **detail\_info** information in audit logs starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, *xid* is recorded as **NA** in audit logs.

## enableSeparationOfDuty

**Parameter description:** Specifies whether the separation of three duties is enabled.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the separation of three duties is enabled.
- **off** indicates that the separation of three duties is disabled.

**Default value:** off

## enable\_nonsysadmin\_execute\_direct

**Parameter description:** Specifies whether non-system administrators and non-monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrators and monitor administrators are allowed to execute the EXECUTE DIRECT ON statement.

**Default value:** off

## enable\_access\_server\_directory

**Parameter description:** Specifies whether to allow non-initial users to create, modify, and delete directories.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

**Default value:** off

---

### NOTICE

- For security purposes, only the initial user can create, modify, and delete DIRECTORY objects by default.
  - If **enable\_access\_server\_directory** is enabled, users with the SYSADMIN permission and users who inherit the **gs\_role\_directory\_create** permission of the built-in role can create directory objects. A user with the SYSADMIN permission, the owner of a directory, a user who is granted with the DROP permission for the directory, or a user who inherits the **gs\_role\_directory\_drop** permission of the built-in role can delete a directory. A user with the SYSADMIN permission and the owner of a directory object can change the owner of the directory object, and the user must be a member of the new owner.
- 

## 17.3.22 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in [Table 17-2](#).

### 17.3.22.1 CM Agent Parameters

#### log\_dir

**Parameter description:** Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or relative to the CM Agent data directory.

**Value range:** a string The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** "log", indicating that CM Agent logs are generated in the CM Agent data directory.

## log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 16 MB

## log\_min\_messages

**Parameter description:** Specifies the message levels to be written to the CM Agent logs. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** warning

## incremental\_build

**Parameter description:** Specifies whether a standby DN is incrementally built. If this parameter is enabled, a standby DN is incrementally built.

**Value range:** Boolean. The value can be **on** or **off**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** on

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string For details about how to modify this parameter, see [Table 17-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** /opt/huawei/snas/bin/snas\_cm\_cmd

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported. For details about how to modify this parameter, see [Table 17-2](#).

**Value range:** a non-negative integer (unit: s)

**Default value:** 1

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported. For details about how to modify this parameter, see [Table 17-2](#).

**Value range:** a non-negative integer

**Default value:** 1

## agent\_report\_interval

**Parameter description:** Specifies the interval at which CM Agent reports the instance status.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1

## agent\_phony\_dead\_check\_interval

**Parameter description:** Specifies the interval at which CM Agent checks whether the DN process is suspended.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10

## agent\_check\_interval

**Parameter description:** Specifies the interval at which CM Agent queries for the status of instances, such as the DNs.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 2

## agent\_heartbeat\_timeout

**Parameter description:** Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

**Value range:** an integer ranging from 2 to  $2^{31} - 1$ . The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 8

## agent\_connect\_timeout

**Parameter description:** Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1

## agent\_connect\_retries

**Parameter description:** Specifies the number of times CM Agent tries to connect to the CM Server.

**Value range:** an integer. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 15

## agent\_kill\_instance\_timeout

**Parameter description:** Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent terminates all instances on the node.

**Value range:** an integer. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0, indicating that the operation of terminating all instances on the node is not initiated.

## security\_mode

**Parameter description:** Specifies whether DNs are started in secure mode. If this parameter is set to **on**, DNs are started in secure mode. Otherwise, DNs are started in non-secure mode.

**Value range:** Boolean. The value can be **on** or **off**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** off

## upgrade\_from

**Parameter description:** Specifies the internal version number of the database before an in-place upgrade. Do not modify the value of this parameter.

**Value range:** a non-negative integer For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0

## process\_cpu\_affinity

**Parameter description:** Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to **0**, core binding will not be performed. If it is set to another value, core binding will be performed, and the number of physical CPU cores is  $2^n$ . Restart the database and CM Agent for any modification of this parameter to take effect. Only Arm is supported. For details about how to modify this parameter, see [Table 17-2](#).

**Value range:** an integer ranging from 0 to 2

**Default value:** 0

## log\_threshold\_check\_interval

**Parameter description:** Specifies the interval for compressing and clearing logs. Logs are compressed and cleared every 1800 seconds.

**Value range:** an integer ranging from 0 to 2147483647. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1800

## dilatation\_shard\_count\_for\_disk\_capacity\_alarm

**Parameter description:** Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

### NOTE

The parameter value must be the same as the actual number of shards to be added.

**Value range:** an integer ranging from 0 to  $2^{32} - 1$ . If this parameter is set to 0, the disk scale-out alarm is not reported. If this parameter is set to a value greater than 0, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1

## log\_max\_size

**Parameter description:** Specifies the maximum size of a log file.

**Value range:** an integer ranging from 0 to 2147483647. The unit is MB. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10240

## log\_max\_count

**Parameter description:** Specifies the maximum number of logs that can be stored on hard disks.

**Value range:** an integer ranging from 0 to 10000. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10000

## log\_saved\_days

**Parameter description:** Specifies the number of days for storing logs.

**Value range:** an integer ranging from 0 to 1000. The unit is day. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 90

## enable\_log\_compress

**Parameter description:** Specifies whether to enable log compression.

**Value range:** Boolean For details about how to modify this parameter, see [Table 17-2](#).

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

**Default value:** on

## agent\_backup\_open

**Parameter description:** Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

**Value range:** 0 or 1. The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 17-1](#).

- 0: disabled.
- 1: enabled.

**Default value:** 0

## enable\_xc\_maintenance\_mode

**Parameter description:** Specifies whether the **pgxc\_node** system catalog can be modified when the database instance is in read-only mode.

**Value range:** Boolean The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 17-1](#).

- **on** indicates that the **pgxc\_node** system catalog can be modified.
- **off** indicates that the **pgxc\_node** system catalog cannot be modified.

