- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- During instantiation, the stored procedure with COMMIT or ROLLBACK cannot be called.
- Package functions cannot be called in triggers.
- Variables in a package cannot be directly used in external SQL statements.
- Private variables and stored procedures in a package cannot be called outside the package.
- Usage that stored procedures do not support are not supported. For example, if COMMIT or ROLLBACK cannot be called in a function, COMMIT or ROLLBACK cannot be called in the function of a package.
- The name of a schema cannot be the same as that of a package.
- Only A-version stored procedures and function definitions are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Variables with the same name in a package, including parameters with the same name in a package, are not supported.
- The global variables in a package are at the session level. The variables in packages cannot be shared in different sessions.
- When a function of an autonomous transaction is called in a package, the cursor variables in the package and recursive functions that use the cursor variables in the package are not allowed.
- The package does not declare the ref cursor variables.
- The default permission on a package is SECURITY INVOKER. To change the default permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- A user with the CREATE ANY PACKAGE permission can create packages in the public and user schemas.
- If the name of a package to be created contains special characters, the special characters cannot contain spaces. You are advised to set the GUC parameter **behavior_compat_options** to **"skip_insert_gs_source"**. Otherwise, an error may occur.
- When a package is created, it depends on an undefined object. If **enable_force_create_obj** is enabled, the creation can be executed and a warning message is displayed. If **enable_force_create_obj** is disabled, the creation cannot be executed.
- When you create a package function, the default parameter value can contain variables in the package but cannot contain cross-package variables.
- When the complex function is called in a package, for example, func(x).a, a composite type is returned. Cross-schema call is supported, but the database.schema.package.func(x).b call is not supported.
- When a stored procedure in a package is created, if the stored procedure name is in the *schema*.*func* or *package*.*func* format, only the value of *func* is obtained, and the declaration of *schema* or *package* is invalid. To disable this behavior by default, set the GUC parameter **behavior_compat_options** to **'forbid_package_function_with_prefix'**.
- When a stored procedure in a package is created, if the input parameters of the stored procedure contain pseudo-type parameters (for example, **anyelement**), variable-length parameters cannot be specified during a call.
- Cursors with parameters created in a package can be referenced (%RowType) and opened across packages. The restrictions are as follows:
  a. Currently, cursors cannot be called in database.schema.package.cursor mode.
  b. If a cursor is defined as a function parameter, you need to set **behavior_compat_options** to **'allow_procedure_compile_check'** in advance to support the parsing of the cursor type.
  c. If **behavior_compat_options** is not set to **'allow_procedure_compile_check'**, cursor%RowType is processed as a composite type, that is, a record. After the parameter is set, the specific type of the cursor can be parsed.
- If the PRAGMA AUTONOMOUS_TRANSACTION syntax is declared in PACKAGE SPECIFICATION or PACKAGE BODY SPECIFICATION, a package can be created, but the autonomous transaction does not take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Only the initial user can perform the REPLACE operation on the packages of the initial user.

Syntax

- CREATE PACKAGE SPECIFICATION

```
CREATE [ OR REPLACE ] PACKAGE [ schema ] package_name
   [ invoker_rights_clause ] { IS | AS } item_list_1 END [ package_name ];
```

  - invoker_rights_clause can be declared as AUTHID DEFINER or AUTHID CURRENT_USER, which indicate the definer permission and caller permission, respectively.
  - **item_list_1** can be a declared variable, stored procedure, or function.
  - The **package_name** after END can be omitted. (In the SQL file generated by **gs_dump**, the name after END is automatically added to the package definition.)

  PACKAGE SPECIFICATION (header) declares public variables, functions, and exceptions in a package, which can be called by external functions or stored procedures. It can only declare stored procedures and functions but cannot define them.

- CREATE PACKAGE BODY

```
CREATE [ OR REPLACE ] PACKAGE BODY [ schema ] package_name
   { IS | AS } declare_section [ initialize_section ] END [ package_name ];
```

  The **package_name** after END can be omitted. (In the SQL file generated by **gs_dump**, the name after END is automatically added to the package definition.)

  PACKAGE BODY defines private variables and functions in a package. If a variable or function is not declared by PACKAGE SPECIFICATION, it is a private variable or private function.

  The package body also has an initialization part to initialize the package. For details, see the example.

Examples

- Create a package.

```
-- Create a test table tbl_test.
gaussdb=# CREATE TABLE tbl_test(uid varchar(6) PRIMARY KEY, area_id varchar(5), level int);

-- Create a package header.
gaussdb=# CREATE OR REPLACE PACKAGE pkg_test AS
    -- Public stored procedures can be called by external systems.
    PROCEDURE proc_ist_tbl_test(v_uid in varchar, v_area_id varchar, v_level int);
    PROCEDURE proc_del_tbl_test(v_uid in varchar);
    PROCEDURE proc_upd_tbl_test(v_uid in varchar, v_area_id varchar, v_level int);
END pkg_test;
/

-- Create a package body.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE OR REPLACE PACKAGE BODY pkg_test AS
    PROCEDURE proc_ist_tbl_test(v_uid in varchar, v_area_id varchar, v_level int) AS
    BEGIN
        INSERT INTO tbl_test VALUES (v_uid, v_area_id, v_level);
    END;
    PROCEDURE proc_del_tbl_test(v_uid in varchar) AS
    BEGIN
        DELETE FROM tbl_test WHERE uid = v_uid;
    END;
    PROCEDURE proc_upd_tbl_test(v_uid in varchar, v_area_id varchar, v_level int) AS
    BEGIN
        UPDATE tbl_test SET area_id = v_area_id, level = v_level WHERE uid = v_uid;
    END;
    var4 int := 10;
    -- The instantiation starts.
BEGIN
    var4 := 10;
    dbe_output.print_line(var4);
END pkg_test;
/
```

- Call a package.

```
-- Use CALL to call the stored procedure of a package.
gaussdb=# CALL pkg_test.proc_ist_tbl_test('0A00B1','01001',24);
gaussdb=# SELECT * FROM tbl_test;
  uid   | area_id | level
--------+---------+---------
 0A00B1 | 01001   |     24
(1 row)

-- Use SELECT to call the stored procedure of a package.
gaussdb=# SELECT pkg_test.proc_upd_tbl_test('0A00B1','01001','26');
gaussdb=# SELECT * FROM tbl_test;
  uid   | area_id | level
--------+---------+-------
 0A00B1 | 01001   |    26
(1 row)

-- Call a stored procedure of a package in an anonymous block.
gaussdb=# BEGIN
pkg_test.proc_del_tbl_test('0A00B1');
END;
/
gaussdb=# SELECT * FROM tbl_test;
 uid | area_id | level
-----+---------+-------
(0 rows)

-- Drop.
gaussdb=# DROP TABLE tbl_test;
gaussdb=# DROP PACKAGE pkg_test;
```

Helpful Links

ALTER PACKAGE and **DROP PACKAGE**

7.12.9.35 CREATE PLUGGABLE DATABASE

Description

Creates a PDB. This concept refers to tenants in the multi-tenancy feature of kernel. It is a special database and can also be regarded as a logical instance divided from a database instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- DDL statements for creating PDBs, including CREATE, ALTER, and DROP, cannot be executed in transaction blocks.
- This command can be used only when the GUC parameter **enable_mtd** is set to **on**.
- This operation can be performed only in the non-PDB. This command cannot be executed in M-compatible databases.
- The operation user must be assigned as **gs_role_create_pdb role** or have the SYSADMIN permission.
- A maximum of 128 user PDBs can be created.
- During the database creation, an error message indicating that permission denied is displayed, possibly because the permission on the data directory in the file system is insufficient. If an error message, indicating no space left on device is displayed, the possible cause is that the disk space is used up.
- An A-compatible PDB is created when the compatibility option is defaulted.
- If the initial account password is not specified during database instance installation, the initial account name is case-sensitive, and the created PDB is an M-compatible database, run the following statements in the CLI before enabling and using the PDB. In this way, the database considers content in double quotation marks ("") as an object reference. After the statement is executed, enable and use the PDB and reset the initial account password as prompted.

  ```
  gs_guc set --pdbname my_pdb -Z datanode -N all -I all -c "sql_mode = 'ansi_quotes'" # my_pdb indicates the new PDB name.
  ```

  (This operation is performed to ensure that the account password can be properly set for the new PDB. You can reset the **sql_mode** parameter as required in subsequent operations.)

Syntax

```
CREATE PLUGGABLE DATABASE pdb_name
   [ [ WITH ] { [ ENCODING [=] 'encoding' ] |
            [ LC_COLLATE [=] 'lc_collate' ] |
            [ LC_CTYPE [=] 'lc_ctype' ] |
            [ DBCOMPATIBILITY [=] 'compatibility_type' ] |
            [ DBTIMEZONE [=] 'time_zone' ] }];
```

Parameters

- **pdb_name**

  Specifies the PDB name.

  Value range: a string that complies with the **Identifier Naming Conventions**. In addition, the PDB name cannot contain a dollar sign ($).

- **ENCODING [=] 'encoding'**

  (Optional) Specifies the character encoding used by the database. The value can be a string (for example, **SQL_ASCII**) or an integer.

  If this parameter is not specified, the UTF-8 encoding format is used for the M-compatible database by default, and the encoding format of the template database is used for other databases by default. By default, the codes of the template databases **template0**, **template1**, and **templatea** are related to the OS environment. The character encoding of **template1** cannot be changed. To

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

change the encoding, use **templatea** to create an A-compatible database and use **template0** to create a non-A-compatible database.

Common values: **GBK**, **UTF8**, **Latin1**, and **GB18030**.

- **LC_COLLATE [=] 'lc_collate'**

  (Optional) Specifies the character set used by the new database. For example, set this parameter by using **lc_collate = 'zh_CN.gbk'**.

  The use of this parameter affects the sort order of strings (for example, the order of using **ORDER BY** for execution and the order of using indexes on text columns). By default, the character set of the template database is used. This parameter does not take effect for the M-compatible database.

  Value range: character sets supported by the OS.

- **LC_CTYPE [=] 'lc_ctype'**

  (Optional) Specifies the character class used by the new database. For example, set this parameter by using **lc_ctype = 'zh_CN.gbk'**. The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits. By default, the character classification of the template database is used. This parameter does not take effect for the M-compatible database.

  Value range: character classes supported by the OS.

- **DBCOMPATIBILITY [=] compatibility_type**

  (Optional) Specifies the compatible database type. The default database is an O-compatible database.

  Value range: **A**, **C**, **PG**, and **M**. They indicate compatibility with O, TD, POSTGRES, and M-compatible databases respectively.

- **DBTIMEZONE [=] time_zone**

  Specifies the time zone of the new database. For example, you can set this parameter by setting **DBTIMEZONE** to **'+00:00'**. This parameter affects the time zone of the new database. The PRC is used by default.

  Prerequisites: The current database is compatible with database A, **a_format_version** is set to **'10c'**, and **a_format_dev_version** is set to **'s2'**.

  Value range: name and abbreviation of the time zone supported by the OS, or the timestamp ranges from –15:59 to +15:00.

Examples

- Prerequisites

  Install the multi-tenant database instance by referring to "Multi-tenant Databases > Installing Multi-tenant Database Instances" in *Feature Guide*.

- Create a PDB.

```
-- Connect to the postgres database as a system administrator and create a resource plan instruction.
gaussdb=# call resource_manager.create_pending_area();
 create_pending_area
---------------------

(1 row)
-- This API is used to create resources. The resource specifications of the current instance determine whether the resources can be successfully created. If the API reports an error, adjust the parameters based on the error description and try again.
gaussdb=# CALL resource_manager.create_resource_plan_directive(pdb_name =>'my_pdb', min_cpu => 4, max_dynamic_memory => '18022MB', max_shared_memory => '14745MB', io_limits=> 300, io_priority => 'High', max_connections => 880);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 create_resource_plan_directive
--------------------------------

(1 row)
gaussdb=# CALL resource_manager.submit_pending_area();
 submit_pending_area
---------------------

(1 row)

-- Connect to the postgres database as a system administrator and create a PDB.
gaussdb=# CREATE PLUGGABLE DATABASE my_pdb;
CREATE PLUGGABLE DATABASE
```

Helpful Links

CREATE DATABASE

7.12.9.36 CREATE PROCEDURE

Description

Creates a stored procedure.

Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.
- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- **current_schema** and **search_path** specified by SET during stored procedure creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- When the function is called by SELECT or CALL, an argument must be provided in the output parameter. The argument does not take effect.
- A stored procedure with the **PACKAGE** attribute can use overloaded functions.
- Do not create an overloaded stored procedure with different parameter names but same stored procedure name and parameter list type.
- When an overloaded stored procedure is called, the variable type must be specified.
- Do not create a stored procedure that has the same name and parameter list as the function.
- Do not overload stored procedures with different default values.
- Only the in, out, and inout parameters of the stored procedure cannot be overloaded after the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**. They can be reloaded after the parameter is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

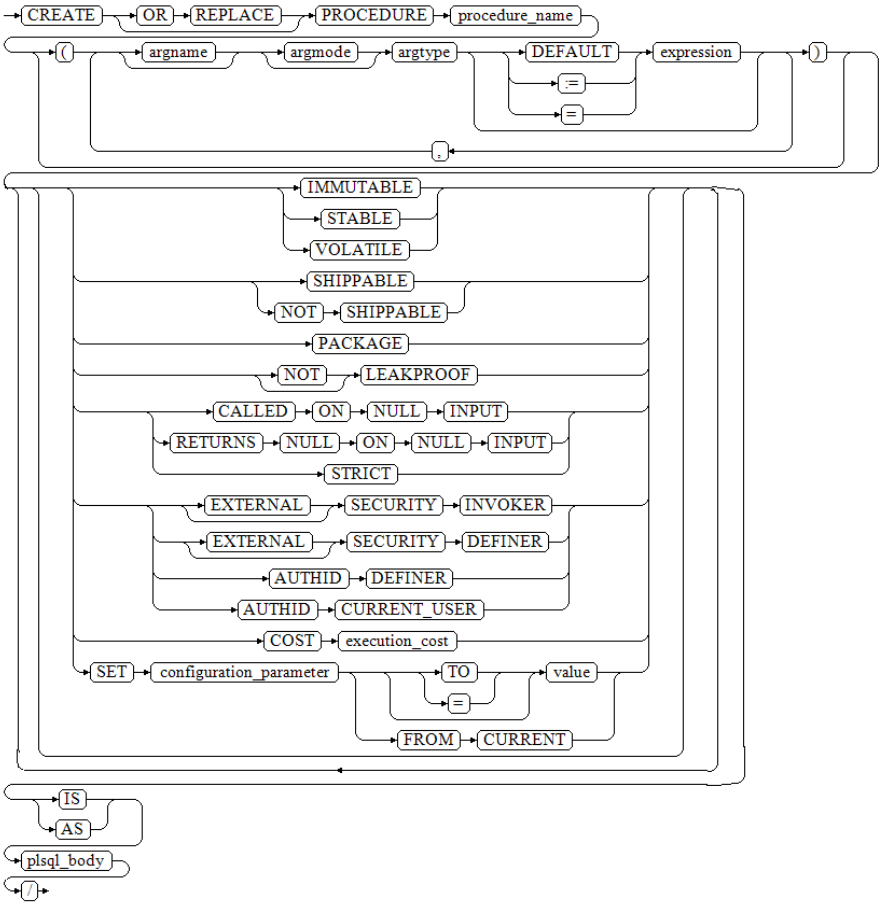
- A-compatible functions are created for A-compatible databases and PG-compatible functions are created for PG-compatible databases. Hybrid creation is not recommended.
- If a function supports overloading, you need to add the keyword PACKAGE.
- If an undeclared variable is used in a stored procedure, an error is reported when the stored procedure is called.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- The stored procedure does not support operations that will return a set.
- When stored procedures without parameters are called in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When other functions with output parameters are called in a stored procedure and an assignment expression, set the GUC parameter **behavior_compat_options** to **'proc_outparam_override'**, define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called functions will be ignored.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: The execute immediate sqlv using func syntax is used to execute a function. The select func into syntax is used to execute a function. DML statements such as INSERT and UPDATE are used to execute a function. When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between IS/AS and plsql_body.
- The default permission on a stored procedure is SECURITY INVOKER. To change the default permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- Users with the CREATE ANY FUNCTION permission can create or replace stored procedures in the user schemas.
- **out/inout** must be set to a variable but not a constant.
- In a centralized environment, if you want to call a stored procedure with the same in parameters but different out parameters, you need to set the GUC parameter **behavior_compat_options** to **'proc_outparam_override'**. After the parameter is enabled, you must add the out parameters no matter whether you use the SELECT or CALL statement to call the stored procedure. After the parameter is enabled, you cannot use **perform** to call a stored procedure or function.
- When a stored procedure is created, it depends on an undefined object. If the **enable_force_create_obj** parameter is enabled, the creation can be executed, and a warning message is displayed. If the **enable_force_create_obj** parameter is disabled, the creation cannot be executed.
- When separation of duties is enabled, the stored procedure of the definer permission can be rebuilt only by the current user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If a stored procedure with the definer specified is created in a schema of another user, the stored procedure will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- When the complex function is called in a stored procedure, for example, **func(x).a**, a composite type is returned. Cross-schema call is supported, but the **database.schema.package.func(x).b** call is not supported.
- When a stored procedure with the **out** parameter is called, you can set the GUC parameter **behavior_compat_options** to **'proc_outparam_transfer_length'** to pass the parameter length. The specifications and constraints are as follows:
  a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
  b. If the **out** parameter does not take effect (for example, **perform**), the length does not need to be passed.
  c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
  d. Regardless of whether the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, the parameter length can be passed.
  e. To pass the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior_compat_options** to **tableof_elem_constraints**.
- Functions contain syntax and functions that use GUC parameters to control features. If GUC parameters are modified in a session, the function may retain the behavior before the modification. Therefore, exercise caution when modifying GUC parameters.
- Only the initial user can perform the REPLACE operation on the stored procedures of the initial user.

Syntax

```
CREATE [ OR REPLACE ] PROCEDURE procedure_name
   [ ( {[ argname ] [ argmode ] argtype [ { DEFAULT | := | = } expression ]}[,...]) ]
   [
     { IMMUTABLE | STABLE | VOLATILE }
     | { SHIPPABLE | NOT SHIPPABLE }
     | {PACKAGE}
     | [ NOT ] LEAKPROOF
     | { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
     | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER | AUTHID
CURRENT_USER}
     | COST execution_cost
     | SET configuration_parameter { [ TO | = ] value | FROM CURRENT }
   ][ ... ]
 { IS | AS }
plsql_body
/
```



Parameters

- **OR REPLACE**

  Replaces the original definition when two stored procedures are with the same name.

- **procedure_name**

  Specifies the name of the stored procedure that is created (optionally with schema names).

  Value range: a string that complies with the **Identifier Naming Conventions**.

  NOTE

  When creating a function with the same name as a system function, you need to specify the schema of the function.

- **argmode**

  Specifies the mode of an argument.

NOTICE

VARIADIC specifies parameters of the array type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameters in **OUT** mode can follow the **VARIADIC** parameter.

- **argname**

  Specifies the argument name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **argtype**

  Specifies the type of an argument. **%TYPE** or **%ROWTYPE** can be used to indirectly reference a variable or table type. For details, see **Variable Definition Statements**.

  Value range: a valid data type

  NOTE

  In **PROCEDURE argtype** outside **PACKAGE**, **%TYPE** cannot reference the type of the *PACKAGE* variable.

- **expression**

  Specifies the default expression of a parameter.

  NOTE

  - If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
  - It is recommended that you define all default parameters after all non-default parameters.
  - If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
  - If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. These inputs can be set to default values. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
  - When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.

- **configuration_parameter**
  - **value**

    Sets the specified configuration parameter to a specified value. If the **value** is **DEFAULT**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string

    - DEFAULT
    - OFF
    - Specified default value
  - **from current**

    Uses the value of **configuration_parameter** of the current session.

- **IMMUTABLE, STABLE,**...

  Specifies a constraint. The function of each parameter is similar to that of CREATE FUNCTION. For details, see **CREATE FUNCTION**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

  When a stored procedure is created, the **PLSQL_BODY** can end with "END;" or "END procedure_name;".

  NOTE

  Constraints for stored procedures ending with **END procedure_name;**:

  1. It is supported only in A-compatible mode (database level).
  2. Only the A-style creation syntax is supported.
  3. Only the scenario where the stored procedure name is set after END is supported.
  4. In a stored procedure, an error is reported when the name after END does not match the actual name. In a stored procedure of the package, an error is reported when the name after END does not match the actual name.

     In the preceding two error scenarios, even if the **enable_force_create_obj** parameter is set to **on**, the creation still fails and an error message is displayed.
  5. If the name after END of a nested subprogram does not match the actual name, when the **enable_force_create_obj** parameter is set to **on**, the creation is successful, and a warning message is displayed. When the parameter is disabled, the stored procedure or package fails to be created, and an error message is displayed.
  6. In the **DBE_PLDEVELOPER.gs_source**, **my_source**, **db_source** and **adm_source** views, the definition of the stored procedure stays consistent (if the created procedure is "END+name", it is displayed as "END+name"). In the **pg_proc** and **\sf** views, the outermost END is not followed by a name in any case. The innermost END is displayed as defined during creation (if the created procedure is "END +name", it is displayed as "END+name").
  7. The stored procedure cannot retain the name following the outermost END in the SQL file generated by **gs_dump**.
  8. If a stored procedure is named IF/LOOP or a subprogram is nested, the stored procedure cannot be ended with END IF/LOOP.

  NOTICE

  When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a stored procedure, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are advised not to perform password-related operations in a stored procedure.

  NOTE

  No specific order is applied to **argname** and **argname**. The following order is advised: **argname**, **argmode**, and **argtype**.

Examples

- Create a stored procedure.

```
-- Create a stored procedure and print the sum of the input parameters.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add(i int, j int)
AS
BEGIN
    dbe_output.print_line('result is: '|| i+j);
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Use CALL to call a stored procedure.
gaussdb=# CALL proc_add(16,17);

-- Use a program block to call a stored procedure.
gaussdb=# BEGIN
    proc_add(16,17);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add;
```

- Create a stored procedure ending with END in an A-compatible database.

```
Create a stored procedure.
-- Create a stored procedure and print the sum of the input parameters.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add(i int, j int)
AS
BEGIN
     dbe_output.print_line('result is: '|| i+j);
END proc_add;
/

-- Use CALL to call a stored procedure.
gaussdb=# CALL proc_add(16,17);

-- Use a program block to call a stored procedure.
gaussdb=# BEGIN
    proc_add(16,17);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add;
```

- Create a stored procedure whose parameter model is **VARIADIC**.

```
-- Create the stored procedure pro_variadic.
gaussdb=# CREATE OR REPLACE PROCEDURE pro_variadic (var1 VARCHAR2(10) DEFAULT 'hello!',var4
VARIADIC int4[])
AS
BEGIN
    dbe_output.print_line(var1);
END;
/

-- Execute the stored procedure.
gaussdb=# SELECT pro_variadic(var1=>'hello', VARIADIC var4=> array[1,2,3,4]);

-- Drop.
gaussdb=# DROP PROCEDURE pro_variadic;
```

- Parameter models: **IN** and **OUT**
  - **IN** (default) indicates that the parameter is an input parameter.
  - **OUT** indicates that the parameter is an output parameter.
  - **IN OUT** indicates that the parameter is an input and output parameter

```
-- Create the stored procedure proc_add1. num1 and num2 are input parameters, and num3 is an
output parameter.
gaussdb=# CREATE PROCEDURE proc_add1 (num1 in int, num2 in int, num3 out int)
AS
BEGIN
    num3 := num1 + num2;
END;
/

-- Use a program block to call the stored procedure and use variable c to receive the parameters sent
by the stored procedure.
gaussdb=# DECLARE
    a int := 20;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    b int := 32;
    c int := 0;
BEGIN
    proc_add1(a,b,c);
    dbe_output.put_line(c);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add1;
```

ALTER PROCEDURE and **DROP PROCEDURE**

Suggestions

- analyse | analyze
  - Do not run **ANALYZE** in a transaction or anonymous block.
  - Do not run **ANALYZE** in a function or stored procedure.

7.12.9.37 CREATE RESOURCE LABEL

Description

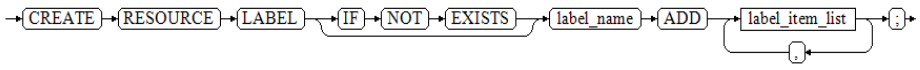
CREATE RESOURCE LABEL is used to create a resource label.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

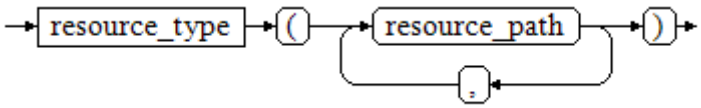
Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...];
```



- label_item_list

  ```
  resource_type(resource_path[, ...])
  ```



- resource_type

  ```
  { TABLE | COLUMN | SCHEMA | VIEW | FUNCTION }
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **IF NOT EXISTS**

  If a resource label with the same name already exists, no error is generated. Instead, a message is displayed, indicating that the resource label already exists.

- **label_name**

  Specifies the resource label name, which must be unique.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the resource label name. If a resource label name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a resource label name that contains uppercase letters, enclose the resource label name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **resource_type**

  Specifies the type of database resources to be labeled.

  Value range: **TABLE**, **COLUMN**, **SCHEMA**, **VIEW**, and **FUNCTION**.

- **resource_path**

  Specifies the path of database resources.

Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create an existing table resource label again and compare the differences between adding IF NOT EXISTS and not adding IF NOT EXISTS.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);
NOTICE:  table_label label already defined, skipping
CREATE RESOURCE LABEL
gaussdb=# CREATE RESOURCE LABEL table_label add TABLE(public.tb_for_label);
ERROR:  table_label label already defined

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$
LANGUAGE SQL;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Delete the table resource label table_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS table_label;

-- Delete the column resource label column_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS column_label;

-- Delete the function resource label func_for_label.
gaussdb=# DROP FUNCTION func_for_label;

-- Delete the view resource label view_for_label.
gaussdb=# DROP VIEW view_for_label;

-- Delete the schema resource label schema_for_label.
gaussdb=# DROP SCHEMA schema_for_label;

-- Delete the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

Helpful Links

ALTER RESOURCE LABEL and **DROP RESOURCE LABEL**

7.12.9.38 CREATE RESOURCE POOL

Description

CREATE RESOURCE POOL creates a resource pool and specifies the Cgroup of the resource pool.

Precautions

Only users with the SYSADMIN permission, or the initial user can perform this operation.

This syntax is not supported in the multi-tenancy scenario. Use the RESOURCE_MANAGER advanced package.

This syntax is not supported during upgrade.

Syntax

```
CREATE RESOURCE POOL pool_name
    [WITH ({MEM_PERCENT=pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT="memory_size" | io_limits=io_limits | io_priority="io_priority" |
max_worker=max_worker | max_connections=max_connections |
max_dynamic_memory="max_dynamic_memory"| max_shared_memory="max_shared_memory" |
max_concurrency=concurrency  }[, ... ])];
```

Parameters

- **pool_name**

  Specifies the name of a resource pool.

  The name of the resource pool cannot be same as that of an existing resource pool.

  Value range: a string that complies with the **Identifier Naming Conventions**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **group_name**

  Specifies the name of a Cgroup.

  NOTE

  - You can use either double quotation marks ("") or single quotation marks (') in the syntax when setting the name of a Cgroup.
  - The value of **group_name** is case-sensitive.
  - If an administrator specifies a Workload Cgroup under Class, for example, **control_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control_group** is set to **class1:workload1:1**.
  - If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.

  Value range: a string. It must comply with the rule in the description, which specifies the created Cgroup.

- **stmt**

  Specifies the maximum number of statements that can be concurrently executed in a resource pool.

  Value range: numeric data ranging from –1 to 2147483647. **–1** indicates no restriction and **0** indicates that no statement can be executed.

- **dop**

  Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

  Value range: numeric data ranging from 1 to 2147483647.

- **memory_size**

  Specifies the maximum memory size of a resource pool.

  Value range: a string from 1 KB to 2047 GB

- **mem_percent**

  Specifies the proportion of available resource pool memory to the total memory or group user memory.

  In multi-tenant scenarios, **mem_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

  In common scenarios, **mem_percent** of common users ranges from 0 to 100. The default value is **0**.

  NOTE

  When both of **mem_percent** and **memory_limit** are specified, only **mem_percent** takes effect.

- **io_limits**

  Specifies the upper limit of IOPS in a resource pool.

  The unit is 10,000.

- **io_priority**

  Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, use the default value **None**.

NOTE

The settings of **io_limits** and **io_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

- **max_worker**

  Concurrency in a table during data redistribution. This is used only for scaling.

- **max_connections**

  Maximum number of connections that can be used by a resource pool.

  NOTE

  The total maximum number of connections in all resource pools cannot exceed the maximum number of connections specified by **max_connections** of the entire GaussDB process.

- **max_dynamic_memory**

  Specifies the maximum dynamic memory that can be used by a resource pool.

- **max_shared_memory**

  Specifies the maximum shared memory that can be used by a resource pool.

- **max_concurrency**

  Specifies the maximum concurrent requests that can be used by a resource pool.

Examples

This example assumes that you have created a Cgroup in advance. (Contact an administrator to create a Cgroup.)

```
-- Create a default resource pool, and associate it with the Medium Timeshare Cgroup under Workload under DefaultClass.
gaussdb=# CREATE RESOURCE POOL pool1;

-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# CREATE RESOURCE POOL pool2 WITH (CONTROL_GROUP="High");

-- Create a resource pool, and associate it with the Low Timeshare Cgroup under Workload under class1.
gaussdb=# CREATE RESOURCE POOL pool3 WITH (CONTROL_GROUP="class1:Low");

-- Create a resource pool, and associate it with the wg1 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool4 WITH (CONTROL_GROUP="class1:wg1");

-- Create a resource pool, and associate it with the wg2 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool5 WITH (CONTROL_GROUP="class1:wg2:3");

-- Drop resource pools.
gaussdb=# DROP RESOURCE POOL pool1;
gaussdb=# DROP RESOURCE POOL pool2;
gaussdb=# DROP RESOURCE POOL pool3;
gaussdb=# DROP RESOURCE POOL pool4;
gaussdb=# DROP RESOURCE POOL pool5;
```

ALTER RESOURCE POOL and **DROP RESOURCE POOL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.39 CREATE ROLE

Description

Creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

Precautions

- If a role is added to the database, the role does not have the login permission.
- Only the user who has the CREATE ROLE permission or a system administrator is allowed to create roles.

Syntax

```
CREATE ROLE role_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The syntax of role information configuration clause **option** is as follows:

```
{SYSADMIN | NOSYSADMIN}
   | {MONADMIN | NOMONADMIN}
   | {OPRADMIN | NOOPRADMIN}
   | {POLADMIN | NOPOLADMIN}
   | {AUDITADMIN | NOAUDITADMIN}
   | {CREATEDB | NOCREATEDB}
   | {USEFT | NOUSEFT}
   | {CREATEROLE | NOCREATEROLE}
   | {INHERIT | NOINHERIT}
   | {LOGIN | NOLOGIN}
   | {REPLICATION | NOREPLICATION}
   | {PERSISTENCE | NOPERSISTENCE}
   | CONNECTION LIMIT connlimit
   | VALID BEGIN 'timestamp'
   | VALID UNTIL 'timestamp'
   | RESOURCE POOL 'respool'
   | USER GROUP 'groupuser'
   | PERM SPACE 'spacelimit'
   | TEMP SPACE 'tmpspacelimit'
   | SPILL SPACE 'spillspacelimit'
   | NODE GROUP logic_cluster_name
   | IN ROLE role_name [, ...]
   | IN GROUP role_name [, ...]
   | ROLE role_name [, ...]
   | ADMIN role_name [, ...]
   | USER role_name [, ...]
   | SYSID uid
   | DEFAULT TABLESPACE tablespace_name
   | PROFILE DEFAULT
   | PROFILE profile_name
   | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **role_name**

  Specifies the name of a role.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **password**

  Specifies the login password.

  A new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the username or the username spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$%^&*()-_=+\|[{}];:,<.>/?).

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a role is created.

  Value range: a character string that cannot be empty.

- **EXPIRED**

  When creating a user, you can specify the **EXPIRED** parameter to create a user whose password is invalid. The user cannot perform simple or extended queries. The statement can be executed only after the password is changed.

- **DISABLE**

  By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.

- **ENCRYPTED | UNENCRYPTED**

  Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

  Specifies whether a new role is a system administrator. Roles with the SYSADMIN attribute have the highest permission.

  Value range: If not specified, **NOSYSADMIN** is the default.

  When separation of duties is disabled, users with the SYSADMIN permission can create users with the SYSADMIN, REPLICATION, CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

  When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

  Specifies whether a role is a monitor administrator.

  Value range: If not specified, **NOMONADMIN** is the default.

- **OPRADMIN | NOOPRADMIN**

  Specifies whether a role is an O&M administrator.

  Value range: If not specified, **NOOPRADMIN** is the default.

- **POLADMIN | NOPOLADMIN**

  Specifies whether a role is a security policy administrator.

  Value range: If not specified, **NOPOLADMIN** is the default.

- **AUDITADMIN | NOAUDITADMIN**

  Specifies whether a role has the audit and management attributes.

  If not specified, **NOAUDITADMIN** is the default.

- **CREATEDB | NOCREATEDB**

  Specifies a role's permission to create databases.

  A new role does not have the permission to create databases.

  Value range: If not specified, **NOCREATEDB** is the default.

- **USEFT | NOUSEFT**

  This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

  Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the CREATEROLE permission can also modify and delete other roles.

  Value range: If not specified, **NOCREATEROLE** is the default.

  When separation of duties is disabled, users with the CREATEROLE permission can create users with the CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

  When separation of duties is enabled, users with the CREATEROLE permission can create users with the CREATEROLE, MONADMIN, POLADMIN, or CREATEDB permission and common users.

- **INHERIT | NOINHERIT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

  Specifies whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.

  Value range: If not specified, **NOLOGIN** is the default.

- **REPLICATION | NOREPLICATION**

  Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.

  If not specified, **NOREPLICATION** is the default.

- **PERSISTENCE | NOPERSISTENCE**

  Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the PERSISTENCE attribute.

- **CONNECTION LIMIT connlimit**

  Specifies how many concurrent connections the role can make.

  NOTICE

  - The system administrator is not restricted by this parameter.
  - **connlimit** is calculated separately for each primary database node. Number of connections of the database = Value of **connlimit** x Number of normal primary database nodes.

  Value range: an integer in the range [–1, 2^{31} – 1]. The default value **–1** means no limit.

- **VALID BEGIN 'timestamp'**

  Sets the timestamp when a role takes effect. If this clause is omitted, the role has no valid start time. **timestamp** indicates the start time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **VALID UNTIL 'timestamp'**

  Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the role has no valid end time. **timestamp** indicates the end time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **RESOURCE POOL 'respool'**

  Sets the name of resource pool used by the role. The name belongs to the system catalog **pg_resource_pool**.

- **USER GROUP 'groupuser'**

  Creates a sub-user. This function is not supported in the current version.

- **PERM SPACE 'spacelimit'**

  Sets the space available for a user.

- **TEMP SPACE 'tmpspacelimit'**

  Sets the space allocated to the temporary table of a user.

- **SPILL SPACE 'spillspacelimit'**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets the operator disk flushing space of a user.

- **IN ROLE role_name**

  Lists one or more existing roles whose permissions will be inherited by a new role. It is not recommended.

- **IN GROUP role_name**

  Specifies an obsolete spelling of IN ROLE. It is not recommended.

- **ROLE role_name**

  Lists one or more existing roles which are automatically added as members of the new role.

- **ADMIN role_name**

  Similar to ROLE. However, ADMIN grants permissions of new roles to other roles.

- **USER role_name**

  Specifies an obsolete spelling of the ROLE clause.

- **SYSID uid**

  The SYSID clause is ignored.

- **DEFAULT TABLESPACE tablespace_name**

  The DEFAULT TABLESPACE clause is ignored.

- **PROFILE profile_name**

  The PROFILE clause is ignored.

- **PGUSER**

  In the current version, this attribute is reserved only for forward compatibility.

Examples

- Differences between CREATE ROLE and CREATE USER:

```
-- Run CREATE ROLE to create role test_role.
gaussdb=# CREATE ROLE test_role PASSWORD '********';
-- Run CREATE USER to create user test_user.
gaussdb=# CREATE USER test_user PASSWORD '********';

-- View the information. Roles created by CREATE ROLE are not allowed to log in to the database by default.
gaussdb=# \du test*
           List of roles
 Role name |  Attributes  | Member of
-----------+--------------+-----------
 test_role | Cannot login | {}
 test_user |              | {}

-- Enable the test_role role to log in to the database.
gaussdb=# ALTER ROLE test_role WITH LOGIN;

gaussdb=# \du test*
           List of roles
 Role name | Attributes | Member of
-----------+------------+-----------
 test_role |            | {}
 test_user |            | {}

-- View schema information. When CREATE USER is executed to create a user, a schema with the same name is automatically created.
gaussdb=# \dn test*
    List of schemas
   Name    |   Owner
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------+-----------
 test_user | test_user
(1 row)

-- Delete.
gaussdb=# DROP ROLE test_role;
gaussdb=# DROP USER test_user;
```

- Creating roles with permissions for the separation of duties.

```
-- Create user lisa with the OPRADMIN permission and user bob with the SYSADMIN permission.
gaussdb=# CREATE ROLE lisa WITH OPRADMIN PASSWORD '*********';
gaussdb=# CREATE ROLE bob WITH SYSADMIN PASSWORD '*********';

-- Query the permissions.
gaussdb=# \du lisa;
                   List of roles
 Role name |         Attributes          | Member of
-----------+-----------------------------+-----------
 lisa      | Cannot login, Operatoradmin | {}

gaussdb=# \du bob
                List of roles
 Role name |       Attributes       | Member of
-----------+------------------------+-----------
 bob       | Cannot login, Sysadmin | {}

-- Create role role11 with the CREATEDB permission.
gaussdb=# CREATE ROLE role11 CREATEDB PASSWORD '********';
CREATE ROLE

-- Query the permissions.
gaussdb=# \du role11
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role11    | Create DB, Cannot login | {}

-- Create role role12 using the ADMIN clause.
gaussdb=# CREATE ROLE role12 WITH  CREATEDB  ADMIN role11  PASSWORD '********';
CREATE ROLE
-- Query the permissions.
gaussdb=# \du role11
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role11    | Create DB, Cannot login | {role12}

gaussdb=# \du role12
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role12    | Create DB, Cannot login | {}

-- Delete the roles.
gaussdb=# DROP ROLE role11;
gaussdb=# DROP ROLE role12;
gaussdb=# DROP ROLE lisa;
gaussdb=# DROP ROLE bob;

-- Configuring the separation of duties: If the parameter enableSeparationOfDuty is set to on, the separation of duties is enabled to restrict the permissions of system administrators. System administrators are not allowed to create or modify user configurations. This effectively controls system administrators' access to private user data.

-- Check whether separation of duties is enabled.
gaussdb=# SHOW enableSeparationOfDuty;
 enableSeparationOfDuty
------------------------
 off
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Run the following statement to modify parameters:
gs_guc set -Z coordinator -Z datanode -N all -I all -c "enableSeparationOfDuty = on"

-- After the setting is successful, the setting takes effect after a restart.
gs_om -t stop
gs_om -t start

-- Check the separation of duties again.
gaussdb=# SHOW enableSeparationOfDuty;
 enableSeparationOfDuty
------------------------
 on
(1 row)
```

- Create a role whose password is invalid.

```
-- Create the role test_role2 whose password is valid.
gaussdb=# CREATE ROLE test_role2 PASSWORD '********' EXPIRED;
gaussdb=# ALTER ROLE test_role2 WITH LOGIN;

-- test_role2 cannot perform any operation after logging in to the database. You can perform operations only after changing the password as prompted.
gaussdb=# SET ROLE test_role2 PASSWORD '********';
gaussdb=> \d
ERROR:  Please use "ALTER ROLE user_name IDENTIFIED BY 'password' REPLACE 'old password';" to modify the expired password of user test_role2 before operation!

-- Change the password of role test_role2.
gaussdb=> ALTER ROLE test_role2 IDENTIFIED BY '********' REPLACE '********';

-- Delete.
gaussdb=> RESET ROLE;
gaussdb=# DROP ROLE test_role2;
```

- Create a role and specify the effective date and expiration date.

```
-- Create a role with its validity from January 1, 2015 to January 1, 2026.
gaussdb=# CREATE ROLE test_role3 WITH LOGIN PASSWORD '********' VALID BEGIN '2015-01-01' VALID UNTIL '2026-01-01';
-- Delete.
gaussdb=# DROP ROLE test_role3;
```

SET ROLE, **ALTER ROLE**, **DROP ROLE**, and **GRANT**

7.12.9.40 CREATE ROW LEVEL SECURITY POLICY

Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running ALTER TABLE ... ENABLE ROW LEVEL SECURITY). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (SELECT, UPDATE, and DELETE) of data tables and does not affect the write (INSERT and MERGE INTO) of data tables. The table owner or system administrators can create an expression in the USING clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the USING expression returns **TRUE**, the tuple is visible to the current user; if the USING expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that SELECT, UPDATE, and DELETE will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

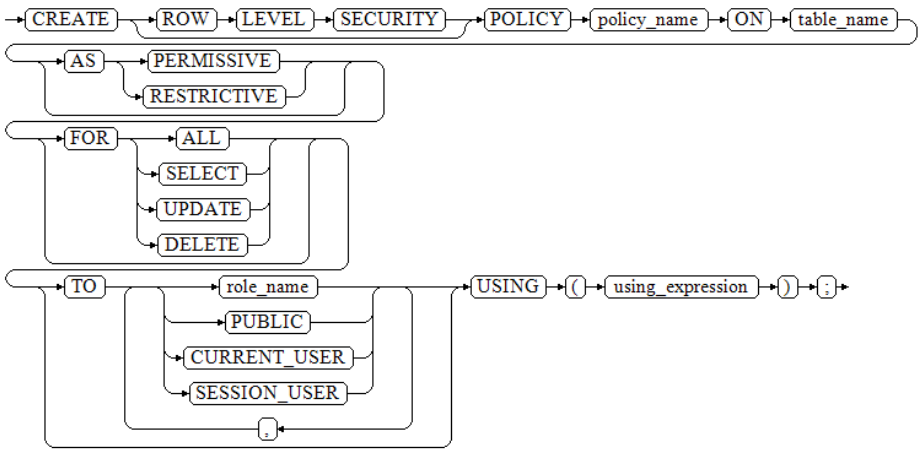
Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user who will be affected.

Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and local temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

Syntax

```
CREATE [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
    [ AS { PERMISSIVE | RESTRICTIVE } ]
    [ FOR { ALL | SELECT | UPDATE | DELETE } ]
    [ TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...] ]
    USING ( using_expression );
```



Parameters

- **policy_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.

- **table_name**

  Specifies the name of a table to which a row-level security policy is applied.

- **PERMISSIVE | RESTRICTIVE**

  PERMISSIVE enables the permissive policy for row-level security. The conditions of the permissive policy are joined through the OR expression.

  RESTRICTIVE enables the restrictive policy for row-level security. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:

  ```
  (using_expression_permissive_1 OR using_expression_permissive_2 ...) AND
  (using_expression_restrictive_1 AND using_expression_restrictive_2 ...)
  ```

  The default value is **PERMISSIVE**.

- **command**

  Specifies the SQL operations affected by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering SELECT, UPDATE, and DELETE.

  If **command** is set to **SELECT**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be queried. The operations that are affected include SELECT, SELECT FOR UPDATE/SHARE, UPDATE ... RETURNING, and DELETE ... RETURNING.

  If **command** is set to **UPDATE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be updated. The operations that are affected include UPDATE, UPDATE ... RETURNING, and SELECT ... FOR UPDATE/SHARE.

  If **command** is set to **DELETE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be deleted. The operations that are affected include DELETE and DELETE ... RETURNING.

  For the relationship between row-level security policies and SQL statements, see **Table 7-254**.

Table 7-254 Relationship between row-level security policies and SQL statements.

Command	SELECT/ALL Policy	UPDATE/ALL Policy	DELETE/ALL Policy
SELECT	Existing row	No	No
SELECT FOR UPDATE/SHARE	Existing row	Existing row	No
UPDATE	No	Existing row	No
UPDATE RETURNING	Existing row	Existing row	No
DELETE	No	No	Existing row
DELETE RETURNING	Existing row	No	Existing row

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **role_name**

  Specifies database users affected by a row-level security policy.

  CURRENT_USER indicates the username in the current operating environment. **SESSION_USER** indicates the session username. If this parameter is not specified, the default value **PUBLIC** is used, indicating that all database users are affected. You can specify multiple affected database users.

  NOTICE

  System administrators are not affected by row-level security.

- **using_expression**

  Specifies an expression defined for a row-level security policy (return type: Boolean).

  The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For SELECT, UPDATE, and DELETE, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the SELECT statement, update the tuple through the UPDATE statement, or delete the tuple through the DELETE statement.

Examples

```
-- Create user alice.
gaussdb=# CREATE USER alice PASSWORD '********';

-- Create user bob.
gaussdb=# CREATE USER bob PASSWORD '********';

-- Create data table all_data.
gaussdb=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
gaussdb=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
gaussdb=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');

DROP ROW LEVEL SECURITY POLICY and **ALTER ROW LEVEL SECURITY POLICY**

7.12.9.41 CREATE RULE

Description

Defines a new rewriting rule.

Precautions

- To define or modify rules for a table, you must be the owner of the table.
- If multiple rules of the same type are defined for the same table, the rules are triggered one by one by name in alphabetical order.
- In the view, the RETURNING clause can be added to the INSERT, UPDATE, and DELETE rules to return columns by view. If a rule is triggered by the **INSERT RETURNING**, **UPDATE RETURNING**, or **DELETE RETURNING** command, these clauses are used to calculate the output result. If a rule is triggered by a command without RETURNING, the RETURNING clause of the rule is ignored. Currently, only unconditional INSTEAD rules can contain the RETURNING clause, and only one RETURNING clause can exist in all rules of one event. This ensures that only one RETURNING clause can be used for result calculation. If the RETURNING clause does not exist in any valid rule, the RETURNING query in this view will be rejected.
- Currently, ON SELECT rules must be unconditional INSTEAD rules and must have actions consisting of a single SELECT query. Therefore, an ON SELECT rule actually turns a table into a view whose visible content is the content returned by the **SELECT** command of the rule, rather than the content in the table (if any).

Syntax

```
CREATE [ OR REPLACE ] RULE name AS ON event
    TO table_name [ WHERE condition ]
    DO [ ALSO | INSTEAD ] { NOTHING | command | ( command ; command ... ) };
```

Events include:

```
SELECT
INSERT
DELETE
UPDATE
```

Parameters

- name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name of the created rule. It must be unique among all the rules for the same table.

Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.

- event

  One of the SELECT, INSERT, UPDATE, and DELETE events.

- table_name

  Name (optionally schema-qualified) of the table or view to which the rule applies.

- condition

  SQL condition expression that returns a Boolean value, which determines whether to execute the rule. Expressions cannot reference any table except **NEW** and **OLD**, and cannot have aggregate functions. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- INSTEAD

  Specifies that a command is used to replace the initial event.

- ALSO

  Specifies that a command should be executed after the initial event. If neither **ALSO** nor **INSTEAD** is specified, **ALSO** is the default value.

- command

  Specifies the command that composes the rule action. A valid command is one of the SELECT, INSERT, UPDATE, and DELETE statements.

Examples

```
-- Create the tbl_rule1 and tbl_rule2 tables for creating rules.
gaussdb=# CREATE TABLE tbl_rule1(c1 int,c2 int,c3 int, c4 int);
gaussdb=# CREATE TABLE tbl_rule2(c1 int,c2 int);

-- Create rule rule_test and use ALSO to specify that commands are executed after the initial event is executed.
gaussdb=# CREATE RULE rule_test AS
    ON INSERT TO tbl_rule1
    DO ALSO INSERT INTO tbl_rule2 VALUES (new.c1, new.c2);

-- Insert data into the tbl_rule1 table and view data in the two tables.
gaussdb=# INSERT INTO tbl_rule1 VALUES(1,11,111,1111), (2,22,222,2222);
gaussdb=# SELECT * FROM tbl_rule1;
 c1 | c2 | c3  |  c4
----+----+-----+------
  1 | 11 | 111 | 1111
  2 | 22 | 222 | 2222
(2 rows)
gaussdb=# SELECT * FROM tbl_rule2;
 c1 | c2
----+----
  1 | 11
  2 | 22
(2 rows)

-- Drop the rule.
gaussdb=# DROP RULE rule_test ON tbl_rule1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the table.
gaussdb=# DROP TABLE tbl_rule1;
gaussdb=# DROP TABLE tbl_rule2;
```

NOTICE

- The name specified after ON SELECT rules must be "_RETURN".
- Currently, the ON SELECT rule must be INSTEAD SELECT, and the table specified by TO is converted to a view. The prerequisite is that the table is empty and does not have restrictions such as triggers, indexes, and child tables. That is, the table must be an initial empty table. Therefore, you are advised to create a view directly instead of using this method.

7.12.9.42 CREATE SCHEMA

Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, CREATE SCHEMA can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the AUTHORIZATION clause is used, all the created objects are owned by this user.

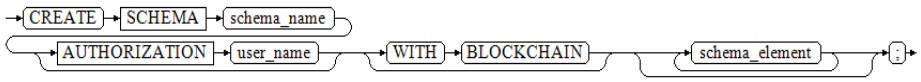
Precautions

- Only a user with the **CREATE** permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

- Create a schema based on a specified name.

```
CREATE SCHEMA schema_name
    [ AUTHORIZATION user_name ] [WITH BLOCKCHAIN] [ schema_element [ ... ] ];
```



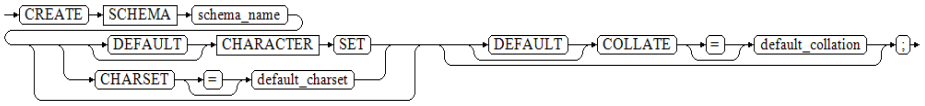
- Create a schema based on a username.

```
CREATE SCHEMA AUTHORIZATION user_name [ schema_element [ ... ] ];
```

- Create a schema and specify the default character set and collation.

```
CREATE SCHEMA schema_name
    [ [DEFAULT] CHARACTER SET | CHARSET [ = ] default_charset ] [ [ DEFAULT] COLLATE [ = ]
default_collation ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **schema_name**

  Specifies the schema name.

  NOTICE

  - The schema name must be unique in the current database.
  - The schema name cannot be the same as the initial username of the current database.
  - The schema name cannot start with pg_.
  - The schema name cannot start with gs_role_.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **AUTHORIZATION user_name**

  Specifies the owner of a schema. If **schema_name** is not specified, **user_name** will be used as the schema name. In this case, **user_name** can only be a role name.

  Value range: an existing username or role name

- **WITH BLOCKCHAIN**

  Specifies the tamper-proof attribute of a schema. In this mode, a row-store common user table is automatically extended to tamper-proof user table.

  NOTE

  To create a tamper-proof schema, set the GUC parameter **enable_ledger** to **on**. The default value is **off**, and the level is SIGHUP.

- **schema_element**

  Specifies an SQL statement defining an object to be created within the schema. Currently, only the CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE TABLE PARTITION, CREATE SEQUENCE, CREATE TRIGGER, and GRANT clauses are supported.

  Objects created by sub-commands are owned by the user specified by AUTHORIZATION.

- **default_charset**

  Specifies the default character set of a schema. If this parameter is specified separately, the default collation of the schema is set to the default collation of the specified character set.

  This syntax is supported only when **sql_compatibility** is set to **'B'**.

- **default_collation**

  Specifies the default collation of a schema. If this parameter is specified separately, the default character set of the schema is set to the character set corresponding to the specified collation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This syntax is supported only when **sql_compatibility** is set to **'B'**. For details about the supported collation, see **Table 7-255**.

NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run the **SHOW SEARCH_PATH** command to check the schemas on the current search path.

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test1 WITH DBCOMPATIBILITY = 'B' ENCODING = 'UTF8' LC_COLLATE =
'zh_CN.utf8' LC_CTYPE = 'zh_CN.utf8';
gaussdb=# \c test1

-- Create the role1 role.
test1=# CREATE ROLE role1 IDENTIFIED BY '********';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by
the clause is role1.
test1=# CREATE SCHEMA AUTHORIZATION role1
                CREATE TABLE films (title text, release date, awards text[])
                CREATE VIEW winners AS SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Create a schema ds and set the default character set of the schema to utf8mb4 and the default collation
to utf8mb4_bin. This syntax is supported only when sql_compatibility is set to 'B'.
test1=# CREATE SCHEMA ds CHARACTER SET utf8mb4 COLLATE utf8mb4_bin;

-- Create role role2.
test1=# CREATE ROLE role2 IDENTIFIED BY '********';

-- Create a schema based on the name.
test1=# CREATE SCHEMA schema1 AUTHORIZATION role2;
CREATE SCHEMA

-- Before modifying the tamper-proof attribute, set the enable_ledger parameter. The default value of
enable_ledger is off, and set enable_ledger to on using gs_guc.
gs_guc reload -Z coordinator -Z datanode -N all -I all -c "enable_ledger=on";

-- After setting, check whether the parameter status is on. If the setting is successful, configure the tamper-
proof attribute.
test1=# SHOW enable_ledger;
 enable_ledger
---------------
 on
(1 row)

-- Create a schema with the tamper-proof attribute specified.
test1=# CREATE SCHEMA ledgernsp WITH BLOCKCHAIN;
CREATE SCHEMA

-- Create a tamper-proof user table.
test1=# CREATE TABLE ledgernsp.usertable(id int, name text);
CREATE TABLE

-- Drop schemas.
test1=# DROP SCHEMA role1 CASCADE;
test1=# DROP SCHEMA ds CASCADE;
test1=# DROP SCHEMA schema1 CASCADE;
test1=# DROP SCHEMA ledgernsp  CASCADE;

-- Drop users.
test1=# DROP USER role1 CASCADE;
test1=# DROP USER role2 CASCADE;

-- Switch to the default database. Change the database name based on actual situation.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
test1=# \c postgres
gaussdb=# DROP DATABASE test1;
```

Helpful Links

ALTER SCHEMA and **DROP SCHEMA**

7.12.9.43 CREATE SECURITY LABEL

Description

CREATE SECURITY LABEL creates a security label for the specified security policy in the current database.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits permissions of the built-in role gs_role_seclabel can create security labels.

Syntax

```
CREATE SECURITY LABEL label_name 'label_content';
```

Parameters

- **label_name**

  Security label name, which must be unique in the database.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the security label name. If a security label name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a security label name that contains uppercase letters, enclose the security label name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **label_content**

  Security label content. The requirements are as follows:

  A security label consists of only one level and at least one range, which are separated by a colon (:). The format is "level:range", for example, "L1:G2,G41,G6-G27".

  – There are 1024 levels named Li, where 1 ≤ i ≤ 1024. The levels meet a partial order relationship (if i ≤ j, then Li ≤ Lj). For example, L1 is lower than L3.

  – There are 1024 ranges named Gi, where 1 ≤ i ≤ 1024. You cannot compare sizes between ranges, but you can perform set operations. Multiple ranges are separated by commas (,), and a hyphen (-) is used to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

specify the interval. For example, {G2-G5} indicates {G2,G3,G4,G5}. {G1} is a subset of {G1, G6}.

- The letters L and G must be capitalized and followed by at least one non-zero digit. Other characters are not allowed. In the {Gxxx-Gyyy} format, yyy must be greater than or equal to xxx.
- If the input levels and ranges do not meet the requirements, the system reports an error.

CAUTION

Example:
gaussdb=# CREATE SECURITY LABEL sec_label3 'L3:'; // The label must contain at least one content range category.
ERROR: in label text "L3:", there at least have one level and one group

Examples

```
-- Create a security label sec_label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';

-- Create security label sec_label with the content of 'L1:G2,G4'.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G2,G4';
ERROR:  security label "sec_label" already exists
-- Create security label sec_label1 with the content of 'L1:G2,G4'.
gaussdb=# CREATE SECURITY LABEL sec_label1 'L1:G2,G4';

-- Create security label sec_label2 with the content of 'L3:G1-G5'.
gaussdb=# CREATE SECURITY LABEL sec_label2 'L3:G1-G5';

-- View the security labels created in the system.
gaussdb=# SELECT * FROM gs_security_label;
 label_name | label_content
------------+---------------
 sec_label  | L1:G4
 sec_label1 | L1:G2,G4
 sec_label2 | L3:G1-G5
(3 rows)

-- Delete the existing security labels sec_label, sec_label1, and sec_label2.
gaussdb=# DROP SECURITY LABEL sec_label;
gaussdb=# DROP SECURITY LABEL sec_label1;
gaussdb=# DROP SECURITY LABEL sec_label2;

-- View the security labels created in the system again.
gaussdb=# SELECT * FROM gs_security_label;
 label_name | label_content
------------+---------------
(0 rows)
```

Helpful Links

DROP SECURITY LABEL and SECURITY LABEL ON

7.12.9.44 CREATE SEQUENCE

Description

CREATE SEQUENCE adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

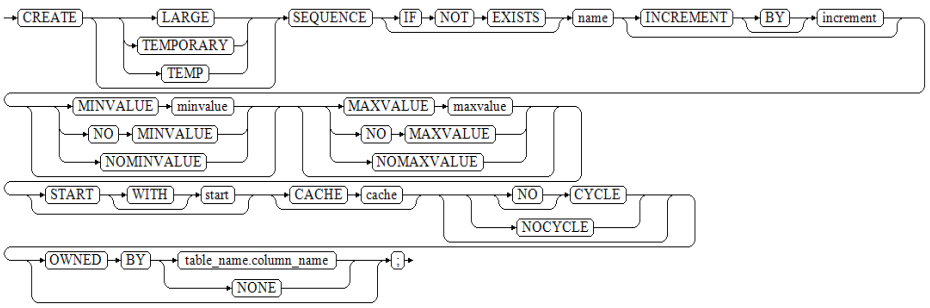
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- A sequence is a special table that stores arithmetic progressions. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views, or foreign tables in the same schema.
- After the sequence is created, functions nextval() and generate_series(1,N) insert data to the table. Make sure that the number of times for calling nextval is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for calling function generate_series() is N+1.
- By default, the maximum value of **SEQUENCE** is 2^{63} – 1. If a large identifier is used, the maximum value can be 2^{127} – 1.
- A user granted the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

Syntax

```
CREATE [ LARGE | TEMPORARY | TEMP ] SEQUENCE [ IF NOT EXISTS ] name [ INCREMENT [ BY ] increment ]
    [ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ] [ MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE]
    [ START [ WITH ] start ] [ CACHE cache ] [ [ NO ] CYCLE | NOCYCLE ]
    [ OWNED BY { table_name.column_name | NONE } ];
```



Parameters

- **LARGE | TEMPORARY | TEMP**

  Specifies the keyword of a temporary sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Enable the PG-compatible mode for the database before creating a temporary sequence.
- The lifecycle of a temporary sequence is at the session level, and temporary sequence objects are isolated by sessions. Sequences are automatically dropped on session exit.
- Temporary sequences exist in a special schema. Each session has only one temporary schema. If a temporary schema is created in advance, the schema name can be provided when the temporary sequence is created. If a temporary schema is not created in advance, the schema name cannot be provided when the temporary sequence is created; in addition, each session can access only the objects in its own temporary schema and cannot access the objects in the temporary schemas of other sessions. If the accessed temporary schema does not belong to this session, an error is reported.
- If temporary sequences exist, the existing permanent sequences with the same name (in this session) become invisible, but they can be referenced with a schema-limited name.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a sequence. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **name**

  Specifies the name of a sequence to be created.

  Value range: a string containing only lowercase letters, uppercase letters, special characters #_$, and digits.

- **increment**

  Optional. Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.

  The default value is **1**.

  NOTE

  In B-compatible mode, if the step is a floating-point number, the value is automatically converted to an integer. In other modes, this parameter cannot be set to a floating-point number.

- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**

  Optional. Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **$-2^{63}-1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**

  Optional. Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is **$2^{63}-1$**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start**

  Optional. Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **cache**

  Optional. Specifies the number of sequences stored in the memory for quick access purposes.

  Default value **1** indicates that one sequence can be generated each time.

  NOTE

  It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences.

- **[NO] CYCLE | NOCYCLE**

  Optional. Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.

  If **NO CYCLE** is specified, any calling of nextval would return an error after the number of sequences reaches **maxvalue** or **minvalue**.

  – **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.

  – If **CYCLE** is specified, the sequence uniqueness cannot be ensured.

- **OWNED BY**

  Optional. Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. OWNED BY only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

  The default value **OWNED BY NONE** indicates that such association does not exist.

NOTICE

You are advised not to use the sequence created using OWNED BY in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

Examples

- Create an ascending sequence named **seq1**. The sequence starts from 101 and the step is 10.

```
gaussdb=# CREATE SEQUENCE seq1
    START 101
    INCREMENT 10;

-- Select the next number from the sequence.
gaussdb=# SELECT nextval('seq1');
 nextval
---------
     101
(1 row)
gaussdb=# SELECT nextval('seq1');
 nextval
---------
     111
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the sequence.
gaussdb=# DROP SEQUENCE seq1;
```

- Implement the auto-increment column.

```
-- Create a table.
gaussdb=# CREATE TABLE test1(id int PRIMARY KEY, name varchar(20));

-- Create a sequence joined with the table.
gaussdb=# CREATE SEQUENCE test_seq2
    START 1
    NO CYCLE
    OWNED BY test1.id;

-- Set the default value of a column.
gaussdb=# ALTER TABLE test1 ALTER COLUMN id SET DEFAULT nextval('test_seq2'::regclass);

-- Insert data.
gaussdb=# INSERT INTO test1 (name) values ('Joe'),('Scott'),('Ben');

-- Query data in the table.
gaussdb=# SELECT * FROM test1;
 id | name
----+-------
  1 | Joe
  2 | Scott
  3 | Ben
(3 rows)

-- Delete the sequence and the table.
gaussdb=# DROP SEQUENCE test_seq2 CASCADE;
gaussdb=# DROP TABLE test1;
```

- Create a cycle sequence.

```
-- Create an ascending sequence seq_test1. The maximum value is 3 and the sequence can be cycled.
gaussdb=# CREATE SEQUENCE seq_test1
    START 1
    MAXVALUE 3
    CYCLE;

-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(
    c1 int DEFAULT nextval('seq_test1'),
    c2 varchar
);
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');

-- Query table data. When the value of ascending sequence seq_test reaches the maximum value, the value starts from the minimum value again.
gaussdb=# SELECT * FROM tbl_test1;
 c1 |  c2
----+------
  1 | test
  2 | test
  3 | test
  1 | test
  2 | test
(5 rows)

-- Delete the table and sequence.
gaussdb=# DROP TABLE tbl_test1;
gaussdb=# DROP SEQUENCE seq_test1;
```

DROP SEQUENCE and ALTER SEQUENCE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.45 CREATE SERVER

Description

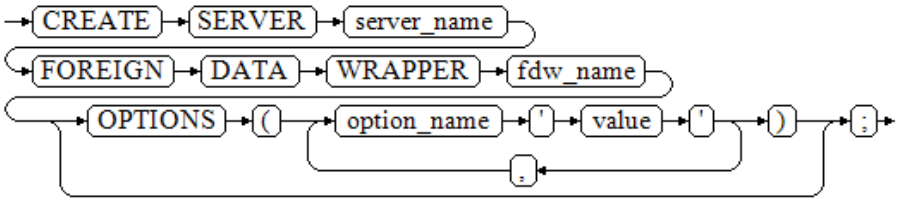
Defines a new foreign server. A foreign server store other homogeneous database information.

Precautions

When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE SERVER server_name
    FOREIGN DATA WRAPPER fdw_name
    [ OPTIONS ( { option_name ' value ' } [, ...] ) ];
```



Parameters

- **server_name**

  Specifies the server name.

  Value range: a string containing no more than 63 bytes.

- **fdw_name**

  Specifies the name of the foreign data wrapper.

  Value range: **dist_fdw**, **log_fdw**, and **file_fdw**. **log_fdw** and **file_fdw** are used only for syntax compatibility in centralized mode. They can be used to create foreign tables but are not actually used.

- **OPTIONS ({ option_name ' value ' } [, ...])**

  Specifies options for the server. These options typically define the connection details of the server, but the actual names and values depend on the foreign data wrapper of the server.

  – Specifies the parameters of a foreign server.

  In addition to the connection parameters supported by libpq, the following parameters are provided:

  – **fdw_startup_cost**

    Estimates the startup time required for a foreign table scan. This value usually contains the time taken to establish a connection, analyze the request at the remote end, and generate a plan. The default value is **100**. The value is a real number greater than 0.

  – **fdw_typle_cost**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the additional consumption when each tuple is scanned on a remote server. The value specifies the extra consumption of data transmission between servers. The default value is **0.01**. The value is a real number greater than 0.

Examples

Create a server, in which **file_fdw** is the foreign data wrapper in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER file_fdw;

-- Delete the server.
gaussdb=# DROP SERVER my_server;
```

Create another server in the homogeneous cluster, where **log_fdw** is the foreign data wrapper in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER server_remote FOREIGN DATA WRAPPER log_fdw OPTIONS
   (address '10.146.187.231:8000,10.180.157.130:8000' ,
  dbname 'test',
  username 'test',
  password '********'
);

-- Delete the server.
gaussdb=# DROP SERVER server_remote;
```

ALTER SERVER and **DROP SERVER**

7.12.9.46 CREATE SLICEGROUP

Description

Creates a group of distribution rules for the usage of range bucket tables and persist the rules to the gs_slicegroup system catalog. It is not supported in the current version.

7.12.9.47 CREATE SYNONYM

Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

Precautions

- The user who creates the synonym will be the owner of the synonym.
- If the schema name is specified, create a synonym in the specified schema. Otherwise, a synonym is created in the current schema.
- Database objects that can be accessed using synonyms include tables, views, types, packages, functions, stored procedures, sequences, or other synonyms.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: SELECT, INSERT, UPDATE, DELETE, EXPLAIN, and CALL.
- The CREATE SYNONYM statement of an associated function or stored procedure cannot be used in a stored procedure. You are advised to use synonyms existing in the pg_synonym system catalog in the stored procedure.
- You are advised not to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, for accessed tables, a message is displayed indicating that the synonym has expired; for accessed functions, stored procedures, and packages, a message is displayed indicating that the objects do not exist.
- Users granted the CREATE ANY SYNONYM permission can create synonyms in user schemas.
- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.
- A synonym can be associated with a package, but not with a function in a package. You can use synonyms associated with a package to access functions and variables in the package.
- If the schema of a synonym is the schema to which the user belongs, the owner of the synonym is also the owner of the schema. In other scenarios, the owner of the synonym is the creator of the synonym by default.
- If **SEARCH_PATH** is set and no synonym schema is specified, for stored procedures and functions, the PG_PROC table is preferentially searched by name. If no function with the same name exists, synonyms are searched based on **SEARCH_PATH**. For other objects, **SEARCH_PATH** is preferentially searched, if their schemas are the same as that of synonyms, the objects are accessed prior to synonyms.
- Objects associated with synonyms cannot be accessed using DDL statements, such as CREATE, DROP, and ALTER.
- Nested synonyms are supported. When you search for a synonym, if the synonym is associated with another synonym, the system continues to search for the associated synonym until the last associated object is found.
- You cannot use \d, \df, or \sf to access information about associated objects through synonyms.
- The process of searching for synonyms is as follows:
  - If the schema of the search object **SCHEMA1.OBJECT1** is specified in the SQL statements:

    The system checks whether **SCHEMA1.OBJECT1** exists. If the object does not exist, it checks whether the synonym **SCHEMA1.OBJECT1** exists. If the synonym **SCHEMA1.OBJECT1** exists, it searches for the object **SCHEMA2.OBJECT2** associated with the synonym. If neither the object **SCHEMA2.OBJECT2** nor the synonym **SCHEMA2.OBJECT2** exists and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

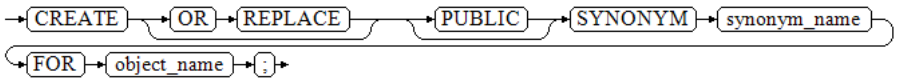
SCHEMA2 is a username, the system searches for the synonym **OBJECT2** in PUBLIC.

– If the schema of the search object **OBJECT1** is not specified in the SQL statements:

The system traverses **SEARCH_PATH** and searches for the **SCHEMA.OBJECT1** object under the specified schema. If the **SCHEMA.OBJECT1** object does not exist, it searches for the synonym **SCHEMA.OBJECT1**. If the synonym **SCHEMA.OBJECT1** does not exist and the schema to be searched for is a username, the system searches for the synonym **OBJECT1** in PUBLIC.

Syntax

```
CREATE [ OR REPLACE ] [PUBLIC] SYNONYM synonym_name
    FOR object_name;
```



Parameters

- **OR REPLACE**

  (Optional) Redefines the synonym if it already exists.

- **PUBLIC**

  (Optional) Creates a PUBLIC synonym.

  NOTE

  - PUBLIC synonyms must be unique in the same database.
  - If the database is upgraded from a version that does not support PUBLIC synonyms to a version that supports PUBLIC synonyms, PUBLIC synonyms cannot be created or deleted before the upgrade is committed.
  - All users can access PUBLIC synonyms. Except the initial user and system administrators, you must have the CREATE PUBLIC SYNONYM and DROP PUBLIC SYNONYM permissions to create and delete PUBLIC synonyms, respectively.
  - For the PUBLIC synonym, the values of **synnamespace** and **synowner** in the PG_SYNONYM system catalog are **0**, the value of **owner** in the ADM_SYNONYMS and DB_SYNONYMS system views is **PUBLIC**, and the value of **schema_name** is **NULL**.
  - If no synonym schema is specified, the system searches for objects with the same name to determine whether the objects exist. Then, the system searches for synonyms by **SEARCH_PATH**. Finally, the system searches for PUBLIC synonyms. If a synonym schema is specified, PUBLIC synonyms are not retrieved.

- **synonym_name**

  Specifies the name of the synonym to be created, which can contain the schema name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **object_name**

  Specifies the name of an object that is associated (optionally with schema names).

  Value range: a string that complies with the **Identifier Naming Conventions**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **object_name** can be the name of an object that does not exist.
- **object_name** can be the name of a remote object accessed by using a database link. For details about how to use database links, see **DATABASE LINK**.

CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption functions gs_encrypt and gs_encrypt_bytea, and the decryption functions gs_decrypt and gs_decrypt_bytea or use aliases to call the functions to prevent sensitive information leakage.

Examples

```
-- Create schema ot.
gaussdb=# CREATE SCHEMA ot;

-- Create a table ot.test_tbl1.
gaussdb=# CREATE TABLE ot.test_tbl1(c1 INT, c2 INT);
gaussdb=# INSERT INTO ot.test_tbl1 values(1,1);

-- View the current value of search_path.
gaussdb=# SHOW search_path;
  search_path
----------------
 "$user",public
(1 row)

-- The current value of search_path does not contain ot, and the current user is not ot. Therefore, an error is reported when you directly view the table name.
gaussdb=# SELECT * FROM test_tbl1;
ERROR:  relation "test_tbl1" does not exist
LINE 1: SELECT * FROM test_tbl1;

-- Create a synonym.
gaussdb=# CREATE OR REPLACE SYNONYM test_tbl1 FOR ot.test_tbl1;
-- Use the synonym.
gaussdb=# SELECT * FROM test_tbl1;
 c1 | c2
----+----
  1 |  1
(1 row)
gaussdb=# INSERT INTO test_tbl1 VALUES (2,2);

-- Drop.
gaussdb=# DROP SYNONYM test_tbl1;
gaussdb=# DROP TABLE ot.test_tbl1;
gaussdb=# DROP SCHEMA ot CASCADE;
```

ALTER SYNONYM and **DROP SYNONYM**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.48 CREATE TABLE

Description

Creates an initially empty table in the current database. The table will be owned by the creator. Row-store tables are created by default.

Precautions

- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files (whose size is 0) created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.
- When JDBC is used, the **DEFAULT** value can be set through PreparedStatement.
- A user with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.
- The XML type cannot be used as a primary key or foreign key.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.
- The number of table constraints cannot exceed 32,767.

Syntax

Create a table.

```
CREATE [ [ GLOBAL | LOCAL ] { TEMPORARY | TEMP } | UNLOGGED ] TABLE [ IF NOT EXISTS ] table_name
   { ( { column_name data_type [ CHARACTER SET | CHARSET charset ] [ compress_mode ] [ COLLATE
collation ] [ column_constraint [ ... ] ]
       | table_constraint
       | LIKE source_table [ like_option [...] ] }
       [, ... ] )
   | LIKE source_table }
   [ table_option [ [ , ] ... ] ]
   [ htap_option ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ ON COMMIT { PRESERVE ROWS | DELETE ROWS | DROP } ]
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]]
   [ TABLESPACE tablespace_name ];
```

- **table_option** is as follows:

  ```
  { COMMENT [ = ] 'string' |
    AUTO_INCREMENT [ = ] value |
    [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default_charset |
    [ DEFAULT ] COLLATE [ = ] default_collation |
    ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" }}
  ```

- **htap_option** is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
{ COLVIEW [ PRIORITY { HIGH | LOW | NONE } ] |
  NOCOLVIEW [ PRIORITY { HIGH | LOW | NONE } ]}
```

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  ON UPDATE update_expr |
  GENERATED ALWAYS AS ( generation_expr ) [STORED] |
  GENERATED [ ALWAYS | BY DEFAULT [ ON NULL ] ] AS IDENTITY [ ( identity_options ) ] |
  AUTO_INCREMENT |
  COMMENT 'string' |
  COLVIEW |
  NOCOLVIEW |
  UNIQUE [KEY] index_parameters |
  PRIMARY KEY index_parameters |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE =
encryption_type_value ) |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
     [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table_constraint** is as follows:

```
[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
  UNIQUE [ index_name ] [ USING method ] ( { { column_name [ ( length ) ] | ( expression ) } [ ASC |
DESC ] } [, ... ] ) index_parameters |
  PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters
  |
  FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
     [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
{ [ COMMENT 'string' ] [ ... ] }
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | PARTITION | RELOPTIONS | UPDATE | IDENTITY | ILM | ALL }
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- **update_expr** is as follows:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

- **identity_options** is as follows:

```
[ INCREMENT [ BY ] increment ] [ MINVALUE minvalue | NO MINVALUE | NOMINVALUE]
[ MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE] [ START [ WITH ] start ] [ CACHE cache |
NOCACHE ] [ [ NO ] CYCLE | NOCYCLE] [ SCALE [ EXTEND | NOEXTEND] | NOSCALE ]
```

Parameters

- **UNLOGGED**

  If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after conflicts, OS restart, database restart, primary/standby switchover, power-off, or abnormal shutdown, incurring data loss risks. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

  If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

  The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using ON COMMIT PRESERVE ROWS or ON COMMIT DELETE ROWS. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg_temp_** when creating a global temporary table.

  A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Local temporary tables are visible to the current session through the schema starting with **pg_temp**. Users should not delete schemas starting with **pg_temp** or **pg_toast_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg_temp_** in the current session, the table will be created as a temporary table.
- If global temporary tables and indexes are being used by other sessions, do not perform ALTER or DROP (except the **ALTER INDEX index_name REBUILD** command).
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, TRUNCATE, REINDEX, and ANALYZE are valid only for the current session.
- You can set the GUC parameter **max_active_global_temporary_table** to determine whether to enable the global temporary table function. If **max_active_global_temporary_table** is set to **0**, the global temporary table function is disabled.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support primary/standby switchover.
- The global temporary table does not respond to automatic clearance. In persistent connection scenarios, you are advised to use the global temporary table in the ON COMMIT DELETE ROWS clause or periodically and manually execute the VACUUM statement. Otherwise, Clogs may not be reclaimed.
- Global temporary tables do not support the following scenarios:
  - Global temporary sequences cannot be created. Global temporary tables of each session use shared sequences, which can only ensure uniqueness but not continuity.
  - Global temporary views cannot be created.
  - Partitioned tables cannot be created.
  - Hash bucket tables cannot be created.
  - Extended statistics are not supported.
  - The ON COMMIT DROP attribute is not supported.

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.

- **table_name**

  Specifies the name of the table to be created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table joined with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog_** or **matviewmap_**. Otherwise, some functions of the table are affected.

- **column_name**

  Specifies the name of a column to be created in the new table.

- **constraint_name**

  Specifies the name of the constraint specified during table creation.

NOTICE

The constraint_name is optional in B-compatible mode (**sql_compatibility = 'B'**). For other modes, constraint_name must be added.

- **index_name**

  Index name

NOTICE

- The **index_name** is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
- For foreign key constraints, if constraint_name and index_name are specified at the same time, constraint_name is used as the index name.
- For a UNIQUE KEY constraint, if both **constraint_name** and **index_name** are specified, the value of **index_name** is used as the index name.

- **USING method**

  Specifies the name of the index method to be used.

  For details about the value range, see USING method in **Parameters**.

NOTICE

- The USING method is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
- In B-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.
- If the storage mode of a table is Ustore and the constraint in the SQL statement is specified as USING BTREE, the underlying layer automatically creates the constraint as USING UBTREE.

- **ASC | DESC**

  ASC specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

ASC | DESC is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**) and M-compatible mode databases (that is, **sql_compatibility** set to **'M'**). For details about the behavior of the M-compatible databases, see "SQL Reference > SQL Syntax > SQL Statements > C > CREATE TABLE" in *M Compatibility Developer Guide*.

- **expression**

  Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

NOTICE

Expression indexes in the UNIQUE constraint are supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).

- **data_type**

  Specifies the data type of the column.

- **compress_mode**

  Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. This parameter is available only to column-store compression.

  Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **CHARACTER SET | CHARSET charset**

  Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

  This syntax is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation;** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result. In B-compatible databases (that is, **sql_compatibility = 'B'**), **utf8mb4_bin**, **utf8mb4_general_ci**, **utf8mb4_unicode_ci**, **binary**, **gbk_chinese_ci**, **gbk_bin**, **gb18030_chinese_ci**, and **gb18030_bin** are also supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Only the character type supports the specified character set. If the binary character set or collation is specified, the character type is converted to the corresponding binary type. If the type mapping does not exist, an error is reported. Currently, only the mapping from the TEXT type to the BLOB type is available.
- Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.
- If the character set or collation of a column is not explicitly specified and the default character set or collation of the table is specified, the character set or collation of the column is inherited from the table. If the default character set or collation of a table does not exist, the character set and collation of table columns inherit the character set and collation of the current database when **b_format_behavior_compat_options** contains **'default_collation'**.

Table 7-255 Character sets and collation supported in B-compatible mode (sql_compatibility set to 'B')

Collation	Character Set	Description
utf8mb4_general_ci	utf8mb4 (utf8)	The general collation is used, which is case-insensitive.
utf8mb4_unicode_ci	utf8mb4 (utf8)	The general collation is used, which is case-insensitive.
utf8mb4_bin	utf8mb4 (utf8)	The binary collation is used, which is case-sensitive.
binary	binary	The binary collation is used.
gbk_chinese_ci	gbk	The Chinese collation is used.
gbk_bin	gbk	The binary collation is used, which is case-sensitive.
gb18030_chinese_ci	gb18030	The Chinese collation is used.
gb18030_bin	gb18030	The binary collation is used, which is case-sensitive.
utf8mb4_0900_ai_ci	utf8mb4	The unicode collation algorithm (UCA) rule is used, which is case-insensitive.
utf8_general_ci	utf8	The general collation is used, which is case-insensitive.
utf8_bin	utf8	The binary collation is used, which is case-sensitive.

- **LIKE source_table [like_option ...]**

  Specifies a table from which a new table automatically copies all column names, their data types, and their NOT NULL constraints.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The target table and the source table are decoupled after creation is complete. Changes to the source table will not be applied to the target table, and it is not possible to include data of the target table in scans of the source table.

The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another LIKE clause, an error is reported.

- The default expressions are copied from the source table to the target table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the target table having default values **NULL**.
- If **INCLUDING UPDATE** is specified, the ON UPDATE CURRENT_TIMESTAMP attribute of the source table column is copied to the target table column. By default, the attribute is not copied.
- If **INCLUDING GENERATED** is specified, the generated expression of the source table column is copied to the target table. By default, the generated expression is not copied.
- The CHECK constraints are copied from the source table to the target table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the target table. NOT NULL constraints are always copied to the target table. These rules also apply to column constraints and table constraints.
- Any indexes on the source table will not be created on the target table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the source column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the target table, and the target table no longer uses the PARTITION BY clause. By default, the partition definition of the source table is not copied. If the source table has an index, you can use the **INCLUDING PARTITION INCLUDING INDEXES** syntax. If only **INCLUDING INDEXES** is used for a partitioned table, the target table will be defined as an ordinary table, but the index is a partitioned index. In this case, an error will be reported because ordinary tables do not support partitioned indexes.
- If **INCLUDING RELOPTIONS** is specified, the target table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING IDENTITY** is specified, the identity of the source table will be copied to the target table, and a SEQUENCE with the same **SEQUENCE** parameter as that of the source table will be created. By default, the identity of the source table is not copied.
- If **INCLUDING ILM** is specified, the ILM policy information of a source table is copied to the target table. To copy the ILM policy information of partition objects in the source table, specify **INCLUDING PARTITION**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **INCLUDING ALL** contains **INCLUDING DEFAULTS**, **INCLUDING UPDATE**, **INCLUDING GENERATED**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING IDENTITY**, and **INCLUDING ILM**.

NOTICE

- If the source table contains a sequence with the SERIAL, BIGSERIAL, SMALLSERIAL, or LARGESERIAL data type, or a column in the source table is a sequence by default and the sequence is created for this table (created by using CREATE SEQUENCE ... OWNED BY), these sequences will not be copied to the target table, and another sequence specific to the target table will be created. This is different from earlier versions. To share a sequence between the source table and target table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are advised not to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in CREATE TABLE ... LIKE execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.
- **EXCLUDING** of a partitioned table must be used together with **INCLUDING ALL**, for example, **INCLUDING ALL EXCLUDING DEFAULTS**, except for **DEFAULTS** of the source partitioned table.
- The CREATE TABLE table_name LIKE source_table syntax is supported only when **sql_compatibility** is set to **'B'** (B-compatible database), **b_format_version** is set to **5.7**, and **b_format_dev_version** is set to **s2**.
- In a B-compatible database, if **b_format_version** is set to **5.7** and **b_format_dev_version** is set to **s2**, **INCLUDING** and **EXCLUDING** cannot be specified. In this case, it is equivalent to specify **INCLUDING ALL** by default.

- **AUTO_INCREMENT [=] value**

  This clause specifies an initial value for an auto-increment column. The value must be a positive number and cannot exceed $2^{127} - 1$.

NOTICE

This clause takes effect only when **sql_compatibility** is set to **'B'**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - The COMMENT 'string' in column_constraint indicates that comments are added to a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

– The COMMENT 'string' in table_constraint indicates that comments are added to the indexes corresponding to the primary key and unique key.