**Default value:** on

## unix\_socket\_directory

**Parameter description:** Specifies the directory location of the Unix socket.

**Value range:** a string For details about how to modify this parameter, see [Table 17-1](#).

**Default value:** "

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 17-1](#).

- 0: disabled.
- 1: enabled.

**Default value:** off

## disaster\_recovery\_type

**Parameter description:** Specifies the type of the DR relationship between the primary and standby database instances.

**Value range:** an integer ranging from 0 to 2 For details about how to modify this parameter, see [Table 17-1](#).

- 0 indicates that no DR relationship is established.
- 1 indicates that the OBS DR relationship is established.
- 2 indicates that the streaming DR relationship is established.

**Default value:** 0

## 17.3.22.2 Parameters Related to CM Server

### log\_dir

**Parameter description:** Specifies the directory where CM Server logs are stored. The value can be an absolute path, or relative to the CM Server data directory.

**Value range:** a string You need to restart CM Server for the modification to take effect. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** "log", indicating that CM Server logs are generated in the CM Server data directory.

### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 16MB

### log\_min\_messages

**Parameter description:** Specifies which message levels are written to the cm\_server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** warning

### thread\_count

**Parameter description:** Specifies the number of threads in the CM Server thread pool.

**Value range:** an integer ranging from 2 to 1000. You need to restart CM Server for the modification to take effect. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1000

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string For details about how to modify this parameter, see [Table 17-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## instance\_failover\_delay\_timeout

**Parameter description:** Specifies the delay in the CM Server failover when the primary CM Server breakdown is detected.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0

## instance\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the instance heartbeat times out.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 6

## cmserver\_ha\_connect\_timeout

**Parameter description:** Specifies the time to wait before the connection between the primary and standby cm\_servers times out.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 2

## cmserver\_ha\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the heartbeat between the primary and standby cm\_servers times out.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 6

## phony\_dead\_effective\_time

**Parameter description:** Specifies the maximum number of times DN processes are detected as zombie. If the number of times a process is detected as zombie is greater than the specified value, the process is considered to be a zombie process and will be restarted.

**Value range:** an integer. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 5

## enable\_transaction\_read\_only

**Parameter description:** Specifies whether the database is in read-only mode.

**Value range:** Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** on

## datastorage\_threshold\_check\_interval

**Parameter description:** Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10

## datastorage\_threshold\_value\_check

**Parameter description:** Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. When adjusting this parameter, you are advised to adjust the **max\_size\_for\_xlog\_retention** parameter of the DN to prevent the cluster read-only threshold from being triggered by backup operations.

**Value range:** an integer ranging from 1 to 99, in percentage. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 85

## max\_datastorage\_threshold\_check

**Parameter description:** Specifies the maximum interval for checking the disk usage. After you modify the **enable\_transaction\_read\_only** parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

Default value: **43200**

## cmserver\_ha\_status\_interval

**Parameter description:** Specifies the interval between synchronizations of primary and standby CM Server status.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

Default value: **1**

## cmserver\_self\_vote\_timeout

**Parameter description:** Specifies the time to wait before the CM Server self-vote times out.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

Default value: **6**

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

**Value range:** a non-negative integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

Default value: **3**

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported.

**Value range:** a non-negative integer. For details about how to modify this parameter, see [Table 17-2](#).

Default value: **1**

## enable\_az\_auto\_switchover

**Parameter description:** Specifies whether to enable automatic AZ switchover. If it is set to **1**, cm\_server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ.

even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

**Value range:** a non-negative integer. The value **0** indicates that automatic AZ switchover is disabled, and the value **1** indicates that automatic AZ switchover is enabled. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1

## **instance\_keep\_heartbeat\_timeout**

**Parameter description:** The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 40

## **az\_switchover\_threshold**

**Parameter description:** If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

**Value range:** an integer ranging from 0 to 100 For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 100

## **az\_check\_and\_arbitrate\_interval**

**Parameter description:** Specifies the interval for checking the AZ status. If the status of an AZ is abnormal, automatic AZ switchover is triggered.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 2

## **az\_connect\_check\_interval**

**Parameter description:** Specifies the interval at which the network connection between AZs is checked.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 60

## **az\_connect\_check\_delay\_time**

**Parameter description:** Specifies the delay between two retries to check the network connection between AZs.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 150

## cmserver\_demote\_delay\_on\_etcd\_fault

**Parameter description:** Specifies the interval at which CM Server switches from the primary state to the standby state due to unhealthy etcd.

**Value range:** an integer. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 8

## instance\_phony\_dead\_restart\_interval

**Parameter description:** Specifies the interval at which the CM Agent process restarts and kills a zombie DN. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

**Value range:** an integer. The unit is s. The minimum value that takes effect is **1800**. If this parameter is set to a value less than **1800**, the value **1800** takes effect. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 21600

## cm\_auth\_method

**Parameter description:** Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the database status.

**Value range:** **gss** or **trust**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** trust

## cm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the `${GAUSSHOMER}/kerberos` directory and ends with keytab. The file name is the same as the name of the user who runs the database. This parameter is used together with **cm\_auth\_method**. If the **cm\_auth\_method** parameter is changed to **gss**, **cm\_krb\_server\_keyfile** must also be configured as the correct path. Otherwise, the database status will be affected.

**Value range:** a string. For details about how to modify the parameter, see [Table 17-2](#).

**Default value:** `${GAUSSHOMER}/kerberos/${UserName}.keytab`. The default value cannot take effect and is used only as a prompt.

## cm\_server\_arbitrate\_delay\_base\_time\_out

**Parameter description:** Specifies the basic delay duration for cm\_server quorum. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The quorum delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Quorum delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10

## cm\_server\_arbitrate\_delay\_incremental\_time\_out

**Parameter description:** Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 3

## force\_promote

**Parameter description:** Specifies whether CM Server enables forcible switchover (that is, when the cluster status is unknown, the basic functions of the cluster are available at the cost of data loss). The value **0** indicates that the function is disabled, and the value **1** indicates that the function is enabled. This parameter applies to DNs.

**Value range:** **0** or **1**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0

## switch\_rto

**Parameter description:** Specifies the delay for the forcible startup of CM Server. When **force\_promote** is set to **1** and a shard in the database does not have primary CM Server, the system starts timing. After the delay, forcible switchover is executed.

**Value range:** an integer ranging from 60 to 2147483647. The unit is s. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 600

## backup\_open

**Parameter description:** Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

**Value range:** 0 or 1. Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see [Table 17-2](#).

- 0: disabled.
- 1: enabled.

**Default value:** 0

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify this parameter, see [Table 17-2](#).

- 0: disabled.
- 1: enabled.

**Default value:** off

## install\_type

**Parameter description:** Specifies the settings related to the DR database instance. It is used to distinguish whether the database instance is based on Dorado.

**Value range:** an integer ranging from 0 to 2 Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see [Table 17-2](#).

- 0 indicates the database instance for which the DR relationship is not established.
- 1 indicates a Dorado-based database instance.
- 2 indicates a streaming-based database instance.

**Default value:** 0

## enable\_ssl

**Parameter description:** Specifies whether to enable SSL.

**Value range:** Boolean After this function is enabled, the SSL certificate is used to encrypt communication. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see [Table 17-2](#).

- on indicates that SSL is enabled.
- off indicates that SSL is disabled.
- **Default value:** off

---

**NOTICE**

To ensure security, you are advised not to disable it. After this function is disabled, the CM **does not** use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

---

## ssl\_cert\_expire\_alert\_threshold

**Parameter description:** Specifies the SSL certificate expiration alarm time.

**Value range:** an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 90

## ssl\_cert\_expire\_check\_interval

**Parameter description:** Specifies the period for checking whether the SSL certificate expires.

**Value range:** an integer. The unit is s. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 86400

## delay\_arbitrate\_timeout

**Parameter description:** Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

**Value range:** an integer, in the range [0,21474836] (unit: second). For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0

## ddb\_type

**Parameter description:** Specifies whether to switch between ETCD and DCC modes.

**Value range:** an integer. **0:** ETCD; **1:** DCC. You need to restart cm\_server for the modification to take effect. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 0

## ddb\_log\_level

**Parameter description:** Sets the DDB log level.

To disable the log function, set this parameter to **NONE**, which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

**Value range:** a string containing one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** **RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE**

## **ddb\_log\_backup\_file\_count**

**Parameter description:** Specifies the maximum number of log files that can be saved.

**Value range:** an integer ranging from 1 to 100. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10

## **ddb\_max\_log\_file\_size**

**Parameter description:** Specifies the maximum number of bytes in a log.

**Value range:** a string, in the range from 1 MB to 1000 MB. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 10M

## **ddb\_log\_suppress\_enable**

**Parameter description:** Specifies whether to enable the log suppression function.

**Value range:** an integer. **0**: disabled; **1**: enabled. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 1

## **ddb\_election\_timeout**

**Parameter description:** Specifies the DCC election timeout period.

**Value range:** an integer, in the range [1,600], in seconds. For details about how to modify this parameter, see [Table 17-2](#).

**Default value:** 3

# **17.3.23 Upgrade Parameters**

## **IsInplaceUpgrade**

**Parameter description:** Specifies whether an upgrade is ongoing. This parameter cannot be modified by users. Only the sysadmin user can access this parameter.

This is a SUSE parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

**Default value:** off

### inplace\_upgrade\_next\_system\_object\_oids

**Parameter description:** Specifies the OID of a new system object during the in-place upgrade. The value of this parameter cannot be changed.

This is a SUSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** empty

### upgrade\_mode

**Parameter description:** Specifies the upgrade mode.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer ranging from 0 to *INT\_MAX*

- **0** indicates that no upgrade is ongoing.
- **1** indicates that a local upgrade is ongoing.
- **2** indicates that a grayscale upgrade is ongoing.

**Default value:** 0

#### NOTE

Special case: When the gray upgrade is used, if the major version upgrade policy is selected, that is, the upgrade script needs to be executed and the binary package needs to be replaced, the value of **upgrade\_mode** is set to **2**; if the minor version upgrade policy is selected, that is, only the binary package needs to be replaced, the value of **upgrade\_mode** is not set to **2**.

## 17.3.24 Miscellaneous Parameters

### enable\_default\_ustore\_table

**Parameter description:** Specifies whether to enable the Ustore storage engine by default. If this parameter is set to **on**, all created tables are Ustore tables.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#). Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

**Value range:** [off,on]

**Default value:** off

### enable\_ustore

**Parameter description:** Specifies whether to enable the Ustore storage engine. If this parameter is set to **on**, Ustore tables can be created. Note that the

**track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** [off,on]

**Default value:** on

## reserve\_space\_for\_nullable\_atts

**Parameter description:** Specifies whether to reserve space for the nullable attribute of an Ustore table. If this parameter is set to **on**, space is reserved for the nullable attribute of the Ustore table by default.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** [off,on]

**Default value:** on

## ustore\_attr

**Parameter description:** Specifies the Ustore test parameters.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

You can set **enable\_ustore\_partial\_seqscan** (copy selective columns only during the sequential scan in the Ustore table), **enable\_candidate\_buf\_usage\_count** (whether dirty pages are evicted and added to the use count weight), and **ustats\_tracker\_naptime** (time for reloading the statistics file).

**umax\_search\_length\_for\_prune** (number of blocks to be pruned before table extension) and **ustore\_unit\_test** (starting the Ustore white box test). The setting method is **ustore\_attr='Parameter to be set'**. For example, if you want to set **enable\_ustore\_partial\_seqscan**, set **ustore\_attr='enable\_ustore\_partial\_seqscan=on'**.

**Value range:** a string

## server\_version

**Parameter description:** Specifies the server version number.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with the *server\_version* version corresponding to PostgreSQL. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool API (query when the tool is connected). This parameter is not recommended. To query the server version, use the `opengauss_version()` function.