NOTICE

- This clause is valid only when **sql_compatibility** is set to **'B'**.
- A table-level comment can contain a maximum of 2048 characters, and a column-level or index-level comment can contain a maximum of 1024 characters.
- Comments in table_constraint support only primary keys and unique keys.

- **ENGINE**

  Supported in B-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

NOTICE

The ENGINE syntax cannot be used in the CREATE TABLE table_name LIKE source_table syntax.

- **COLVIEW | NOCOLVIEW**

  Specifies whether to create IMCV table metadata for a table, column, or partition. To create an IMCV table, you should enable the **enable_htap** parameter.

- **PRIORITY { HIGH | LOW | NONE }**

  Specifies the priority for loading data into the IMCV table. It can be set to **HIGH**, **LOW**, or the default value.

- **WITH ({ storage_parameter = value } [, ...])**

  Specifies an optional storage parameter for a table or an index. The WITH clause used for tables can also contain **OIDS=FALSE** to specify that rows of the new table should not contain OIDs. The WITH clause does not support the OIDS=TRUE syntax.

  NOTE

  When using **Numeric** of arbitrary precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

  The description of parameters is as follows:

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. If the Astore is used, the default value is **100** (completely filled). When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 10 to 100

- ORIENTATION

  Specifies the storage mode of table data. This parameter cannot be modified once it is set.

  Value range:

  - **ROW** indicates that table data is stored in rows.

    ROW applies to OLTP service and scenarios with a large number of point queries or addition/deletion operations.

  Default value:

  If an ordinary tablespace is specified, the default is **ROW**.

- STORAGE_TYPE

  Specifies the storage engine type. This parameter cannot be modified once it is set.

  Value range:

  - **USTORE** indicates that tables support the in-place update storage engine. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
  - **ASTORE** indicates that tables support the append-only storage engine.

  Default value:

  If **ORIENTATION** and **STORAGE_TYPE** are not specified, Ustore is used by default, indicating that the table supports the in-place update-based storage engine.

- INIT_TD

  Specifies the number of TDs to be initialized when a Ustore table is created. This parameter can be modified by running the **ALTER TABLE** command. Note that this parameter affects the maximum size of a single tuple stored on the data page. The conversion method is MAX_TUPLE_SIZE = BLCKSZ – INIT_TD * TD_SIZE. For example, if you change the number of INIT_TD from 4 to 8, the maximum size of a single tuple decreases by 4 x INIT_TD.

  Value range: 2 to 128

  Default value: **4**

- COMPRESSION

  Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded. This parameter is available only to column-store compression.

  Value range: **YES** or **NO** for row-store tables.

  Default value: **NO**

- COMPRESSLEVEL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the table data compression ratio and duration at the same compression level. This divides a compression level into sublevels, providing more choices for compression ratio and duration. As the value becomes greater, the compression ratio becomes higher and duration longer at the same compression level.

Value range: 0 to 3

Default value: **0**

- segment

  The data is stored in segment-page mode. This parameter supports only row-store tables. Protection against unauthorized deletion and damage of physical files 1 to 5 is not supported.

  Value range: **on** and **off**

  Default value: **off**

- parallel_workers

  Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

  Value range: [0,32], int type. The value **0** indicates that parallel index creation is disabled.

  Default value: If this parameter is not set, the parallel index creation function is disabled.

- hasuids

  If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

  Value range: **on** and **off**

  Default value: **off**

- collate

  In B-compatible databases (**sql_compatibility** = **'B'**), this parameter is used to record the default collation of tables. Generally, this parameter is used only for internal storage, import, and export. You are advised not to specify or modify this parameter.

  Value range: OIDs in the collation that is independently supported in B-compatible databases.

  Default value: **0**

- stat_state

  Determines whether table statistics are locked. If locked, the table statistics cannot be updated.

  Value range: **locked** and **unlock**

  Default value: **unlock**

- statistic_granularity

  Records the default **partition_mode** when the table analyzes statistics. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

  Value range: See the value range of **partition_mode**.

  Default value: **AUTO**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**

- autovacuum_vacuum_threshold

  Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

  Value range: 0 to 1000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

- autovacuum_freeze_max_age

  Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

  Value range: 100000 to 2000000000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

– autovacuum_freeze_table_age

Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

Value range: 0 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

- **WITHOUT OIDS**

  It is equivalent to **WITH(OIDS=FALSE)**.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS | DROP }**

  ON COMMIT determines what to do when you commit a temporary table creation operation. Currently, **PRESERVE ROWS** and **DELETE ROWS** are supported.

  – **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.

  – **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

  – **DROP**: The temporary table will be dropped at the end of the current transaction block. Only local temporary tables are supported. Global temporary tables are not supported.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store. For example, CREATE TABLE t1 (a int) ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 3 DAY OF NO MODIFICATION ON (a != 0) indicates that the **t1** table is created and the advanced compression policy is added: rows that are not modified in three days and **a != 0** is specified.

  – AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.

  – ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

  > NOTE
  >
  > Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies the tablespace where the new table is created. If not specified, the default tablespace is used.

- **CONSTRAINT constraint_name**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column. You cannot add a constraint name to the clause AUTO_INCREMENT | COMMENT 'string' | ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE = encryption_type_value).
- A table constraint is not bound to a particular column but can apply to more than one column.

- **NOT NULL**

  Forbids NULL values in columns.

- **NULL**

  Allows to contain NULL values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (expression)**

  Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

  A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

  NOTE

  <>NULL and **!=NULL** are invalid in an expression. Change them to **IS NOT NULL**.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **ON UPDATE update_expr**

  The ON UPDATE clause is an attribute constraint of a column.

  When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This attribute can be specified in a B-compatible database (that is, **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**) or a PG-compatible database (this syntax is not supported during upgrade observation).
- In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also specify or not specify the precision of a keyword with parentheses. The three types of keywords are synonyms of each other and have the same attribute effect. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. In a PG-compatible database, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE NOW(5) are not supported.
- This attribute can be specified only on columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime. A PG-compatible database does not support the datetime type.
- The CREATE TABLE AS syntax does not inherit the column attributes.
- The CREATE TABLE LIKE syntax can use INCLUDING UPDATE or EXCLUDING UPDATE to inherit or exclude a constraint. In a PG-compatible database, only EXCLUDING UPDATE can be used to exclude a constraint. The INCLUDING ILM option is added to copy the ILM policy information of the old table. This option is used together with the INCLUDING PARTITION option to copy the policy information of partition objects in the old table.
- The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, **CREATE TABLE t1 (col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3));**. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
- The same column cannot be specified for this attribute and the generated column constraint at the same time.
- This attribute cannot be specified for the partition key in a partitioned table.

- **GENERATED ALWAYS AS (generation_expr) [STORED]**

  This clause creates a column as a generated column. The value of the generated column is calculated by **generation_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored like an ordinary column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause together. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause together.
- The method of modifying and deleting generated columns is the same as that of ordinary columns. If you delete an ordinary column that a generated column depends on, the generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for ordinary columns.

- **GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [(identity_options)]**

  Creates a column as an IDENTITY column. An implicit sequence is automatically created based on identity_options and attached to a specified column. When data is inserted, the value obtained from the sequence is automatically assigned to the column.

  – **GENERATED [ALWAYS] AS IDENTITY**: Only identity values provided by the sequence generator can be inserted into this column. User-specified values cannot be inserted into this column.

  – **GENERATED BY DEFAULT AS IDENTITY**: User-specified values are preferentially inserted into this column. If no value is specified, the identity values provided by the sequence generator are inserted.

  – **GENERATED BY DEFAULT ON NULL AS IDENTITY**: User-specified values are preferentially inserted into this column. If a null value is specified or no value is specified, the identity values provided by the sequence generator are inserted.

  The optional identity_options clause can be used to override sequence options.

  – **increment**: specifies the implicit sequence step. If the value is a positive number, an ascending sequence is generated. If the value is a negative number, a descending sequence is generated. The default value is **1**.

  – **MINVALUE minvalue | NO MINVALUE | NOMINVALUE**: specifies the minimum value of an execution sequence. If **minvalue** is not specified or **NO MINVALUE** is specified, the default value of an ascending sequence is **1**, and the default value of a descending sequence is **$-10^{27} + 1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

  – **MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE**: specifies the maximum value of an execution sequence. If **maxvalue** is not specified or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NO MAXVALUE is specified, the default value of an ascending sequence is $10^{28} - 1$, and the default value of a descending sequence is **–1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start** specifies the start value of an implicit sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**: specifies the number of sequences stored in the memory for quick access purposes. The default value is **1**, indicating that only one value can be generated at a time, that is, no cache is generated.
- **NOCACHE**: No value of the sequence is stored in advance.
- **CYCLE**: recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**. If **NO CYCLE** is declared, any call to nextval returns an error after the sequence reaches its maximum or minimum value. **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.
- **SCALE**: enables sequence scalability. If specified, a numeric offset is appended to the beginning of the sequence to prevent duplicate items in the generated value. If **NOSCALE** is declared, sequence scalability is disabled. The default value is **NOSCALE**.
- **EXTEND**: extends the numeric offset length (default value: **6**), aligns the sequence generation value to **x** (default value: **6**) + **y** (maximum number of digits). **SCALE** must be specified when **EXTEND** is specified. If **NOEXTEND** is declared, the numeric offset length is not extended. The default value is **NOEXTEND**.

NOTE

- The IDENTITY column can only be of the smallint, integer, bigint, decimal, numeric, float, double precision, or real type.
- In A-compatible mode, when an IDENTITY column of the integer type is created, the IDENTITY column is of the numeric type by default.
- The method of changing an IDENTITY column is the same as that of changing an ordinary column, but the type can be changed only to smallint, integer, bigint, decimal, numeric, float, double precision, or real.
- By default, the IDENTITY column has the NOT NULL constraint.
- A table can contain only one IDENTITY column.
- The method of deleting an IDENTITY column is the same as that of deleting an ordinary column. When a column is deleted, the implicit sequence of the IDENTITY column is automatically deleted.
- The IDENTITY column cannot be specified together with the SET DEFAULT action.
- The type of the implicit sequence that is automatically created is LARGE SEQUENCE.
- You cannot use DROP LARGE SEQUENCE or ALTER LARGE SEQUENCE to modify the implicit sequence of an identity.
- The [SCALE [EXTEND | NOEXTED] | NOSCALE] clause is available only when an IDENTITY column is created in a centralized system in A-compatible mode.
- In a fully-encrypted database, the encrypted IDENTITY column cannot be specified during table creation.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the value of this column is not specified (or the value of this column is set to **0**, **NULL**, or **DEFAULT**), the value of this column is automatically increased by the auto-increment counter.

If this column is inserted or updated to a value greater than the current auto-increment counter, the auto-increment counter is updated to this value after the command is executed successfully.

The initial auto-increment value is set by the AUTO_INCREMENT [=] value clause. If it is not set, the default value **1** is used.

NOTE

- The auto-increment column can be specified only when **sql_compatibility** is set to **'B'**.
- The data type of the auto-increment column can only be integer, 4-byte or 8-byte floating point, or Boolean.
  - An error occurs if the auto-increment continues after an auto-increment value reaches the maximum value of a column data type.
- Each table can have only one auto-increment column.
- It is recommended that the auto-increment column be the first column of an index. Otherwise, an alarm is generated when a table is created, and errors may occur when some operations are performed on a table that contains auto-increment columns, for example, ALTER TABLE EXCHANGE PARTITION.
- The DEFAULT value cannot be specified for an auto-increment column.
- The expression of the CHECK constraint cannot contain auto-increment columns, and the expression for generating columns cannot contain auto-increment columns.
- You can specify that the auto-increment column can be NULL. If it is not specified, the auto-increment column contains the NOT NULL constraint by default.
- When a table containing an auto-increment column is created, a sequence that depends on the column is created as an auto-increment counter. You are not allowed to modify or delete the sequence using sequence-related functions. You can view the value of the sequence. Do not make other sequences depend on or associate with this auto-increment column.
- Sequences are not created for auto-increment columns in local temporary tables.
- The auto-increment and refresh operations of the auto-increment counter are not rolled back.
  - Before data is inserted into a table, **0** or **NULL** triggers auto-increment. After data is inserted or updated to a table, the auto-increment counter is updated. If an error is reported after auto-increment and data is not inserted or updated to the table, the auto-increment counter does not roll back. Subsequent insert statements trigger auto-increment based on the auto-increment counter. As a result, the values of the auto-increment columns in the table are discontinuous.
  - If you insert or import reserved auto-increment cache values in batches, the values in the auto-increment column may be discontinuous. For details, see the description of the **auto_increment_cache** parameter.

- **[DEFAULT] CHARACTER SET | CHARSET [=] default_charset**

  Specifies the default character set of a table. If this parameter is specified separately, the default collation of the table is set to the default collation of the specified character set.

  This syntax is supported only when **sql_compatibility** is set to **'B'**.

- **[DEFAULT] COLLATE [=] default_collation**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the default collation of a table. If this parameter is specified separately, the default character set of the table is set to the character set corresponding to the specified collation.

This syntax is supported only when **sql_compatibility** is set to **'B'**. For details about the collation, see **Table 7-255**.

NOTE

If the character set or collation of a table is not explicitly specified and the default character set or collation of the schema is specified, the character set or collation of the table is inherited from the schema. If the default character set or collation of a schema does not exist, the character set and collation of the table inherit the character set and collation of the current database when **b_format_behavior_compat_options** contains **'default_collation'**.

- **UNIQUE [KEY] index_parameters**

  Specifies that a group of one or more columns of a table can contain only unique values.

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'B'**, which has the same semantics as UNIQUE.

- **UNIQUE [index_name][USING method]({{ column_name [(length)] | (expression) } [ASC | DESC] }[, ...]) index_parameters**

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a UNIQUE constraint, NULL is not considered equal.

  column_name (length) indicates the prefix key. For details, see **column_name (length)**.

  index_name indicates the index name.

  NOTICE

  - The **index_name** is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - For a UNIQUE KEY constraint, if both **constraint_name** and **index_name** are specified, the value of **index_name** is used as the index name.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY [USING method] ({ column_name [ASC | DESC] } [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

  Only one primary key can be specified for a table.

- **REFERENCES reftable [(refcolumn)] [MATCH matchtype] [ON DELETE action] [ON UPDATE action] (column constraint)**

  FOREIGN KEY (column_name [, ...]) REFERENCES reftable [(refcolumn [, ...])] [MATCH matchtype] [ON DELETE action] [ON UPDATE action] (table constraint)

  The FOREIGN KEY constraint requires that the group consisting of one or more columns in the new table should contain and match only the referenced column values in the referenced table. If **refcolumn** is omitted, the primary

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

key of **reftable** is used. The referenced column should be the only column or primary key in the referenced table. A FOREIGN KEY constraint cannot be defined between a temporary table and a permanent table.

There are three types of matching between a reference column and a referenced column:

- **MATCH FULL**: A column with multiple foreign keys cannot be **NULL** unless all foreign key columns are **NULL**.
- **MATCH SIMPLE** (default): Any unexpected foreign key column can be **NULL**.
- **MATCH PARTIAL**: This option is not supported currently.

In addition, when certain operations are performed on the data in the referenced table, the operations are performed on the corresponding columns in the new table. **ON DELETE**: specifies the operations to be executed after a referenced row in the referenced table is deleted. **ON UPDATE**: specifies the operation to be performed when the referenced column data in the referenced table is updated. Possible responses to the **ON DELETE** and **ON UPDATE** clauses are as follows:

- **NO ACTION** (default): When data is deleted or updated, an error indicating that the FOREIGN KEY constraint is violated is created. If the constraint is deferrable and there are still any referenced rows, this error will occur when the constraint is checked.
- **RESTRICT**: When data is deleted or updated, an error indicating that the FOREIGN KEY constraint is violated is created. It is the same as **NO ACTION** except that the constraint is not deferrable.
- **CASCADE**: deletes any row that references the deleted row from the new table, or update the column value of the referenced row in the new table to the new value of the referenced column.
- **SET NULL**: sets the referenced columns to **NULL**.
- **SET DEFAULT**: sets the referenced columns to their default values.

- **DEFERRABLE | NOT DEFERRABLE**

  Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, PRIMARY KEY constraints, and FOREIGN KEY constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  - If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
  - If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If not specified, the index is created in **default_tablespace**. If **default_tablespace** is empty, the default tablespace of the database is used.

- **ENCRYPTION_TYPE = encryption_type_value**

  For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption_type_value** is **DETERMINISTIC** or **RANDOMIZED**.

- **COLVIEW | NOCOLVIEW**

  Specifies an IMCV table or a non-IMCV table. For details, see section "Hybrid Transactional/Analytical Processing" in *Feature Guide*.

Examples

- Create an ordinary table.

```
gaussdb=# CREATE TABLE tbl_test1(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
);

gaussdb=# DROP TABLE tbl_test1;
```

- Use the WITH clause to set storage parameters for a table or index.

```
-- Create a table and specify fill factors.
gaussdb=# CREATE TABLE tbl_test2(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
) WITH (FILLFACTOR = 70);

-- Create a table and specify a storage engine.
gaussdb=# CREATE TABLE tbl_test3(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
) WITH (STORAGE_TYPE = ASTORE);

-- Drop.
gaussdb=# DROP TABLE tbl_test2;
gaussdb=# DROP TABLE tbl_test3;
```

- Use a temporary table.

```
-- Create a temporary table.
gaussdb=# CREATE GLOBAL TEMP TABLE test_t1(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),
    country   VARCHAR(30) DEFAULT 'China'
);

-- Insert data into the current session.
gaussdb=# INSERT INTO test_t1 VALUES ('0000009','Jack','Guangzhou','China');

-- The data in the temporary table is visible only in the current session. Therefore, the table does not contain data in another session.
gaussdb=# SELECT * FROM test_t1;
 id | name | province | country
----+------+----------+---------
(0 rows)
-- Create a temporary table and specify that this table is deleted when the transaction is committed.
gaussdb=# CREATE TEMPORARY TABLE test_t2(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
) ON COMMIT DELETE ROWS;
-- Drop tables.
gaussdb=# DROP TABLE test_t1;
gaussdb=# DROP TABLE test_t2;
```

- Specify a character set and collation during table creation.

```
-- Create a frontend database.
gaussdb=# CREATE DATABASE testdb1 DBCOMPATIBILITY = 'B' ENCODING = 'UTF8';
gaussdb=# \c testdb1

-- Create table t1. Set the default character set of t1 to utf8mb4 and the default collation to
utf8mb4_bin. Set the character set and collation of the c1 column to the default values of the table.
Set the character set of the c2 column to utf8mb4, and its collation to utf8mb4_unicode_ci.
testdb1=# CREATE TABLE t1(c1 text, c2 text charset utf8mb4 collate utf8mb4_unicode_ci) charset
utf8mb4 collate utf8mb4_bin;

-- Drop.
testdb1=# DROP TABLE t1;
testdb1=# \c postgres
gaussdb=# DROP DATABASE testdb1;
```

- IF NOT EXISTS keyword

  If this keyword is used, NOTICE is reported when the table does not exist. If this keyword is not used, ERROR is reported. In either case, the table fails to be created.

```
gaussdb=# CREATE TABLE test_t3(id INT);

-- Create a table named test_t3.
gaussdb=# CREATE TABLE test_t3(id INT);
ERROR:  Relation test_t3 already exists in schema public.
DETAIL:  Creating new table with existing name in the same schema.

-- Use the IF NOT EXISTS keyword.
gaussdb=# CREATE TABLE IF NOT EXISTS test_t3(id INT);
NOTICE:  Relation test_t3 already exists, skipping.
CREATE TABLE

-- Drop the table.
gaussdb=# DROP TABLE test_t3;
```

- Specifying a tablespace during table creation

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE ds_tbs1 RELATIVE LOCATION 'tablespace/tablespace_1';

-- Specify a tablespace when creating a table.
gaussdb=# CREATE TABLE test(id CHAR(7), name VARCHAR(20)) TABLESPACE ds_tbs1;

-- Drop the table and tablespace.
gaussdb=# DROP TABLE test;
gaussdb=# DROP TABLESPACE ds_tbs1;
```

- Specifying the AUTO_INCREMENT column during table creation

```
-- Create a table and specify an auto-increment column. The column starts from 10.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY = 'B';
gaussdb=# \c test
test=# CREATE TABLE test_autoinc(col int primary key AUTO_INCREMENT, col1 int)
AUTO_INCREMENT = 10;

-- You are advised to use the auto-increment column as the first column of the index to create an
index.
test=# CREATE INDEX test_autoinc_ai ON test_autoinc(col);

-- Enter NULL to trigger auto-increment. The auto-increment value is 10.
test=# INSERT INTO test_autoinc(col, col1) VALUES(NULL,1);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Enter 100. The auto-increment is not triggered. After the insertion is successful, the auto-increment count is updated to 100.
test=# INSERT INTO test_autoinc(col, col1) VALUES(100,2);

-- Enter 0 to trigger auto-increment. The auto-increment value is 101.
test=# INSERT INTO test_autoinc(col, col1) VALUES(0,3);

test=# SELECT col,col1 FROM test_autoinc ORDER BY 2,1;
 col | col1
-----+------
  10 |    1
 100 |    2
 101 |    3
(3 rows)

-- Drop.
test=# DROP TABLE test_autoinc;
-- Switch to the default database. Change the database name based on actual situation.
test=# \c postgres
gaussdb=# DROP DATABASE test;
```

- Creating a table using CREATE TABLE ... LIKE

```
-- Create the source table t1.
gaussdb=# CREATE TABLE t1(col INT);
CREATE TABLE

gaussdb=# \d t1
      Table "public.t1"
 Column |  Type   | Modifiers
--------+---------+-----------
 col    | integer |

-- Create the target table t2.
gaussdb=# CREATE TABLE t2(LIKE t1);
CREATE TABLE

gaussdb=# \d t2
      Table "public.t2"
 Column |  Type   | Modifiers
--------+---------+-----------
 col    | integer |

-- Drop.
gaussdb=# DROP TABLE t1,t2;
```

Examples of Creating a Table and Adding Constraints to the Table

- NOT NULL constraints

  If no value is specified for a column with a NOT NULL constraint when data is added, an error is reported. You can add NOT NULL constraints to multiple columns in a table.

```
-- Create a table and add a NOT NULL constraint to the id column.
gaussdb=# CREATE TABLE test_t4(
    id       CHAR(7) NOT NULL,
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
);

-- If the value of id is not specified or is NULL during data insertion, the NOT NULL constraint is triggered. As a result, the insertion fails.
gaussdb=# INSERT INTO test_t4 (name,province) VALUES ('scott','Shanghai');
ERROR:  Null value in column id violates not-null constraint.
DETAIL:  Failing row contains (null, scott, Shanghai, China).

-- Drop the table.
gaussdb=# DROP TABLE test_t4;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- UNIQUE constraint

  The keyword UNIQUE is used to add a UNIQUE constraint to a column. When data is inserted, the constraint is triggered if the column is duplicate. Multiple **NULL** values are not duplicate values. When a UNIQUE constraint is added, a unique index is automatically added. You can add UNIQUE constraints to multiple columns in a table.

```
-- Create a table to add UNIQUE constraints.
gaussdb=# CREATE TABLE test_t5(
    id       CHAR(7) UNIQUE USING INDEX TABLESPACE pg_default,
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
);

-- You can also use the following method to manually name a UNIQUE constraint and add constraints
for multiple columns:
gaussdb=# CREATE TABLE test_t6(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                     -- Province
    country   VARCHAR(30) DEFAULT 'China',        -- Country
    CONSTRAINT unq_test_id UNIQUE (id,name)
);
-- When data with duplicate IDs is inserted, constraints are triggered. As a result, the insertion fails.
gaussdb=# INSERT INTO test_t5(id) VALUES('0000010');
INSERT 0 1
gaussdb=# INSERT INTO test_t5(id) VALUES('0000010');
ERROR:  Duplicate key value violates unique constraint "test_t5_id_key".
DETAIL:  Key (id)=(0000010) already exists.
-- The constraint is not triggered when data whose id is NULL is inserted for multiple times.
gaussdb=# INSERT INTO test_t5(id) VALUES (NULL);
INSERT 0 1
gaussdb=# INSERT INTO test_t5(id) VALUES (NULL);
INSERT 0 1

-- Drop tables.
gaussdb=# DROP TABLE test_t5;
gaussdb=# DROP TABLE test_t6;
```

- Primary key constraints

  The keyword PRIMARY KEY is used to add a UNIQUE constraint to a column. The column must be unique and cannot be empty. When a PRIMARY KEY constraint is added, a unique index is automatically created for the table, and a NOT NULL constraint is automatically added for the column.

  Only one PRIMARY KEY constraint can be defined in each table.

```
-- Create a table and add a PRIMARY KEY constraint to the table.
gaussdb=# CREATE TABLE test_t6(
    id       CHAR(7) PRIMARY KEY,
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
);
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES ('0000001','july','Beijing');

-- You can also use the following method to manually name a UNIQUE constraint and add constraints
for multiple columns:
gaussdb=# CREATE TABLE test_t7(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China',        -- Country
    CONSTRAINT pk_test_t6_id PRIMARY KEY (id,name)
);
-- Insert data whose id is NULL to trigger the constraint.
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES (NULL,'july','Beijing');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ERROR:  Null value in column id violates not-null constraint.
DETAIL:  Failing row contains (null, july, Beijing, China).

-- Insert data with duplicate id values to trigger the constraint.
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES ('0000001','ben','Shanghai');
ERROR:  Duplicate key value violates unique constraint "test_t6_pkey".
DETAIL:  Key (id)=(0000001) already exists.
-- Drop the tables.
gaussdb=# DROP TABLE test_t6;
gaussdb=# DROP TABLE test_t7;
```

- Check constraints

  The keyword CHECK adds a constraint to a column. The CHECK constraint must reference one or more columns in the table, and the result returned by the expression must be a Boolean value. Currently, expressions cannot contain subqueries. Both CHECK and NOT NULL constraints can be defined for the same column.

```
-- Create a table and add check constraints.
gaussdb=# CREATE TABLE test_t8 (
    id       CHAR(7),
    name     VARCHAR(20),
    age      INT CHECK(age > 0 AND age < 150)
);

-- Or run the following SQL statements to manually name check constraints and add check
constraints for one or more columns:
gaussdb=# CREATE TABLE test_t9 (
    id       CHAR(7),
    name     VARCHAR(20),
    age      INT,
    CONSTRAINT chek_test_t8_age CHECK(age > 0 AND age < 150)
);
-- If a value that does not comply with the expression is inserted, the CHECK constraint is triggered.
As a result, the insertion fails.
gaussdb=# INSERT INTO test_t8 (id,name,age) VALUES ('0000007','scott',200);
ERROR:  New row for relation test_t8 violates check constraint test_t8_age_check.
DETAIL:  N/A
-- Drop the tables.
gaussdb=# DROP TABLE test_t8;
gaussdb=# DROP TABLE test_t9;
```

- Foreign key constraints

  When two tables contain one or more public columns, you can use foreign key constraints to enforce the relationship between the two tables.

  - **FOREIGN KEY**: columns that are related to the referenced table.
  - **REFERENCES**: columns that are related to the referenced table and the original table.

  Foreign key constraints have the following features:

  - A column defined as a FOREIGN KEY constraint can contain only the values of the referenced columns in other tables or **NULL**.
  - You can define foreign key constraints for one or more columns.
  - A column that defines a FOREIGN KEY constraint and the corresponding referenced column can exist in the same table, which is called self-reference.
  - Both FOREIGN KEY and NOT NULL constraints can be defined for the same column.
  - Columns to be applied in the main table must have PRIMARY KEY constraints or UNIQUE constraints.

```
-- Create a department table.
gaussdb=# CREATE TABLE dept(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    deptno INT PRIMARY KEY,
    loc VARCHAR(200)
);

-- Create an employee table, add foreign key constraints, and depend on the deptno column in the
department table.
gaussdb=# CREATE TABLE emp(
    empno INT,
    name VARCHAR(50),
    deptno INT,
    CONSTRAINT fk_emp FOREIGN KEY (deptno) REFERENCES dept(deptno)
);
-- Insert data to the dept table.
gaussdb=# INSERT INTO dept VALUES (10,'Beijing');
gaussdb=# INSERT INTO dept VALUES (20,'Beijing');
gaussdb=# INSERT INTO dept VALUES (30,'Shanghai');

-- Insert data that meets the constraints into the emp table.
gaussdb=# INSERT INTO emp VALUES (1,'Bob',10);

-- Insert data whose deptno column is NULL into the emp table.
gaussdb=# INSERT INTO emp VALUES (2,'Scott',NULL);

-- Insert data that does not meet the constraints into the emp table. (The deptno column is 999 and
cannot be found in the dept table.)
gaussdb=# INSERT INTO emp VALUES (1,'Jack',999);
ERROR:  insert or update on table "emp" violates foreign key constraint "fk_emp"
DETAIL:  Key (deptno)=(999) is not present in table "dept".
-- View data.
gaussdb=# SELECT * FROM emp;
 empno | name  | deptno
-------+-------+--------
     1 | Bob   |     10
     2 | Scott |
(2 rows)
-- Drop the tables.
gaussdb=# DROP TABLE emp;
gaussdb=# DROP TABLE dept;
```

Helpful Links

ALTER TABLE, **DROP TABLE**, and **CREATE TABLESPACE**

Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
- LIKE
  - The target table automatically inherits all column names, data types, and NOT NULL constraints from this table. The target table is irrelevant to the source table after the creation.
- LIKE INCLUDING DEFAULTS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The default expressions are copied from the source table to the target table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the target table having default values **NULL**.
- LIKE INCLUDING CONSTRAINTS
  - The CHECK constraints are copied from the source table to the target table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the target table. NOT NULL constraints are always copied to the target table. These rules also apply to column constraints and table constraints.
- LIKE INCLUDING INDEXES
  - Any indexes on the source table will not be created on the target table, unless the **INCLUDING INDEXES** clause is specified.
- LIKE INCLUDING STORAGE
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- LIKE INCLUDING COMMENTS
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- LIKE INCLUDING PARTITION
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the target table, and the target table no longer uses the PARTITION BY clause. By default, the partition definition of the source table is not copied.

NOTICE

List and hash partitioned tables do not support **LIKE INCLUDING PARTITION**.

- LIKE INCLUDING RELOPTIONS
  - If **INCLUDING RELOPTIONS** is specified, the target table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- LIKE INCLUDING IDENTITY
  - If **INCLUDING IDENTITY** is specified, a SEQUENCE with the same **SEQUENCE** parameter as the source table is created to implement the identity, and the IDENTITY type is the same as that of the source table. By default, the identity of the source table is not copied.
- LIKE INCLUDING ALL
  - **INCLUDING ALL** contains the content of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING IDENTITY**, and **INCLUDING ILM**.
- ORIENTATION ROW

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Creates a row-store table. Row store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row store can improve the efficiency.

7.12.9.49 CREATE TABLE AS

Description

Creates a table from the results of a query.

It creates a table and fills it with data obtained using SELECT. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

CREATE TABLE AS queries a source table once and writes the data in a new table. This table will not change according to the source table. In contrast, the view re-computes and defines its SELECT statement at each query.

Precautions

- The table created in this way inherits only the names and data types of the SELECT output columns.
- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

Syntax

```
CREATE [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] TABLE [ IF NOT EXISTS ] table_name
    [ (column_name [, ...] ) ]
    [ { ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } } [ [ , ] ... ] ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
    [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]]
    [ TABLESPACE tablespace_name ]
    AS query
    [ WITH [ NO ] DATA ];
```

Parameters

- **UNLOGGED**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

- Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
- Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

  If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

  The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using ON COMMIT PRESERVE ROWS or ON COMMIT DELETE ROWS. The former one creates a session-level table, where user data is automatically cleared when a session ends; the latter creates a transaction-level table, where user data is automatically cleared when a COMMIT or ROLLBACK operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with pg_temp when creating a global temporary table.

  A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. TEMP is equivalent to TEMPORARY.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Local temporary tables are visible to the current session through the schema starting with **pg_temp**. Users should not delete schema started with **pg_temp** or **pg_toast_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table and its schema is set to that starting with pg_temp in the current session, the table will be created as a temporary table.
- If global temporary tables or indexes are being used by other sessions, do not perform ALTER or DROP on the tables or indexes.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, TRUNCATE, REINDEX, and ANALYZE are valid only for the current session.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a table. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **table_name**

  Specifies the name of the table to be created.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  (Optional) Specifies the name of a column to be created in the new table. If no column name is specified, the columns in the new table are the same as those entered in the SELECT statement.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **ENGINE**

  Supported in B-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. See details of parameters below.

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. If the Astore is used, the default value is **100** (completely filled). When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row–store tables.

    Value range: 10–100.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- ORIENTATION

  Value range:

  ROW (default value): The data will be stored in rows.

- COMPRESSION

  Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

  Value range:

  This parameter is available only to column-store compression.

- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**

- autovacuum_vacuum_threshold

  Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 1000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

– autovacuum_freeze_max_age

Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

Value range: 100000 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

– autovacuum_freeze_table_age

Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

Value range: 0 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

  ON COMMIT determines what to do when you commit a temporary table creation operation. Currently, only **PRESERVE ROWS** and **DELETE ROWS** are supported.

  – **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.

  – **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store.

  – AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.

  – ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

  > NOTE
  >
  > Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **AS query**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[WITH [NO] DATA]**

  Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

Examples

- If no column name is specified, the columns in the new table are the same as those queried in the SELECT statement.

```
-- Create the test1 table and insert two records into the table.
gaussdb=# CREATE TABLE test1(col1 int PRIMARY KEY,col2 varchar(10));
gaussdb=# INSERT INTO test1 VALUES (1,'col1'),(101,'col101');
-- Query the data whose col1 is less than 100 in the table.
gaussdb=# SELECT * FROM test1 WHERE col1 < 100;
 col1 | col2
------+------
    1 | col1
(1 row)

-- Create the test2 table and insert the queried data into the table.
gaussdb=# CREATE TABLE test2 AS SELECT * FROM test1 WHERE col1 < 100;

-- Query the structure of the test2 table.
gaussdb=# \d test2;
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 col1   | integer               |
 col2   | character varying(10) |
```

- Specify column names for the new table.

```
-- Use test1 to copy a new table test3 and specify column names.
gaussdb=# CREATE TABLE test3(c1,c2) AS SELECT * FROM test1;

-- Query the structure of the test3 table.
gaussdb=# \d test3
            Table "public.test3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 c1     | integer               |
 c2     | character varying(10) |

-- Drop.
gaussdb=# DROP TABLE test1,test2,test3;
```

- Specify a compression policy for the new table.

```
gaussdb=# CREATE TABLE old_table (a int);

-- Enable the ILM feature of the database.
gaussdb=# ALTER DATABASE SET ILM = on;

gaussdb=# CREATE TABLE ilm_table
    ILM ADD POLICY ROW STORE COMPRESS ADVANCED
    ROW AFTER 3 MONTHS OF NO MODIFICATION
    AS (SELECT * FROM old_table);

-- Drop.
gaussdb=# DROP TABLE old_table,ilm_table;
```

CREATE TABLE and **SELECT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.50 CREATE TABLE PARTITION

Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, interval partitioning, hash partitioning, and list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions. Currently, range partitioning only allows the use of the range partitioning policy.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

Interval partitioning is a special type of range partitioning. Compared with range partitioning, interval value definition is added. When no matching partition can be found for an inserted record, a partition can be automatically created based on the interval value.

Interval partitioning supports only table-based partitioning of a list where the data type can be TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE] and DATE.

Interval partitioning policy: A record is mapped to a created partition based on the partition key value. If the record can be mapped to a created partition, the record is inserted into the corresponding partition. Otherwise, a partition is automatically created based on the partition key value and table definition information, and then the record is inserted into the new partition. The data range of the new partition is equal to the interval value.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

do not overlap in different partitions. A partition is created for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- When you query or update most of the records in a partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or deleting that partition. This not only improves performance but also avoids the VACUUM overload caused by bulk DELETE operations (hash partitions cannot be deleted).

Precautions

- If the constraint key of the UNIQUE constraint and PRIMARY KEY constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning supports only single-column partition keys, and does not support multi-column partition keys.
- When you have the INSERT permission on an interval partitioned table, partitions can be automatically created when you run INSERT to write data to the table.
- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 1048575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient memory. Create partitions based on the value of **local_syscache_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local_syscache_threshold**. In addition, some space must be reserved for other functions.
- Considering the impact on performance, it is recommended that the maximum number of partitions in a single table be less than or equal to 2000 and the number of subpartitions multiplied by (Number of local indexes + 1) be less than or equal to 10000.
- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Currently, the statement specifying a partition cannot perform global index scan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Data of the XML type cannot be used as partition keys or level-2 partition keys.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

Syntax

```
CREATE TABLE [ IF NOT EXISTS ] partition_table_name
{ ( [
   { column_name data_type [ CHARACTER SET | CHARSET charset ] [ COLLATE collation ]
[ column_constraint [ ... ] ]
   | table_constraint
   | LIKE source_table [ like_option [...] ] }
   [, ... ]
] )
   | LIKE source_table }
   [ table_option [ [ , ] ... ] ]
   [ htap_option ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]]
   [ TABLESPACE tablespace_name ]
    PARTITION BY {
      {RANGE [COLUMNS] (partition_key) [ INTERVAL (interval_expr) [ STORE IN (tablespace_name
[, ... ] ) ] ] [ PARTITIONS integer ] ( partition_less_than_item [, ... ] )} |
      {RANGE [COLUMNS] (partition_key) [ INTERVAL (interval_expr) [ STORE IN (tablespace_name
[, ... ] ) ] ] [ PARTITIONS integer ] ( partition_start_end_item [, ... ] )} |
      {LIST [COLUMNS] (partition_key) [ AUTOMATIC ] [ PARTITIONS integer ] ( PARTITION
partition_name VALUES [IN] (list_values) [
ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]] [ { COLVIEW | NOCOLVIEW } [ PRIORITY { HIGH | LOW | NONE } ] ]
[TABLESPACE [=] tablespace_name
][, ... ])} |
      {{ HASH | KEY } (partition_key) [ PARTITIONS integer ] ( PARTITION partition_name [
ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]] [ { COLVIEW | NOCOLVIEW } [ PRIORITY { HIGH | LOW | NONE } ] ]
[TABLESPACE [=] tablespace_name
][, ... ])}
   } [ { ENABLE | DISABLE } ROW MOVEMENT ];
```

- **table_option** is as follows:

  ```
  { COMMENT [ = ] 'string' |
    AUTO_INCREMENT [ = ] value |
    [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default_charset |
    [ DEFAULT ] COLLATE [ = ] default_collation |
     ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" }  }
  ```

- **htap_option** is as follows:

  ```
  { COLVIEW [ PRIORITY { HIGH | LOW | NONE } ] |
    NOCOLVIEW [ PRIORITY { HIGH | LOW | NONE } ]}
  ```

- **column_constraint** is as follows:

  ```
  [ CONSTRAINT constraint_name ]
  { NOT NULL |
    NULL |
    CHECK ( expression ) |
    DEFAULT default_expr |
    ON UPDATE update_expr |
  ```

    [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **table_constraint** is as follows:

```
[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
  UNIQUE [ index_name ][ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] )
index_parameters |
  PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters |
  FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
     [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
{ [ COMMENT 'string' ] [ ... ] }
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | RELOPTIONS| UPDATE | IDENTITY | ILM | ALL }
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- **partition_less_than_item** is as follows:

```
PARTITION partition_name VALUES LESS THAN { ( { partition_value | MAXVALUE } [, ... ] ) |
MAXVALUE } [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month |
year } OF NO MODIFICATION [ ON ( EXPR )]] [ { COLVIEW | NOCOLVIEW } [ PRIORITY { HIGH | LOW
| NONE } ] ][TABLESPACE [=] tablespace_name]
```

- **partition_start_end_item** is as follows:

```
PARTITION partition_name {
      {START(partition_value) END (partition_value) EVERY (interval_value)} |
      {START(partition_value) END ({partition_value | MAXVALUE})} |
      {START(partition_value)} |
      {END({partition_value | MAXVALUE})}
} [
ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]] [ { COLVIEW | NOCOLVIEW } [ PRIORITY { HIGH | LOW | NONE } ] ]
[TABLESPACE [=] tablespace_name
]
```

- **update_expr** is as follows:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

- **identity_options** is as follows:

```
[ INCREMENT [ BY ] increment ] [ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ]
[ MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE ]
[ START [ WITH ] start ] [ CACHE cache | NOCACHE ] [ [ NO ] CYCLE | NOCYCLE ] [ SCALE [ EXTEND
| NOEXTEND ] | NOSCALE ]
```

Parameters

- **IF NOT EXISTS**

  Sends a notice instead of throwing an error, if a table with the same name exists.

- **partition_table_name**

  Specifies the name of a partitioned table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **column_name**

  Specifies the name of a column to be created in the new table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **data_type**

  Specifies the data type of the column.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation;** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **CONSTRAINT constraint_name**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

  There are two ways to define constraints:

  – A column constraint is defined as part of a column definition, and it is bound to a particular column. You cannot add a constraint name to the clause AUTO_INCREMENT | COMMENT 'string' | ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE = encryption_type_value).

  – A table constraint is not bound to a particular column but can apply to more than one column. The constraint_name is optional in B-compatible mode (**sql_compatibility = 'B'**). For other modes, constraint_name must be added.

- **index_name**

  Index name

  NOTICE

  - The **index_name** is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - For foreign key constraints, if constraint_name and index_name are specified at the same time, constraint_name is used as the index name.
  - For a UNIQUE KEY constraint, if both **constraint_name** and **index_name** are specified, the value of **index_name** is used as the index name.

- **USING method**

  Specifies the name of the index method to be used.

  For details about the value range, see USING method in **Parameters**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The USING method is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
- In B-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.

- **ASC | DESC**

  ASC specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

NOTICE

The ASC|DESC is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).

- **LIKE source_table [like_option ...]**

  Specifies a table from which a new table automatically copies all column names, their data types, and their NOT NULL constraints.

  The new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

  - Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
  - If **INCLUDING UPDATE** is specified, the **ON UPDATE CURRENT_TIMESTAMP** attribute of the original table column is copied to the new table column. By default, this attribute is not copied.
  - If **INCLUDING GENERATED** is specified, the generated expression of the original table column is copied to the new table. By default, the generated expression is not copied.
  - NOT NULL constraints are always copied to the new table. CHECK constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

  The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
  - If **INCLUDING STORAGE** is specified, the **STORAGE** setting of the original table column is also copied. By default, the **STORAGE** setting is not included.
  - If **INCLUDING COMMENTS** is specified, comments of the original table columns, constraints, and indexes are also copied. The default behavior is to exclude comments.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If **INCLUDING RELOPTIONS** is specified, the storage parameters (WITH clauses) of the original table are also copied to the new table. The default behavior is to exclude partition definition of the storage parameter of the original table.
  - If **INCLUDING IDENTITY** is specified, the IDENTITY function of the original table is copied to the new table, and a SEQUENCE with the same **SEQUENCE** parameter as that of the original table is created. By default, the IDENTITY function of the original table is not copied.
  - If **INCLUDING ILM** is specified, the ILM policy information of a source table is copied to the target table. To copy the ILM policy information of partition objects in the source table, specify **INCLUDING PARTITION**.
  - **INCLUDING ALL** contains the content of **INCLUDING DEFAULTS**, **INCLUDING UPDATE**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING IDENTITY**, and **INCLUDING ILM**.

NOTICE

- The CREATE TABLE table_name LIKE source_table syntax is supported only when **sql_compatibility** is set to **'B'** (B-compatible database), **b_format_version** is set to **5.7**, and **b_format_dev_version** is set to **s2**.
- In a B-compatible database, if **b_format_version** is set to **5.7** and **b_format_dev_version** is set to **s2**, **INCLUDING** and **EXCLUDING** cannot be specified. In this case, it is equivalent to specify **INCLUDING ALL** by default.

- **AUTO_INCREMENT [=] value**

  This clause specifies an initial value for an auto-increment column. The value must be a positive integer and cannot exceed $2^{127} - 1$.

NOTICE

This clause takes effect only when **sql_compatibility** is set to **'B'**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - The COMMENT 'string' in column_constraint indicates that comments are added to a column.
  - The COMMENT 'string' in table_constraint indicates that comments are added to the indexes corresponding to the primary key and unique key.

  For details, see **COMMENT [=] 'string'**.
- **CHARACTER SET | CHARSET charset**

  Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

  This syntax is supported only in B-compatible databases (that is, **sql_compatibility** is set to **'B'**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result. In B-compatible databases (that is, **sql_compatibility = 'B'**), **utf8mb4_bin**, **utf8mb4_general_ci**, **utf8mb4_unicode_ci**, **binary**, **gbk_chinese_ci**, **gbk_bin**, **gb18030_chinese_ci**, and **gb18030_bin** are also supported.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. If the Astore is used, the default value is **100** (completely filled). When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

    Value range: 10 to 100

  – ORIENTATION

    Determines the data storage mode of the table.

    Value range:

    ROW (default value): The data will be stored in rows.

    NOTICE

    ORIENTATION cannot be modified.

  – STORAGE_TYPE

    Specifies the storage engine type. This parameter cannot be modified once it is set.

    Value range:

    - **USTORE** indicates that tables support the in-place update storage engine. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
    - **ASTORE** indicates that tables support the append-only storage engine.

    Default value:

    If this parameter is not specified, the **enable_default_ustore_table** parameter determines the storage engine mode, which is inplace-update storage by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COMPRESSION
  - This parameter is available only to column-store compression.
- segment

  The data is stored in segment-page mode. This parameter supports only row-store tables. Temporary tables and unlogged tables are not supported.

  Value range: **on** and **off**

  Default value: **off**
- statistic_granularity

  Specifies the default **partition_mode** of a table during statistics analysis. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

  Value range: See the value range of **partition_mode**.

  Default value: **AUTO**.
- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**
- autovacuum_vacuum_threshold

  Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.
- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  The value ranges from **0** to **2147483647**.

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.
- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.
- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

– autovacuum_freeze_min_age

Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

Value range: 0 to 1000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

– autovacuum_freeze_max_age

Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

Value range: 100000 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

– autovacuum_freeze_table_age

Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

Value range: 0 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store. Partitions inherit the policy of the table.

  – AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.

  – ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **PARTITION BY RANGE [COLUMNS] (partition_key)**

  Creates a range partition. **partition_key** is the name of the partition key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The COLUMNS keyword can be used only when **sql_compatibility** is set to **'B'**. The semantics of PARTITION BY RANGE COLUMNS is the same as that of PARTITION BY RANGE.

(1) Assume that the VALUES LESS THAN syntax is used.

NOTICE

If the VALUES LESS THAN clause is used, a range partitioning policy supports a partition key with up to 16 columns.

Data types supported by the partition keys are as follows: TINYINT, SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, CHARACTER VARYING(n), VARCHAR(n), CHARACTER(n), CHAR(n), CHARACTER, CHAR, TEXT, NVARCHAR, NVARCHAR2, NAME, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.

(2) Assume that the START END syntax is used.

NOTICE

In this case, only one partition key is supported.

Data types supported by the partition key are as follows: TINYINT, SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.

(3) Assume that the INTERVAL syntax is used.

NOTICE

If the INTERVAL clause is specified, the range partitioning supports only one partition key.

In this case, the data types supported by the partition key are TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE] and DATE.

- **PARTITION partition_name VALUES LESS THAN {({ partition_value | MAXVALUE } [,...]) | MAXVALUE }**

  Specifies the information of partitions. **partition_name** is the name of a range partition. **partition_value** is the upper limit of a range partition, and the value depends on the type of **partition_key**. *MAXVALUE* usually specifies the upper limit of the last range partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Each partition requires an upper limit.
- The data type of the upper limit must be the same as that of the partition key.
- In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.
- MAVALUE that is not in parentheses can be used only when **sql_compatibility** is set to **'B'** and can have only one partition key.

- **PARTITION partition_name {START (partition_value) END (partition_value) EVERY (interval_value)} | {START (partition_value) END (partition_value|MAXVALUE)} | {START(partition_value)} | {END (partition_value | MAXVALUE)}**

  Specifies the information of partitions.

  - **partition_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition_name** is **p1**):
    - If **START**+**END**+**EVERY** is used, the names of partitions will be defined as **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1_1**, **p1_2**, and **p1_3**. In this case, **p1** is a name prefix.
    - If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition, and its name will be **p1_0**. The other partitions are then named **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1_0**, **p1_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.
  - **partition_value**: start value or end value of a range partition. The value depends on **partition_key** and cannot be *MAXVALUE*.
  - **interval_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** – **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
  - *MAXVALUE* usually specifies the upper limit of the last range partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The START END syntax must comply with the following rules:
   - The value of **START** (if any, same for the following situations) in each **partition_start_end_item** must be smaller than that of **END**.
   - In two adjacent **partition_start_end_item** statements, the value of the first **END** must be equal to that of the second **START**.
   - The value of **EVERY** in each **partition_start_end_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
   - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
   - Partitions created by the same **partition_start_end_item** belong to the same tablespace.
   - If **partition_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
   - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
3. In statements for creating partitioned tables, START END and LESS THAN cannot be used together.
4. The START END syntax in a partitioned table creation SQL statement will be replaced by the VALUES LESS THAN syntax when gs_dump is executed.

- **INTERVAL (interval_expr) [STORE IN (tablespace_name [, ...])]**

  Defines interval partitioning.

  – **interval_expr**: interval for automatically creating partitions. The value must comply with the value type of **partition_key**. Currently, only the numeric type and date/time type are supported, for example, **1 day** and **1 month**.

  – **STORE IN (tablespace_name [, ...])**: specifies the list of tablespaces for storing automatically created partitions. If this parameter is specified, the automatically created partitions are cyclically selected from the tablespace list. Otherwise, the default tablespace of the partitioned table is used.

- **PARTITION BY LIST [COLUMNS] (partition_key)**

  Create a list partition. **partition_key** is the name of the partition key.

  The keyword COLUMNS can be used only when **sql_compatibility** is set to **'B'**. The semantics of PARTITION BY LIST COLUMNS is the same as that of PARTITION BY LIST.

  – A list partitioning policy supports a partition key with up to 16 columns.

  – For the clause syntax VALUES [IN] (list_values), if **list_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The clause VALUES IN can be used only when **sql_compatibility** is set to **'B'**. The semantics is the same as that of **VALUES**.

  Partition keys support the following data types: TINYINT, SMALLINT, INTEGER, BIGINT, NUMERIC, VARCHAR(n), CHAR, BPCHAR, NVARCHAR, NVARCHAR2, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition_key)**

  Create a hash partition. **partition_key** is the name of the partition key.

  For **partition_key**, the hash partitioning policy supports only one column of partition keys.

  Partition keys support the following data types: TINYINT, SMALLINT, INTEGER, BIGINT, NUMERIC, VARCHAR(n), CHAR, BPCHAR, TEXT, NVARCHAR, NVARCHAR2, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY KEY(partition_key)**

  This parameter can be used only when **sql_compatibility** is set to **'B'**. The semantics is the same as that of **PARTITION BY HASH(partition_key)**.

- **AUTOMATIC**

  If keyword **AUTOMATIC** is specified when a table is created, the automatic partitioning function of list partitions is enabled. By default, the automatic partitioning function is disabled. Only list partitions can use the automatic partitioning function.

  After the automatic partitioning function is enabled, if the inserted data cannot match an existing partition, an independent partition is automatically created.

- **PARTITIONS integer**

  Specifies the number of partitions.

  integer indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

  - When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql_compatibility** is set to **'B'**.
  - When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

  Specifies whether to enable row movement.

  If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE** (default value): Row movement is enabled.
- **DISABLE**: Row movement is disabled.

If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

The old data is marked as deleted in the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, as well as UPDATE and DELETE concurrency.

a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

   - If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.
   - If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

   - If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.
   - If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

  Forbids NULL values in columns. **ENABLE** can be omitted.

- **NULL**

  Allows to contain NULL values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [NO INHERIT]**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

ENABLE can be omitted.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **ON UPDATE update_expr**

  The ON UPDATE clause is an attribute constraint of a column.

  When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This attribute can be specified only in B-compatible database 5.7 (that is, **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**).
- In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also specify or not specify the precision of a keyword with parentheses. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. The three types of keywords are synonyms of each other and have the same attribute effect.
- This attribute can be specified only for columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime.
- The CREATE TABLE AS syntax does not inherit the column attributes.
- The CREATE TABLE LIKE syntax can use INCLUDING UPDATE or EXCLUDING UPDATE to inherit or exclude a constraint. The INCLUDING ILM option is added to copy the ILM policy information of the old table. This option is used together with the INCLUDING PARTITION option to copy the policy information of partition objects in the old table.
- The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, **CREATE TABLE t1 (col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3));**. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
- The same column cannot be specified for this attribute and the generated column constraint at the same time.
- This attribute cannot be specified for the partition key in a partitioned table.

- **GENERATED ALWAYS AS (generation_expr) [STORED]**

  This clause creates a column as a generated column. The value of the generated column is calculated by **generation_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored like an ordinary column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause together. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause together.
- The method of modifying and deleting generated columns is the same as that of ordinary columns. If you delete an ordinary column that a generated column depends on, the generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for ordinary columns.

- **GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [(identity_options)]**

  Creates a column as an IDENTITY column. An implicit sequence is automatically created based on identity_options and attached to a specified column. When data is inserted, the value obtained from the sequence is automatically assigned to the column.

  – **GENERATED ALWAYS AS IDENTITY**: Only identity values provided by the sequence generator can be inserted into this column. User-specified values cannot be inserted into this column.

  – **GENERATED BY DEFAULT AS IDENTITY**: User-specified values are preferentially inserted into this column. If no value is specified, the identity values provided by the sequence generator are inserted.

  – **GENERATED BY DEFAULT ON NULL AS IDENTITY**: User-specified values are preferentially inserted into this column. If a null value is specified or no value is specified, the identity values provided by the sequence generator are inserted.

  The optional identity_options clause can be used to override sequence options.

  – **increment**: specifies the implicit sequence step. If the value is a positive number, an ascending sequence is generated. If the value is a negative number, a descending sequence is generated. The default value is **1**.

  – **MINVALUE minvalue | NO MINVALUE | NOMINVALUE**: specifies the minimum value of an execution sequence. If **minvalue** is not specified or **NO MINVALUE** is specified, the default value of an ascending sequence is **1**, and the default value of a descending sequence is **$-10^{27} + 1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

  – **MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE**: specifies the maximum value of an execution sequence. If **maxvalue** is not specified or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NO MAXVALUE is specified, the default value of an ascending sequence is 10^{28} **– 1**, and the default value of a descending sequence is **–1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start** specifies the start value of an implicit sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**: specifies the number of sequences stored in the memory for quick access purposes. The default value is **1**, indicating that only one value can be generated at a time, that is, no cache is generated.
- **NOCACHE**: No value of the sequence is stored in advance.
- **CYCLE**: recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**. If **NO CYCLE** is declared, any call to nextval returns an error after the sequence reaches its maximum or minimum value. **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.
- **SCALE**: enables sequence scalability. If specified, a numeric offset is appended to the beginning of the sequence to prevent duplicate items in the generated value. If **NOSCALE** is declared, sequence scalability is disabled. The default value is **NOSCALE**.
- **EXTEND**: extends the numeric offset length (default value: **6**), aligns the sequence generation value to **x** (default value: **6**) + **y** (maximum number of digits). **SCALE** must be specified when **EXTEND** is specified. If **NOEXTEND** is declared, the numeric offset length is not extended. The default value is **NOEXTEND**.

NOTE

- The IDENTITY column can only be of the smallint, integer, bigint, decimal, numeric, float, double precision, or real type.
- In A-compatible mode, when an IDENTITY column of the integer type is created, the IDENTITY column is of the numeric type by default.
- The method of changing an IDENTITY column is the same as that of changing an ordinary column, but the type can be changed only to smallint, integer, bigint, decimal, numeric, float, double precision, or real.
- By default, the IDENTITY column has the NOT NULL constraint.
- A table can contain only one IDENTITY column.
- The method of deleting an IDENTITY column is the same as that of deleting an ordinary column. When a column is deleted, the implicit sequence of the IDENTITY column is automatically deleted.
- The IDENTITY column cannot be specified together with the SET DEFAULT action.
- The type of the implicit sequence that is automatically created is LARGE SEQUENCE.
- You cannot use DROP LARGE SEQUENCE or ALTER LARGE SEQUENCE to modify the implicit sequence of an identity.
- The [SCALE [EXTEND | NOEXTED] | NOSCALE] clause is available only when an IDENTITY column is created in a centralized system in A-compatible mode.
- In a fully-encrypted database, the encrypted IDENTITY column cannot be specified during table creation.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

  For details, see **AUTO_INCREMENT**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **UNIQUE [KEY] index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a UNIQUE constraint, NULL is not considered equal.

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'B'**, which has the same semantics as UNIQUE.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY (column_name [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

  Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

  Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, PRIMARY KEY constraints, and FOREIGN KEY constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  – If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.

  – If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace_name**

  Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If not specified, the index is created in **default_tablespace**. If **default_tablespace** is empty, the default tablespace of the database is used.

- **COLVIEW | NOCOLVIEW**

  Specifies whether to load IMCV for a table or partition. For details, see section "Hybrid Transactional/Analytical Processing" in *Feature Guide*.

Examples of Range Partitioning

- VALUES LESS THAN

```
-- Create a tablespace.
CREATE TABLESPACE tbs_test_range1_p1 RELATIVE LOCATION 'tbs_test_range1/tablespace_1';
CREATE TABLESPACE tbs_test_range1_p2 RELATIVE LOCATION 'tbs_test_range1/tablespace_2';
CREATE TABLESPACE tbs_test_range1_p3 RELATIVE LOCATION 'tbs_test_range1/tablespace_3';
CREATE TABLESPACE tbs_test_range1_p4 RELATIVE LOCATION 'tbs_test_range1/tablespace_4';

-- Create a partitioned table test_range1.
CREATE TABLE test_range1(
    id INT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    info VARCHAR(20)
) PARTITION BY RANGE (id) (
    PARTITION p1 VALUES LESS THAN (200) TABLESPACE tbs_test_range1_p1,
    PARTITION p2 VALUES LESS THAN (400) TABLESPACE tbs_test_range1_p2,
    PARTITION p3 VALUES LESS THAN (600) TABLESPACE tbs_test_range1_p3,
    PARTITION pmax VALUES LESS THAN (MAXVALUE) TABLESPACE tbs_test_range1_p4
);

-- Insert 1000 data records.
INSERT INTO test_range1 VALUES(GENERATE_SERIES(1,1000),'abcd');

-- Check that the number of rows in the p1 partition is 199, that is, the record range is [1, 200).
SELECT COUNT(*) FROM test_range1 PARTITION (p1);
 count
-------
   199
(1 row)

-- Check that the number of rows in the p2 partition is 200, that is, the record range is [200, 400).
SELECT COUNT(*) FROM test_range1 PARTITION (p2);
 count
-------
   200
(1 row)

-- View the partition information.
SELECT a.relname, a.boundaries, b.spcname
FROM pg_partition a, pg_tablespace b
WHERE a.reltablespace = b.oid AND a.parentid = 'test_range1'::regclass;
 relname | boundaries |      spcname
---------+------------+--------------------
 p1      | {200}      | tbs_test_range1_p1
 p2      | {400}      | tbs_test_range1_p2
 p3      | {600}      | tbs_test_range1_p3
 pmax    | {NULL}     | tbs_test_range1_p4
(4 rows)

-- Drop.
DROP TABLE test_range1;
DROP TABLESPACE tbs_test_range1_p1;
DROP TABLESPACE tbs_test_range1_p2;
DROP TABLESPACE tbs_test_range1_p3;
DROP TABLESPACE tbs_test_range1_p4;
```

- START END

```
-- Create a partitioned table.
CREATE TABLE test_range2(
    id INT,
    info VARCHAR(20)
) PARTITION BY RANGE (id) (
    PARTITION p1 START(1) END(600) EVERY(200),
    PARTITION p2 START(600) END(800),
    PARTITION pmax START(800) END(MAXVALUE)
);

-- View the partition information.
SELECT relname, boundaries FROM pg_partition WHERE parentid = 'test_range2'::regclass AND
parttype = 'p' ORDER BY 1;
 relname | boundaries
---------+------------
 p1_0    | {1}
 p1_1    | {201}
 p1_2    | {401}
 p1_3    | {600}
 p2      | {800}
 pmax    | {NULL}
(6 rows)

-- Drop.
DROP TABLE test_range2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example of List Partitions

```
-- Create a list partitioned table.
CREATE TABLE test_list ( NAME VARCHAR ( 50 ), area VARCHAR ( 50 ) )
PARTITION BY LIST (area) (
    PARTITION p1 VALUES ('Beijing'),
    PARTITION p2 VALUES ('Shanghai'),
    PARTITION p3 VALUES ('Guangzhou'),
    PARTITION p4 VALUES ('Shenzhen'),
    PARTITION pdefault VALUES (DEFAULT)
);

-- Insert data.
INSERT INTO test_list VALUES ('bob', 'Shanghai'),('scott', 'Sichuan');

-- Query partition data.
SELECT * FROM test_list PARTITION (p2);
 name |   area
------+----------
 bob  | Shanghai
(1 row)
SELECT * FROM test_list PARTITION (pdefault);
 name  |  area
-------+---------
 scott | Sichuan
(1 row)

-- Drop.
DROP TABLE test_list;
```

Example of Hash Partitioning

```
-- Create a hash partitioned table and specify the number of partitions.
CREATE TABLE test_hash1(c1 int) PARTITION BY HASH(c1) PARTITIONS 3;

-- Create a hash partitioned table and specify the names of partitions.
CREATE TABLE test_hash2(c1 int) PARTITION BY HASH(C1)(
    PARTITION pa,
    PARTITION pb,
    PARTITION pc
);

-- View the partition information.
SELECT b.relname AS table_name,
       a.relname AS partition_name
FROM pg_partition a,
     pg_class b
WHERE b.relname LIKE 'test_hash%'
  AND a.parttype = 'p'
  AND a.parentid = b.oid;
 table_name | partition_name
------------+----------------
 test_hash1 | p2
 test_hash1 | p1
 test_hash1 | p0
 test_hash2 | pc
 test_hash2 | pb
 test_hash2 | pa
(6 rows)

-- Drop.
DROP TABLE test_hash1,test_hash2;
```

ALTER TABLE PARTITION and **DROP TABLE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.51 CREATE TABLE PARTITION | SUBPARTITION AS

Description

Creates a partitioned table from the results of a query.

CREATE TABLE PARTITION | SUBPARTITION AS creates a partitioned table and fills it with data obtained using SELECT. Data is partitioned based on the specified partitioning policy. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

Syntax

- Run CREATE TABLE PARTITION AS to create a level-1 partitioned table and fill in the subquery data.

```
CREATE  TABLE [ IF NOT EXISTS ] partition_table_name
    [ (column_name [, ...] ) ]
    [ { ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } } [ [ , ] ... ] ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF
NO MODIFICATION [ ON ( EXPR )]]
    [ TABLESPACE tablespace_name ]
     PARTITION BY partition_clause partition_definition_list
    AS query
    [ WITH [ NO ] DATA ];
```

- Run CREATE TABLE SUBPARTITION AS to create a level-2 partitioned table and fill it with data obtained through subqueries.

```
CREATE  TABLE [ IF NOT EXISTS ] partition_table_name
    [ (column_name [, ...] ) ]
    [ { ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } } [ [ , ] ... ] ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF
NO MODIFICATION [ ON ( EXPR )]]
    [ TABLESPACE tablespace_name ]
     PARTITION BY partition_clause
     SUBPARTITION BY subpartition_clause
     partition_subpartition_definition_list
    AS query
    [ WITH [ NO ] DATA ];
```

For details about each column, see **Syntax**.

Parameters

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a table. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **partition_table_name**

  Specifies the name of the partitioned table to be created.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  (Optional) Specifies the name of a column to be created in the new table. If no column name is specified, the columns in the new table are the same as those entered in the SELECT statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string that complies with the **Identifier Naming Conventions**.

- **ENGINE**

  Supported in B-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. See details of parameters below.

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. If the Astore is used, the default value is **100** (completely filled). When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row–store tables.

    Value range: 10–100.

  – ORIENTATION

    Value range:

    ROW (default value): The data will be stored in rows.

  – COMPRESSION

    Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

    Value range:

    This parameter is available only to column-store compression.

  – autovacuum_enabled

    Specifies whether the autovacuum function is enabled for the table.

    Value range: **on** and **off**

    Default value: **on**

  – autovacuum_vacuum_threshold

    Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

    The value ranges from **0** to **2147483647**.

    The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

  – autovacuum_analyze_threshold

    Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The value ranges from **0** to **2147483647**.

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

– autovacuum_vacuum_scale_factor

Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

Value range: 0.0 to 100.0

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

– autovacuum_analyze_scale_factor

Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

Value range: 0.0 to 100.0

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

– autovacuum_freeze_min_age

Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

Value range: 0 to 1000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

– autovacuum_freeze_max_age

Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

Value range: 100000 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

– autovacuum_freeze_table_age

Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

Value range: 0 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store.

  – AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

    NOTE

    Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **PARTITION BY**

  For details about the columns of **partition_clause** and **partition_definition_list**, see **Parameters**.

- **SUBPARTITION BY**

  For details about the columns of **subpartition_clause** and **partition_subpartition_definition_list**, see **Parameters**.

- **AS query**

  Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[WITH [NO] DATA]**

  Specifies whether the data produced by the query should be copied to the new partitioned table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

Examples

- Create a level-1 partitioned table and fill it with data obtained through subqueries.

```
-- Create source table t1 and insert three data records.
gaussdb=# CREATE TABLE t1(a int, b int);
gaussdb=# INSERT INTO t1 VALUES(8, 2);
gaussdb=# INSERT INTO t1 VALUES(18, 3);
gaussdb=# INSERT INTO t1 VALUES(28, 4);
-- Create a level-1 partitioned table using CREATE TABLE PARTITION AS and fill it with data obtained through subqueries.
gaussdb=# CREATE TABLE t1_part_dup PARTITION BY RANGE(a)
(
    PARTITION p1 VALUES LESS THAN(10),
    PARTITION p2 VALUES LESS THAN(20),
    PARTITION p3 VALUES LESS THAN(MAXVALUE)
) AS SELECT * FROM t1;
gaussdb=# \d+ t1_part_dup;
          Table "create_table_as_partition_by.t1_part_dup"
 Column |  Type   | Modifiers | Storage | Stats target | Description
--------+---------+-----------+---------+--------------+-------------
 a      | integer |           | plain   |              |
 b      | integer |           | plain   |              |
Partition By RANGE(a)
Number of partitions: 3 (View pg_partition to check each partition range.)
Has OIDs: no
Options: orientation=row, compression=no
gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p1) ORDER BY a;
 a | b
---+---
 8 | 2
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)
gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p2) ORDER BY a;
 a  | b
----+---
 18 | 3
(1 row)
gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p3) ORDER BY a;
 a  | b
----+---
 28 | 4
(1 row)
gaussdb=# DROP TABLE t1,t1_part_dup;
```

- Create a level-2 partitioned table and fill it with data obtained through subqueries.

```
-- Create source table t1 and insert six data records.
gaussdb=# CREATE TABLE t1(a int, b int, c int, d varchar, e varchar) PARTITION BY RANGE(a)
SUBPARTITION BY RANGE(b)
(
   PARTITION p1 VALUES LESS THAN(200)
   (SUBPARTITION s1 VALUES LESS THAN (500),
    SUBPARTITION s2 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p2 VALUES LESS THAN(500)
   (SUBPARTITION s3 VALUES LESS THAN (500),
    SUBPARTITION s4 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p3 VALUES LESS THAN(MAXVALUE)
   (SUBPARTITION s5 VALUES LESS THAN (500),
    SUBPARTITION s6 VALUES LESS THAN (MAXVALUE)
   )
);

gaussdb=# INSERT INTO t1 VALUES (100, 300, 1, 'aA');
gaussdb=# INSERT INTO t1 VALUES (150, 550, 1, 'bB');
gaussdb=# INSERT INTO t1 VALUES (250, 150, 1, 'cC');
gaussdb=# INSERT INTO t1 VALUES (350, 560, 1, 'dD');
gaussdb=# INSERT INTO t1 VALUES (550, 100, 1, 'eE');
gaussdb=# INSERT INTO t1 VALUES (650, 600, 1, 'fF');

-- Create a level-2 partitioned table using CREATE TABLE SUBPARTITION AS and fill it with data
obtained through subqueries.
gaussdb=# CREATE TABLE t1_part_dup PARTITION BY RANGE(a) SUBPARTITION BY RANGE(b)
(
   PARTITION p1 VALUES LESS THAN(200)
   (SUBPARTITION s1 VALUES LESS THAN (500),
    SUBPARTITION s2 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p2 VALUES LESS THAN(500)
   (SUBPARTITION s3 VALUES LESS THAN (500),
    SUBPARTITION s4 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p3 VALUES LESS THAN(MAXVALUE)
   (SUBPARTITION s5 VALUES LESS THAN (500),
    SUBPARTITION s6 VALUES LESS THAN (MAXVALUE)
   )
) AS SELECT * FROM t1;
gaussdb=# \d+ t1_part_dup;
                Table "create_table_as_partition_by.t1_part_dup"
 Column |       Type        | Modifiers | Storage  | Stats target | Description
--------+-------------------+-----------+----------+--------------+-------------
 a      | integer           |           | plain    |              |
 b      | integer           |           | plain    |              |
 c      | integer           |           | plain    |              |
 d      | character varying |           | extended |              |
 e      | character varying |           | extended |              |
Partition By RANGE(a) Subpartition By RANGE(b)

gaussdb=# DROP TABLE t1, t1_part_dup;
```

Helpful Links

CREATE TABLE AS, **CREATE TABLE PARTITION**, and **CREATE TABLE SUBPARTITION**

7.12.9.52 CREATE TABLESPACE

Description

Creates a tablespace in a database.

Precautions

- A system administrator or a user who inherits permissions of the built-in role gs_role_tablespace can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If running **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform OM operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- Each PDB has its own tablespace objects. Only relative paths can be used to create tablespaces in the PDB.

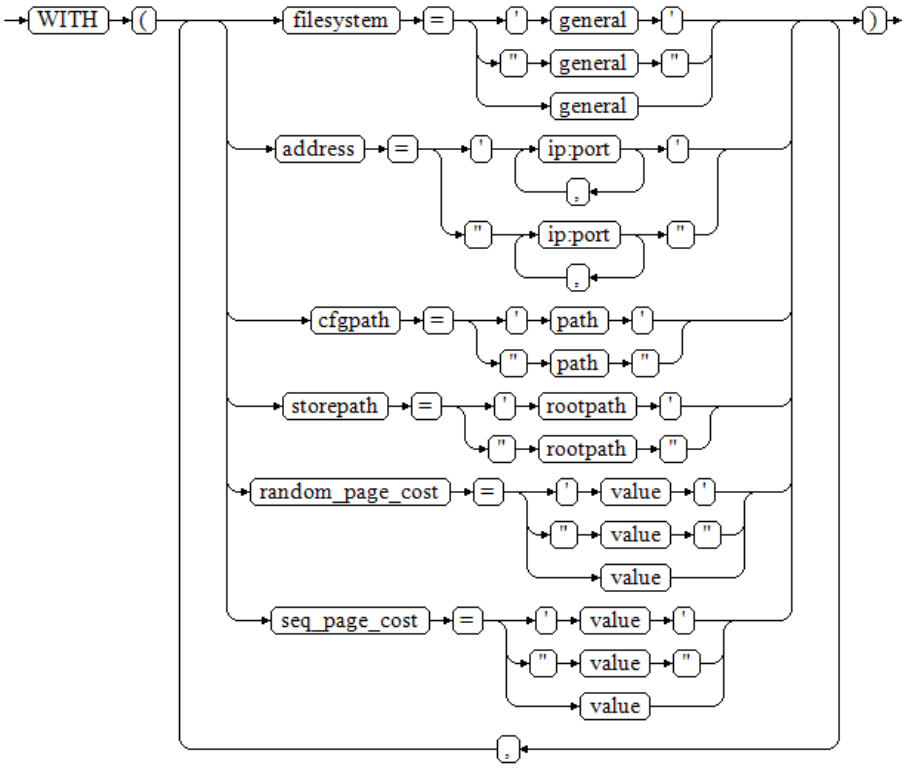
Syntax

```
CREATE TABLESPACE tablespace_name
    [ OWNER user_name ] [ RELATIVE ] LOCATION 'directory' [ MAXSIZE 'space_size' ]
    [with_option_clause];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

with_option_clause for creating a general tablespace is as follows:

```
WITH ({filesystem= { ' general ' | " general " | general } | address = { ' ip:port [, ... ] ' | " ip:port [, ... ] " } |
cfgpath = { ' path ' | " path " } | storepath = { ' rootpath ' | " rootpath " } | random_page_cost = { ' value ' | "
value " | value } | seq_page_cost = { ' value ' | " value " | value }}[, ... ])
```



Parameters

- **tablespace_name**

  Specifies name of a tablespace to be created.

  The tablespace name must be distinct from the name of any existing tablespace in the database and cannot start with "pg", which are reserved for system catalog spaces.

  Value range: a string. It must comply with the **naming convention**.

- **OWNER user_name**

  Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.

  Only system administrators can create tablespaces, but they can use the OWNER clause to assign ownership of tablespaces to non-system-administrators.

  Value range: a string. It must be an existing user.

- **RELATIVE**

  If this parameter is specified, a relative path is used. The location directory is relative to the data directory on each database node.

  Directory hierarchy: the relative path of the directory **/pg_location/** A relative path contains a maximum of two levels.

  If this parameter is not specified, the absolute tablespace path is used. The location directory must be an absolute path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **LOCATION directory**

  Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

  – The system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
  – The directory must be an absolute path, and does not contain special characters, such as dollar sign ($) and greater-than sign (>).
  – The directory cannot be specified under the database data directory.
  – The directory must be a local path.

  Value range: a string. It must be a valid directory.

- **MAXSIZE 'space_size'**

  Specifies the maximum value of the tablespace in a single database node.

  Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 8 bits, which is 1 KB to 9007199254740991 KB.

- **address**

  Specifies the IP address and port number.

- **cfgpath**

  Specifies the configuration file path.

- **storepath**

  Specifies the root path.

- **filesystem**

  Specifies the file system used by the tablespace.

  Value range:

  general: general file system.

  hdfs: Hadoop distributed file system. The current version does not support this function.

  Default value: **general**

- **random_page_cost**

  Specifies the time and resources required for randomly reading pages.

  Value range: 0 to 1.79769e+308

  Default value: value of the GUC parameter **random_page_cost**

- **seq_page_cost**

  Specifies the time and resources required for reading pages in sequence.

  Value range: 0 to 1.79769e+308

  Default value: value of GUC parameter **seq_page_cost**

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Create a tablespace and specify the maximum value.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLESPACE tbs_location2 RELATIVE LOCATION 'test_tablespace/test_tablespace_2'
MAXSIZE '10G';

-- Query tablespace information.
gaussdb=# SELECT * FROM pg_tablespace WHERE spcname = 'tbs_location2';
    spcname     | spcowner | spcacl | spcoptions | spcmaxsize | relative
----------------+----------+--------+------------+------------+----------
 tbs_location2 |       10 |        |            | 10485760 K | t
(1 row)

-- Create a user joe.
gaussdb=# CREATE ROLE joe IDENTIFIED BY '********';

-- Create a tablespace and set its owner to user joe.
gaussdb=# CREATE TABLESPACE tbs_location3 OWNER joe RELATIVE LOCATION 'test_tablespace/
test_tablespace_3';

-- Create a tablespace and specify an absolute path. (Change the path based on the actual situation.)
gaussdb=# CREATE TABLESPACE tbs_location4 LOCATION '/tmp/tbs_location4';

-- Delete tablespaces and users.
gaussdb=# DROP TABLESPACE tbs_location1;
gaussdb=# DROP TABLESPACE tbs_location2;
gaussdb=# DROP TABLESPACE tbs_location3;
gaussdb=# DROP TABLESPACE tbs_location4;
gaussdb=# DROP ROLE joe;
```

CREATE DATABASE, **CREATE TABLE**, **CREATE INDEX**, **DROP TABLESPACE**, and **ALTER TABLESPACE**

Suggestions

- create tablespace

  You are advised not to create tablespaces in a transaction.

7.12.9.53 CREATE TABLE SUBPARTITION

Description

Creates a level-2 partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table. For a level-2 partitioned table, the top-level node table and level-1 partitioned table are logical tables and do not store data. Only the level-2 partitioned (leaf node) stores data.

The partitioning solution of a level-2 partitioned table is a combination of the partitioning solutions of two level-1 partitions. For details about the partitioning solution of a level-1 partitioned table, see **CREATE TABLE PARTITION**.

Common combination solutions for level-2 partitioned tables include range-range partitioning, range-list partitioning, range-hash partitioning, list-range partitioning, list-list partitioning, list-hash partitioning, hash-range partitioning, hash-list partitioning, and hash-hash partitioning. Currently, level-2 partitioned tables can only be row-store tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- A level-2 partitioned table has two partition keys. A range/list partition key supports only 16 columns, and a hash partition key supports only one column.
- If the constraint key of the UNIQUE constraint and PRIMARY KEY constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created. If a local unique index is created, all partition keys must be included.
- When a level-2 partitioned table is created, if the specified level-2 partition is not displayed under the level-1 partition, a level-2 partition with the same range is automatically created.
- The maximum total number of partitions (including level-1 and level-2 partitions) in a level-2 partitioned table is 1,048,575. Generally, you are advised not to create so many partitions. If the memory is insufficient due to too many partitions, the performance deteriorates sharply. Create partitions based on the value of **local_syscache_threshold**. The memory allocated to the level-2 partitioned tables can be calculated as follows: total number of partitions x 3/1024, in MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local_syscache_threshold**. In addition, some space must be reserved for other functions.
- Considering the impact on performance, it is recommended that the maximum number of partitions in a single table be less than or equal to 2000 and the number of level-2 partitions multiplied by (Number of local indexes + 1) be less than or equal to 10000.
- Level-2 partitioned tables support only row store and do not support hash bucket.
- Clusters are not supported.
- When specifying a partition for query, for example, running **SELECT * FROM tablename PARTITION/SUBPARTITION** (*partitionname*), ensure that the keyword PARTITION and SUBPARTITION is correct. If they are incorrect, no error is reported during the query. In this case, the query is performed based on the table alias.
- Encrypted databases, ledger databases, and row-level security are not supported.
- In the PARTITION/SUBPARTITION FOR (VALUES) syntax for level-2 partitioned tables, VALUES can only be constants.
- In the PARTITION/SUBPARTITION FOR (VALUES) syntax for level-2 partitioned tables, if data type conversion is required for VALUES, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- Currently, the statement specifying a partition cannot perform global index scan.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MySQL-compatible mode, uppercase conversion will be unavailable.