**Value range:** a string

**Default value:** 9.2.4

## server\_version\_num

**Parameter description:** Specifies the server version number.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with the *server\_version\_num* version corresponding to PostgreSQL. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool API (query when the tool is connected).

**Value range:** an integer

**Default value:** 90204

## block\_size

**Parameter description:** Specifies the block size of the current database.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Value:** 8192

**Default value:** 8192

## segment\_size

**Parameter description:** Specifies the segment file size of the current database.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Unit:** 8 KB

**Default value:** 131072, that is, 1 GB

## max\_index\_keys

**Parameter description:** Specifies the maximum number of index keys supported by the current database.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Default value:** 32

## integer\_datetimes

**Parameter description:** Specifies whether the date and time are in the 64-bit integer format.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Value range:** Boolean

- **on:** yes.
- **off:** no.

**Default value:** on

## lc\_collate

**Parameter description:** Specifies the locale in which sorting of textual data is done.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration set during the database installation and deployment.

## lc\_ctype

**Parameter description:** Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration set during the database installation and deployment.

## max\_identifier\_length

**Parameter description:** Specifies the maximum identifier length.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Value range:** an integer

**Default value:** 63

## server\_encoding

**Parameter description:** Specifies the database encoding (character set).

By default, `gs_initdb` will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified.

**Default value:** determined by the current system environment when the database is created.

## enable\_upgrade\_merge\_lock\_mode

**Parameter description:** If this parameter is set to **on**, the delta merge operation internally increases the lock level, and errors can be prevented when update and delete operations are performed at the same time.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the delta merge operation internally increases the lock level. In this way, when the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation, one operation can be performed only after the previous one is complete.
- If this parameter is set to **off** and the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation to the data in a row in the delta table of the table, errors will be reported during the later operation, and the operation will stop.

**Default value:** off

## transparent\_encrypt\_kms\_region

**Parameter description:** Specifies the deployment region of the entire database. It must contain only the characters specified in RFC3986, and the maximum length is 2047 bytes. This parameter applies only to the DWS scenario in the current version.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** empty

## basebackup\_timeout

**Parameter description:** Specifies the timeout interval for a connection that has no read or write operations after a backup transfer is complete.

When the gs\_basebackup tool is used for transmission and a high compression rate is specified, the transmission of the tablespace may time out (the client needs to compress the transmitted data).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is s. **0** indicates that archiving timeout is disabled.

**Default value:** 600s

## datanode\_heartbeat\_interval

**Parameter description:** Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than wal\_receiver\_timeout/2.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1000 to 60000. The unit is ms.

**Default value:** 1s

## max\_concurrent\_autonomous\_transactions

**Parameter description:** Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0–1024

**Default value:** 10

## cluster\_run\_mode

**Parameter description:** Specifies whether a DN belongs to the primary or standby database instance in the dual-database instance DR scenario. For a single database instance, use the default primary database instance.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates the primary database instance.
- **cluster\_standby** indicates the standby database instance.

**Default value:** cluster\_primary

## dfs\_partition\_directory\_length

**Parameter description:** Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 92 to 7999

**Default value:** 512

## enable\_gpi\_auto\_update

**Parameter description:** Determines whether global indexes are updated by default in partition DDL commands.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- The value **on** indicates that the global index is updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- The value **off** indicates that the global index is not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

**Default value:** off

## 17.3.25 Wait Events

### enable\_instr\_track\_wait

**Parameter description:** Specifies whether to enable real-time collection of wait event information.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0

tool is used to test performance, the performance fluctuates by about 1.4% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

**Default value:** on

## 17.3.26 Query

### instr\_unique\_sql\_count

**Parameter description:** Specifies the maximum number of Unique SQL records to be collected. The value **0** indicates that the function of collecting Unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, the original data in the system will be cleared and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system is greater than the value of **instr\_unique\_sql\_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 200000

### instr\_unique\_sql\_track\_type

**Parameter description:** Specifies which SQL statements are recorded in Unique SQL.

This is an INTERNAL parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated values

**top:** Only top-level SQL statements are recorded.

**Default value:** top

### enable\_instr\_rt\_percentile

**Parameter description:** Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** on

## percentile

**Parameter description:** Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This is an INTERNAL parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** 80, 95

## instr\_rt\_percentile\_interval

**Parameter description:** Specifies the interval at which the background calculation thread calculates the SQL response time.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**Default value:** 10s

## enable\_instr\_cpu\_timer

**Parameter description:** Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates the CPU time consumed during SQL statement execution is captured.
- **off** indicates the CPU time consumed during SQL statement execution is not captured.

**Default value:** on

## enable\_stmt\_track

**Parameter description:** Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0

tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** Full/Slow SQL capture is enabled.
- **off:** Full /Slow SQL capture is disabled.

**Default value:** on

## track\_stmt\_parameter

**Parameter description:** After **track\_stmt\_parameter** is enabled, the executed statements recorded in **statement\_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate problems. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is query string; parameters: \$1=value1,\$2=value2, .... This parameter is used to display complete SQL information and is not controlled by the **track\_activity\_query\_size** parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** The function of displaying complete SQL statement information is enabled.
- **off:** The function of displaying complete SQL statement information is disabled.

**Default value:** off

## track\_stmt\_session\_slot

**Parameter description:** Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve idle space.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1000

## track\_stmt\_details\_size

**Parameter description:** Specifies the maximum size (in bytes) of execution events that can be collected by a single statement.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000000

**Default value:** 4096

## track\_stmt\_retention\_time

**Parameter description:** Specifies the retention period of full/slow SQL statement records. This parameter is a combination of parameters. This parameter is read every 60 seconds and records exceeding the retention period are deleted. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

This parameter consists of two parts in the format of 'full sql retention time, slow sql retention time'.

**full sql retention time** indicates the retention time of full SQL statements. The value ranges from 0 to 86400.

**slow sql retention time** indicates the retention time of slow SQL statements. The value ranges from 0 to 604800.

**Default value:** 3600,604800

## track\_stmt\_stat\_level

**Parameter description:** Determines the level of statement execution tracing.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#). The value is case-insensitive.

**Value range:** a string

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

### NOTE

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level ( $L2 > L1 > L0$ ) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > STATEMENT\_HISTORY > STATEMENT\_HISTORY columns" in *Developer Guide*.

**Default value:** OFF,L0

## enable\_auto\_clean\_unique\_sql

**Parameter description:** Specifies whether to enable the automatic elimination function of unique SQL statements when the number of unique SQL statements generated in the system is equal to or greater than the value of **instr\_unique\_sql\_count**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** off

**CAUTION**

Some snapshot information comes from unique SQL statements. Therefore, when automatic elimination is enabled, if the selected start snapshot and end snapshot exceed the elimination time, the WDR report cannot be generated.

---

## asp\_log\_directory

**Parameter description:** Specifies the directory for storing ASP log files on the server when **asp\_flush\_mode** is set to **all** or **file**. The value can be an absolute path, or relative to the **data** directory. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

---

**NOTICE**

If the value of **asp\_log\_directory** in the configuration file is an invalid path, the database instance cannot be restarted.

---

**NOTE**

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## perf\_directory

**Parameter description:** Specifies the directory of the output file of the performance view dotting task. Only the sysadmin user can access this parameter. The value can be an absolute path, or relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**NOTE**

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## unique\_sql\_retention\_time

**Parameter description:** Specifies the memory cleanup interval for the unique SQL hash table. The default value is 30 minutes.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 3650

**Default value:** 30 min

## 17.3.27 System Performance Snapshot

### enable\_wdr\_snapshot

**Parameter description:** Specifies whether to enable the database monitoring snapshot function.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

**Default value:** on

### wdr\_snapshot\_retention\_days

**Parameter description:** Specifies the number of days for storing database monitoring snapshot data in the system. When the number of snapshots generated during database running exceeds the maximum number of snapshots that can be generated within the retention period, the system clears the snapshot data with the smallest **snapshot\_id** at the interval specified by **wdr\_snapshot\_interval**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 1 to 8

**Default value:** 8

### wdr\_snapshot\_query\_timeout

**Parameter description:** Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the SQL statement execution is not complete and a result is not returned within the specified time, the snapshot operation fails.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 100 to *INT\_MAX*. The unit is s.

**Default value:** 100s

### wdr\_snapshot\_interval

**Parameter description:** Specifies the interval at which the backend thread Snapshot automatically performs snapshot operations on the database monitoring data.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 10 to 60. The unit is min.

**Default value:** 1h

## asp\_flush\_mode

**Parameter description:** Specifies the mode for the ASP to update data to the disk. The value can be **file** (default value), **table** (system catalog), or **all** (system catalog and file). Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** a string, which can be **table**, **file**, or **all**

**Default value:** table

## asp\_flush\_rate

**Parameter description:** When the number of samples reaches the value of **asp\_sample\_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp\_flush\_rate** indicates the update proportion. If this parameter is set to **10**, it indicates that the update ratio is 10:1.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** an integer ranging from 1 to 10

**Default value:** 10

## asp\_log\_filename

**Parameter description:** Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** a string

**Default value:** asp-%Y-%m-%d\_%H%M%S.log

## asp\_retention\_days

**Parameter description:** Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 7

**Default value:** 2

## asp\_sample\_interval

**Parameter description:** Specifies the sampling interval.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 10. The unit is s.

**Default value:** 1s

## asp\_sample\_num

**Parameter description:** Specifies the maximum number of samples allowed in the LOCAL\_ACTIVE\_SESSION view. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 100000.

**Default value:** 100000

## enable\_asp

**Parameter description:** Specifies whether to enable the active session profile function.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** The function is enabled.
- **off:** The function is disabled.

**Default value:** on

## 17.3.28 Security Configuration

### elastic\_search\_ip\_addr

**Parameter description:** Specifies the IP address of the Elasticsearch system.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

**Default value:** 'https:127.0.0.1'

### enable\_security\_policy

**Parameter description:** Specifies whether the unified audit and dynamic data masking policies take effect.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**on:** The security policy is enabled.

**off:** The security policy is disabled.

**Default value:** off

### use\_elastic\_search

**Parameter description:** Specifies whether to send unified audit logs to Elasticsearch. If **enable\_security\_policy** and this parameter are enabled, unified

audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic\_search\_ip\_addr** can be properly connected. Otherwise, the process fails to be started.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**on:** Unified audit logs are sent to Elasticsearch.

**off:** Unified audit logs are not sent to Elasticsearch.

**Default value:** off

## is\_sysadmin

**Parameter description:** Specifies whether the current user is an initial user.

This is a fixed INTERNAL parameter and cannot be modified.

**Value range:** Boolean

**on** indicates that the user is an initial user.

**off** indicates that the user is not an initial user.

**Default value:** off

## 17.3.29 Global Temporary Table

### max\_active\_global\_temporary\_table

**Parameter description:** Specifies whether global temporary tables can be created. Currently, the Ustore engine does not support global temporary tables. The value of this parameter determines the memory reserved in the shared cache for hash tables required by global temporary tables. The total number of active global temporary tables in all sessions is not forcibly limited.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000

- **0:** The global temporary table function is disabled.
- **> 0:** The global temporary table function is enabled.

**Default value:** 1000

### vacuum\_gtt\_defer\_check\_age

**Parameter description:** Checks the differences between the global temporary table relfrozenxid and the ordinary table after VACUUM is executed. WARNING is generated if the difference value exceeds the specified parameter value. Use the default value for this parameter.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000

**Default value:** 10000

## **enable\_gtt\_concurrent\_truncate**

**Parameter description:** Specifies whether to support concurrent execution of TRUNCATE TABLE and DML operations on global temporary tables and concurrent execution of TRUNCATE TABLE on global temporary tables.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on/true** indicates that the preceding operations can be performed concurrently.
- **off/false** indicates that the preceding operations cannot be performed concurrently.