Syntax

```
CREATE TABLE [ IF NOT EXISTS ] subpartition_table_name
{(
{ column_name data_type [ CHARACTER SET | CHARSET charset ][ COLLATE collation ] [ column_constraint
[ ... ] ]
| table_constraint
| LIKE source_table [ like_option [...] ] }[, ... ]
)
| LIKE source_table }
[ table_option [ [ , ] ... ] ]
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ TABLESPACE tablespace_name ]
PARTITION BY {RANGE [ COLUMNS ] | LIST [ COLUMNS ] | HASH | KEY} (partition_keys) [ AUTOMATIC ]
[ PARTITIONS integer ]
SUBPARTITION BY {RANGE | LIST | HASH | KEY} (subpartition_keys) [ AUTOMATIC ] [ SUBPARTITIONS
integer ]
(
  PARTITION partition_name1 [ VALUES LESS THAN {(val1  | MAXVALUE) | MAXVALUE} | VALUES [IN]
(val1[, ...]) ]
[ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR ) ] ]
 [ TABLESPACE [=] tablespace ]
  [(
      { SUBPARTITION subpartition_name1 [ VALUES LESS THAN (val1_1) | VALUES (val1_1[, ...])]
[ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR ) ] ]
 [ TABLESPACE [=] tablespace ] } [, ...]
  )][, ...]
)[ { ENABLE | DISABLE } ROW MOVEMENT ];
```

- **table_option** is as follows:

  ```
  { COMMENT [ = ] 'string' |
    AUTO_INCREMENT [ = ] value |
    [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default_charset |
    [ DEFAULT ] COLLATE [ = ] default_collation |
    ENGINE [ = ] { InnoDB | 'InnoDB' | ''InnoDB'' }
  }
  ```

- **column_constraint** is as follows:

  ```
  [ CONSTRAINT constraint_name ]
  { NOT NULL |
    NULL |
    CHECK ( expression ) |
    DEFAULT default_expr |
    ON UPDATE update_expr |
    GENERATED ALWAYS AS ( generation_expr ) [STORED] |
    GENERATED [ ALWAYS | BY DEFAULT [ ON NULL ] ] AS IDENTITY [ ( identity_options ) ] |
    AUTO_INCREMENT |
    COMMENT 'string' |
    UNIQUE [KEY] index_parameters |
    PRIMARY KEY index_parameters |
    REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
        [ ON DELETE action ] [ ON UPDATE action ] }
  [ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
  ```

- **table_constraint** is as follows:

  ```
  [ CONSTRAINT [ constraint_name ] ]
  { CHECK ( expression ) |
    UNIQUE  [ index_name ][ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] )
  index_parameters |
    PRIMARY KEY  [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters |
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
    [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
{ [ COMMENT 'string' ] [ ... ] }
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | RELOPTIONS| UPDATE | IDENTITY | ILM | ALL }
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- **update_expr** is as follows:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

Parameters

- **IF NOT EXISTS**

  Does not throw an error if a relationship with the same name existed. A notice is issued in this case.

- **subpartition_table_name**

  Specifies the name of a level-2 partitioned table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  Specifies the name of a column to be created in the new table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **data_type**

  Specifies the data type of the column.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation;** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **CONSTRAINT constraint_name**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

  There are two ways to define constraints:

  – A column constraint is defined as part of a column definition, and it is bound to a particular column.

  – A table constraint applies to multiple columns.

  NOTICE

  The constraint_name is optional in B-compatible mode (**sql_compatibility = 'B'**). For other modes, constraint_name must be added.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **index_name**

  Index name

  NOTICE

  - The **index_name** is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - For foreign key constraints, if constraint_name and index_name are specified at the same time, constraint_name is used as the index name.
  - For a unique key constraint, if both constraint_name and index_name are specified, index_name is used as the index name.

- **USING method**

  Specifies the name of the index method to be used.

  For details about the value range, see USING method in **Parameters**.

  NOTICE

  - The USING method is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - In B-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.

- **ASC | DESC**

  ASC specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

  NOTICE

  The ASC|DESC is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).

- **LIKE source_table [like_option ...]**

  Specifies a table from which a new table automatically copies all column names, their data types, and their NOT NULL constraints.

  The new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

  - Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
  - If **INCLUDING UPDATE** is specified, the **ON UPDATE CURRENT_TIMESTAMP** attribute of the original table column is copied to the new table column. By default, the attribute is not copied.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If **INCLUDING GENERATED** is specified, the generated expression of the original table column is copied to the new table. By default, the generated expression is not copied.
  - NOT NULL constraints are always copied to the target table. CHECK constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

  The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.
  - Any indexes on the original table will not be created on the new table, unless the INCLUDING INDEXES clause is specified.
  - If **INCLUDING STORAGE** is specified, the **STORAGE** setting of the original table column is also copied. By default, the **STORAGE** setting is not included.
  - If **INCLUDING COMMENTS** is specified, comments of the original table columns, constraints, and indexes are also copied. The default behavior is to exclude comments.
  - If **INCLUDING RELOPTIONS** is specified, the storage parameters (WITH clauses) of the original table are also copied to the new table. The default behavior is to exclude partition definition of the storage parameter of the original table.
  - If INCLUDING IDENTITY is specified, the IDENTITY function of the original table is copied to the new table, and a SEQUENCE with the same SEQUENCE parameter as that of the original table is created. By default, the IDENTITY function of the original table is not copied.
  - If **INCLUDING ILM** is specified, the ILM policy information of a source table is copied to the target table. To copy the ILM policy information of partition objects in the source table, specify **INCLUDING PARTITION**.
  - **INCLUDING ALL** contains the content of **INCLUDING DEFAULTS**, **INCLUDING UPDATE**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING IDENTITY**, and **INCLUDING ILM**.

- **AUTO_INCREMENT [=] value**

  This clause specifies an initial value for an auto-increment column. The value must be a positive integer and cannot exceed $2^{127} - 1$.

  NOTICE

  This clause takes effect only when **sql_compatibility** is set to **'B'**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - The COMMENT 'string' in column_constraint indicates that comments are added to a column.
  - The COMMENT 'string' in table_constraint indicates that comments are added to the indexes corresponding to the primary key and unique key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details, see **COMMENT [=] 'string'**.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

  – FILLFACTOR

  The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. If the Astore is used, the default value is **100** (completely filled). When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

  Value range: 10 to 100.

  – ORIENTATION

  Determines the data storage mode of the table.

  Value range:

  ▪ **ROW** (default value): The data will be stored in rows.

  NOTICE

  ORIENTATION cannot be modified.

  – STORAGE_TYPE

  Specifies the storage engine type. This parameter cannot be modified once it is set.

  Value range:

  ▪ **USTORE** indicates that tables support the in-place update storage engine.

  NOTICE

  To use Ustore tables, you need to enable the **track_counts** and **track_activities** parameters. Otherwise, space expansion occurs.

  ▪ **ASTORE** indicates that tables support the append-only storage engine.

  Default value:

  If no table is specified, data is stored in inplace-update mode by default.

  – COMPRESSION

  ▪ This parameter is available only to column-store compression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - segment

    The data is stored in segment-page mode. This parameter supports only row-store tables. Temporary tables and unlogged tables are not supported.

    Value range: **on** and **off**

    Default value: **off**

  - statistic_granularity

    Specifies the default **partition_mode** of a table during statistics analysis. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

    Value range: See the value range of **partition_mode**.

    Default value: **AUTO**.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store. Subpartitions inherit the policy of partitions.

  - AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.
  - ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

    NOTE

    Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **PARTITION BY {RANGE [COLUMNS] | LIST [COLUMNS] | HASH | KEY} (partition_keys)**
  - For **partition_keys**, only 16 columns are supported for the range and list partition keys, and only one column is supported for the hash partition key.
  - The data types supported by the partition key are the same as those supported by the level-1 partitioned table.
  - The COLUMNS keyword can be used only when **sql_compatibility** is set to **'B'** and can be added only after RANGE or LIST. The semantics of RANGE COLUMNS is the same as that of RANGE, and the semantics of LIST COLUMNS is the same as that of LIST.
  - The KEY keyword can be used only when **sql_compatibility** is set to **'B'**. The meaning of KEY is the same as that of HASH.
- **SUBPARTITION BY {RANGE | LIST | HASH | KEY} (subpartition_keys)**
  - For **subpartition_keys**, only 16 columns are supported for the range and list partition keys, and only one column is supported for the hash partition key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The data types supported by the partition key are the same as those supported by the level-1 partitioned table.
  - The KEY keyword can be used only when **sql_compatibility** is set to **'B'**. The meaning of KEY is the same as that of HASH.

- **AUTOMATIC**

  If keyword **AUTOMATIC** is specified when a table is created, the automatic partitioning function of list partitions is enabled. By default, the automatic partitioning function is disabled. Only list partitions can use the automatic partitioning function.

  After the automatic partitioning function is enabled, if the inserted data cannot match an existing partition, an independent partition is automatically created.

  NOTE

  Based on whether the automatic partitioning function is enabled for level-1 and level-2 partitions, the following situations may occur during data insertion:

  - The automatic expansion function is enabled for the level-1 partition, and any partition policy is used for the level-2 partition. If the inserted data does not match the level-1 partition, the corresponding level-1 partition is automatically created, and the corresponding level-2 partition is a full set.
  - The automatic partitioning function is enabled for the level-2 partition, and the level-1 partition is any partition policy. If the inserted data does not match the level-1 partition, the insertion fails. If the inserted data matches the level-1 partition but does not match the level-2 partition, the corresponding level-2 partition is automatically created.
  - The automatic partitioning function is enabled for both level-1 and level-2 partitions. If the inserted data does not match the level-1 or level-2 partition, the system automatically creates a partition at the corresponding level.

- **PARTITIONS integer**

  Specifies the number of partitions.

  integer indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

  - When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql_compatibility** is set to **'B'**.
  - When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **SUBPARTITIONS integer**

  Specifies the number of level-2 partitions.

  integer indicates the number of level-2 partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - This clause can be specified only for level-2 HASH and KEY partitions.
    - If level-2 partitions are not defined, an *integer* number of level-2 partitions are automatically generated in each level-1 partition. The automatically generated level-2 partitions are named in the format of "level-1 partition name+sp+number", where the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default.
    - If level-2 partitions are defined, the number of level-2 partitions must be the same as the value of **integer**.
    - If level-2 partitions are not defined and the number of level-2 partitions is not specified, a unique level-2 partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

  Specifies whether to enable row movement.

  If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  - **ENABLE** (default value): Row movement is enabled.
  - **DISABLE**: Row movement is disabled.

  If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

  The old data is marked as deleted in the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

  If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, UPDATE and DELETE concurrency.

  a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.
     - If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.
     - If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

  b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.
     - If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.
     - If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

  Forbids NULL values in columns. **ENABLE** can be omitted.

- **NULL**

  Allows to contain NULL values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [NO INHERIT]**

  Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is true or unknown; otherwise, an error is thrown and the database is not altered.

  A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

  A constraint marked with **NO INHERIT** will not propagate to child tables.

  ENABLE can be omitted.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **ON UPDATE update_expr**

  The ON UPDATE clause is an attribute constraint of a column.

  When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This attribute can be specified only in B-compatible database 5.7 (that is, **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**).
- In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also specify or not specify the precision of a keyword with parentheses. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. The three types of keywords are synonyms of each other and have the same attribute effect.
- This attribute can be specified only for columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime.
- The CREATE TABLE AS syntax does not inherit the column attributes.
- The CREATE TABLE LIKE syntax can use INCLUDING UPDATE or EXCLUDING UPDATE to inherit or exclude a constraint. The INCLUDING ILM option is added to copy the ILM policy information of the old table. This option is used together with the INCLUDING PARTITION option to copy the policy information of partition objects in the old table.
- The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, CREATE TABLE t1 (col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3));. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
- The same column cannot be specified for this attribute and the generated column constraint at the same time.
- This attribute cannot be specified for the partition key in a partitioned table.

- **GENERATED ALWAYS AS (generation_expr) [STORED]**

  This clause creates a column as a generated column. The value of the generated column is calculated by **generation_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored like an ordinary column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause together. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause together.
- The method of modifying and deleting generated columns is the same as that of ordinary columns. If you delete an ordinary column that a generated column depends on, the generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for ordinary columns.

- **GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [(identity_options)]**

  Creates a column as an IDENTITY column. An implicit sequence is automatically created based on identity_options and attached to a specified column. When data is inserted, the value obtained from the sequence is automatically assigned to the column.

  – **GENERATED ALWAYS AS IDENTITY**: Only identity values provided by the sequence generator can be inserted into this column. User-specified values cannot be inserted into this column.

  – **GENERATED BY DEFAULT AS IDENTITY**: User-specified values are preferentially inserted into this column. If no value is specified, the identity values provided by the sequence generator are inserted.

  – **GENERATED BY DEFAULT ON NULL AS IDENTITY**: User-specified values are preferentially inserted into this column. If a null value is specified or no value is specified, the identity values provided by the sequence generator are inserted.

  The optional identity_options clause can be used to override sequence options.

  – **increment**: specifies the implicit sequence step. If the value is a positive number, an ascending sequence is generated. If the value is a negative number, a descending sequence is generated. The default value is **1**.

  – **MINVALUE minvalue | NO MINVALUE | NOMINVALUE**: specifies the minimum value of an execution sequence. If **minvalue** is not specified or **NO MINVALUE** is specified, the default value of an ascending sequence is **1**, and the default value of a descending sequence is **$-10^{27} + 1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

  – **MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE**: specifies the maximum value of an execution sequence. If **maxvalue** is not specified or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NO MAXVALUE is specified, the default value of an ascending sequence is $10^{28} - 1$, and the default value of a descending sequence is **–1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start** specifies the start value of an implicit sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**: specifies the number of sequences stored in the memory for quick access purposes. The default value is **1**, indicating that only one value can be generated at a time, that is, no cache is generated.
- **NOCACHE**: No value of the sequence is stored in advance.
- **CYCLE**: recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**. If **NO CYCLE** is declared, any call to nextval returns an error after the sequence reaches its maximum or minimum value. **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.
- **SCALE**: enables sequence scalability. If specified, a numeric offset is appended to the beginning of the sequence to prevent duplicate items in the generated value. If **NOSCALE** is declared, sequence scalability is disabled. The default value is **NOSCALE**.
- **EXTEND**: extends the numeric offset length (default value: **6**), aligns the sequence generation value to **x** (default value: **6**) + **y** (maximum number of digits). **SCALE** must be specified when **EXTEND** is specified. If **NOEXTEND** is declared, the numeric offset length is not extended. The default value is **NOEXTEND**.

NOTE

- The IDENTITY column can only be of the smallint, integer, bigint, decimal, numeric, float, double precision, or real type.
- In A-compatible mode, when an IDENTITY column of the integer type is created, the IDENTITY column is of the numeric type by default.
- The method of changing an IDENTITY column is the same as that of changing an ordinary column, but the type can be changed only to smallint, integer, bigint, decimal, numeric, float, double precision, or real.
- By default, the IDENTITY column has the NOT NULL constraint.
- A table can contain only one IDENTITY column.
- The method of deleting an IDENTITY column is the same as that of deleting an ordinary column. When a column is deleted, the implicit sequence of the IDENTITY column is automatically deleted.
- The IDENTITY column cannot be specified together with the SET DEFAULT action.
- The type of the implicit sequence that is automatically created is LARGE SEQUENCE.
- You cannot use DROP LARGE SEQUENCE or ALTER LARGE SEQUENCE to modify the implicit sequence of an identity.
- After permission is granted to the table, data can be inserted properly. To modify the IDENTITY column, delete the IDENTITY attribute, or delete the IDENTITY column, you need to grant permission to the corresponding implicit sequence.
- The [SCALE [EXTEND | NOEXTED] | NOSCALE] clause is available only when an IDENTITY column is created in a centralized system in A-compatible mode.
- In a fully-encrypted database, the encrypted IDENTITY column cannot be specified during table creation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

  For details, see **AUTO_INCREMENT**.

- **UNIQUE [KEY] index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a UNIQUE constraint, NULL is not considered equal.

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'B'**, which has the same semantics as UNIQUE.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY (column_name [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

  Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

  Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, PRIMARY KEY constraints, and FOREIGN KEY constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  – If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.

  – If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace_name**

  Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If not specified, the index is created in **default_tablespace**. If **default_tablespace** is empty, the default tablespace of the database is used.

Examples

- Creating a level-2 partitioned table

```
-- Create a level-2 partitioned table tbl_list_list. Both of the level-1 and level-2 partitions are of the LIST type.
gaussdb=# CREATE TABLE tbl_list_list(
    sal_year    varchar(4)  NOT NULL,
    area_id     char(5)     NOT NULL,
    emp_id      char(5)     NOT NULL,
    sales_amt   int
) PARTITION BY LIST (sal_year) SUBPARTITION BY LIST(area_id)(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    PARTITION P_2019 VALUES ('2019')(
        SUBPARTITION p_2019_01001 VALUES ('01001'),
        SUBPARTITION p_2019_01002 VALUES ('01002'),
        SUBPARTITION p_2019_01003 VALUES ('01003')
    ),
    PARTITION p_2020 VALUES ('2020')(
        SUBPARTITION p_2020_01001 VALUES ('01001'),
        SUBPARTITION p_2020_01002 VALUES ('01002'),
        SUBPARTITION p_2020_01003 VALUES ('01003')
    )
);

-- Create a level-2 partitioned table tbl_range_list. The level-1 partition is of the RANGE type and
level-2 partition is of the LIST type.
gaussdb=# CREATE TABLE tbl_range_list(
    sal_date    varchar(6)  NOT NULL,
    area_id     char(5)     NOT NULL,
    emp_id      char(5)     NOT NULL,
    sales_amt   int
) PARTITION BY RANGE (sal_date) SUBPARTITION BY LIST(area_id)(
    PARTITION p_201901 VALUES LESS THAN (201902)(
        SUBPARTITION p_201901_01001 VALUES ('01001'),
        SUBPARTITION p_201901_01002 VALUES ('01002'),
        SUBPARTITION p_201901_01003 VALUES ('01003')
    ),
    PARTITION p_201902 VALUES LESS THAN (201903)(
        SUBPARTITION p_201902_01001 VALUES ('01001'),
        SUBPARTITION p_201902_01002 VALUES ('01002'),
        SUBPARTITION p_201902_01003 VALUES ('01003')
    )
);

-- Create a level-2 partitioned table multi_range_list for multi-column partition keys. The level-1
partition is of the RANGE type and level-2 partition is of the LIST type.
gaussdb=# CREATE TABLE multi_range_list(c1 int, c2 int, c3 int)
PARTITION BY RANGE (c1,c2) SUBPARTITION BY LIST (c2, c3)
(
    PARTITION P_RANGE1 VALUES LESS THAN (10,10)
    (
        SUBPARTITION P_RANGE1_LIST1 VALUES ((1,1),(2,2)),
        SUBPARTITION P_RANGE1_LIST2 VALUES ((5,5),(6,6)),
        SUBPARTITION P_RANGE1_LIST3 VALUES ((8,8),(9,9))
    ),
    PARTITION P_RANGE2 VALUES LESS THAN (20,20)
    (
        SUBPARTITION P_RANGE2_LIST1 VALUES ((11,11),(12,12)),
        SUBPARTITION P_RANGE2_LIST2 VALUES ((15,15),(16,16)),
        SUBPARTITION P_RANGE2_LIST3 VALUES ((18,18),(19,19))
    ),
    PARTITION P_RANGE3 VALUES LESS THAN (30,30)
    (
        SUBPARTITION P_RANGE3_LIST1 VALUES ((21,21),(22,22)),
        SUBPARTITION P_RANGE3_LIST2 VALUES ((25,25),(26,26)),
        SUBPARTITION P_RANGE3_LIST3 VALUES ((28,28),(29,29))
    )
);
```

- Specifying partitions in a level-2 partitioned table using DML statements
  - INSERT

    ```
    -- Insert data to a specified level-1 partition.
    gaussdb=# INSERT INTO tbl_range_list PARTITION(p_201901) VALUES('201901', '01001', '0001',
    75000 );

    -- The actual partition is inconsistent with the specified partition. An error is reported.
    gaussdb=# INSERT INTO tbl_range_list PARTITION(p_201902) VALUES('201901', '01001', '0002',
    6000);
    ERROR:  inserted partition key does not map to the table partition
    DETAIL:  N/A.
    ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Insert data to a specified level-2 partition.
gaussdb=# INSERT INTO tbl_range_list SUBPARTITION(p_201902_01001) VALUES('201902',
'01001', '0002', 8000);
```

- SELECT

```
-- Query data in a specified partition.
gaussdb=# SELECT * FROM tbl_range_list PARTITION(p_201902);
 sal_date | area_id | emp_id | sales_amt
----------+---------+--------+-----------
 201902   | 01001   | 0002   |      8000
(1 row)

gaussdb=# SELECT * FROM tbl_range_list SUBPARTITION(p_201901_01001);
 sal_date | area_id | emp_id | sales_amt
----------+---------+--------+-----------
 201901   | 01001   | 0001   |     75000
(1 row)
```

- UPDATE

```
-- Update data in a specified partition.
gaussdb=# UPDATE tbl_range_list PARTITION(p_201901) SET sales_amt = 7000;

gaussdb=# SELECT * FROM tbl_range_list;
 sal_date | area_id | emp_id | sales_amt
----------+---------+--------+-----------
 201901   | 01001   | 0001   |      7000
 201902   | 01001   | 0002   |      8000
(2 rows)

gaussdb=# UPDATE tbl_range_list SUBPARTITION FOR('201902','01001') SET sales_amt=6000;

gaussdb=# SELECT * FROM tbl_range_list;
 sal_date | area_id | emp_id | sales_amt
----------+---------+--------+-----------
 201901   | 01001   | 0001   |      7000

```

7.12.9.54 CREATE TRIGGER

Description

CREATE TRIGGER is used to create a trigger. A trigger is a special type of stored procedure, and is used for complex service rules and requirements and help ensure reference integrity. A trigger is associated with a specified table or view and executes a specified function under specific conditions. This allows you to retain the relationships defined in the table when you add, update, or delete rows in the table.

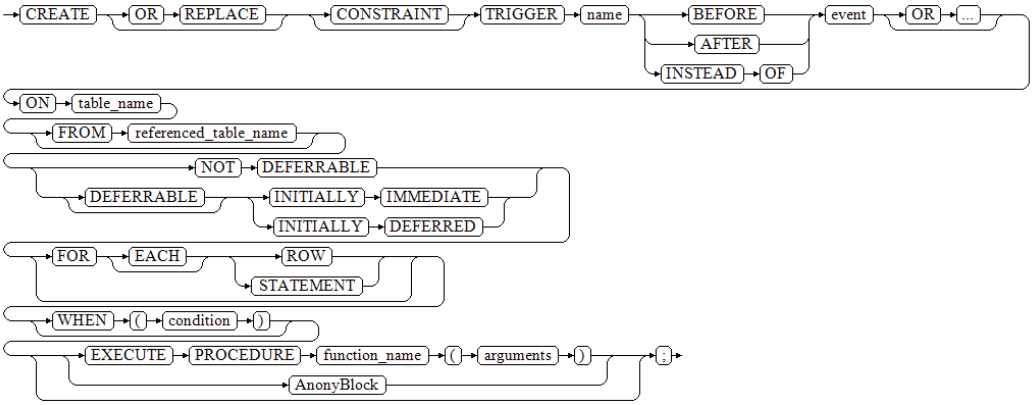
Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.
- When a trigger statement is executed, the permission is determined by the trigger creator.
- To create a trigger, you must have the TRIGGER permission on the specified table or have the CREATE ANY TRIGGER permission.
- A row-level trigger function triggered by BEFORE can return a **NULL** value, indicating that operations on the row are ignored. Subsequent triggers will not be executed and no INSERT, UPDATE, or DELETE action will be generated on the row. The return value of the trigger function triggered by AFTER is not affected.
- For a BEFORE DELETE trigger, the return value **NEW** of the trigger function indicates **NULL**. For a BEFORE INSERT trigger, the return value **OLD** indicates **NULL**. For a BEFORE UPDATE trigger, the return value **NULL** indicates **NULL**.
- For a trigger function whose event is INSERT or UPDATE, the normal return value is **NEW**. If a non-NULL row is returned, the inserted or updated row is modified. For a trigger function whose event is DELETE, the normal return value is **OLD**.
- INSTEAD OF triggers can only work on views. Their trigger functions can also return **NULL**, indicating that subsequent triggers will not be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

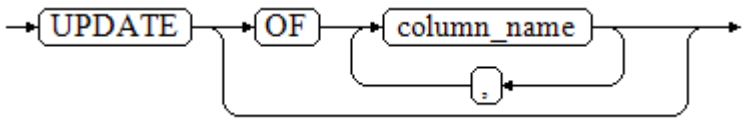
```
CREATE [OR REPLACE] [ CONSTRAINT ] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
   ON table_name
   [ FROM referenced_table_name ]
   { NOT DEFERRABLE | [ DEFERRABLE ] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
   [ FOR [ EACH ] { ROW | STATEMENT } ]
   [ WHEN ( condition ) ]
   [ EXECUTE PROCEDURE function_name ( arguments ) | AnonyBlock ];
```



Events include:

```
INSERT
```

```
UPDATE [ OF column_name [, ... ] ]
```



```
DELETE
```

```
TRUNCATE
```

Parameters

- **OR REPLACE**

  (Optional) If this parameter is specified, the existing trigger will be modified.

  Constraint triggers and internal triggers cannot be created or modified using the OR REPLACE syntax. A constraint trigger is a trigger created using CREATE CONSTRAINT TRIGGER. An internal trigger is a trigger implicitly created by some SQL statements. For example, if a foreign key constraint is added to a table, four triggers are implicitly created. The four triggers are internal triggers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CONSTRAINT**

  (Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using SET CONSTRAINTS. Constraint triggers must be AFTER ROW triggers.

- **name**

  Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using **SET CONSTRAINTS**.

  Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.

- **BEFORE**

  Specifies that the function is called before the event.

- **AFTER**

  Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

  Specifies that the function is called instead of the event.

- **event**

  Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

  For UPDATE events, it is possible to specify a list of columns using this syntax:

  ```
  UPDATE OF column_name1 [, column_name2 ... ]
  ```

  The trigger will only fire if at least one of the listed columns is mentioned as a target of the UPDATE statement. INSTEAD OF UPDATE events do not support lists of columns. If the column specified by UPDATE OF contains a generated column, the trigger is also fired when the column on which the generated column depends is the target column of the UPDATE statement.

- **table_name**

  Specifies the name of the table for which the trigger is created.

  Value range: name of an existing table in the database

- **referenced_table_name**

  Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.

  Value range: name of an existing table in the database

- **DEFERRABLE | NOT DEFERRABLE**

  Specifies the start time of the trigger. It can only be specified for constraint triggers. Determines whether the constraint can be deferred.

  For details, see **CREATE TABLE**.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint. It can only be specified for constraint triggers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details, see **CREATE TABLE**.

- **FOR EACH ROW | FOR EACH STATEMENT**

  Specifies the frequency of firing the trigger.

  - **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
  - **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

  If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

  Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.

  In FOR EACH ROW triggers, the WHEN condition can refer to columns of the old and/or new row values by writing **OLD.***column name* or **NEW.***column name* respectively. In addition, INSERT triggers cannot refer to OLD, and DELETE triggers cannot refer to NEW.

  INSTEAD OF triggers do not support WHEN conditions.

  Currently, WHEN expressions cannot contain subqueries.

  Note that for constraint triggers, evaluation of the WHEN condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **ANONYBLOCK**

  For the anonymous block in an A-compatible database, statements are executed when a trigger is triggered. When you use the anonymous block syntax to create a trigger, a function with the same name as the trigger is created. Ensure that the function name does not conflict with any existing function name.

- **function_name**

  Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

- **arguments**

  Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

  NOTE

  The following details trigger types:

  - INSTEAD OF triggers must be marked as FOR EACH ROW and can be defined only on views.
  - BEFORE and AFTER triggers on a view must be marked as FOR EACH STATEMENT.
  - TRUNCATE triggers must be marked as FOR EACH STATEMENT.

Table 7-256 Types of triggers supported on tables and views

When	Event	Row-Level	Statement-Level
BEFORE	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
AFTER	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
INSTEAD OF	INSERT/UPDATE/DELETE	Views	Not supported.
	TRUNCATE	Not supported.	Not supported.

Table 7-257 Special variables of PL/pgSQL trigger functions

Variable	Description
NEW	New tuple for INSERT and UPDATE operations. This variable is **NULL** for **DELETE** operations and statement-level triggers.
OLD	Old tuple for UPDATE and DELETE operations. This variable is **NULL** for **INSERT** operations and statement-level triggers.
TG_NAME	Trigger name.
TG_WHEN	Trigger timing (**BEFORE**, **AFTER**, or **INSTEAD OF**).
TG_LEVEL	Trigger frequency (**ROW** or **STATEMENT**).
TG_OP	Trigger operations (**INSERT**/**UPDATE**/**DELETE**/**TRUNCATE**) that must be capitalized.
TG_RELID	OID of the table where the trigger resides.
TG_RELNAME	Name of the table where the trigger resides. (This variable has been replaced by **TG_TABLE_NAME**.)
TG_TABLE_NAME	Name of the table where the trigger resides.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Variable	Description
TG_TABLE_SCHEMA	Schema of the table where the trigger resides.
TG_NARGS	Number of parameters for the trigger function.
TG_ARGV[]	List of parameters for the trigger function.

Examples

```
-- Create a source table and a target table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);
```

Use the INSERT trigger.

```
-- Create an INSERT trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END
        $$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_insert_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)
```

Use anonymous blocks and the OR REPLACE syntax to create triggers.

```
-- Create an INSERT trigger using the anonymous block syntax.
gaussdb=# CREATE TRIGGER insert_trigger_with_anonyblock
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END;
        /

-- Create an INSERT trigger using the OR REPLACE syntax.
gaussdb=# CREATE OR REPLACE TRIGGER insert_trigger_with_anonyblock
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END;
        /

-- Drop the trigger.
gaussdb=# DROP TRIGGER insert_trigger_with_anonyblock ON test_trigger_src_tbl; -- Drop the implicitly
created function insert_trigger_with_anonyblock.
```

Use the UPDATE trigger.

```
-- Create an UPDATE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
        AFTER UPDATE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_update_func();

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)
```

Use the DELETE trigger.

```
-- Create a DELETE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE plpgsql;

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger BEFORE DELETE ON test_trigger_src_tbl FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
(0 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)
```

Rename a trigger.

```
-- Rename a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;
```

Disable a trigger.

```
-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // The trigger does not take effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;
```

Deleting a trigger

```
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

Deleting a function

```
gaussdb=# DROP FUNCTION tri_insert_func;

gaussdb=# DROP FUNCTION tri_update_func;

gaussdb=# DROP FUNCTION tri_delete_func;
-- Drop the source table and destination table.
gaussdb=# DROP TABLE test_trigger_src_tbl;
gaussdb=# DROP TABLE test_trigger_des_tbl;
```

ALTER TRIGGER, **DROP TRIGGER**, and **ALTER TABLE**

7.12.9.55 CREATE TYPE

Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: composite type, base type, shell type, enumerated type, and set type.

- Composite type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

A composite type is specified by a list of attribute names and data types. If the data type of an attribute is collatable, the attribute's collation rule can also be specified. This is essentially the same as the row type of a table, but using **CREATE TYPE** avoids the need to create an actual table when all that is wanted is to define a type. A stand-alone composite type is useful as the parameter or return type of a function.

To create a composite type, you must have the **USAGE** permission on all of its attribute types.

- Base type

  You can create a base type (scalar type). Generally, these functions must be written in the underlying language.

- Shell type

  A shell type is simply a placeholder for a type to be defined later; it is created by issuing **CREATE TYPE** with no parameters except for the type name. Shell types are needed as forward references when base types are created.

- Enumerated type

  An enumerated type is a list of one or more quoted labels, each of which must be 1 to 63 bytes long.

- Set type

  It is similar to an array but has no length limit. It is mainly used in stored procedures.

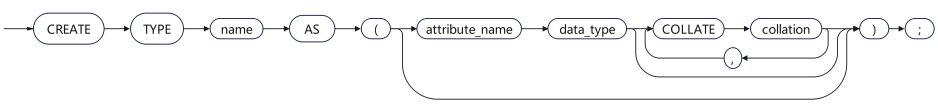
- A user with the CREATE ANY TYPE permission can create types in the public and user schemas.

Precautions

- If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)
- When creating a non-system type by associating a function, the user needs to understand the definition of the type and the function associated with the type. If this function is not properly used, permissions may be exploited due to the associated function.

Syntax

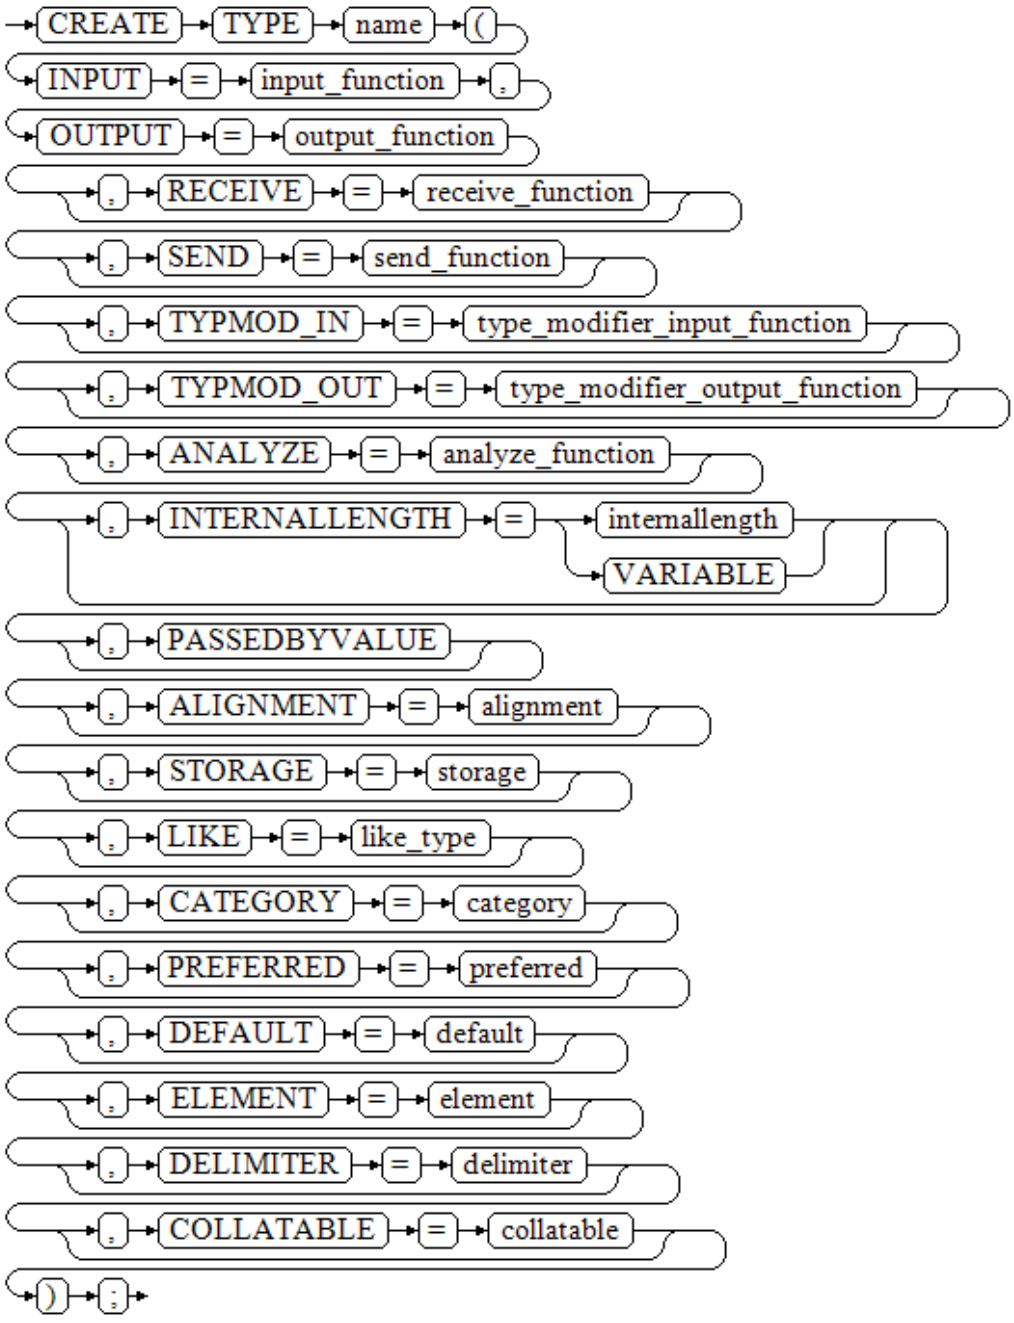
```
CREATE TYPE name AS
    ( [ attribute_name data_type [ COLLATE collation ] [, ... ] ] );
```



```
CREATE TYPE name (
    INPUT = input_function,
    OUTPUT = output_function
    [ , RECEIVE = receive_function ]
    [ , SEND = send_function ]
    [ , TYPMOD_IN = type_modifier_input_function ]
    [ , TYPMOD_OUT = type_modifier_output_function ]
    [ , ANALYZE = analyze_function ]
```

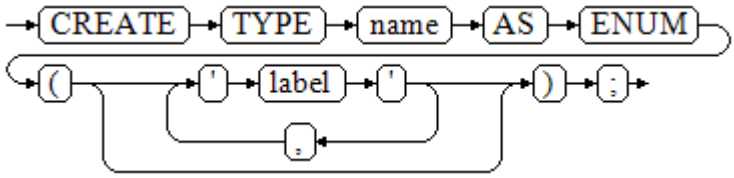
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    [ , INTERNALLENGTH = { internallength | VARIABLE } ]
    [ , PASSEDBYVALUE ]
    [ , ALIGNMENT = alignment ]
    [ , STORAGE = storage ]
    [ , LIKE = like_type ]
    [ , CATEGORY = category ]
    [ , PREFERRED = preferred ]
    [ , DEFAULT = default ]
    [ , ELEMENT = element ]
    [ , DELIMITER = delimiter ]
    [ , COLLATABLE = collatable ]
);
```



```
CREATE TYPE name;
```

```
CREATE TYPE name AS ENUM
    ( [ 'label' [, ... ] ] );
```



```
CREATE TYPE name AS TABLE OF data_type;
```

Parameters

Composite type

- **name**

  Specifies the name (optionally schema-qualified) of the type to be created.

- **attribute_name**

  Specifies the name of an attribute (column) for the composite type.

- **data_type**

  Specifies the name of an existing data type to become a column of the composite type. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

- **collation**

  Specifies the name of an existing collation rule to be associated with a column of the composite type. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

  NOTE

  The constructor of the composite type can use the => to assign values. The restrictions are as follows:

  - The => function is used when the constructor of the composite type assigns values. This function is supported only for A-compatible databases (**sql_compatibility** set to **'A'**).
  - The constructor of the composite type uses the => function to assign values. This function is supported only when => is consecutively used to assign values to input parameters, for example, **composite_name(elename1 => val1, elename2 => val2, elename3 => val3)** or **composite_name(val1, elename2 => val2, elename3 => val3)**. Discontinuous use of => or => is not supported. The last input parameter, for example, **composite_name(elename1 => val1, elename2 => val2, val3)** or **composite_name(val1, elename2 => val2, val3)**, is not assigned a value.

Base type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

When creating a base type, you can place parameters in any order. The input_function and output_function parameters are required, and other parameters are optional.

- **input_function**

  Specifies the name of a function that converts data from the type's external textual form to its internal form.

  The input function may be declared as taking one parameter of type cstring or taking three parameters of types cstring, oid, and integer.

  – The cstring-type parameter is the input text as a C string.

  – The oid-type parameter is the type's own OID (except for array types, which instead receive their element type's OID).

  – The integer-type parameter is typmod of the target column, if known (**–1** will be passed if not known).

  The input function must return a value of the data type itself. Usually, an input function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the input function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

  NOTE

  - The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by running the **CREATE TYPE** *name* command, with no additional parameters. Then, the I/O functions written in C can be defined as referencing the shell type. Finally, CREATE TYPE with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.
  - If the input and output functions are internal functions and are specified as internal system functions, the parameter types of the input and output functions must be the same, and the parameter types of **INTERNALLENGTH** and **PASSEDBYVALUE** of the new type must be the same as those of the input and output functions.

- **output_function**

  Specifies the name of a function that converts data from the type's internal form to its external textual form.

  The output function must be declared as taking one parameter of the new data type. The output function must return type cstring. Output functions are not called for **NULL** values.

- **receive_function**

  (Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

  If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.

- The internal-type parameter is a pointer to a StringInfo buffer holding the received byte strings.
- The oid- and integer-type parameters are the same as those of the text input function.

The receive function must return a value of the data type itself. Usually, a receive function should be declared as **STRICT**. If it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send_function**

  (Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

  If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not called for **NULL** values.

- **type_modifier_input_function**

  (Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type_modifier_output_function**

  (Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

  NOTE

  type_modifier_input_function and **type_modifier_output_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as char(5) or numeric(30,2). GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type_modifier_input_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type_modifier_input_function**. The **type_modifier_output_function** converts the internal integer typmod value back to the correct form for user display. It must return a cstring value that is the exact string to append to the type name. For example, a numeric function may return (30,2). It is allowed to omit the **type_modifier_output_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze_function**

  (Optional) Specifies the name of a function that performs statistical analysis for the data type.

  By default, **ANALYZE** will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a Boolean result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **internallength**

  (Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

  While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to **-1**.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

  (Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

  (Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**. The default is **int4**.

  The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.

- **storage**

  (Optional) Specifies the storage strategy for the data type.

  If specified, it must be **plain**, **external**, **extended**, or **main**. The default is **plain**.

  - **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
  - **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
  - **external** allows the value to be moved out of the main table, but the system will not try to compress it.
  - **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

    All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default **TOAST** storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using **ALTER TABLE SET STORAGE**.

- **like_type**

  (Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

passedbyvalue, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this CREATE TYPE statement.

Specifying representation in this way is especially useful when the underlying implementation of a new type references an existing type.

- **category**

  (Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

  (Optional) Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**, else **FALSE**. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

  NOTE

  The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

  (Optional) Specifies the default value for the data type. If this is omitted, the default is null.

  A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the **DEFAULT** keyword. (Such a default can be overridden by an explicit **DEFAULT** clause attached to a particular column.)

- **element**

  (Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), specify **ELEMENT = int4**.

- **delimiter**

  (Optional) Specifies the delimiter character to be used between values in arrays made of this type.

  delimiter can be set to a specific character. The default delimiter is the comma (,). Note that the delimiter is associated with the array element type, not the array type itself.

- **collatable**

  (Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

  If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

  (Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

NOTE

Whenever a user-defined type is created, GaussDB automatically creates an associated array type whose name consists of the element type's name prepended with an underscore (_).

Examples

```
-- Create a composite type, create a table, insert data, and make a query.
gaussdb=# CREATE TYPE compfoo AS (f1 int, f2 text);
gaussdb=# CREATE TABLE t1_compfoo(a int, b compfoo);
gaussdb=# CREATE TABLE t2_compfoo(a int, b compfoo);
gaussdb=# INSERT INTO t1_compfoo values(1,(1,'demo'));
gaussdb=# INSERT INTO t2_compfoo SELECT * FROM t1_compfoo;
gaussdb=# SELECT (b).f1 FROM t1_compfoo;
gaussdb=# SELECT * FROM t1_compfoo t1 JOIN t2_compfoo t2 ON (t1.b).f1=(t1.b).f1;

-- Rename the data type.
gaussdb=# ALTER TYPE compfoo RENAME TO compfoo1;

-- Change the owner of the user-defined type compfoo1 to usr1.
gaussdb=# CREATE USER usr1 PASSWORD '********';

7.12.9.56 CREATE USER

Description

Creates a user with a specified password. A user is a basic element for GaussDB authentication. You can use the correct username and password to log in to the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

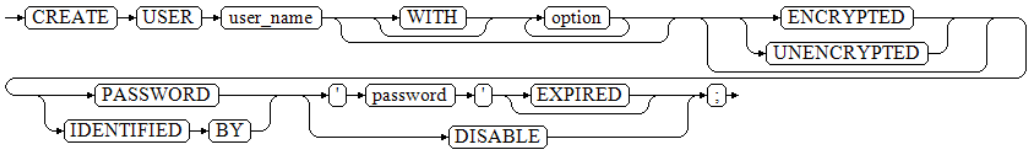
GaussDB and grant different permissions to different users so that different users can perform different operations.

Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

```
CREATE USER user_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```



The option clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | {AUDITADMIN | NOAUDITADMIN}
    | {CREATEDB | NOCREATEDB}
    | {USEFT | NOUSEFT}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}

    | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **user_name**

  Name of the user to be created.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the username. If a username contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a username that contains uppercase letters, enclose the username with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **password**

  Specifies the login password.

  The new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the username or the username spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$%^&*()-_=+\|[{}];:,<.>/?).

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a user is created.

  Value range: a string

For other parameters, see **CREATE ROLE**.

Examples

```
-- Create user jim whose login password is ********.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Create user kim whose login password is ********.
gaussdb=# CREATE USER kim IDENTIFIED BY '********';

-- Create user tom whose login password is ********.
gaussdb=# CREATE USER TOM PASSWORD '**********';

-- Create user TOM whose login password is ********.
gaussdb=# CREATE USER "TOM" PASSWORD '**********';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
gaussdb=# CREATE USER dim CREATEDB PASSWORD '********';

-- Query the permissions of the dim user.
gaussdb=#  \du dim

ALTER USER, **CREATE ROLE**, and **DROP USER**

7.12.9.57 CREATE USER MAPPING

Description

CREATE USER MAPPING defines a new mapping from a user to an external server. A user mapping usually contains connection information. The foreign data wrapper uses the connection information and the information contained in the external server to access an external data source, the owner of an external server can create a user mapping for the server for any user. If a user is granted the USAGE privilege on the server, the user can create a user mapping for its own username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- If the **password** option is displayed in **OPTIONS**, ensure that the **usermapping.key.cipher** and **usermapping.key.rand** files exist in the *$GAUSSHOME*/**bin** directory of each node in GaussDB. If the two files do not exist, use the gs_guc tool to generate them and use the gs_ssh tool to release them to the *$GAUSSHOME*/**bin** directory on each node in GaussDB. For details, see the description in **OPTIONS ({ option_name 'value' } [, ...])**.
- When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE USER MAPPING FOR { user_name | USER | CURRENT_USER | PUBLIC }
    SERVER server_name
    [ OPTIONS ( option 'value' [ , ... ] ) ];
```

Parameters

- **user_name**

  Specifies the name of an existing user to map to a foreign server.

  CURRENT_USER and **USER** match the name of the current user. When **PUBLIC** is specified, a public mapping is created and used when no mapping for a particular user is available.

- **server_name**

  Specifies the name of the existing server for a created user mapping.

- **OPTIONS ({ option_name ' value ' } [, ...])**

  Specifies options for user mapping. These options typically define the actual username and password of this mapping. The option name must be unique. The allowed option names and values are related to the foreign data wrapper of the server.

  NOTE

  - User passwords are encrypted and stored in the system catalog **PG_USER_MAPPING**. During the encryption, **usermapping.key.cipher** and **usermapping.key.rand** are used as the encryption password file and encryption factor. Before using the tool for the first time, create the two files, save the files to the *$GAUSSHOME*/**bin** directory on each node, and ensure that you have the read permission on the files. **gs_ssh** helps you quickly place files in the specified directory of each node.
    ```
    gs_ssh -c "gs_guc generate -o usermapping -S default -D $GAUSSHOME/bin"
    ```
  - If the **-S** parameter is set to default, a password is randomly generated. You can also specify a password for the **-S** parameter to ensure the security and uniqueness of the generated password file. You do not need to save or memorize the password. For details about other parameters, see the description of the **gs_guc** tool in "Tool Reference".

Examples

```
-- Create a role.
gaussdb=# CREATE ROLE bob PASSWORD '********';

-- Create a foreign server.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a user mapping.
gaussdb=# CREATE USER MAPPING FOR bob SERVER my_server OPTIONS (USER 'bob', PASSWORD
'********');

-- Modify the user mapping.
gaussdb=# ALTER USER MAPPING FOR bob SERVER my_server OPTIONS (SET PASSWORD '********');

-- Delete the user mapping.
gaussdb=# DROP USER MAPPING FOR bob SERVER my_server;

-- Delete the foreign server.
gaussdb=# DROP SERVER my_server;

-- Delete the role.
gaussdb=# DROP ROLE bob;
```

Helpful Links

ALTER USER MAPPING and **DROP USER MAPPING**

7.12.9.58 CREATE VIEW

Description

Creates a view. A view is a virtual table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

- You can define frequently used data as views to encapsulate complex query SQL statements, which simplifies operations.
- You can query only data defined in a view, which is secure. Columns in a base table are hidden to protect the data structure of the database.
- User permission management is simplified. Only the permission to use views is granted to users.

Precautions

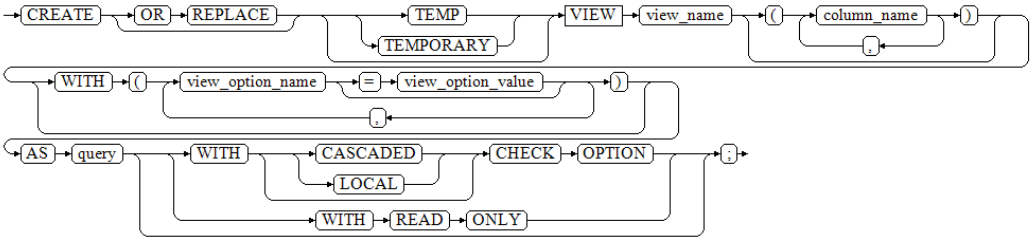
A user granted the CREATE ANY TABLE permission can create views in the public and user schemas.

Non-initial users are not allowed to perform the CREATE OR REPLACE operation on system views in the SYS, DBE_PERF, and INFORMATION_SCHEMA schemas.

Syntax

```
CREATE [ OR REPLACE ] [ TEMP | TEMPORARY ] VIEW view_name [ ( column_name [, ...] ) ]
    [ WITH ( {view_option_name [= view_option_value]} [, ... ] ) ]
    AS query
    [ WITH [ CASCADED | LOCAL ] CHECK OPTION  | WITH READ ONLY ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



NOTE

You can use WITH(security_barrier) to create a relatively secure view. This prevents attackers from printing hidden base table data by using the RAISE statement of low-cost functions.

After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

Parameters

- **OR REPLACE**

  (Optional) Redefines the view if it already exists.

- **TEMP | TEMPORARY**

  (Optional) Creates a temporary view. The view is automatically deleted when the current session ends. If any table referenced by a view is a temporary table, the view is created as a temporary view (regardless of whether **TEMP| TEMPORARY** is specified in the SQL statement).

- **view_name**

  Specifies the name (optionally schema-qualified) of the view to be created.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **view_option_name [= view_option_value]**

  Specifies an optional parameter for a view.

  Currently, view_option_name supports only **security_barrier** and **check_option**.

  security_barrier: This parameter is used when the view attempts to provide row-level security. Value range: Boolean (**true** or **false**).

  check_option: controls the behavior of updating a view. Value range: **CASCADED** and **LOCAL**.

- **query**

  Specifies a SELECT or VALUES statement that will provide the columns and rows of the view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If a DDL operation that will change the OID of the specified partition is used, for example, DROP, SPLIT, or MERGE, the view is unavailable. In this case, you need to create a view.

- **WITH [CASCADED | LOCAL] CHECK OPTION**

  Controls the behavior of updatable views. INSERT and UPDATE on the view will be checked to ensure that new rows meet the view-defining condition, that is, the new rows are visible through the view. If the check fails, the modification is rejected. If this option is not added, INSERT and UPDATE on the view are allowed to create rows that are not visible through the view. **WITH CHECK OPTION** can be set to **CASCADED** or **LOCAL**:

  CASCADED: New rows are checked against the conditions of the view and all underlying views. If **CHECK OPTION** is specified, and neither **LOCAL** nor **CASCADED** is specified, then **CASCADED** is used by default.

  LOCAL: New rows are only checked against the conditions defined directly on the view itself. Any conditions defined on underlying views are not checked (unless they also specify **CHECK OPTION**).

- **WITH READ ONLY**

  A read-only view is defined. You cannot insert, update, or delete data in the view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The concepts involved in the constraints on updating, inserting, and deleting views are described as follows:
  - Join view: view created with multiple tables using JOIN.
  - Key-preserved table: Insertion, update, and deletion of multi-table join views are restricted by key-preserved tables. In a multi-table view, if each row in the source table corresponds to each row in the view, and a row in the source table does not correspond to multiple rows in the view after the JOIN, the source table is a key-preserved table.

    Currently, you can determine whether a target table is a key-preserved table only by using the JOIN condition. The equivalence class (that is, combining JOIN and WHERE condition) cannot be used to determine whether a target table is a key-preserved table.
  - Relationship between the top layer and the bottom layer: A view may be nested at multiple layers. For example, a view consists of one or more views or subqueries. The view that is directly operated by the DML is called the top layer. The tables and views that form the view and the tables and views in the WITH clause are called the corresponding bottom layer.
  - Columns that can be updated: Columns that are not system columns or whole-row references and directly reference user columns in the base table can be updated. You can query the **is_updatable** column in **information_schema.columns** to check whether a column in a view or table can be updated.
  - Updatable view: view that can be inserted, updated, or deleted. Updatable views do not contain DISTINCT, GROUP BY, HAVING, LIMIT, OFFSET, UNPIVOT, FOR UPDATE, FETCH and START WITH CONNECT BY clauses, set operations (UNION, INTERSECT, and EXCEPT), aggregate functions, window functions, and return set functions (array_agg, json_agg, and generate_series), and flashback. **WITH CHECK OPTION** can be defined only on updatable views. To check whether a view can be updated, query the **is_updatable** and **is_insertable_into** columns in **information_schema.views** or the **information_schema.tables.is_insertable_into** column. In **information_schema.views**, **is_updatable** specifies whether a view can be updated or deleted, **is_insertable_into** specifies whether data can be inserted into a view, and **information_schema.tables.is_insertable_into** specifies whether data can be inserted into a relationship.
- If an updatable view has an INSTEAD OF trigger or INSTEAD rule, using CHECK OPTION does not check the conditions on that view.
- If an underlying view of an updatable view has an INSTEAD OF trigger and the updatable view defines the **CHECK OPTION** option of the CASCADED type, in non-A-compatible mode, the conditions of the underlying view with the INSTEAD OF trigger are recursively checked, and the conditions of the underlying view with the trigger are not checked. In A-compatible mode, the **CHECK OPTION** option of all views is invalid and no check is performed.
- If **CASCADED CHECK OPTION** is defined in the upper-layer view and **LOCAL CHECK OPTION** is defined in the lower-layer view, **LOCAL CHECK OPTION** in the lower-layer view is overwritten by **CASCADED CHECK OPTION** in the upper-layer view.
- If an updatable view or any of its underlying relationships has an INSTEAD rule that causes INSERT or UPDATE rewriting, using CHECK OPTION will not check the conditions on all views.
- If **CHECK OPTION** is specified, insert and update operations cannot be performed on join columns in multi-table join views or multi-table join subqueries.
- If **CHECK OPTION** is specified, duplicate base tables exist in a multi-table join view or multi-table join subquery, and the duplicate base tables are not all key-preserved tables, the view or subquery cannot be deleted.

Examples

- Ordinary view

```
-- Create the test_tb1 table and insert 100 data records into the table.
gaussdb=# CREATE TABLE test_tb1(col1 int, col2 int);
gaussdb=# INSERT INTO test_tb1 VALUES (generate_series(1,100),generate_series(1,100));
-- Create a view whose value of col1 is less than 3.
gaussdb=# CREATE VIEW test_v1 AS SELECT * FROM test_tb1 WHERE col1 < 3;
-- Query a view.
gaussdb=# SELECT * FROM test_v1;
 col1 | col2
------+------
    1 |    1
    2 |    2
(2 rows)

-- Delete the table and the view.
gaussdb=# DROP VIEW test_v1;
gaussdb=# DROP TABLE test_tb1;
```

- Read-only view

```
-- Create the test_tb table.
gaussdb=# CREATE TABLE test_tb(c1 int, c2 int);

-- Create the test_v read-only view.
gaussdb=# CREATE  VIEW test_v AS SELECT * FROM test_tb WITH READ ONLY;

-- Write data to the view to check whether the view is read-only.
gaussdb=# INSERT INTO test_v VALUES (1, 1);
ERROR:  Cannot perform a DML operation on a read-only view.

-- Delete the table and the view.
gaussdb=# DROP VIEW test_v;
gaussdb=# DROP TABLE test_tb;
```

- REPLACE application

```
-- Create tables a and b.
gaussdb=# CREATE TABLE a(c1 int, c2 int);
gaussdb=# CREATE TABLE b(c1 int, c2 int, c3 int);

-- Insert data into a and b.
gaussdb=# INSERT INTO a VALUES (1, 1);
gaussdb=# INSERT INTO b VALUES (1, 1, 1);

-- Query.
gaussdb=# SELECT * FROM a;
 c1 | c2

7.12.9.59 CREATE WEAK PASSWORD DICTIONARY

Description

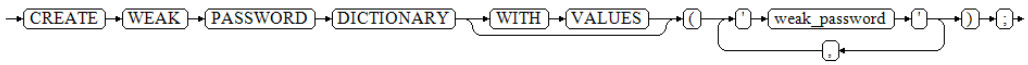
CREATE WEAK PASSWORD DICTIONARY creates a weak password dictionary, which is empty by default. You can use this syntax to add one or more weak passwords to the gs_global_config system catalog.

Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the gs_global_config system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the gs_global_config system catalog, only one weak password is retained in the system catalog.

Syntax

```
CREATE WEAK PASSWORD DICTIONARY
    [WITH VALUES] ( {'weak_password'} [, ...] );
```



Parameters

- **weak_password**

  Specifies a weak password.

  Value range: a string.

Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********');

-- Check weak passwords in the gs_global_config system catalog.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
     name       |    value
----------------+--------------
 weak_password   | ********
(1 rows)

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********'),('********');

-- Check the weak password in the gs_global_config system catalog again. The asterisk (*) in a weak password does not represent the password content.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
     name       |     value
----------------+----------------
 weak_password   | ********
 weak_password   | ********
 weak_password   | ********
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
 name | value
------+-------
(0 rows)
```

DROP WEAK PASSWORD DICTIONARY

7.12.9.60 CURSOR

Description

This statement is used to create a cursor and retrieve specified rows of data from a query.

To process SQL statements, the stored procedure thread assigns a memory segment to store context association. Cursors are handles or pointers pointing to context areas. With cursors, stored procedures can control alterations in context areas.

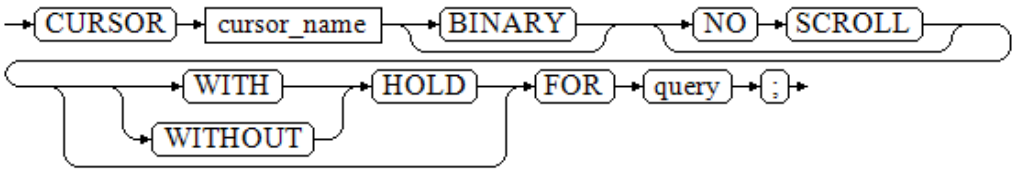
Precautions

- CURSOR is used only in transaction blocks.
- Generally, CURSOR and SELECT both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. FETCH implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).
- Parameters can be defined for static cursors. The parameters support default values. However, the default value of a parameter cannot be a variable outside the package. You can define a variable in the package, assign the variable outside the package to the defined variable, and use the variable as the default value.
- The definition of a cursor generates a query object. Currently, packages or stored procedures do not support the creation of dependencies on query objects.

Syntax

```
CURSOR cursor_name
    [ BINARY ]  [ NO SCROLL ]  [ { WITH | WITHOUT } HOLD ]
    FOR query;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Specifies that data retrieved by a cursor will be returned in binary format, not in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

  – **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.

  – Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

  NOTE

  In cmdsql, only the NO SCROLL keyword can be added or the scrolling option is not added. The SCROLL keyword cannot be added.

  In a stored procedure, the keywords NO SCROLL and SCROLL can be added, or the scrolling option is not added.

  Among explicit cursors, only cursors declared as **NO SCROLL** can be concurrently executed. You are advised to set this parameter to **NO SCROLL** for cursors that do not need to retrieve data rows in reverse order.

- **WITH HOLD | WITHOUT HOLD**

  Specifies whether a cursor can be used after the transaction that created it ends.

  – **WITH HOLD**: The cursor can be used after the transaction that created it ends.

  – **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.

  – If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

- **query**

  Uses the **SELECT** or **VALUES** clause to specify the rows to be returned by a cursor.

  Value range: **SELECT** or **VALUES** clause

Examples

Example 1:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,20));

-- Set up cursor1.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the FETCH command to retrieve three rows of data.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
 c1
----
  1
  2
  3
(3 rows)

-- Run the MOVE command to move the cursor backwards by two rows. No result is returned.
gaussdb=# MOVE FORWARD 2 FROM cursor1;
MOVE 2

-- Run the FETCH command to retrieve two rows of data.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 c1
----
  6
  7
(2 rows)

-- Close the cursor and end the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;
```

Example 2: Cursor with the WITH HOLD attribute

```
-- Set up a WITH HOLD cursor named cursor2.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor2 WITH HOLD FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the FETCH command to retrieve three rows of data.
gaussdb=# FETCH FORWARD 3 FROM cursor2;
 c1
----
  1
  2
  3
(3 rows)

-- Different from common cursors, cursors with the WITH HOLD attribute can still be used after a
transaction ends.
gaussdb=# END;
gaussdb=# FETCH FORWARD 2 FROM cursor2;
 c1
----
  4
  5
(2 rows)

-- Close the cursor.
gaussdb=# CLOSE cursor2;

-- Drop.
gaussdb=# DROP TABLE tbl_test;
```

7.12.10 D

7.12.10.1 DEALLOCATE

Description

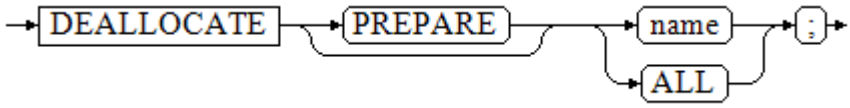
DEALLOCATE deallocates prepared statements.

Precautions

- If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.
- The PREPARE keyword in the syntax is always ignored.

Syntax

```
DEALLOCATE [ PREPARE ] { name | ALL };
```



Parameters

- **name**

  Specifies the name of the prepared statement to be deallocated.
- **ALL**

  Deallocates all prepared statements.

Examples

```
-- View existing prepared statements.
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name | statement | parameter_types
------+-----------+-----------------
(0 rows)

-- Create four prepared statements q1, q2, q3, and q4.
gaussdb=# PREPARE q1 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q2 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q3 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q4 AS SELECT 1 AS a;
PREPARE

-- View existing prepared statements again.
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name |          statement           | parameter_types
------+------------------------------+-----------------
 q1   | PREPARE q1 AS SELECT 1 AS a; | {}
 q4   | PREPARE q4 AS SELECT 1 AS a; | {}
 q3   | PREPARE q3 AS SELECT 1 AS a; | {}
 q2   | PREPARE q2 AS SELECT 1 AS a; | {}
(4 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the prepared statements q4 and view the remaining prepared statements.
gaussdb=# DEALLOCATE q4;
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name |          statement           | parameter_types
------+------------------------------+-----------------
 q1   | PREPARE q1 AS SELECT 1 AS a; | {}
 q3   | PREPARE q3 AS SELECT 1 AS a; | {}
 q2   | PREPARE q2 AS SELECT 1 AS a; | {}
(3 rows)

-- Delete all prepared statements and view the remaining prepared statements.
gaussdb=# DEALLOCATE ALL;
DEALLOCATE ALL
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name | statement | parameter_types
------+-----------+-----------------
(0 rows)
```

7.12.10.2 DECLARE

Description

DECLARE defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in **BEGIN**.

To process SQL statements, the stored procedure thread assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, CURSOR and SELECT both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. FETCH implements conversion between binary data and text data.

Precautions

- CURSOR is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte value containing the internal representation of the value (in big-endian byte order).

Syntax

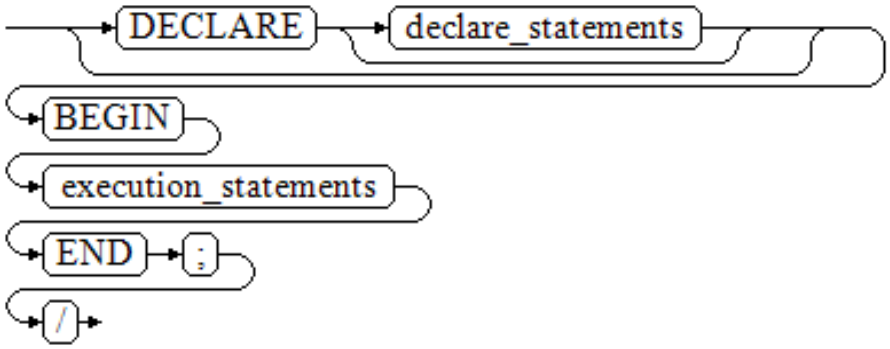
- Define a cursor.

```
DECLARE cursor_name [ BINARY ] [ NO SCROLL ]
    CURSOR [ { WITH | WITHOUT } HOLD ] FOR query;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```



Parameters

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Causes the cursor to return data in binary rather than in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

- **WITH HOLD**

  WITHOUT HOLD

  Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.

  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

  NOTICE

  - For a cursor declared as **WITH HOLD**, all data of the cursor is cached when a transaction ends. If the cursor has a large amount of data, this process may take a long time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **query**

  Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.

  Value range: **SELECT** or **VALUES** clause
- **declare_statements**

  Declares a variable, including its name and type, for example, **sales_cnt int**.
- **execution_statements**

  Specifies the statement to be executed in an anonymous block.

  Value range: an existing function name

Examples

For details about how to define a cursor, see **Examples** in section "FETCH."

Helpful Links

BEGIN and **FETCH**

7.12.10.3 DELETE

Description

Deletes rows that satisfy the WHERE clause from the specified table. If the WHERE clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

Precautions

- The owner of a table, users granted the DELETE permission on the table, or users granted the DELETE ANY TABLE permission can delete data from the table. When separation of duties is disabled, a system administrator has the permission to delete data from the table by default, as well as the SELECT permission on any table in the USING clause or whose values are read in condition.
- The syntax for deleting multiple tables is not applicable to views and tables containing RULE.
- For a DELETE statement whose subquery is a STREAM plan, UPDATE cannot be performed on the deleted row data.

Syntax

Delete a single table:

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM] [ ONLY ] {table_name [ * ] [ [ [partition_clause]  [ [ AS ] alias ] ] |
[ [ [ AS ] alias ] [partitions_clause] ] ] | subquery [ [ AS ] alias ] | view_name [ [ AS ] alias ]}
    [ USING using_list ]
    [ WHERE condition | WHERE CURRENT OF cursor_name ]
    [ ORDER BY { expression  [ ASC | DESC | USING operator ] } ]
    [ LIMIT { count } ]
    [ RETURNING { * | { output_expr [ [ AS ] output_name ] } [, ...] } ];
```

Delete multiple tables:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM]
   {[ ONLY ] table_name [ * ] [ [ [partition_clause]  [ [ AS ] alias ] ] | [ [ [ AS ] alias ]
[partitions_clause] ] ]} [, ...]
   [ USING using_list ]
   [ WHERE condition ];
```

or

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */]
   {[ ONLY ] table_name [ * ] [ [ [partition_clause]  [ [ AS ] alias ] ] | [ [ [ AS ] alias ]
[partitions_clause] ] ]} [, ...]
   [ FROM using_list ]
   [ WHERE condition ];
```

- Format of **with_query**:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
  ( {select | values | insert | update | delete} )
  ```

- Format of **subquery**:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
  { FIRST | LAST } ]} [, ...] ]
  [ OFFSET start [ ROW | ROWS ] ]
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
  [ into_option ];
  ```

- The specified subquery source **from_item**:

  ```
  {[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
  ```

- Format of **partition_clause**:

  ```
  PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
  SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
  ```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

    column_name specifies the column name displayed in the subquery result set.

  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
  - You can use MATERIALIZED or NOT MATERIALIZED to modify the CTE.

    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint**

  Follows the DELETE keyword in the **/*+ */** format. It is used to optimize the plan of a DELETE statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ONLY**

  If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.

- **table_name**

  Specifies the name (optionally schema-qualified) of the target table.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

  The object to be deleted can be a subquery. When data in a subquery is deleted, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

  If there is only one table in the subquery, the table is deleted. If there are multiple tables or nested tables in the subquery, the system determines whether the table can be deleted by checking whether there is a key-preserved table. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Specifies name of the target view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on deleting views and subqueries are as follows:

- The DELETE operation can be performed only on columns that directly reference user columns in the base table.
- A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
- Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT or OFFSET clause at the top layer are not supported.
- Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
- Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
- Views with BEFORE or AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
- Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
- A join view or subquery can delete only the key-preserved tables in the view or subquery. If there is only one key-preserved table, the data in the table is deleted. If there are multiple key-preserved tables, only the data in the first key-preserved table following **from** is deleted.
- If the **CHECK OPTION** option is specified in the join view or subquery, the base table is duplicate, and the duplicate base table retains inconsistent key table attributes in the view or subquery, rows cannot be deleted from the join view or subquery. For details about the key-preserved table, see **CREATE VIEW**.
- The DELETE operation cannot be performed on the system view.
- Deleting multiple tables is not supported.

- **partition_clause**

  Deletes a specified partition.

  PARTITION { (partition_name) | FOR (partition_value [, ...]) } |

  SUBPARTITION { (subpartition_name) | FOR (subpartition_value [, ...]) }

  For details about the keywords, see **SELECT**.

  For details, see **CREATE TABLE SUBPARTITION**.

- **partitions_clause**

  Deletes multiple partitions.

  PARTITION { ({ partition_name | subpartition_name } [, ...]) }

  This syntax takes effect only when **sql_compatibility** is set to **B**.

  For details about the keywords, see **SELECT**.

  For details, see **CREATE TABLE SUBPARTITION**.

- **alias**

  Specifies a substitute name for the target table.

  Value range: a string. It must comply with the **naming convention**.

- **using_list**

  Specifies the USING clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When **sql_compatibility** is set to **B** or multiple tables are to be deleted, the target tables can appear at the same time when **using_list** specifies the set of associated tables. In addition, the aliases of the tables can be defined and used in the target tables. In other situations, the target tables cannot appear repeatedly in **using_list**.

- **condition**

  Specifies an expression that returns a Boolean value. Only rows for which this expression returns **true** will be deleted. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor_name**

  When the cursor points to a row in a table, you can use this syntax to delete the row. For details about the restrictions, see **UPDATE**.

- **ORDER BY**

  For details about the keywords, see **SELECT**.

- **LIMIT**

  For details about the keywords, see **SELECT**.

- **output_expr**

  Specifies an expression used to calculate the output result after a row is deleted using the DELETE statement. The expression can use any column of the table. You can use ***** to return all columns of the deleted row.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string. It must comply with the **naming convention**.

Examples

- Deleting some data records

```
-- Create a table.
gaussdb=# CREATE TABLE test_t1(col1 INT,col2 INT);
gaussdb=# INSERT INTO test_t1 VALUES (1, 1), (2, 2), (3, 3), (4, 4), (4, 6);

-- Delete some data records from the table.
gaussdb=# DELETE FROM test_t1 WHERE col1 = 4;

-- Query.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
------+------
    1 |    1
    2 |    2
    3 |    3
(3 rows)
```

- Deleting all data

```
-- Delete all data.
gaussdb=# DELETE FROM test_t1;

-- Query.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------+------
(0 rows)

-- Delete the table.
gaussdb=# DROP TABLE test_t1;
```

- **WITH [RECURSIVE] with_query [, ...]**

```
-- Student table.
gaussdb=# CREATE TABLE student(id INT,name varchar(50));

-- Grade table.
gaussdb=# CREATE TABLE grade(id INT,score CHAR);

gaussdb=# INSERT INTO student VALUES (1, 'tom'), (2, 'jerry'), (3, 'david');
gaussdb=# INSERT INTO grade VALUES (1, 'A'), (2, 'B'), (3, 'b');

-- Delete the data whose id is 2 from the student table and delete the data of the student from the grade table.
gaussdb=# WITH del_stu AS(DELETE FROM student WHERE id = 2 RETURNING id)
    DELETE FROM grade WHERE id = (SELECT id FROM del_stu);

-- Query data.
gaussdb=# SELECT * FROM student;
 id | name
----+-------
  1 | tom
  3 | david
(2 rows)

gaussdb=# SELECT * FROM grade;
 id | score
----+-------
  1 | A
  3 | b
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE grade;
gaussdb=# DROP TABLE student;
```

- Deleting a view or subquery

  Example 1: Deleting a subquery

```
-- Create a schema.
gaussdb=# CREATE SCHEMA del_subqry;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'del_subqry';
SET

-- Create tables and insert data into the tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"
CREATE TABLE
gaussdb=# CREATE TABLE tdata (x INT PRIMARY KEY, y INT);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "tdata_pkey" for table "tdata"
CREATE TABLE
gaussdb=# CREATE TABLE tinfo (z INT PRIMARY KEY, comm VARCHAR2(20));
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "tinfo_pkey" for table "tinfo"
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4
gaussdb=# INSERT INTO t2 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4

```

Suggestions

- DELETE

  To delete all records in a table, use the TRUNCATE syntax.

7.12.10.4 DO

Description

DO executes anonymous code blocks.

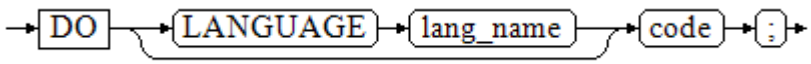
A code block is regarded as a function body without parameters. The return value type is void. It is parsed and executed a single time.

Precautions

- Before using a procedural language, you must install it in the current database by running the **CREATE LANGUAGE** command. PL/pgSQL is installed by default. To install another language, you must specify it.
- To use an untrusted language, you must have the USAGE permission on the programming language or the system administrator permission.

Syntax

```
DO [ LANGUAGE lang_name ] code;
```



Parameters

- **lang_name**

  Specifies the name of the procedural language the code is written in. If omitted, the default language is PL/pgSQL.

- **code**

  Specifies the programming language code that can be executed. The value must be a character string.

Examples

```
-- Create the webuser user.
gaussdb=# CREATE USER webuser PASSWORD '********';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
gaussdb=# DO $$DECLARE r record;
BEGIN
    FOR r IN SELECT c.relname table_name,n.nspname table_schema FROM pg_class c,pg_namespace n
            WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
    LOOP
        EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    END LOOP;
END$$;

-- Delete the webuser user.
gaussdb=# DROP USER webuser CASCADE;
```

7.12.10.5 DROP AGGREGATE

Description

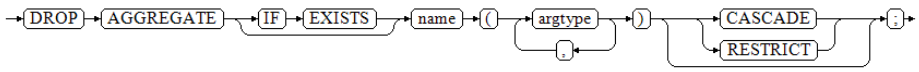
Deletes an aggregate function.

Precautions

DROP AGGREGATE deletes an existing aggregate function. Only the owner of the aggregate function can run this command.

Syntax

```
DROP AGGREGATE [ IF EXISTS ] name ( argtype [ , ... ] ) [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Do not throw an error if the specified aggregation does not exist. A notice is issued in this case.

- **name**

  Existing aggregate function name (optionally schema-qualified).

- **argtype**

  Input data type of the aggregate function. To reference a zero-parameter aggregate function, use * to replace the input data type list.

- **CASCADE**

  Cascade deletes objects that depend on the aggregate function.

- **RESTRICT**

  Refuses to delete the aggregate function if any objects depend on it. This is a default processing.

Examples

```
-- Create a user-defined function.
gaussdb=# CREATE OR REPLACE FUNCTION int_add(int,int)
    RETURNS int AS $BODY$
declare
begin
    return $1 + $2;
end;
$BODY$ language plpgsql;

-- Create an aggregate function.
gaussdb=# CREATE AGGREGATE myavg(int)
(
    sfunc = int_add,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    stype = int,
    initcond = '0'
);

-- Delete the aggregate function myavg of the int type.
gaussdb=# DROP AGGREGATE myavg(int);

-- Delete the user-defined function.
gaussdb=# DROP FUNCTION int_add(int,int);
```

Helpful Links

ALTER AGGREGATE and **CREATE AGGREGATE**

Compatibility

The SQL standard does not provide the **DROP AGGREGATE** statement.

7.12.10.6 DROP AUDIT POLICY

Description

Deletes an audit policy.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

Parameters

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **IF EXISTS**

  Checks whether the audit policy exists. If it exists, the deletion is successful. Otherwise, a NOTICE message is sent.

Examples

```
-- Create the adt1 policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;
CREATE AUDIT POLICY

-- Delete the audit policy adt1.
gaussdb=# DROP AUDIT POLICY adt1;
DROP AUDIT POLICY

-- When you delete the audit policy adt0 that does not exist, the system displays a message indicating that the deletion fails because the audit policy does not exist.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# DROP AUDIT POLICY adt0;
ERROR:  adt0 policy does not exist, drop failed
```

Helpful Links

ALTER AUDIT POLICY and **CREATE AUDIT POLICY**

7.12.10.7 DROP CAST

Description

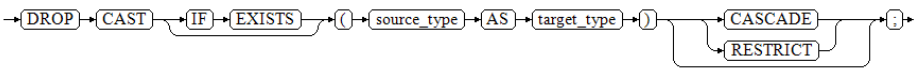
Drops a type conversion.

Precautions

To delete a type conversion, you must have permissions on the source or destination data type. This is the same permission as creating a type conversion.

Syntax

```
DROP CAST [ IF EXISTS ] (source_type AS target_type) [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Do not throw an error if the specified conversion does not exist. A notice is issued in this case.

- **source_type**

  Source data type in the type conversion.

- **target_type**

  Type of the target data in the type conversion.

- **CASCADE** | **RESTRICT**

  These keys have no effect because there is no dependency on type conversion.

Examples

See **Examples**.

Helpful Links

CREATE CAST

Compatibility

DROP CAST complies with the SQL standard.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.8 DROP CLIENT MASTER KEY

Description

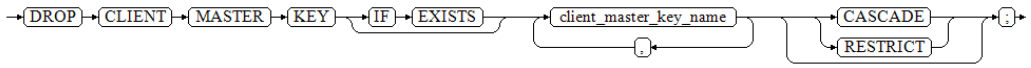
Deletes a CMK.

Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only delete the metadata of key objects recorded in the system catalog of the database, but cannot delete the key entities managed by the client key tool or online key service.

Syntax

```
DROP CLIENT MASTER KEY [ IF EXISTS ] client_master_key_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If a specified CMK does not exist, a notice rather than an error is issued.
- **client_master_key_name**

  Name of a CMK to be deleted.

  Value range: a string. It is the name of an existing CMK object.
- **CASCADE** | **RESTRICT**
  - Allows/Restricts to delete objects that depend on the CMK.

Helpful Links

CREATE CLIENT MASTER KEY

7.12.10.9 DROP COLUMN ENCRYPTION KEY

Description

Deletes a column encryption key (CEK).

Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.

Syntax

```
DROP COLUMN ENCRYPTION KEY [ IF EXISTS ] client_column_key_name [, ...] [ CASCADE | RESTRICT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **IF EXISTS**

  If a specified CEK does not exist, a notice rather than an error is issued.
- **client_column_key_name**

  Name of a CEK to be deleted.

  Value range: a string. It is the name of an existing CEK.
- **CASCADE** | **RESTRICT**

  For fully-encrypted databases, this syntax is high-risk operation. Actually, encrypted columns that depend on CEKs cannot be deleted.

Helpful Links

ALTER COLUMN ENCRYPTION KEY and **CREATE COLUMN ENCRYPTION KEY**

7.12.10.10 DROP DATABASE

Description

Deletes a database.

Precautions

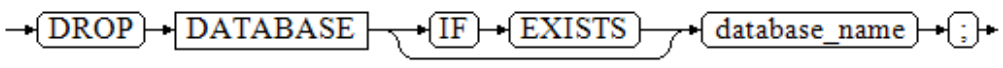
- Only the database owner or a user granted the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled **POSTGRES**, **TEMPLATE0**, **TEMPLATE1**, and **TEMPLATEA** databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql command **\l**.
- If any users are connected to the database, the database cannot be deleted. You can view the DV_SESSIONS view to check the database connections.
- **DROP DATABASE** cannot be executed within a transaction block.
- If **DROP DATABASE** fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

NOTICE

DROP DATABASE cannot be undone.

Syntax

```
DROP DATABASE [ IF EXISTS ] database_name;
```



Parameters

- **IF EXISTS**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Reports a notice instead of an error if the specified database does not exist.

- **database_name**

  Specifies the name of the database to be deleted.

  Value range: an existing database name

Examples

```
-- Create a database.
gaussdb=# CREATE DATABASE testdb1;

-- Drop a database.
gaussdb=# DROP DATABASE testdb1;
```

Helpful Links

ALTER DATABASE and **CREATE DATABASE**

Suggestions

- DROP DATABASE

  Do not delete databases during transactions.

7.12.10.11 DROP DATABASE LINK

Description

Deletes database link objects.

Syntax

```
DROP [ PUBLIC ] DATABASE LINK [ IF EXISTS ] dblink_name;
```

Parameters

- **dblink_name**

  Name of a connection object.

- **IF EXISTS**

  Reports a notice instead of an error if the specified **DATABASE LINK** does not exist.

- **PUBLIC**

  Specifies the connection type. If **PUBLIC** is not specified, the database link is private by default.

Examples

```
-- Create a user with the SYSADMIN permission.
gaussdb=#  CREATE USER user1 WITH SYSADMIN PASSWORD '********';
gaussdb=#  SET ROLE user1 PASSWORD '********';

-- Create a private database link. host can be an IPv6 address.
gaussdb=#  CREATE DATABASE LINK private_dblink CONNECT TO 'user1' IDENTIFIED BY '********' USING
(host '192.168.11.11',port '54399',dbname 'db01');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the private database link.
gaussdb=#  DROP DATABASE LINK private_dblink;

-- Create a public database link. host can be an IPv6 address.
gaussdb=#  CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '********'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Drop the public database link.
gaussdb=#  DROP PUBLIC DATABASE LINK public_dblink;

-- Drop the created user.
gaussdb=#  RESET ROLE;
gaussdb=#  DROP USER user1;
```

Helpful Links

ALTER DATABASE LINK and **CREATE DATABASE LINK**

7.12.10.12 DROP DIRECTORY

Description

Deletes a directory.

Precautions

- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to delete the directory object.
- When **enable_access_server_directory** is set to **on**, a user with the SYSADMIN permission, a directory object owner, a user granted the DROP permission for a directory, or a user who inherits permissions from the built-in role gs_role_directory_drop can delete a directory object.
- The DIRECTORY object cannot be used in a PDB.

Syntax

```
DROP DIRECTORY [ IF EXISTS ] directory_name;
```

Parameters

- **directory_name**

  Specifies the name of the directory to be deleted.

  Value range: an existing directory name

- **IF EXISTS**

  If the directory object does not exist, a NOTICE message is displayed.

Examples

```
-- Create a directory object.
gaussdb=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';

-- Delete the directory object.
gaussdb=# DROP DIRECTORY dir;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE DIRECTORY and **ALTER DIRECTORY**

7.12.10.13 DROP EVENT

Description

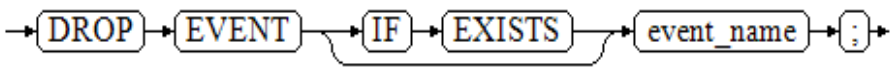
Deletes a scheduled task.

Precautions

Operations related to scheduled tasks are supported only when **sql_compatibility** is set to **'B'**.

Syntax

```
DROP EVENT [IF EXISTS] event_name;
```



Parameters

- **IF EXISTS**

  If the scheduled task does not exist, a NOTICE message is displayed.

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test_event WITH DBCOMPATIBILITY = 'b';
gaussdb=# \c test_event

-- Create a table.
test_event=# CREATE TABLE t_ev(num int);

-- Create a scheduled event that is executed once every five seconds. After the event is executed, the scheduled event is automatically deleted.
test_event=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE AT sysdate + interval 5 second DO INSERT INTO t_ev VALUES(0);

-- Query the table five seconds later.
test_event=# SELECT * FROM t_ev;
 num
-----
   0
(1 row)

-- Create a scheduled event that is executed every minute.
test_event=# CREATE EVENT IF NOT EXISTS event_e2 ON SCHEDULE EVERY 1 minute DO INSERT INTO t_ev VALUES(1);

-- Query the table every one minute. A new record is displayed.
test_event=# SELECT * FROM t_ev;
 num
-----
   0
   1
   1
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the scheduled event.
test_event=# DROP EVENT event_e2;

-- Drop the table.
test_event=# DROP TABLE t_ev;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual database name.
test_event=#\c postgres
gaussdb=# DROP DATABASE test_event;
```

Helpful Links

ALTER EVENT, **CREATE EVENT**, and **SHOW EVENTS**

7.12.10.14 DROP EXTENSION

NOTICE

The extended function is for internal use only. You are advised not to use it. Currently, DROP EXTENSION can be performed only on postgis, postgis_sfcgal, postgis_raster, postgis_topology, yukon_geomodel, yukon_geogridcoder, pkg_bpchar_opc, and tablefunc.

Description

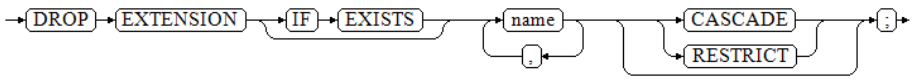
Deletes an extension.

Precautions

- The **DROP EXTENSION** command drops an extension from the database. When you drop an extension, the components that make up the extension are also deleted.
- The **DROP EXTENSION** command can be used only by the owner of the extension or the initial user.

Syntax

```
DROP EXTENSION [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If the **IF EXISTS** parameter is used and the extension does not exist, no error is reported. Instead, a notice is generated.
- **name**

  Specifies the name of an installed extension.
- **CASCADE**

  Automatically deletes objects that depend on the extension.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **RESTRICT**

  If any object depends on an extension, the extension cannot be deleted (unless all its member objects and other extension objects are deleted at a time using the **DROP** command). This is a default processing.

Helpful Links

ALTER EXTENSION and **CREATE EXTENSION**

7.12.10.15 DROP FOREIGN DATA WRAPPER

Description

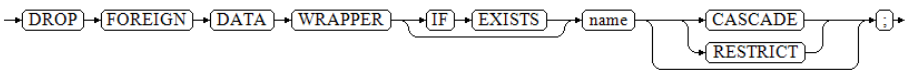
Deletes a specified foreign data wrapper.

Precautions

The DROP statement can be successfully executed only when **support_extended_features** is set to **on**.