**Default value:** on

## **17.3.30 HyperLogLog**

### **hll\_default\_log2m**

**Parameter description:** Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows:  $[-1.04/2^{\log_2 m^{*1/2}}, +1.04/2^{\log_2 m^{*1/2}}]$

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 16

**Default value:** 14

### **hll\_default\_log2explicit**

**Parameter description:** Specifies the default threshold for switching from the explicit mode to the sparse mode.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 12 The value 0 indicates that the explicit mode is skipped. The value 1 to 12 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2explicit}}$ .

**Default value:** 10

### **hll\_default\_log2sparse**

**Parameter description:** Specifies the default threshold for switching from the sparse mode to the full mode.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 14 The value 0 indicates that the explicit mode is skipped. The value 1 to 14 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2sparse}}$ .

**Default value:** 12

## hll\_duplicate\_check

**Parameter description:** Specifies whether duplicatecheck is enabled by default.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1 0: disabled; 1: enabled

**Default value:** 0

## 17.3.31 User-defined Functions

### udf\_memory\_limit

**Parameter description:** Controls the maximum physical memory that can be used when each database node executes UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer. The value range is from 200 x 1024 to *max\_process\_memory* and the unit is KB.

**Default value:** 200 MB

### FencedUDFMemoryLimit

**Parameter description:** Specifies the virtual memory used by each fenced udf worker process.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. 0 indicates that the memory is not limited.

**Default value:** 0

### UDFWorkerMemHardLimit

**Parameter description:** Specifies the maximum value of **fencedUDFMemoryLimit**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB.

**Default value:** 1 GB

## 17.3.32 Scheduled Task

### job\_queue\_processes

**Parameter description:** Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using **gs\_guc**, and you need to restart **gaussdb** to make the setting take effect.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 to 1000

Function:

- Setting **job\_queue\_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job\_queue\_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the job\_scheduler thread polls the **pg\_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job\_queue\_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the submit API) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

**Default value:** 10

### enable\_prevent\_job\_task\_startup

**Parameter description:** Specifies whether to start the job thread.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

**Default value:** off

## 17.3.33 Thread Pool

### enable\_thread\_pool

**Parameter description:** Specifies whether to enable the thread pool function. This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the thread pool function is enabled.
- **off** indicates that the thread pool function is disabled.

**Default value:** on

### thread\_pool\_attr

**Parameter description:** Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on**. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of three parts: thread\_num, group\_num, and cpubind\_info. The meanings of the three parts are as follows:

- **thread\_num** is the total number of initial threads in the thread pool, which can be dynamically expanded. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread\_num** = Number of CPU cores x 3–5. The maximum value of **thread\_num** is **4096**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**.
- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive.

**Default value:**

'**4096,2,(nobind)**' (128-core CPU/1024-GB memory, 104-core CPU/1024-GB memory, and 96-core CPU/1024-GB memory); '**2048,2,(nobind)**' (96-core CPU/768-GB memory); '**1024,2,(nobind)**' (64-core CPU/512-GB memory, 60-core CPU/480-GB memory, and 32-core CPU/256-GB memory); '**512,2,(nobind)**' (16-core CPU/128-GB memory); '**256,2,(nobind)**' (8-core CPU/64-GB memory);

## thread\_pool\_stream\_attr

**Parameter description:** Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on** and only takes effect on DNs. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of four parts: 'stream\_thread\_num, stream\_proc\_ratio ,group\_num ,cpubind\_info'. The meanings of the four parts are as follows:

- **stream\_thread\_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream\_thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream\_thread\_num** = Number of CPU cores x 3-5. The maximum value of **stream\_thread\_num** is **4096**.
- **stream\_proc\_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating point number. The default value is **0.2**. The reserved proc resources are calculated as follows: **stream\_proc\_ratio** x **stream\_thread\_num**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**. The value of **group\_num** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **group\_num** in **thread\_pool\_attr** is used.
- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind\_info** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **cpubind\_info** in **thread\_pool\_attr** is used.

**Default value:**

**stream\_thread\_num:** 16

**stream\_proc\_ratio:** 0.2

**group\_num** and **cpubind\_info:** For details, see [thread\\_pool\\_attr](#).

## resilience\_threadpool\_reject\_cond

**Parameter description:** Specifies the percentage of accumulated sessions in the thread pool for escape from overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_thread\_pool** are enabled. This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of **recover\_threadpool\_percent** and **overload\_threadpool\_percent**. The meanings of the two parts are as follows:

- **recover\_threadpool\_percent:** Percentage of the number of sessions that are recovered to the normal state in the initial number of threads in the thread pool. When the number of accessed sessions is less than the initial number of threads in the thread pool multiplied by the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.
- **overload\_threadpool\_percent:** Percentage of the number of accessed sessions to the initial number of threads in the thread pool when the thread pool is overloaded. If the number of accessed sessions is greater than the initial number of threads in the thread pool multiplied by the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections to access the thread pool. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.

**Default value:** '0,0', indicating that the thread pool escape function is disabled.

### Example:

```
resilience_threadpool_reject_cond = '100,200'
```

When the number of stacked sessions exceeds 200% of the initial number of threads in the thread pool, new connections are forbidden and stacked sessions are killed. When the number of stacked sessions is less than 100% of the initial number of threads in the thread pool, new connections are allowed.

---

### NOTICE

- The number of stacked sessions can be obtained by querying the number of data records in the **pg\_stat\_activity** view. A few background threads need to be filtered out. The initial number of threads in the thread pool can be obtained by querying the **thread\_pool\_attr** parameter.
  - If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
  - The values of **recover\_threadpool\_percent** and **overload\_threadpool\_percent** can be 0 at the same time. In addition, the value of **recover\_threadpool\_percent** must be smaller than that of **overload\_threadpool\_percent**. Otherwise, the setting does not take effect.
-

## 17.3.34 Backup and Restoration

### operation\_mode

**Parameter description:** Specifies whether the system enters the backup and restoration mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

**Default value:** off

### enable\_cbm\_tracking

**Parameter description:** This parameter must be enabled when Roach is used to perform full and incremental backups. If this parameter is disabled, the backup will fail.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on:** The cbm tracking is enabled.
- **off:** The cbm tracking is disabled.

**Default value:** off

### max\_size\_for\_xlog\_retention

**Parameter description:** Specifies when to forcibly push the backup replication slot to prevent the disk from being full and the cluster from being read-only because logs cannot be recycled during backup. It is recommended that the value of this parameter be a little smaller than the value of **datastorage\_threshold\_value\_check** of the CM Server component to prevent the cluster from entering the read-only state.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** -100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80% and log recycling is blocked due to backup operations. For example, **-80** indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80%.
- A positive value indicates that the backup replication slot is triggered based on the size of stacked logs. For example, **32** indicates that the backup replication slot is forcibly pushed when the redo position of the current checkpoint exceeds 32 log segments (the size of each log segment is 16 MB) and logs are recycled because the backup operation is blocked.

**Default value:** 0

## 17.3.35 Undo

### undo\_space\_limit\_size

**Parameter description:** Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You can set this parameter to a large value based on service requirements and then set it to a proper value based on the actual undo space usage. The value of **undo\_space\_limit\_size** must be equal to or greater than that of **undo\_limit\_size\_per\_transaction**.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 102400 to 2147483647. The unit is 8 KB.

**Default value:** 256GB

### undo\_limit\_size\_per\_transaction

**Parameter description:** Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo\_limit\_size\_per\_transaction** to a value less than or equal to that of **undo\_space\_limit\_size**. If the value of **undo\_limit\_size\_per\_transaction** is greater than that of **undo\_space\_limit\_size**, the displayed value is the same as the configured value when you run the **show undo\_limit\_size\_per\_transaction** command to query the parameter. The only difference is that the smaller value between **undo\_space\_limit\_size** and **undo\_limit\_size\_per\_transaction** is used as the actual undo space threshold of a single transaction. If the **undo\_limit\_size\_per\_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is 8 KB.

**Default value:** 32 GB

## 17.3.36 DCF Parameters Settings

### enable\_dcf

**Parameter description:** Specifies whether to enable the DCF mode. This parameter cannot be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean. The value can be **on** or **off**. The value **on** indicates that the current installation mode is DCF, and the value **off** indicates that the current installation mode is not DCF.

**Default value:** off

### dcf\_ssl

**Parameter description:** Specifies whether to enable SSL. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean. The value can be **on** or **off**. The value **on** indicates that SSL is used, and the value **off** indicates that SSL is not used.

**Default value:** on

## dcf\_config

**Parameter description:** Specifies the customized configuration information during installation. This parameter cannot be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Default value:** a string, which is specified by users during installation

## dcf\_data\_path

**Parameter description:** Specifies the DCF data path. This parameter cannot be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Default value:** a string, which is the **dcf\_data** directory under the data directory of the DN

## dcf\_log\_path

**Parameter description:** Specifies the DCF log path. This parameter cannot be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Default value:** a string, which is the **dcf\_log** directory under the data directory of the DN.

## dcf\_node\_id

**Parameter description:** Specifies the ID of the DN where the DCF is located. This parameter is defined by users during installation and cannot be modified.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Default value:** an integer, which is specified by users during installation

## dcf\_max\_workers

**Parameter description:** Specifies the number of DCF callback function threads. If the number of nodes exceeds 7, increase the value of this parameter (for example, to 40). Otherwise, the primary node may remain in the promoting state and the log replication between the primary and standby nodes has no progress.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 262143

**Default value:** 10

## dcf\_truncate\_threshold

**Parameter description:** Specifies the threshold for a DN to truncate DCF logs.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 100000

## dcf\_election\_timeout

**Parameter description:** Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout period.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 600, in seconds

**Default value:** 3

## dcf\_enable\_auto\_election\_priority

**Parameter description:** Specifies whether the DCF priority can be automatically adjusted. The value **0** indicates that automatic adjustment is not allowed, and the value **1** indicates that automatic adjustment is allowed.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** 0 or 1.

**Default value:** 1

## dcf\_election\_switch\_threshold

**Parameter description:** Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in seconds.

**Default value:** 0

## dcf\_run\_mode

**Parameter description:** Specifies the DCF election mode. The value **0** indicates that the automatic DCF election mode is enabled, and the value **2** indicates that the DCF election mode is disabled. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated type. The value can be **0** or **2**.

**Default value:** **0**

## dcf\_log\_level

**Parameter description:** Specifies the DCF log level.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** a string

- Disable the log function: **NONE**, indicating that the log function is disabled and cannot be used for the following log levels:
- Enable the log function: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**

You can select a string from the preceding strings and use vertical bars (|) to combine the strings. The log level cannot be left blank.

**Default value:** **RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE**

## dcf\_log\_backup\_file\_count

**Parameter description:** Specifies the number of DCF run log backups.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** **10**

## dcf\_max\_log\_file\_size

**Parameter description:** Specifies the maximum size of a DCF run log file.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 1000, in MB

**Default value:** **10**

## dcf\_socket\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, the connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** **5000**

## dcf\_connect\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, the connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** 60000

## dcf\_mec\_fragment\_size

**Parameter description:** Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 10240, in KB

**Default value:** 64

## dcf\_stg\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

## dcf\_stg\_pool\_init\_size

**Parameter description:** Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

## dcf\_mec\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 200

## dcf\_flow\_control\_disk\_rawait\_threshold

**Parameter description:** Specifies the disk waiting threshold for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in microseconds

**Default value:** 100000

## dcf\_flow\_control\_net\_queue\_message\_num\_threshold

**Parameter description:** Specifies the threshold for the number of messages in a network queue for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1024

## dcf\_flow\_control\_cpu\_threshold

**Parameter description:** Specifies the threshold for DCF CPU flow control.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in percentage (%)

**Default value:** 100

## dcf\_mec\_batch\_size

**Parameter description:** Specifies the number of batch messages for DCF communication. When the value is 0, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1024

**Default value:** 0

## dcf\_mem\_pool\_max\_size

**Parameter description:** Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

## dcf\_mem\_pool\_init\_size

**Parameter description:** Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

## dcf\_compress\_algorithm

**Parameter description:** Specifies the compression algorithm for DCF run log transmission. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer

- 0 indicates no compression.
- 1 indicates the ZSTD compression algorithm.
- 2 indicates the LZ4 compression algorithm.