Syntax

```
DROP FOREIGN DATA WRAPPER [ IF EXISTS ] name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Sends a notification instead of throwing an error if the foreign data wrapper does not exist.

- **name**

  Specifies the name of an existing foreign data wrapper.

- **CASCADE**

  Automatically drops objects (such as servers) that depend on the foreign data wrapper.

- **RESTRICT**

  If there are objects that depend on the foreign data wrapper, the foreign data wrapper cannot be deleted. This is the default behavior.

Example

```
-- Delete the foreign data wrapper dbi.
gaussdb=# DROP FOREIGN DATA WRAPPER dbi;
```

Helpful Links

CREATE FOREIGN DATA WRAPPER and **ALTER FOREIGN DATA WRAPPER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.16 DROP FOREIGN TABLE

Description

Drops a foreign table.

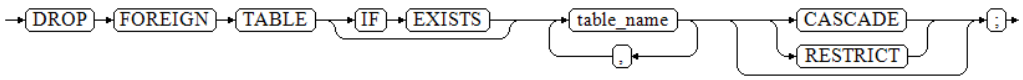
Precautions

DROP FOREIGN TABLE forcibly drops the specified table and the indexes depending on the table. After the table is dropped, the functions and stored procedures that need to use this table cannot be executed.

In the multi-tenancy scenario, only the initial user can run the **DROP FOREIGN TABLE** command in the PDB.

Syntax

```
DROP FOREIGN TABLE [ IF EXISTS ]
    table_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.

- **table_name**

  Specifies the name of the table.

  Value range: an existing table name.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically drops the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to drop the table if any objects depend on it. This is the default action.

Examples

See **Examples**.

Helpful Links

ALTER FOREIGN TABLE and **CREATE FOREIGN TABLE**

7.12.10.17 DROP FUNCTION

Description

Deletes a function.

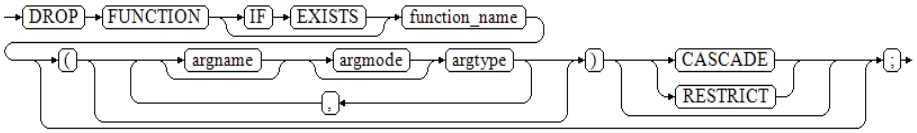
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- If a function involves operations on temporary tables, DROP FUNCTION cannot be used.
- Only the function owner or a user with the DROP permission can run the **DROP FUNCTION** command. By default, system administrators have the permission.
- Only the initial user has the permission to perform the DROP operation on the functions of the initial user.

Syntax

```
DROP FUNCTION [ IF EXISTS ] function_name
[ ( [ {[ argname ] [ argmode ] argtype} [, ...] ] ) [ CASCADE | RESTRICT ] ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified function does not exist.
- **function_name**

  Specifies the name of the function to be deleted.

  Value range: an existing function name
- **argmode**

  Specifies the parameter mode of the function.
- **argname**

  Specifies the parameter name of the function.
- **argtype**

  Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the function.
  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

Examples

- Delete the list of parameters that can be omitted when a function.

```
-- Create a function.
gaussdb=# CREATE FUNCTION func_test(varchar) RETURN VARCHAR AS
BEGIN
    RETURN $1||_'test';
END;
/

-- Delete the function.
gaussdb=# DROP FUNCTION func_test;
```

- Delete a function with the same name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If a function with the same name exists, add a parameter list when deleting the function. Otherwise, an error is reported.

```
-- Create a function.
gaussdb=# CREATE FUNCTION func_add(int) RETURNS int AS $$
BEGIN
    RETURN $1+10;
END;
$$ LANGUAGE PLPGSQL;

-- func_add is an overloaded function.
gaussdb=# CREATE FUNCTION func_add(int,int) RETURNS int AS $$
BEGIN
    RETURN $1+$2;
END;
$$ LANGUAGE PLPGSQL;

-- Delete the function.
gaussdb=# DROP FUNCTION func_add(int);
gaussdb=# DROP FUNCTION func_add(int,int);
```

Helpful Links

ALTER FUNCTION and **CREATE FUNCTION**

7.12.10.18 DROP GLOBAL CONFIGURATION

Description

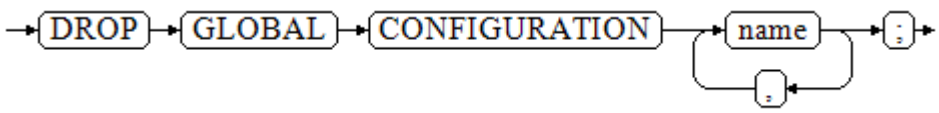
Drops parameter values from the gs_global_config system catalog.

Precautions

- Only the initial database user can run this command.
- The parameter name cannot be **weak_password** or **undostoragetype**.

Syntax

```
DROP GLOBAL CONFIGURATION name [, ...];
```



Parameters

- **name**

  The parameter must exist in the gs_global_config system catalog. If you delete a parameter that does not exist, an error will be reported.

Examples

See **Examples**.

Helpful Links

ALTER GLOBAL CONFIGURATION

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.19 DROP GROUP

Description

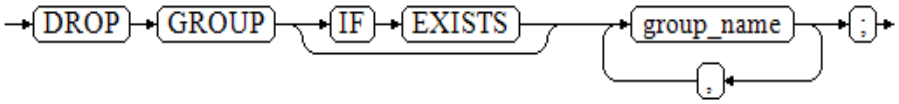
Drops a user group. DROP GROUP is an alias for DROP ROLE.

Precautions

DROP GROUP is an API of the GaussDB management tool. You are advised not to use this API, because doing so affects GaussDB.

Syntax

```
DROP GROUP [ IF EXISTS ] group_name [, ...];
```



Parameters

- **IF EXISTS**

  If a role does not exist, no error is reported. Instead, a notification is sent, indicating that the role does not exist.

- **group_name**

  Specifies the name of the role to be deleted.

  Value range: an existing role name.

Examples

See **Examples**.

Helpful Links

ALTER GROUP, **CREATE GROUP**, and **DROP ROLE**

7.12.10.20 DROP INDEX

Description

Deletes an index.

Precautions

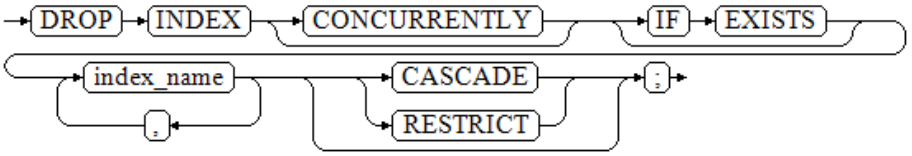
- Only the index owner, owner of the schema where the index resides, a user who has the INDEX permission on the table where the index resides, or a user who has the DROP ANY INDEX permission can run the **DROP INDEX** command. When the separation of duties is disabled, the system administrator has this permission by default.
- For a global temporary table, if a session has initialized a global temporary table object (including creating a global temporary table and inserting data

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

into the global temporary table for the first time), other sessions cannot delete indexes from the table.

Syntax

```
DROP INDEX [ CONCURRENTLY ] [ IF EXISTS ]
    index_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **CONCURRENTLY**

  Deletes an index without locking it. When an index is deleted, other statements cannot access the table on which the index depends. With this option, the statement does not lock the table during index deletion.

  This parameter can specify only one index name and does not support **CASCADE**.

  The **DROP INDEX** statement can be run within a transaction, but **DROP INDEX CONCURRENTLY** cannot.

- **IF EXISTS**

  Reports a notice instead of an error if the specified index does not exist.

- **index_name**

  Specifies the index name to be deleted.

  Value range: an existing index

- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly deletes the objects that depend on the index.
  - **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test1_index (id INT, name VARCHAR(20));

-- Create an index.
gaussdb=# CREATE INDEX idx_test1 (id);

-- Delete the index.
gaussdb=# DROP INDEX IF EXISTS idx_test1 CASCADE;

-- Delete the table.
gaussdb=#  DROP TABLE test1_index;
```

Helpful Links

ALTER INDEX and **CREATE INDEX**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.21 DROP LANGUAGE

Function

Deletes a procedural language.

Precautions

In the current version, you cannot delete the procedural language features created, so this syntax cannot be used.

7.12.10.22 DROP MASKING POLICY

Description

Deletes a masking policy.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP MASKING POLICY [ IF EXISTS ] policy_name;
```

Parameters

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: A string indicating an existing policy name.

Examples

```
-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text, col6
text, col7 text,col8 text);

-- Insert data into the tb_for_masking table.
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',
'abc@huawei.com', '1234-4567-7890-0123', 'abcdef 123456 ui 323 jsfd321 j3k2l3', '4880-9898-4545-2525',
'this is a llt case');

-- Create a resource label for sensitive column col1.
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a resource label for sensitive column col2.
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);

-- Create a resource label for sensitive column col3.
gaussdb=# CREATE RESOURCE LABEL mask_lb3 ADD COLUMN(tb_for_masking.col3);

-- Create a data masking policy named maskpol1.
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a data masking policy named maskpol2.
gaussdb=# CREATE MASKING POLICY maskpol2 randommasking ON LABEL(mask_lb2);

-- Create a data masking policy named maskpol3.
gaussdb=# CREATE MASKING POLICY maskpol3 basicemailmasking ON LABEL(mask_lb3);

-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Delete a group of masking policies.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol2, maskpol3;

-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL mask_lb1;
gaussdb=# DROP RESOURCE LABEL mask_lb2;
gaussdb=# DROP RESOURCE LABEL mask_lb3;

-- Delete the table.
gaussdb=# DROP TABLE tb_for_masking;
```

7.12.10.23 DROP MATERIALIZED VIEW

Description

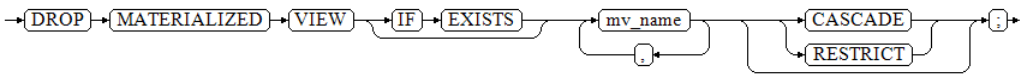
Deletes an existing materialized view from the database.

Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted the DROP permission on the materialized view, or users granted the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

Syntax

```
DROP MATERIALIZED VIEW [ IF EXISTS ] mv_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified materialized view does not exist.

- **mv_name**

  Name of the materialized view to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the materialized view.
  - **RESTRICT**: refuses to delete the materialized view if any objects depend on it. This is the default action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a materialized view named my_mv.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
gaussdb=# DROP TABLE my_table;
```

Helpful Links

7.12.10.24 DROP MODEL

Description

Deletes a model object that has been trained and saved.

Precautions

The deleted model can be viewed in the gs_model_warehouse system catalog.

Syntax

```
DROP MODEL model_name;
```

Parameters

- **model_name**

  Specifies a model name.

  Value range: a string. It must comply with the **naming convention**.

Examples

```
-- Create a data table.
gaussdb=# CREATE TABLE houses (
id INTEGER,
tax INTEGER,
bedroom INTEGER,
bath DOUBLE PRECISION,
price INTEGER,
size INTEGER,
lot INTEGER,
mark text
);

-- Insert training data.
gaussdb=# INSERT INTO houses(id, tax, bedroom, bath, price, size, lot, mark) VALUES
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

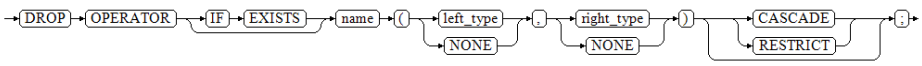
CREATE MODEL and **PREDICT BY**

7.12.10.25 DROP OPERATOR

Drops the definition of an operator.

Syntax

```
DROP OPERATOR [ IF EXISTS ]  name ( { left_type | NONE } , { right_type | NONE } )[ CASCADE | RESTRICT ];
```



Parameters

- **name**

  Name of an existing operator.

- **left_type**

  Data type of the left operand for the operator; if there is no left operand, write NONE.

- **right_type**

  Data type of the right operand for the operator; if there is no right operand, write NONE.

Examples

See **Examples**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

ALTER OPERATOR, **CREATE OPERATOR**, and **CREATE OPERATOR CLASS**

7.12.10.26 DROP OWNED

Function

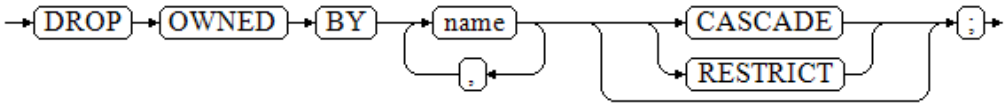
Deletes permissions on database objects owned by a database role.

Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- DROP OWNED is often used to prepare for removing one or more roles. Because DROP OWNED affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.
- Private database links owned by a role can be deleted only after the **CASCADE** option is added.

Syntax

```
DROP OWNED BY name [, ...] [ CASCADE | RESTRICT ];
```



Parameter Description

- **name**

  Specifies the role name.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.
  - **RESTRICT**: refuses to delete the object if any objects depend on it. This is the default action.

Examples

```
-- Create user jim.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Revoke user jim's permissions on all objects in the current database and on shared objects (databases and tablespaces).
gaussdb=# DROP OWNED BY jim;

-- Delete user jim.
gaussdb=# DROP USER jim;
```

Helpful Links

REASSIGN OWNED and **DROP ROLE**

7.12.10.27 DROP PACKAGE

Description

Deletes the existing package or package body.

Precautions

After a package body is dropped, the stored procedures and functions in the package become invalid.

Only the initial user has the permission to perform the DROP operation on the packages of the initial user.

Syntax

```
DROP PACKAGE [ IF EXISTS ] package_name;
```

```
DROP PACKAGE BODY [ IF EXISTS ] package_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified stored procedure does not exist.

- **package_name**

  Specifies the name of the package to be deleted.

  Value range: an existing package name.

Examples

```
-- Create a package.
gaussdb=# CREATE OR REPLACE PACKAGE PCK1
IS
a int;
END pck1;
/
CREATE PACKAGE

-- Delete the package.
gaussdb=# DROP PACKAGE PCK1;
DROP PACKAGE
```

Helpful Links

ALTER PACKAGE and **CREATE PACKAGE**

7.12.10.28 DROP PLUGGABLE DATABASE INCLUDING DATAFILES

Description

Drops PDB objects and all database objects and data in the PDB.

Precautions

- This command can be used only when the GUC parameter **enable_mtd** is set to **on**.
- This command can be performed only in the non-PDB. This command cannot be executed in M-compatible databases.
- The operation user must be the PDB owner (see the pg_database.datdba system catalog) or have the SYSADMIN permission.
- Before deleting, run the ALTER PLUGGABLE DATABASE statement to stop the PDB.
- The template PDB (**template_pdb**) cannot be deleted using this statement.
- When a PDB is deleted, the resource plan directive object joined with the PDB is not deleted.

Syntax

```
DROP PLUGGABLE DATABASE pdb_name INCLUDING DATAFILES;
```

Parameters

- **pdb_name**

  Specifies the name of the PDB to be dropped.

Examples

- Prerequisites

  For details about how to create a PDB, see **Examples** in **CREATE PLUGGABLE DATABASE**.

- Dropping a PDB

```
-- If the PDB is in the open state, it cannot be dropped; the PDB must be closed first.
gaussdb=# alter pluggable database my_pdb close immediate;
ALTER PLUGGABLE DATABASE

-- Connect to the postgres database as a system administrator and drop the closed PDB.
gaussdb=# drop pluggable database my_pdb including datafiles;
DROP PLUGGABLE DATABASE
```

Helpful Links

CREATE PLUGGABLE DATABASE and **12.2.17.33 PG_DATABASE**

7.12.10.29 DROP PROCEDURE

Description

Deletes a stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only the initial user has the permission to perform the DROP operation on the stored procedures of the initial user.

Syntax

```
DROP PROCEDURE [ IF EXISTS ] procedure_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified stored procedure does not exist.

- **procedure_name**

  Specifies the name of the stored procedure to be deleted.

  Value range: an existing stored procedure name

Examples

See **Examples**.

Helpful Links

ALTER PROCEDURE and **CREATE PROCEDURE**

7.12.10.30 DROP RESOURCE LABEL

Description

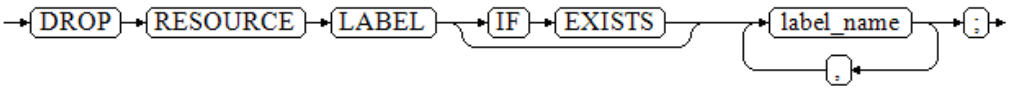
DROP RESOURCE LABEL is used to delete resource labels.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```



Parameters

- **label_name**

  Specifies the resource label name.

  Value range: a string. It must comply with the **naming convention**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create an existing table resource label again and compare the differences between adding IF NOT EXISTS and not adding IF NOT EXISTS.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);
NOTICE:  table_label label already defined, skipping
CREATE RESOURCE LABEL
gaussdb=# CREATE RESOURCE LABEL table_label add TABLE(public.tb_for_label);
ERROR:  table_label label already defined

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$ LANGUAGE SQL;

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Delete the table resource label table_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS table_label;

-- Delete the column resource label column_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS column_label;

-- Delete the function resource label func_for_label.
gaussdb=# DROP FUNCTION func_for_label;

-- Delete the view resource label view_for_label.
gaussdb=# DROP VIEW view_for_label;

-- Delete the schema resource label schema_for_label.
gaussdb=# DROP SCHEMA schema_for_label;

-- Delete the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

Helpful Links

ALTER RESOURCE LABEL and **CREATE RESOURCE LABEL**

7.12.10.31 DROP RESOURCE POOL

Description

Drops a resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The resource pool cannot be deleted if it is associated with a role.

Precautions

Only users with the SYSADMIN permission, or the initial user can perform this operation.

This syntax is not supported in the multi-tenancy scenario. Use the RESOURCE_MANAGER advanced package.

This syntax is not supported during upgrade.

Syntax

```
DROP RESOURCE POOL [ IF EXISTS ] pool_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if a specified resource pool does not exist.

- **pool_name**

  Specifies the name of a created resource pool.

  Value range: a string that complies with the **Identifier Naming Conventions**.

Examples

See **Examples**.

Helpful Links

ALTER RESOURCE POOL and **CREATE RESOURCE POOL**

7.12.10.32 DROP ROLE

Description

Deletes a role.

Syntax

```
DROP ROLE [ IF EXISTS ] role_name [, ...];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified role does not exist.
- **role_name**

  Specifies the name of the role to be deleted.

  Value range: an existing role name

Examples

```
-- Create role role11.
gaussdb=# CREATE ROLE role11  PASSWORD '********';
CREATE ROLE

-- Delete role role11.
gaussdb=# DROP ROLE IF EXISTS role11;
DROP ROLE

-- Delete role role12 that does not exist.
gaussdb=# DROP ROLE IF EXISTS role12;
NOTICE:  role "role12" does not exist, skipping
DROP ROLE
```

Helpful Links

CREATE ROLE, ALTER ROLE, and SET ROLE

7.12.10.33 DROP ROW LEVEL SECURITY POLICY

Function

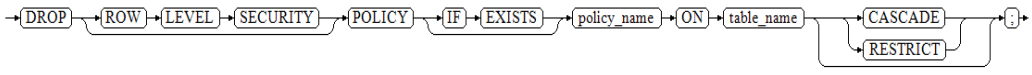
Deletes a row-level security policy from a table.

Precautions

Only the table owner or administrators can delete a row-level security policy from the table.

Syntax

```
DROP [ ROW LEVEL SECURITY ] POLICY [ IF EXISTS ] policy_name ON table_name [ CASCADE | RESTRICT ];
```



Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified row-level security policy does not exist.
- **policy_name**

  Specifies the name of the row-level security policy to be deleted.
- **table_name**

  Specifies the name of the table containing the row-level security policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CASCADE | RESTRICT**

  Currently, no objects depend on row-level security policies. Therefore, CASCADE is equivalent to RESTRICT, and they are reserved to ensure backward compatibility.

Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- Delete the row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

Helpful Links

ALTER ROW LEVEL SECURITY POLICY and **CREATE ROW LEVEL SECURITY POLICY**

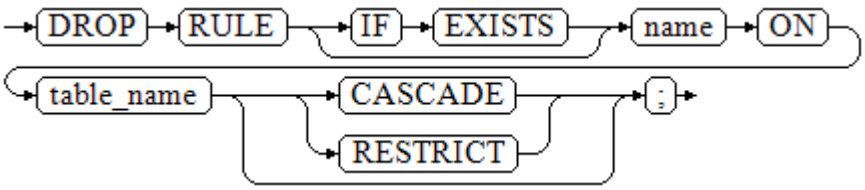
7.12.10.34 DROP RULE

Description

Deletes a rewriting rule.

Syntax

```
DROP RULE [ IF EXISTS ] name ON table_name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If the rule does not exist, a notice is thrown.
- **name**

  Name of an existing rule to be deleted.
- **table_name**

  Name of the table to which the rule applies.
- **CASCADE**

  Automatically cascade deletes objects that depend on this rule.
- **RESTRICT**

  Refuses to delete the rule if any objects depend on it. The default value is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create the def_test table and the def_view_test view for creating rules.
gaussdb=# CREATE TABLE def_test (
c1 int4 DEFAULT 5,
c2 text DEFAULT 'initial_default'
);
gaussdb=# CREATE VIEW def_view_test AS SELECT * FROM def_test;
-- Create the rule def_view_test_ins.
gaussdb=# CREATE RULE def_view_test_ins AS
gaussdb=# ON INSERT TO def_view_test
gaussdb=#DO INSTEAD INSERT INTO def_test SELECT new.*;
-- Delete the rule def_view_test_ins.
gaussdb=# DROP RULE def_view_test_ins ON def_view_test;
-- Delete the def_test table and the def_view_test view.
gaussdb=# DROP VIEW def_view_test;
gaussdb=# DROP TABLE def_test;
```

Helpful Links

CREATE RULE

7.12.10.35 DROP SCHEMA

Description

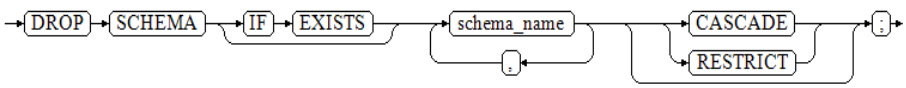
Drops a schema from the current database.

Precautions

- Only the owner of a schema or a user with the DROP permission for a schema can run the **DROP SCHEMA** command. If separation of duties is disabled, system administrators have this permission by default.
- Users except the initial user and O&M administrator cannot drop the schema of the O&M administrator.
- You are not allowed to drop DBE_PLDEVELOPER when **allow_system_table_mods** is disabled.
- Only the initial user has the permission to delete system schemas.

Syntax

```
DROP SCHEMA [ IF EXISTS ] schema_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified schema does not exist.
- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name.
- **CASCADE | RESTRICT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CASCADE**: automatically deletes all the objects contained in the schema.
- **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

NOTICE

Schemas beginning with **pg_temp** or **pg_toast_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

Examples

```
-- Create role role2.
gaussdb=# CREATE ROLE role2 IDENTIFIED BY '********';

-- Create a schema based on the name.
gaussdb=# CREATE SCHEMA schema1 AUTHORIZATION role2;
CREATE SCHEMA

-- Drop the schema.
gaussdb=# DROP SCHEMA schema1 CASCADE;

-- Drop a user.
gaussdb=# DROP USER role2 CASCADE;
```

Helpful Links

ALTER SCHEMA and **CREATE SCHEMA**

7.12.10.36 DROP SECURITY LABEL

Description

DROP SECURITY LABEL is used to delete security labels from the current database.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits permissions of the built-in role gs_role_seclabel can delete security labels.

Syntax

```
DROP SECURITY LABEL label_name;
```

Parameters

- **label_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Security label name. The security label to be deleted must exist in the database.

Examples

```
-- Create a security label sec_label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';

-- Delete the security label sec_label2 that does not exist.
gaussdb=# DROP SECURITY LABEL sec_label2;
ERROR:  security label "sec_label2" does not exist

-- Delete the existing security label sec_label.
gaussdb=# DROP SECURITY LABEL sec_label;
```

Helpful Links

CREATE SECURITY LABEL and SECURITY LABEL ON

7.12.10.37 DROP SEQUENCE

Description

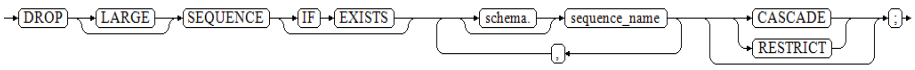
Deletes a sequence from the current database.

Precautions

- Only the owner of a sequence, the owner of the schema to which the sequence belongs, or a user granted the DROP permission on a sequence or a user granted the DROP ANY SEQUENCE permission can delete a sequence. When separation of duties is disabled, a system administrator has this permission by default.
- If the LARGE identifier is used when a sequence is created, the LARGE identifier must be used when the sequence is dropped.

Syntax

```
DROP [ LARGE ] SEQUENCE [ IF EXISTS ] {[schema.]sequence_name} [ , ... ] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified sequence does not exist.
- **sequence_name**

  Specifies the name of the sequence to be deleted.
- **CASCADE**

  Cascadingly deletes the objects that depend on the sequence.
- **RESTRICT**

  Refuses to delete the sequence if any objects depend on it. This is the default action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create an ascending sequence named serial, starting from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Delete a sequence.
gaussdb=# DROP SEQUENCE serial;
```

Helpful Links

ALTER SEQUENCE and **DROP SEQUENCE**

7.12.10.38 DROP SERVER

Description

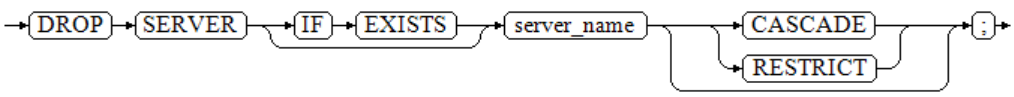
Deletes an existing data server.

Precautions

Only the server owner or a user granted the DROP permission can run the **DROP SERVER** command. A system administrator has this permission by default.

Syntax

```
DROP SERVER [ IF EXISTS ] server_name [ CASCADE | RESTRICT ] ;
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified data server does not exist.
- **server_name**

  Specifies the name of the data server to be dropped.
- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

Example

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;
CREATE SERVER

-- Delete the server.
gaussdb=# DROP SERVER my_server;
DROP SERVER
```

Helpful Links

ALTER SERVER and **CREATE SERVER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.39 DROP SLICEGROUP

Description

Drops a specified slice group. It is not supported in the current version.

7.12.10.40 DROP SYNONYM

Description

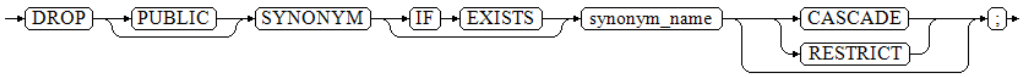
Deletes a synonym.

Precautions

Only the synonym owner or a user granted the DROP ANY SEQUENCE permission can run the **DROP SYNONYM** command. The system administrator has this permission by default.

Syntax

```
DROP [PUBLIC] SYNONYM [ IF EXISTS ] synonym_name [ CASCADE | RESTRICT ];
```



Parameters

- **PUBLIC**

  (Optional) Deletes PUBLIC synonyms.

- **IF EXISTS**

  Reports a notice instead of an error if the specified synonym does not exist.

- **synonym_name**

  Specifies the name (optionally schema-qualified) of the synonym to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

Examples

```
-- Create a synonym.
gaussdb=# CREATE OR REPLACE SYNONYM test_tbl1 FOR test_tbl1;
-- Delete the synonym.
gaussdb=# DROP SYNONYM test_tbl1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

ALTER SYNONYM and **CREATE SYNONYM**

7.12.10.41 DROP TABLE

Description

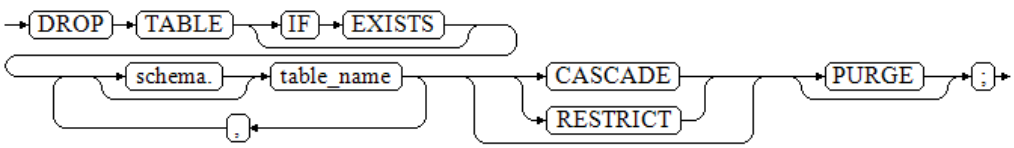
Deletes a table.

Precautions

- After DROP TABLE deletes the table, the indexes depending on the table are deleted, and the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.
- The owner of a table, the owner of the schema of the table, users with the DROP permission on the table, or users with the DROP ANY TABLE permission can delete the specified table. When separation of duties is disabled, a system administrator has the permission to delete the specified table by default.
- When DROP TABLE is executed, if the table to be deleted references another table as a foreign key table, triggers on the referenced table will be deleted in cascading mode. In this case, an eight-level lock needs to be added to the referenced table, which may cause service congestion.

Syntax

```
DROP TABLE [ IF EXISTS ]
    { [schema.]table_name } [, ...] [ CASCADE | RESTRICT ] [ PURGE ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.
- **schema**

  Specifies the schema name.
- **table_name**

  Specifies the name of the table to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: allows cascade deletion of the objects that depend on the table, such as views, triggers, and indexes. Note that associated table objects cannot be deleted cascadingly.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.
- **PURGE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin when you use DROP TABLE to delete tables.

Examples

```
-- Create the test table.
gaussdb=# CREATE TABLE test(c1 int, c2 int);
-- Drop the test table.
gaussdb=# DROP TABLE IF EXISTS test;

-- Create the test1 table.
gaussdb=# CREATE TABLE test1(c1 int, c2 int);
-- Create the v_test1 view.
gaussdb=# CREATE VIEW v_test1 AS SELECT * FROM test1 WHERE c1 < 20;
-- An error is reported when the table is deleted.
gaussdb=# DROP TABLE test1;
ERROR:  table test1 cannot be dropped because other objects depend on it.
DETAIL:  view v_test1 depends on table test1
HINT:  Use DROP ... CASCADE to drop the dependent objects.

-- Use the CASCADE parameter to drop the test1 table, which will automatically delete the views.
gaussdb=# DROP TABLE test1 CASCADE;
NOTICE:  drop cascades to view v_test1
DROP TABLE
```

Helpful Links

ALTER TABLE and **CREATE TABLE**

7.12.10.42 DROP TABLESPACE

Description

Deletes a tablespace.

Precautions

- Only the tablespace owner or a user granted the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- DROP TABLESPACE cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of DROP TABLESPACE, database queries by other sessions using **\db** may fail and need to be reattempted.
- If DROP TABLESPACE fails to be executed, execute DROP TABLESPACE IF EXISTS.

Syntax

```
DROP TABLESPACE [ IF EXISTS ] tablespace_name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace_name**

  Specifies the name of the tablespace to be deleted.

  Value range: an existing tablespace name

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_location1;
```

Helpful Links

ALTER TABLESPACE and **CREATE TABLESPACE**

Suggestions

- DROP TABLESPACE

  Do not delete tablespaces during transactions.

7.12.10.43 DROP TRIGGER

Description

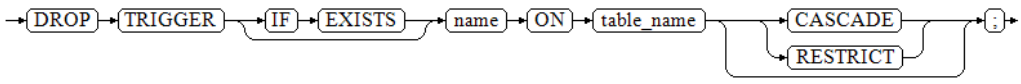
DROP TRIGGER is used to delete a trigger.

Precautions

Only the trigger owner or a user granted the DROP ANY TRIGGER permission can run the **DROP TRIGGER** command. The system administrator has this permission by default.

Syntax

```
DROP TRIGGER [ IF EXISTS ] name ON table_name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified trigger does not exist.
- **trigger_name**

  Specifies the name of the trigger to be deleted.

  Value range: an existing trigger name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **table_name**

  Specifies the name of the table containing the trigger.

  Value range: name of the table containing the trigger

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

Examples

```
-- Create a source table and a target table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);
```

Use the INSERT trigger.

```
-- Create an INSERT trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END
        $$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_insert_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)
```

Use anonymous blocks and the OR REPLACE syntax to create triggers.

```
-- Create an INSERT trigger using the anonymous block syntax.
gaussdb=# CREATE TRIGGER insert_trigger_with_anonyblock
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END;
        /

-- Create an INSERT trigger using the OR REPLACE syntax.
gaussdb=# CREATE OR REPLACE TRIGGER insert_trigger_with_anonyblock
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END;
        /

-- Drop the trigger.
gaussdb=# DROP TRIGGER insert_trigger_with_anonyblock ON test_trigger_src_tbl; -- Drop the implicitly
created function insert_trigger_with_anonyblock.
```

Use the UPDATE trigger.

```
-- Create an UPDATE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
        AFTER UPDATE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_update_func();

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)
```

Use the DELETE trigger.

```
-- Create a DELETE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE plpgsql;

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger BEFORE DELETE ON test_trigger_src_tbl FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
(0 rows)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----+-----+-----
(0 rows)
```

Rename a trigger.

```
-- Rename a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;
```

Disable a trigger.

```
-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // The trigger does not take effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;
```

Deleting a trigger

```
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

Deleting a function

```
gaussdb=# DROP FUNCTION tri_insert_func;

gaussdb=# DROP FUNCTION tri_update_func;

gaussdb=# DROP FUNCTION tri_delete_func;
-- Drop the source table and destination table.
gaussdb=# DROP TABLE test_trigger_src_tbl;
gaussdb=# DROP TABLE test_trigger_des_tbl;
```

7.12.10.44 DROP TYPE

Description

Drops a user-defined data type.

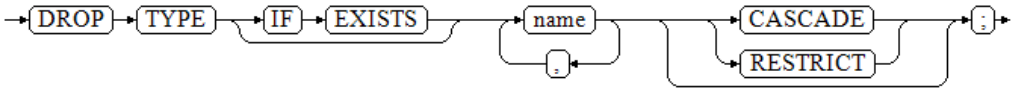
Precautions

Only the owner of a type, a user granted the DROP permission on a type, or a user granted the DROP ANY TYPE permission on a sequence can run the **DROP TYPE** command. When separation of duties is disabled, a system administrator has this permission by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP TYPE [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified type does not exist.

- **name**

  Specifies the name (optionally schema-qualified) of the type to be deleted.

- **CASCADE**

  Automatically deletes the objects (such as columns, functions, and operators) that depend on the type.

- **RESTRICT**

  Refuses to delete the type if any objects depend on it. This is the default action.

Examples

See **Examples**.

Helpful Links

CREATE TYPE and **ALTER TYPE**

7.12.10.45 DROP USER

Description

DROP USER deletes users in the GaussDB. This permission can be executed only when you have the permission to create users. After the command for deleting a user is executed successfully, the schema with the same name is deleted.

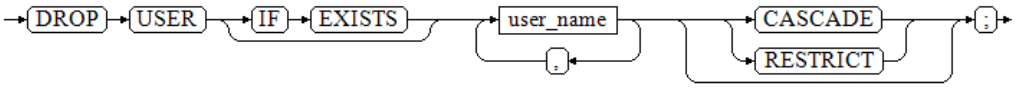
Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. It cannot delete locked objects unless the objects are unlocked or the threads locking the objects are terminated.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. **DROP USER** cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to delete the objects owned by the user and the granted permissions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP USER [ IF EXISTS ] user_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  When this parameter is used, if the specified user does not exist, a notice instead of an error is sent. Therefore, this parameter can be used to avoid errors.

- **user_name**

  Specifies the name of the user to be deleted.

  Value range: an existing username in the database.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the user.
  - **RESTRICT**: refuses to delete the user if any objects depend on it. This is the default action.

    NOTE

    In GaussDB, the **enable_kill_query** configuration parameter exists in the **gaussdb.conf** file. This parameter affects **CASCADE**.

    - If **enable_kill_query** is **on** and **CASCADE** is used, the statement automatically kills the threads locking dependent objects and then deletes the specified user.
    - If **enable_kill_query** is **off** and **CASCADE** is used, the statement waits until the threads locking dependent objects end and then deletes the specified user.

Example

```
-- Create user jim whose login password is ********.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Delete user tom that does not exist.
gaussdb=# DROP USER IF EXISTS tom;
NOTICE:  role "tom" does not exist, skipping
DROP ROLE

-- Delete the user.
gaussdb=# DROP USER jim CASCADE;
```

Helpful Links

ALTER USER and **CREATE USER**

7.12.10.46 DROP USER MAPPING

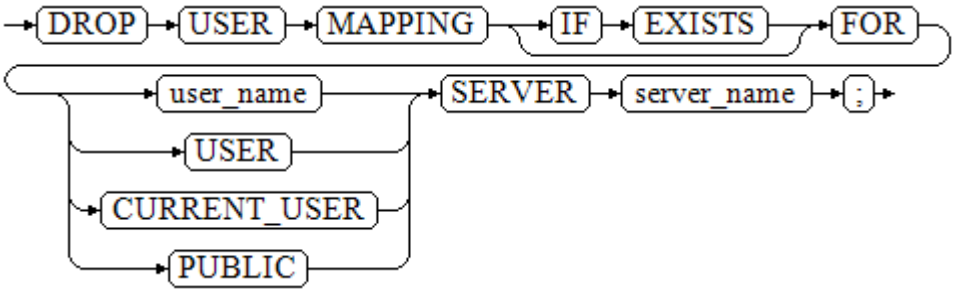
Description

DROP USER MAPPING is used to delete the user mapping from a user to a foreign server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP USER MAPPING [ IF EXISTS ] FOR { user_name | USER | CURRENT_USER | PUBLIC } SERVER
server_name;
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the user mapping does not exist.

  CAUTION

  Different from many statements, the **IF EXISTS** parameter is used only for the DROP USER MAPPING statement. When the CREATE USER MAPPING statement uses this parameter, a syntax error is reported.

- **user_name**

  Specifies username of the mapping.

  CURRENT_USER and USER match the name of the current user. PUBLIC is used to match all current and future usernames in the system.

- **server_name**

  Specifies name of the server to which the user is mapped.

Examples

```
-- Create a role.
gaussdb=# CREATE ROLE bob PASSWORD '********';

-- Create a foreign server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a user mapping.
gaussdb=# CREATE USER MAPPING FOR bob SERVER my_server OPTIONS (USER 'bob', PASSWORD
'********');

-- Modify the user mapping.
gaussdb=# ALTER USER MAPPING FOR bob SERVER my_server OPTIONS (SET PASSWORD '********');

-- Delete the user mapping.
gaussdb=# DROP USER MAPPING FOR bob SERVER my_server;

-- Delete the foreign server.
gaussdb=# DROP SERVER my_server;

-- Delete the role.
gaussdb=# DROP ROLE bob;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

ALTER USER MAPPING and **CREATE USER MAPPING**

7.12.10.47 DROP VIEW

Description

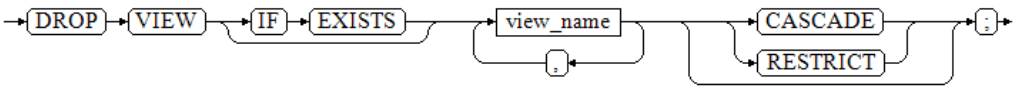
DROP VIEW deletes a view from a database.

Precautions

The owner of a view, owner of the schema of the view, users granted the DROP permission on the view, or users granted the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, a system administrator has the permission to run the command when separation of duties is disabled.

Syntax

```
DROP VIEW [ IF EXISTS ] view_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified view does not exist.
- **view_name**

  Specifies the name of the view to be deleted.

  Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

Examples

```
-- Create the test_tb1 table and insert 100 data records into the table.
gaussdb=# CREATE TABLE test_tb1(col1 int, col2 int);
gaussdb=# INSERT INTO test_tb1 VALUES (generate_series(1,100),generate_series(1,100));

-- Create a view whose value of col1 is less than 3.
gaussdb=# CREATE VIEW test_v1 AS SELECT * FROM test_tb1 WHERE col1 < 3;

-- Query the view.
gaussdb=# SELECT * FROM test_v1;
 col1 | col2
------+------
    1 |    1
    2 |    2
(2 rows)

-- Delete the table and the view.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# DROP VIEW test_v1;
gaussdb=# DROP TABLE test_tb1;
```

Helpful Links

ALTER VIEW and **CREATE VIEW**

7.12.10.48 DROP WEAK PASSWORD DICTIONARY

Description

DROP WEAK PASSWORD DICTIONARY is used to clear the weak password dictionary. You can run this statement to clear all weak passwords in the gs_global_config system catalog.

Precautions

Only the initial user, system administrator, and security administrator have the permission to execute this syntax.

Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********');

-- Check weak passwords in the gs_global_config system catalog.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
      name       |    value
-----------------+--------------
 weak_password   | ********
(1 rows)

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
 name | value
------+-------
(0 rows)
```

Helpful Links

CREATE WEAK PASSWORD DICTIONARY

7.12.11 E

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.11.1 EXECUTE

Description

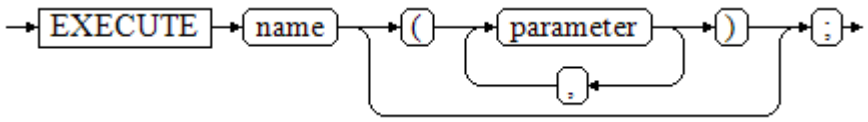
Executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the PREPARE statement.

Precautions

If the PREPARE statement declares some parameters when the prepared statement is created, the parameter set passed to the EXECUTE statement must be compatible. Otherwise, an error occurs.

Syntax

```
EXECUTE name [ ( parameter [, ...] ) ];
```



Parameters

- **name**

  Specifies the name of the prepared statement to be executed.

- **parameter**

  Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created. **ROWNUM** cannot be used as a parameter.

Examples

```
-- Create the reason table.
gaussdb=# CREATE TABLE reason (
    CD_DEMO_SK          int NOT NULL,
    CD_GENDER           varchar(10),
    CD_MARITAL_STATUS   varchar(10)
);

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
gaussdb=# PREPARE insert_reason(int,varchar(10),varchar(10)) AS INSERT INTO reason VALUES($1,$2,$3);
gaussdb=# EXECUTE insert_reason(52, 'AAAAAAAADD', 'reason 52');

-- Query data.
gaussdb=# SELECT * FROM reason;
 cd_demo_sk | cd_gender  | cd_marital_status
------------+------------+--------------------
         52 | AAAAAAAADD | reason 52
(1 row)

-- Drop the reason table.
gaussdb=# DROP TABLE reason;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

PREPARE and **DEALLOCATE**

7.12.11.2 EXPDP DATABASE

Description

Exports all physical files in a database.

Syntax

```
EXPDP DATABASE db_name LOCATION = 'directory';
```

Parameters

- **db_name**

  Name of the database to be exported.
- **directory**

  Directory for storing exported files.

Examples

```
-- The EXPDP DATABASE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you call it directly, the error message "ERROR: Only auxdb is allowed to execute expdp cmd." is displayed.
gaussdb=# EXPDP DATABASE test LOCATION = '/data1/expdp/database';
```

7.12.11.3 EXPDP PLUGGABLE DATABASE

Description

Exports all physical files in a PDB.

NOTE

EXPDP PLUGGABLE DATABASE is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you call it directly, the error message "ERROR: Only auxdb is allowed to execute expdp cmd." is displayed.

Syntax

```
EXPDP PLUGGABLE DATABASE LOCATION = 'directory';
```

Parameters

- **directory**

  Directory for storing exported files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Prerequisites

  For details about how to create and open a PDB, see **Examples** in **ALTER PLUGGABLE DATABASE**.

- Export a PDB.

```
--Create an export directory.
mkdir /data1/expdp/my_pdb

-- Connect to the PDB and perform the export operation.
gaussdb=# \c my_pdb;
my_pdb=# EXPDP PLUGGABLE DATABASE LOCATION = '/data1/expdp/my_pdb';
```

7.12.11.4 EXPDP TABLE

Description

Exports all table-related index, sequence, partition, TOAST, and TOAST index files.

Syntax

```
EXPDP TABLE table_name LOCATION = 'directory';
```

Parameters

- **table_name**

  Name of the table to be exported.

- **directory**

  Directory for storing exported files.

Examples

```
-- The EXPDP TABLE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you call it directly, the error message "ERROR: Only auxdb is allowed to execute expdp cmd." is displayed.
gaussdb=# EXPDP TABLE test_t LOCATION = '/data1/expdp/table0';
```

7.12.11.5 EXPLAIN

Description

Shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the SQL statement will be scanned, for example, by plain sequential scan or index scan. - and if multiple tables are referenced, what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, influencing the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

and total number of rows it actually returned are added to the display. This is useful for determining whether the plan generator's estimate is close to the actual value.

Precautions

The statement is actually executed when ANALYZE is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use the following approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

Syntax

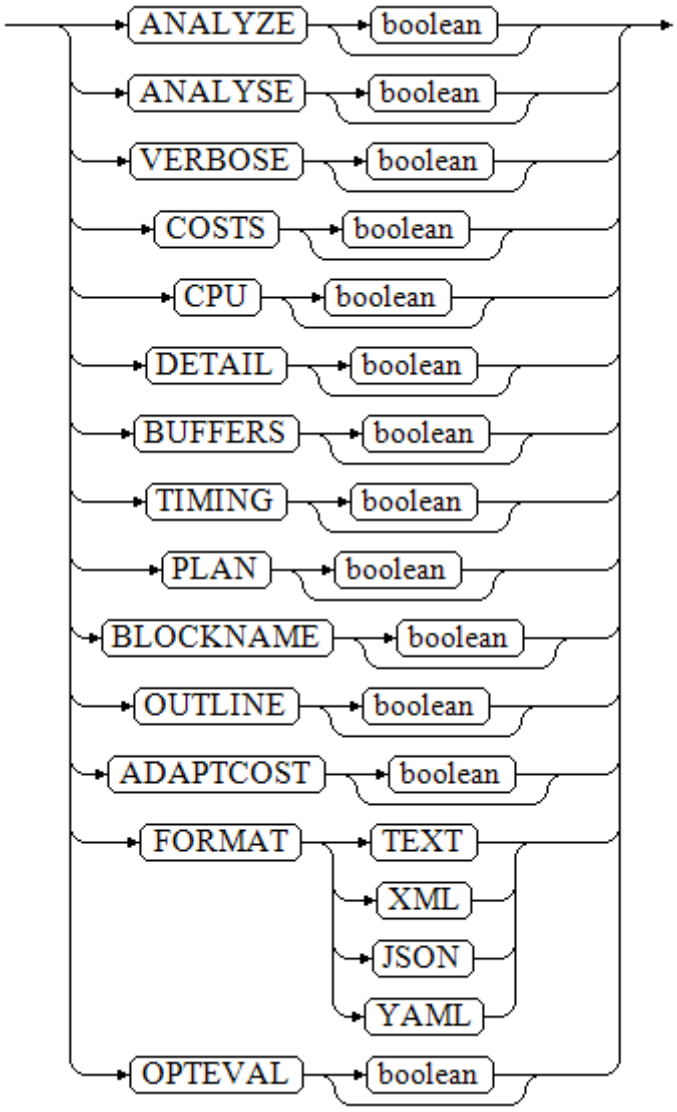
- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

  ```
  EXPLAIN [ (  option  [, ...] )  ] statement;
  ```

  
  The syntax of the **option** clause is as follows:

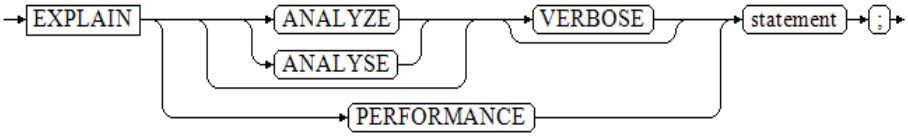
  ```
  ANALYZE [ boolean ] |
      ANALYSE [ boolean ] |
      VERBOSE [ boolean ] |
      COSTS [ boolean ] |
      CPU [ boolean ] |
      DETAIL [ boolean ] |
      BUFFERS [ boolean ] |
      TIMING [ boolean ] |
      PLAN [ boolean ] |
      BLOCKNAME [ boolean ] |
      OUTLINE [ boolean ] |
      ADAPTCOST [ boolean ] |
      FORMAT { TEXT | XML | JSON | YAML } |
      OPTEVAL [ boolean ]
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



- Display the execution plan of an SQL statement, where options are in order.

```
EXPLAIN { [   ANALYZE  | ANALYSE   ] [ VERBOSE ]  | PERFORMANCE  } statement;
```



Parameters

- **statement**

  Specifies the SQL statement to explain.

- **ANALYZE boolean | ANALYSE boolean**

  Specifies whether to display actual run times and other statistics. When two parameters are used at the same time, the latter one in **option** takes effect.

  Value range:

  – **TRUE** (default): displays them.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **FALSE**: does not display them.
- **VERBOSE boolean**

  Specifies whether to display additional information regarding the plan.

  Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **COSTS boolean**

  Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.

  Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **CPU boolean**

  Specifies whether to display CPU usage. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **DETAIL boolean**

  Displays information about database nodes. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **BUFFERS boolean**

  Specifies whether to display buffer usage. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  - **TRUE**: displays it.
  - **FALSE** (default): does not display it.
- **TIMING boolean**

  Specifies whether to display the actual startup time and time spent on the output node. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **PLAN boolean**

  Specifies whether to store the execution plan in **PLAN_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.

  Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **ON** (default): The execution plan is stored in **PLAN_TABLE** and not printed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **OFF**: The execution plan is not stored but is printed on the screen.
- **BLOCKNAME boolean**

  Specifies whether to display the query block where each operation of the plan is located. When this option is enabled, the name of the query block where each operation is performed is displayed in the **Query Block** column. This helps users obtain the query block name and use hints to modify the execution plan.
  - **TRUE** (default value): When the plan is displayed, the name of the query block where each operation is located is displayed in the **Query Block** column. This option must be used in the pretty mode. For details, see **Hints for Specifying the Query Block Where the Hint Is Located**.
  - **FALSE**: The plan display is not affected.
- **OUTLINE boolean**

  Determines whether to display outline hints of a plan.
  - **ON**: When a plan is displayed, outline hints are displayed below the plan. This option must be used in the pretty mode. For details, see **Outline Hints**.
  - **OFF** (default value): The outline hints of the plan are not displayed.
- **ADAPTCOST boolean**

  Specifies whether to display the cardinality estimation method of a plan in the normal mode.
  - **ON** (default): Display the cardinality estimation method, including the default method and feedback method, on the plan node in the normal mode. This parameter does not take effect for prepared statements.
  - **OFF**: Do not display the cardinality estimation method.
- **FORMAT**

  Specifies the output format.

  Value range: **TEXT**, **XML**, **JSON**, and **YAML**

  Default value: **TEXT**
- **PERFORMANCE**

  Prints all relevant information in execution. Some information is described as follows:
  - **ex c/r**: indicates the average number of CPU cycles used by each row, which is equal to **(ex cyc) / (ex row)**.
  - **ex row**: indicates the number of executed rows.
  - **ex cyc**: indicates the number of used CPU cycles.
  - **inc cyc**: indicates the total number of CPU cycles used by subnodes.
  - **shared hit**: indicates the shared buffer hits of the operator.
  - **loops**: indicates the number of operator loop execution times.
  - **total_calls**: indicates the total number of generated elements.
  - **remote query poll time stream gather**: indicates the operator used to listen to the network poll time when data on each DN reaches the CN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **deserialize time**: indicates the time required for deserialization.
  - **estimated time**: indicates the estimated time.

- **OPTEVAL boolean**

  Specifies whether to display the cost elimination details of the scan operator (currently, only seqscan, indexscan, indexonlyscan and bitmapheapscan are supported). When this function is enabled, a plan block named Cost Evaluation Info (identified by plan id) is displayed in the execution plan. This option can only coexist with COSTS, VERBOSE, and FORMAT. For details about the parameters in the plan block, see **Example 2**.

  Value range:

  - **TRUE**: displays the cost elimination details of the SCAN operator.
  - **FALSE** (default): does not display it.

Example 1

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk         INTEGER           NOT NULL,
ca_address_id         CHARACTER(16)     NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAABAAAAAAA'),(10000,
'AAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
gaussdb=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
gaussdb=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
                           QUERY PLAN
-------------------------------------------------------------------------
 Seq Scan on customer_address_p1  (cost=0.00..25.13 rows=1513 width=24)
(1 row)

-- Use the ANALYZE option to add runtime statistics to the output.
gaussdb=# EXPLAIN ANALYZE SELECT * FROM tpcds.customer_address_p1;
                                        QUERY PLAN
-------------------------------------------------------------------------------------------------------------------
Seq Scan on customer_address_p1  (cost=0.00..25.13 rows=1513 width=24) (actual time=0.015..0.016
rows=2 loops=1)
 Total runtime: 0.108 ms
(2 rows)

-- Use the ANALYZE and CPU options to output the CPU usage information.
gaussdb=# EXPLAIN (ANALYZE,CPU)SELECT * FROM tpcds.customer_address_p1;
                                        QUERY PLAN
-------------------------------------------------------------------------------------------------------------------
Seq Scan on customer_address_p1  (cost=0.00..25.13 rows=1513 width=24) (actual time=0.011..0.012
rows=2 loops=1)
   (CPU: ex c/r=47397856228403856, ex row=2, ex cyc=94795712456807712, inc cyc=94795712456807712)
 Total runtime: 0.092 ms
(3 rows)

-- Generate an execution plan in JSON format (with explain_perf_mode being normal).
gaussdb=# EXPLAIN(FORMAT JSON) SELECT * FROM tpcds.customer_address_p1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                QUERY PLAN
------------------------------------------------
 [                                     +
   {                                   +
     "Plan": {                           +
       "Node Type": "Seq Scan",             +

NOTE

For the Cost Evaluation Info (identified by plan id) plan block:

1. The rows **2 --** and **4 --** represent the current winning operator, and the indentation plan blocks under each row represent the operators directly eliminated by the current winning operator. For example, operator 2 eliminates the Seq Scan and Bitmap Heap Scan operators.
2. The preceding key parameters are described as follows:
    1. **id** indicates that the current operator is converted from a path with a specified ID. The value is used to locate a path in debug2 logs.
    2. **rpage** indicates the number of pages in the base table used during the cost model calculation.
    3. **ipage** indicates the number of pages in the index used during the cost model calculation.
    4. **tuples** indicates the number of tuples used in the cost model calculation.
    5. **selec** indicates the index selectivity used during cost model calculation. The value **–1** indicates that the index selectivity of the current operator is invalid.
    6. **ml** indicates the ML model event that is currently triggered during cost model calculation. The value **1** indicates that the cache specified by **effective_cache_size** is sufficient, the value **2** indicates that the cache specified by **effective_cache_size** is insufficient, and the value **3** indicates that the cache specified by **effective_cache_size** is severely insufficient.
    7. **iscost** specifies whether an event of ignoring the startup cost has occurred during model cost calculation.
    8. **lossy** specifies whether to trigger the lossy mechanism of bitmap heap scan during cost model calculation.
    9. **uidx** specifies whether to trigger the unique index first rule during cost model calculation.

7.12.11.6 EXPLAIN PLAN

Description

EXPLAIN PLAN saves information about an execution plan into the **PLAN_TABLE** table. Different from the EXPLAIN statement, EXPLAIN PLAN only saves plan information and does not print information on the screen.

Precautions

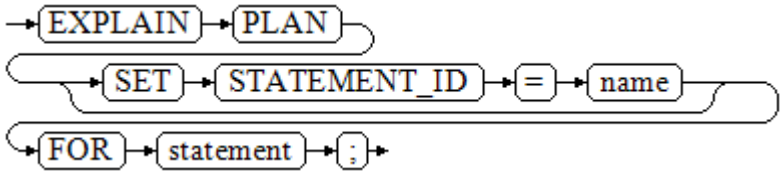
- The database node cannot collect plan information about SQL statements that are incorrectly executed.
- Data in **PLAN_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.
- **PLAN**: saves plan information into **PLAN_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT_ID**: tags each query. The tag information will be stored in **PLAN_TABLE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- After the EXPLAIN PLAN statement is executed, plan information is automatically stored in **PLAN_TABLE**. INSERT, UPDATE, and ANALYZE cannot be performed on **PLAN_TABLE**. For details about **PLAN_TABLE**, see **PLAN_TABLE**.

Syntax

```
EXPLAIN PLAN
[ SET STATEMENT_ID = name ]
FOR statement ;
```



Parameters

- **name**

  Specifies a query tag.

  Value range: a string

  NOTE

  If the EXPLAIN PLAN statement does not contain **SET STATEMENT_ID**, **STATEMENT_ID** is empty by default. In addition, the value of **STATEMENT_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

- **statement**

  Specifies the SQL statement to explain.

Examples

```
-- Create tables foo1 and foo2.
gaussdb=# CREATE TABLE foo1(f1 int, f2 text, f3 text[]);
gaussdb=# CREATE TABLE foo2(f1 int, f2 text, f3 text[]);

-- Run EXPLAIN PLAN.
gaussdb=# EXPLAIN PLAN SET STATEMENT_ID = 'TPCH-Q4' FOR SELECT f1, count(*) FROM foo1 WHERE f1
> 1 AND f1 < 3 AND EXISTS (SELECT * FROM foo2) GROUP BY f1;

-- Query PLAN_TABLE.
gaussdb=# SELECT * FROM plan_table;

-- Delete data from the PLAN_TABLE table and delete tables foo1 and foo2.
gaussdb=# DELETE FROM plan_table WHERE STATEMENT_ID = 'TPCH-Q4';
gaussdb=# DROP TABLE foo1;
gaussdb=# DROP TABLE foo2;
```

7.12.12 F

7.12.12.1 FETCH

Description

FETCH retrieves rows using a previously created cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

A cursor has an associated position, which is used by FETCH. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

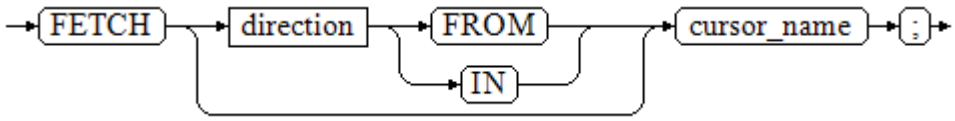
- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If FETCH runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- FETCH ALL or FETCH BACKWARD ALL will always leave the cursor positioned after the last row or before the first row.

Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like FETCH BACKWARD are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This action will succeed unless the cursor is positioned before the first row or after the last row. If the cursor is positioned before the first row or after the last row, no row is returned.

Syntax

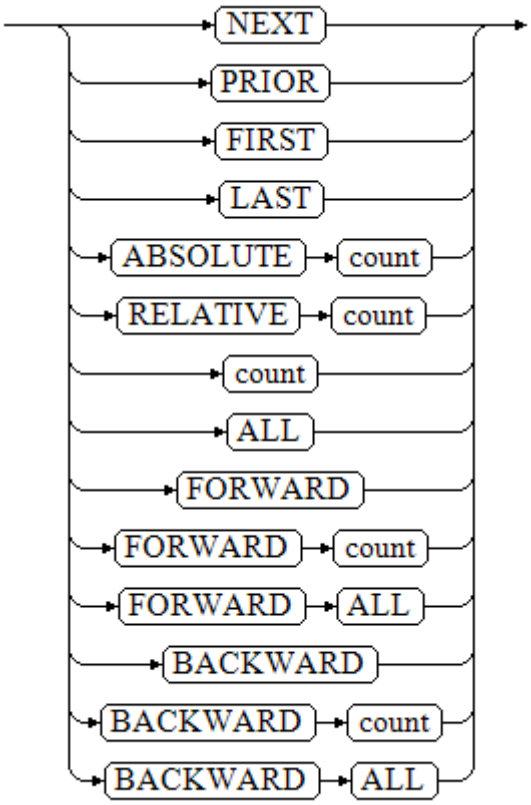
```
FETCH [ direction { FROM | IN } ] cursor_name;
```



The **direction** clause specifies optional parameters.

```
NEXT
  | PRIOR
  | FIRST
  | LAST
  | ABSOLUTE count
  | RELATIVE count
  | count
  | ALL
  | FORWARD
  | FORWARD count
  | FORWARD ALL
  | BACKWARD
  | BACKWARD count
  | BACKWARD ALL
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **direction**

  Defines the fetch direction.

  Value range:

  - NEXT (default value)

    Fetches the next row.
  - **PRIOR**

    Fetches the prior row.
  - **FIRST**

    Fetches the first row of the query (same as **ABSOLUTE 1**).
  - **LAST**

    Fetches the last row of the query (same as **ABSOLUTE -1**).
  - **ABSOLUTE** *count*

    Fetches the *count*'th row of the query.

    ABSOLUTE fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.

    Value range: a possibly-signed integer

    - If *count* is positive, the *count*'th row of the query will be fetched.
    - If *count* is negative, the **abs(***count***)**th row from the end of the query result will be fetched.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If *count* is set to **0**, the cursor is positioned before the first row.
- RELATIVE count

  Fetches the *count*'th succeeding row or the *count*'th prior row if count is negative.

  Value range: a possibly-signed integer

  - If *count* is positive, the *count*th succeeding row will be fetched.
  - If **count** is a negative integer, fetches the abs(count)'th prior row.
  - If the current row contains no data, **RELATIVE 0** returns null.
- count

  Fetches the next *count* rows (same as **FORWARD** *count*).
- ALL

  Fetches all remaining rows (same as **FORWARD ALL**).
- FORWARD

  Fetches the next row (same as **NEXT**).
- FORWARD count

  Fetches the *count* succeeding rows or *count* prior rows if *count* is negative.
- FORWARD ALL

  Fetches all remaining rows.
- BACKWARD

  Fetches the prior row (same as **PRIOR**).
- BACKWARD count

  Fetches the prior *count* rows (scanning backwards).

  Value range: a possibly-signed integer

  - If *count* is positive, the prior *count* rows will be fetched.
  - If *count* is negative, the succeeding *abs (count)* rows will be fetched.
  - **BACKWARD 0** re-fetches the current row, if any.
- BACKWARD ALL

  Fetches all prior rows (scanning backwards).

- **{ FROM | IN } cursor_name**

  Specifies the cursor name using the keyword **FROM** or **IN**.

  Value range: an existing cursor name

Examples

```
-- Create the test table and insert 20 data records into the table.
gaussdb=# CREATE TABLE test(c1 int, c2 int);
gaussdb=# INSERT INTO test VALUES (generate_series(1,20),generate_series(1,20));

-- Start a transaction and create a cursor named cursor1.
gaussdb=# START TRANSACTION;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM test ORDER BY 1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- The cursor retrieves three rows of data from the associated position.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
 c1 | c2
----+----
  1 |  1
  2 |  2
  3 |  3
(3 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;

-- Delete the table.
gaussdb=# DROP TABLE test;
```

CLOSE, **MOVE**, and **CURSOR**

7.12.13 G

7.12.13.1 GRANT

Description

Grants permissions to roles and users.

GRANT is used in the following scenarios:

- **Granting system permissions to roles or users**

  System permissions are also called user attributes, including SYSADMIN, CREATEDB, CREATEROLE, AUDITADMIN, MONADMIN, OPRADMIN, POLADMIN, INHERIT, REPLICATION, and LOGIN.

  They can be specified only by the CREATE ROLE or ALTER ROLE statement. The SYSADMIN permissions can be granted and revoked using GRANT ALL PRIVILEGE and REVOKE ALL PRIVILEGE, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using PUBLIC.

- **Granting database object permissions to roles or users**

  Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

  GRANT gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

  The keyword PUBLIC indicates that the permissions are to be granted to all roles, including those that might be created later. PUBLIC can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to PUBLIC.

  If WITH GRANT OPTION is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to PUBLIC, which is a unique GaussDB attribute.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GaussDB grants the permissions on certain types of objects to PUBLIC. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to PUBLIC users, but the following permissions are granted to PUBLIC users: CONNECT and CREATE TEMP TABLE permissions on databases, EXECUTE permission on functions, and USAGE permission on languages and data types (including domains). An object owner can revoke the default permissions granted to PUBLIC users and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. In addition, you can restrict the permissions of the PUBLIC user group by referring to t"Permission Management" in *Security Hardening Guide*. These default permissions can be modified by running the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the ALTER, DROP, COMMENT, INDEX, VACUUM, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

  Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

  If WITH ADMIN OPTION is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

  When separation of duties is disabled, the system administrator can grant or revoke the permissions of any non-permanent user, O&M administrator, or private user role, and the security administrator can grant or revoke the permissions of any non-system administrator, built-in role, permanent user, O&M administrator, or private user role.

- **Granting ANY permissions to roles or users**

  Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If WITH ADMIN OPTION is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to PUBLIC. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

  Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE, UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY PACKAGE, EXECUTE ANY PACKAGE, CREATE ANY TYPE, ALTER ANY TYPE, DROP ANY TYPE, ALTER ANY SEQUENCE, DROP ANY SEQUENCE, SELECT ANY SEQUENCE, ALTER ANY INDEX, DROP ANY INDEX, CREATE ANY SYNONYM, DROP ANY SYNONYM, CREATE ANY TRIGGER, ALTER ANY TRIGGER, and DROP ANY TRIGGER. For details about the ANY permission scope, see **Table 7-258**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- It is not allowed to grant the ANY permissions to PUBLIC or revoke the ANY permissions from PUBLIC.
- The ANY permissions are database permissions and are valid only for database objects that are granted the permissions. For example, SELECT ANY TABLE only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted the CREATE ANY TABLE permission, the owner of a table created in a schema with the same name as the user is the owner of the schema. When the user performs other operations on the table, the user needs to be granted the corresponding operation permission. Similarly, if a user is granted the CREATE ANY FUNCTION, CREATE ANY PACKAGE, CREATE ANY TYPE, CREATE ANY SEQUENCE, or CREATE ANY INDEX permission, the owner of an object created in a schema with the same name is the owner of the schema. If a user is granted the CREATE ANY TRIGGER or CREATE ANY SYNONYM permission, the owner of an object created in a schema with the same name is the creator.
- Exercise caution when granting the CREATE ANY FUNCTION or CREATE ANY PACKAGE permission to users to prevent other users from using DEFINER functions or PACKAGE for privilege escalation.
- When GRANT is used to grant a user the permission to use a table, if the permission is not properly used, ALTER may be used to add expressions to the default values and constraints of the table, or indexes may be created to add expressions to INDEX. In this case, the permission may be exploited.
- When GRANT is used to grant the TRIGGER permission, if the permission is not properly used, the WHEN condition may be used to create expressions. When the trigger is triggered, the permission may be exploited.
- When granting permissions to users, pay special attention to the definer permission on functions/packages. The definer permission is executed as the owner of the functions/packages. If the permission is not properly granted (including GRANT ROLE TO ROLE), the permission may be exploited.
- Do not grant object permissions to too many users. You can use roles or PUBLIC based on service requirements.
- If the **ON DATABASE** option is specified when the GRANT statement is executed in a PDB, only the CREATE permission of the PDB (used for schemas in the PDB) can be granted. The GRANT statement cannot be executed for a PDB in a non-PDB.

Syntax

- Grant the table or view access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP
| COMMENT | INDEX | VACUUM } [, ...]
    | ALL [ PRIVILEGES ] }
  ON { [ TABLE ] table_name [, ...]
    | ALL TABLES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column access permission to a user or role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
GRANT { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )} [, ...]
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
  ON [ TABLE ] table_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

If you have the permission to access a table, you have the permission to access all columns in the table by default. To grant only the access permission on a column in a table, you need to revoke the access permission on the table.

Grant the sequence access permission to a specified role or user. The **LARGE** column is optional. The assignment statement does not distinguish whether the sequence is LARGE.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON { [ [ LARGE ] SEQUENCE ] sequence_name [, ...]
    | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the database access permission to a user or role.

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON DATABASE database_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the domain access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON DOMAIN domain_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

In the current version, the domain access permission cannot be granted.

- Grant the CMK access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON CLIENT_MASTER_KEY client_master_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column encryption key (CEK) access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON COLUMN_ENCRYPTION_KEY column_encryption_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON FOREIGN DATA WRAPPER fdw_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON FOREIGN SERVER server_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
    | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

- Grant the procedural language access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
    ON LANGUAGE lang_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON SCHEMA schema_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

  NOTE

  When you grant table or view permissions to other users, you also need to grant the USAGE permission on the schema that the tables and views belong to. Without the USAGE permission, the users with table or view permissions can only see the object names, but cannot access them. This syntax cannot be used to grant the permission to create tables in schemas with the same name, but you can use the syntax for granting permission of a role to another user or role to achieve the same effect.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TABLESPACE tablespace_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TYPE type_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

  NOTE

  In the current version, the type access permission cannot be granted.

- Grant the DIRECTORY permission to a role.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
  ON DIRECTORY directory_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant the PACKAGE permission to a role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
  ON { PACKAGE package_name [, ...]
    | ALL PACKAGES IN SCHEMA schema_name [, ...] }
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
  TO role_name [, ...]
  [ WITH ADMIN OPTION ];
```

- Grant the SYSADMIN permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
  TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT
ANY TABLE | UPDATE ANY TABLE |
  DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
  CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |
  SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER | DROP ANY TRIGGER
 } [, ...]
  TO [ GROUP ] role_name [, ...]
  [ WITH ADMIN OPTION ];
```

- Grant the database link object permission to a specified user.

```
GRANT { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK TO role_name;
```

  NOTE

  - **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and used only as a compatible API. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
  - When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.
  - In addition to the statement for directly granting the database link permission, you can also obtain the database link permission by inheriting permission and granting permission to an administrator.
  - For details about database links, see **DATABASE LINK**.

- Grant the permission to create PUBLIC synonyms to a specified user.

```
GRANT { CREATE | DROP } PUBLIC SYNONYM TO role_name [ WITH ADMIN OPTION ];
```

  Built-in roles (gs_role_public_synonym_create and gs_role_public_synonym_drop) can also be used to grant users the permission to create and delete PUBLIC synonyms.

  – Grant the permission to create PUBLIC synonyms to a user.

```
GRANT gs_role_public_synonym_create TO role_name;
```

  – Grant the permission to delete PUBLIC synonyms to a user.

```
GRANT gs_role_public_synonym_drop TO role_name;
```

Parameters

GRANT permissions are classified as follows:

- **SELECT**

  Allows SELECT from any column, or the specific columns listed, of the specified table, view, or sequence. The SELECT permission on the corresponding column is also required for UPDATE or DELETE.

- **INSERT**

  Allows INSERT of a new row into a table.

- **UPDATE**

  Allows you to run the **UPDATE** command on any column in the specified table. The **UPDATE** command also requires the SELECT permission to query which rows need to be updated. **SELECT ... FOR UPDATE** and **SELECT ... FOR SHARE** also require this permission on at least one column, in addition to the **SELECT** permission.

- **DELETE**

  Allows DELETE of a row from a table. Generally, DELETE also requires the SELECT permission to query which rows need to be deleted.

- TRUNCATE

  Allows TRUNCATE on a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **REFERENCES**

  Allows creation of a FOREIGN KEY constraint referencing a table. This permission is required on both referencing and referenced tables.

- **TRIGGER**

  Allows the creation of a trigger on the specified table.

- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the CREATE permission on the schema of the object.
  - For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.

- **CONNECT**

  Allows the grantee to connect to the database.

- **EXECUTE**

  Allows calling a function, including use of any operators that are implemented on top of the function.

- **USAGE**
  - For procedural languages, allows use of the language for the creation of functions in that language.
  - For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
  - For sequences, allows use of the **nextval** function.

- **ALTER**

  Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.

- **DROP**

  Allows users to delete specified objects.

- **COMMENT**

  Allows users to define or modify comments of a specified object.

- **INDEX**

  Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.

- **VACUUM**

  Allows users to perform ANALYZE and VACUUM operations on specified tables.

- **ALL PRIVILEGES**

  Grants all available permissions to a user or role at a time. Only a system administrator has the GRANT ALL PRIVILEGES permission.

GRANT parameters are as follows:

- **role_name**

  Specifies the username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **table_name**
  Specifies the table name.
- **column_name**
  Specifies the column name.
- **schema_name**
  Specifies the schema name.
- **database_name**
  Specifies the database name.
- **function_name**
  Specifies the function name.
- **procedure_name**
  Specifies the stored procedure name.
- **sequence_name**
  Specifies the sequence name.
- **domain_name**
  Specifies the domain type name.
- **fdw_name**
  Specifies the foreign data wrapper name.
- **lang_name**
  Specifies the language name.
- **type_name**
  Specifies the type name.
- **argmode**
  Specifies the parameter mode.
  Value range: a string that complies with the **Identifier Naming Conventions**.
- **arg_name**
  Specifies the parameter name.
  Value range: a string that complies with the **Identifier Naming Conventions**.
- **arg_type**
  Specifies the parameter type.
  Value range: a string that complies with the **Identifier Naming Conventions**.
- **loid**
  Specifies the identifier of the large object that includes this page.
  Value range: a string that complies with the **Identifier Naming Conventions**.
- **tablespace_name**
  Specifies the tablespace name.
- **client_master_key**
  Specifies the name of the CMK.
  Value range: a string that complies with the **Identifier Naming Conventions**.
- **column_encryption_key**
  Name of the column encryption key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string that complies with the **Identifier Naming Conventions**.

- **directory_name**

  Specifies the directory name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **WITH GRANT OPTION**

  If WITH GRANT OPTION is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to PUBLIC.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The GRANT ALL PRIVILEGES forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

NOTE

When separation of duties is disabled, database administrators can access all objects, regardless of object permission settings. This is comparable to the permissions of **root** in a Unix system. As with **root**, it is unwise to operate as a system administrator except when necessary.

- **WITH ADMIN OPTION**

  If WITH ADMIN OPTION is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.

  For the ANY permissions, if WITH ADMIN OPTION is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

Table 7-258 ANY permissions

System Permission	Description
CREATE ANY TABLE	Users can create tables or views in the public and user schemas. The users must be granted the permission to create sequences to create a table that contains serial columns.
ALTER ANY TABLE	Users' ALTER permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a PRIMARY KEY constraint or UNIQUE constraint to the table, the users must be granted the index permission on the table.
DROP ANY TABLE	Users' DROP permission on tables or views in the public and user schemas.
SELECT ANY TABLE	Users' SELECT permission on tables or views in the public and user schemas, which is still subject to row-level security.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

System Permission	Description
UPDATE ANY TABLE	Users' UPDATE permission on tables or views in the public and user schemas, which is still subject to row-level security.
INSERT ANY TABLE	Users' INSERT permission on tables or views in the public and user schemas.
DELETE ANY TABLE	Users' DELETE permission on tables or views in the public and user schemas, which is still subject to row-level security.
CREATE ANY FUNCTION	Users can create functions or stored procedures in the user schemas.
EXECUTE ANY FUNCTION	Users' EXECUTE permission on functions or stored procedures in the public and user schemas.
CREATE ANY PACKAGE	Users' permission to create packages in the public and user schemas.
EXECUTE ANY PACKAGE	Users' EXECUTE permission on packages in the public and user schemas.
CREATE ANY TYPE	Users can create types in the public and user schemas.
CREATE ANY SEQUENCE	Users can create sequences in the public and user schemas.
CREATE ANY INDEX	Users can create indexes in the public and user schemas. The users must be granted the permission to create tablespaces to create a partitioned table index in a tablespace.
ALTER ANY TYPE	Users have the ALTER permission on types in public and user schemas, excluding modifying the owner of a type or modifying the schema of a type.
DROP ANY TYPE	Users' DROP permission on types in the public and user schemas.
ALTER ANY SEQUENCE	Users have the ALTER permission on sequences in public and user schemas, excluding modifying the owner of a sequence.
DROP ANY SEQUENCE	Users' DROP permission on sequences in the public and user schemas.
SELECT ANY SEQUENCE	Users' SELECT, USAGE, and UPDATE permissions on sequences in the public and user schemas.
ALTER ANY INDEX	Users' ALTER permission on indexes in the public and user schemas. To rename an index, users also need the permission to create objects in the schema where the index is located. If tablespace operations are involved, users need to have the corresponding operation permission on the tablespace. To set an index to **UNUSABLE**, users must have the DROP ANY INDEX permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

System Permission	Description
DROP ANY INDEX	Users' DROP permission on indexes in the public and user schemas.
CREATE ANY TRIGGER	Users can create triggers in the public and user schemas.
ALTER ANY TRIGGER	Users' ALTER permission on triggers in the public and user schemas.
DROP ANY TRIGGER	Users' DROP permission on triggers in the public and user schemas.
CREATE ANY SYNONYM	Users can create synonyms in user schema.
DROP ANY SYNONYM	Users' DROP permission on synonyms in the public and user schemas.

NOTE

If a user is granted any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except public listed in **Table 13-1**.

Examples

Example 1: Grant system permissions to a user or role.

Create the **joe** user and grant the SYSADMIN permission to it.

```
gaussdb=# CREATE USER joe PASSWORD '********';
gaussdb=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the SYSADMIN permission.

Example 2: Grant object permissions to a user or role.

1. Revoke the SYSADMIN permission from the **joe** user. Grant the usage permission of the tpcds schema and all permissions on the **tpcds.reason** table to **joe**.

   ```
   gaussdb=# CREATE SCHEMA tpcds;
   CREATE SCHEMA
   gaussdb=# CREATE TABLE tpcds.reason
   (
   r_reason_sk         INTEGER      NOT NULL,
   r_reason_id         CHAR(16)     NOT NULL,
   r_reason_desc       VARCHAR(20)
   );
   CREATE TABLE
   gaussdb=# REVOKE ALL PRIVILEGES FROM joe;
   gaussdb=# GRANT USAGE ON SCHEMA tpcds TO joe;
   gaussdb=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
   ```

   Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Grant the retrieve permission of **r_reason_sk**, **r_reason_id**, and **r_reason_desc** columns and the update permission of the **r_reason_desc** column in the **tpcds.reason** table to **joe**.

```
gaussdb=# GRANT SELECT (r_reason_sk,r_reason_id,r_reason_desc),UPDATE (r_reason_desc) ON tpcds.reason TO joe;
```

   Then **joe** has the retrieve permission on the **r_reason_sk**, **r_reason_id**, and **r_reason_desc** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

```
gaussdb=# GRANT SELECT (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
```

   Grant the database connection permission and the permission to create schemas in GaussDB to user **joe**, and allow user **joe** to grant this permission to other users.

```
gaussdb=# CREATE DATABASE testdb;
gaussdb=# GRANT CREATE,CONNECT ON DATABASE testdb TO joe WITH GRANT OPTION;
```

   Create the **tpcds_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds_manager**, but do not allow **tpcds_manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE tpcds_manager PASSWORD '********';
gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
```

   Grant all permissions on the **tpcds_tbspc** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

```
gaussdb=# CREATE TABLESPACE tpcds_tbspc RELATIVE LOCATION 'tablespace/tablespace_1';
gaussdb=# GRANT ALL ON TABLESPACE tpcds_tbspc TO joe;
```

   Grant the PUBLIC synonym permission on creating the **tpcds.reason** table to **joe** using the built-in role (**gs_role_public_synonym_create**).

```
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR tpcds.reason;
gaussdb=# GRANT gs_role_public_synonym_create TO joe;
```

3. Create the fun1 function in the tpcds schema, and grants the ALTER permission of the fun1 function to **joe**.

```
gaussdb=# CREATE or replace FUNCTION tpcds.fun1() RETURN boolean AS
BEGIN
SELECT current_user;
RETURN true;
END;
/
gaussdb=# GRANT ALTER ON FUNCTION tpcds.fun1() TO joe;
```

Example 3: Grant a user's or role's permissions to other users or roles.

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE manager PASSWORD '********';
gaussdb=# GRANT joe TO manager WITH ADMIN OPTION;
```

2. Create the **senior_manager** user and grant **manager**'s permissions to it.

```
gaussdb=# CREATE ROLE senior_manager PASSWORD '********';
gaussdb=# GRANT manager TO senior_manager;
```

3. Revoke permissions and delete users.

```
gaussdb=# REVOKE joe FROM manager;
gaussdb=# REVOKE manager FROM senior_manager;
gaussdb=# DROP USER manager;
gaussdb=# DROP DATABASE testdb;
```

Example 4: Grant the CMK or CEK permission to other users or roles.

1. Connect to an encrypted database.

```
-- Use the -C parameter to enable the encrypted database function.
gsql -p 57101 gaussdb -r -C
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=#  CREATE CLIENT MASTER KEY MyCMK1 WITH ( KEY_STORE = xxx, KEY_PATH = xxx,
ALGORITHM = AES_256_CBC);
CREATE CLIENT MASTER KEY
gaussdb=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY =
MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
```

2. Create a role **newuser** and grant the key permission to **newuser**.

```
gaussdb=# CREATE USER newuser PASSWORD '********';
CREATE ROLE
gaussdb=# GRANT ALL ON SCHEMA public TO newuser;
GRANT
gaussdb=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;
GRANT
gaussdb=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;
GRANT
```

3. Set the user to connect to a database and use a CEK to create an encrypted table.

```
gaussdb=# SET ROLE newuser PASSWORD '********';
gaussdb=>  CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH
(COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));
CREATE TABLE
gaussdb=> SELECT has_cek_privilege('newuser', 'MyCEK1', 'USAGE');
 has_cek_privilege
-------------------
 t
(1 row)
```

4. Revoke permissions and delete users.

```
gaussdb=> RESET ROLE;
gaussdb=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;
gaussdb=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;
gaussdb=# DROP TABLE newuser.acltest1;
gaussdb=# DROP COLUMN ENCRYPTION KEY MyCEK1;
gaussdb=# DROP CLIENT MASTER KEY MyCMK1;
gaussdb=# DROP SCHEMA IF EXISTS newuser CASCADE;
gaussdb=# REVOKE ALL ON SCHEMA public FROM newuser;
gaussdb=# DROP ROLE IF EXISTS newuser;
```

Example 5: Revoke permissions and drop roles and users.

```
gaussdb=# REVOKE gs_role_public_synonym_create FROM joe;
gaussdb=# REVOKE ALTER ON FUNCTION tpcds.fun1() FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON tpcds.reason FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON SCHEMA tpcds FROM joe;
gaussdb=# REVOKE ALL ON TABLESPACE tpcds_tbspc FROM joe;
gaussdb=# DROP TABLESPACE tpcds_tbspc;
gaussdb=# REVOKE USAGE,CREATE ON SCHEMA tpcds FROM tpcds_manager;
gaussdb=# DROP ROLE tpcds_manager;
gaussdb=# DROP ROLE senior_manager;
gaussdb=# DROP USER joe CASCADE;
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP SYNONYM t1;
gaussdb=# DROP FUNCTION tpcds.fun1();
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

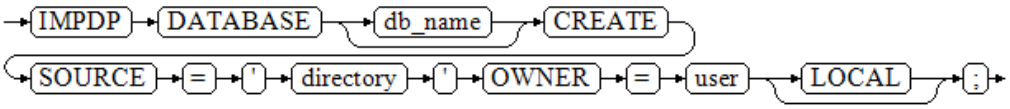
7.12.14.1 IMPDP DATABASE CREATE

Description

Specifies the preparation phase for importing a database.

Syntax

```
IMPDP DATABASE [db_name] CREATE SOURCE = 'directory' OWNER = user [LOCAL];
```



Parameters

- **db_name**: name of the new database after the import. If this parameter is not specified, the original database name is retained after the import.
- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this column is specified, data is imported to the original cluster. If this column is not specified, data is imported to a new cluster.

Examples

```
-- The IMPDP DATABASE CREATE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP DATABASE test CREATE SOURCE = '/data1/impdp/database' OWNER=admin;
```

7.12.14.2 IMPDP PLUGGABLE DATABASE CREATE

Description

Specifies the execution phase of importing a PDB.

NOTICE

The IMPDP PLUGGABLE DATABASE CREATE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, unexpected restart may occur. Therefore, you are advised not to directly call the syntax.

Syntax

```
IMPDP PLUGGABLE DATABASE pdb_name CREATE SOURCE = 'directory' OWNER = user;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **pdb_name**: name of the new PDB after the import. If this parameter is not specified, the original PDB name is retained after the import.
- **directory**: data source directory of the imported PDB.
- **user**: owner of the imported PDB.

Examples

- Prerequisites

  For details about how to export PDB files, see **Examples** in **EXPDP PLUGGABLE DATABASE**.

- Importing a PDB

```
-- Connect to the postgres database as a system administrator and create user tom whose login password is ********.
gaussdb=# CREATE USER TOM PASSWORD '**********';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE

-- Connect to the postgres database as a system administrator and import the PDB file.
gaussdb=# IMPDP PLUGGABLE DATABASE my_pdb1 CREATE SOURCE = '/data1/expdp/my_pdb' OWNER=tom;
IMPDP PLUGGABLE DATABASE CREATE
```

7.12.14.3 IMPDP PLUGGABLE DATABASE RECOVER

Description

Specifies the rectification phase of importing a PDB.

NOTE

The IMPDP PLUGGABLE DATABASE RECOVER syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. You are advised not to directly call the syntax.

Syntax

```
IMPDP PLUGGABLE DATABASE RECOVER;
```

Examples

- Prerequisites

  For details about how to import the PDB, see **Examples** in chapter **IMPDP PLUGGABLE DATABASE CREATE**.

- Importing and restoring a PDB

```
-- Connect to the postgres database as a system administrator and allocate the resource plan instructions for the PDB created during the import.
gaussdb=# call resource_manager.create_pending_area();
 create_pending_area
---------------------

(1 row)
-- This API is used to create resources. The resource specifications of the current instance determine whether the resources can be successfully created. If the API reports an error, adjust the parameters
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
based on the error description and try again.
gaussdb=# CALL resource_manager.create_resource_plan_directive(pdb_name =>'my_pdb1', min_cpu
=> 4, max_dynamic_memory => '18022MB', max_shared_memory => '14745MB', io_limits=> 300,
io_priority => 'High', max_connections => 880);
 create_resource_plan_directive
--------------------------------

(1 row)
gaussdb=# CALL resource_manager.submit_pending_area();
 submit_pending_area
---------------------

(1 row)

-- Connect to the postgres database as a system administrator and enable the PDB created during
the import.
gaussdb=# alter pluggable database my_pdb1 open;
ALTER PLUGGABLE DATABASE

-- Connect to the PDB and perform the import and restoration operations.
gaussdb=# \c my_pdb1;
my_pdb=# IMPDP PLUGGABLE DATABASE RECOVER;
IMPDP PLUGGABLE DATABASE RECOVER
```

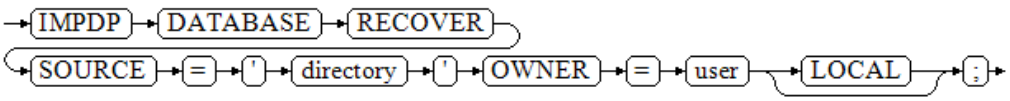
7.12.14.4 IMPDP RECOVER

Description

Specifies the execution phase of importing a database.

Syntax

```
IMPDP DATABASE RECOVER SOURCE = 'directory' OWNER = user [LOCAL];
```



Parameters

- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this column is specified, data is imported to the original cluster. If this column is not specified, data is imported to a new cluster.

Examples

```
-- The IMPDP DATABASE RECOVER syntax is used for fine-grained backup and restoration and is called by
the backup and restoration tool. If you directly call the syntax, an error message may be displayed,
indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP DATABASE RECOVER SOURCE = '/data1/impdp/database' OWNER=admin;
```

7.12.14.5 IMPDP TABLE

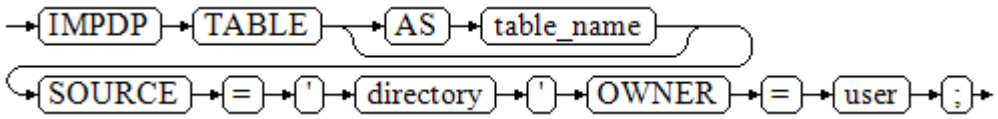
Description

Specifies the execution phase of importing a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
IMPDP TABLE [AS table_name] SOURCE = 'directory' OWNER = user;
```



Parameters

- **table_name**: name of the new table after the import. If this parameter is not specified, the original table name is retained after the import.
- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

Examples

```
-- The IMPDP TABLE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP TABLE SOURCE = '/data1/impdp/table0' OWNER=admin;
```

7.12.14.6 IMPDP TABLE PREPARE

Description

Specifies the preparation phase for importing a table.

Syntax

```
IMPDP TABLE PREPARE SOURCE = 'directory' OWNER = user;
```

Parameters

- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

Examples

```
-- The IMPDP TABLE PREPARE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP TABLE PREPARE SOURCE = '/data1/impdp/table0' OWNER=admin;
```

7.12.14.7 INSERT

Description

Inserts one or more rows of data into a table.

Precautions

- You must have the INSERT permission on a table to insert data to it. If a user is granted the INSERT ANY TABLE permission, the user has the USAGE permission on all schemas except system schemas and the INSERT permission on tables in these schemas.
- Use of the RETURNING clause requires the SELECT permission on all columns mentioned in RETURNING.
- If ON DUPLICATE KEY UPDATE is used, you must have the INSERT and UPDATE permissions on the table and the SELECT permission on the columns of the UPDATE clause.
- If you use the query clause to insert rows from a query, you need to have the SELECT permission on any table or column used in the query.
- The generated column cannot be directly written. In the INSERT statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- When you connect to a TD-compatible database and **td_compatible_truncation** is **on**, a long string will be automatically truncated. If later INSERT statements (not involving foreign tables) insert long strings to columns of CHAR- and VARCHAR-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

  NOTE

  If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
INSERT [/*+ plan_hint */] [ IGNORE ] INTO table_name [ { [alias_name] [ ( column_name [, ...] ) ] } |
{ [partition_clause] [ AS alias ] [ ( column_name [, ...] ) ] } ]    { DEFAULT VALUES
   | { VALUES | VALUE } {( { expression | DEFAULT } [, ...] ) }[, ...]
   | query }
   [ { ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...]
[ WHERE condition ] } }
| { [ ON CONFLICT [ conflict_target ] conflict_action ] } ]
   [ RETURNING {* | {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

Insert subqueries and views.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
INSERT [/*+ plan_hint */] INTO {subquery | view_name} [ AS alias ] [ ( column_name [, ...] ) ]
{ DEFAULT VALUES
   | { VALUES | VALUE } {( { expression | DEFAULT } [, ...] ) }[, ...]
   | query }
   [ RETURNING {* | {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

- Detailed information of **subquery**:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
[ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
[ into_option ];
```

- The specified subquery source **from_item** is as follows:

```
{[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
```

- Detailed information of **with_query**:

```
with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
( {SELECT | VALUES | INSERT | UPDATE | DELETE} )
```

- Detailed information of **partition_clause**:

```
PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
```

- Detailed information of **conflict_target**:

```
( { index_column_name | ( index_expression ) } [, ...] ) [ WHERE index_predicate ]
```

- Detailed information of **conflict_action**:

```
DO NOTHING |
DO UPDATE SET { column_name = { expression | DEFAULT } | ( column_name [, ...] ) = ( { expression |
DEFAULT } [, ...] ) } [, ...] [ WHERE condition ]
```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, a SELECT subquery can be referenced by name.

  with_query:

  – **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

  – **column_name** specifies the column name displayed in the subquery result set.

  – Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.

  NOTICE

  If a subquery is a DML statement with a RETURNING statement, the number of command output records of the INSERT statement is determined by the subquery. Assume that table **T1** exists. Run the following statement:

  ```
  WITH CTE AS (INSERT INTO T1 VALUES(1,2) RETURNING *) INSERT INTO T1 SELECT * FROM CTE;
  ```

  The number of command output records of the preceding statement is determined by the following part instead of the entire statement. That is, the command output is "INSERT 0 1" instead of "INSERT 0 2".

  ```
  INSERT INTO T1 VALUES(1,2) RETURNING *
  ```

  – You can use MATERIALIZED or NOT MATERIALIZED to modify the CTE.

  – If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

NOTE

INSERT ON DUPLICATE KEY UPDATE does not support the WITH or WITH RECURSIVE clauses.

- plan_hint clause

  Follows the INSERT keyword in the **/*+ */** format. It is used to optimize the plan of an INSERT statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **IGNORE**

  When the INSERT statement uses the IGNORE keyword, some ERROR-level errors can be degraded to WARNING-level errors, and invalid values can be adjusted to the closest values based on error scenarios. GaussDB supports the following error codes for error downgrade:

  - Damage to the NOT NULL constraint
  - UNIQUE KEY conflict
  - No partition found for the inserted value
  - Unmatch between the inserted data and the specified partition
  - Multiple rows returned for a subquery
  - Oversized data
  - Time function overflow
  - Division by 0
  - Incorrect value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

1. INSERT IGNORE is supported only when **sql_compatibility** is set to **'B'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s1'**.
2. INSERT IGNORE does not support encrypted tables, foreign tables, and MOT.
3. INSERT IGNORE does not support PRIMARY KEY constraints or UNIQUE KEY constraints that take effect with a delay.
4. INSERT IGNORE allows **NULL** values to damage NOT NULL constraints in terms of some data types, whose OIDs are TIMESTAMPOID, TIMESTAMPTZOID, TIMEOID, TIMETZOID, RELTIMEOID, INTERVALOID, TINTERVALOOID, SMALLDATETIMEOID, DATEOID, NAMEOID, POINTOID, PATHOID, POLYGONOID, CIRCLEOID, LSEGOID, BOXOID, JSONOID, JSONBOID, XMLOID, XMLTYPEOID, VARBITOID, NUMERICOID, CIDROID, INETOID, MACADDROID, NUMRANGEOID, INT8RANGEOID, INT4RANGEOID, TSRANGEOID, TSTZRANGEOID, DATERANGEOID, ABSTIMEOID, BOOLOID, INT8OID, INT4OID, INT2OID, INT1OID, FLOAT4OID, FLOAT8OID, CASHOID, UINT1OID, UINT2OID, UINT4OID, UINT8OID, BPCHAROID, VARCHAROID, NVARCHAR2OID, CHAROID, BYTEAOID, RAWOID, BLOBOID, CLOBOID, TEXTOID, YEAROID, and SET. The following table lists the zero values of each data type.
5. When the default zero value is used for calculation, exercise caution when using IGNORE to ignore the NOT NULL constraint.

OID of Each Data Type	Default Zero Value
INT8OID, INT4OID, INT2OID, INT1OID, UINT1OID, UINT2OID, UINT4OID, UINT8OID, FLOAT4OID, FLOAT8OID, NUMERICOID	0 or 0.00 (The number of 0s after the decimal point is specified by a parameter.)
BPCHAROID, VARCHAROID, CHAROID, BYTEAOID, RAWOID, BLOBOID, NVARCHAR2OID, CLOBOID, TEXTOID, VARBITOID, NAMEOID, SET	Empty string
NUMRANGEOID, INT8RANGEOID, INT4RANGEOID, TSRANGEOID, TSTZRANGEOID, DATERANGEOID	empty
TIMEOID	time '00:00:00'
TIMETZOID	timetz '00:00:00'
INTERVALOID	interval '00:00:00'
TINTERVALOOID	tinterval(abstime '1970-01-01 00:00:00', abstime '1970-01-01 00:00:00')
SMALLDATETIMEOID	smalldatetime '1970-01-01 00:00:00'
ABSTIMEOID	abstime '1970-01-01 00:00:00'
RELTIMEOID	reltime '00:00:00'
TIMESTAMPOID, TIMESTAMPTZOID	1970-01-01 00:00:00
DATEOID	1970-01-01

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

OID of Each Data Type	Default Zero Value
YEAROID	0000
POINTOID	(0,0)
PATHOID, POLYGONOID	((0,0))
CIRCLEOID	<(0,0),0>
LSEGOID	[(0,0),(0,0)]
BOXOID	(0,0),(0,0)
JSONOID, JSONBOID, XMLOID	'null'
XMLTYPEOID	'<null/>'
CIDROID	0.0.0.0/32
INETOID	0.0.0.0
MACADDROID	00:00:00:00:00:00
BOOLOID	f
CASHOID	$0.00

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name.

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

  The inserted object can be a subquery. When a subquery is inserted, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

  If a subquery contains only one table, data is inserted into the table. If a subquery contains multiple tables or has nested relationships, check whether a key-preserved table exists to determine whether data can be inserted. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Specifies the target view to be inserted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on inserting views and subqueries are as follows:

1. Only columns that directly reference user columns in the base table can be inserted.
2. A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
3. Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT, or OFFSET clause at the top layer are not supported.
4. Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
5. Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
6. Views with BEFORE/AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
7. The ON DUPLICATE KEY UPDATE function is not supported.
8. Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
9. For a multi-table join view or subquery, only one base table can be inserted at a time.
10. When INSERT joins a view or subquery, explicitly specified columns to be inserted or implicitly specified columns (columns specified during view or subquery creation) cannot reference columns of non-key-preserved tables; if the WITH CHECK OPTION clause is used, INSERT operations cannot be performed on join columns in join views or subqueries. For details about the key-preserved table, see **CREATE VIEW**.
11. System views cannot be inserted.

- **alias_name**

  Specifies the table alias when the INSERT statement is used without AS alias.

  NOTE

  1. When the INSERT statement is used without AS alias, the table alias cannot be a keyword (such as SELECT and VALUE) or an expression. The alias must comply with the identifier naming rule.
  2. When the INSERT statement is used without AS alias, data cannot be inserted to the specified partition.

- **partition_clause**

  Inserts data to a specified partition.

  For details about the keywords, see **SELECT**.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

  For details, see **CREATE TABLE SUBPARTITION**.

- **column_name**

  Specifies the name of a column in a table.

  – The column name can be qualified with a subcolumn name or array index, if needed.

  – Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

data into only some columns of a composite type leaves the other columns **NULL**.

- The target column names **column_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
- The target columns are the first *N* column names, if there are only *N* columns supplied by the VALUE clause or query.
- The values provided by the VALUE clause and query are associated with the corresponding columns from left to right in the table.
- Data can be inserted in the format of **table alias.column name**.

Value range: name of an existing column.

- **expression**

  Specifies an expression or a value to assign to the corresponding column.

  - In the INSERT ON DUPLICATE KEY UPDATE statement, expression can be **VALUES(***column_name***)** or **EXCLUDED.***column_name*, indicating that the value of **column_name** corresponding to the conflict row is referenced. **VALUES(***column_name***)** can be nested in a compound expression, for example, **VALUES(***column_name***) + 1**, **VALUES(***column_name***) + VALUES(***column_name***)**, and **function_name(VALUES(***column_name***))**.

    NOTE

    - **VALUES(***column_name***)** can be used only in the ON DUPLICATE KEY UPDATE clause.
    - **VALUES(***column_name***)** cannot be used in the IN or NOT IN expressions.
  - If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
  - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

- **DEFAULT**

  Specifies the default value of a column. The value is **NULL** if no default value is assigned to it.

- **query**

  Specifies a query statement (SELECT statement) whose result is used as the data to be inserted.

- **RETURNING**

  Returns the inserted rows. The syntax of the RETURNING list is identical to that of the output list of SELECT.

- **output_expression**

  Specifies an expression used to calculate the output result of the INSERT statement after each row is inserted.

  Value range: The expression can use any column in the table. You can use the asterisk (*) to return all columns of the inserted row.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string that complies with the **Identifier Naming Conventions**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ON DUPLICATE KEY UPDATE**

  For a table with a UNIQUE constraint (UNIQUE INDEX or PRIMARY KEY), if the inserted data violates the UNIQUE constraint, the UPDATE clause is executed on the conflicting row to complete the update. For a table without a UNIQUE constraint, only the INSERT operation is performed. If **NOTHING** is specified for UPDATE, this insertion is ignored. You can use **EXCLUDED.** or **VALUES()** to select the column corresponding to the source data.

  - Row triggers are supported. The execution sequence of triggers is determined by the actual execution process.

    Executing INSERT will trigger the BEFORE INSERT and AFTER INSERT triggers.

    Executing **UPDATE** will trigger the BEFORE INSERT, BEFORE UPDATE, and AFTER UPDATE triggers.

    Executing **UPDATE NOTHING** will trigger the BEFORE INSERT trigger.
  - Statement triggers are supported. The triggers are determined by the statement to be executed.

    Executing **UPDATE NOTHING** will trigger the BEFORE INSERT and AFTER INSERT triggers.

    Executing **UPDATE** will trigger the BEFORE INSERT, AFTER INSERT, BEFORE UPDATE, and AFTER UPDATE.
  - The UNIQUE constraint or primary key of DEFERRABLE is not supported.
  - If a table has multiple UNIQUE constraints and the inserted data violates multiple UNIQUE constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)
  - If multiple rows are inserted and these rows conflict with the same row in the table, the system inserts or updates the first row and then updates other rows in sequence.
  - Primary keys and unique index columns cannot be updated.
  - Foreign tables are not supported.
  - The expression of UPDATE statement cannot contain sublinks.

- **ON CONFLICT**

  If a UNIQUE constraint or exclusive constraint conflict occurs during an insertion, the insertion is canceled when ON CONFLICT is followed by DO NOTHING, and the update is performed when it is followed by DO UPDATE SET. If no conflict occurs, the common INSERT process is executed.

  - **index_column_name**: Name of the index column.
  - **index_expression**: Similar to **index_column_name**, it is an expression index based on one or more columns of the table and can be used for fast access to a variation of the basic data.
  - **index_predicate**: condition expression that specifies the range of a partially unique index.
  - **expression**: expression or value to be assigned to the corresponding column.
  - **DEFAULT**: The corresponding column will be filled with the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The INSERT... ON CONFLICT syntax has the following restrictions:

1. Only PG compatibility is supported.
2. The [COLLATE collation] [opclass] syntax is not supported.
3. The ON CONSTRAINT constraint_name syntax is not supported.
4. Users must have the UPDATE permission before using DO UPDATE SET.
5. Nesting in the conflict_target, UPDATE SET, or UPDATE SET clause is not supported.
6. Column-format tables, foreign tables, STREAM objects, and CONTVIEW objects are not supported.
7. Multiple data records with the same unique key cannot be inserted into the same statement at a time.
8. Database links are not supported.
9. Subqueries cannot be inserted.

Examples

- **Insert a data record.**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t1(col1 INT,col2 VARCHAR);

-- Insert data.
gaussdb=# INSERT INTO test_t1 (col1, col2) VALUES (1,'AB');

-- Insert data into some columns of the table.
gaussdb=# INSERT INTO test_t1 (col1) VALUES (2);

-- There is no parenthesis on the left of the VALUES keyword. Values must be added to all fields in the parenthesis on the right according to the table structure sequence.
gaussdb=# INSERT INTO test_t1 VALUES (3,'AC');

-- Query the table.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
------+------
    1 | AB
    2 |
    3 | AC
(3 rows)

-- Drop the table.
gaussdb=# DROP TABLE test_t1;
```

- **Insert multiple data records.**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t2(col1 INT,col2 VARCHAR);
gaussdb=# CREATE TABLE test_t3(col1 INT,col2 VARCHAR);

-- Insert multiple data records.
gaussdb=# INSERT INTO test_t2 (col1, col2) VALUES (10,'AA'),(20,'BB'),(30,'CC');

-- Query the table.
gaussdb=# SELECT * FROM test_t2;
 col1 | col2
------+------
   10 | AA
   20 | BB
   30 | CC
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Insert data in test_t2 into test_t3.
gaussdb=# INSERT INTO test_t3 SELECT * FROM test_t2;

-- Query the table.
gaussdb=# SELECT * FROM test_t3;
 col1 | col2
------+------
   10 | AA
   20 | BB
   30 | CC
(3 rows)

-- Drop the table.
gaussdb=# DROP TABLE test_t2;
gaussdb=# DROP TABLE test_t3;
```

- **ON DUPLICATE KEY UPDATE**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t4 (id INT PRIMARY KEY, info VARCHAR(10));
gaussdb=# INSERT INTO test_t4 VALUES (1, 'AA'), (2,'BB'), (3, 'CC');

-- Use the ON DUPLICATE KEY UPDATE keyword.
gaussdb=# INSERT INTO test_t4 VALUES (3, 'DD'), (4, 'EE') ON DUPLICATE KEY UPDATE info =
VALUES(info);

-- Query the table.
gaussdb=# SELECT * FROM test_t4;
 id | info
----+------
  1 | AA
  2 | BB
  4 | EE
  3 | DD

-- Drop the table.
gaussdb=# DROP TABLE test_t4;
```

- **ON CONFLICT**

  Example:

```
-- Create a table.
gaussdb=# CREATE DATABASE pg_db dbcompatibility = 'PG';
gaussdb=# \c pg_db
pg_db=# CREATE TABLE insert_onconflict_tb1(a INT PRIMARY KEY, b INT, c VARCHAR2(20));
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 2, 'aaa'), (2, 0, 'zzz');
-- Query the table.
pg_db=# SELECT * FROM insert_onconflict_tb1;
 a | b |  c
---+---+-----
 1 | 2 | aaa
 2 | 0 | zzz
(2 rows)
-- Use the ON CONFLICT keyword.
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 5, 'ddd'), (2, 1, 'yyy') ON CONFLICT (a) DO
UPDATE SET b=excluded.b, c=excluded.c;
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 5, 'ddd'), (2, 1, 'yyy') ON CONFLICT (a) DO
NOTHING;
-- Query the table.
pg_db=# SELECT * FROM insert_onconflict_tb1;
 a | b |  c
---+---+-----
 1 | 5 | ddd
 2 | 1 | yyy
(2 rows)
-- Drop the table.
pg_db=# DROP TABLE insert_onconflict_tb1;
pg_db=# \c postgres
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the PG-compatible library.
gaussdb=# DROP DATABASE pg_db;
```

- **INSERT IGNORE**

  Example 1: Damage to the NOT NULL constraint

```
-- Create a B-compatible database.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY ='B';
gaussdb=# \c test
-- Set the pre-installation parameters.
test=# set b_format_version = '5.7';
test=# set b_format_dev_version = 's1';

-- Create a table.
test=# CREATE TABLE test_t5(f1 INT NOT NULL);
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t5 VALUES(NULL);
WARNING:  null value in column "f1" violates not-null constraint
DETAIL:  Failing row contains (null).
INSERT 0 1

-- Query the table.
test=# SELECT * FROM test_t5;
 f1
----
  0
(1 row)

-- Drop the table.
test=# DROP TABLE test_t5;
```

  Example 2: UNIQUE KEY conflict

```
-- Create a table.
test=# CREATE TABLE test_t6(f1 INT PRIMARY KEY);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "test_t6_pkey" for table "test_t6"
CREATE TABLE

-- Insert data.
test=# INSERT INTO test_t6 VALUES(1);
INSERT 0 1

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t6 VALUES(1);
WARNING:  duplicate key value violates unique constraint "test_t6_pkey"
INSERT 0 0

-- Query the table.
test=# SELECT * FROM test_t6;
 f1
----
  1
(1 row)

-- Drop the table.
test=# DROP TABLE test_t6;
DROP TABLE
```

  Example 3: No partition found for the inserted value

```
-- Create a table.
test=# CREATE TABLE test_t7(f1 INT, f2 INT) PARTITION BY LIST(f1) (PARTITION p0 VALUES(1, 4, 7),
PARTITION p1 VALUES (2, 5, 8));
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t7 VALUES(3, 5);
WARNING:  inserted partition key does not map to any table partition
INSERT 0 0
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Query the table.
test=# SELECT * FROM test_t7;
 f1 | f2
----+----
(0 rows)

-- Drop the table.
test=# DROP TABLE test_t7;
DROP TABLE
```

Example 4: Unmatch between the inserted data and the specified partition

```
-- Create a table.
test=# CREATE TABLE test_t8(f1 INT NOT NULL, f2 TEXT, f3 INT) PARTITION BY RANGE(f1)
(PARTITION p0 VALUES LESS THAN(5), PARTITION p1 VALUES LESS THAN(10), PARTITION p2
VALUES LESS THAN(15), PARTITION p3 VALUES LESS THAN(MAXVALUE));
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t8 PARTITION(p2) VALUES(20, 'Jan', 1);
WARNING:  inserted partition key does not map to the table partition
DETAIL:  N/A.
INSERT 0 0

-- Query the table.
test=# SELECT * FROM test_t8;
 f1 | f2 | f3
----+----+----
(0 rows)

-- Drop the table.
test=# DROP TABLE test_t8;
DROP TABLE
```

Example 5: Multiple rows returned for a subquery

```
-- Create a table.
test=# CREATE TABLE test_t9(f1 INT, f2 INT);
CREATE TABLE

-- Insert data.
test=# INSERT INTO test_t9 VALUES(1, 1), (2, 2), (3, 3);
INSERT 0 3

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t9 VALUES((SELECT f1 FROM test_t9), 0);
WARNING:  more than one row returned by a subquery used as an expression
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
test=# SELECT * FROM test_t9 WHERE f2 = 0;
 f1 | f2
----+----
    |  0
(1 row)

-- Drop the table.
test=# DROP TABLE test_t9;
DROP TABLE
```

Example 6: Oversized data

```
-- Create a table.
test=# CREATE TABLE test_t10(f1 VARCHAR(5));
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t10 VALUES('aaaaaaaaa');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
WARNING:  value too long for type character varying(5)
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
test=# SELECT * FROM test_t10;
  f1
-------
 aaaaa
(1 row)

-- Drop the table.
test=# DROP TABLE test_t10;
DROP TABLE
```

Example 7: Time function overflow

```
-- Create a table.
test=# CREATE TABLE test_t11(f1 DATETIME);
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t11 VALUES(date_sub('2000-01-01', INTERVAL 2001 YEAR));
WARNING:  Datetime function: datetime field overflow
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
test=# SELECT * FROM test_t11;
 f1
----

(1 row)

-- Drop the table.
test=# DROP TABLE test_t11;
DROP TABLE
```

Example 8: Division by 0

```
-- Create a table.
test=# CREATE TABLE test_t12(f1 INT);
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t12 VALUES(1/0);
WARNING:  division by zero
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
test=# SELECT * FROM test_t12;
 f1
----

(1 row)

-- Drop the table.
test=# DROP TABLE test_t12;
DROP TABLE
```

Example 9: Incorrect value

```
-- Create a table.
test=# CREATE TABLE test_t13(f1 FLOAT);
CREATE TABLE

-- Use the IGNORE keyword.
test=# INSERT IGNORE INTO test_t13 VALUES('1.11aaa');
WARNING:  invalid input syntax for type real: "1.11aaa"
LINE 1: INSERT IGNORE INTO test_t13 VALUES('1.11aaa');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                                    ^
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
test=# SELECT * FROM  test_t13;
 f1
------
 1.11
(1 row)

-- Drop the table.
test=# DROP TABLE test_t13;
-- Drop a database. (Change the database name based on the actual situation.)
test=# \c test;
test=# DROP DATABASE test;
```

Example 10: Insert a data record using a table alias.

```
-- Create a table.
gaussdb=# create table tb1 (va int , vb int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'va' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

 -- Use a table alias.
gaussdb=# insert into tb1 as tt(tt.va, tt.vb) values (1,2);
INSERT 0 1
gaussdb=# insert into tb1 tt(tt.va, tt.vb) values (3,4);
INSERT 0 1

-- Query the table.
gaussdb=# select * from tb1;
 va | vb
----+----
  1 |  2
  3 |  4
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE tb1;
DROP TABLE
```

- **WITH [RECURSIVE] with_query [, ...]**

  Example:

```
-- Grade table.
gaussdb=# CREATE TABLE grade (
    sid INT,
    course VARCHAR(20),
    score FLOAT
);

-- Student table.
gaussdb=# CREATE TABLE student(
    sid INT PRIMARY KEY,
    class INT,
    name  VARCHAR(50),
    sex INT CHECK (sex = 0 or sex = 1)
);

-- Insert data.
gaussdb=# WITH student_sid AS ( INSERT INTO student ( sid, CLASS, NAME, sex ) VALUES ( 1, 1,
'Scott', 1 ) RETURNING sid )
    INSERT INTO grade ( sid, course, score )
    VALUE ( ( SELECT sid FROM student_sid ), 'math', '96' ),
      ( ( SELECT sid FROM student_sid ), 'chinese', '82' ),
      ( ( SELECT sid FROM student_sid ), 'english', '86' );

-- Query the table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM student;
 sid | class | name  | sex
-----+-------+-------+-----
   1 |     1 | scott |   1
(1 row)

gaussdb=# SELECT * FROM grade;
 sid | course  | score
-----+---------+-------
   1 | math    |    96
   1 | chinese |    82
   1 | english |    86
(3 rows)

-- Drop tables.
gaussdb=# DROP TABLE student;
gaussdb=# DROP TABLE grade;
```

- **Insert data into a view or subquery.**

  Example 1: Insert a subquery.

```
-- Create a schema.
gaussdb=# CREATE SCHEMA ins_subqry;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'ins_subqry';
SET

-- Create tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"
CREATE TABLE

-- Insert data into t1 through a subquery.
gaussdb=# INSERT INTO (SELECT * FROM t1) VALUES (1, 1);
INSERT 0 1
gaussdb=# INSERT INTO (SELECT * FROM t1 WHERE y1 < 3) VALUES (5, 5);
INSERT 0 1

-- Insert a subquery with CHECK OPTION specified.
gaussdb=# INSERT INTO (SELECT * FROM t1 WHERE y1 < 3 WITH CHECK OPTION) VALUES (5, 5);
ERROR:  new row violates WITH CHECK OPTION for view "__unnamed_subquery__"
DETAIL:  Failing row contains (5, 5).

-- Insert a subquery with READONLY specified.
gaussdb=# INSERT INTO (SELECT * FROM t1 WITH READ ONLY) VALUES (5, 5);
ERROR:  cannot perform a DML operation on a read-only subquery.

-- Insert a multi-table join subquery.
gaussdb=# INSERT INTO (SELECT * FROM t1, t2 WHERE x1 = x2) (x1, y1) VALUES (2, 2);
INSERT 0 1

-- Drop a schema.

DROP SCHEMA
```

Suggestions

- VALUES

  When you run the **INSERT** statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance.

  Example:

  ```
  INSERT INTO sections VALUES (30, 'Administration', 31, 1900),(40, 'Development', 35, 2000), (50, 'Development' , 60 , 2001);
  ```

7.12.14.8 INSERT ALL

Description

Inserts one or multiple data records into multiple tables.

Precautions

- You must have the INSERT permission on a table to insert data to it. If a user is granted the INSERT ANY TABLE permission, the user has the USAGE permission on all schemas except system schemas and the INSERT permission on tables in these schemas.
- If you use the query clause to insert rows from a query, you need to have the SELECT permission on any table or column used in the query.
- The generated column cannot be directly written. In the INSERT statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- This syntax can be executed only in the A-compatible mode.

Syntax

```
INSERT [/*+ plan_hint */] [ ALL | FIRST ]
   { [ WHEN condition THEN ]
   { INTO table_name
   [ { [alias_name] [ ( column_name [, ...] ) ] } | { [partition_clause] [ AS alias ]
   [ ( column_name [, ...] ) ] } ]
   [ VALUES {( { expression | DEFAULT } [, ...] ) } ] }[, ...] }[, ...]
   { subquery };
```

Parameters

- **plan_hint** clause

  Follows the INSERT keyword in the **/*+ */** format. Only the syntax format is adapted, and specific functions are not supported.

- **ALL | FIRST**

  The keyword cannot be omitted and can only be **ALL**, if a conditional clause (WHEN condition THEN) is not used. The keyword can be omitted and is **ALL** by default if a conditional clause is used. In this case, the meanings of **ALL** and **FIRST** are as follows:

  - **ALL**: Run through all branches of matching conditions and insert data into the corresponding table as long as the conditions are met.
  - **FIRST**: After finding the first branch that meets the conditions, insert the data into the table corresponding to the branch, and the check for remaining branches stops.

- **WHEN condition THEN**

  Specifies the condition judgment when inserting data into a table. The insertion is performed only when the condition is met. For conditions, refer to the columns in the subquery.

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **alias_name**

  Specifies the table alias when the INSERT statement is used without AS alias.

  NOTE

  1. When the INTO clause is used without AS alias, the table alias cannot be a keyword (such as SELECT and VALUE) or an expression. The alias must comply with the **Identifier Naming Conventions**.
  2. When the INTO clause is used without AS alias, the table alias cannot be in the INTO table_name alias_name(alias_name.col1, ...,alias_name.coln) VALUES(xxx); format.
  3. When the INTO clause is used without AS alias, data cannot be inserted into the specified partition.

- **partition_clause**

  Inserts data to a specified partition.

  ```
  PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
  SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
  ```

  For details about the keywords, see **SELECT**.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

  For details, see **CREATE TABLE SUBPARTITION**.

- **column_name**

  Specifies the name of a column in a table.

  - The column name can be qualified with a subcolumn name or array index, if needed.
  - Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.
  - The target column names **column_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
  - The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.

  Value range: an existing column

- **VALUES**

  It cannot be followed by multiple rows.

- **expression**

  Specifies an expression or a value to assign to the corresponding column.

  - If single-quotation marks **(')** are inserted into a column, the single-quotation marks need to be used for escape.
  - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.
  - Aggregate functions are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Subqueries are not supported.

- **DEFAULT**

  Specifies the default value of a column. The value is **NULL** if no specified default value has been assigned to it.

- **subquery**

  Specifies a query statement (SELECT statement) that uses query results as the inserted data and cannot be omitted. If there are no subqueries, use SELECT * FROM DUAL.

  If a subquery contains a table alias, the alias cannot be referenced in the CONDITION and INTO clauses.

Examples

- **Inserting data to multiple tables without conditions**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE insert_all_test0(c1 INT, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test1(c1 INT, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test2(c1 INT, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test3(c1 INT, c2 VARCHAR2(20));

-- Construct data.
gaussdb=# INSERT INTO insert_all_test0 VALUES(1,'a'),(2,'b'),(3,'c'),(4,'d'),(5,'e');

-- Insert data to the tables.
gaussdb=# INSERT ALL
gaussdb-# INTO insert_all_test1
gaussdb-# INTO insert_all_test1 VALUES(1,'a')
gaussdb-# INTO insert_all_test1(c1,c2)
gaussdb-# INTO insert_all_test1(c1) VALUES(1)
gaussdb-# INTO insert_all_test1(c2) VALUES('aaa')
gaussdb-# INTO insert_all_test2(c2) VALUES(c2)
gaussdb-# INTO insert_all_test2(c2) VALUES(c2||'*')
gaussdb-# INTO insert_all_test3(c1,c2) VALUES(1,'a')
gaussdb-# INTO insert_all_test3(c1,c2) VALUES(1,c2)
gaussdb-# INTO insert_all_test3(c1,c2) VALUES(c1,c2)

-- Drop the table.
gaussdb=# DROP TABLE insert_all_test0;
gaussdb=# DROP TABLE insert_all_test1;
gaussdb=# DROP TABLE insert_all_test2;
gaussdb=# DROP TABLE insert_all_test3;
```

- **Support INSERT ALL in PL/SQL.**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE insert_all_test0(c1 int, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test1(c1 int, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test2(c1 int, c2 VARCHAR2(20));
gaussdb=# CREATE TABLE insert_all_test3(c1 int, c2 VARCHAR2(20));

-- Construct data.
gaussdb=# INSERT INTO insert_all_test0 VALUES(1,'a'),(2,'b'),(3,'c'),(4,'d'),(5,'e');

-- Insert data to the tables using PL/SQL.
gaussdb=# DECLARE
gaussdb-# var1 INT := 666;
gaussdb-# var2 VARCHAR2(20) := '***';
gaussdb-# BEGIN
gaussdb$# INSERT ALL
gaussdb$# INTO insert_all_test1 VALUES(var1,var2)
gaussdb$# INTO insert_all_test1(c1) VALUES(var1)
gaussdb$# INTO insert_all_test2(c2) VALUES(var2||'???')
gaussdb$# INTO insert_all_test3(c1,c2) VALUES(c1,c2)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb$# SELECT * FROM insert_all_test0;
gaussdb$# END;
gaussdb$# /

-- Query data.
gaussdb=# SELECT * FROM insert_all_test1 ORDER BY c1,c2;

gaussdb=# DROP TABLE insert_all_test3;
```

7.12.15 L

7.12.15.1 LOAD DATA

Description

Imports data from a file to a specified table in the database.

Precautions

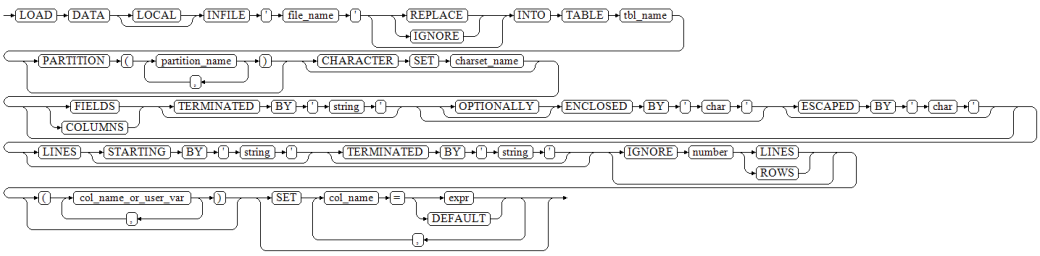
- The LOAD DATA syntax is supported only in B-compatible mode (**sql_compatibility** set to **'B'**).
- The LOAD DATA syntax is the same as that of database B only when **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s2'**.
- The GUC parameters related to the LOAD DATA syntax are the same as those of the COPY FROM syntax.
- The LOAD DATA syntax requires the INSERT and DELETE permissions on tables.
- If the data written to a table by running **LOAD DATA** cannot be converted to the data type of the table, the import fails.
- LOAD DATA applies only to tables but not views.

Syntax

```
LOAD DATA
   [LOCAL]
   INFILE 'file_name'
   [REPLACE | IGNORE]
   INTO TABLE tbl_name
   [PARTITION (partition_name [, partition_name] ...)]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[CHARACTER SET charset_name]
[{FIELDS | COLUMNS}
    [TERMINATED BY 'string']
    [[OPTIONALLY] ENCLOSED BY 'char']
    [ESCAPED BY 'char']
]
[LINES
    [STARTING BY 'string']
    [TERMINATED BY 'string']
]
[IGNORE number {LINES | ROWS}]
[(col_name_or_user_var
    [, col_name_or_user_var] ...)]
[SET col_name={expr | DEFAULT}
    [, col_name={expr | DEFAULT}] ...]
```



Parameters

- **LOCAL**

  Specifies the location of the file to be imported.

  If **LOCAL** is not specified and **file_name** is a relative path, data is imported to the data directory by default.

  If the **LOCAL** parameter is specified, **file_name** must be set to an absolute path. If **file_name** is set to a relative path, data is imported to the location of the database binary file by default, that is, *$GAUSSHOME*/**bin/**.

  NOTE

  If the imported data conflicts with the table data or the number of columns in the file is less than the number of columns in the specified table, the function of specifying **LOCAL** is the same as that of specifying **IGNORE**.

- **REPLACE | IGNORE**

  If the data to be imported conflicts with the original data in the table, specifying **REPLACE** replaces the conflicting data, and specifying **IGNORE** skips the conflicting data and continues the import. If data conflicts occur but none of **REPLACE**, **IGNORE**, or **LOCAL** is specified, the import stops and an error is reported.

  NOTE

  If the number of columns in the file is less than that in the specified table, specifying **IGNORE** or **LOCAL** will assign default values to the remaining columns. If neither **IGNORE** nor **LOCAL** is specified, an error is reported.

- **PARTITION**

  If the table to be imported is a partitioned table, this parameter specifies a partition. If the data is inconsistent with the specified partition range, an error is reported.

- **CHARACTER SET**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the encoding format of a data file. The default value is the current client-side encoding format.

- **FIELDS | COLUMNS**
  - **TERMINATED BY**

    Specifies the delimiter between columns. The default value is **\t**.

    NOTE

    The specified newline character cannot be the same as the delimiter.
  - **[OPTIONALLY] ENCLOSED BY**

    Specifies the quotation mark character. The default value is **''**.

    The **OPTIONALLY** parameter is optional and does not take effect.

    The quotation mark can only be a single character and cannot be a character string.
  - **ESCAPED BY**

    Specifies the escape character. The default value is **'\'**.

    The escape character can only be a single character and cannot be a character string.
- **LINES**
  - **STARTING BY**

    Specifies the style of the starting field in the data file to be imported.
  - **TERMINATED BY**

    Specifies the newline character style of the imported data file.
- **IGNORE**

  Specifies that the first *number* rows of the data file are skipped during data import.
- **col_name_or_user_var**

  Specifies an optional list of columns to be copied.

  Value range: any columns. All columns will be copied if no column list is specified.

  NOTE

  - The parameter for specifying columns cannot be used to specify a column repeatedly.
  - When columns are specified using the LOAD DATA syntax, **col_name_or_user_var** can be specified as existing columns or user variables. If it is specified as a user variable, the GUC parameter **b_format_behavior_compat_options** must be set to **'enable_set_variables'**.
- **SET**

  Specifies the column value, which can be an expression or **DEFAULT**.

  NOTE

  - The expression does not support column names.
  - If no implicit conversion exists between the expression result type and the type of the assigned column, an error is reported.

```

7.12.15.2 LOCK

Description

LOCK TABLE obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use LOCK if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This prevents data from being concurrently modified, ensuring that subsequent queries can read committed and persistent data. It is because the **SHARE** lock mode conflicts with the **ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

Precautions

- LOCK TABLE is useless outside a transaction block: the lock would remain held only to the completion of the statement. If LOCK TABLE is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- LOCK TABLE ... IN ACCESS SHARE MODE requires SELECT privileges on the target table. All other forms of LOCK require table-level UPDATE and/or the DELETE permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- There is no UNLOCK TABLE statement. Locks are always released at transaction end.
- LOCK TABLE only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all lock modes have the same semantics as long as LOCK TABLE is involved. The only difference lies in whether locks conflict with each other. For details about the rules, see **Table 7-259**.
- If the xc_maintenance_mode parameter is not enabled, an error is reported when an ACCESS EXCLUSIVE lock is applied for a system catalog.

Syntax

```
LOCK [ TABLE ] {[ ONLY ] name [, ...]| {name [ * ]} [, ...]}
    [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
    [ NOWAIT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Table 7-259 Lock mode conflicts

Requested Lock Mode/ Current Lock Mode	ACCESS SHARE	ROW SHARE	ROW EXCLUSIVE	SHARE UPDATE EXCLUSIVE	SHARE	SHARE ROW EXCLUSIVE	EXCLUSIVE	ACCESS EXCLUSIVE
ACCESS SHARE	-	-	-	-	-	-	-	X
ROW SHARE	-	-	-	-	-	-	X	X
ROW EXCLUSIVE	-	-	-	-	X	X	X	X
SHARE UPDATE EXCLUSIVE	-	-	-	X	X	X	X	X
SHARE	-	-	X	X	-	X	X	X
SHARE ROW EXCLUSIVE	-	-	X	X	X	X	X	X
EXCLUSIVE	-	X	X	X	X	X	X	X
ACCESS EXCLUSIVE	X	X	X	X	X	X	X	X

LOCK parameters are as follows:

- **name**

  Specifies the name (optionally schema-qualified) of an existing table to lock.

  Tables are locked one-by-one in the order specified in the LOCK TABLE statement.

  Value range: an existing table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **ONLY**

  If **ONLY** is specified, only that table is locked. If it is not specified, the table and all its sub-tables are locked.

- **ACCESS SHARE**

  Conflicts with the ACCESS EXCLUSIVE lock mode only.

  The SELECT statement acquires a lock of this mode on referenced tables. Typically, any command that reads a table without modifying it acquires this lock mode.

- **ROW SHARE**

  It conflicts with the EXCLUSIVE and ACCESS EXCLUSIVE lock modes.

  SELECT FOR UPDATE and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.

- **ROW EXCLUSIVE**

  Allows concurrent read of a table but does not allow modification of data in the table. **ROW EXCLUSIVE** is the same as **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire this lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.

- **SHARE UPDATE EXCLUSIVE**

  Protects a table against concurrent schema changes and VACUUM runs.

  The VACUUM (without FULL), ANALYZE, and CREATE INDEX CONCURRENTLY statements automatically request this lock.

- **SHARE**

  Allows concurrent queries of a table but does not allow modification of the table.

  Acquired by **CREATE INDEX** (without **CONCURRENTLY**).

- **SHARE ROW EXCLUSIVE**

  Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.

  No SQL statements automatically acquire this lock mode.

- **EXCLUSIVE**

  Allows concurrent queries of the target table but does not allow any other operations.

  This mode allows only concurrent ACCESS SHARE locks; that is, only reads from the table can proceed concurrently with a transaction holding this lock mode.

  No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

- **ACCESS EXCLUSIVE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Guarantees that the holder is the only transaction accessing the table in any way.

The ALTER TABLE, DROP TABLE, TRUNCATE and REINDEX statements automatically request this lock.

This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.

- **NOWAIT**

  Specifies that **LOCK TABLE** should not wait for any conflicting locks to be released: if the specified lock(s) cannot be acquired immediately without waiting, the transaction is aborted.

  If a table-level lock is obtained without specifying **NOWAIT** and other mutex locks exist, the system waits for other locks to be released.

Examples

- SHARE ROW EXCLUSIVE

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (
r_reason_sk         INTEGER      NOT NULL,
r_reason_id         CHAR(16)     NOT NULL,
r_reason_desc       INTEGER
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', '18'),(5,
'AAAAAAAACAAAAAAA', '362'),(7, 'AAAAAAAADAAAAAAA', '585');

-- Create a table named reason_t1.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Use the SHARE ROW EXCLUSIVE MODE lock mode to lock a table.
gaussdb=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

-- If you perform the DELETE operation on another device, the operation is blocked.
gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

-- End the transaction and release the lock.
gaussdb=# COMMIT;
```

- ROW EXCLUSIVE

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- After the UPDATE statement is executed, request a ROW EXCLUSIVE lock on the referenced table.
gaussdb=# UPDATE tpcds.reason_t1 SET r_reason_desc=180 WHERE r_reason_sk=1;

-- When the ALTER TABLE statement is executed on another device, the operation is blocked.
gaussdb=# ALTER TABLE tpcds.reason_t1 ADD r_reason_asc int;

-- End the transaction and release the lock.
gaussdb=# COMMIT;
```

- ACCESS EXCLUSIVE

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- After the TRUNCATE statement is executed, request an ACCESS EXCLUSIVE lock on the referenced
table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# TRUNCATE tpcds.reason_t1;

-- When the SELECT statement is executed on another device, the operation is blocked.
gaussdb=# SELECT * FROM tpcds.reason_t1;

-- End the transaction and release the lock.
gaussdb=# COMMIT;

-- Drop the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Drop the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Drop a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

7.12.15.3 LOCK BUCKETS

Description

Bucket-based lock.

Precautions

The current version does not support this syntax.

7.12.16 M

7.12.16.1 MARK BUCKETS

Description

Used by the scale-out tool to notify the kernel of the buckets that have been migrated.

Precautions

The current version does not support this syntax.

7.12.16.2 MERGE INTO

Description

MERGE INTO conditionally matches data in a target table with that in a source table. If data matches, UPDATE is executed on the target table; if data does not match, INSERT is executed. You can use this syntax to run UPDATE and INSERT at a time for convenience.

Precautions

You have the INSERT and UPDATE permissions for the target table and the SELECT permission for the source table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [ partition_clause ] [ [ AS ] alias ]
USING { { table_name | view_name } | subquery } [ [ AS ] alias ]
ON ( condition )
[
  WHEN MATCHED THEN
  UPDATE SET { column_name = { expression | subquery | DEFAULT } |
         ( column_name [, ...] ) = ( { expression | subquery | DEFAULT } [, ...] ) } [, ...]
  [ WHERE condition ]
]
[
  WHEN NOT MATCHED THEN
  INSERT { DEFAULT VALUES |
  [ ( column_name [, ...] ) ] VALUES ( { expression | subquery | DEFAULT } [, ...] ) [, ...] [ WHERE condition ] }
];
```

Format of **partition_clause**:

```
PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
```

Parameters

- plan_hint clause

  Follows the MERGE keyword in the **/*+ */** format. It is used to optimize the plan of a MERGE statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- INTO clause

  Specifies the target table that is being updated or has data being inserted.

- **table_name**

  Specifies the name of the target table.

- **partition_clause**

  Performs MERGE operations on a specified partition.

  For details about the keywords, see **SELECT**.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

  For details, see **CREATE TABLE SUBPARTITION**.

- **alias**

  Specifies the alias of the target table.

  Value range: a string. It must comply with the **naming convention**.

- USING clause

  Specifies the source table, which can be a table, view, or subquery.

- ON clause

  Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.

- WHEN MATCHED clause

  Performs UPDATE if data in the source table matches that in the target table based on the condition.

  System catalogs and system columns cannot be updated.

- WHEN NOT MATCHED clause

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Performs INSERT if data in the source table does not match that in the target table based on the condition.

An INSERT clause cannot contain multiple VALUES.

The order of WHEN MATCHED and WHEN NOT MATCHED clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two WHEN MATCHED or WHEN NOT MATCHED clauses cannot be specified at the same time.

- **DEFAULT**

  Specifies the default value of a column.

  The value is **NULL** if no default value is assigned to it.

- **WHERE condition**

  Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
gaussdb=# CREATE TABLE products
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
gaussdb=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

gaussdb=# CREATE TABLE newproducts
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
gaussdb=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
gaussdb=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
  UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
  INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
gaussdb=# SELECT * FROM products ORDER BY product_id;
 product_id |  product_name  | category
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------+----------------+-----------
      1501 | vivitar 35mm   | electrncs
      1502 | olympus camera | electrncs
      1600 | play gym       | toys
      1601 | lamaze         | toys
      1666 | harry potter   | toys
      1700 | wait interface | books
(6 rows)

-- Delete the table.
gaussdb=# DROP TABLE products;
gaussdb=# DROP TABLE newproducts;
```

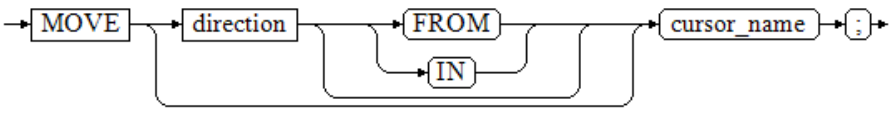
7.12.16.3 MOVE

Description

MOVE repositions a cursor without retrieving any data. MOVE works exactly like the **FETCH** statement, except MOVE only repositions the cursor and does not return rows.

Syntax

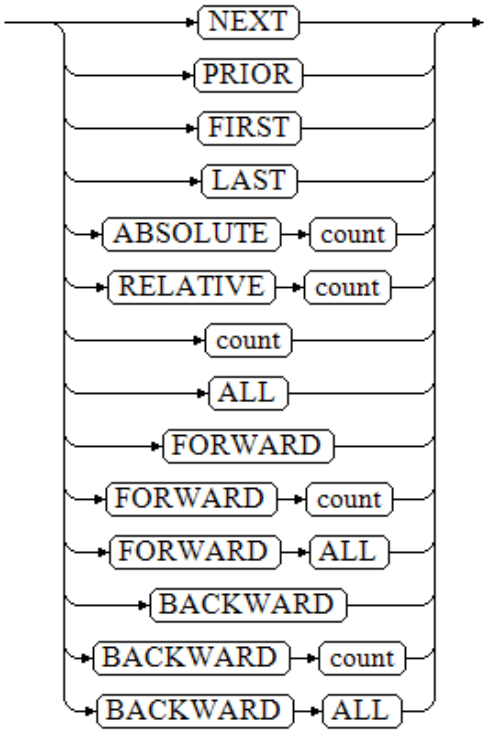
```
MOVE [ direction [ FROM | IN ] ] cursor_name;
```



The direction clause specifies optional parameters.

```
NEXT
  | PRIOR
  | FIRST
  | LAST
  | ABSOLUTE count
  | RELATIVE count
  | count
  | ALL
  | FORWARD
  | FORWARD count
  | FORWARD ALL
  | BACKWARD
  | BACKWARD count
  | BACKWARD ALL
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

The parameters of MOVE and FETCH are the same. For details, see **Parameters** in "FETCH."

NOTE

On successful completion, a MOVE statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a FETCH statement with the same parameters would have returned (possibly zero).

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,20));

-- Set up cursor1.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the MOVE command to move the cursor backwards by five rows. No result is returned.
gaussdb=# MOVE FORWARD 5 FROM cursor1;
MOVE 5

-- Run the FETCH command to retrieve two rows of data.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 c1
----
  6
  7
(2 rows)

-- Close the cursor and end the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop.
gaussdb=# DROP TABLE tbl_test;
```

Helpful Links

CLOSE and **FETCH**

7.12.17 P

7.12.17.1 PREDICT BY

Description

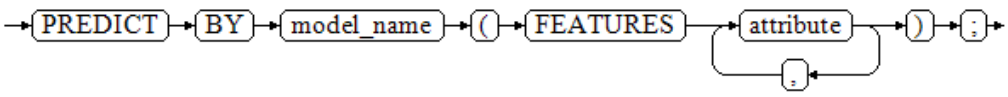
Uses a trained model to perform prediction tasks.

Precautions

The name of the called model can be viewed in the gs_model_warehouse system catalog.

Syntax

```
PREDICT BY model_name (FEATURES attribute [, attribute]...);
```



Parameters

- **model_name**

  Name of the model of a speculative task.

  Value range: a string. It must comply with the **naming convention**.

- **attribute**

  Name of the input feature column of a speculative task.

  Value range: a string. It must comply with the **naming convention**.

Examples

```
-- Create a data table.
gaussdb=# CREATE TABLE houses (
id INTEGER,
tax INTEGER,
bedroom INTEGER,
bath DOUBLE PRECISION,
price INTEGER,
size INTEGER,
lot INTEGER,
mark text
);

-- Insert training data.
gaussdb=# INSERT INTO houses(id, tax, bedroom, bath, price, size, lot, mark) VALUES
(1,590,2,1,50000,770,22100,'a+'),
(2,1050,3,2,85000,1410,12000,'a+'),
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(3,20,2,1,22500,1060,3500,'a-'),
(4,870,2,2,90000,1300,17500,'a+'),
(5,1320,3,2,133000,1500,30000,'a+'),
(6,1350,2,1,90500,850,25700,'a-'),
(7,2790,3,2.5,260000,2130,25000,'a+'),
(8,680,2,1,142500,1170,22000,'a-'),
(9,1840,3,2,160000,1500,19000,'a+'),
(10,3680,4,2,240000,2790,20000,'a-'),
(11,1660,3,1,87000,1030,17500,'a+'),
(12,1620,3,2,118500,1250,20000,'a-'),
(13,3100,3,2,140000,1760,38000,'a+'),
(14,2090,2,3,148000,1550,14000,'a-'),
(15,650,3,1.5,65000,1450,12000,'a-');

-- Train the model.
gaussdb=# CREATE MODEL price_model USING logistic_regression
 FEATURES size, lot
 TARGET mark
 FROM HOUSES
 WITH learning_rate=0.88, max_iterations=default;

-- Predict.
gaussdb=# SELECT id, PREDICT BY price_model (FEATURES size,lot) FROM houses;

-- Delete the model.
gaussdb=# DROP MODEL price_model;

-- Delete the table.
gaussdb=# DROP TABLE houses;
```

Helpful Links

CREATE MODEL and **DROP MODEL**

7.12.17.2 PREPARE

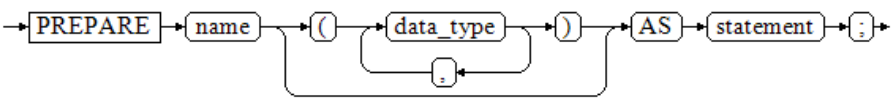
Description

Creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the PREPARE statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly calling **DEALLOCATE** or automatically deleted when the session ends.

Syntax

```
PREPARE name [ ( data_type [, ...] ) ] AS statement;
```



Parameters

- **name**

  Specifies the name of a prepared statement. It must be unique in the session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **data_type**

  Specifies the type of an argument.

- **statement**

  Specifies a SELECT, INSERT, UPDATE, DELETE, MERGE INTO, or VALUES statement.

Examples

See **Examples**.

Helpful Links

DEALLOCATE and **EXECUTE**

7.12.17.3 PREPARE TRANSACTION

Description

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.
- When running the **PREPARE TRANSACTION** statement, increase the value of **max_prepared_transactions** in configuration file **gaussdb.conf**. You are advised to set it to a value not less than that of **max_connections** so that one pending prepared transaction is available for each session.

Syntax

```
PREPARE TRANSACTION transaction_id;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **transaction_id**

  Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

  Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

Examples

```
-- Start a transaction.
gaussdb=# BEGIN;
BEGIN

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';
PREPARE TRANSACTION

-- Cancel the transaction whose identifier is trans_test.
gaussdb=# ROLLBACK PREPARED 'trans_test';
ROLLBACK PREPARED
```

COMMIT PREPARED and **ROLLBACK PREPARED**

7.12.17.4 PURGE

Description

The **PURGE** statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.
- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

Precautions

- The PURGE operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the PURGE operation are as follows:
  - **PURGE TABLE**: The user must be the owner of the table and must have the USAGE permission on the schema to which the table belongs. When the separation of duties is disabled, system administrators have this permission by default.
  - **PURGE INDEX**: The user must be the owner of the index and have the USAGE permission on the schema to which the index belongs. When the separation of duties is disabled, system administrators have this permission by default.
  - **PURGE RECYCLEBIN**: Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the USAGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

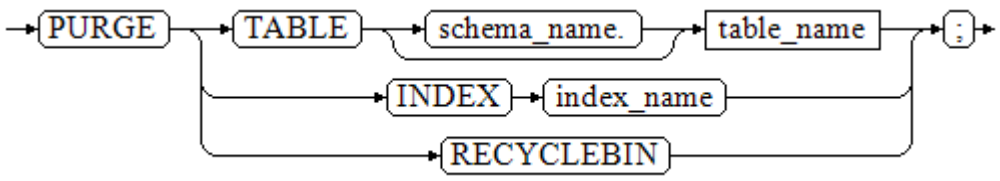
permission of the schema to which the objects belong. When the separation of duties is disabled, system administrators can clear all objects in the recycle bin by default.

Prerequisites

- The **enable_recyclebin** parameter has been enabled to enable the recycle bin. Contact an administrator for details about how to use the parameter.
- The **recyclebin_retention_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact an administrator for details about how to use the parameter.

Syntax

```
PURGE { TABLE [schema_name.]table_name
      | INDEX index_name
      | RECYCLEBIN
    };
```



Parameters

- **schema_name**

  Specifies the schema name.

- **TABLE [schema_name.] table_name**

  Clears a specified table in the recycle bin. The table can be schema-qualified.

- **INDEX index_name**

  Clears a specified index in the recycle bin.

- **RECYCLEBIN**

  Clears all objects in the recycle bin.

Examples

```
-- Create the reason_t1 table.
gaussdb=# CREATE TABLE reason_t1(
    r_reason_sk     integer,
    r_reason_id     character(16),
    r_reason_desc   character(100)
) WITH(STORAGE_TYPE = ustore);

-- Create the reason_t2 table.
gaussdb=# CREATE TABLE reason_t2(
    r_reason_sk     integer,
    r_reason_id     character(16),
    r_reason_desc   character(100)
) WITH(STORAGE_TYPE = ustore);

-- Add indexes to the reason_t1 and reason_t2 tables.
gaussdb=#  CREATE INDEX idx_t1 on reason_t1(r_reason_id);
gaussdb=#  CREATE INDEX idx_t2 on reason_t2(r_reason_id);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=#  DROP TABLE reason_t1;
gaussdb=#  DROP TABLE reason_t2;

-- View the recycle bin.
gaussdb=#  SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
          rcyname           | rcyoriginname | rcytablespace
----------------------------+---------------+---------------
 BIN$31C94EB4207$8001$0==$0 | reason_t1     |             0
 BIN$31C94EB420D$8001$0==$0 | idx_t1        |             0
 BIN$31C94EB420A$8004$0==$0 | reason_t2     |             0

```

7.12.18 R

7.12.18.1 REASSIGN OWNED

Description

Changes the owner of the database object.

REASSIGN OWNED changes the database object owner of an old role to a new role.

Precautions

- REASSIGN OWNED is often executed before role deletion.
- To run the REASSIGN OWNED statement, you must have the permissions of the original and target roles.

Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **old_role**

  Specifies the role name of the old owner.

- **new_role**

  Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

Examples

```
-- Create the test_jim and test_tom users.
gaussdb=# CREATE USER test_jim PASSWORD '********';
gaussdb=# CREATE USER test_tom PASSWORD '********';

-- View the user with the same name as owner of the automatically created schema.
gaussdb=# \dn test*
   List of schemas
   Name   |  Owner
----------+----------
 test_jim | test_jim
 test_tom | test_tom
(2 rows)

-- Change the owner of all database objects owned by test_jim to test_tom.
gaussdb=# REASSIGN OWNED BY test_jim TO test_tom;

-- View the schema information. The owner of the test_jim schema is changed to test_tom.
gaussdb=# \dn test*
   List of schemas
   Name   |  Owner
----------+----------
 test_jim | test_tom
 test_tom | test_tom
(2 rows)

-- Delete the test_jim and test_tom users.
gaussdb=# DROP USER test_jim, test_tom CASCADE;
```

Helpful Links

DROP OWNED

7.12.18.2 REFRESH INCREMENTAL MATERIALIZED VIEW

Description

REFRESH INCREMENTAL MATERIALIZED VIEW refreshes a materialized view in incremental mode.

Precautions

- Incremental refresh supports only fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- View the fast-refresh materialized view.
gaussdb=# SELECT * FROM my_imv;
 c1 | c2
----+----
  1 |  1
  2 |  2
(2 rows)

-- Delete the fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

7.12.18.3 REFRESH MATERIALIZED VIEW

Description

REFRESH MATERIALIZED VIEW refreshes materialized views in complete-refresh mode.

Precautions

- Full refreshing can be performed on both complete- and fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete the fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

7.12.18.4 REINDEX

Description

Rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which REINDEX can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.
- An index build with the **CONCURRENTLY** option failed, leaving an "invalid" index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- REINDEX DATABASE and REINDEX SYSTEM cannot be performed in transaction blocks. Currently, REINDEX operations cannot be performed on materialized views.
- If the index contains the **lpi_parallel_method** option and the value is **PARTITION**, and the **parallel_workers** value of the index's table is greater than 0, the index cannot be rebuilt in parallel. If the index does not contain the **lpi_parallel_method** option or the value of the option is set to **AUTO**, page-level parallel index is rebuilt by default. For details, see **LPI_PARALLEL_METHOD**.
- UGINs cannot be rebuilt online or parallelly.
- When REINDEX CONCURRENTLY is used to rebuild indexes online, the index sequence in the table changes, and the query plan may change.

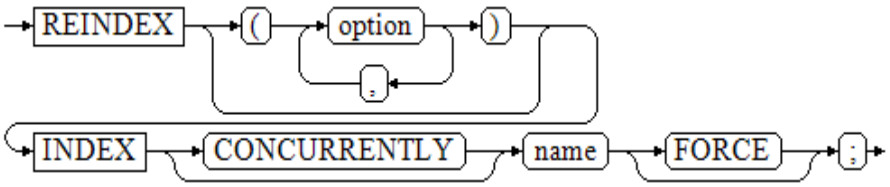
Syntax

- Rebuild an ordinary index.

```
REINDEX { INDEX | [INTERNAL] TABLE | DATABASE | SYSTEM } [ CONCURRENTLY ] name [ FORCE ];
```

- Rebuild the index and convert the type.

```
REINDEX [ ( option [, ...] ) ] { INDEX } [ CONCURRENTLY ] name [ FORCE ];
```



- Rebuild an index partition.

```
REINDEX { INDEX | [INTERNAL] TABLE } name
    PARTITION partition_name [ FORCE ];
```

Parameters

- **INDEX**

  Rebuilds the specified index.

- **TABLE**

  Rebuilds all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index on the table has been invalidated by running **alter unusable**, the index cannot be rebuilt. Indexes in the TOAST table cannot be rebuilt when specifying the CONCURRENTLY option.

- **DATABASE**

  Rebuilds all indexes within the current database. Indexes in the TOAST table within the current database cannot be rebuilt when specifying the CONCURRENTLY option.

- **SYSTEM**

  Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.

- **option**

  Currently, only **CROSSBUCKET** is supported, and the value can only be **ON** or **OFF**. This parameter is used to determine whether the index of a hash bucket

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

table is converted to a cross-bucket index (CBI) or local-bucket index (LBI). This conversion supports only the indexes on a distributed hash bucket table and does not support GSIs.

- **CONCURRENTLY**

  Rebuilds an index (with ShareUpdateExclusiveLock) in non-blocking DML mode. When an index is rebuilt, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the recreation. Indexes in system catalogs cannot be rebuilt online. REINDEX INTERNAL TABLE CONCURRENTLY, REINDEX SYSTEM CONCURRENTLY, and REINDEX INVALID INDEX CONCURRENTLY are not supported. When REINDEX DATABASE CONCURRENTLY is executed, all indexes on user tables in the current database are rebuilt online (indexes on system catalogs are not processed). REINDEX CONCURRENTLY cannot be executed within a transaction. Online index rebuilding supports only B-tree and UB-tree indexes, ordinary indexes, global indexes, and local indexes. PCR UB-tree indexes, level-2 partitions, and GSIs are not supported. Online parallel index rebuilding supports only ordinary indexes, global indexes, and local indexes of Astore and Ustore. Other online index rebuilding specifications are inherited from the current version. If online index rebuilding fails, the system automatically clears new indexes to prevent resource occupation in scenarios such as manual cancellation, duplicate unique index key values, insufficient resources, thread startup failure, and lock timeout. If the system cannot automatically clear invalid new indexes (for example, the database breaks down, FATAL, or PANIC), you need to manually clear invalid new indexes (using the DROP INDEX statement) and temporary tables (using the DROP TABLE statement) as soon as possible to prevent more resources from being occupied. Generally, the extension of an invalid index name is **_ccnew**. The execution of REINDEX INDEX CONCURRENTLY adds a four-level session lock to the table and its first several phases are similar to those of CREATE INDEX CONCURRENTLY. Therefore, the execution may be suspended or deadlocked, which is similar to that of CREATE INDEX CONCURRENTLY. For example, if two sessions perform the REINDEX CONCURRENTLY operation on the same index or table at the same time, a deadlock occurs. For details, see **CONCURRENTLY**.

  NOTE

  This keyword is specified when an index is rebuilt. For Astore, you need to complete two full table scans for building. During the first scan, a new index is created without blocking read and write operations. During the second scan, the changes in the first scan are merged and updated. For Ustore, you need to complete a full table scan. During the scan, data generated by concurrent DML operations is inserted into the temporary table named **index_oid_cctmp**. After the scan is complete, you merge the temporary table to the new index suffixed with **_ccnew{n}**, delete the temporary table, exchange the old and new indexes, mark the old index as dead, enable the new index, and rebuild the index.

- **name**

  Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.

  NOTE

  REINDEX DATABASE and **SYSTEM** can create indexes for only the current database. Therefore, **name** must be the same as the current database name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **FORCE**

  Deprecated parameter. It is currently reserved for compatibility with earlier versions.

- **partition_name**

  Name of the index or table to be reindexed.

  Value range:

  – The name of an index is specified if REINDEX INDEX is used.
  – The name of a table is specified if REINDEX TABLE is used.

NOTICE

REINDEX DATABASE and REINDEX SYSTEM cannot be performed in transaction blocks.

Examples

```
-- Create the table tbl_test and insert data into the tables.
gaussdb=# CREATE TABLE tbl_test(c1 int,c2 varchar);
gaussdb=# INSERT INTO tbl_test VALUES (1, 'AAAAAAA'),(5, 'AAAAAAB'),(10, 'AAAAAAC');

-- Create an index and check the index size.
gaussdb=# CREATE INDEX idx_test_c1 ON tbl_test(c1);
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
 size
-------
 64 kB
(1 row)

-- Insert 10,000 data records and then delete the data. It is found that the index becomes larger.
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,10000),'test');
gaussdb=# DELETE FROM tbl_test WHERE c2 = 'test';
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
  size
--------
 376 kB
(1 row)

-- After an independent index is rebuilt, the index size is restored to the initial size.
gaussdb=# REINDEX INDEX idx_test_c1;
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
 size
-------
 64 kB
(1 row)

-- Rebuild a single index online.
gaussdb=# REINDEX INDEX CONCURRENTLY idx_test_c1;

-- Rebuild all indexes in the table tbl_test.
gaussdb=# REINDEX TABLE tbl_test;

-- Rebuild all indexes in the table tbl_test online.
gaussdb=# REINDEX TABLE CONCURRENTLY tbl_test;

-- Drop the tbl_test table.
gaussdb=# DROP TABLE tbl_test;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Suggestions

- INTERNAL TABLE

  This scenario is used for fault recovery. You are advised not to perform concurrent operations.
- DATABASE

  You are not allowed to reindex databases in transactions.
- SYSTEM

  You are not allowed to reindex system catalogs in transactions.

7.12.18.5 RELEASE SAVEPOINT

Description

RELEASE SAVEPOINT destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use ROLLBACK TO SAVEPOINT. Destroying a savepoint when it is no longer needed allows the system to recycle some resources earlier than transaction end.

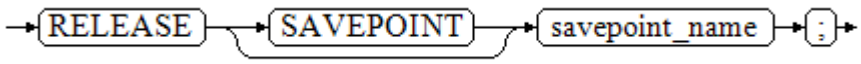
RELEASE SAVEPOINT also destroys all savepoints that were established after the named savepoint was established.

Precautions

- Releasing a savepoint name that was not previously defined will cause an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name;
```



Parameters

- **savepoint_name**

  Specifies the name of the savepoint to be destroyed.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.table1(a int);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (3);

-- Establish a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Query the table content, which should contain both 3 and 4.
gaussdb=# SELECT * FROM tpcds.table1;
 a
---
 3
 4
(2 rows)

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content again. You can see 3 and 4 at the same time.
gaussdb=# SELECT * FROM tpcds.table1;
 a
---
 3
 4
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE tpcds.table1;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

Helpful Links

SAVEPOINT and **ROLLBACK TO SAVEPOINT**

7.12.18.6 RENAME TABLE

Description

In the same statement, changing the name of a single table or multiple tables does not affect the stored data.

Precautions

- When the name of a single table is changed, this syntax is equivalent to RENAME in ALTER TABLE.
- Changing the names of multiple tables is equivalent to running **ALTER TABLE** for multiple times. However, changing the names of local and non-local temporary tables at the same time is not supported.

Syntax

```
RENAME { TABLE | TABLES } table_name TO new_table_name [, table_name2 TO new_table_name2, ...];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If you run this command in a version 5.7 B-compatible database (**sql_compatibility** set to **'B'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s2'**), the following situations may occur:

- If the new table name starts with "#MySQL50#" and is followed by other characters, "#MySQL50#" will be ignored.
- If the old and new table names are the same, no error is reported.

Parameters

- **TABLE | TABLES**

  TABLE and TABLES can be used interchangeably, regardless of the number of tables operated in the statement.

- **table_name TO new_table_name [, table_name2 TO new_table_name2, ...]**

  table_name and **table_name2** indicate the names of the tables to be modified.

  new_table_name and **new_table_name2** indicate the new table names.

  TO is the connection word.

Examples

- Rename a single table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# RENAME TABLE aa TO test_alt1;
gaussdb=# DROP TABLE test_alt1;
```

- Rename multiple tables.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# CREATE TABLE bb(c1 int, c2 int);
gaussdb=# RENAME TABLE aa TO test_alt1, bb TO test_alt2;
gaussdb=# DROP TABLE test_alt1,test_alt2;
```

Helpful Links

ALTER TABLE

7.12.18.7 REPLACE

Description

Inserts data into a table or replaces existing data in a table. If the data to be inserted has the primary key or unique key conflicts with the existing data, the REPLACE statement deletes the existing data and then inserts the new data.

You can use REPLACE in the following ways:

- Replace or insert values. That is, VALUES or VALUE is used to construct a row of records and insert the row into the table.
- Replace or insert the query. One or more rows of records are constructed based on the result set returned by SELECT and inserted into a table.
- Set the value of a specified column. Similar to value insertion, the default value is used for columns that are not specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- To execute this statement, you must have the DELETE and INSERT permissions on the table.
- If the primary key or unique key does not conflict, you can directly insert the data. If the primary key or unique key conflicts, delete the original data and then insert the new data.
- The return format of the REPLACE operation is **REPLACE 0** *X*, where *X* indicates the number of DELETE and INSERT operations.
- In the REPLACE...SELECT syntax, the number of columns in **select_list** must be the same as the number of columns to be inserted.
- In the REPLACE...SET syntax:
  - If **col_name** has a default value, **SET col_name = col_name + 1** is equivalent to **SET col_name =** *Default value of col_name* **+ 1**.
  - If **col_name** has neither default value nor NOT NULL constraint, **SET col_name = col_name + 1** is equivalent to **col_name = NULL**.
  - If **col_name** does not have a default value but has a NOT NULL constraint, the data types that support a default value are timestamp, timestamp with time zone, time, time with time zone, interval, tinterval, smalldatetime, date, uuid, name, point, polygon, circle, lseg, box, json, jsonb, xml, varbit, numeric, cidr, inet, macaddr, numrange, int8range, int4range, tsrange, tstzrange, daterange, hash16, hash32, bool, bytea, char, bigint, int, smallint, tinyint, text, raw, blob, clob, float4, float8, abstime, reltime, bpchar, varchar, nvarchar, money, uint1, uint2, uint4, uint8, set, and enum. The default values are described in the following table.

Table 7-260

Data Type	Default Value of col_name
int8, int4, int2, int1, float8, float4, numeric, uint1, uint2, uint4, and uint8	**0**. If **numeric** specifies a decimal place, the decimal place is displayed. For example, **NUMERIC (10, 3): 0.000**
text, clob, bpchar, varchar, char, nvarchar2, name, blob, raw, and varbit	Empty string.
numrange, int8range, int4range, tsrange, tstzrange, and daterange	empty
bytea	\x
money	$0.00
json, jsonb, and xml	'null'
macaddr	00:00:00:00:00:00
inet	0.0.0.0
cidr	0.0.0.0/32

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data Type	Default Value of col_name
point	(0,0)
lseg	[(0,0),(0,0)]
box	(0,0),(0,0)
path	((0,0))
polygon	((0,0))
circle	<(0,0),0>
uuid	00000000-0000-0000-0000-000000000000
hash16	0000000000000000
hash32	00000000000000000000000000000000
bool	f
abstime	abstime '1970-01-01 00:00:00'
reltime	reltime '00:00:00'
interval	interval '00:00:00'
tinterval	tinterval(abstime '1970-01-01 00:00:00', abstime '1970-01-01 00:00:00')
timestamp	timestamp '1970-01-01 00:00:00'
timestamp with time zone	timestamptz '1970-01-01 00:00:00'
date	date '1970-01-01'
time	time '00:00:00'
time with time zone	timetz '00:00:00'
smalldatetime	smalldatetime '1970-01-01 00:00:00'

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The default value of the enumerated type (ENUM) is the first element. If the first element does not exist, **NULL** is returned.
- The SET data type is supported only when **sql_compatibility** is set to **'B'**. The default value is an empty string.
- When **sql_compatibility** is set to **'A'**, an empty string of the text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, or byteawithoutordercol type is equivalent to **NULL**. If a column has a NOT NULL constraint, an error is reported when a reference column is used to insert data into a table.
- When **sql_compatibility** is set to **'B'**, if **b_format_version** is set to **'5.7'**, **b_format_dev_version** is set to **'s1'**, and **sql_mode** does not contain **strict_tans_tables**, **only_full_group_by**, **no_zero_in_date**, **no_zero_date**, or **error_for_division_by_zero**, then the default values of **timestamp** and **datetime** are **0000-00-00 00:00:00**, and the default value of **DATE** is **0000-00-00** under the NOT NULL constraint.
- The uint1, uint2, uint4, and uint8 data types are supported only when **sql_compatibility** is set to **'B'**.
- If the default value of the function expression can be calculated during parsing, the default value is the calculated constant. Otherwise, the value is **NULL**.
- In other scenarios, the default value is **NULL**.

- In the REPLACE... SET syntax, the current **col_name** value depends on the previous **col_name** value. If there is no previous **col_name** value, the default value is used. For example, in the **SET f1 = f1 + 1, f2 = f1** scenario, **f1** is equal to the default value of **f1** (assumed to **0**) plus 1, and **f2** is equal to the calculated value of **f1**, that is **1**.
- Triggers are supported. The execution sequence of triggers is determined by the actual execution process.
  - Executing INSERT will trigger the BEFORE INSERT and AFTER INSERT triggers.
  - Executing DELETE will trigger the BEFORE DELETE and AFTER DELETE triggers.
- The UNIQUE constraint or primary key of DEFERRABLE is not supported.
- If a table has multiple UNIQUE constraints and the inserted data violates multiple UNIQUE constraints, all the data that violates the constraints is deleted and new data is inserted. In this scenario, data may be deleted by mistake. Therefore, exercise caution when performing this operation.
- If multiple rows are inserted and these rows have UNIQUE constraint conflicts with data in the same row in the table, the REPLACE operation is performed in sequence.
- In **SET col_name = col_name + 1**, the length of **col_name** cannot exceed 1. For example, in **SET col_name = table_name.col_name + 1**, the length of **table_name.col_name** is 2. Formats such as B.A, C.B.A, and D.C.B.A are not supported.
- When comparing floating-point data, note that precision loss may occur.
- If a row-level security policy is created on a table, REPLACE INTO is not supported.
- Foreign tables are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Encrypted tables are not supported.
- Memory tables are not supported.

Syntax

- Replace or insert values.

```
REPLACE [ INTO ] table_name
   [ PARTITION ( partition_name [, ... ] ) ]
   [ ( col_name [, ... ] ) ]
   { VALUES | VALUE } ( value [, ... ] ) [, ... ];

-- The format of value is as follows:
{ expression | DEFAULT }
```

- Replace or insert the query.

```
REPLACE [ INTO ] table_name
   [ PARTITION ( partition_name [, ... ] ) ]
   [ ( col_name [, ... ]) ]
   query;
```

- Set the value of a specified column.

```
REPLACE [ INTO ] table_name
   [ PARTITION ( partition_name [, ... ] ) ]
   SET col_name = value [, ... ];

-- The format of value is as follows:
{ expression | DEFAULT }
```

Parameters

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name.

- **col_name**

  Specifies the name of a column in a table.

  - The column name can be qualified with a subcolumn name or array index, if needed.
  - Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.
  - The target column names (specified by **col_name**) can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
  - The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.

  Value range: name of an existing column.

- **PARTITION (partition_name [, ...])**

  Inserts data to a specified partition. **partition_name** indicates the partition name.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **value**

  Specifies the value to be inserted. The value format is as follows:

  ```
  { expression | DEFAULT }
  ```

  a. **expression** indicates that a valid expression or value is assigned to the corresponding column.

     If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.

     If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

  b. **DEFAULT** indicates the default value of the corresponding column name. The value is **NULL** if no default value is assigned to it.

- **query**

  Specifies a query statement (SELECT statement) whose result is used as the data to be inserted.

Examples

```
-- Create table test.
gaussdb=# CREATE TABLE test(f1 int primary key, f2 int, f3 int);

-- Insert three data records.
gaussdb=# INSERT INTO test VALUES(1, 1, 1), (2, 2, 2), (3, 3, 3);
INSERT 0 3

-- Replace or insert values.
gaussdb=# REPLACE INTO test VALUES(1, 11, 11);
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 1;
 f1 | f2 | f3
----+----+----
  1 | 11 | 11
(1 row)

-- Replace or insert the query.
gaussdb=# REPLACE INTO test SELECT 2, 22, 22;
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 2;
 f1 | f2 | f3
----+----+----
  2 | 22 | 22
(1 row)

-- Replace or insert the specified column.
gaussdb=# REPLACE INTO test SET f1 = f1 + 3, f2 = f1 * 10 + 3, f3 = f2;
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 3;
 f1 | f2 | f3

7.12.18.8 RESET

Description

RESET restores GUC parameters to their default values. The default values are parameter default values complied in the **gaussdb.conf** configuration file.

RESET is an alternative spelling for:

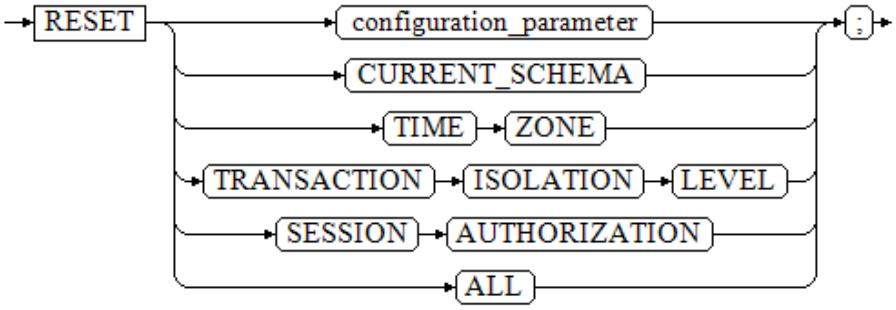
```
SET configuration_parameter TO DEFAULT;
```

Precautions

RESET and SET have the same transaction behavior. Their impact will be rolled back.

Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME ZONE | TRANSACTION ISOLATION LEVEL |
SESSION AUTHORIZATION | ALL };
```



Parameters

- **configuration_parameter**

  Specifies the name of a GUC parameter.

  Value range: GUC parameters. You can view them by running the **SHOW ALL** statement.
- **CURRENT_SCHEMA**

  Specifies the current schema.
- **TIME ZONE**

  Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**

  Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**

  Specifies the session authorization.
- **ALL**

  Resets all GUC parameters to default values.

Examples

```
-- Set the time zone to Italy.
gaussdb=# SET timezone TO 'Europe/Rome';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- View the current time zone.
gaussdb=# SHOW timezone;
  TimeZone
-------------
 Europe/Rome
(1 row)

-- Set the time zone to the default value.
gaussdb=# RESET timezone;
-- View the current time zone.
gaussdb=# SHOW timezone;
 TimeZone
----------
 PRC
(1 row)

-- The preceding SQL statement is equivalent to the following two SQL statements. Set the time zone to the default value.
gaussdb=# SET timezone TO DEFAULT;
gaussdb=# ALTER SESSION SET timezone to DEFAULT;
```

Helpful Links

SET and **SHOW**

7.12.18.9 REVOKE

Description

Revokes permissions from one or more roles.

Precautions

If a non-owner user of an object attempts to REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the REVOKE ALL PRIVILEGES form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.
- If the **ON DATABASE** option is specified when the REVOKE statement is executed in a PDB, only the CREATE permission of the PDB (used for schemas in the PDB) can be revoked. The REVOKE statement cannot be executed for a PDB in a non-PDB.

Syntax

- Revoke the permission on a specified table or view.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT | INDEX | VACUUM }[, ...]
    | ALL [ PRIVILEGES ] }
    ON { [ TABLE ] table_name [, ...]
        | ALL TABLES IN SCHEMA schema_name [, ...] }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified field in a table.

```
REVOKE [ GRANT OPTION FOR ]
  { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )}[, ...]
  | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
  ON [ TABLE ] table_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified sequence. The **LARGE** field is optional. The recycling statement does not distinguish whether the sequence is LARGE.