**Default value:** 0

## dcf\_compress\_level

**Parameter description:** Specifies the compression level for DCF log transmission. This parameter takes effect upon the system restart. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf\_compress\_algorithm** parameter is set.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 22

If compression is disabled, the configured compression level does not take effect.

**Default value:** 1

## dcf\_mec\_channel\_num

**Parameter description:** Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 64

**Default value:** 1

## dcf\_rep\_append\_thread\_num

**Parameter description:** Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 2

## dcf\_mec\_agent\_thread\_num

**Parameter description:** Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended that the value of **dcf\_mec\_agent\_thread\_num** be equal to or greater than 2 x Number of nodes x Value of **dcf\_mec\_channel\_num**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 10

## dcf\_mec\_reactor\_thread\_num

**Parameter description:** Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf\_mec\_reactor\_thread\_num** to the value of **dcf\_mec\_agent\_thread\_num** be 1:40.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 1

## dcf\_log\_file\_permission

**Parameter description:** Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf\_log\_path\_permission** is set to **750**, **dcf\_log\_file\_permission** can only be set to **600** or **640**. If **dcf\_log\_path\_permission** is set to **700**, **dcf\_log\_file\_permission** can only be set to **600**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated type. The value can be **600** or **640**.

**Default value:** 600

## dcf\_log\_path\_permission

**Parameter description:** Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** enumerated type. The value can be **700** or **750**.

**Default value:** 700

## 17.3.37 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore engine supports flashback, while the Astore engine does not support flashback.

### enable\_recyclebin

**Parameter description:** Specifies whether the recycle bin is enabled or disabled in real time.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

**Default value:** off

### recyclebin\_retention\_time

**Parameter description:** Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 15 min (900s)

### version\_retention\_age

**Parameter description:** Specifies the number of transactions retained in the earlier version. If the number of transactions exceeds the value of this parameter, the earlier version will be recycled and cleared.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487. 0 means no delay.

**Default value:** 0

This parameter has been deprecated.

---

### vacuum\_defer\_cleanup\_age

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records, so that **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately. You can also set this parameter to configure the retention period of the flashback function in the earlier version.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay. The value range needs to be extended to 100 million.

**Default value:** 0

---

 **CAUTION**

This parameter can be ignored when you use the Ustore engine to flash back. It serves the Astore flashback function of the earlier version and has other functions. The flashback function is not used in this version.

---

## undo\_retention\_time

**Parameter description:** Specifies the period for retaining undo logs of earlier versions.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 0 to 259200. The unit is second.

**Default value:** 0

---

 **CAUTION**

1. If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
  2. If the time within which the undo logs of earlier versions need to be retained is **time1** and the statement execution time for the flashback query is **time2**, you need to set **undo\_retention\_time** to a value greater than the sum of **time1** and **time2**. That is, set **undo\_retention\_time** to a value greater than  $\text{time1} + \text{time2} + 3\text{s}$ . You are advised to set **undo\_retention\_time** to a value equal to  $\text{time1} + 1.5 \times \text{time2}$ . For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo\_retention\_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.
- 

## 17.3.38 Rollback Parameters

### max\_undo\_workers

**Parameter description:** Specifies the number of undo worker threads invoked during asynchronous rollback. The parameter setting takes effect after the system is restarted.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 5

## 17.3.39 AI Features

### enable\_hypo\_index

**Parameter description:** Specifies whether the database optimizer considers the created virtual index when executing the **EXPLAIN** statement. By executing **EXPLAIN** on a specific query statement, you can evaluate whether the index can improve the execution efficiency of the query statement based on the execution plan provided by the optimizer.

This is a USERSET parameter. Set it based on instructions in [Table 17-1](#).

**Value range:** Boolean

- **on** indicates that a virtual index is created during **EXPLAIN** execution.
- **off** indicates that no virtual index is created during **EXPLAIN** execution.

**Default value:** off

## 17.3.40 Global SysCache Parameters

### enable\_global\_syscache

**Parameter description:** Specifies whether to enable the global system cache function. This is a POSTMASTER parameter. Set it based on instructions in [Table 17-2](#).

**Value range:** Boolean

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

**Default value:** on

You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal\_level** of the standby node to **hot\_standby** or higher if you need to access the standby node.

### global\_syscache\_threshold

**Parameter description:** Specifies the maximum memory usage of the global system cache.

This is a SIGHUP parameter. Set it based on instructions in [Table 17-2](#).

The **enable\_global\_syscache** parameter must be enabled.

**Value range:** an integer ranging from 16384 to 1073741824. The unit is KB.

**Default value:** 163840

Recommended calculation formula: The smaller value of the number of hot databases and the number of threads x Memory size allocated to each database.

That is, **global\_syscache\_threshold** = **min(count(hot dbs), count(threads))** x **memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

**memofdb** indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

## 17.3.41 Reserved Parameters

### NOTE

The following parameters are reserved and do not take effect in this version.

acce\_min\_datasize\_per\_thread  
cstore\_insert\_mode  
enable\_constraint\_optimization  
enable\_hadoop\_env  
enable\_hdfs\_predicate\_pushdown  
enable\_orc\_cache  
schedule\_splits\_threshold  
backend\_version  
undo\_zone\_count  
version\_retention\_age  
enable\_incremental\_catchup  
wait\_dummy\_time

## Deprecated Functions