```
REVOKE [ GRANT OPTION FOR ]
  { { SELECT | UPDATE | ALTER | DROP | COMMENT }[, ...]
  | ALL [ PRIVILEGES ] }
  ON { [ [ LARGE ] SEQUENCE ] sequence_name [, ...]
    | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified database.

```
REVOKE [ GRANT OPTION FOR ]
  { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
  | ALL [ PRIVILEGES ] }
  ON DATABASE database_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified domain.

```
REVOKE [ GRANT OPTION FOR ]
  { USAGE | ALL [ PRIVILEGES ] }
  ON DOMAIN domain_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified CMK.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
  ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified CEK.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
  ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified directory.

```
REVOKE [ GRANT OPTION FOR ]
  { { READ | WRITE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON DIRECTORY directory_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external data source.

```
REVOKE [ GRANT OPTION FOR ]
  { USAGE | ALL [ PRIVILEGES ] }
  ON FOREIGN DATA WRAPPER fdw_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external server.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON FOREIGN SERVER server_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
REVOKE [ GRANT OPTION FOR ]
    { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
       | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [ GRANT OPTION FOR ]
    { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON { PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
       | ALL PROCEDURE IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [ GRANT OPTION FOR ]
  { USAGE | ALL [ PRIVILEGES ] }
    ON LANGUAGE lang_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified schema.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON SCHEMA schema_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TABLESPACE tablespace_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified type.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TYPE type_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a package object.

```
REVOKE [ GRANT OPTION FOR ]
  { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
  ON PACKAGE package_name [, ...]
  FROM {[GROUP] role_name | PUBLIC} [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke permissions from a role.

```
REVOKE [ ADMIN OPTION FOR ]
    role_name [, ...] FROM role_name [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the SYSADMIN permission from a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ ADMIN OPTION FOR ]
  { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
TABLE | UPDATE ANY TABLE |
  DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
  CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY
TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |
  SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER | DROP ANY TRIGGER
} [, ...]
  FROM [ GROUP ] role_name [, ...];
```

- Revoke the permission on database links.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
REVOKE { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK FROM role_name;
```

> **NOTE**
>
> For details about database links, see **DATABASE LINK**.

- Revoke the permission on PUBLIC synonyms.
  ```
  REVOKE { CREATE | DROP } PUBLIC SYNONYM FROM role_name;
  ```
  Built-in roles (gs_role_public_synonym_create and gs_role_public_synonym_drop) can also be used to revoke the permission on PUBLIC synonyms.
  - Revoke the permission to create PUBLIC synonyms.
    ```
    REVOKE gs_role_public_synonym_create FROM role_name;
    ```
  - Revoke the permission to delete PUBLIC synonyms.
    ```
    REVOKE gs_role_public_synonym_drop FROM role_name;
    ```

Parameters

The keyword PUBLIC indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see **Parameters** in section "GRANT".

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to PUBLIC users. Therefore, revoking the SELECT permission on an object from PUBLIC users does not necessarily mean that the SELECT permission on the object has been revoked from all roles, because the SELECT permission directly granted to roles and inherited from parent roles remains. Similarly, if the SELECT permission is revoked from a user but is not revoked from PUBLIC users, the user can still run the SELECT statement.

If GRANT OPTION FOR is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the UPDATE permission on a table and the **WITH GRANT OPTION** option and has granted them to user B, the permission that user B holds is called dependent permission. When user A's permission or grant option is revoked, CASCADE must be declared to revoke all dependent permissions.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use CASCADE. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

If the role executing REVOKE holds permissions indirectly by using more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, it is best practice to use SET ROLE to become the specific role, and then execute REVOKE. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Revoke the permission of role **jerry** from user **joe**.

```
-- Create role jerry.
gaussdb=# CREATE role jerry PASSWORD 'xxxxxxxxxx';

-- Grant the CREATE ANY TABLE permission to jerry and allow the role to grant the permission to others.
gaussdb=# GRANT create any table TO jerry with admin option;

-- Create user joe and grant the permission of role jerry to it.
gaussdb=#  CREATE user joe PASSWORD 'xxxxxxxxxx';
gaussdb=#  GRANT jerry TO joe;

-- Revoke the permission of role jerry from user joe.
gaussdb=#  REVOKE jerry FROM joe;
```

- Revoke system permissions from user **tom**.

```
-- Create user tom.
gaussdb=# CREATE USER tom PASSWORD 'xxxxxxxxxx';

-- Grant system permissions to user tom.
gaussdb=# GRANT ALL PRIVILEGES TO tom;

-- Revoke system permissions from user tom.
gaussdb=# REVOKE ALL PRIVILEGES FROM tom;
```

- Revoke the SELECT permission on the **reason** table in schema **tpcds** from user **joe**.

```
-- Create schema tpcds.
gaussdb=# CREATE SCHEMA tpcds;

-- Create table reason in schema tpcds.
gaussdb=# CREATE TABLE tpcds.reason (
r_reason_sk         INTEGER      NOT NULL,
r_reason_id         CHAR(16)     NOT NULL,
r_reason_desc       VARCHAR(20)
);

-- Grant the query permission on the table tpcds.reason to joe.
gaussdb=# GRANT select ON tpcds.reason TO joe;

-- Revoke the SELECT permission on the reason table in schema tpcds from user joe.
gaussdb=# REVOKE SELECT ON TABLE tpcds.reason FROM joe;
```

- Revoke the ALTER permission on the **fun1()** function in schema **tpcds** from user **joe**.

```
-- Create function fun1().
gaussdb=# CREATE or replace FUNCTION tpcds.fun1() RETURN boolean AS
BEGIN
SELECT current_user;
RETURN true;
END;
/
-- Grant the ALTER permission on the fun1() function to user joe.
gaussdb=# GRANT ALTER ON FUNCTION tpcds.fun1() TO joe;

-- Revoke the ALTER permission for the fun1() function in schema tpcds from user joe.
gaussdb=#  REVOKE ALTER ON FUNCTION tpcds.fun1() FROM joe;
```

- Revoke the CONNECT permission on database **testdb** from user **joe**.

```
-- Create the database testdb.
gaussdb=# CREATE DATABASE testdb;

-- Grant the CONNECT permission on database testdb to user joe.
gaussdb=# GRANT connect on database testdb TO joe WITH GRANT OPTION;

-- Revoke the CONNECT permission on database testdb from user joe.
gaussdb=# REVOKE CONNECT ON database testdb FROM joe;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Clear data.

```
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP FUNCTION tpcds.fun1();
gaussdb=# DROP SCHEMA tpcds CASCADE;
gaussdb=# DROP USER joe;
gaussdb=# DROP USER tom;
gaussdb=# REVOKE create any table FROM jerry;
gaussdb=# DROP ROLE jerry;
gaussdb=# DROP DATABASE testdb;
```

Helpful Links

GRANT

7.12.18.10 ROLLBACK

Description

Rolls back the current transaction and backs out all updates in the transaction.

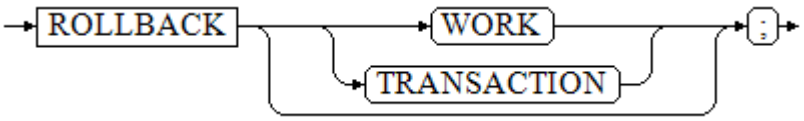
If a fault occurs during the running of a transaction, the transaction cannot be executed. The system cancels all completed operations on the database in the transaction, and the database status returns to the time when the transaction starts.

Precautions

If a ROLLBACK statement is executed out of a transaction, no error occurs, but a notice is displayed.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ];
```



Parameters

WORK | TRANSACTION

Specifies the optional keyword that more clearly illustrates the syntax.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test (id int, name text);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Alter the table structure.
gaussdb=# ALTER TABLE test ADD COLUMN score int;

-- View the table structure.
gaussdb=# \d test;
    Table "public.test"
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 Column |  Type   | Modifiers
--------+---------+-----------
 id     | integer |
 name   | text    |
 score  | integer |

-- Perform rollback.
gaussdb=# ROLLBACK;

-- The table structure is restored to the initial state.
gaussdb=# \d test;
     Table "public.test"
 Column |  Type   | Modifiers
--------+---------+-----------
 id     | integer |
 name   | text    |

-- Drop the test table.
gaussdb=# DROP TABLE test;
```

Helpful Links

COMMIT | END

7.12.18.11 ROLLBACK PREPARED

Description

Cancels a transaction ready for two-phase commit.

Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc_maintenance_mode** is set to **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user who initiates a transaction or a system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
ROLLBACK PREPARED transaction_id ;
```

Parameters

transaction_id

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

Examples

```
-- Start.
gaussdb=# BEGIN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
BEGIN

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';
PREPARE TRANSACTION

-- Cancel the transaction whose identifier is trans_test.
gaussdb=# ROLLBACK PREPARED 'trans_test';
ROLLBACK PREPARED
```

Helpful Links

COMMIT PREPARED and **PREPARE TRANSACTION**.

7.12.18.12 ROLLBACK TO SAVEPOINT

Description

ROLLBACK TO SAVEPOINT rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

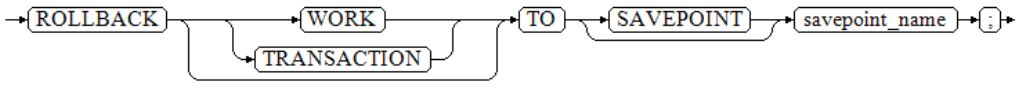
Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a FETCH statement inside a savepoint that is later rolled back, the cursor remains at the position that FETCH left it pointing to (that is, the cursor motion caused by FETCH is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using ROLLBACK TO SAVEPOINT, the cursor can no longer be used.
- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ] TO [ SAVEPOINT ] savepoint_name;
```



Parameters

- **WORK | TRANSACTION**

  Specifies the optional keyword that more clearly illustrates the syntax.
- **savepoint_name**

  Rolls back to a savepoint.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Set the savepoint my_savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Roll back to the savepoint my_savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Cursor positions are not affected by savepoint rollback.
gaussdb=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;

-- Set the savepoint foo.
gaussdb=# SAVEPOINT foo;

-- Read a data record, which is the first one.
gaussdb=# FETCH 1 FROM foo;
 ?column?
----------
        1
-- Roll back to the savepoint foo.
gaussdb=# ROLLBACK TO SAVEPOINT foo;

-- Read a data record, which is the second one.
gaussdb=# FETCH 1 FROM foo;
 ?column?
----------
        2
-- Release a savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- End the transaction.
gaussdb=# COMMIT;
```

Helpful Links

SAVEPOINT and **RELEASE SAVEPOINT**

7.12.19 S

7.12.19.1 SAVEPOINT

Description

SAVEPOINT establishes a new savepoint in the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

Precautions

- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a thread or process caused by a node or connection failure, or of an error caused by the inconsistency

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.

- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. If the latest savepoint is released, the previous savepoint will again become accessible to ROLLBACK TO SAVEPOINT and RELEASE SAVEPOINT. In addition, SAVEPOINT fully complies with the SQL standard.

Syntax

```
SAVEPOINT savepoint_name;
```

Parameters

savepoint_name

Specifies the name of the new savepoint.

NOTICE

When using SAVEPOINT, you are advised to release SAVEPOINT promptly to avoid too many nested subtransactions. It is recommended that the number of nested subtransactions be less than or equal to 10,000. If the number of nested subtransactions is too large, the current transaction performance may deteriorate.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
rolled back.
gaussdb=# SELECT * FROM table1;

-- Delete the table.
gaussdb=# DROP TABLE table1;
```

Helpful Links

RELEASE SAVEPOINT and **ROLLBACK TO SAVEPOINT**

7.12.19.2 SECURITY LABEL ON

Description

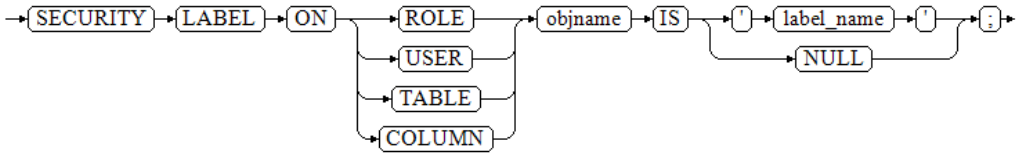
Applies, updates, or cancels a security label.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits the permissions of the built-in role gs_role_seclabel can update or cancel security labels.

Syntax

```
SECURITY LABEL ON { ROLE | USER | TABLE | COLUMN } objname IS {'label_name' | NULL};
```



Parameters

- **objname**
  - For **ROLE** and **USER**, **objname** indicates the user/role name.
  - For **TABLE**, **objname** indicates the table name, which can be prefixed with a schema name.
  - For **COLUMN**, **objname** indicates the name in the format of "table name.column name", which can be prefixed with a schema name.
- **label_name**

  Specifies the security label name.
- **NULL**

  Specifies that the security label is canceled.

Examples

```
-- Create a security label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';

-- Create a table.
gaussdb=# CREATE TABLE tbl(c1 int, c2 int);

-- Create a user.
gaussdb=# CREATE USER bob WITH PASSWORD '********';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Apply a security label to the user.
gaussdb=# SECURITY LABEL ON ROLE bob IS 'sec_label';

-- Apply a security label to the table.
gaussdb=# SECURITY LABEL ON TABLE tbl IS 'sec_label';

-- Apply a security label to a column of the table.
gaussdb=# SECURITY LABEL ON COLUMN tbl.c1 IS 'sec_label';

-- Cancel the security label of the user.
gaussdb=# SECURITY LABEL ON ROLE bob IS NULL;

-- Cancel the security label of the table.
gaussdb=# SECURITY LABEL ON TABLE tbl IS NULL;

-- Cancel the security label of the column of the table.
gaussdb=# SECURITY LABEL ON COLUMN tbl.c1 IS NULL;

-- Delete table tb1.
gaussdb=# DROP TABLE tbl;

-- Delete user bob.
gaussdb=# DROP USER bob;

-- Delete the existing security label sec_label.
gaussdb=# DROP SECURITY LABEL sec_label;
```

Helpful Links

CREATE SECURITY LABEL and **DROP SECURITY LABEL**

7.12.19.3 SELECT

Description

SELECT retrieves data from a table or view.

Serving as an overlaid filter on database tables, the SELECT statement uses SQL keywords to filter data tables and extract the required data.

Precautions

- The owner of the table, users with the SELECT permission on the table, and users with the SELECT ANY TABLE permission can read data in the table or view. When the separation of duties is disabled, system administrators have this permission by default.
- You must have the SELECT permission on each field used in the SELECT statement.
- Using FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE also requires the UPDATE permission in addition to the SELECT permission.

Syntax

- Query data.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ into_option ]
[ FROM from_item [, ...] ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[ WHERE condition ]
[ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ WINDOW {window_name AS ( window_definition )} [, ...] ]
[ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST | LAST } ]} [, ...] ]
[ LIMIT { [offset,] count | ALL } ]
[ OFFSET start [ ROW | ROWS ] ]
[ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
[ into_option ]
[ {FOR { UPDATE | NO KEY UPDATE | SHARE | KEY SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT n | SKIP LOCKED ]}[...] ]
[into_option];
```

NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Only reference aliases in **targetlist**.
- Reference a prior expression in a subsequent expression.
- The **volatile** function cannot be used.
- The **Window** function cannot be used.
- Aliases cannot be referenced in the **JOIN ON** condition.
- An error is reported if the target list contains multiple aliases to be referenced.

NOTICE

In the scenario where the SELECT statement plan is cached, the WHERE IN candidate subset cannot be too large. It is recommended that the number of conditions be less than or equal to 100 to prevent high dynamic memory.

- If the WHERE IN candidate subset is too large, the memory usage of the generated plan increases.
- If the WHERE IN subsets constructed by concatenated SQL statements are different, the SQL template of the cache plan cannot be reused. A large number of different plans are generated, and the plans cannot be shared. As a result, a large amount of memory is occupied.

- The subquery **with_query** is as follows:

```
with_query_name [ ( column_name [, ...] ) ]
    AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
```

- The INTO clause is as follows:

```
into_option:
        INTO var_name [, var_name] ...
 | INTO OUTFILE 'file_name'
  [CHARACTER SET charset_name]
  export_options
 | INTO DUMPFILE 'file_name'
export_options:
[FIELDS
    [TERMINATED BY 'string']
    [[OPTIONALLY] ENCLOSED BY 'char']
    [ESCAPED BY 'char' ]
]
[LINES
    [STARTING BY 'string']
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  [TERMINATED BY 'string']
]
```

- The specified query source **from_item** is as follows:

```
{[ ONLY ] table_name [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
[ TABLESAMPLE sampling_method ( argument [, ...] ) [ REPEATABLE ( seed ) ] ]
[ TIMECAPSULE {TIMESTAMP | CSN} expression ]
|( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|function_name ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
|function_name ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
|xmltable_clause
|from_item unpivot_clause
|from_item pivot_clause
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
```

- The GROUP BY clause is as follows:

```
()
| expression
| ( expression [, ...] )
| ROLLUP ( { expression | ( expression [, ...] ) } [, ...] )
| CUBE ( { expression | ( expression [, ...] ) } [, ...] )
| GROUPING SETS ( grouping_element [, ...] )
```

- The partition_clause for specifying partitions in **from_item** is as follows:

```
PARTITION { ( { partition_name | subpartition_name } [, ...] ) | FOR (  partition_value [, ...] ) } |
SUBPARTITION { ( subpartition_name ) | FOR (  subpartition_value [, ...] )}
```

  NOTE

  - The specified partition applies only to partitioned tables.
  - If PARTITION specifies multiple partition names, level-1 and level-2 partition names can coexist and can be the same. The union set of the partition range is used.

- The sorting order nlssort_expression_clause is as follows:

```
NLSSORT ( column_name, ' NLS_SORT = { SCHINESE_PINYIN_M | generic_m_ci } ' )
```

  The second parameter can be **generic_m_ci**, which supports only the case-insensitive order for English characters.

- Simplified query syntax, equivalent to SELECT * FROM table_name.

```
TABLE { ONLY {(table_name)| table_name} | table_name [ * ]};
```

- For xmltable_clause:

```
XMLTABLE(
xmlnamespaces_clause
row_expression
passing_clause
columns_clause
)
```

  - For xmlnamespaces_clause:

```
[
   XMLNAMESPACES(
   {string AS identifier }
   |
   { DEFAULT string }
   [, { string AS identifier } | { DEFAULT string } ]...
   ),
]
```

  - For passing_clause:

```
PASSING [BY { REF | VALUE }] document_expression [BY { REF | VALUE }]
```

  - For columns_clause:

```
[
   COLUMNS
   name { type [PATH column_expression] [DEFAULT default_expression] [NOT NULL | NULL] |
FOR ORDINALITY }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  [, ...]
]
```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

  If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

  The detailed format of **with_query** is as follows: **with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})**

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
  - RECURSIVE can appear only after WITH. In the case of multiple CTEs, you only need to declare RECURSIVE at the first CTE.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- plan_hint clause

  Follows the SELECT keyword in the **/*+**<*Plan hint*> ***/** format. It is used to optimize the plan of a SELECT statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ALL**

  Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.

- **DISTINCT [ON (expression [, ...])]**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Removes all duplicate rows from the result set of the SELECT statement so that each row in the result set is unique.

Only the first row in the set of rows that have the same result calculated on the given expression **ON (expression [, ...])** is retained.

NOTICE

DISTINCT ON expression is explained with the same rule of **ORDER BY**. Unless you use **ORDER BY** to guarantee that the required row appears first, you cannot know what the first row is.

- SELECT list

  Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (*) is used to represent the column name.

  You may use the **AS output_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.

  Column names can be expressed in the following formats:

  – Manually input column names which are separated by commas (,)

  – Columns computed in the **FROM** clause.

- DENSE_RANK keyword

  Sorts group rows based on a specified rule and returns the values of the first or last group. The options are as follows:

  – **FIRST** aggregates the minimum number of rows.

  – **LAST** aggregates the maximum number of rows.

  For details, see **KEEP (DENSE_RANK { FIRST | LAST } ORDER BY expr)**.

- INTO clause

  Exports the result of SELECT to a specified user-defined variable or file.

  – var_name

    User-defined variable name. See var_name in **SET**.

  – OUTFILE

    ▪ **CHARACTER SET** specifies the encoding format.

    ▪ **FIELDS** specifies the attribute of each column.

      ○ **TERMINATED** specifies the separator.

      ○ **[OPTIONALLY] ENCLOSED** specifies the quotation mark. When **OPTIONALLY** is specified, it takes effect only for the string data type.

      ○ **ESCAPED** specifies the escape character.

    ▪ **LINES** specifies the row attribute.

      ○ **STARTING** specifies the beginning of a row.

      ○ **TERMINATED** specifies the end of a row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - DUMPFILE

    Exports a single row of data without separators or linefeed characters to a file.

  - file_name

    Specifies the absolute path of a file.

```
Three positions of into_option are as follows:
-- Create custom variables.
gaussdb=# CREATE DATABASE user_var dbcompatibility 'b';
gaussdb=# \c user_var
user_var=# SET b_format_behavior_compat_options = enable_set_variables;
user_var=# SET @my_var := 1;
-- Create table t.
user_var=# CREATE TABLE t (a int, b text);
user_var=# INSERT INTO t values(1,'a');
-- Before the FROM clause
user_var=# SELECT a INTO @my_var FROM t;
-- Before the LOCK clause
user_var=# SELECT a FROM t INTO @my_var FOR UPDATE;
-- At the end of the SELECT statement
user_var=# SELECT a FROM t FOR UPDATE INTO @my_var;

Export to a file.
user_var=# SELECT * FROM t;
 a | b
---+---
 1 | a
(1 row)
-- Export data to the outfile file. (Change the absolute path of the outfile file as required.)
user_var=# SELECT * FROM t INTO OUTFILE '/home/gaussdb/t.txt' FIELDS TERMINATED BY '~'
ENCLOSED BY 't' ESCAPED BY '^' LINES STARTING BY '$' TERMINATED BY '&\n';
-- File content: $t1t~tat&, where LINES STARTING BY($),FIELDS TERMINATED BY(~),ENCLOSED
BY(t),LINES TERMINATED BY(&\n)
-- Export data to the dumpfile file.
user_var=# SELECT * FROM t INTO DUMPFILE '/home/gaussdb/t.txt';
File content: 1a
-- Switch to the initial database. Replace init_db with the actual initial database name.
user_var=# \c init_db;
-- Drop the database.
gaussdb=# DROP DATABASE user_var;
```

- FROM clause

  Specifies one or more source tables for SELECT.

  The **FROM** clause can contain the following elements:

  - table_name

    Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema_name.table_name.

    > NOTE
    >
    > You can use database links to perform operations on remote tables and synonyms. For details, see **DATABASE LINK**.

  - alias

    Gives a temporary alias to a table to facilitate the quotation by other queries.

    An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely hides the actual name of the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If an alias is specified for the *joined_table* table created by JOIN and *joined_table* is wrapped with "()", that is, (*joined_table*), non-reserved keywords UNPIVOT and PIVOT cannot be used as aliases.

- TABLESAMPLE sampling_method (argument [, ...]) [REPEATABLE (seed)]

  The TABLESAMPLE clause following **table_name** specifies that the specified **sampling_method** should be used to retrieve the subset of rows in the table.

  The optional REPEATABLE clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and **argument** values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

  Queries the table data of a specified CSN or at a specified time point.

  Currently, the following tables do not support flashback query: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, and inherited tables.

  - TIMECAPSULE TIMESTAMP

    Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp.

  - TIMECAPSULE CSN

    Searches for the result set of a specified CSN based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in gs_txn_snapshot.

  - expression

    Constants, functions, or SQL expressions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails. The error message "ERROR: The table definition of %s has been changed." is displayed when flashback is performed on a table where DDL operations have been performed. The error message "ERROR: recycle object %s desired does not exist" is displayed when flashback is performed on a table where DDL operations, such as changing namespaces and table names, have been performed.
- Flashback query supports scanning PCR UB-tree indexes. If no such indexes, flashback query supports only seq scan for full table scan.
- When the flashback point is too old, the source version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
- After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.

– column_alias

  Specifies the column alias.

– PARTITION

  Queries data in the specified partition in a partitioned table.

– partition_name

  Specifies the name of a partition.

– partition_value

  Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.

– SUBPARTITION

  Queries data in the specified level-2 partition in a partitioned table.

– subpartition_name

  Specifies the name of a level-2 partition.

– subpartition_value

  Specifies the key values of specified level-1 and level-2 partitions. The values of the two partition keys specified by the **SUBPARTITION FOR** clause uniquely identify a level-2 partition.

– subquery

  Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.

– with_query_name

  Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- function_name

  Function name. Function calls can appear in the **FROM** clause.

- join_type

  There are five options:

  - [INNER] JOIN

    A JOIN clause combines two FROM items. You can use parentheses to determine the order of nesting. In the absence of parentheses, JOIN nests left-to-right.

  - LEFT [OUTER] JOIN

    Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that the condition of the JOIN clause is used only when matches are being calculated. The condition of the outer layer is applied after the calculation.

  - RIGHT [OUTER] JOIN

    Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).

    This is just a notational convenience because you can always convert it to a LEFT OUTER JOIN by switching the left and right inputs.

  - FULL [OUTER] JOIN

    Returns all the joined rows, pluses one row for each unmatched left-hand row (extended with **NULL** on the right), and pluses one row for each unmatched right-hand row (extended with **NULL** on the left).

  - CROSS JOIN

    Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain FROM and WHERE.

    NOTE

    For the INNER and OUTER join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join_condition**, or **USING (join_column [, ...])**. For CROSS JOIN, none of these clauses can appear.

    You can use JOIN consecutively.

  CROSS JOIN and INNER JOIN produce a simple Cartesian product, the same result as you get from listing the two items at the top level of FROM.

- ON join_condition

  Defines which rows have matches in joins. Example: ON left_table.a = right_table.a You are advised not to use numeric types such as int for **join_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- USING(join_column[, ...])

  ON left_table.a = right_table.a AND left_table.b = right_table.b ... abbreviation. Corresponding columns must have the same name.

- NATURAL

  Shorthand for a USING list that contains all columns in the two tables that have the same names.

- from item

  Specifies the name of the query source object connected.

- xmltable_clause

  Currently, xmltable_clause can be used only in A- or PG-compatible mode. xmltable_clause produces a virtual table based on data of the given XMLTYPE (in A-compatible mode) or XML (in PG-compatible mode) type.

  - xmlnamespaces_clause

    The optional xmlnamespaces_clause is a clause that starts with XMLNAMESPACES followed by a comma-separated XML namespace declaration. **string** indicates the full name of the namespace for which single quotation marks are used as boundary characters. **identifier** indicates the namespace alias for which double quotation marks are used as boundary characters. The alias can be used in row_expression and columns_clause. In the current version, DEFAULT cannot be used to declare the default namespace.

  - row_expression

    The required **row_expression** is an XPath 1.0 expression with English single quotation marks as boundary characters. The document_expression in the subsequent passing_clause is used as its context to obtain a group of XML nodes. These nodes are processed by columns_clause to generate each row of the virtual table.

  - passing_clause

    The required passing_clause starts with PASSING, where **document_expression** is the data of the XMLTYPE (in A-compatible mode) or XML (in PG-compatible mode) type that is passed to XMLTABLE for processing. Currently, only single-root data is supported. In A-compatible mode, an error is reported regardless of whether BY VALUE or BY REF in the first or second place is used. In PG-compatible mode, although BY VALUE or BY REF in the first and second places can be identified and received, no functional processing is performed.

  - columns_clause

    The optional columns_clause is used to specify the information required for the columns to be generated in the virtual table.

    - **name** indicates the name of a column.
    - **type** indicates the column type.
    - **PATH**: **column_expression** in the optional **PATH** part is an expression of XPath 1.0. A node in the node set obtained by **row_expression** is used as the context of the node, and the data

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

required by the value of the corresponding column in the row data generated by the node is obtained through processing by the node. There is an implicit conversion when it is converted to a result of the TYPE type. If the **PATH** part is not provided, **name** is regarded as **column_expression**.

- **DEFAULT**: **default_expression** in the optional **DEFAULT** part is an expression. If a NULL value is obtained after **column_expression** processing, the result obtained by calculating **default_expression** is used to generate the value of the column. Note that **default_expression** is calculated only when necessary. If the expression is stable, **default_expression** is calculated only once when necessary.
- **NOT NULL** | **NULL**: In PG-compatible mode, the optional NOT NULL or NULL is used to indicate whether the column value can be **NULL**. If the column value is inconsistent with the specified option, an error is reported.
- **FOR ORDINALITY**: indicates that the column is a row number column. Row numbers starting from 1 are filled for generated rows. Only one column can be marked as **FOR ORDINALITY**.
- In A-compatible mode, columns_clause can be omitted. After columns_clause is omitted, the default **columns_clause: COLUMNS column_value XMLTYPE PATH '.'** is generated internally for subsequent processing. In PG-compatible mode, columns_clause cannot be omitted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Currently, xmltable_clause has the following restrictions:

- The involved XPath expressions are XPath 1.0.
- Currently, XPath expressions such as '**..**' cannot be used in **column_expression**.
- When the data obtained through **column_expression** is converted to the data of the TYPE type, in A-compatible mode, if the obtained data is too long and exceeds the typmod of the type, the data will be truncated. Currently, long data is truncated only when the typmod of the CHAR, CHARACTER, NCHAR, BPCHAR, VARCHAR, CHARACTER VARYING, VARCHAR2 and NVARCHAR2 data types (including those attached with (n)) is greater than 0. In PG-compatible mode, an error is reported.
- Currently, the maximum size of the input XMLTYPE (in A-compatible mode) or XML (in PG-compatible mode) type data is 1 GB.
- For upgrade from a version that does not support XMLTABLE to a version that supports XMLTABLE, the XMLTABLE syntax cannot be used during the upgrade observation period.
- The following expression is supported in XPath only in A-compatible mode: *:nodename, where **nodename** indicates the node name. This expression indicates that the namespace of the node specified by **nodename** is ignored when the node is selected.
- The non-reserved keyword XMLTABLE cannot be used as the name of a function of the Functions as Table Sources type.

NOTE

When non-constructed XMLTYPE (in A-compatible mode) data is entered, spaces and carriage return characters that are at the same level as the non-constructed part and are used to control the writing format between nodes are parsed as text nodes. For example, in the following text, the space and carriage return between the end label of **node2** and the start label of **node3** are parsed as text nodes, which is different from that in database A.

Input:

```
<root>
<node1>node1</node1>
malform
<node2>node2</node2>
<node3>node3</node3>
</root>
```

Actual situation:

```
<root><node1>node1</node1>
malform
<node2>node2</node2>
<node3>node3</node3>
</root>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Currently, the functions implemented by xmltable_clause are different from those implemented by databases A and PG. Pay attention to the differences. For details, see **Table 7-261**.

Table 7-261 Comparison between GaussDB Kernel and databases A and PG

GaussDB Kernel	PG	Database A
XPath 1.0 expressions are used at **row_expression** and **PATH** in columns_clause.	Same as that in GaussDB Kernel.	XQuery 1.0 expressions are used at **row_expression** and **PATH** in columns_clause.
The default namespace function is not supported.	Same as that in GaussDB Kernel.	The default namespace function is supported.
A single data record can be passed through passing_clause, but the alias cannot be used.	Same as that in GaussDB Kernel. (Note that the input data is of the XML type.)	Multiple data records can be passed through the corresponding clause and aliases can be used.
The passing_clause cannot be omitted.	Same as that in GaussDB Kernel.	The corresponding clause can be omitted.
The RETURNING SEQUENCE BY REF clause cannot be used after passing_clause.	Same as that in GaussDB Kernel.	The RETURNING SEQUENCE BY REF clause can be used after the corresponding clause.
In columns_clause, you cannot use (SEQUENCE) BY REF to modify the returned data of the XMLType type.	Same as that in GaussDB Kernel.	You can use (SEQUENCE) BY REF in the corresponding clause to modify the returned data of the XMLType type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GaussDB Kernel	PG	Database A
If the **PATH** part in columns_clause is omitted and the column name is not enclosed using double quotation marks (""), the node can be correctly found for subsequent operations when the node name in the data passed to XMLTABLE is in lowercase.	Same as that in GaussDB Kernel.	If the corresponding part is omitted and the column name is not enclosed using double quotation marks (""), the node can be correctly found for subsequent operations when the node name in the data passed to XMLTABLE is in uppercase.
The declaration of the column type in columns_clause cannot be omitted.	Same as that in GaussDB Kernel.	The declaration of the column type in the corresponding clause can be omitted.
In A-compatible mode, the columns_clause can be omitted. In PG-compatible mode, the columns_clause cannot be omitted.	The corresponding clause cannot be omitted.	The corresponding clause can be omitted.
In A-compatible mode, if the returned data length exceeds the typmod of the type, the data is truncated. In PG-compatible mode, if the returned data length exceeds the typmod of the type, an error is reported.	An error is reported when the length of the returned data exceeds the typmod of the type.	If the length of the returned data exceeds the value of typmod, the data is truncated.

Example:

```
gaussdb=# SELECT * FROM XMLTABLE(
gaussdb(# XMLNAMESPACES('nspace1' AS "ns1", 'nspace2' AS "ns2"), -- Declare two XML namespaces 'nspace1' and 'nspace2' and the corresponding aliases "ns1" and "ns2".
gaussdb(# '/ns1:root/*:child' -- Select the root node whose namespace is 'nspace1' from the passed data through row_expression, select all child nodes under the root node, and ignore the child namespaces. ns1 is the alias of 'nspace1'.
gaussdb(# PASSING xmltype(
gaussdb(# '<root xmlns="nspace1">
gaussdb'#     <child>
gaussdb'#         <name>peter</name>
gaussdb'#         <age>11</age>
gaussdb'#     </child>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb'#     <child xmlns="nspace1">
gaussdb'#         <name>qiqi</name>
gaussdb'#         <age>12</age>
gaussdb'#     </child>
gaussdb'#     <child xmlns="nspace2">
gaussdb'#         <name>hacker</name>
gaussdb'#         <age>15</age>
gaussdb'#     </child>
gaussdb'# </root>')
gaussdb(# COLUMNS
gaussdb(# columns FOR ORDINALITY, -- Row number column
gaussdb(# name varchar(10) path 'ns1:name', -- Select the name node whose namespace is 'nspace1' from each child node obtained by row_expression, convert the value in the node to varchar(10), and return the value. ns1 is the alias of nspace1.
gaussdb(# age int); -- Select the age node from each child node obtained by row_expression, convert the value in the node to int, and return the value. The first child node does not explicitly specify the namespace. Therefore, the namespace of the parent node root is followed. Therefore, no value in this column is returned.
 column | name  | age
--------+-------+-----
      1 | peter |
      2 | qiqi  |
      3 |       |
(3 rows)
```

– unpivot_clause

  Converts a column to a row. The syntax format is as follows:

```
UNPIVOT [ {INCLUDE | EXCLUDE} NULLS ]
  (
     unpivot_col_clause
     unpivot_for_clause
     unpivot_in_clause
  )
```

  - {INCLUDE | EXCLUDE} NULLS

    Controls whether the converted result contains NULL rows. **INCLUDE NULLS** indicates that the converted results contain NULL rows. **EXCLUDE NULLS** indicates that the converted results do not contain NULL rows. If this clause is ignored, the unpivot operation removes NULL rows from the converted results by default.

  - unpivot_col_clause

```
unpivot_col_element
```

    unpivot_col_element specifies the output column names. These columns store the values to be converted.

  - unpivot_col_element

```
{ column | ( column [, column]... ) }
```

    unpivot_col_element has two forms: column and (column [, column]...).

  - unpivot_for_clause

```
FOR { unpivot_col_element }
```

    unpivot_col_element contained in the unpivot_for_clause is used to specify the output column names. These columns store the alias and names of the column to be converted.

  - unpivot_in_clause

```
IN ( unpivot_in_element [,unpivot_in_element...] )
```

    unpivot_in_clause specifies the columns to be converted. The column names and column values are saved in the previously specified output columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

unpivot_in_element
{ unpivot_col_element }[AS { unpivot_alias_element }]

unpivot_col_element specifies the column to be converted. If (column [, column]...) is used to specify the column to be converted, the *column* names are connected by underscores (_) and saved in the output columns. For example, IN ((col1, col2)) generates the column name **col1_col2** and saves it in the output column specified by unpivot_for_clause. In addition, the AS keyword can be used to specify an alias for the column to be converted. Once an alias is specified, the alias is saved in the output column instead of the name of column to be converted.

- unpivot_alias_element
  { alias | (alias [, alias]...)}

  Similar to **unpivot_col_element**, **unpivot_alias_element** has two forms. **alias** indicates the specified alias.

NOTICE

Currently, unpivot_clause has the following restrictions:

- This parameter can be used only in A-compatible mode.
- The unpivot_clause clause cannot be used with hints.
- For unpivot_col_clause, the number of output columns specified by unpivot_col_element must be the same as that of unpivot_col_element contained in unpivot_in_clause.
- For unpivot_for_clause, the number of output columns specified by unpivot_col_element must be the same as the number of aliases specified by unpivot_alias_element contained in unpivot_in_clause.
- For unpivot_in_clause, the alias must be a constant or an expression that can be converted to a constant.
- For unpivot_in_clause, constant expressions support only IMMUTABLE functions.
- For all unpivot_col_element parameters contained in unpivot_in_clause, if the column types in the same position of these unpivot_col_element parameters are different, UNPIVOT attempts to convert the column types in order to convert the values of columns to be converted to a public type. Similarly, for all unpivot_alias_element parameters, if the alias types of these unpivot_alias_element parameters in the same position are different, UNPIVOT attempts to do the similar type conversion.

  For example, assume that there is an unpivot_in_clause in the form of IN (col1, col2), where col1 is of the int type and col2 is of the float type, UNPIVOT attempts to convert the column value of col1 to the public type float during the calculation.

– pivot_clause

  Converts a row to column. The syntax format is as follows:

```
PIVOT [ XML ]
( aggregate_function ( expr ) [[AS] alias ]
   [, aggregate_function ( expr ) [[AS] alias ] ]...
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  pivot_for_clause
  pivot_in_clause
)
```

- aggregate_function (expr) [[AS] alias]

  Aggregates calculation on a given expression. The calculation result is saved in the output column specified by pivot_in_clause. [AS] alias (the keyword AS can be omitted) can be used to specify an alias for **aggregate_function**. The alias is appended to the output column name specified by **pivot_in_clause** in the format of "_alias".

- pivot_for_clause

  ```
  FOR { column
    | ( column [, column]... )
    }
  ```

  Specifies the row to be converted. The **column** indicates a column of the row to be converted.

- pivot_in_clause

  ```
  IN ( { { { expr
        | ( expr [, expr]... )
        } [ [AS] alias]
      }...
    }
  )
  ```

  Specifies the name of the output column. The column name can consist of one or more expressions, for example, (expr1, expr2). When a column name consists of multiple expressions, these expressions are connected by underscores (_) in sequence. That is, the output column name corresponding to (expr1, expr2) is "expr1_expr2". These expressions not only generate output column names, but also determine the time when the aggregate function is triggered. If the values of row to be converted is the same as the value of these expressions, the results calculated by **aggregate_function** are saved in the output column names that consist of these expressions. Assume that expr1 is "1" and expr2 is "2". For row "1 2", **aggregate_function** is used for calculation. For row "1 1", the calculation is not triggered.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Currently, pivot_clause has the following restrictions:

- This parameter can be used only in A-compatible mode.
- The pivot_clause clause cannot be used with hints.
- If more than one aggregate_function is specified, at most one aggregate_function is allowed to have no alias, the rest of the aggregate_function functions are required to specify an alias.
- XML supports only syntax but does not support functions.
- The expression in pivot_in_clause can be a constant or an expression that can be converted to a constant. If the expression is not a unary expression, specify an alias for the expression.
- For pivot_in_clause, constant expressions support only IMMUTABLE functions.
- For the expression in pivot_in_clause, when the keyword AS is used to specify an alias for the expression, only the non-reserved keywords can be used as aliases.
- If the length of an output column name exceeds 63 characters, an error is reported.

- WHERE clause

  The WHERE clause forms an expression for row selection to narrow down the query range of SELECT. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

  In a WHERE clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

  a. It can appear only in the WHERE clause.
  b. If a table join has been specified in the FROM clause, the operator (+) cannot be used in the WHERE clause.
  c. The operator (+) can work only on columns of tables or views, instead of on expressions.
  d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
  e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the FROM clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.
  f. Expressions where the operator (+) is used cannot be directly connected through OR.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the JOIN condition.

h. A table cannot have multiple foreign tables.

i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through AND or OR.

j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- For the WHERE clause, if special character "%", "_", or "\" is queried in LIKE, add the slash "\" before each character.
- For a hierarchical query, the WHERE expression is processed as follows in a multi-table join query:

  Decompose the WHERE expression based on the disjunctive and conjunctive actions and check whether each subexpression involves multiple tables (potential join conditions) queried at the current layer. If a subexpression is not a sublink and involves only multiple tables queried at the current layer, push it down to the non-recursive START WITH clause or the recursive CONNECT BY clause of the hierarchical query for prior execution as the JOIN condition. Otherwise, place it after the recursive CONNECT BY clause for execution as a filter condition.

  During internal implementation, the subexpressions that do not meet pushdown requirements in the parse tree of the original WHERE expression are deleted to obtain the final expression that can be pushed down. Then, the subexpressions that meet the pushdown condition are removed from the parse tree of the original WHERE expression to obtain the final expression that is not pushed down.

  To sum up, pay attention to the following points:

  - When the WHERE expression is split, the disjunctive action is also split. Therefore, the two expressions joined by OR are also split.
  - Sublinks must not be pushed down.
  - If an input column is not queried at the current layer, the column will not be pushed down.

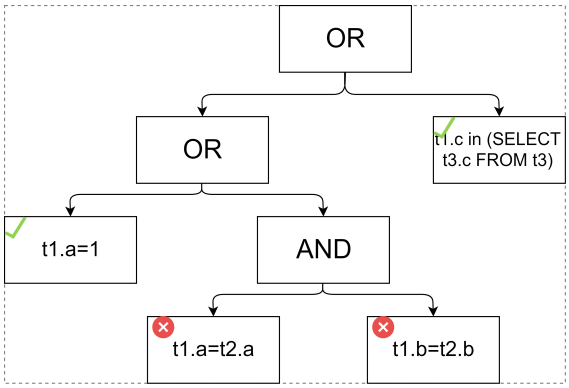
  Then, for the following example:

```
SELECT * FROM t1,t2
WHERE t1.a=1 or t1.a=t2.a and t1.b=t2.b or t1.c in (SELECT t3.c FROM t3)
START WITH t1.c=1
CONNECT BY PRIOR t2.c=t1.c;
```

  The following figure shows the pushdown conditions after the WHERE expression is split disjunctively and conjunctively.

  It is equivalent to "t1.a=t2.a AND t1.b=t2.b". The following figure shows the conditions that are not pushed down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



It is equivalent to "t1.a=1 OR t1.c in (SELECT t3.c FROM t3)".

For another example:

```
SELECT * FROM t3 WHERE EXISTS(
SELECT * FROM t1,t2
WHERE t1.a+t2.a=t3.a
START WITH t1.c=1
CONNECT BY PRIOR t2.c=t1.c;
)
```

The WHERE condition contains **t3.a** inputted by the outer query. Therefore, the WHERE condition is not pushed down.

- If an IN condition is contained in a WHERE clause and no parenthesis is added after IN, only one element can be added after IN, and restrictions can be used only in the A-compatible mode. The element has the following restrictions:
  - Constant: such as character strings, integers, and floating points
  - Column name
  - CASE WHEN clause
  - Function

- **START WITH clause**

  The **START WITH** clause is usually used together with the **CONNECT BY** clause and indicates the initial condition of recursion. Data is traversed recursively and hierarchically. If this clause is omitted and the CONNECT BY clause is used alone, all rows in the table are used as the initial set. For details, see **CONNECT BY**.

- CONNECT BY clause

  CONNECT BY indicates a recursive join condition. It is used together with START WITH to implement data traversal and recursion. Example:

```
gaussdb=#  CREATE TABLE test(name varchar, id int, fatherid int);
gaussdb=#  INSERT INTO test VALUES('A', 1, 0), ('B', 2, 1),('C',3,1),('D',4,1),('E',5,2);
gaussdb=#  SELECT * FROM TEST START WITH id = 1 CONNECT BY prior id = fatherid ORDER
SIBLINGS BY id DESC;
 name | id | fatherid
------+----+----------
 A    | 1 |        0
 D    | 4 |        1
 C    | 3 |        1
 B    | 2 |        1
 E    | 5 |        2
(5 rows)
```

  In the CONNECT BY condition, the PRIOR keyword can be specified for a column to indicate that the column is recursive. If NOCYCLE is added before

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the recursive join condition, recursion stops when a loop record is encountered. (Note: A SELECT statement containing the START WITH .. CONNECT BY clause does not support the FOR SHARE or UPDATE lock.)

The process of executing the START WITH statement is as follows:

a. The initial data set is selected based on the condition in the START WITH clause. In the preceding example, **('A', 1, 0)** is selected first. Then, this initial data set is set as the working set.
b. If the working set is not empty, the data in the working set is used as the input for the next query. The filter criteria are specified in the CONNECT BY clause. The keyword PRIOR indicates the current record. For example, **prior id = fatherid** in the preceding example indicates that the ID of the current record is the **fatherid** of the next record.
c. Set the data set filtered in step 2 as the working set and repeat the operation in step 2.

In addition, the database adds the following pseudocolumns to each selected data record so that users can learn about the location of the data in the recursive or tree structure:

- **LEVEL**: level of a node. The level of the root node is **1**.
- **CONNECT_BY_ISLEAF**: specifies whether a node is a leaf node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

connect_by_isleaf: If a node does not have any subnode, the node is a leaf node and **connect_by_isleaf** is set to **1**. Otherwise, **connect_by_isleaf** is set to **0**.

Assume that table T1 exists and the data in table T1 is shown in **Figure 7-12**.

Figure 7-12 Data structure

T1	
A	B
1	2
2	3
2	4
3	5

Run the following statement:

```
SELECT * FROM T1 CONNECT BY PRIOR B=A AND LEVEL<=3;
```

The tree structure of the result is shown in **Figure 7-13**, where the blue nodes are leaf nodes.

Figure 7-13 Logical structure of the execution

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In addition to pseudocolumns, the following query functions are provided (for details, see **Hierarchical Recursion Query Functions**):

- **sys_connect_by_path(col, separator)**: returns the connection path from the root node to the current row. The **col** parameter indicates the name of the column displayed in the path, and the **separator** parameter indicates the connector.
- **connect_by_root(col)**: displays the top-level node of the node. **col** indicates the name of the output column.

If a loop exists in the data set, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

Besides, in the hierarchical query, the search is performed strictly according to the depth-first order. If **ROWNUM** is used as the filter condition in START WITH or CONNECT, the value of **ROWNUM** is increased by 1 for each record to be returned. Then, the record is verified based on **ROWNUM** conditions. Records that do not satisfy the conditions are discarded and the value of **ROWNUM** is decreased by 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The PRIOR keyword can be used only in the CONNECT BY clause instead of the START WITH clause.
- In addition to **targetlist**, "prior (single column)" is parsed as "prior single column". User-defined functions named **prior** are not perceived.
- The PRIOR keyword can be specified only for columns in the table instead of expressions, pseudocolumns, or type conversion. For example, PRIOR (a + 1) is not allowed.
- In the CONNECT BY clause, the column using the keyword PRIOR cannot be in the same condition with pseudocolumns such as level and rownum, but they can be in different conditions. For example, (PRIOR a = level) is not allowed, but (PRIOR a = b) and (level = 1) is allowed. Different conditions refer to the conditions connected by AND at the top of the CONNECT BY clause. For example, (PRIOR a = 1 or level = 1) is considered as a condition and is not allowed.
- In the START WITH and CONNECT BY clauses, pseudocolumns cannot be used for sublinks, for example, "rownum = (subquery)" or "rownum in (subquery)".
- You are advised not to use pseudo columns in the CONNECT BY statement. If pseudocolumns need to be used, you need to test the columns to avoid inconsistency between the result and expected result.
- When START WITH and CONNECT BY are called on the CTE defined by WITH AS, if there are multiple CTEs, ensure that the definition of each CTE does not depend on other CTEs.
- If no loop exists in the data but the error message "runs into cycle" is reported, increase the value of **max_recursive_times**.
- **connect_by_isleaf**, **connect_by_iscycle** and **level** are of the int type.
- In hierarchical queries, **connect_by_isleaf**, **connect_by_iscycle**, and **level** must be parsed as pseudocolumns and will not be parsed as columns whose alias names in projection columns are the same as pseudocolumns.
- You are advised not to reference other views when defining views with hierarchical queries.
- Optimization suggestions for the START WITH clause:
  - Create indexes based on the conditions in the CONNECT BY clause to improve the performance of the START WITH clause.
  - Identify bottlenecks based on the plan collected by running EXPLAIN PERFORMANCE. If the recursive operator (inner plan) of RECURSIVE UNION is the Hash JOIN operator, but the hash table is created for the temporary table **tmp_result** or the hash table in plan is materialized (that is, the batch size is greater than 1), the possible cause is that the value of **work_mem** is too small. As a result, the hash table cannot be created for the outer data table. You can increase the value of **work_mem** to improve performance.

    Note: GaussDB optimizes tables with a small volume of data and caches table results in hash tables to improve performance. In this case, indexes are not required. However, if the data volume exceeds the limit specified by **work_mem**, the optimization becomes invalid. In this case, you can create indexes for optimization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- You are advised not to use pseudo columns in the START WITH statement. If pseudo columns need to be used, please test the columns to avoid inconsistency between the result and expected result.
- Columns modified by PRIOR support only the following types: INT8, INT1, INT2, OID, INT4, BOOL, CHAR, NAME, FLOAT4, FLOAT8, ABSTIME, RELTIME, DATE, CASH, TIME, TIMESTAMP, TIMESTAMPTZ, SMALLDATETIME, UUID, INTERVAL, TIMETZ, INT2VECTOR, CLOB, NVARCHAR2, VARCHAR, TEXT, VECTOR, BPCHAR, RAW, BYTEA, NUMERIC, XID, CID, and TID. The whitelist restriction cannot be bypassed by forcibly converting the type to the preceding types, for example, PRIOR col::text (where **col** is not of the type in the whitelist) is not supported.
- In a hierarchical query statement, if the projection column utilizes a window function, the result depends on the order of the intermediate result set. To use a window function, conduct thorough testing to verify that the semantics align with expectations.

The default behavior of START WITH is width-first search. However, depth-first search can be implemented by working with pseudocolumns. Example:

```
gaussdb=# SELECT sys_connect_by_path(name,'-') as path, *, LEVEL FROM test START WITH id = 1
CONNECT BY fatherid=prior id ORDER BY path;
  path  | name | id | fatherid | level
--------+------+----+----------+-------
 -A     | A    |  1 |        0 |     1
 -A-B   | B    |  2 |        1 |     2
 -A-B-E | E    |  5 |        2 |     3
 -A-C   | C    |  3 |        1 |     2
 -A-D   | D    |  4 |        1 |     2
gaussdb=# DROP TABLE test;
```

If a loop exists in the data set, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

- **ORDER SIBLINGS BY clause**

  The output of the START WITH statement is returned level by level. However, there is no sequence guarantee at each level because the database automatically selects the optimal execution path during each round of query. In the preceding example, A is output first, but the sequence of B, C, and D is not fixed. If you have requirements on the final output sequence, you can use ORDER SIBLINGS BY. The usage of ORDER SIBLINGS BY is the same as that of ORDER BY. ORDER SIBLINGS BY is used for sorting at each level during recursion.

  NOTICE

  The expression following ORDER SIBLINGS BY only supports sorting by calling non-aggregate and window functions for ordinary columns, column name offsets, and column names. It does not support calling system functions related to START WITH for column names or using pseudocolumns related to START WITH.

- **GROUP BY clause**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

- CUBE ({ expression | (expression [, ...]) } [, ...])

  A CUBE grouping is an extension to the **GROUP BY** clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions (n=3) in the CUBE clause, the operation results in $2^n = 2^3 = 8$ groupings. Rows grouped on the values of *n* expressions are called regular rows, and the rest are called superaggregate rows.

- GROUPING SETS (grouping_element [, ...])

  GROUPING SETS is another extension to the GROUP BY clause. It allows you to specify multiple GROUP BY clauses. This improves efficiency by trimming away unnecessary data. After you specify the required data group, the database does not need to compute a whole **ROLLUP** or **CUBE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If **sql_mode** contains the **ONLY_FULL_GROUP_BY** option, the following situations occur:
  - If the non-aggregate function column in the SELECT list is consistent with the column for GROUP BY, no error is reported.
  - If the non-aggregate function column in the SELECT list is inconsistent with the column for GROUP BY, the following situations may occur:
    - If the GROUP BY list contains a primary key or a unique non-null key, the SQL statement does not report an error.
    - Non-aggregate function columns in the SELECT list are also included in the GROUP BY or WHERE lists. If included in the WHERE list, the columns in the WHERE clause must be in the form of a constant, and then no error will be reported.
    - If both the JOIN and GROUP BY clauses are contained, the following situations may occur:
      - LEFT JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains columns from the LEFT JOIN table.

        For example, when LEFT JOIN operations are performed on tables **t1** and **t2**, if the condition in the ON clause is **t1.col1=t2.col2 ...**, the GROUP BY clause only needs to contain **t1.col1**.
      - RIGHT JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains columns from the RIGHT JOIN table.

        For example, when RIGHT JOIN operations are performed on tables **t1** and **t2**, if the condition in the ON clause is **t1.col1=t2.col2 ...**, the GROUP BY clause only needs to contain **t2.col2**.
      - INNER JOIN/CROSS JOIN/STRAIGHT_JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains either of the columns.
- If **sql_mode** does not contain the **ONLY_FULL_GROUP_BY** option, no restriction exists and no error is reported in the preceding error scenarios.

  If a non-aggregate column beyond the column for GROUP BY contains multiple data records after it is grouped, due to difference in execution plans, the queried column data is a random data record in the grouped data.

- HAVING clause

  Used together with the GROUP BY clause to select special groups. The **HAVING** clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the **HAVING** clause are extracted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- WINDOW clause

  The general format is **WINDOW window_name AS (window_definition) [, ...]**. **window_name** is a name can be referenced by **window_definition**. **window_definition** can be expressed in the following forms:

  ```
  [ existing_window_name ]
  [ PARTITION BY expression [, ...] ]
  [ ORDER BY expression [ ASC | DESC | USING operator ] [ NULLS { FIRST | LAST } ] [, ...] ]
  [ frame_clause ]
  ```

  frame_clause defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. frame_clause can be expressed in the following forms:

  ```
  [ RANGE | ROWS ] frame_start
  [ RANGE | ROWS ] BETWEEN frame_start AND frame_end
  ```

  Formats of **frame_start** and **frame_end**:

  ```
  UNBOUNDED PRECEDING
  VALUE PRECEDING
  CURRENT ROW
  VALUE FOLLOWING
  UNBOUNDED FOLLOWING
  ```

  NOTE

  Restrictions on scenarios where VALUE is used:

  - The table columns operated by the aggregate function or window function support only the INT1, INT2, INT4, INT8, FLOAT4, FLOAT8, NUMERIC, INTERVAL, TIME, TIMETZ, TIMESTAMP, TIMESTAMPTZ, and DATE types.
  - The VALUE type supports only the INT1, INT2, INT4, INT8, INT16, FLOAT4, FLOAT8, NUMERIC, INTERVAL, and character string (only character strings that can be implicitly converted to numbers are supported) types.
  - The value of VALUE must be a non-negative number.
  - Currently, **VALUE** only supports constants as the upper and lower boundaries and does not support variables and expressions.

- UNION clause

  Computes the set union of the rows returned by the involved **SELECT** statements.

  The **UNION** clause has the following constraints:

  – By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.

  – The number of columns in multiple SELECT statements must be the same, and the data type and sequence of each column must be the same.

  – Multiple **UNION** operators in the same SELECT statement are evaluated left to right, unless otherwise specified by parentheses.

  – **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, and **FOR KEY SHARE** cannot be specified in the result or input of **UNION**.

  – The GUC parameter **enable_union_all_order** determines whether to preserve the order of UNION ALL subqueries.

    - Enabling: **set enable_union_all_order to on**
    - Disabling: **set enable_union_all_order to off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Querying: **show enable_union_all_order**

When the **enable_union_all_order** parameter is enabled, subquery order preserving is supported if **UNION** is set to **ALL** and the main query is not sorted. In other cases, subquery order preserving is not supported.

General expression:

```
select_statement UNION [ALL] select_statement
```

- **select_statement** can be any SELECT statement without the ORDER BY, LIMIT, FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE clause.
- ORDER BY and LIMIT can be attached to subexpressions if enclosed in parentheses.

NOTICE

- It is recommended that the number of UNION ALL clauses be less than 100. If the number of UNION ALL clauses exceeds 100, ensure that the instance memory is sufficient.
- The following constraints apply when you perform set operations with **NULL**:
  - **NULL** can only be a projection column itself or a projection column in a subquery of the FROM statement.
  - In CTEs and recursive queries, complex subqueries (DISTINCT, GROUP BY, and ORDER BY statements) are not supported.

- **INTERSECT clause**

  Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

  The **INTERSECT** clause has the following constraints:

  - Multiple **INTERSECT** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
  - Processing **INTERSECT** preferentially when **UNION** and **INTERSECT** operations are executed for results of multiple **SELECT** statements.

  General format:

  ```
  select_statement INTERSECT select_statement
  ```

  select_statement can be any SELECT statement without the FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE clause.

- **EXCEPT clause**

  Has the following common form:

  ```
  select_statement EXCEPT [ ALL ] select_statement
  ```

  select_statement can be any SELECT statement without the **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, or **FOR KEY SHARE** clause.

  The **EXCEPT** operator computes the set of rows that are in the result of the left SELECT statement but not in the result of the right one.

  The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has *m* duplicates in the left

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

table and *n* duplicates in the right table will appear MAX(*m*–*n*, 0) times in the result set.

Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

Currently, the **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, and **FOR KEY SHARE** clauses cannot be specified for the result of **EXCEPT** or any input of **EXCEPT**.

- **MINUS clause**

  Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

  Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

  – If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.

  – If they are equal according to all specified expressions, they are returned in an implementation-dependent order.

  – When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.

  – When used with the GROUP BY clause, the columns to be sorted in ORDER BY must be included in the columns of the result set retrieved by the SELECT statement.

  When the clause is not used with the GROUP BY clause and the columns of the result set retrieved by the SELECT statement contain aggregate functions:

  – The ORDER BY clause is ignored if the columns of the retrieved result set do not contain any set returning functions.

  – Only the sorting of the columns that contain set returning functions is retained if the columns of the retrieved result set contain set returning functions.

  NOTE

  To support Chinese pinyin order, set the encoding format to **UTF-8**, **GB18030**, **GB18030_2022**, **GBK**, or **ZHS16GBK** when initializing the database. The statements are as follows:

  initdb –E UTF8 –D ../data –locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -locale=zh_CN.GB18030, initdb -E GB18030_2022 -D ../data -locale=zh_CN.GB18030, initdb –E GBK –D ../data –locale=zh_CN.GBK, or initdb –E ZHS16GBK –D ../data –locale=zh_CN.GBK.

- **LIMIT clause**

  Consists of two independent sub-clauses:

  LIMIT { count | ALL } limits the number of rows to be returned. **count** specifies the number of rows to be returned. The effect of **LIMIT ALL** is the same as that of omitting the LIMIT clause.

  OFFSET start count specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

  ROWNUM cannot be used as count or offset in the LIMIT clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **OFFSET clause**

  The SQL: 2008 standard has introduced a different clause:

  OFFSET start { ROW | ROWS }

  start specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  If **count** is omitted in a **FETCH** clause, it defaults to **1**.

- **Locking clause**

  The **FOR UPDATE** clause locks the rows retrieved by **SELECT**. This prevents these rows from being modified or deleted by other transactions before the current transaction ends. That is, other transactions that attempt to run **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, or **SELECT FOR KEY SHARE** for these rows will be blocked until the current transaction ends. Any **DELETE** on a row will also acquire the **FOR UPDATE** locking mode, as will **UPDATE** that modifies values on the primary key column. Conversely, **SELECT FOR UPDATE** waits for concurrent transactions that have run the preceding commands on the same row, and then locks and returns the updated row (there may be no row because the row may have been deleted).

  FOR NO KEY UPDATE behaves similarly to **FOR UPDATE**, except that it acquires a weaker lock that will not block **SELECT FOR KEY SHARE** that attempts to acquire the lock on the same row. Any **UPDATE** that does not acquire the **FOR UPDATE** lock will also acquire this locking mode.

  FOR SHARE behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A shared lock blocks other transactions from executing **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, or **SELECT FOR NO KEY UPDATE**, but does not block **SELECT FOR SHARE** or **SELECT FOR KEY SHARE**.

  FOR KEY SHARE is similar to **FOR SHARE** except that its lock is weak. **SELECT FOR UPDATE** is blocked but **SELECT FOR NO KEY UPDATE** is not blocked. A key-shared lock blocks other transactions from executing **DELETE** or **UPDATE** that modifies the key value, but does not block **UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, or **SELECT FOR KEY SHARE**.

  To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately and there is no waiting. If you use **WAIT N** and the selected row cannot be locked immediately, the operation needs to wait for *n* seconds (the value of *n* is of the int type with a range of $0 \leq n \leq$ 2147483). If the lock is obtained within *n* seconds, the operation is performed normally. Otherwise, an error is reported. If you use **SKIP LOCKED**, locked rows are skipped when a table is locked. Only rows that are locked using a row lock can be skipped. In scenarios where locks do not block each other in different transactions, for example, SELECT FOR SHARE - SELECT FOR SHARE/FOR KEY SHARE, SELECT FOR KEY SHARE - SELECT FOR KEY SHARE/FOR NO KEY SHARE, rows that are locked with preceding locks are not skipped though **SKIP LOCKED** is specified.

  If specified tables are named in a locking clause, then only rows coming from those tables are locked; any other tables used in **SELECT** are simply read as usual. Otherwise, locking all tables in the statement.

  If a locking clause is applied to a view or sub-query, it affects all tables used in the view or sub-query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Multiple locking clauses can be written if it is necessary to specify different locking behaviors for different tables.

If a table appears (or implicitly appears) in multiple clauses at the same time, the strongest lock is used. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

NOTICE

- Only FOR SHARE and FOR UPDATE can be used to query the Ustore table.
- For the FOR UPDATE/SHARE statements whose subquery is a stream plan, the same locked row cannot be concurrently updated.
- The DATABASE LINK function does not support the SKIP LOCKED syntax.

- NLS_SORT

  Specifies that a field is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to **UTF8**, **GB18030**, **GB18030_2022**, **GBK**, or **ZHS16GBK** when creating a database. If you set the encoding format to another format, for example, **SQL_ASCII**, an error may be reported or the sorting mode may be invalid.

  Value range:

  – **SCHINESE_PINYIN_M**, sorted by Pinyin order.

  – **generic_m_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

- **PARTITION clause**

  Queries data in the specified partition in a partitioned table.

7.12.19.3.1 Simple Queries

A simple query retrieves one or more columns of data from one or more tables or views.

The following example demonstrates a typical simple query operation that retrieves both partial and complete information from a specified table:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE student(
    sid INT PRIMARY KEY,
    class INT,
    name  VARCHAR(50),
    sex INT CHECK(sex = 0 OR sex = 1) -- Gender. 1: male; 0: female
);
gaussdb=# INSERT INTO student (sid, class, name, sex) VALUES (1, 1, 'michael', 0);
gaussdb=# INSERT INTO student (sid, class, name, sex) VALUES (2, 2, 'bob', 1);
gaussdb=# INSERT INTO student (sid, class, name, sex) VALUES (3, 2, 'gary', 0);

-- Query some columns.
gaussdb=# SELECT sid, name FROM student;
 sid |  name
-----+---------
   1 | michael
   2 | bob
   3 | gary
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Query all columns.
gaussdb=# SELECT * FROM student;
 sid | class |  name   | sex
-----+-------+---------+-----
   1 |     1 | michael |   0
   2 |     2 | bob     |   1
   3 |     2 | gary    |   0
(3 rows)

-- Specify the column alias.
gaussdb=# SELECT sid student_id, name FROM student;
 student_id |  name
------------+---------
          1 | michael
          2 | bob
          3 | gary
(3 rows)

-- Drop.
gaussdb=# DROP TABLE student;
```

7.12.19.3.2 Conditional Queries

A conditional query retrieves data that meets the conditions.

The following example demonstrates a typical conditional query that displays the query results in a specified table based on specific query conditions:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_grade(
    id INT,
    name VARCHAR(20),
    score FLOAT        -- Score
);
gaussdb=# INSERT INTO test_grade VALUES (1,'Scott',90),(2,'Jack',87.5),(3,'Ben',48);

-- Query information about students who fail to pass the test.
gaussdb=# SELECT * FROM test_grade WHERE score < 60;
 id | name | score
----+------+-------
  3 | Ben  |    48
(1 row)

-- Drop.
gaussdb=# DROP TABLE test_grade;
```

7.12.19.3.3 Group Queries

A group query is usually used together with aggregate functions to query category statistics. Common aggregate functions include count(), sum(), avg(), min(), and max(). GROUP BY is often used in group queries.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE student (id INT,name VARCHAR(20),class INT);
gaussdb=# INSERT INTO student VALUES (1, 'Scott', 1), (2, 'Ben', 1);
gaussdb=# INSERT INTO student VALUES (3, 'Jack', 2),(4, 'Anna', 2),(5, 'Judy', 2);
gaussdb=# INSERT INTO student VALUES (6, 'Sally', 3), (7, 'Jordan', 3);

-- Use the aggregate function COUNT() to count the number of people in each class.
gaussdb=# SELECT class, count(*) AS cnt FROM student GROUP BY class;
 class | cnt
-------+-----
     2 |   3
     1 |   2
     3 |   2
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Use the HAVING clause to retrieve data of classes with fewer than three people.
gaussdb=# SELECT class, COUNT(*) AS num FROM student GROUP BY class HAVING COUNT(*) < 3;
 class | num
-------+-----
     1 |   2
     3 |   2
(2 rows)

-- Drop.
gaussdb=# DROP TABLE student;
```

sql_mode contains the **ONLY_FULL_GROUP_BY** option, which is used to verify the GROUP BY list and SELECT list.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test (
          id int  primary key NOT NULL,
          id_2 int unique NOT NULL,
          s1 varchar(10),
          s2 int,
          s3 varchar(12)
        );
gaussdb=# INSERT INTO test value(1,101,'a',1000,'aa');
gaussdb=# INSERT INTO test value(2,102,'b',2000,'aaa');
gaussdb=# INSERT INTO test value(3,103,'c',3000,'aaaa');
gaussdb=# INSERT INTO test value(4,104,'b',4000,'aaa');
gaussdb=# INSERT INTO test value(5,105,'c',5000,'aaaaa');
gaussdb=# CREATE TABLE tb1(a int, b int, c int);
gaussdb=# INSERT INTO tb1 VALUES(1, 4, 11);
gaussdb=# INSERT INTO tb1 VALUES(2, 5, 12);
gaussdb=# INSERT INTO tb1 VALUES(2, 6, 13);
gaussdb=# INSERT INTO tb1 VALUES(2, 2, 13);
gaussdb=# CREATE TABLE tb2(a int, b int);
gaussdb=# INSERT INTO tb2 VALUES(2, 7);
gaussdb=# INSERT INTO tb2 VALUES(2, 8);
gaussdb=# INSERT INTO tb2 VALUES(3, 9);

-- Set <b>sql_mode</b>.
gaussdb=# SET sql_mode =
'ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_
BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION';

-- If the non-aggregate function column in the SELECT list is consistent with the column for GROUP BY, no
error is reported.
gaussdb=# SELECT s1, s3 FROM test GROUP BY s1,s3 ORDER BY s1,s3;
 s1 |  s3
----+-------
 a  | aa
 b  | aaa
 c  | aaaa
 c  | aaaaa

(1 row)

-- Drop.
gaussdb=# DROP TABLE test, tb1, tb2;
```

7.12.19.3.4 Pagination Queries

The syntax is as follows:

```
SELECT query_list FROM table_name [ LIMIT { [offset,] count | ALL } ]
```

- **offset**: indicates the number of rows to skip before starting to return rows.
- **count**: indicates the number of data records to be retrieved after the skipped rows.
- **ALL**: indicates that all data after the skipped rows is retrieved.

```
-- Create a table and insert 100 data records into the table.
gaussdb=# CREATE TABLE testl(id int PRIMARY KEY, flag varchar(10));
gaussdb=# INSERT INTO testl (id, flag) VALUES (generate_series(1,100),'flag'||generate_series(1,100));

-- Query the first five data records.
gaussdb=# SELECT * FROM testl ORDER BY 1  LIMIT 5;
 id | flag
----+-------
  1 | flag1
  2 | flag2
  3 | flag3
  4 | flag4
  5 | flag5
(5 rows)

-- Query four data records after the twentieth record.
gaussdb=# SELECT * FROM testl ORDER BY 1 LIMIT 20,4;
 id |  flag
----+--------
 21 | flag21
 22 | flag22
 23 | flag23
 24 | flag24
(4 rows)

-- Query all data after the ninety-sixth record.
gaussdb=# SELECT * FROM testl ORDER BY 1 LIMIT 96,ALL;
 id  |  flag
-----+---------
  97 | flag97
  98 | flag98
  99 | flag99
 100 | flag100
(4 rows)

-- Delete.
gaussdb=# DROP TABLE testl;
```

7.12.19.3.5 Partition Queries

Queries data in a specified partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The following example is a typical partition query, demonstrating how to partition a specified table and query information of a designated partition:

```
-- Create a range partitioned table.
gaussdb=# CREATE TABLE test_range1(
    id INT,
    info VARCHAR(20)
) PARTITION BY RANGE (id) (
    PARTITION p1 VALUES LESS THAN (200),
    PARTITION p2 VALUES LESS THAN (400),
    PARTITION p3 VALUES LESS THAN (600),
    PARTITION p4 VALUES LESS THAN (800),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);
-- Insert 1000 data records.
gaussdb=# INSERT INTO test_range1 VALUES(GENERATE_SERIES(1,1000),'abcd');

-- Query the number of data records in the p1 partition.
gaussdb=# SELECT COUNT(*) FROM test_range1 PARTITION (p1);
 count
-------
   199
(1 row)

-- Drop.
gaussdb=# DROP TABLE test_range1;
```

7.12.19.3.6 Join Queries

A join query may also be referred to as a cross-table query, where multiple tables need to be associated.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE emp(
    id int,             -- Employee ID
    name varchar,   -- Employee name
    deptno int      -- Employee department ID
);

gaussdb=# CREATE TABLE dept(
    deptno int,     -- Department ID
    depname varchar -- Department name
);

gaussdb=# INSERT INTO emp VALUES (1, 'Joe', 10), (2, 'Scott', 20), (3, 'Ben', 999);   -- The department of Ben has not been confirmed yet. Therefore, the department ID is 999.
gaussdb=# INSERT INTO dept VALUES (10, 'hr'), (20, 'it'), (30, 'sal');                -- There is no employee in the sal department.
```

- INNER JOIN

  ```
  gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 JOIN dept t2 ON t1.deptno = t2.deptno;
   id | name  | depname
  ----+-------+---------
    1 | Joe   | hr
    2 | Scott | it
  (2 rows)
  ```

- LEFT JOIN

  ```
  gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 LEFT JOIN dept t2 ON t1.deptno =
  t2.deptno;
   id | name  | depname
  ----+-------+---------
    1 | Joe   | hr
    2 | Scott | it
    3 | Ben   |
  (3 rows)
  ```

- RIGHT JOIN

  ```
  gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 RIGHT JOIN dept t2 ON t1.deptno =
  t2.deptno;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
    |       | sal
(3 rows)
```

- FULL JOIN

```
gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 FULL JOIN dept t2 ON t1.deptno =
t2.deptno;
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
    |       | sal
  3 | Ben   |
(4 rows)

-- Delete.
gaussdb=# DROP TABLE emp,dept;
```

7.12.19.3.7 Subqueries

A query can be nested in another query, and its result is used as the data source or condition of the other query. Outer queries are also called parent queries, and inner queries are also called subqueries.

- Subqueries can be classified into single-row subqueries and multi-row subqueries based on the number of records returned.
- Subqueries can be classified into correlated subqueries and non-correlated subqueries based on whether a subquery is executed for multiple times.

Single-Row Subqueries

Single-row subquery operators include >=, >, <=, <, and <>.

```
-- Create a student table and insert data into the table.
gaussdb=# CREATE TABLE student(
    sid VARCHAR(5),      -- Student ID
    grade INT,           -- Grade
    name VARCHAR(20),    -- Name
    height INT           -- Height
);
gaussdb=# INSERT INTO student VALUES ('00001',1,'Scott',135),('00002',1,'Jack',95),('00003',1,'Ben',100);
gaussdb=# INSERT INTO student VALUES ('00004',2,'Henry',115),('00005',2,'Jordan',130),
('00006',2,'Bob',126);
gaussdb=# INSERT INTO student VALUES ('00007',3,'Bella',128),('00008',3,'Alicia',136);
-- Create a teacher table and insert data into the table.
gaussdb=# CREATE TABLE teacher (
    name VARCHAR(20),    -- Teacher name
    grade INT            -- Class
);
-- Insert data.
gaussdb=# INSERT INTO teacher VALUES ('Bill',1),('Sally',2),('Luke',3);

-- Query the students who are taller than Bella.
gaussdb=# SELECT * FROM student
WHERE height > (SELECT height FROM student WHERE name = 'Bella');
  sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00008 |     3 | Alicia |    136
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Multi-Row Subqueries

Multi-row subquery operators are as follows:

- IN: equal to any value in the list.
- ANY: used together with single-row comparison operators to compare with any value returned by the subquery.
- ALL: used together with single-row comparison operators to compare with all values returned by the subquery.
- SOME: another name for ANY and both operators have the same effect.

Example: Query the students of Sally and Luke.

```
gaussdb=# SELECT * FROM student t1 WHERE t1.grade IN (
    SELECT grade FROM teacher WHERE name = 'Sally' OR name = 'Luke'
);
  sid  | grade |  name  | height
-------+-------+--------+--------
 00004 |     2 | Henry  |    115
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00007 |     3 | Bella  |    128
 00008 |     3 | Alicia |    136
(5 rows)
```

Example: Query the students in grade 2 who are taller than any students in grade 3.

```
gaussdb=# SELECT * FROM student
WHERE grade = 2 AND
      height > ANY (SELECT height FROM student WHERE grade = 3);
  sid  | grade |  name  | height
-------+-------+--------+--------
 00005 |     2 | Jordan |    130
(1 row)

-- The query result is equivalent to that of the following query:
gaussdb=# SELECT * FROM student
WHERE grade = 2 AND
      height > (SELECT MIN(height) FROM student WHERE grade = 3);
```

Example: Query the students in grade 1 who are taller than all students in grade 2.

```
gaussdb=# SELECT * FROM student
WHERE grade = 1 AND
      height > ALL (SELECT height FROM student WHERE grade = 2);
  sid  | grade | name  | height
-------+-------+-------+--------
 00001 |     1 | Scott |    135
(1 row)

-- The query result is equivalent to that of the following query:
gaussdb=# SELECT * FROM student
WHERE grade = 1 AND
      height > (SELECT MAX(height) FROM student WHERE grade = 2);
```

Correlated Subqueries

Characteristics: Subqueries cannot run independently and are related to parent queries. Execute parent queries and then subqueries. Each time a parent query is executed, its subquery is recalculated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example: Query the students whose height is greater than the average height of the students in the class.

```
gaussdb=# SELECT * FROM student out
WHERE height > (SELECT AVG(height) FROM student
               WHERE grade = out.grade);
 sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00008 |     3 | Alicia |    136
(4 rows)
```

Non-Correlated Subqueries

Characteristics: A subquery queries the value and then returns the result to the outer layer for query.

Example: Query the students whose height is greater than the average height of the students in the class.

```
gaussdb=# SELECT t1.*
FROM student t1,
    (SELECT grade, AVG(height) avg_hei FROM student GROUP BY grade) t2
WHERE t1.grade = t2.grade AND
     t1.height > t2.avg_hei;
 sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00008 |     3 | Alicia |    136
(4 rows)
-- Delete.
gaussdb=# DROP TABLE student;
gaussdb=# DROP TABLE teacher;
```

7.12.19.3.8 Hierarchical Queries

Syntax

```
SELECT [level], column FROM table
START WITH condition
CONNECT BY[PRIOR column1 = column2|column1 = prior column2]
[ORDER SIBLINGS BY] [GROUP BY]
```

Parameters

- **level**: specifies the pseudocolumn to return the query level.
- **START WITH**: specifies the hierarchy, that is, the root row of the query.
- **CONNECT BY**: specifies the relationship between parent rows and child rows.
- **PRIOR**: specifies the parent level.
- **ORDER SIBLINGS BY**: specifies the sequence in the same level.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE area (id INT,name VARCHAR(25),parent_id INT);
gaussdb=# INSERT INTO area VALUES (1,'China',NULL);
gaussdb=# INSERT INTO area VALUES (2,'Beijing',1);
gaussdb=# INSERT INTO area VALUES(3,'Chaoyang District',2);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO area VALUES(4,'Shaanxi Province',1);
gaussdb=# INSERT INTO area VALUES(5,'Xi''an',4);
gaussdb=# INSERT INTO area VALUES(6,'Yanta District',5);
gaussdb=# INSERT INTO area VALUES(7,'Weiyang District',5);

-- Query the hierarchy.
gaussdb=# SELECT level, name FROM area
   START WITH (id = 1)
   CONNECT BY PRIOR id = parent_id;
 level |  name
-------+--------
     1 | China
     2 | Shaanxi Province
     3 | Xi'an
     4 | Weiyang District
     4 | Yanta District
     2 | Beijing
     3 | Chaoyang District
(7 rows)
```

- Use WHERE to remove a node (only Beijing).

```
-- Use WHERE to remove a node (only Beijing).
gaussdb=# SELECT level, name FROM area
   WHERE id <> 2
   START WITH (id = 1)
   CONNECT BY PRIOR id = parent_id;
 level |  name
-------+--------
     1 | China
     2 | Shaanxi Province
     3 | Xi'an
     4 | Weiyang District
     4 | Yanta District
     3 | Chaoyang District
(6 rows)
```

- Add a condition to the CONNECT BY PRIOR clause to remove a branch (Beijing and its sub-regions).

```
gaussdb=# SELECT level, name FROM area
   START WITH (id = 1)
   CONNECT BY PRIOR id = parent_id AND id <> 2;
 level |  name
-------+--------
     1 | China
     2 | Shaanxi Province
     3 | Xi'an
     4 | Weiyang District
     4 | Yanta District
(5 rows)

-- Delete.
gaussdb=# DROP TABLE area;
```

7.12.19.3.9 Compound Queries

A query that contains a compound operator is a compound query. All compound queries have the same priority. The number of columns and expressions in each query result in a set operation must be the same, and the types must be compatible.

Common set operations include:

- UNION: a union set of the two query result sets where duplicates are removed.
- UNION ALL: a union set of the two queries where the results of the two queries are simply combined.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- INTERSECT: intersection of two queries (only duplicated data is displayed).
- MINUS: difference of two query result sets. Only the data that exists in the first result set but does not exist in the second result set is displayed, and the data is sorted based on the results in the first column.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test1(c11 INT, c12 VARCHAR);
gaussdb=# INSERT INTO test1 VALUES (1,'a'),(2,'b'),(4,'d');

gaussdb=# CREATE TABLE test2(c21 INT, c22 VARCHAR);
gaussdb=# INSERT INTO test2 VALUES (1,'a'),(3,'c');
```

- UNION

```
gaussdb=# SELECT * FROM test1 UNION SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
   4 | d
   2 | b
   3 | c
(4 rows)
```

- UNION ALL

```
gaussdb=# SELECT * FROM test1 UNION ALL SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
   2 | b
   4 | d
   1 | a
   3 | c
(5 rows)
```

- INTERSECT

```
gaussdb=# SELECT * FROM test1 INTERSECT SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
(1 row)
```

- MINUS

```
gaussdb=# SELECT * FROM test1 MINUS SELECT * FROM test2;
 c11 | c12
-----+-----
   4 | d
   2 | b
(2 rows)
-- Delete.
gaussdb=# DROP TABLE test1,test2;
```

7.12.19.3.10 Rows to Columns and Columns to Rows

- Rows to columns

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_p1(id INT, math INT, english INT);
gaussdb=# INSERT INTO test_p1 VALUES (1,84,78), (2,98,82), (3,68,59);
gaussdb=# SELECT * FROM test_p1;
 id | math | english
----+------+---------
  3 |   68 |      59
  1 |   84 |      78
  2 |   98 |      82
(3 rows)

-- Convert rows to columns.
gaussdb=# SELECT * FROM test_p1 UNPIVOT(score FOR class IN(math, english));
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 id |  class  | score
----+---------+-------
  3 | MATH    |    68
  3 | ENGLISH |    59
  1 | MATH    |    84
  1 | ENGLISH |    78
  2 | MATH    |    98
  2 | ENGLISH |    82
(6 rows)

-- Delete.
gaussdb=# DROP TABLE test_p1;
```

- Columns to rows

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_p2(id INT, class VARCHAR(20), score INT);
gaussdb=# INSERT INTO test_p2 VALUES (1,'math',64), (1,'english',78);
gaussdb=# INSERT INTO test_p2 VALUES (2,'math',98), (2,'english',82);
gaussdb=# INSERT INTO test_p2 VALUES (3,'math',68), (3,'english',59);
gaussdb=# SELECT * FROM test_p2;
 id |  class  | score
----+---------+-------
  3 | math    |    68
  3 | english |    59
  1 | math    |    64
  1 | english |    78
  2 | math    |    98
  2 | english |    82
(6 rows)

-- Convert columns to rows.
gaussdb=# SELECT * FROM test_p2 PIVOT(MAX(score) FOR class IN('math','english'));
 id | 'math' | 'english'
----+--------+-----------
  3 |     68 |        59
  1 |     64 |        78
  2 |     98 |        82
(3 rows)

-- Delete.
gaussdb=# DROP TABLE test_p2;
```

7.12.19.3.11 Window Function Queries

The window function performs a calculation on the related row set in the data set and returns a result set.

Compared with the calculation performed by the aggregate function, the window function does not aggregate multiple rows into a single output row.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE fruit_sale (
  "statistical_date" date,
  "product" varchar(255),
  "year" varchar(5),
  "sales_quantity" numeric(8),
  "amount" numeric(8)
);

gaussdb=# INSERT INTO fruit_sale VALUES ('2024-01-01', 'Watermelon', '2024', 1721, 253541);
gaussdb=# INSERT INTO fruit_sale VALUES ('2024-01-01', 'Apple', '2024', 5559, 269419);
gaussdb=# INSERT INTO fruit_sale VALUES ('2024-02-01', 'Watermelon', '2024', 4711, 129644);

-- Collect statistics on the sales volume of all fruits.
gaussdb=# SELECT *,SUM(sales_quantity) OVER (PARTITION by null) total_qty FROM fruit_sale;
 statistical_date | product | year | sales_quantity | amount | total_qty
------------------+---------+------+----------------+--------+-----------
 2024-01-01       | Watermelon    | 2024 |          1721 | 253541 |     11991
 2024-01-01       | Apple    | 2024 |          5559 | 269419 |     11991
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 2024-02-01       | Watermelon    | 2024 |          4711 | 129644 |     11991
(3 rows)

-- Drop.
gaussdb=# DROP TABLE fruit_sale;
```

7.12.19.3.12 Simplified Queries

Uses the TABLE syntax to directly specify a particular table for query.

The operation is equivalent to performing a simple query for all table information using the SELECT syntax.

```
-- Create a table.
gaussdb=# CREATE TABLE t1(c1 int, c2 int, c3 int);

-- Insert data.
gaussdb=# INSERT INTO t1 VALUES (1,2,3);
 c1 | c2 | c3
----+----+----
  1 |  2 |  3
(1 row)

-- Query data in the table.
gaussdb=# TABLE t1;
 c1 | c2 | c3
----+----+----
  1 |  2 |  3
(1 row)

-- Drop.
gaussdb=# DROP TABLE t1;
```

7.12.19.3.13 Queries Using Hints

Optimizes the query result based on the specified hint rule.

The following example demonstrates a typical hint query that optimizes the query results based on specific hint rules in a specified table.

```
-- Create a table.
gaussdb=# CREATE TABLE t1(c1 int, c2 int, c3 int);
gaussdb=# CREATE TABLE t2(c1 int, c2 int, c3 int);
gaussdb=# CREATE INDEX it1 ON t1(c1,c2);

-- Specify the scanning mode using a hint.
gaussdb=# EXPLAIN SELECT /*+ indexscan(t1 it1)*/* from t1,t2 WHERE t1.c1=t2.c2;
 id |             operation             | E-rows | E-width |     E-costs
----+-----------------------------------+--------+---------+-----------------
  1 | ->  Hash Join (2,3)               |  18915 |      24 | 53.763..345.512
  2 |    ->  Index Scan using it1 on t1 |   1945 |      12 | 0.000..73.425
  3 |    ->  Hash                       |   1945 |      12 | 29.450..29.450
  4 |       ->  Seq Scan on t2          |   1945 |      12 | 0.000..29.450
(4 rows)

 Predicate Information (identified by plan id)
-----------------------------------------------
   1 --Hash Join (2,3)
         Hash Cond: (t1.c1 = t2.c2)
(2 rows)

-- Specify the number of rows using a hint.
gaussdb=# EXPLAIN SELECT /*+ rows(t1 t2 #5)*/* FROM t1,t2;
 id |        operation          | E-rows | E-width |     E-costs
----+---------------------------+--------+---------+-----------------
  1 | ->  Nested Loop (2,3)     |      5 |      24 | 0.000..47351.575
  2 |    ->  Seq Scan on t1     |   1945 |      12 | 0.000..29.450
  3 |    ->  Materialize        |   1945 |      12 | 0.000..39.175
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 4 |      ->  Seq Scan on t2 |   1945 |      12 | 0.000..29.450
(4 rows)

gaussdb=# DROP TABLE t1;
gaussdb=# DROP TABLE t2;
```

7.12.19.4 SELECT INTO

Description

SELECT INTO creates a table based on the query result and inserts data retrieved by the query to the new table. Different from common SELECT, SELECT INTO does not return data to the client. The columns of the new table have the same names and data types as the output columns of SELECT.

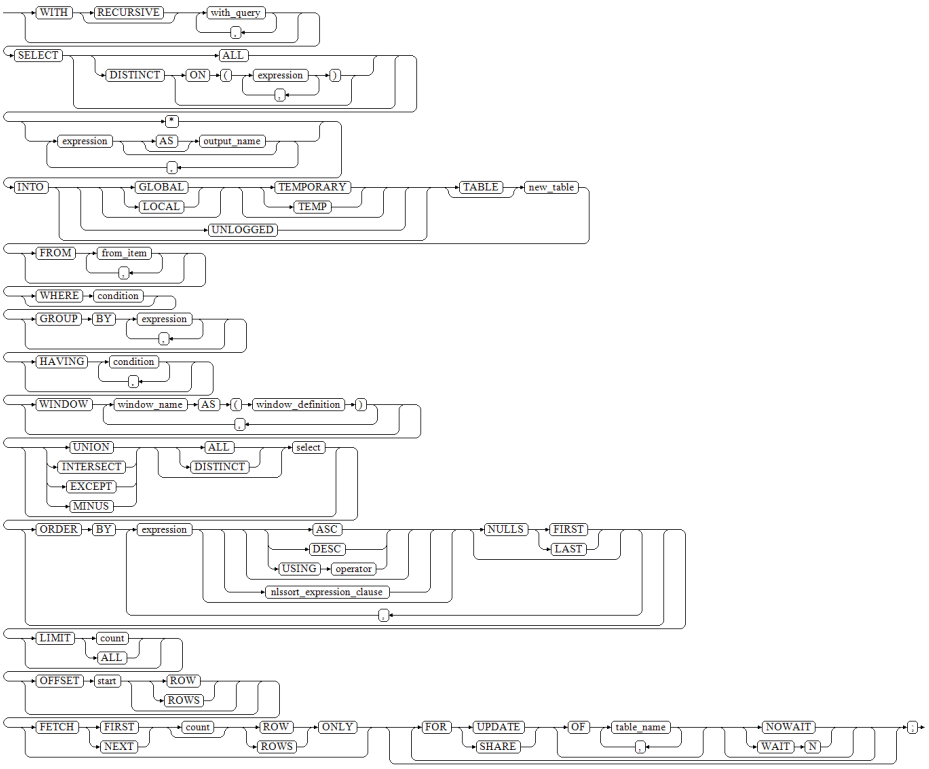
Precautions

CREATE TABLE AS provides functions similar to SELECT INTO in functions and provides a superset of functions provided by SELECT INTO. You are advised to use CREATE TABLE AS, because SELECT INTO cannot be used in a stored procedure.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
    { * | {expression [ [ AS ] output_name ]} [, ...] }
    INTO [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] [ TABLE ] new_table
    [ FROM from_item [, ...] ]
    [ WHERE condition ]
    [ GROUP BY expression [, ...] ]
    [ HAVING condition [, ...] ]
    [ WINDOW {window_name AS ( window_definition )} [, ...] ]
    [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
    [ LIMIT { count | ALL } ]
    [ OFFSET start [ ROW | ROWS ] ]
    [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
    [ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT |WAIT N]} [...] ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **new_table**

  Specifies the name of the new table.

- **UNLOGGED**

  Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

  – Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

  – Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the GLOBAL or LOCAL keyword before TEMP or TEMPORARY. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

  If TEMP or TEMPORARY is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table

is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using ON COMMIT PRESERVE ROWS or ON COMMIT DELETE ROWS. The former one creates a session-level table, where user data is automatically cleared when a session ends; the latter creates a transaction-level table, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg_temp_** when creating a global temporary table.

A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. TEMP is equivalent to TEMPORARY.

NOTICE

- Local temporary tables are visible to the current session through the schema starting with **pg_temp_**. You are advised not to manually delete the schema starting with **pg_temp_** or **pg_toast_temp_**.
- If TEMPORARY or TEMP is not specified when you create a table and its schema is set to that starting with **pg_temp_** in the current session, the table will be created as a temporary table.
- If another session is using a global temporary table or index, the ALTER or DROP operation cannot be performed on it.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

NOTE

For details about other parameters of SELECT INTO, see **Parameters**.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_person (
  id     integer,
  name   varchar(20),
  gender varchar(5) CHECK(gender = 'Male' or gender = 'Female')
);
gaussdb=# INSERT INTO tbl_person VALUES (1, 'Bob', 'Male'),(2, 'Anne', 'Female'),(3, 'Jack', 'Male'),(4,
'Danny', 'Male'),(5, 'Alice', 'Female'),(6, 'Susan', 'Female');

-- Add information about all persons whose gender is male in the person table to the new table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * INTO tbl_man FROM tbl_person WHERE gender =' Male'

-- Query data in the tbl_man table.
gaussdb=# SELECT * FROM tbl_man;
 id | name  | gender
----+-------+-----
  1 | Bob   | Male
  3 | Jack  | Male
  4 | Danny | Male
(3 rows)

-- Drop the table.
gaussdb=# DROP TABLE tbl_person, tbl_man;
```

Helpful Links

SELECT

7.12.19.5 SET

Description

Modifies a GUC parameter.

Precautions

Most GUC parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

Syntax

- Set the system time zone.
  ```
  SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
  ```
- Set the schema of the table.
  ```
  SET [ SESSION | LOCAL ]
    {CURRENT_SCHEMA { TO | = } { schema | DEFAULT }
    | SCHEMA 'schema'};
  ```
- Set client-side encoding.
  ```
  SET [ SESSION | LOCAL ] NAMES {'charset_name' [COLLATE 'collation_name'] | DEFAULT};
  ```
- Set other GUC parameters.
  ```
  SET [ SESSION | LOCAL ]
    {config_parameter { { TO | = } { value | DEFAULT }
                      | FROM CURRENT }};
  ```
- Set parameters in B-compatible mode (**sql_compatibility** set to **'B'**).
  ```
  SET [ SESSION | @@SESSION. | @@]
      {config_parameter = { expr | DEFAULT }};
  ```
- Set user-defined user variables.
  ```
  SET @var_name := expr [, @var_name := expr] ...
  SET @var_name = expr [, @var_name = expr] ...
  ```
- Set XML parsing mode.
  ```
  SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
  ```

Parameters

- **SESSION**

  Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If this command is executed in a transaction, the effect of the command disappears after the transaction is rolled back. Once the surrounding transaction is committed, the effect will persist until the end of the session, unless the parameters are reset by another SET statement.

- **LOCAL**

  Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.

  The effect of this command lasts only until the end of the current transaction, whether the transaction is committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME ZONE timezone**

  Specifies the local time zone for the current session.

  Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT_SCHEMA schema**

  Specifies the current schema.

  Value range: an existing schema name If the schema name does not exist, the value of **CURRENT_SCHEMA** will be empty.

- **SCHEMA schema**

  Specifies the current schema. Here the schema is a string.

  Example: set schema 'public';

- **NAMES {'charset_name' [COLLATE 'collation_name'] | DEFAULT};**
- The COLLATE clause can be specified when the **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s2'** in B-compatible mode.

  Sets the client character encoding, character set of a constant string, collation, and character set of the returned result.

  It is equivalent to:

  ```
  set client_encoding = charset_name; set character_set_connection = charset_name;
  set collation_connection = collation_name; set character_set_results = charset_name;
  ```

  Value range: character sets and collations supported in B-compatible mode. Currently, the database character set must be specified for **charset_name**.

- The COLLATE clause cannot be specified in other scenarios.

  Specifies the client character encoding.

  It is equivalent to:

  ```
  set client_encoding to charset_name
  ```

  Value range: a valid character encoding name. The GUC parameter corresponding to this option is **client_encoding**. The default encoding is **UTF8**.

- **config_parameter**

  Specifies the name of a configurable GUC parameter. You can use **SHOW ALL** to view available GUC parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max_datanodes**.

- **value**

  Specifies the new value of **config_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these. **DEFAULT** can be written to indicate resetting the parameter to its default value.

- **SESSION | @@SESSION. | @@**

  The declared parameter takes effect in superuser or user mode, which can be determined by the context column in the pg_settings system view. If neither GLOBAL nor SESSION exists, SESSION is used as the default value. The value of **config_parameter** can be an expression.

  > NOTE
  >
  > 1. SET SESSION is supported only in B-compatible mode (**sql_compatibility** set to **'B'**) and the value of **b_format_behavior_compat_options** is set to **'enable_set_variables'**.
  > 2. When @@config_parameter is used for operator calculation, use spaces to separate them. For example, in the **set @@config_parameter1=@@config_parameter1*2;** command, **=@@** is used as an operator. You can change **=@@** to **set @config_parameter1= @@config_parameter1 * 2**.

- **var_name**

  User-defined variable name. A variable name can contain only digits, letters, underscores (_), periods (.), and dollar signs ($). If a variable name is quoted using single or double quotation marks, other characters can be used, such as 'var_name', "var_name", and `var_name`.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- User-defined variables can be set only in B-compatible mode (**sql_compatibility** set to **'B'**) and the value of the GUC parameter **b_format_behavior_compat_options** is set to **'enable_set_variables'**.
- User-defined variables store only integers, floating point numbers, strings, bit strings, and NULL. The BOOLEAN, INT1, INT2, INT4, and INT8 types will be converted to the INT8 type, and the FLOAT4, FLOAT8, and NUMERIC types will be converted to the FLOAT8 type for storage. Note that the precision of the floating-point type may be lost. The BIT type is stored in BIT, the VARBIT type is stored in VARBIT, and the NULL value is stored in NULL. If other types can be converted into character strings, they are converted into TEXT for storage.
- When @var_name is used for operator calculation, use spaces to separate them. For example, in the **set @v1=@v2+1;** command, **=@** is used as an operator. You can change **=@** to **set @v1= @v2+1**.
- When **sql_compatibility** is set to **'B'** and **b_format_behavior_compat_options** is set to **'enable_set_variables'**, for the original @ expr of the database (see **Arithmetic Operators**), there must be a space between @ and expr. Otherwise, @ will be parsed into a user-defined variable.
- The value of an uninitialized variable is NULL.
- Character strings stored in user-defined variables in the PREPARE statement support only the SELECT, INSERT, UPDATE, DELETE, and MERGE syntax.
- In consecutive value assignment scenarios, only **@var_name1 := @var_name2 :=... := expr and @var_name1 = @var_name2 :=... := expr** is supported. An equal sign (=) indicates a value assignment only when it is placed at the beginning, and other positions indicate comparison operators.

- **expr**

  Expression, which can be directly or indirectly converted to an integer, floating point, string, bit string, or NULL.

  NOTE

  Do not use functions that contain sensitive information (such as passwords) in character string expressions, such as encryption and decryption functions gs_encrypt and gs_decrypt, to prevent sensitive information leakage.

Examples

```
-- Set the time zone.
gaussdb=# SET TIME ZONE 'PST8PDT';

-- Set the search path of a schema.
gaussdb=# SET search_path TO tpcds, public;

-- Set client-side encoding.
gaussdb=# SET client_encoding TO utf8;

-- Set XML parsing mode.
gaussdb=# SET XML OPTION DOCUMENT;

-- Set the date style to the traditional POSTGRES style (date placed before month):
gaussdb=# SET datestyle TO postgres,dmy;

--Set user-defined variables.
gaussdb=# CREATE DATABASE user_var DBCOMPATIBILITY 'B';
gaussdb=# \c user_var
user_var=# SET b_format_behavior_compat_options = enable_set_variables;
user_var=# SET @v1 := 1, @v2 := 1.1, @v3 := true, @v4 := 'dasda', @v5 := x'41';

-- Query user-defined variables.
user_var=# SELECT @v1, @v2, @v3, @v4, @v5, @v6, @v7;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
@v1 | @v2 | @v3 |  @v4  |   @v5    | @v6 | @v7
-----+-----+-----+-------+----------+-----+-----
   1 | 1.1 |   1 | dasda | 01000001 |     |
(1 row)
-- Use user-defined variables.
user_var=# SET @sql = 'select 1';
user_var=# PREPARE stmt as @sql;
user_var=# EXECUTE stmt;
user_var=# \c postgres

-- Drop the database.
gaussdb=# DROP DATABASE user_var;
```

```
-- Set B-compatible parameters.
gaussdb=# CREATE DATABASE test_set dbcompatibility 'B';
gaussdb=# \c test_set
test_set=# set b_format_behavior_compat_options = 'enable_set_variables';

-- Set session variables.
test_set=# SET @@codegen_cost_threshold = 10000;
test_set=# SET @@session.codegen_cost_threshold = @@codegen_cost_threshold * 2;

-- Set global variables.
test_set=# \c postgres

-- Drop the database.
gaussdb=# DROP DATABASE test_set;
```

RESET and **SHOW**

7.12.19.6 SET CONSTRAINTS

Description

SET CONSTRAINTS sets the behavior of constraint checking within the current transaction.

IMMEDIATE constraints are checked at the end of each statement. DEFERRED constraints are not checked until transaction commit. Each constraint has its own mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by SET CONSTRAINTS.

SET CONSTRAINTS with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, any data that is modified at the end of the transaction is checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction.

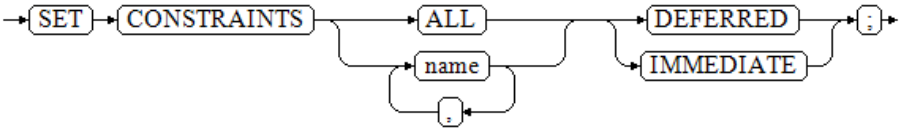
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

SET CONSTRAINTS sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (START TRANSACTION/COMMIT pair), it will not appear to have any effect.

Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE };
```



Parameters

- **name**

  Specifies the constraint name.

  Value range: an existing table name, which can be found in the system catalog **pg_constraint**.

- **ALL**

  Specifies all constraints.

- **DEFERRED**

  Specifies that constraints are not checked until transaction commit.

- **IMMEDIATE**

  Specifies that constraints are checked at the end of each statement.

Examples

```
-- Set that constraints are checked when a transaction is committed.
gaussdb=# SET CONSTRAINTS ALL DEFERRED;

-- Set that constraints are checked at the end of each statement.
gaussdb=# SET CONSTRAINTS ALL IMMEDIATE;
```

7.12.19.7 SET ROLE

Description

Sets the current user identifier of the current session.

Precautions

- Users of the current session must be the role members specified by **rolename**, but system administrators can choose any roles.
- Executing this statement may add or restrict permissions of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all permissions of roles that SET ROLE enables the role to be. In this case, SET ROLE physically deletes all permissions directly granted to session users and permissions of its belonging roles and only leaves permissions of the specified roles. If the role of the session user has the **NOINHERITS** attribute, SET ROLE

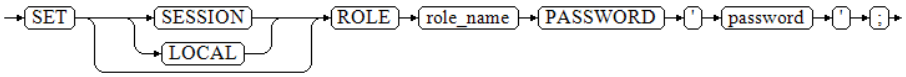
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

deletes permissions directly granted to the session user and obtains permissions of the specified role.

Syntax

- Set the current user identifier of the current session.

```
SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';
```



- Reset the current user identifier to that of the current session.

```
RESET ROLE;
```

Parameters

- **SESSION**

  Specifies that the statement takes effect only for the current session. This parameter is used by default.

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Indicates the role name.

  Value range: a string. It must be an existing username in the database.

- **password**

  Specifies the password of a role. It must comply with the password convention.

  NOTE

  - The restrictions on using a ciphertext password are as follows:
    - An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.
  - Ciphertext passwords are usually used in gs_dump and gs_dumpall export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **RESET ROLE**

  Resets the current user identifier.

Examples

```
-- Query the current session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Create a role paul.
gaussdb=# CREATE ROLE paul PASSWORD '********';

-- Set the current user to paul.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SET ROLE paul PASSWORD '********';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | paul
(1 row)

-- Reset the current user.
gaussdb=> RESET ROLE;

-- Drop the user.
gaussdb=# DROP USER paul;
```

Helpful Links

SET SESSION AUTHORIZATION

7.12.19.8 SET SESSION AUTHORIZATION

Description

Sets the session user identifier and the current user identifier of the current SQL session to a specified user.

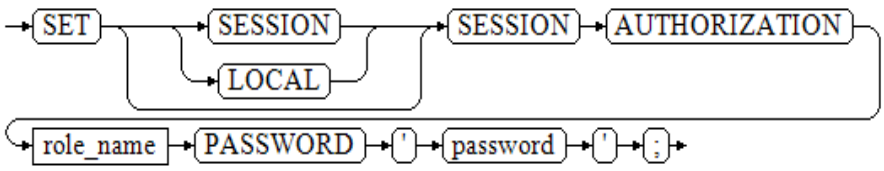
Precautions

The session identifier can be changed only when the initial session user has the system administrator rights. Otherwise, the system supports the statement only when the authenticated username is specified.

Syntax

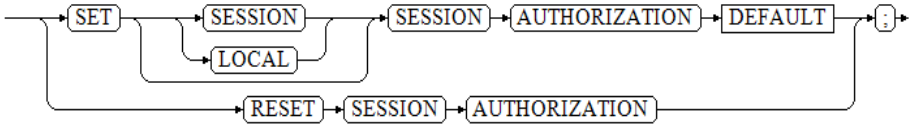
- Set the session user identifier and the current user identifier of the current session.

```
SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';
```



- Reset the identifiers of the session and current users to the initially authenticated usernames.

```
{SET [ SESSION | LOCAL ] SESSION AUTHORIZATION DEFAULT
   | RESET SESSION AUTHORIZATION};
```



Parameters

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Username.

  Value range: a string. It must be an existing username in the database.

- **password**

  Specifies the password of a role. It must comply with the password convention.

  NOTE

  The restrictions on using a ciphertext password are as follows:

  - An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.

  Ciphertext passwords are usually used in gs_dump and gs_dumpall export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **DEFAULT**

  Resets the identifiers of the session and current users to the initially authenticated usernames.

Examples

```
-- Query the session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Create a role paul.
gaussdb=# CREATE ROLE paul PASSWORD '********';

-- Set the current user to paul, and query the session user and current user.
gaussdb=# SET SESSION AUTHORIZATION paul PASSWORD '********';
gaussdb=> SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 paul         | paul
(1 row)

-- Reset the session user and the current user.
gaussdb=> RESET SESSION AUTHORIZATION;
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Delete the user.
gaussdb=# DROP USER paul;
```

SET ROLE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.9 SET TRANSACTION

Description

Sets the transaction characteristics. Available transaction characteristics include the transaction isolation level and transaction access mode (read/write or read only). You can set the local features of the current transaction, the default global transaction features inside a session, or the global transaction features among sessions of the current database.

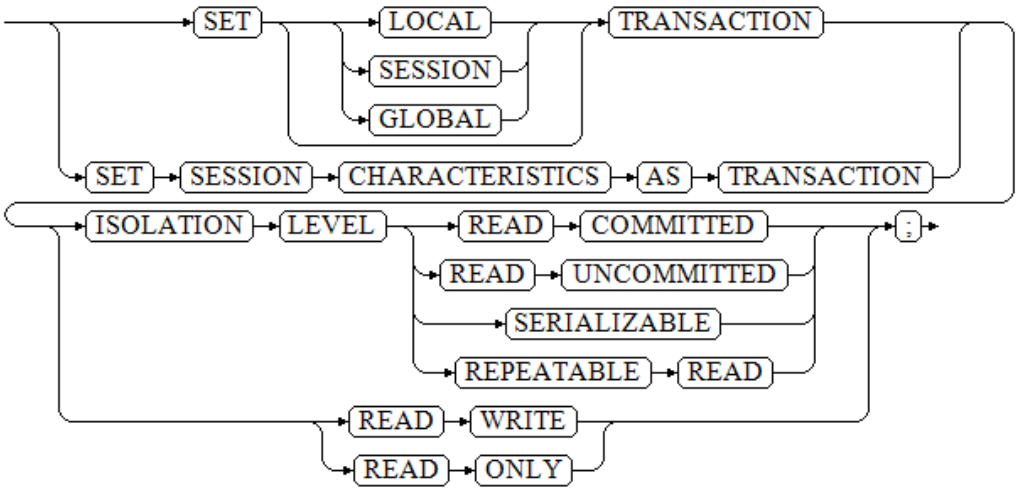
Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect. The settings of the global transaction features among sessions of the current database take effect after reconnection.

Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [ LOCAL | SESSION | GLOBAL ] TRANSACTION|SET SESSION CHARACTERISTICS AS TRANSACTION }
  { ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
  | { READ WRITE | READ ONLY } };
```



Parameters

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

  The SET SESSION TRANSACTION statement takes effect only after **sql_compatibility** is set to **'B'** and the GUC parameter **b_format_behavior_compat_options** is set to **set_session_transaction**. It is equivalent to SET SESSION CHARACTERISTICS AS TRANSACTION.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **GLOBAL**

  Specifies that this command takes effect for global sessions of the current database.

  Application scope: This parameter takes effect in when **sql_compatibility** is set to **'B'**. It takes effect for subsequent sessions.

- **SESSION CHARACTERISTICS**

  Specifies that the specified parameters take effect for the current session.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  NOTE

  - The isolation level cannot be changed after data is modified using SELECT, INSERT, DELETE, UPDATE, FETCH, or COPY in the current transaction.
  - The SET SESSION CHARACTERISTICS AS TRANSACTION ISOLATION LEVEL in a transaction block does not take effect for the current transaction. It takes effect only after the COMMIT operation is performed.

  Value range:

  - **READ COMMITTED**: Only committed data can be read. This is the default value.
  - **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE my_compatible_db DBCOMPATIBILITY 'B';
gaussdb=# \c my_compatible_db

-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
my_compatible_db=# START TRANSACTION;
my_compatible_db=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
my_compatible_db=# COMMIT;

-- Set the transaction isolation level and read/write mode of the current session.
-- In B-compatible mode (sql_compatibility = 'B'), set b_format_behavior_compat_options to set_session_transaction.
my_compatible_db=# SET b_format_behavior_compat_options TO set_session_transaction;
my_compatible_db=# SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;

-- Set the transaction isolation level and read/write mode of all sessions of the current database (sql_compatibility = 'B').
gaussdb=# SET GLOBAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual database name.
my_compatible_db=# \c postgres
gaussdb=# DROP DATABASE my_compatible_db;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

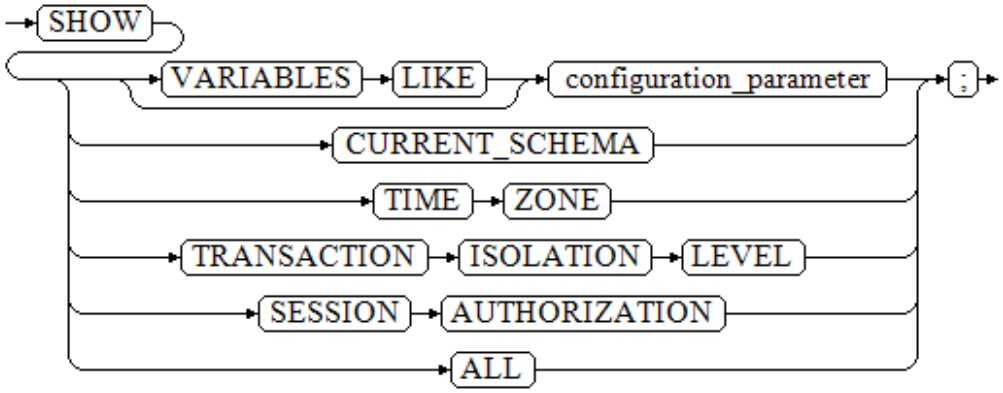
7.12.19.10 SHOW

Description

SHOW shows the current value of a GUC parameter.

Syntax

```
SHOW
 {
   [VARIABLES LIKE] configuration_parameter |
   CURRENT_SCHEMA |
   TIME ZONE |
   TRANSACTION ISOLATION LEVEL |
   SESSION AUTHORIZATION |
   ALL
 };
```



Parameters

- **configuration_parameter**

  Specifies the name of a GUC parameter.

  Value range: GUC parameters. You can view them by running the **SHOW ALL** command.

  NOTE

  Some parameters viewed by running **SHOW ALL** cannot be set by running **SET**, for example, **max_datanodes**.

- **CURRENT_SCHEMA**

  Specifies the current schema.

- **TIME ZONE**

  Specifies the time zone.

- **TRANSACTION ISOLATION LEVEL**

  Specifies the transaction isolation level.

- **SESSION AUTHORIZATION**

  Specifies the session authorization.

- **ALL**

  Specifies all GUC parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Show the value of timezone.
gaussdb=# SHOW timezone;
TimeZone
----------
 PRC
(1 row)

-- Show the current schema.
gaussdb=# SHOW CURRENT_SCHEMA;
 current_schema
----------------
 "$user",public
(1 row)

-- Show the isolation level of a transaction.
gaussdb=# SHOW TRANSACTION ISOLATION LEVEL;
 transaction_isolation
-----------------------
 read committed
(1 row)

-- Show the user identifier of the current session.
gaussdb=# SHOW SESSION AUTHORIZATION;
 session_authorization
-----------------------
 omm1
(1 row)

-- Show all parameters.
gaussdb=# SHOW ALL;

-- Show all parameters whose names contain var.
gaussdb=# SHOW VARIABLES LIKE var;
```

Helpful Links

SET and **RESET**

7.12.19.11 SHOW EVENTS

Description

Displays basic information about all scheduled tasks in a specified schema.

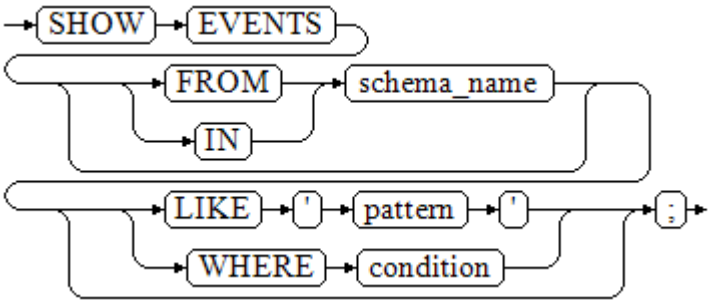
Precautions

Operations related to scheduled tasks are supported only when **sql_compatibility** is set to **'B'**.

Syntax

```
SHOW EVENTS
    [{FROM | IN} schema_name]
    [LIKE 'pattern' | WHERE condition];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **{FROM | IN}**

  Specifies the schema to be queried. By default, the current schema is queried.

- **LIKE**

  Matches a scheduled task by name. If this parameter is not specified, all scheduled tasks in the current schema are printed.

- **WHERE**

  Forms an expression for row selection to narrow down the query range of **SHOW EVENTS**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved.

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test_event WITH DBCOMPATIBILITY = 'b';
test_event=# \c test_event

-- Create a schema.
test_event=# CREATE SCHEMA test;

-- Create a table.
test_event=# CREATE TABLE t_ev(num int);

-- Create a scheduled task in the current schema by default.
test_event=# CREATE EVENT IF NOT EXISTS event_e2 ON SCHEDULE EVERY 1 minute DO insert into t_ev
values(1);

-- Create a scheduled task in the test schema.
test_event=# CREATE EVENT IF NOT EXISTS test.event_e3 ON SCHEDULE EVERY 1 minute DO insert into
t_ev values(2);

-- View the scheduled tasks.
test_event=# SHOW EVENTS;
job_name | schema_name | log_user | priv_user | job_status |         start_date         |       interval       |
end_date       | enable |                failure_msg
----------+-------------+----------+-----------+------------+----------------------------+----------------------
+---------------------+--------+-------------------------------
event_e2  | public      | omm      | omm       | s          | 2023-11-28 10:13:48.675215 | interval '1'  minute |
3999-12-31 16:00:00 | t      |
(1 rows)

-- View the scheduled task in the test schema.
test_event=# SHOW EVENTS FROM test;
job_name | schema_name | log_user | priv_user | job_status |         start_date         |       interval       |
end_date       | enable |                failure_msg
----------+-------------+----------+-----------+------------+----------------------------+----------------------
+---------------------+--------+-------------------------------event_e3 | test        | omm      | omm       | s          |
2023-11-28 10:29:42.327827 | interval '1'  minute | 3999-12-31 16:00:00 | t      |
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the scheduled tasks.
test_event=# DROP EVENT event_e2;
test_event=# DROP EVENT test.event_e3;

-- Delete the table.
test_event=# DROP TABLE t_ev;

-- Delete a schema.
test_event=# DROP SCHEMA test;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual database name.
test_event=# \c postgres
gaussdb=# DROP DATABASE test_event;
```

Helpful Links

ALTER EVENT, **CREATE EVENT**, and **DROP EVENT**

7.12.19.12 SHUTDOWN

Description

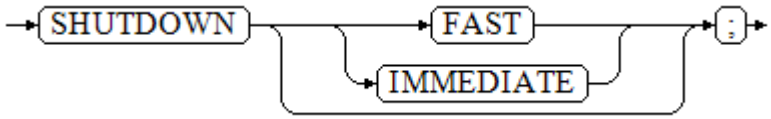
SHUTDOWN shuts down the currently connected database node.

Precautions

Only the administrator can run this command.

Syntax

```
SHUTDOWN [FAST | IMMEDIATE];
```



Parameters

- **FAST | IMMEDIATE**

  FAST: Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.

  IMMEDIATE: Shuts down the server forcibly. Fault recovery will occur on the next startup.

  If the shutdown mode is not specified, the default value **FAST** is used.

Examples

```
-- Shut down the current database node.
gaussdb=# SHUTDOWN;

-- Shut down the current database node in fast mode.
gaussdb=# SHUTDOWN FAST;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.13 SNAPSHOT

Description

Controls data in a unified manner for multiple users.

Precautions

- The GUC parameter **db4ai_snapshot_mode** classifies the snapshot storage models into MSS and CSS. The GUC parameter **db4ai_snapshot_version_delimiter** specifies the version separator and its default value is **@**. The GUC parameter **db4ai_snapshot_version_separator** specifies the sub-version separator and its default value is **.**.
- When the incremental storage mode is used for snapshots, the snapshots are dependent on each other. Snapshots must be deleted in the dependency sequence.
- The snapshot feature is used to maintain data between team members, involving data transcription between administrators and common users. Therefore, the snapshot feature is not supported in the separation-of-duties scenario (**enableSeparationOfDuty** is set to **ON**).
- When you need a stable and available snapshot for tasks such as AI training, you need to publish the snapshot.

Syntax

1. Create a snapshot.

   You can use the CREATE SNAPSHOT... AS and CREATE SNAPSHOT... FROM statements to create a data table snapshot.

   – CREATE SNAPSHOT AS

   ```
   CREATE SNAPSHOT <qualified_name> [@ <version | ident | sconst>]
     [COMMENT IS <sconst>}
     AS query;
   ```

   – CREATE SNAPSHOT FROM

   ```
   CREATE SNAPSHOT <qualified_name> [@ <version | ident | sconst>]
     FROM @ <version | ident | sconst>
     [COMMENT IS <comment>}
       USING (
       { INSERT [INTO SNAPSHOT] ...
         | UPDATE [SNAPSHOT] [AS <alias>] SET ... [FROM ...] [WHERE ...]
         | DELETE [FROM SNAPSHOT] [AS <alias>] [USING ...] [WHERE ...]
         | ALTER [SNAPSHOT] { ADD ... | DROP ... } [, ...]
       } [; …]
     );
   ```

2. Delete a snapshot.

   PURGE SNAPSHOT

   ```
   PURGE SNAPSHOT <qualified_name> @ <version | ident | sconst>;
   ```

3. Sample snapshots.

   SAMPLE SNAPSHOT

   ```
   SAMPLE SNAPSHOT <qualified_name> @ <version | ident | sconst>
     [STRATIFY BY <attr_list>]
     { AS <label> AT RATIO <num> [COMMENT IS <comment>] } [, ...]
   ```

4. Publish snapshots.

   PUBLISH SNAPSHOT

   ```
   PUBLISH SNAPSHOT <qualified_name> @ <version | ident | sconst>;
   ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

5. Archive snapshots.

   ARCHIVE SNAPSHOT
   ```
   ARCHIVE SNAPSHOT <qualified_name> @ <version | ident | sconst>;
   ```

6. Query snapshots.
   ```
   SELECT * FROM DB4AISHOT(<qualified_name> @ <version | ident | sconst> );
   ```

Parameters

- **qualified_name**

  Name of the snapshot to be created

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **version**

  (Optional) Version number of a snapshot. This parameter is optional. The system automatically extends the sequence number.

  Value range: string, consisting of numbers and separators.

- ident

  Identifies the snapshot suffix number (or major version).

  Value range: an integer.

- **sconst**

  Marks the version number with a floating-point number. The feature replaces the decimal point with the separator specified by the GUC parameter **db4ai_snapshot_version_separator** in the background.

  Value range: a floating-point number.

- **comment**

  Specifies the comment to be added.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **alias**

  Specifies the alias of the current object.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **attr_list**

  Specifies the list of target objects.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **label**

  Alias of the sampled data column.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **num**

  Specifies the ratio.

  Its value is a digit.

Examples

```
-- Create data table t1.
gaussdb=# CREATE TABLE t1 (id int, name varchar);

-- Insert data.
gaussdb=# INSERT INTO t1 VALUES (1, 'zhangsan');
gaussdb=# INSERT INTO t1 VALUES (2, 'lisi');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO t1 VALUES (3, 'wangwu');
gaussdb=# INSERT INTO t1 VALUES (4, 'lisa');
gaussdb=# INSERT INTO t1 VALUES (5, 'jack');

-- Create a snapshot.
gaussdb=# CREATE SNAPSHOT s1@1.0 comment is 'first version' AS SELECT * FROM t1;

-- Create snapshots in iteration mode.
gaussdb=# CREATE SNAPSHOT s1@2.0 FROM @1.0 comment is 'inherits from @1.0' USING (INSERT
VALUES(6, 'john'), (7, 'tim'); DELETE WHERE id = 1);

-- View snapshot content.
gaussdb=# SELECT * FROM DB4AISHOT(s1@1.0);
 id |   name
----+----------
  1 | zhangsan
  2 | lisi
  3 | wangwu
  4 | lisa
  5 | jack
(5 rows)
gaussdb=# SELECT * FROM DB4AISHOT(s1@2.0);
 id |  name
----+--------
  2 | lisi
  3 | wangwu
  4 | lisa
  5 | jack
  6 | john
  7 | tim
(6 rows)
-- Sample snapshots.
gaussdb=# SAMPLE SNAPSHOT s1@2.0 stratify by name as nick at ratio .5;

-- Delete snapshots.
gaussdb=# PURGE SNAPSHOT s1@2.0;
gaussdb=# PURGE SNAPSHOT s1nick@2.0;
gaussdb=# PURGE SNAPSHOT s1@1.0;

-- Drop table t1.
gaussdb=# DROP TABLE t1;
```

7.12.19.14 START TRANSACTION

Description

START TRANSACTION starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using **SET TRANSACTION**.

Precautions

When START TRANSACTION is used, **autocommit** remains disabled and is not restored to the initial state until you run COMMIT or ROLLBACK to end a transaction.

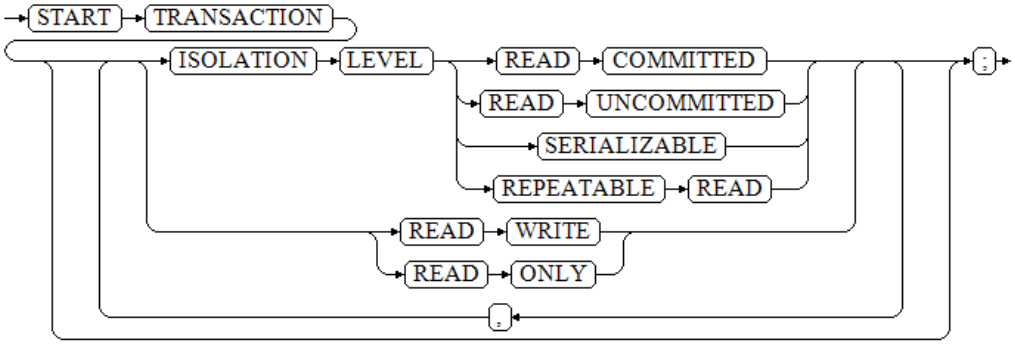
Syntax

Format 1: START TRANSACTION

```
START TRANSACTION
 [
  {
    ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
```

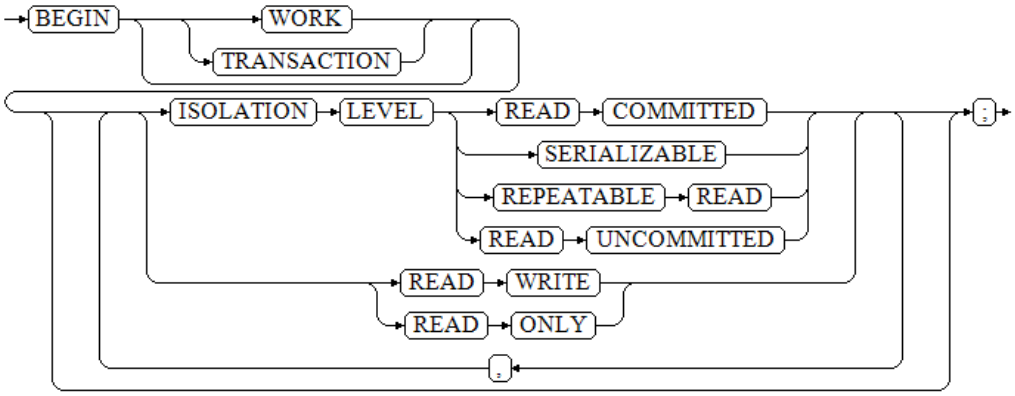
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    | { READ WRITE | READ ONLY }
  } [, ...]
];
```



Format 2: BEGIN

```
BEGIN [ WORK | TRANSACTION ]
 [
  {
    ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ | READ UNCOMMITTED }
    | { READ WRITE | READ ONLY }
   } [, ...]
];
```



Parameters

- **WORK | TRANSACTION**

  Specifies the optional keyword in BEGIN format without functions.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  > NOTE
  >
  > The isolation level of a transaction cannot be reset after the first clause (SELECT, INSERT, DELETE, UPDATE, FETCH, or COPY) for modifying data is executed in the transaction.

  Value range:

  - **READ COMMITTED**: Only committed data can be read. This is the default value.
  - **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, GaussDB does not support this isolation level. Setting this isolation level is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (c1 int, c2 int);

-- Start a transaction in default mode.
gaussdb=# START TRANSACTION;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction in default mode.
gaussdb=# BEGIN;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
gaussdb=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# COMMIT;

-- Delete the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds;
```

Helpful Links

COMMIT | END, **ROLLBACK**, and **SET TRANSACTION**

7.12.20 T

7.12.20.1 TIMECAPSULE TABLE

Description

The TIMECAPSULE TABLE statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the source version of the data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

Precautions

- The TIMECAPSULE TABLE statement can be used to flash back the data of the source version or the data from the recycle bin.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - TO TIMECAPSULE and TO CSN can flash a table back to an earlier version. Currently, only the Ustore engine is supported.
  - The recycle bin records the objects dropped or truncated by running DROP and TRUNCATE. TO BEFORE DROP and TO BEFORE TRUNCATE can flash data back from the recycle bin. Currently, the Ustore and Astore are supported.

- The following object types do not support flashback: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, hash bucket tables, and encrypted tables.
- Flashback is not supported for tables that contain user-defined types.
- After flashback is enabled, tables in the recycle bin can be backed up but cannot be restored.
- If a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage is executed between the flashback point and the current point, the flashback fails.
- To run DROP, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.

  To run TRUNCATE, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.
- Scenarios or tables that do not support DROP or TRUNCATE:
  - Scenario where the recycle bin is disabled (**enable_recyclebin** is set to **off**)
  - Scenario where the system is in the maintenance state (**xc_maintenance_mode** is set to **on**) or is upgraded from an unsupported baseline version to a supported version
  - Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to delete multiple objects at the same time.)
  - System catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, encrypted tables, and hash bucket tables
  - Objects in the recycle bin are cleared and do not support DROP or TRUNCATE FLASHBACK. The **recyclebin_retention_time** parameter specifies the retention period of objects in the recycle bin.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations.
  - If a statement (such as DDL, DCL, VACUUM FULL, and partition adding/deleting/splitting/merging) that modifies the table structure or affects physical files are executed between the TRUNCATE TABLE and TRUNCATE flashback operations, the flashback fails.
  - When a table is entirely deleted or truncated, partitions are moved to the recycle bin along with the entire table. A single deleted partition cannot be moved to the recycle bin. This avoids data consistency damage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If the object on which the table depends is an external object (for example, a composite object or a user-defined object), the table is physically deleted and is not moved to the recycle bin.

- DROP FLASHBACK constraints

  You can specify either the original user-defined name of the table or the system-generated name assigned to the object when it was dropped.

  - System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **SELECT * FROM gs_recyclebin;**.
  - If you specify a user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. To retrieve a table of an earlier version, perform the following steps:
    - Specify the system-generated recycle bin name of the table you want to retrieve.
    - Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
  - During table restoration, the dropped table along with its original base table name is restored. The subobject names of the table remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.
  - If a table has default values that reference sequences and user-defined functions, flashing back the dropped table will succeed, but the default values will not be restored.
  - Similarly, if a table is referenced by views, dropping the table will cascadingly delete the views. Therefore, flashing back the dropped table will succeed, but the views will not be restored.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
  - The **recyclebin_retention_time** parameter specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

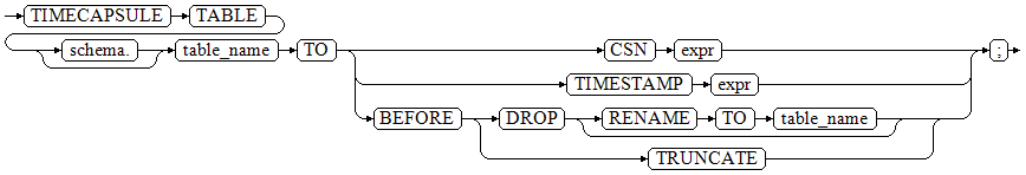
- TRUNCATE FLASHBACK constraints
  - After TRUNCATE FLASHBACK is performed, the statistics remain unchanged and are still displayed as **0**. You can modify the statistics by manual ANALYZE during off-peak hours (to reduce the impact on performance).
  - RENAME TO supports only the DROP FLASHBACK operation to specify a new name for the retrieval table, but does not support TRUNCATE FLASHBACK.
  - TRUNCATE FLASHBACK cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. If a statement (such as DDL, DCL, VACUUM FULL, and partition adding/deleting/splitting/merging) that modifies the table structure or affects physical storages are executed between the flashback point and current point, the flashback fails. The error message "ERROR: The table definition

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of %s has been changed." is displayed when flashback is performed on a table where DDL operations have been performed. The error message "ERROR: recycle object %s desired does not exist" is displayed when flashback is performed on a table where DDL operations, such as changing namespaces and table names, have been performed.

Syntax

```
TIMECAPSULE TABLE
   [schema.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP [RENAME TO table_name] |
TRUNCATE } };
```



Parameters

- **schema**

  Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.

- **table_name**

  Specifies a table name.

- **TO CSN**

  Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.

- **TO TIMESTAMP**

  Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.

  Note: When the flashback point is too old, the source version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.

- **TO BEFORE DROP**

  Retrieves dropped tables and their subobjects from the recycle bin.

- **RENAME TO**

  Specifies a new name for the table retrieved from the recycle bin.

- **TO BEFORE TRUNCATE**

  Flashes back to the point in time before the TRUNCATE operation.

Examples

- **Flashing data back to a specified time**

  You need to set the **undo_retention_time** parameter to set the retention period of old undo logs.

  Contact an administrator for information about how to use the parameter.

(2 rows)

-- Delete a table. (The PURGE parameter is added to delete the table data from the recycle bin.)
gaussdb=# DROP TABLE tbl_test1 PURGE;
```

7.12.20.2 TRUNCATE

Description

TRUNCATE quickly removes all rows from a database table.

It has the same effect as an unqualified DELETE on each table, but TRUNCATE is faster because it does not actually scan the tables. This is most useful on large tables.

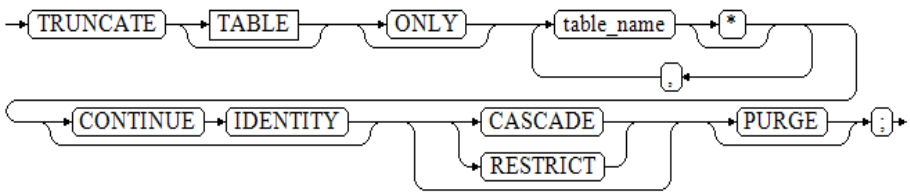
Precautions

- TRUNCATE TABLE has the same function as a DELETE statement with no WHERE clause, emptying a table.
- TRUNCATE TABLE uses less system and transaction log resources as compared with DELETE.
  - DELETE deletes a row each time, and records the deletion of each row in the transaction log.
  - TRUNCATE TABLE deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between TRUNCATE, DELETE, and DROP are as follows:
  - TRUNCATE TABLE deletes content, releases space, but does not delete definitions.
  - DELETE TABLE deletes content, but does not delete definitions nor release space.
  - DROP TABLE deletes content and definitions, and releases space.

Syntax

- Delete data from a table.

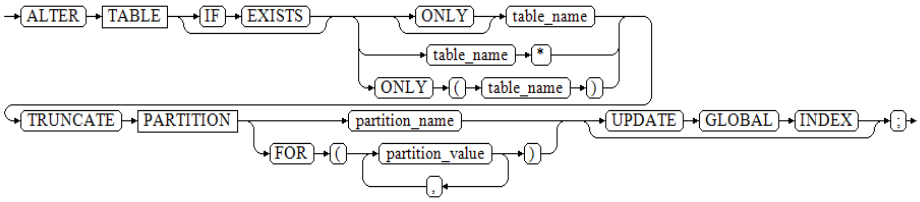
```
TRUNCATE [ TABLE ] [ ONLY ] {table_name [ * ]} [, ... ]
    [ CONTINUE IDENTITY ] [ CASCADE | RESTRICT] [ PURGE ];
```



- Truncate the data in a partition.

```
ALTER TABLE [ IF EXISTS  ] { [ ONLY  ] table_name
                           | table_name *
                           | ONLY ( table_name )  }
    TRUNCATE PARTITION { partition_name
                       | FOR (  partition_value  [, ...] )  } [ UPDATE GLOBAL INDEX ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **ONLY**

  If **ONLY** is specified, only the specified table is cleared. If **ONLY** is not specified, the table and all its subtables (if any) are cleared.

- **table_name**

  Specifies the name (optionally schema-qualified) of the target table.

  Value range: an existing table name

- **CONTINUE IDENTITY**

  Does not change the values of sequences. This is the default action.

- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly truncates all tables added to a group due to CASCADE.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the command.

- **PURGE**

  Purges table data in the recycle bin by default.

- **partition_name**

  Specifies the partition in the target partitioned table.

  Value range: an existing partition name.

- **partition_value**

  Specifies the value of the specified partition key.

  The value specified by **PARTITION FOR** can uniquely identify a partition.

  Value range: value range of the partition key for the partition to be renamed

  NOTICE

  When the **PARTITION FOR** clause is used, the entire partition where **partition_value** is located is cleared.

- **UPDATE GLOBAL INDEX**

  If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

Examples

- Clear table data.

```
                                (35,'AAAAAAAABAAAAAAA','reason 5'), (45,'AAAAAAAACAAAAAAA','reason
6');

-- Clear the p_05_before partition.
gaussdb=# ALTER TABLE reason_p TRUNCATE PARTITION p_05_before UPDATE GLOBAL INDEX;

-- Clear the partitioned table.
gaussdb=# TRUNCATE TABLE reason_p;

-- Delete the reason_p table.
gaussdb=# DROP TABLE reason_p;
```

7.12.21 U

7.12.21.1 UPDATE

Description

Updates specified columns in all rows that meet the specified conditions. You can use WHERE to declare conditions. All columns specified by the SET clause will be updated. Other columns retain their original values.

Precautions

- The owner of a table, users with the UPDATE permission on the table, or users with the UPDATE ANY TABLE permission can update data in the table. When the separation of duties is disabled, system administrators have this permission by default.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The generated column cannot be directly written. In the UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The multi-table update syntax does not apply to views and tables containing RULE.
- For the UPDATE statement whose subquery is a stream plan, the same row cannot be concurrently updated.
- You cannot modify the database character encoding by updating a system catalog. Such operation will cause exceptions in existing data or other operations. If you need to change the character encoding of a database, follow the database switching process to migrate data.

Syntax

```
Update a single table:
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] [ ONLY ] {table_name [ partition_clause ] | subquery | view_name} [ * ] [ [ AS ]
alias ]
SET {column_name = { expression | DEFAULT }
   |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
   [ FROM from_list] [ WHERE condition | WHERE CURRENT OF cursor_name ]
   [ ORDER BY {expression [ [ ASC | DESC | USING operator ]
   [ LIMIT { count } ]
   [ RETURNING {*
            | {output_expression [ [ AS ] output_name ]} [, ...] }];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
Update multiple tables:
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] table_list
SET {column_name = { expression | DEFAULT }
   |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
   [ FROM from_list] [ WHERE condition ];

where sub_query can be:
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
[ LIMIT { [offset,] count | ALL } ]
```

- The subquery **with_query** is as follows:

  ```
  with_query_name [ ( column_name [, ...] ) ]
     AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
  ```

- **subquery**:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
  { FIRST | LAST } ]} [, ...] ]
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
  [ into_option ];
  ```

- The specified subquery source **from_item** is as follows:

  ```
  {[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
  ```

- **partition_clause**:

  ```
  PARTITION { ( { partition_name | subpartition_name } [, ...] ) | FOR (  partition_value [, ...] ) } |
  SUBPARTITION { ( subpartition_name ) | FOR (  subpartition_value [, ...] )}
  ```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

  If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
  - You can use MATERIALIZED or NOT MATERIALIZED to modify the CTE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint**

  Follows the UPDATE keyword in the **/*+ */** format. It is used to optimize the plan of an UPDATE statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **table_name**

  Specifies the name (optionally schema-qualified) of the table to be updated. If ONLY is specified before the table name, only matched rows in the table are updated. If it is not specified, any matching rows inherited from the table are also updated.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

  Specifies the subquery to be updated. When a subquery is updated, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

  If a subquery contains only one table, data is updated into the table. If a subquery contains multiple tables or has nested relationships, check whether a key-preserved table exists to determine whether data can be updated. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Specifies the target view to be updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on updating views and subqueries are as follows:

- The UPDATE operation can be performed only on columns that directly reference user columns in the base table.
- A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
- Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT, or OFFSET clause at the top layer are not supported.
- Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
- Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
- Views with BEFORE or AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
- Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
- Only one base table can be updated at a time in a multi-table join view or join subquery.
- Join views or subqueries can update only key-preserved tables. If **CHECK OPTION** is specified, join columns cannot be updated. For details about the key-preserved table, see **CREATE VIEW**.
- System views cannot be updated.

- **partition_clause**

  Updates a specified partition.

  PARTITION { ({ partition_name | subpartition_name } [, ...]) | FOR (partition_value [, ...]) } |

  SUBPARTITION { (subpartition_name) | FOR (subpartition_value [, ...]) }

  For details about the keywords, see **SELECT**.

  For details, see **CREATE TABLE SUBPARTITION**.

  NOTE

  If PARTITION specifies multiple partition names, level-1 and level-2 partition names can coexist and can be the same. The union set of the partition range is used.

- **alias**

  Specifies a substitute name for the target table.

  Value range: a string. It must comply with the **naming convention**.

- **table_list**

  Specifies an expression list of a table. It is similar to **from_list**, but can declare both the target table and associated table. It is used only in the syntax for updating multiple tables. The items of **table_list** can be subqueries.

- **column_name**

  Specifies the name of the column to be modified.

  You can refer to this column by specifying the target table alias and the column name. Example: **UPDATE foo AS f SET f.col_name = 'namecol'**

  Value range: name of an existing column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **expression**

  Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

  Specifies the default value of a column.

  The value is **NULL** if no default value is assigned to it.

- **sub_query**

  Specifies a subquery.

  This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the SELECT statement, see **SELECT**.

  When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.

  NOTICE

  If the WHERE clause of a subquery in the SET clause uses the "(+)" operator, the configuration item **enable_ora_joinop_in_updatestmt** must be added to the compatibility parameter **behavior_compat_options** for the setting to take effect.

- **from_list**

  Specifies a list of table expressions, allowing columns from other tables to appear in the WHERE condition and the update expressions. This is similar to the list of tables that can be specified in the FROM clause of a SELECT statement.

  NOTICE

  Note that the target table cannot appear in **from_list**, unless you intend a self-join (in which case it must appear with an alias in **from_list**).

- **condition**

  Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to Boolean values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor_name**

  When the cursor points to a row in a table, you can use this syntax to update the row.

  cursor_name: specifies the name of a cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This syntax is not supported by the database in the B-compatible mode.
- This syntax supports only ordinary tables. Partitioned tables are not supported.
- This syntax can be used only in stored procedures.
- This syntax cannot be used together with other WHERE conditions.
- Multi-table update is not supported.
- This syntax cannot be used together with WITH, USING, ORDER BY, or FROM.
- The SELECT statement corresponding to the CURSOR must be declared as FOR UPDATE.
- The SELECT statement corresponding to the CURSOR supports only a single table. It does not support LIMIT/OFFSET, subqueries, or sublinks.
- The CURSOR declared as FOR UPDATE in a stored procedure cannot be used after being committed or rolled back.
- If the row to which the cursor points does not exist, an error is reported (only when UPDATE is used instead of DELETE) in the A-compatible mode, indicating that the specified row does not exist. In other compatibility modes, no error is reported.

- **ORDER BY**

  For details about the keywords, see **SELECT**.

- **LIMIT**

  For details about the keywords, see **SELECT**.

- **RETURNING output_expression**

  Specifies an expression to be computed and returned by the UPDATE statement after each row is updated.

  Value range: The expression can use any column names of the table named by **table_name** or tables listed in **FROM**. Write * to return all columns.

- **output_name**

  Specifies a name to use for a returned column.

Examples

- Modify all data in the table.

```
-- Create the tbl_test1 table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(id int, info varchar(10));
gaussdb=# INSERT INTO tbl_test1 VALUES (1, 'A'), (2, 'B');

-- Query.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | A
  2 | B
(2 rows)

-- Modify the info column of all data in the tbl_test1 table.
gaussdb=# UPDATE tbl_test1 SET info = 'aa';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Query the tbl_test1 table.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | aa
  2 | aa
(2 rows)
```

- Modify some data in the table.

```
-- Modify the data whose ID is 2 in the tbl_test1 table.
gaussdb=# UPDATE tbl_test1 SET info = 'bb' WHERE id = 2;

-- Query the tbl_test1 table.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | aa
  2 | bb
(2 rows)
```

- Modify the data and return the modified data.

```
-- Modify the data whose ID is 1 in the tbl_test1 table and specify the info column to be returned.
gaussdb=# UPDATE tbl_test1 SET info = 'ABC' WHERE id = 1 RETURNING info;
 info
------
 ABC
(1 row)

UPDATE 1

-- Drop the tbl_test1 table.
gaussdb=# DROP TABLE tbl_test1;
```

- Use a subquery to insert new data based on the existing data when modifying data.

```
-- Create a table.
gaussdb=# CREATE TABLE test_grade (
    sid int,                -- Student ID
    name varchar(50),       -- Name
    score char,             -- Score
    examtime date,          -- Exam time
    last_exam boolean       -- The last exam or not
);

-- Insert data.
gaussdb=# INSERT INTO test_grade VALUES (1,'Scott','A','2008-07-08',1),(2,'Ben','D','2008-07-08',1),
(3,'Jack','D','2008-07-08',1);

-- Query.
gaussdb=# SELECT * FROM test_grade;
 sid | name  | score |  examtime  | last_exam
-----+-------+-------+------------+-----------
   3 | Jack  | D     | 2008-07-08 | t
   1 | Scott | A     | 2008-07-08 | t
   2 | Ben   | D     | 2008-07-08 | t
(3 rows)

-- On August 25, 2008, Ben took a make-up exam and the score is B. You need to change the value of
last_exam to No, and then insert the score of August 25, 2008.
gaussdb=# WITH old_exam AS ( UPDATE test_grade SET last_exam = 0 WHERE sid = 2 AND
examtime = '2008-07-08' RETURNING sid, name )

7.12.22 V

7.12.22.1 VACUUM

Description

VACUUM recycles storage space occupied by tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a VACUUM is done. Therefore, it is necessary to do VACUUM periodically, especially on frequently-updated tables.

Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. With a parameter, VACUUM processes only that table.
- To perform VACUUM operation on a table, you must be a table owner or a user granted the VACUUM permission on the table. When separation of duties

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

is disabled, system administrators have this permission by default. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by a system administrator). VACUUM skips over any tables that the calling user does not have the permission to vacuum.

- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- FULL is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. VACUUM FULL usually shrinks a table more than VACUUM does. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- VACUUM FULL returns the free space in the table to the tablespace by rebuilding the table. During the rebuilding, extra storage space equivalent to the valid data size in the table is required. For a non-segment-page table, after VACUUM FULL is executed, the physical files occupied by the original table are deleted, and the physical file space occupied by the original table is returned to the OS. For a segment-page table, after VACUUM FULL is executed, the physical space occupied by the original table is returned to the segment-page data file instead of the OS.
- VACUUM causes a substantial increase in I/O traffic, which might cause poor performance for other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, VACUUM prints progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- VACUUM and VACUUM FULL clear deleted tuples after the delay specified by **vacuum_defer_cleanup_age**.
- VACUUM ANALYZE executes a VACUUM operation and then an ANALYZE operation for each selected table. This is a handy combination form for routine maintenance scripts.
- Plain VACUUM (without FULL) simply recycles space and makes it available for reuse. This form of statement can operate concurrently with normal reading and writing of the table, as an exclusive lock is not obtained. VACUUM FULL executes wider processing, including moving rows across blocks to compress tables so they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- A deadlock may occur when multiple VACUUM FULL statements are executed simultaneously.
- If the **xc_maintenance_mode** parameter is not enabled, the VACUUM FULL operation will skip all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be recycled. After running **DELETE**, execute 1000 non-SELECT transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to the space.
- During VACUUM FULL, an exclusive lock is added to the table. Therefore, you are advised not to run **VACUUM FULL** during peak hours because it may cause long waiting time or service interruption.
- For Ustore, the behavior of manual VACUUM is the same as that in Astore. Locks are obtained to clear heap tables and indexes. In Ustore, AUTOVACUUM only clears GPIs of partitioned tables, updates FSMs of heap tables, and recycles index pages.
- When **VACUUM FULL** is executed, partitions are traversed for clearance and GPIs are rebuilt after partition clearance. Therefore, if there are a large number of partitions, you are advised to delete GPIs first and rebuild indexes after **VACUUM FULL** is executed. In this way, the execution time of **VACUUM FULL** is reduced.
- You cannot perform VACUUM FULL online for database-level, index-level, partitioned table, secondary partitioned table, segment-page table, hash bucket table, temporary table, unlogged table, and HTAP table objects. If an object involves the preceding unsupported types, the ONLINE keyword does not take effect. By default, VACUUM FULL is executed offline, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online.
- When performing online VACUUM FULL operations, reserve sufficient disk space, at least equal to the total size of the tables to be operated and the accessories such as indexes on the tables.
- If the online VACUUM FULL execution is canceled, the residual data clearance process starts first. If the execution is also canceled again, the clearance process ends and residual data remains.
- Resource contention exists between online VACUUM FULL operations and user services. Therefore, online VACUUM FULL operations are not suitable for heavy-traffic scenarios. In scenarios where resources are limited, fine-grained resource control is recommended. Parallel acceleration is not recommended.
- Online VACUUM FULL operations are not supported in M-compatible mode.
- Online VACUUM FULL execution does not support the FREEZE keyword. If both FREEZE and ONLINE keywords are specified, VACUUM FULL is executed offline by default, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online.
- Online VACUUM FULL operations cannot be performed in a transaction or a stored procedure.
- If online VACUUM FULL fails, significant table space bloat may occur. The bloat degree is proportional to the online VACUUM FULL execution duration and the number of concurrent write operations. Long transactions may block online VACUUM FULL. You are advised not to perform online VACUUM FULL when long transactions exist.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- After VACUUM FULL is executed online, DQL operations are blocked and an error is reported for concurrent DML operations.
- During online VACUUM FULL execution, do not execute DDL statements concurrently with other DDL statements. Otherwise, deadlocks or errors may occur. In this case, reconnect to the client and try again.
- A schema named **online$$ddl$$[hash value]** is generated during online VACUUM FULL execution.
  - By default, the owner of the schema is the initial user. You are advised not to perform the operations on the schema during online VACUUM FULL execution. Otherwise, the online VACUUM FULL execution may be terminated and an unknown error may occur. You are advised not to query tables in this schema. By default, gs_dump will not export this schema.
  - You cannot create a schema whose prefix is **online$$**. Otherwise, an error notice is displayed. If schemas with the same name conflict with each other, online VACUUM FULL execution does not take effect. By default, VACUUM FULL is executed offline, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online due to the schema name conflict.

Syntax

- Recycle space and update statistics information, without requirements for keyword orders.

```
VACUUM [ ( { FULL | FREEZE | VERBOSE | { ANALYZE | ANALYSE } } [, ... ] ) ]
    [ table_name [ (column_name [, ... ] ) ] [ PARTITION ( partition_name ) | SUBPARTITION
( subpartition_name ) ] ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle space, without updating statistics information.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ]
    [ table_name [ PARTITION ( partition_name ) | SUBPARTITION ( subpartition_name ) ] ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle space and update statistics information, and require keywords in order.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ] { ANALYZE | ANALYSE } [ VERBOSE ]
    [ table_name [ ( column_name [, ... ] ) ] ] [ PARTITION ( partition_name ) ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle the space of a specified bucket and update the **bucketxid** column in the pg_hashbucket system catalog. Statistics are not updated. This function is not supported in the current version.

```
VACUUM FREEZE BUCKETS (bucketid [, ... ]);
```

Parameters

- **FULL**

  Selects "FULL" vacuum, which can recycle more space, but takes much longer and exclusively locks the table.

  > NOTE
  >
  > Using **FULL** will cause statistics missing. To collect statistics, add the keyword **ANALYZE** to **VACUUM FULL**.

- **FREEZE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Is equivalent to running **VACUUM** with the **vacuum_freeze_min_age** parameter set to **0**.

- **VERBOSE**

  Prints a detailed VACUUM activity report for each table.

- **ANALYZE | ANALYSE**

  Updates statistics used by the planner to determine the most efficient way to execute a query.

  NOTE

  VACUUM is also triggered when **autovacuum** is set to **analyze** for a Ustore partitioned table.

- **table_name**

  Specifies the name (optionally schema-qualified) of a specific table to vacuum.

  Value range: name of a specific table to vacuum. The default value indicates all tables in the current database.

- **column_name**

  Specifies the name of the column to be analyzed. This parameter must be used together with ANALYZE.

  Value range: name of the column to be analyzed Defaults are all columns.

  NOTE

  The mechanism of the VACUUM ANALYZE statement is to execute VACUUM and ANALYZE in sequence. Therefore, if **column_name** is incorrect, VACUUM may be successfully executed but ANALYZE may fail to be executed. For a partitioned table, ANALYZE may fail to be executed after VACUUM is successfully executed on a partition.

- **partition_name**

  Specifies the level-1 partition name of the table to be cleared. If it is left empty, all level-1 partitions are cleared.

- **subpartition_name**

  Specifies the level-2 partition name of the table to be cleared. If it is left empty, all level-2 partitions are cleared.

- **ONLINE | OFFLINE**

  Executes VACUUM online or offline. This parameter is used to execute VACUUM FULL online and therefore the read and write services are not blocked for a long time during VACUUM FULL.

  The keywords ONLINE and OFFLINE are used.

  – ONLINE: executes online. If the VACUUM FULL statement contains scenarios (such as the FREEZE keyword) that are not supported by the current feature, the statement is executed offline and a NOTICE is displayed, indicating that the ONLINE keyword is ignored.

  – OFFLINE: executes offline.

  Value range: **OFFLINE** or **ONLINE**, which indicates offline execution and online execution respectively. The value is **OFFLINE** by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> If VACUUM FULL fails to be executed online due to user instruction termination commands, lock timeout, or database faults, the system automatically clears residual objects. Automatic cleanup may fail due to reasons such as lock timeout. In this case, manual cleanup is required. For severe faults, such as FATAL, PANIC, and database faults, residual temporary schema objects may exist, affecting subsequent online VACUUM FULL and online DDL execution. In this case, you need to use the **online_ddl_cleanup()** function to manually clear the objects. If no residual data exists, you are advised not to use the online_ddl_cleanup() function. Otherwise, online VACUUM FULL may be terminated and an unknown error may occur.

- **online_parameter**

  Specifies the online VACUUM FULL option when the ONLINE keyword is specified. This parameter does not take effect if the ONLINE keyword is not specified or conditions for online VACUUM FULL execution are not met.

  Value range:

  - **parallel_threads**: controls multi-thread parallel operations to achieve higher performance when resources are sufficient. Value range: an integer ranging from 1 to 32. The default value is **1**.

    - When a user enables resource control, for example, I/O resource control (for example, **io_limits** > **0** or **io_priority** = **high**/**medium**/**low**), **parallel_threads** ignores resource control under the user or session. In addition, a message is displayed, indicating that the current resource control is invalid and multi-thread acceleration is enabled. The online VACUUM FULL multi-thread execution complies with the resource control of the initial user.

    - This parameter can take effect together with the index parallel parameter **parallel_workers**. **parallel_workers** controls the degree of parallelism for index building during VACUUM FULL, and **parallel_threads** controls the degree of parallelism for catchups during VACUUM FULL.

  - **max_catchup_times**: controls the maximum number of catchups. This parameter is used to prevent the execution of VACUUM FULL from taking a long time. Value range: an integer ranging from 1 to 50. The default value is **50**.

    Online VACUUM FULL execution records the IUD incremental data generated during data reconstruction to a temporary table and reconstructs the incremental data in multiple rounds of catchups. To prevent VACUUM FULL catchup failures due to a large amount of concurrent IUD data, you can set this parameter to limit the number of catchups.

Examples

- VACUUM

```
-- Create the table tbl_test and insert data into the tables.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (1);

-- View the data and the CTID of the data.
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 (0,1) |  1
(1 row)

-- Delete the data record.
gaussdb=# DELETE FROM tbl_test;

-- Insert a data record again. It is found that a new ctid is used.
gaussdb=# INSERT INTO tbl_test VALUES (2);
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
 (0,2) |  2
(1 row)

-- After the VACUUM statement is executed, the old space is reused when data is inserted.
gaussdb=# VACUUM ANALYZE tbl_test;
gaussdb=# INSERT INTO tbl_test VALUES (3);
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
 (0,1) |  3
 (0,2) |  2
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE tbl_test;
```

- VACUUM FULL

```
-- Create a table.
gaussdb=# CREATE TABLE tbl_test2(c1 int);

-- Insert 100,000 data records and check the table size.
gaussdb=# INSERT INTO tbl_test2 VALUES (generate_series(1,100000));
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 3048 kB
(1 row)

-- Delete data and check the table size.
gaussdb=# DELETE FROM tbl_test2;
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 3048 kB
(1 row)

-- Use VACUUM FULL to reclaim space and check the table size.
gaussdb=# VACUUM FULL ANALYZE tbl_test2;
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 0 bytes
(1 row)

-- Use VACUUM FULL to recycle spaces online.
gaussdb=# VACUUM FULL ANALYZE tbl_test2 ONLINE;

-- Drop.
gaussdb=# DROP TABLE tbl_test2;
```

Suggestions

- VACUUM
  - VACUUM cannot be executed inside a transaction block.
  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.

- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.

7.12.22.2 VALUES

Description

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

Precautions

- VALUES lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. VALUES appearing within INSERT is a special case, because the desired column types are known from the INSERT's target table, and need not be inferred by scanning the VALUES list. In this case, a large number of result rows can be processed.
- If more than one row is specified, all the rows must have the same number of elements.

Syntax

```
VALUES {( expression [, ...] )} [, ...]
    [ ORDER BY { sort_expression [ ASC | DESC | USING operator ] } [, ...] ]
    [ LIMIT { count | ALL } ]
    [ OFFSET start [ ROW | ROWS ] ]
    [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ];
```

Parameters

- **expression**

  Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.

  In a **VALUES** list appearing at the top level of an **INSERT**, an expression can be replaced by **DEFAULT** to indicate that the destination column's default value should be inserted. **DEFAULT** cannot be used when **VALUES** appears in other contexts.

- **sort_expression**

  Specifies an expression or integer constant indicating how to sort the result rows.

- **ASC**

  Specifies an ascending sort order.

- **DESC**

  Specifies a descending sort order.

- **operator**

  Specifies a sorting operator.

- **count**

  Specifies the maximum number of rows to return.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **OFFSET start [ROW | ROWS]**

  Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  The **FETCH** clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test_t2(col1 INT,col2 VARCHAR);
gaussdb=# CREATE TABLE test_t3(col1 INT,col2 VARCHAR);

-- Insert multiple data records.
gaussdb=# INSERT INTO test_t2 (col1, col2) VALUES (10,'AA'),(20,'BB'),(30,'CC');

-- Perform a pagination query and return to the first page. Display one row of data on each page.
gaussdb=# SELECT * FROM test_t2 ORDER BY col1 ASC LIMIT 1 OFFSET 0;
col1 | col2
------+------
   10 | AA
(1 row)

-- Insert data in test_t2 into test_t3.
gaussdb=# INSERT INTO test_t3 SELECT * FROM test_t2;

-- Perform a query using FETCH and return to the first page. Display one row of data on each page.
gaussdb=# SELECT * FROM test_t3 ORDER BY col1 ASC OFFSET 0 FETCH FIRST 1 ROWS ONLY;
 col1 | col2
------+------
   10 | AA
(1 row)

-- Delete tables test_t2 and test_t3.
gaussdb=# DROP TABLE test_t2;
gaussdb=# DROP TABLE test_t3;
```

7.13 Appendix

7.13.1 Extended Functions

The following table lists the extended functions supported by GaussDB. These functions are for reference only.

Category	Name	Description
Access privilege inquiry function	has_sequence_privilege(user, sequence, privilege)	Queries whether a specified user has privilege for sequences.
	has_sequence_privilege(sequence, privilege)	Queries whether the current user has privilege for sequence.
Trigger function	pg_get_triggerdef(oid)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.
	pg_get_triggerdef(oid, boolean)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.13.2 Extended Syntax

GaussDB provides the following extended syntax:

Table 7-262 Extended SQL syntax

Category	Keywords	Description
Creating a table	column_constraint: **REFERENCES reftable [(refcolumn)] [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE][ON DELETE action] [ON UPDATE action]**	You can run **REFERENCES reftable[(*refcolumn*)] [MATCH FULL |MATCH PARTIAL | MATCH SIMPLE] [ON DELETE action] [ON UPDATE action]** to create foreign key constraints for tables.
Loading a module	**CREATE EXTENSION**	Loads a new module to the current database. This feature is for internal use only. You are advised not to use it.
	DROP EXTENSION	Deletes the loaded module. This feature is for internal use only. You are advised not to use it.
Aggregate functions	**CREATE AGGREGATE**	Defines a new aggregate function.
	ALTER AGGREGATE	Modifies the definition of an aggregate function.
	DROP AGGREGATE	Drops an existing function.

7.13.3 Dollar-Quoted String Constants

If a string sequence contains a single quotation mark ('), double the single quotation mark (') to two single quotation marks (''). Otherwise, the SQL statement may fail to be executed.

If a string contains many single quotation marks (') or backslashes (\), the string may be difficult to understand and error-prone because all the single quotation marks (') are doubled.

To make the query more readable in such situations, dollar quoting is provided to write string constants. A dollar-quoted string constant consists of a dollar sign ($), a "tag" of zero or more characters, another dollar sign, an arbitrary sequence of characters that make up the string content, a dollar sign, another tag the same as the previous one, and a dollar sign.

```
gaussdb=# SELECT $$it's an example$$;
   ?column?
```

```
-----------------
 it's an example
(1 row)
```

7.13.4 DATABASE LINK

Description

In the local database, a database link is used to connect to and access the remote database.

A database link can be public or private. A private database link can be accessed only by the creator, while a public database link can be accessed by all users.

All created database link information is stored in the system view gs_db_links of the local database.

Precautions

- The database link feature can be used only in A-compatible versions.
- The remote database connected to database link supports only 503.1.0 and later versions.
- Ensure that the values of the compatibility parameter **DBCOMPATIBILITY** and GUC parameters **behavior_compat_options**, **a_format_dev_version**, and **a_format_version** of the local and remote databases are the same.
- When a session is enabled for a database link connection, the following GUC parameters are set:

  ```
  set search_path=pg_catalog, '$user', 'public';
  set datestyle=ISO;
  set intervalstyle=postgres;
  set extra_float_digits=3;
  ```

  Other parameters are set at the remote end. If the remote parameters are different from the local parameters, the data display formats may be different. Therefore, ensure that the remote parameters are the same as the local parameters.
- Preparations: Use gs_guc to add a whitelist to the **gs_hba.conf** file to allow client connections.

  ```
  Example: gs_guc reload -I all -N all -Z datanode -h "host all all 192.168.11.11/32 sha256"
  ```

  For details about the parameters, see the description of gs_guc client authentication policy settings.
- The permission to create a database link needs to be granted using the GRANT syntax. By default, a new user does not have the permission, but a system administrator has the permission. For details, see GRANT description.
- When a database link is used to perform operations on a remote table, a schema corresponding to the remote table is created locally. If the metadata of the table does not exist locally, the metadata is written to the local system catalog. In this case, a level-7 lock is used to ensure write consistency until the transaction ends. When a database link is deleted, the corresponding metadata is also deleted.
- When DATABASE LINK is used, locally created tables are used only to store metadata of remote tables. The table structure cannot be queried using the \d or pg_get_tabledef function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If a long transaction uses the database link to operate a remote object for the first time, the lock is held until the transaction ends. Other transactions that use the dblink for the first time are blocked. To avoid this problem, run a quick statement, for example, "select * from t1@dblink where 1=2;", to query the remote object to be used and flush its metadata to disks. In addition, similar problem also occurs when the structure of the remote table changes and the stored metadata is updated locally.
- If the local and remote character sets are different, an error indicating that the conversion fails may be reported. The error information is that the remote end returns an error. If the character encoding of the local database is GB18030_2022, the character encoding sent to the remote database is converted to GB18030. Therefore, if the character set of the local database is GB18030_2022, the character set of the remote database can only be GB18030 or GB18030_2022.
- If a key file is regenerated after a database link is created, an error is reported when the database link is used. This is because the key file used for creating the database link is different from that used for decryption.
- When a schema corresponding to the remote end is created locally, "USERNAME (available only for private database link) #remote schema@DBLINK" is used as the schema name. The maximum length of the schema name is 63 characters.

NOTICE

When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.

Syntax

- Create a database link.

```
CREATE [ PUBLIC ] DATABASE LINK dblink
  [ CONNECT TO { CURRENT_USER | user IDENTIFIED BY password } ] [ USING ( option 'value' [...]) ];
```

- Modify the database link information.

```
ALTER [ PUBLIC ] DATABASE LINK dblink
  { CONNECT TO user IDENTIFIED BY password };
```

- Drop a specified database link.

```
DROP [ PUBLIC ] DATABASE LINK dblink ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- If **CONNECT TO user IDENTIFIED BY password** is specified, the database link makes a connection as a user with specified password.
- If **CONNECT TO CURRENT_USER** is specified, the database link connects to the remote database as the local initial user.
- If the preceding two clauses are omitted, the database link connects to the remote database as a local initial user.
- **dblink**: name of the database link to be created.
- **user**: username used by the created database link.
- **password**: password of the username.
- **USING (option 'value' [, ...])**

  Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

  - **host**: specifies the IP address for connection. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, encrypted databases, SSL settings, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
  - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
  - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
  - **fetch_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch_size** ranges from 0 to 2147483647. The default value is **100**.

  Notes:

  - You can write only part of the preceding options in the brackets after USING.
  - If the keyword USING is not written, the content in the brackets is not written as well.
  - When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

- Perform the SELECT operation through a database link.

  NOTE

  The syntax for accessing a remote database object by using a created database link is basically the same as that for accessing a local object. The difference is that **@dblink** is added to the end of the remote object descriptor. For details about restrictions on SQL statements, see **Table 7-263**.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
 SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
{ FIRST | LAST } ]} [, ...] ]
 [ LIMIT { [offset,] count | ALL } ]
 [ OFFSET start [ ROW | ROWS ] ]
 [ {FOR { UPDATE | SHARE} [ OF table_name [, ...] ] } [...] ];
 {[ ONLY ] table_name [ * ] [ partition_clause ] @ dblink  [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |[function_name] ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
  |[function_name] ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]};
```

- Perform the INSERT operation through a database link.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
  INSERT [/*+ plan_hint */] INTO table_name [ partition_clause ] @ dblink [ ( column_name [, ...] ) ]
     { DEFAULT VALUES
     | VALUES {( { expression | DEFAULT } [, ...] ) }[, ...]
     | query }
     [ RETURNING { {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

- Perform the UPDATE operation through a database link.

```
UPDATE [/*+ plan_hint */] [ ONLY ] table_name [ partition_clause ] @ dblink  [ [ AS ] alias ]
 SET {column_name = { expression | DEFAULT }
    |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
    [ FROM from_list ] [ WHERE condition ]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
    [ LIMIT { [offset,] count | ALL } ]
    [ RETURNING { {output_expression [ [ AS ] output_name ]} [, ...] }];
 where sub_query can be:
 SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
 { * | {expression [ [ AS ] output_name ]} [, ...] }
 [ FROM from_item [, ...] ]
 [ WHERE condition ]
 [ GEOUP BY grouping_element [, ...] ]
 [ HAVING condition [, ...] ];
```

- Perform the DELETE operation through a database link.

```
 [ WITH [ RECURSIVE ] with_query [, ...] ]
 DELETE [/*+ plan_hint */] FROM [ ONLY ] table_name [ partition_clause ] @ dblink  [ [ AS ] alias ]
    [ USING using_list ]
    [ WHERE condition]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
    [ LIMIT { [offset,] count | ALL } ]
    [ RETURNING { * | { output_expr [ [ AS ] output_name ] } [, ...] } ];
```

- Perform the LOCK TABLE operation through a database link.

```
 LOCK [ TABLE ] {[ ONLY ] name @ dblink  [, ...]}

    [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE |
SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
    [ NOWAIT ];
```

- Call a stored procedure or function of the remote database.

```
CALL | SELECT [ schema. ] { func_name@dblink | procedure_name@dblink } ( param_expr );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CAUTION

- When a database link calls a remote function or stored procedure, the user-defined types, **out** output parameters, aggregate functions, window functions, and return set functions are not supported. **SELECT * FROM func@dblink()** cannot be used to call the function or stored procedure.
- When a database link calls a remote function or stored procedure, functions under PUBLIC are called by default if no schema is specified.
- When the database link calls a remote function or stored procedure, **param_expr** does not support the use of ":=" or "=>" to separate parameter names and parameter values.

NOTE

- The meanings of the parameters irrelevant to database link in the preceding SQL statements are the same as those in the original SQL statements.
- When specifying a column name, you can add "@dblink" to the end of the column name to specify the column of the table to which the corresponding database link points.

Restrictions

- **Transaction**

  When a database link is used, the relationship between local and remote transactions is as follows:

  a. A local transaction synchronously controls the commit/rollback status of a remote transaction.

  b. The relationship between isolation levels is as follows.

Local Isolation Level	Remote Isolation Level
Read Uncommitted	Repeatable Read
Read Committed	Repeatable Read
Repeatable Read	Repeatable Read
Serializable	Serializable

NOTICE

If you commit a local transaction, a transaction commit request is sent to the remote end. If the local transaction fails to be committed due to an exception (such as a connection exception or a local cluster instance exception) after the remote transaction is successfully committed, the committed remote transaction cannot be withdrawn. As a result, the local transaction may be inconsistent with the remote transaction.

- **Permissions of local users to use database links**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a. If the keyword public is used, the link is a public database link and can be used by all users or schemas.

b. If the keyword public is not used, the link is a private database link and can be used only by the current user or schema. (User **sys** cannot use database links across schemas.)

- **Permission to access remote database objects through database links**

  The permissions to access remote database objects are the same as those of the remote connection user bound to the database link.

- **Supported SQL statements**
  - For details about the statements supported by database links, see **Table 7-263**.
  - For details about the table types supported by database links, see **Table 7-264**.
- **Function call using a database link**
  - When a database link calls a remote function, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, aggregate functions, window functions, and return set functions are not supported.
  - When a database link calls a stored procedure or function of a remote database in the PLSQL_BODY, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, overloaded functions, aggregate functions, window functions, and return set functions are not supported.

NOTICE

- You can use the following syntax to call stored procedures or functions of a remote database in the PLSQL_BODY: [CALL | SELECT] [schema.] { func_name@dblink | procedure_name@dblink } (param_expr).
- You can use the following syntax to call parameterless stored procedures or functions of a remote database in the PLSQL_BODY: [CALL | SELECT] [schema.] { func_name@dblink | procedure_name@dblink } ( ).

- **Synonyms**
  - The database link name cannot be created as a synonym.
  - Synonyms that point to a database link object in a remote database cannot be called through database link. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK1** on **DB2** for connecting to **DB1**. Create the synonym "CREATE SYNONYM T1 FOR TABLE1@DBLINK1".
    - Step 3: Create **DBLINK2** on **DB3** for connecting to **DB2**. Call the synonym T1 "SELECT * FROM T1@DBLINK2" on **DB2** through **DBLINK2**.
- **Table type constraints**
  - HASHBUCKET: The query or DML operation cannot be performed on the remote hash bucket table through database link.
  - SLICE: The query or DML operation cannot be performed on the remote slice table through database link.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Replication table: The query or DML operation cannot be performed on the remote replication table through database link.
  - TEMPORARY: The query or DML operation cannot be performed on the remote temporary table through database link.
- **Views**
  - Currently, you can create a view for a remote table of a database link. However, when the structure of the remote table changes, an exception may occur when you use the view. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK** on **DB2** for connecting to **DB1**. Create the view "CREATE VIEW V1 AS SELECT * FROM TABLE1@DBLINK".
    - Step 3: Delete a column from **TABLE1** on **DB1**. An error is reported when you query the view on **DB2**.
- **Other scenarios**
  - The database link table does not support triggers, including the scenarios where a database link is used in the function called by a trigger, the function called by a trigger is a database link function, and the trigger is defined on a database link.
  - The UPSERT and MERGE syntaxes are not supported.
  - The CURRENT CURSOR syntax is not supported.
  - Hidden columns in a table cannot be queried.
- **Dump and backup**
  - Dump operations cannot be performed on database link-related database objects. A standby node does not support calling or connection through a database link.
  - Database objects such as database links cannot be restored from the backup of their clusters. This is because the key files of different clusters are different and the corresponding cluster key file is required for decryption when the database link is used.
- **Predicate pushdown constraints**

  The WHERE clause can only be equipped with built-in data types, operators, and functions, and the used functions are of the IMMUTABLE type.
- **Aggregate function pushdown constraints**

  Only single tables that do not contain GROUP, ORDER BY, HAVING, and LIMIT clauses in the SELECT statement are supported. Window functions are not supported.
- **Hint pushdown**

  Only hints in scan mode can be pushed down based on the hint conditions of database link table objects. The syntax format is as follows:

  ```
  [no] tablescan|indexscan|indexonlyscan(table [index])
  ```

  The table name or table alias in a query block must be unique.

Table 7-263 Supported SQL statements

SQL Type	Operation Object	Supported Option	Execution Context
Creating a database link	DATABASE LINK	N/A	Common transaction block
Modifying a database link	DATABASE LINK	Only the username and password can be changed.	Common transaction block
Deleting a database link	DATABASE LINK	N/A	Common transaction block
SELECT statement	Ordinary table, ordinary view, and complete-refresh materialized view	• WHERE clause • JOIN clause used between a database link table and an inner table • JOIN clause used between database link tables • Aggregate function • LIMIT clause • ORDER BY clause • GROUP BY and HAVING clauses • UNION clause • WITH clause • START WITH and CONNECT BY clauses • FOR UPDATE clause • ROWNUM	Common transaction block, stored procedure, function, advanced package, and logical view
INSERT statement	Ordinary table	• Inserting multiple values	Common transaction block, stored procedure, function, and advanced package

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SQL Type	Operation Object	Supported Option	Execution Context
UPDATE statement	Ordinary table	• LIMIT clause • ORDER BY clause • WHERE clause	Common transaction block, stored procedure, function, and advanced package
DELETE statement	Ordinary table	• LIMIT clause • ORDER BY clause • WHERE clause	Common transaction block, stored procedure, function, and advanced package
LOCK TABLE statement	Ordinary table	• LOCKMODE clause • NOWAIT clause	Common transaction block

Table 7-264 Supported table types

Dimension	GaussDB Table Type		Database Link Support
TEMP option	Temporary table		Not supported
	Global temporary table		Supported
UNLOGGED option	Unlogged table		Supported
Storage features	Row store	Astore	Supported
		Ustore	Supported
	Partitioned table		Supported
	Level-2 partitioned table		Supported
Views	Remote view accessed by a database link		DQL statements are supported, but DML statements are not supported.
	Remote table associated with a local view through a database link		DQL statements are supported, but DML statements are not supported.

8 Best Practices

8.1 Best Practices of SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace UNION with UNION ALL.

  UNION eliminates duplicate rows while merging two result sets but **UNION ALL** merges the two result sets without deduplication. Therefore, replace **UNION** with **UNION ALL** if you are sure that the two result sets do not contain duplicate rows based on the service logic.

- Add not null to the join columns.

  If there are many **NULL** values in the **JOIN** columns, you can add the filter criterion **IS NOT NULL** to filter data in advance to improve the **JOIN** efficiency.

- Convert NOT IN to NOT EXISTS.

  Nested Loop Anti Join must be used to implement **NOT IN**, and **Hash Anti Join** is required for **NOT EXISTS**. If no NULL value exists in the **JOIN** columns, NOT IN is equivalent to NOT EXISTS. Therefore, if you are sure that no **NULL** value exists, you can convert NOT IN to NOT EXISTS to generate hash join and to improve the query performance.

  The statements for creating a foreign table are as follows:

  ```
  DROP SCHEMA IF EXISTS no_in_to_no_exists_test CASCADE;
  CREATE SCHEMA no_in_to_no_exists_test;
  SET CURRENT_SCHEMA=no_in_to_no_exists_test;
  CREATE TABLE t1(c1 int, c2 int, c3 int);
  CREATE TABLE t2(d1 int, d2 int NOT NULL, d3 int);
  ```

  The statement for implementing the query using NOT IN is as follows:

  ```
  SELECT * FROM t1 WHERE  c1 NOT IN (SELECT d2 FROM t2);
  ```

  The plan is as follows:

  ```
  gaussdb=# EXPLAIN SELECT * FROM t1 WHERE  c1 NOT IN (SELECT d2 FROM t2);
                            QUERY PLAN
  ------------------------------------------------------------------
   Nested Loop Anti Join  (cost=0.00..29749.02 rows=968 width=12)
     Join Filter: ((t1.c1 = t2.d2) OR (t1.c1 IS NULL))
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ->  Seq Scan on t1  (cost=0.00..29.45 rows=1945 width=12)
  ->  Materialize  (cost=0.00..39.17 rows=1945 width=4)
        ->  Seq Scan on t2  (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

Because there is no null value in the **t2.d2** column (the **t2.d2** column is **NOT NULL** in the table definition), the query can be equivalently modified as follows:

```
SELECT * FROM t1 WHERE  NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE  NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
                          QUERY PLAN
---------------------------------------------------------------------
 Hash Anti Join  (cost=53.76..99.14 rows=972 width=12)
   Hash Cond: (t1.c1 = t2.d2)
   ->  Seq Scan on t1  (cost=0.00..29.45 rows=1945 width=12)
   ->  Hash  (cost=29.45..29.45 rows=1945 width=4)
         ->  Seq Scan on t2  (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

- Use hashagg.

  If the GROUP BY condition exists in the query statement, the generated plan may contain sorting operations, that is, the plan contains the GroupAgg+Sort operator. As a result, the performance is poor. You can set the GUC parameter **work_mem** to increase the available memory and generate a plan with HashAgg to avoid sorting operations and improve performance. For details about how to set **work_mem**, contact the administrator.

- Replace functions with CASE statements.

  The database performance greatly deteriorates if a large number of functions are called. In this case, you can change the pushdown functions to CASE statements.

- Do not use functions or expressions for indexes.

  Using functions or expressions for indexes will stop indexing and enable scanning on the full table.

- Do not use operator (!=, <, or >), NULL, OR, or implicit parameter conversion in WHERE clauses.

- For tables with frequent data changes, add hints to related SQL statements to fix an execution plan.

  For a table with frequent data changes, the statistics may not be the latest before the automatic ANALYZE is triggered. As a result, the execution plan may not be optimal. You are advised to add hints to related SQL statements to fix the execution plan.

- Split complex SQL statements.

  You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:

  – The same subquery is involved in multiple SQL statements of a job and the subquery contains a large amount of data.
  – Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
  – Functions such as substr and to_number cause incorrect measures for subqueries containing a large amount of data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- BROADCAST subqueries are performed on large tables in multi-DN environment.

For details about optimization, see **Typical SQL Optimization Methods**.

8.2 Best Practices for Permission Configuration

Context

A database may be used by many users, and users are grouped into a database role for easy management. A database role can be regarded as one or a group of database users.

For databases, users and roles are basically the same. The difference is that when CREATE ROLE is used to create a role, no schema with the same name is created and the user does not have the LOGIN permission by default. When CREATE USER is used to create a user, a schema with the same name is automatically created. By default, the user has the LOGIN permission. That is, a role with the LOGIN permission can be considered to be a user. In service design, you are advised to use a role to manage permissions rather than accessing databases.

Overview

Improper permission configuration may cause permission exploitation. This section describes the functions of each permission role.

Solution

1. **Database user**

   Database users are used to connect databases, access database objects, and run SQL statements. Only an existing database user can be used to connect databases. Therefore, a database administrator must plan a database user for each user who wants to connect to a database.

   Specify at least an account and the corresponding password for a database user.

   By default, database users can be classified into two types, as listed in **Table 8-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-1 User types

Type	Description
Initial User	Has the highest-level database rights, that is, has all system and object permissions. The initial user is not affected by the settings of the object permissions. This is comparable to the permissions of **root** in a Unix system. For security purposes, you are advised not to operate as an initial user unless necessary. When installing or initializing a database, you can specify the initial username and password. If you do not specify the username, an initial user with the same name as the OS user who installs the database is automatically generated. If no password is specified, the initial user password is empty after the installation. You need to set the initial user password on the gsql client before performing other operations. Note: For security purposes, remote login to GaussDB Kernel in trust mode is prohibited for all users, and remote login in any mode is prohibited for the initial user.
Common User	By default, a user can access the default database system catalogs (excluding pg_authid, pg_largeobject, pg_user_status, and pg_auth_history) and views and connect to the default database **postgres**, as well as the objects in the public schema, including tables, views, and functions. • You can run CREATE USER and ALTER USER to specify system permissions, or run GRANT ALL PRIVILEGE to grant the SYSADMIN permission. • You can run the GRANT statement to assign object permissions to a common user. • The user can run the GRANT statement to assign other user permissions to a common user.

2. **Database permission types**

   Permissions and roles work together to specify accessible data and executable SQL statements. For details, see **Table 8-2**.

   System permissions are specified by using the CREATE USER/ALTER USER and CREATE ROLE/ALTER ROLE statements and cannot be inherited from roles. The SYSADMIN permission can be granted or revoked by using the GRANT/REVOKE ALL PRIVILEGES statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-2 Permission types

Type	Description
System permission	System permissions are also regarded as user attributes, which can be specified when a user is being created or modified. System permissions include SYSADMIN, MONADMIN, OPRADMIN, POLADMIN, CREATEDB, CREATEROLE, AUDITADMIN, and LOGIN. They can be specified only by the CREATE USER or ALTER USER statement. System permissions except SYSADMIN cannot be granted or revoked by the GRANT or REVOKE statement. In addition, system permissions cannot be inherited from roles.
Object permission	Object permissions are operation permissions for tables, views, indexes, sequences, and functions. These permissions include SELECT, INSERT, UPDATE, and DELETE. Only an object owner or SYSADMIN can use the GRANT/REVOKE statement to grant or revoke object permissions.
Role	A role is a group of permissions. If a role consists of system permissions, these permissions cannot be granted to other users or roles. If a role consists of object permissions, these permissions can be granted to other users or roles.

3. **Database permission model**
   a. **System permission model**
      - **Default permission mechanism**

        Figure 8-1 Permission architecture

        
        Figure 8-1 shows the permission architecture. In the default permission mechanism, the SYSADMIN has most permissions.

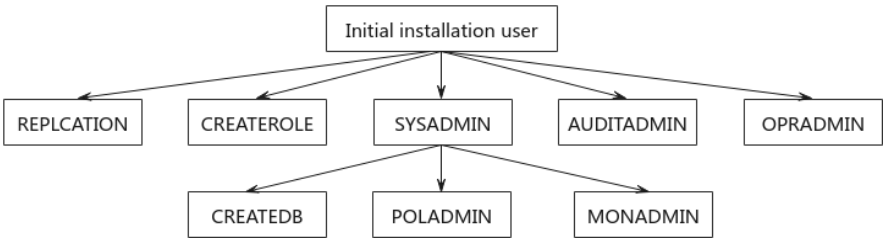
        - **Initial installation user**: an account automatically generated during cluster installation. This account has the highest permissions in the system and can perform all operations.
        - **SYSADMIN**: system administrator permissions, which are only inferior to those of the initial installation user. By default, the system administrator has the same permissions as the object owner, excluding the permissions of the monitor administrator and O&M administrator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **MONADMIN**: monitor administrator permissions, including the permissions to access and grant views and functions in the monitor schema DBE_PERF.
- **OPRADMIN**: O&M administrator permissions, including the permission to use Roach to perform backup and restoration.
- **CREATEROLE**: security administrator permissions, including the permissions to create, modify, and delete users and roles.
- **AUDITADMIN**: audit administrator permissions, including the permissions to view and maintain database audit logs.
- **CREATEDB**: permission to create databases.
- **POLADMIN**: security policy administrator permissions, including the permissions to create resource labels, dynamic data masking policies, and unified audit policies.

▪ **Separation of duties**

Figure 8-2 Separation of duties



- **SYSADMIN**: system administrator permission. The user with this attribute no longer has the permissions to create, modify, delete users or roles, or view or maintain database audit logs.
- **CREATEROLE**: security administrator permissions, including the permissions to create, modify, and delete users and roles.
- **AUDITADMIN**: audit administrator permissions, including the permissions to view and maintain database audit logs.
- A user or role can only have the system permissions of either SYSADMIN, CREATEROLE, o AUDITADMIN.

b. **Object permission model**

▪ Object permissions refer to the permissions to perform operations for database objects (such as databases, schemas, and tables), including SELECT, INSERT, UPDATE, DELETE, and CONNECT.

▪ The permissions vary by object. Object permissions can be granted to users or roles.

▪ You can use GRANT or REVOKE to grant permissions to a user or revoke them from the user. Object permissions can be inherited by a role.

c. **Role permission model**

GaussDB Kernel provides a group of default roles whose names start with **gs_role_**. These roles are provided to access to specific, typically high-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

privileged operations. You can grant these roles to other users or roles within the database so that they can use specific functions. These roles should be given with great care to ensure that they are used where they are needed. **Table 8-3** describes the permissions of built-in roles.

Table 8-3 Permissions of built-in roles

Role	Permission
gs_role_copy_files	Permission to run the **copy... to/from filename** command. However, the GUC parameter **enable_copy_server_files** must be set first to enable the function of copying server files.
gs_role_signal_backend	Permission to call the pg_cancel_backend(), pg_terminate_backend(), and pg_terminate_session() functions to cancel or terminate other sessions. However, this role cannot perform operations on sessions of the initial user or users with the PERSISTENCE attribute.
gs_role_tablespace	Permission to create a tablespace.
gs_role_replication	Permission to call logical replication functions, such as kill_snapshot(), pg_create_logical_replication_slot(), pg_create_physical_replication_slot(), pg_drop_replication_slot(), pg_replication_slot_advance(), pg_create_physical_replication_slot_extern(), pg_logical_slot_get_changes(), pg_logical_slot_peek_changes(), pg_logical_slot_get_binary_changes(), and pg_logical_slot_peek_binary_changes().
gs_role_account_lock	Permission to lock and unlock users. However, this role cannot lock or unlock the initial user or users with the PERSISTENCE attribute.
gs_role_pldebugger	Permission to debug functions in dbe_pldebugger.
gs_role_directory_create	Permission to create directory objects. However, this role needs to enable the GUC parameter **enable_access_server_directory** first.
gs_role_directory_drop	Permission to drop directory objects. However, this role needs to enable the GUC parameter **enable_access_server_directory** first.

4. System permission configuration
   - **Configuring the default permission mechanism**
     - **Initial user**

       The account automatically generated during database installation is called an initial user. The initial user is also the SYSADMIN, MONADMIN, OPRADMIN, and POLADMIN. It has the highest

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

permissions in the system and can perform all operations. If the initial username is not specified during installation, the username is the same as the name of the OS user who installs the database. If the password of the initial user is not specified during the installation, the password is empty after the installation. In this case, you need to change the password of the initial user on the gsql client before performing other operations. If the initial user password is empty, you cannot perform other SQL operations, such as upgrade, capacity expansion, and node replacement, except changing the password.

An initial user bypasses all permission checks. You are advised to use the initial user as a database administrator only for database management other than service running.

- **SYSADMIN**

```
gaussdb=#CREATE USER u_sysadmin WITH SYSADMIN password '********';
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_sysadmin01 SYSADMIN;
```

- **MONADMIN**

```
gaussdb=#CREATE USER u_monadmin WITH MONADMIN password '********';
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_monadmin01 MONADMIN;
```

- **OPRADMIN**

```
gaussdb=#CREATE USER u_opradmin WITH OPRADMIN password "xxxxxxxxx";
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_opradmin01 OPRADMIN;
```

- **POLADMIN**

```
gaussdb=#CREATE USER u_poladmin WITH POLADMIN password "xxxxxxxxx";
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_poladmin01 POLADMIN;
```

– **Configuring the separation of duties**

To configure this mode, you need to set the GUC parameter **enableSeparationOfDuty** to **on**. This is a POSTMASTER parameter. After this parameter is modified, you need to restart the database.

```
gs_guc set -Z datanode -N all -I all -c "enableSeparationOfDuty=on"
gs_om -t stop
gs_om -t start
```

The syntax for creating and configuring user permissions is the same as that for default permissions.

5. Role permission configuration

```
-- Create the database test.
gaussdb=#CREATE DATABASE test;
-- Create role1 and user1.
gaussdb=#CREATE ROLE role1 PASSWORD '********';
gaussdb=#CREATE USER user1 PASSWORD '********';
-- Grant the CREATE ANY TABLE permission to role1.
gaussdb=#GRANT CREATE ON DATABASE test TO role1;

-- If role1 is assigned to user1, user1 belongs to group role1 and inherits the permissions of role1 to create schemas in the database test.
gaussdb=#GRANT role1 TO user1;

-- Query user and role information.
gaussdb=#\du role1|user1;
          List of roles
 Role name |  Attributes  | Member of
-----------+--------------+-----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
role1     | Cannot login | {}
user1     |              | {role1}
```

Practice Effect

None.

8.3 Best Practices for VACUUM

8.3.1 VACUUM Parameters

Table 8-4 VACUUM parameters

Name	Description	Default Value
track_counts	Specifies whether to enable the statistics collection function.	on
AutoVacuum	Specifies whether to enable the automatic cleanup function.	on
AutoVacuum_mode	Specifies whether Autoanalyze or AutoVacuum is enabled. This parameter is valid only when **AutoVacuum** is set to **on**.	mix
autovacuum_max_workers	Specifies the maximum number of working processes that can be automatically cleared.	3
autovacuum_naptime	Specifies the interval between two automatic vacuum operations.	10min
autovacuum_vacuum_cost_limit	Specifies the upper limit of the cost used in AutoVacuum.	1000
autovacuum_vacuum_cost_delay	Specifies the sleep time required if the cost exceeds the upper limit.	20ms
vacuum_freeze_min_age	Specifies the upper limit of tuple age. The tuple needs to be frozen if this upper limit is exceeded.	2000000000
autovacuum_freeze_max_age	Specifies the upper limit of table age. AutoVacuum needs to be forcibly started if this upper limit is exceeded.	4000000000
vacuum_freeze_table_age	Specifies the upper limit of table age. The emergency mode needs to be executed if this upper limit is exceeded.	4000000000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Description	Default Value
autovacuum_vacuum_threshold	Specifies the threshold for AutoVacuum to perform VACUUM.	50
autovacuum_vacuum_scale_factor	Specifies the AutoVacuum factor, which is the scale factor for AutoVacuum to perform VACUUM.	0.2
autovacuum_analyze_threshold	Specifies the threshold for AutoVacuum to perform ANALYZE.	50
autovacuum_analyze_scale_factor	Specifies the autoanalyze factor, which is the scale factor for AutoVacuum to perform ANALYZE.	0.1

8.3.2 FAQ

8.3.2.1 Possible Causes of Data Table Bloat

To ensure the service performance of the database, the delete operation does not immediately release the space of historical version rows. Instead, the rows are marked as deleted. The space is then asynchronously reclaimed. If the recycling operation is blocked or a logic defect occurs, the deleted space cannot be reused, and the newly inserted rows continuously expand the file, leading to tablespace bloat. Space bloat may occur in database indexes, heap tables, and log files. In this section, the principle of heap tablespace bloat is discussed.

For Astore, the multi-version mechanism stores historical versions in the heap table to form a version chain. When a tuple is deleted or updated, the original tuple becomes a dead tuple. Recycling can be triggered only when the transaction ID of the operation transaction is less than **oldestxmin**. Therefore, Astore is prone to have space bloat issues.

Ustore uses the multi-version management mechanism to store historical versions in undo logs. The historical versions can be cleared after transactions are submitted. In addition, Ustore uses in-place update instead of the append update mode of Astore. The update operation does not cause heap tablespace bloat. Therefore, in frequent update scenarios, the space stability of Ustore is much better than that of Astore. However, this does not mean that Ustore is not subject to space bloat. Based on the backtracking and summary of historical problems, the main causes of heap tablespace bloat are classified into the following types:

1. A long transaction exists. As a result, **oldestxmin** is not properly updated. After a transaction is deleted and submitted, the space cannot be reused.
2. The AUTOVACUUM cleanup is inefficient and cannot keep up with the rate at which dead tuples are generated.
3. FSM is incorrect or inaccurate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.3.2.1.1 oldestxmin Is Stuck Due to Long Transactions

Symptom

VACUUM of Astore can only clean up dead tuples that have been committed and whose transaction IDs are smaller than **oldestxmin**. If a long transaction is not committed for a long time, **oldestxmin** cannot be updated. As a result, AUTOVACUUM cannot reclaim dead tuples, causing Astore space bloat.

Fault Locating

To solve this problem, use the gs_txid_oldestxmin() view to query **oldestxmin** and use the txid_current() view to query the latest XID. Then, you can determine whether **oldestxmin** is stuck based on the difference between the two views.

```
select txid_current() as xid, gs_txid_oldestxmin() as oldestxmin, xid - oldestxmin as diff;
```

Example:

```
gaussdb=# select txid_current() as xid, gs_txid_oldestxmin() as oldestxmin, xid - oldestxmin as diff;
  xid   | oldestxmin | diff
--------+------------+------
 220790 |     220789 |    1
(1 row)
```

Generally, a difference of less than 10,000 between the two is considered normal. If the difference is too large, for example, several hundred thousand or even millions, long transactions exist in the system. You can use pg_stat_activity to obtain information about blocked transactions.

```
select 'elp:'|| now() - xact_start diff, query, datname, pid, usename, xact_start, enqueue, state, query_id,
query from pg_stat_activity where query not like 'WLM%' order by diff desc;
select * from pg_running_xacts;
```

Example:

```
gaussdb=# select 'elp:'|| now() - xact_start diff, query, datname, pid, usename, xact_start, enqueue, state,
query_id, query from pg_stat_activity where query not like 'WLM%' and state='active' order by diff desc;
     diff     |                                                
```

```
                                                | postgres | 140124747724544 | postgres |
|         | active |
    0 |
 elp:         |
                                                | postgres | 140124232349440 | postgres |
|         | active |
    0 |
(6 rows)

gaussdb=# select * from pg_running_xacts where pid=140125682005760;
 handle |  gxid  | state |  node  | xmin | vacuum | timeline | prepare_xid |       pid       | next_xid | dbid
--------+--------+-------+--------+------+--------+----------+-------------+-----------------+----------+-------
     -1 | 220796 | 0     | sgnode |    0 | f      |       11 |           0 | 140125682005760 |        0 | 12912
(1 row)
```

In addition, logical replication slots may also block the update of **oldestxmin**. You can check the replication slot information as follows:

```
select * from pg_get_replication_slots();
```

Example:

```
gaussdb=# select * from pg_get_replication_slots();
 slot_name | plugin | slot_type | datoid | active | xmin | catalog_xmin | restart_lsn | dummy_standby |
confirmed_flush | confirmed_csn | dictionary_csn_min | slo
t_dictionary_type
-----------+--------+-----------+--------+--------+------+--------------+-------------+---------------+-----------------
+---------------+--------------------+----
-----------------
 dn_6003   |        | physical  |      0 | t      |      |              | 0/15E52890  | f             |               |
|                 |
 dn_6002   |        | physical  |      0 | t      |      |              | 0/15E52890  | f             |               |
|                 |
(2 rows)
```

Workarounds

After identifying the active thread that blocks the update of **oldestxmin**, terminate the corresponding thread.

8.3.2.1.2 AUTOVACUUM Cleanup Efficiency Is Low

Symptom

AUTOVACUUM requires a large number of I/O operations during cleanup. AUTOVACUUM has its own I/O control mechanism. It reduces the impact of AUTOVACUUM threads on services by controlling the number of page accesses per unit of time. This I/O control mechanism greatly affects the efficiency of VACUUM in large table and large-capacity scenarios.

Fault Locating

For details about how to estimate the cleanup efficiency, see **How Do I Estimate the VACUUM Cleanup Rate or How Long It Will Take?**.

Workarounds

If AUTOVACUUM cleanup is slow and cannot keep up with the generation of dead rows, dead rows are stacked continuously. In this case, perform the following operations:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Modify the AUTOVACUUM parameter: When the system I/O resources are sufficient, you can reduce the value of **autovacuum_vacuum_cost_delay** to speed up the VACUUM cleanup. The default value of this parameter is **20ms**. That is, a forced sleep is triggered when about 20 to 50 pages are scanned, and the duration of each sleep is 20 ms. You are advised to set this parameter to **1ms** to improve the cleanup efficiency of background threads.
2. Perform VACUUM manually: If dead rows cannot be reclaimed immediately after the parameter is modified, you can use the view to identify tables with a large number of dead rows and manually perform VACUUM on those tables. Manual execution of VACUUM is not subject to I/O control. Therefore, dead rows can be cleaned up efficiently.

8.3.2.1.3 FSM Is Damaged

Symptom

FSM is a mechanism used to maintain free space of data pages. Each FSM entry uses 8 bits to describe the free space of a page. The allocation of all data pages and space management depend on the accuracy of this mechanism. If FSM is inaccurate, free pages may fail to be obtained, triggering the page extension logic.

Fault Locating

In GaussDB 505.2, the spatial accuracy analysis view is introduced. Such problems can be quickly analyzed and located.

Workarounds

Perform VACUUM manually to rebuild FSM of the target table and quickly restore the FSM accuracy.

8.3.2.2 How Do I Estimate the Current Table or Database Space Bloat Ratio?

- Method 1: If possible, use INSERT INTO SELECT to fully import data from the old table to the new table. Estimate the space bloat ratio based on the sizes of the old and new tables. Example:

```
gaussdb=# create table t4(like t3);
CREATE TABLE
gaussdb=# insert into t4 select * from t3;
INSERT 0 85376
gaussdb=# select pg_table_size('t3'::regclass) / pg_table_size('t4'::regclass);
    ?column?
------------------
 7.87027797576622
(1 row)
```

- Method 2: Run the **\d** command to view the table structure, estimate the average length of tuples, and multiply the average length by the number of active tuples to estimate the space occupied by the tables. Bloat ratio ≈ Table size/(Number of active rows × Average length of a single row) Average length of a single row ≈ Sum of lengths of all columns + Row pointer length (4 bytes) + tuple header length (24 bytes) You can use COUNT(*) or the pg_stat_get_live_tuples function to obtain the number of active rows.

  Example:

```
gaussdb=# select pg_table_size('t3'::regclass);
 pg_table_size
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
---------------
     90456064
(1 row)
gaussdb=# \d t3;
          Table "public.t3"
 Column |      Type      | Modifiers
--------+----------------+-----------
 a      | integer        |
 b      | character(100) |

gaussdb=# select count(1) from t3;
 count
-------
 85376
(1 row)
```

In the preceding example, the total length of all columns is 104 bytes (100 bytes + 4 bytes), the number of valid rows is 85,376, and the valid space is approximately 85376 × (104 + 4 + 24) = 11269632. Bloat ratio ≈ 90456064/11269632 = 8, that is, the space has bloated by nine times, which is approximately equal to the result of method 1.

8.3.2.3 How Do I Evaluate Whether the Current Table or Database Requires VACUUM?

GaussDB provides the system function pg_autovac_status to query whether a table has reached the VACUUM threshold. Combined with the pg_class system catalog, you can query the top *N* tables with the highest dead row rates. For example, the following SQL statement queries the top 10 tables with the highest dead row rates:

```
SELECT
C.oid AS relid,
N.nspname AS schemaname,
C.relname AS relname,
C.reltuples AS n_rel_tup,
pg_catalog.pg_stat_get_dead_tuples(C.oid) AS n_dead_tup,
pg_catalog.pg_autovac_status(C.oid).doVacuum as need_Vacuum,
CAST(n_dead_tup / C.reltuples AS decimal(10, 2)) AS dead_radio
FROM pg_class C LEFT JOIN
pg_index I ON C.oid = I.indrelid
LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE C.relkind IN ('r') and C.reltuples > 0
GROUP BY C.oid, N.nspname, C.relname, C.reltuples, need_Vacuum
order by dead_radio desc limit 10;
```

The command output is as follows:

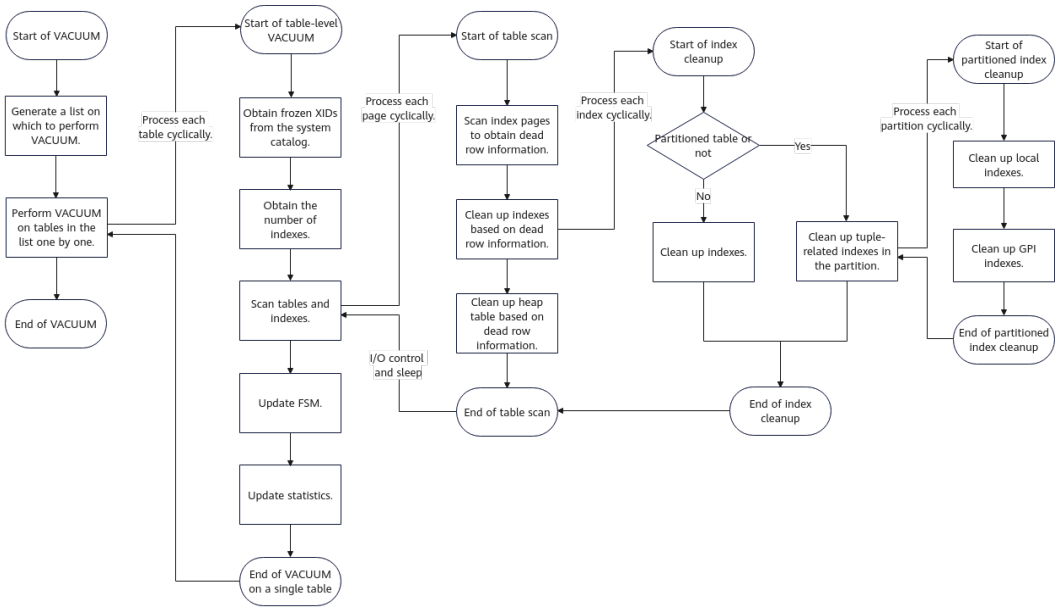
```
 relid | schemaname |          relname          | n_rel_tup | n_dead_tup | need_vacuum | dead_radio
-------+------------+---------------------------+-----------+------------+-------------+------------
  2604 | pg_catalog | pg_attrdef                |         1 |         14 |             |      14.00
  2606 | pg_catalog | pg_constraint             |        12 |         15 |             |       1.25
  3118 | pg_catalog | pg_foreign_table          |         2 |          2 |             |       1.00
  3079 | pg_catalog | pg_extension              |        24 |         15 |             |        .63
  2601 | pg_catalog | pg_am                     |        11 |          4 |             |        .36
  1417 | pg_catalog | pg_foreign_server         |         4 |          1 |             |        .25
  2610 | pg_catalog | pg_index                  |       421 |         82 |             |        .19
  2328 | pg_catalog | pg_foreign_data_wrapper   |         6 |          1 |             |        .17
  2619 | pg_catalog | pg_statistic              |      1231 |        187 |             |        .15
  2609 | pg_catalog | pg_description            |      4748 |         25 |             |        .01
(10 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.3.2.4 How Do I Estimate the VACUUM Cleanup Rate or How Long It Will Take?

The execution of AUTOVACUUM is divided into several steps. The execution duration of each step is different. The following figure shows the simplified process.

Figure 8-3 VACUUM process



As shown in the preceding figure, the time required to perform VACUUM on a single table is related to the number of table pages, number of index pages, number of global indexes, number of partitions, and I/O control time.

The formula for estimating the speed of VACUUM on a single table is as follows:

- Non-partitioned tables

  Number of pages = Number of data pages + Number of index pages

  Cleanup time = Number of pages × Cleanup duration + Number of pages/Evaluation cost × Sleep time

  Cleanup speed = Total number of dead rows/Cleanup time

- Partitioned Table

  Number of pages = Number of data pages + Number of ordinary index pages + (Total number of global index pages) × Number of partitions

  Cleanup time = Number of pages × Cleanup duration + Number of pages/Evaluation cost × Sleep time

  Cleanup speed = Total number of dead rows/Cleanup time

You can run the following SQL statement to evaluate the speed of VACUUM on a single table:

- Non-partitioned table

```
select
((heap_pages * prune_time) + (index_pages * prune_time) * nindexs + ((heap_pages+index_pages) *
hit_percent * Vacuum_cost_page_hit + (heap_pages+index_pages) * miss_percent *
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
Vacuum_cost_page_miss + (heap_pages+index_pages) * dirty_percent * Vacuum_cost_page_dirty) *
Vacuum_cost_delay / Vacuum_cost_limit) as totaltime, deadtuples/totaltime as speed
from
(select relpages as heap_pages,  b.n_dead_tup as deadtuples, b.n_dead_tup/(reltuples+b.n_dead_tup
+1) as dirty_percent from pg_class a, pg_stat_all_tables b where a.relname = 't1' and b.relname =
a.relname) as abc , (select sum(relpages) as index_pages, count(*) as nindexs from pg_class where
relname in (select indexname from pg_indexes where tablename = 't1') and relkind = 'i') as bcd ,
(select 0.07 as prune_time, 0.05 as miss_percent , 0.95 as hit_percent , 1 as Vacuum_cost_page_hit,10
as Vacuum_cost_page_miss , 200 as Vacuum_cost_limit ,20 as Vacuum_cost_delay , 20 as
Vacuum_cost_page_dirty);
```

- Partitioned table

```
select
((heap_pages * prune_time) + (local_index_pages * prune_time) * nlocalindexs + (gpi_index_pages *
prune_time) * npartitions * ngpiindexs + ((heap_pages + local_index_pages + gpi_index_pages) *
hit_percent * Vacuum_cost_page_hit + (heap_pages + local_index_pages + gpi_index_pages) *
miss_percent * Vacuum_cost_page_miss + (heap_pages + local_index_pages + gpi_index_pages) *
dirty_percent * Vacuum_cost_page_dirty) * Vacuum_cost_delay / Vacuum_cost_limit) as total_time,
 dead_tuples/total_time as speed
 from
 (select relpages as heap_pages, b.n_dead_tup as dead_tuples, b.n_dead_tup/(reltuples+b.n_dead_tup
+1) as dirty_percent from pg_class a, pg_stat_all_tables b where a.relname = 't1' and b.relname =
a.relname) as abc ,
 (select sum(relpages) as local_index_pages,
 count(*) as nlocalindexs
 from
 pg_class where oid in (select indexrelid from pg_index where indrelid=(select oid from pg_class where
relname = 't1')) and relkind='i') as bcd , (select sum(relpages) as gpi_index_pages, count(*) as
ngpiindexs  from pg_class where oid in (select indexrelid from pg_index where indrelid=(select oid
from pg_class where relname = 't1')) and relkind='I') as fenqu , (select count(*) as npartitions from
pg_partition where parentid in (select oid from pg_class where relname = 't1'))as qqq ,(select 0.07 as
prune_time, 0.05 as miss_percent , 0.95 as hit_percent , 1 as Vacuum_cost_page_hit,10 as
Vacuum_cost_page_miss , 200 as Vacuum_cost_limit ,20 as Vacuum_cost_delay , 20 as
Vacuum_cost_page_dirty) as yyy;
```

NOTE

1. In the formula, **prune_time** indicates the time required for cleaning up a tuple. The value is related to the hardware I/O capability. For SSDs, the value is around 0.07 ms. For NVMe SSDs with higher I/O capabilities, set this parameter to a smaller value. For HDDs with lower I/O capabilities, set this parameter to a larger value.
2. **miss_percent** and **hit_percent** indicate the cache hit and miss rates. In scenarios right after data import, the cache hit rate is relatively low. After the system becomes stable, the miss rate is around 0.5 and the hit rate is around 0.95.
3. The value of **vacuum_cost_delay** is the same as the value of the GUC parameter **autovacuum_vacuum_cost_delay**.

In addition, the following progress analysis view is introduced in the current version to obtain the AUTOVACUUM progress and efficiency.

```
gaussdb=# select * from gs_stat_progress_vacuum(140123447490304);
       pid       | dataname | relid | relname |      phase      |
         detail
-----------------+----------+-------+---------+---------------

(1 row)
```

8.3.2.5 How Do I Locate Inaccurate Statistics Such as Number of Dead Rows in the Database?

You can use ANALYZE to update the statistics. If there is a significant difference in dead row data before and after the execution of ANALYZE, it indicates that the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

statistics are inaccurate. Note that ANALYZE is performed based on sampling. Therefore, there is a certain error. When a large number of empty pages exist in the table, the accuracy of statistics by sampling may be affected. In this case, you can use the gs_parse_page_bypath tool mentioned in the preceding to increase the sampling ratio to parse the pages more accurately and calculate the number of dead rows.

8.4 Best Practices for Import and Export Using COPY

The **COPY** syntax is a useful tool for exporting data from GaussDB to data files in CSV, BINARY, FIXED, or TEXT format. It can also import data from the four types of files to a specified table.

8.4.1 Typical Scenarios

Preparations

During import or export using COPY, the database requires file read/write permissions on the server. To grant these permissions, enable the GUC parameter **enable_copy_server_files**.

```
gs_guc reload -I all -N all -Z datanode -c "enable_copy_server_files=on"
```

NOTICE

- Parameters in the COPY command must match the actual data in files, including the format, delimiter, newline character, and character set.
- If the specified client-side encoding matches the server-side encoding, the COPY command preserves the binary form of data during import and export, preventing any structural damage that may result from transcoding. This mechanism guarantees the integrity and originality of data migration, making it suitable for scenarios that demand absolute fidelity.

8.4.1.1 Using the Recommended CSV Format

In **CSV format**, each file is divided into multiple records using newline characters. Each record is further split into multiple fields using **delimiters**, which are commas (',') by default. Each field can be enclosed within a pair of **quote characters**, which are double quotation marks ('"') by default. This eliminates the need to escape special characters such as EOL characters and delimiters within the field content. Furthermore, CSV is a widely recognized standard with exceptional cross-platform compatibility and cross-industry universality, solidifying its position as the top recommended format.

Recommended export command:

```
copy {data_source} to '/path/export.csv' delimiter ',' quote '"' escape '"' encoding {server_encoding} csv;
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
```

Corresponding import command:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
copy {data_destination} from '/path/export.csv' delimiter ',' quote '"' escape '"' encoding {file_encoding} csv;
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during file export.
```

NOTICE

To import a manually created CSV data file into the database, ensure that the file complies with CSV standards. Additionally, specify the correct parameters, including delimiters, quote characters, and EOL characters, in the COPY command.

Examples

Step 1 Prepare data.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# CREATE TABLE test_copy(id int, name text);
CREATE TABLE
db1=# insert into test_copy values(1, 'aaa');
INSERT 0 1
db1=# insert into test_copy values(2, e'bb\nb');
INSERT 0 1
db1=# insert into test_copy values(3, e'cc\tc');
INSERT 0 1
db1=# insert into test_copy(name) values('ddd');
INSERT 0 1
db1=# insert into test_copy values(5, e'ee\\e');
INSERT 0 1
db1=# insert into test_copy values(6, ',');
INSERT 0 1
db1=# insert into test_copy values(7, '"');
INSERT 0 1
db1=#  SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  2 | bb       +
    | b
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(7 rows)
```

Step 2 Export data from the entire table.

```
db1=# copy test_copy to '/home/xy/test.csv' delimiter ',' quote '"' escape '"' encoding 'UTF-8' csv;
COPY 7
```

The content of the exported CSV file is as follows:

```
1,aaa
2,"bb
b"
3,cc    c
,ddd
5,ee\e
6,","
7,""""""
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Import data.

```
db1=# truncate test_copy;
TRUNCATE TABLE
db1=# copy test_copy from '/home/xy/test.csv' delimiter ',' quote '"' escape '"' encoding 'UTF-8' csv;
COPY 7
```

Step 4 (Custom data set export) Export the **name** column for all rows in **test_copy**, excluding those with an empty ID.

```
db1=# copy (select name from test_copy where id is not null) to '/home/xy/test.csv' delimiter ',' quote '"'
escape '"' encoding 'UTF-8' csv;
COPY 6
```

The content of the exported CSV file is as follows:

```
aaa
"bb
b"
cc    c
ee\e
","
""""""
```

----End

8.4.1.2 Importing and Exporting Data with Extreme Performance

When there are strict demands for data import and export performance, and the import and export occur between database instances of the same version, you can use the **BINARY** format to read and store data as binary numbers other than regular text. Although this format provides performance advantages over others, it comes with the following limitations:

1. The BINARY format is specific to GaussDB, making it non-portable. It is advisable to use this format only for importing and exporting data between databases of the same version.
2. The BINARY format is tightly coupled with specific data types. For example, while the TEXT format allows exporting data from a smallint field and importing it into an integer column, this is not possible with the BINARY format.
3. Certain data types cannot be imported or exported using the BINARY format. For details, see **BINARY limitations**.

Recommended export command:

```
set client_encoding = '{server_encoding}';
copy {data_source} to '/path/export.bin' binary;
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
```

Corresponding import command:

```
set client_encoding = '{file_encoding}';
copy {data_destination} from '/path/export.bin' binary;
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Before choosing the BINARY format, carefully review its limitations. Use it to enhance import and export performance only when you are completely certain that these limitations will not impact the data to be exported.

Examples

Step 1 Prepare data.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# CREATE TABLE test_copy(id int, name text);
CREATE TABLE
db1=# insert into test_copy values(1, 'aaa');
INSERT 0 1
db1=# insert into test_copy values(3, e'cc\tc');
INSERT 0 1
db1=# insert into test_copy(name) values('ddd');
INSERT 0 1
db1=# insert into test_copy values(5, e'ee\\e');
INSERT 0 1
db1=# insert into test_copy values(6, ',');
INSERT 0 1
db1=# insert into test_copy values(7, '"');
INSERT 0 1
db1=# SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# set client_encoding = 'UTF-8';
SET
db1=# COPY test_copy TO '/home/xy/test.bin' BINARY;
COPY 6
```

Step 3 Import data.

```
db1=# truncate test_copy;
TRUNCATE TABLE
db1=# set client_encoding = 'UTF-8';
SET
db1=# copy test_copy from '/home/xy/test.bin' BINARY;
COPY 6
```

----End

8.4.1.3 Exporting Files for Manual Parsing

The FIXED format maintains a fixed data structure to simplify file parsing: Each row represents a record, and within each row, the starting offset and length of each field value are fixed. Therefore, it is advisable to utilize the FIXED format

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

when you need to manually parse a data file exported from the database. Despite this, the FIXED format has its limitations, as detailed in **FIXED description**.

Recommended export command:

```
COPY {data_source} FROM '/path/export.fixed' encoding {server_encoding} FIXED
FORMATTER(col1_name(col1_offset, col1_length), col2_name(col2_offset, col2_length));
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
-- col1_name(col1_offset, col1_length) indicates that the data named col1_name in each row of the data file starts at the position with an offset of col1_offset and extends for a length of col1_length.
```

Corresponding import command:

```
COPY {data_destination} from '/path/export.fixed' encoding {file_encoding} FIXED
FORMATTER(col1_name(col1_offset, col1_length), col2_name(col2_offset, col2_length));
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during file export.
-- col1_name(col1_offset, col1_length) indicates that the data named col1_name in each row of the data file starts at the position with an offset of col1_offset and extends for a length of col1_length.
```

NOTICE

The fixed column width format has limitations: It requires maintaining a relatively uniform width for each column in the table, allowing for the selection of an appropriate fixed **col_length** to prevent data truncation and eliminate unnecessary spaces in all columns. In cases where column widths vary significantly or change dynamically, it is advisable to prioritize flexible formats such as TEXT or CSV to ensure data integrity and efficient use of storage space.

Examples

Step 1 Prepare data.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# CREATE TABLE test_copy(id int, name text);
CREATE TABLE
db1=# insert into test_copy values(1, 'aaa');
INSERT 0 1
db1=# insert into test_copy values(2, 'bb"b');
INSERT 0 1
db1=# insert into test_copy values(3, 'cc  c');
INSERT 0 1
db1=# insert into test_copy values('', e'dd\td');
INSERT 0 1
db1=# insert into test_copy values('5', e'ee\e');
INSERT 0 1
db1=# select * from test_copy;
 id |   name
----+----------
  1 | aaa
  2 | bb"b
  3 | cc  c
    | dd      d
  5 | eee
(5 rows)
```

Step 2 Export data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
db1=# COPY test_copy TO '/home/xy/test.fixed' encoding 'UTF-8' FIXED FORMATTER(id(0,1), name(1,5));
COPY 5
```

The content of the exported data file is as follows:

```
1  aaa
2 bb"b
3cc  c
  dd    d
5  eee
```

Step 3 Import data.

```
db1=# truncate test_copy;
TRUNCATE TABLE
db1=# copy test_copy from '/home/xy/test.fixed' encoding 'UTF-8' FIXED FORMATTER(id(0,1), name(1,5));
COPY 5
```

----End

8.4.1.4 Importing and Exporting Data When Only the TEXT Format Is Available

In TEXT format, each file is divided into multiple records using **EOL characters**. Each record is further split into multiple fields using **delimiters**, which are tab characters ('\t') by default.

Using the TEXT format necessitates special logic, for example:

- The backspace (0x08), form-feed (0x0C), newline (0x0A), carriage return (0x0D), horizontal tab (0x09), and vertical tab (0x0B) characters are escaped as **'\b'**, **'\f'**, **'\n'**, **'\r'**, **'\t'**, and **'\v'**, respectively.
- By default, the EOL character is configured as the first identified **'\n'**, **'\r'**, or **'\r\n'** during import, and as **'\n'** during export.
- A single backslash is escaped as double backslashes.
- NULL values are escaped as **'\N'**.

Exporting Data from and Importing Data into GaussDB

Recommended export command:

```
copy {data_source} to '/path/export.txt' eol e'\n' delimiter e'\t' encoding '{server_encoding}';
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
```

Corresponding import command:

```
copy {data_destination} from '/path/export.txt' eol e'\n' delimiter e'\t' encoding '{file_encoding}';
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
```

Example:

Step 1 Prepare data.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# create table test_copy(id int, name text);
CREATE TABLE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
db1=# insert into test_copy values(1, 'aaa');
INSERT 0 1
db1=# insert into test_copy values(3, e'cc\tc');
INSERT 0 1
db1=# insert into test_copy(name) values('ddd');
INSERT 0 1
db1=# insert into test_copy values(5, e'ee\\e');
INSERT 0 1
db1=# insert into test_copy values(6, e',');
INSERT 0 1
db1=# insert into test_copy values(7, e'"');
INSERT 0 1
db1=# select * from test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# copy test_copy to '/home/xy/test.txt' eol e'\n' delimiter e'\t' encoding 'UTF-8';
COPY 6
```

Step 3 Import data.

```
db1=# truncate test_copy;
TRUNCATE TABLE
db1=# copy test_copy from '/home/xy/test.txt' eol e'\n' delimiter e'\t' encoding 'UTF-8';
COPY 6
```

----End

Exporting Data Files from GaussDB for Manual Parsing

In this scenario, you will not want the exported TEXT files to exhibit any escape behavior specific to GaussDB. Follow these steps:

- Check for EOL characters or delimiters in the field data.
- If they exist, modify the **EOL** or **delimiter** parameter to use other characters that do not appear in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.
- You can use the **NULL** option to specify how NULL values should be represented during export.
- Finally, include the **without escaping** parameter to prevent escaping in the output.

Recommended export command:

```
copy {data_source} to '/path/export.txt' without escaping eol e'\x1E' delimiter e'\x1F' null '\N' encoding
'{server_encoding}';
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The primary function of the escaping mechanism is to prevent special characters (such as delimiters and newline characters) in fields from damaging the file structure. When choosing to disable the escaping mechanism, be sure to isolate special characters by carefully choosing delimiters and newline characters for non-escaping scenarios and ensuring that these characters are absent in the data content. This is essential for non-escaped file parsing, as any character conflicts can lead to data parsing failure or structural disorder.

Example:

Step 1 Prepare data.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# create table test_copy(id int, name text);
CREATE TABLE
db1=# insert into test_copy values(1, 'aaa');
INSERT 0 1
db1=# insert into test_copy values(3, e'cc\tc');
INSERT 0 1
db1=# insert into test_copy(name) values('ddd');
INSERT 0 1
db1=# insert into test_copy values(5, e'ee\\e');
INSERT 0 1
db1=# insert into test_copy values(6, e',');
INSERT 0 1
db1=# insert into test_copy values(7, e'"');
INSERT 0 1
db1=# select * from test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# copy test_copy to '/home/xy/test.txt' without escaping eol e'\x1E' delimiter e'\x1F' null '\N' encoding
'UTF-8';
COPY 6
```

Step 3 Read data. In this step, data is first split into rows based on the selected EOL character (0x1E). Then each row of data stream is further divided based on the delimiter (0x1F) to extract the field values within each row.

----End

Importing User-Created Data Files into GaussDB

If you only have raw field data without a complete data file, you can create a data file manually. To minimize the need for extensive modifications—such as escaping or other special character processing—it is advisable to use the TEXT format. When creating a data file in TEXT format, you can select custom delimiters and EOL characters to ensure accurate data import.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Select an EOL character. If the field data contains 0x0A, do not use 0x0A as the EOL character. Otherwise, newlines within the field data will be misinterpreted as EOL characters, resulting in a single line of data being split into two. To prevent this issue, ensure that the selected EOL character is not present in the field data. For instance, consider using 0x1E as the EOL character since it is not found in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.

Step 2 Select a delimiter. If the field data contains tab characters, do not use them as delimiters. Otherwise, tabs within the field data will be misinterpreted as delimiters, resulting in a single field being split into two. To prevent this issue, ensure that the selected delimiter is not present in the field data. For instance, consider using 0x1F as the delimiter since it is not found in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.

Step 3 Build data. Create a data file using the EOL character and delimiter selected in steps 1 and 2. Check the character set of the server. You need to generate a data file that matches the server's character set.

Step 4 Import data. In this example, the character set of the data file is UTF-8.

```
db1=# copy test_copy to '/home/xy/test.txt' without escaping eol e'\x1E' delimiter e'\x1F' null '\N' encoding 'UTF-8';
COPY 6
```

----End

8.4.1.5 Importing and Exporting Data Files on a GSQL Client

When you execute the COPY command to export data on a GSQL client, the generated data files are saved on the database server by default. This can make it difficult for users to access the files. To offer easier file access, the \COPY command directly generates data files on the local client.

Differences Between COPY and \COPY

1. File location: The files generated and read during COPY import are located on the server. Conversely, in \COPY import, both the generated and read files are located on the client.
2. Performance: To complete \COPY import, the client must read file streams and transmit them to the server. This results in decreased performance in comparison to COPY.
3. Function: Compared to COPY, \COPY offers an additional capability—parallel import on clients. For detailed specifications, consult "Database Connection Tools > gsql for Connecting to a Database > Meta-Command Reference" in *Tool Reference*.

Example \COPY Commands

The difference between the export commands of \COPY and COPY is that **COPY** is replaced by **\COPY**. Below is a simple example of converting CSV export commands from **COPY** to their **\COPY** equivalents:

```
-- COPY commands
COPY {data_source} to '/path/export.csv' encoding {server_encoding} csv;
COPY {data_source} from '/path/export.csv' encoding {server_encoding} csv;
-- Corresponding \COPY commands
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
\COPY {data_source} to '/path/export.csv' encoding {server_encoding} csv;
\COPY {data_source} from '/path/export.csv' encoding {server_encoding} csv;
```

Example Commands for Parallel Import

```
-- Command for import in CSV format
\COPY {data_destination} from '/path/export.txt' encoding {file_encoding} parallel {parallel_num} csv;
-- Command for import in FIXED format
\COPY {data_destination} from '/path/export.txt' encoding {file_encoding} parallel {parallel_num} fixed;
-- Command for import in TEXT format
\COPY {data_destination} from '/path/export.txt' encoding {file_encoding} parallel {parallel_num};
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
-- parallel_num indicates the number of clients for data import. When there are sufficient cluster resources, it is advisable to set it to 8.
```

8.4.1.6 Importing and Exporting Data Through the JDBC Driver

In the presence of the JDBC driver, you can call its CopyManager APIs to implement data import and export. CopyManager can import data into tables and export data from databases in batches.

8.4.1.7 Importing Erroneous Data Through Error Tolerance

Both the COPY and \COPY commands will halt the data import process upon detecting any data exceptions. To overcome this limitation, GaussDB provides two error tolerance modes: intelligent correction mode and strict verification mode. The strict verification mode (Level 1 error tolerance) is preferred because it can skip abnormal records, maintaining data integrity and minimizing the impact on import performance. For details, see **Guide to Importing Erroneous Data**.

Below are import commands executed in strict verification mode (Level1 error tolerance):

```
-- CSV format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding {file_encoding} CSV;
-- BINARY format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding {file_encoding} BINARY;
-- FIXED format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding {file_encoding} FIXED;
-- TEXT format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding {file_encoding};
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
-- limit_num specifies the maximum number of erroneous rows that the COPY FROM statement can tolerate during data import. If this limit is exceeded, errors will be reported as usual according to the original mechanism.
```

NOTICE

To use the error tolerance feature, regular users require permissions on the two system catalogs of the feature. Execute the following SQL statements to grant them these permissions:

```
grant insert,select,delete on pgxc_copy_error_log to {user_name};
grant insert,select,delete on gs_copy_summary to {user_name};
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.2 Guide to Exporting Erroneous Data

Data errors during export typically occur when character strings or binary data that does not match the server-side encoding is inserted into the database. To address this, you are advised to keep the client-side encoding consistent with the server-side encoding, eliminating the need for validity checks against the server-side encoding and data transcoding.

Encoding Consistency Principle During Export

1. When the client-side encoding is consistent with the server-side encoding:
   - Native data is exported.
   - Data integrity and originality are guaranteed.
   - Character set conversion is not required.
2. When the client-side encoding is inconsistent with the server-side encoding:
   - The client-side encoding is employed as the target encoding standard for the exported files.
   - The kernel first checks existing data against the server-side encoding. Upon detecting any data encoded in an illegal format, it will report an error.
   - The kernel then proceeds to transcode the data. If it encounters any characters that cannot be transcoded (due to code bits present in the source character set but not in the target character set), it will report an error.

Solutions to Illegal Encoding

If your database contains any data encoded in an illegal format and you wish to export the data without triggering an error, consider the following methods:

Preferred method: Keep the client-side encoding consistent with the server-side encoding. Then export data using the server-side encoding without performing any transcoding.

Step 1 Query the database server-side encoding.

```
gaussdb=# show server_encoding;
```

Step 2 Query the database client-side encoding.

```
gaussdb=# show client_encoding;
```

Step 3 Keep the client-side encoding consistent with the server-side encoding.

```
gaussdb=# set client_encoding = '{server_encoding}';
```

Step 4 Execute COPY to export data to a file in standard CSV format.

```
gaussdb=# COPY test_copy TO '/data/test_copy.csv' CSV;
```

----End

Alternative solution: Use placeholders ('?') to replace any bytes encoded in an illegal format. This solution depends on the transcoding capability of the database kernel and will alter the content of the exported data.

Step 1 Query the database server-side encoding.

```
gaussdb=# show server_encoding;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Set the database client-side encoding as the target encoding.

```
gaussdb=# set client_encoding = {target_encoding};
```

Step 3 Leverage the kernel's transcoding capability to replace any bytes encoded in an illegal format while exporting data.

```
gaussdb=# COPY test_copy TO '/data/test_copy.csv' CSV COMPATIBLE_ILLEGAL_CHARS;
```

----End

NOTICE

- Consider enabling the **COMPATIBLE_ILLEGAL_CHARS** parameter to correct any exported data encoded in an illegal format during export, while keeping the data in the database unchanged. Kindly use this parameter as necessary.
- When enabled, the **COMPATIBLE_ILLEGAL_CHARS** parameter:
  - Replaces illegal characters with the ones specified in the **convert_illegal_char_mode** parameter. The default replacement character is **'?'** (U+003F).
  - Replaces zero characters (U+0000) with spaces (U+0020). If you do not need this replacement, configure the zero-character function in different compatible modes.
- For detailed constraints on the **COMPATIBLE_ILLEGAL_CHAR....** parameter, refer to the COPY syntax section.

Typical Scenario Examples

The basic processing logic for independent zero characters is simple. This document focuses on streamlining the error tolerance process for complex exception scenarios where both zero characters (\0) and characters encoded in an illegal format are present in data streams.

1. Build UTF-8 zero characters and illegal characters.

```
gaussdb=# create database db_utf8 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db_utf8
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db_utf8" as user "omm".
db_utf8=# create table test_encodings(id int, content text);
CREATE TABLE
db_utf8=# insert into test_encodings values(1,
dbe_raw.cast_to_varchar2(dbe_raw.concat(dbe_raw.cast_from_varchar2_to_raw('Import'),
hextoraw('00'), dbe_raw.cast_from_varchar2_to_raw('Export'))));
INSERT 0 1
db_utf8=# insert into test_encodings values(2,
dbe_raw.cast_to_varchar2(dbe_raw.concat(hextoraw('2297'),
dbe_raw.cast_from_varchar2_to_raw('Import/Export'))));
INSERT 0 1
db_utf8=# show client_encoding;
 client_encoding
-----------------
 UTF8
(1 row)
-- The content in row 1 includes zero characters, while that in row 2 includes characters that are not
encoded by UTF-8.
db_utf8=# select *, dbe_raw.cast_from_varchar2_to_raw(content) from test_encodings;
 id |  content  |  cast_from_varchar2_to_raw
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----+-----------+-----------------------------
 1 | Import      | E5AFBCE585A500E5AFBCE587BA
 2 | "Import/Export | 2297E5AFBCE585A5E5AFBCE587BA
(2 rows)
```

2. Selecting the server's character set for file export allows for direct export without transcoding. However, if a different character set is selected, transcoding will be required. During transcoding, the system will report an error upon detecting the illegal UTF-8 character 0x97. In this situation, simply enable the **compatible_illegal_chars** parameter to ensure successful file export.

```
db_utf8=# copy test_encodings to '/home/xy/encodings.txt.utf8' encoding 'utf-8';
COPY 2
db_utf8=# copy test_encodings to '/home/xy/encodings.txt.gb18030' encoding 'gb18030';
ERROR:  invalid byte sequence for encoding "UTF8": 0x97
db_utf8=# copy test_encodings to '/home/xy/encodings.txt.gb18030' encoding 'gb18030'
compatible_illegal_chars;
COPY 2
```

3. Open the **/home/xy/encodings.txt.utf8** file with UTF-8 encoding. In this example, compatibility handling for character A is not implemented, and the **support_zero_character** option and **compatible_illegal_chars** parameter are disabled. You will notice that the data in the second column of the first row has been truncated, and there are garbled characters in the second column of the second row. Although no explicit exception is shown, the **hexdump** command reveals the presence of garbled characters. You can refer to this example to reproduce the problem, but specific data details are not provided here.

```
1    Import
2    "Import/Export
```

4. Open the **/home/xy/encodings.txt.gb18030** file with GB18030 encoding. You will notice that the zero character in the second column of the first row has been replaced by a space, and the illegal character in the second column of the second row has been replaced by a question mark (?).

```
1    Import Export
2    "?Import/Export
```

8.4.3 Guide to Importing Erroneous Data

The error tolerance mechanism during data import provides two modes.

Intelligent Correction Mode (Adaptive Import)

- Principle: Prioritize data integrity and leverage intelligent correction to ensure that the highest possible volume of accurate data is imported.
- Scenario: Apply this mode when the imported data contains column count exceptions, including extra, missing, or deprecated columns, as well as abnormal characters.
- Procedure:
  a. Rectify the column count exceptions by truncating extra columns, padding missing columns, and discarding deprecated columns.
  b. Transcode the character sets and clean illegal characters.
  c. Write all data into the target database.
- Output: corrected data set, along with logs recorded by GaussDB for character exceptions

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Example:

  a. Extra columns: The number of data columns is greater than that of table columns. In this situation, you can specify the **ignore_extra_data** option in the COPY statement, and GaussDB will import data from the correct number of columns into the table while discarding the extra columns.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# create table test_copy(id int, content text);
CREATE TABLE
db1=# copy test_copy from stdin delimiter ',';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1,Import,Export
>>\.
ERROR:  extra data after last expected column
CONTEXT:  COPY test_copy, line 1: "1,Import,Export"
-- When ignore_extra_data is not specified, the import fails. However, specifying it ensures a
successful import.
db1=# copy test_copy from stdin delimiter ',' ignore_extra_data;
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1,Import,Export
>> \.
COPY 1
db1=# select * from test_copy;
 id | content
----+---------
  1 | Import
(1 row)
```

  b. Missing columns: The number of data columns is less than that of table columns. In this situation, you can specify the **fill_missing_fields** option in the COPY statement, and GaussDB will import data into the matched table columns. If columns do not match any of the imported data, they will be padded with their default values if available. However, if no default values are available, they will be padded with **NULL** instead.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
db1=# create table test_copy(id int, content text, comment1 text, comment2 text);
CREATE TABLE
db1=# copy test_copy from stdin delimiter ',';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1,Import
>> \.
ERROR:  missing data for column "comment1"
CONTEXT:  COPY test_copy, line 1: "1,Import"
-- When fill_missing_fields is not specified, the import fails. However, specifying it ensures a
successful import.
db1=# copy test_copy from stdin delimiter ',' fill_missing_fields 'multi';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1,Import
>> \.
COPY 1
db1=# select * from test_copy;
 id | content | comment1 | comment2
----+---------+----------+----------
  1 | Import  |          |
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. Deprecated columns: Some data columns do not need to be imported into the database. In this situation, you can specify the **FILLER** option in the COPY statement, and GaussDB will skip the specified columns. If the corresponding columns are present in the database, they will be padded with their default values if available. However, if no default values are available, they will be padded with **NULL** instead.

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
db1=# create table test_copy(id int, comment text default 'Export', content text);
CREATE TABLE
db1=# copy test_copy from stdin delimiter ',';
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>>1,No need to import,Import
>\.
COPY 1
db1=# select * from test_copy;
 id |  comment   | content
----+------------+---------
  1 | No need to import | Import
(1 row)
-- When the filler(comment) option is not specified, the content in the second column will be imported into the comment column. However, when the option is specified, the content will not be imported. In this example, the option is specified, and the default value will be inserted into the comment column.
db1=# copy test_copy(id,comment,content) from stdin delimiter ',' filler (comment);
Enter data to be copied followed by a newline.
End with a backslash and a period on a line by itself.
>> 1,No need to import,Import
>> \.
COPY 1
db1=# select * from test_copy;
 id |  comment   | content
----+------------+---------
  1 | No need to import | Import
  1 | Export       | Import
(2 rows)
```

d. Character exceptions: When dealing with character exceptions, take appropriate actions based on the consistency of server-side encoding with client-side encoding.

   - Consistent encoding: If the data being imported contains any characters encoded in an illegal format or zero characters, consider setting the GUC parameter **copy_special_character_version** to **'no_error'** for error tolerance. In this setting, GaussDB will accept data that does not comply with the encoding format. Instead of reporting an error, it will directly insert the data into the table according to the original encoding format.

     For details, see the example data file, **/home/xy/encodings.txt.utf8**, generated in **Guide to Exporting Erroneous Data**. To simulate the scenario where files with encoding exceptions are not transcoded during import, you can create a database with UTF-8 encoding.

     ```
     gaussdb=# create database db_utf8 encoding='UTF-8' LC_COLLATE='en_US.UTF-8'
     LC_CTYPE ='en_US.UTF-8' dbcompatibility = 'A';
     CREATE DATABASE
     gaussdb=# \c db_utf8
     Non-SSL connection (SSL connection is recommended when requiring high-security)
     You are now connected to database "db_utf8" as user "omm".
     db_utf8=# create table test_encodings(id int, content text);
     CREATE TABLE
     db_utf8=# show copy_special_character_version;
     ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 copy_special_character_version
--------------------------------

(1 row)
db_utf8=# copy test_encodings from '/home/omm/temp/encodings.txt.utf8';
ERROR:  invalid byte sequence for encoding "UTF8": 0x97
CONTEXT:  COPY test_encodings, line 2
db_utf8=# set copy_special_character_version = 'no_error';
SET
db_utf8=# copy test_encodings from '/home/xy/encodings.txt.utf8';
COPY 2
db_utf8=# select * from test_encodings;
 id |  content
----+-----------
  1 | Import
  2 | "Import/Export
(2 rows)
```

- Inconsistent encoding: Transcoding is required if the server-side encoding does not match the client-side encoding. COPY implements transcoding through the **compatible_illegal_chars** parameter. If illegal characters are imported into GaussDB, the error tolerance mechanism will convert them and store the resulting characters in GaussDB. The entire import process will proceed without any errors or interruptions. This ensures efficient and stable data import, even in complex environments with inconsistent encoding.

Strict Verification Mode (Precise Import)

- Principle: Prioritize data accuracy and enforce strict compliance when importing data into the database.
- Scenario: Apply this mode in fields that demand strict data accuracy, particularly for sensitive data like medical records and financial transactions. This mode helps alleviate concerns about **intelligent correction** potentially compromising data accuracy.
- Procedure:
  a. Conduct a series of verifications at multiple levels (column count exceptions, character exceptions, data type conversion exceptions, and constraint conflicts).
  b. Generate an error diagnosis report (which includes row numbers, error types, and error data).
  c. Create an erroneous data isolation area.
  d. Only import the original data that successfully passes these verifications into the database.
- Output: pure data set and error details report (further details available in gs_copy_error_log and gs_copy_summary)
- Error tolerance levels:
  a. Level 1 error tolerance: applies to all the exceptions processed by the intelligent correction mode, including extra data source columns, data type conversion errors, overlong columns, and transcoding exceptions. The process is as follows:

```
-- When the number of data type errors during data import does not exceed 100, no error will be reported, and GaussDB will proceed to the next row. However, if the number exceeds 100, an error will be reported. The details and row number of the erroneous data will be recorded in the gs_copy_error_log table.
gaussdb=# copy test_copy from '/home/omm/temp/test.csv' log errors reject limit '100' csv;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- In comparison to the previous statement, the next one includes an additional action:
recording all data from the erroneous row in gs_copy_error_log. This action is recommended
when there is no risk to data security. Note that SYSADMIN permissions are required.
gaussdb=# copy test_copy from '/home/omm/temp/test.csv' log errors data reject limit '100' csv;
```

b. Level 2 error tolerance: Building on Level 1, Level 2 extends support to address constraint conflicts in data, including NOT NULL constraints, conditional constraints, PRIMARY KEY constraints, UNIQUE constraints, and unique index constraints. The process is as follows:

```
-- To support a new error type, constraint conflict, while keeping the same COPY statement and
error tolerance logic as Level 1, set the GUC parameter as follows:
gaussdb=# set a_format_load_with_constraints_violation = 's2';
gaussdb=# copy test_copy from '/home/omm/temp/test.csv' log errors data reject limit '100' csv;
```

- Example:

a. Level 1 error tolerance:

```
gaussdb=# create database db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' dbcompatibility = 'A';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# create table t1(a int primary key, b char(2) not null, c text check(length(c) < 2),
comment text);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t1_pkey" for table "t1"

ow in relation "t1" violates check constraint "t1_c_check".
(9 rows)
```

Conclusion

To optimize data import processes, you can combine the intelligent correction mode with the strict verification mode, with the intelligent correction mode taking priority. When intelligent correction is enabled during a COPY import and it corrects a data item, strict verification will not be triggered for that specific row. Consequently, the error table will not record relevant data, nor will it update **reject limit**. Before importing data, carefully evaluate whether to automatically correct column and character exceptions or discard them, depending on specific requirements.

For strict verification mode, Level 1 is recommended by default, as it effectively identifies the most common errors without compromising import performance. However, if you are operating in centralized A-compatible mode, you can consider Level 2. Be mindful that Level 2 can degrade import performance and consume additional memory resources. Therefore, do not enable Level 2 by default and enable it only when there are constraint conflicts in your data. For more details, refer to **the error tolerance capabilities of COPY**.

8.5 Best Practices for Import and Export Using Tools

8.5.1 Instance-level Import and Export

gs_dumpall can be used to logically back up database instances and export data of all databases in an instance, including data in the default database, data in user-defined databases, and definitions of global objects shared by all databases.

For details about how to use the gs_dumpall tool, see "Data Import and Export Tools > gs_dumpall for Exporting All Database Information" in *Tool Reference*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- gs_dumpall does not back up parameters for running databases.
- gs_dumpall supports only plain-text format export. Therefore, only gsql can be used to restore a file exported using gs_dumpall.
- After restoration, you are advised to run **ANALYZE** on each database to provide useful statistics for the optimizer.

During backup, you are advised to run the following commands as the initial user or a user with SYSADMIN permissions:

```
nohup gs_dumpall -U root -W ******** -f /data/backup/bkp2.sql -p 8000 > /data/backup/dumpall_backup.log &
```

During restoration, you are advised to run the following commands as the initial user:

```
nohup gsql -d postgres -p 8000 -U root -W ******** -f /data/backup/bkp2.sql -a > /data/backup/dumpall_restore.log &
```

8.5.2 Database-level Import and Export

gs_dump can be used to back up a single database and supports four archive formats. The application scenarios of these archive formats are described in **Table 8-5**. You can choose a proper archive format as required.

For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

Table 8-5 Formats of exported files

Format	Value of -F	Description	Suggestion	Import Tool
Plain-text	p	A plain-text script file containing SQL statements and commands. The commands can be executed on gsql, a command line terminal, to rebuild database objects and load table data.	For a small-sized database or the exported SQL file needs to be modified, the plain-text format is recommended.	Before using gsql to restore database objects, you can use a text editor to edit the plain-text export file as needed. For details about how to use the gsql tool, see "Database Connection Tools > gsql for Connecting to a Database > gsql Usage Guide" in *Tool Reference*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Format	Value of -F	Description	Suggestion	Import Tool
Custom	c	A binary file that allows the restoration of all or selected database objects from an exported file.	For medium- or large-sized databases, the backup result needs to be exported to a single file. You are advised to customize the archive format.	You can use gs_restore to import database objects from a custom-, directory-, or tar-format archive. For details about how to use the gs_restore tool, see "Data Import and Export Tools > gs_restore for Importing Data" in *Tool Reference*.
Directory	d	A directory containing directory files of database objects and the data files of tables and BLOBs.	For medium- or large-sized databases, database objects and data files need to be stored and exported in different directories. Therefore, the directory format is recommended.	
.tar archive	t	A tar-format archive that allows the restoration of all or selected database objects from an exported file. The tar file cannot be further compressed and has an 8-GB limitation on the size of each single file.	For a small-sized database, you need to export the archive result and pack it. The tar format is recommended.	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- gs_dump does not back up all global objects (roles, tablespaces, and corresponding permissions) of the database. Therefore, ensure that global objects have been created on the target database or new instance before the restoration. The **-g** command of gs_dumpall can be used to export global objects and use gsql to import global objects at the target end. For details about how to use the gs_dumpall tool, see "Data Import and Export Tools > gs_dumpall for Exporting All Database Information" in *Tool Reference*.
- gs_dump and gs_restore do not support import and export across database compatibility modes. Ensure that the database compatibility mode and compatibility configuration parameters of the source and target databases are the same. For details about how to query and create a database of a specified compatibility mode, see **CREATE DATABASE**.
- Do not modify the files and contents exported using the **-F c/d/t** formats. Otherwise, the restoration may fail. If you need to modify or replace the file exported using the **-F p** format, edit them with caution.
- After restoration, you are advised to run **ANALYZE** on the database to provide useful statistics for the optimizer.

You are advised to run the following command as the initial user or a user with the SYSADMIN permission to back up data. The source database is **my_database**, and the exported data contains data and object definitions.

```
-- Plain-text
nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_database_backup.sql > /data/backup/my_database_backup.log &
-- Custom
nohup gs_dump my_database -U root -W ******** -p 8000 -F c -f /data/backup/my_database_backup.dmp > /data/backup/my_database_backup.log &
-- Directory
nohup gs_dump my_database -U root -W ******** -p 8000 -F d -f /data/backup/my_database_backup > /data/backup/my_database_backup.log &
-- .tar archive
nohup gs_dump my_database -U root -W ******** -p 8000 -F t -f /data/backup/my_database_backup.tar > /data/backup/my_database_backup.log &
```

Before restoration, you need to create a target database that has the same attributes as the source database and does not contain any data.

```
-- Run the following gsql meta-command to view the database attribute information:
\l+
-- Create a target database based on the queried attribute information.
create database my_database2 encoding='xxxxx' LC_COLLATE='xxxxx' LC_CTYPE ='xxxxx' TEMPLATE=xxx DBCOMPATIBILITY 'xxx';
```

Run the following command as the initial user or a user with the SYSADMIN permissions to restore the database:

```
-- Plain-text
nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_database_backup.sql -a > /data/backup/my_database_restore.log &
-- Custom
nohup gs_restore /data/backup/my_database_backup.dmp -d my_database2 -p 8000 -U root -W ******** -F c -v > /data/backup/my_database_restore.log &
-- Directory
nohup gs_restore /data/backup/my_database_backup -d my_database2 -p 8000 -U root -W ******** -F d -v > /data/backup/my_database_restore.log &
-- .tar archive
nohup gs_restore /data/backup/my_database_backup.tar -d my_database2 -p 8000 -U root -W ******** -F t -v > /data/backup/my_database_restore.log &
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.5.3 Schema-level Import and Export

The gs_dump tool can be used to back up a single schema and you are advised to use the gs_dump tool and the **-n** parameter to do so. Multiple **-n** parameters can be used to back up multiple schemas.

For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

NOTICE

If the exported schema depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the schema is imported. Therefore, ensure that the dependent objects have been created before importing the schema.

You are advised to run the following command as the initial user or a user with SYSADMIN permissions to back up data. The source database is **my_database**, and the exported data contains data and object definitions.

```
-- Plain-text
nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_schema_backup.sql -n
my_schema > /data/backup/my_schema_backup.log &
-- Custom
nohup gs_dump my_database -U root -W ******** -p 8000 -F c -f /data/backup/my_schema_backup.dmp -n
my_schema > /data/backup/my_schema_backup.log &
-- Directory
nohup gs_dump my_database -U root -W ******** -p 8000 -F d -f /data/backup/my_schema_backup -n
my_schema > /data/backup/my_schema_backup.log &
-- .tar archive
nohup gs_dump my_database -U root -W ******** -p 8000 -F t -f /data/backup/my_schema_backup.tar -n
my_schema > /data/backup/my_schema_backup.log &
```

Before restoration, you need to create a target database that has the same attributes as the source database and does not contain the target schema.

```
-- Run the following gsql meta-command to view the database attribute information:
\l+
-- Create a target database based on the queried attribute information.
create database my_database2 encoding='xxxxx' LC_COLLATE='xxxxx' LC_CTYPE ='xxxxx' TEMPLATE=xxx
DBCOMPATIBILITY 'xxx';
```

Run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

```
-- Plain-text
nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_schema_backup.sql -a > /data/
backup/my_schema_restore.log &
-- Custom. For details about how to use the gs_restore tool, see "Data Import and Export Tools > gs_restore
for Importing Data" in Tool Reference.
nohup gs_restore /data/backup/my_database_backup.dmp -d my_database2 -p 8000 -U root -W ******** -F c
-v -n my_schema > /data/backup/my_schema_restore.log &
-- Directory
nohup gs_restore /data/backup/my_database_backup -d my_database2 -p 8000 -U root -W ******** -F d -v -
n my_schema > /data/backup/my_schema_restore.log &
-- .tar archive
nohup gs_restore /data/backup/my_database_backup.tar -d my_database2 -p 8000 -U root -W ******** -F t -
v -n my_schema > /data/backup/my_schema_restore.log &
```

8.5.4 Table-level Import and Export

Many tools are available for table-level import and export. You can select a proper tool based on the following scenarios:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. If you need to export the definition and data of a single table to the same file, you are advised to use the plain-text archive of the gs_dump tool and the **-t** parameter. You can use multiple **-t** parameters to back up multiple tables. For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

   NOTICE

   If the exported table depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the table is imported. Therefore, ensure that the dependent objects have been created before importing the table.

   You are advised to run the following command as the initial user or a user with the SYSADMIN permission to back up data. The source database is **my_database**, and the target table is **my_table** in **my_schema**.

   ```
   nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_table_backup.sql -t my_schema.my_table > /data/backup/my_table_backup.log &
   ```

   Before restoration, create a target database with the same attributes as the source database, and ensure that the target schema exists in the database and no target table exists. Then, run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

   ```
   nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_table_backup.sql -a > /data/backup/my_table_restore.log &
   ```

2. Only the definition of a single table needs to be exported and no data in the table is required.

   NOTICE

   If the exported table depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the table is imported. Therefore, ensure that the dependent objects have been created before importing the table.

   You are advised to use the plain-text archive of the gs_dump tool together with the **-s** parameter. The command is as follows:

   ```
   nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_table_backup.sql -t my_schema.my_table -s > /data/backup/my_table_backup.log &
   ```

   Before restoration, create a target database with the same attributes as the source database, and ensure that the target schema exists in the database and no target table exists. Then, run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

   ```
   nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_table_backup.sql -a > /data/backup/my_table_restore.log &
   ```

3. If you are used to using Oracle SQLLDR or need to save the data import logs (such as import result, discarded data, and error data) to the client, you can use gs_loader.

   gs_loader supports importing data files in CSV, TEXT, and FIXED formats. CSV is recommended for data import. For details about how to use the gs_loader tool, see "Data Import and Export Tools > gs_loader for Importing Data" in *Tool Reference*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The data files in the three formats must use "\n" or "\r\n" as the line terminator, and the line terminators of the entire file must be the same (either "\n" or "\r\n").
- In TEXT format, gs_loader cannot identify escaped special characters (for example, '\n', which is still '\n' after import and will not be escaped to 0x0A), compared with COPY. By default, the TEXT file exported using COPY is escaped. If gs_loader is used to import the file, the escaped characters cannot be converted back, causing inconsistency. Therefore, gs_loader can import only the TEXT files that are exported by COPY and are not escaped (using WITHOUT ESCAPING).

The typical application scenarios are as follows:

– The format of the upstream data file can be customized or determined as CSV.

  The CSV format is compatible with multiple platforms and is universal in the industry. Many data sources support the export of data files in CSV format. Unless the upstream data file format is not CSV, you need to select the import method based on the actual file format (TEXT or FIXED). In addition, CSV files are recommended. If the column data contains special characters (such as commas and newline characters), the data file can only be saved as CSV because the CSV format uses quote characters to enclose the data containing special characters to prevent the special characters in the field data from conflicting with separators and line terminators.

  When importing a standard CSV file, add the *FIELDS CSV* statement to the control file. The following is an example:

```
-- Create a table.
gaussdb=# create table test_loader(id int, name name);

-- View the control file test.ctl.
LOAD DATA
TRUNCATE INTO TABLE test_loader
FIELDS CSV
FIELDS TERMINATED BY ','
OPTIONALLY ENCLOSED BY '"'
(
  id integer external,
  name char
)

-- View the data file test.csv.
1,"aa
a"
2,"bb b"
3,"cc,c"
4,ddd

-- Import data.
gs_loader -p xxx host=xxx control=test.ctl data=test.csv -d testdb -W xxx

-- The import is successful. View the import result.
gaussdb=# select * from t1;
 id |   name
----+-----------
  1 | aa      +
    | a
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 2 | bb      b
 3 | cc,c
 4 | ddd
(4 rows)
```

NOTE

- If the column quote characters are not standard double quotation marks, you can set it using the *OPTIONALLY ENCLOSED BY* clause.
- If the column separator is not a standard comma (,), you can set it using the *FIELDS TERMINATED BY* clause.

– The upstream data file is in TEXT format.

In TEXT format, gs_loader cannot identify escaped special characters (for example, '\n', which is still '\n' after import and will not be escaped to 0x0A), compared with COPY. Therefore, data containing special characters such as delimiters and line terminators is not supported in TEXT format. Otherwise, the structure will be disordered.

The following is an example of importing a valid data file in TEXT format:

```
-- Create a table.
gaussdb=# create table test_loader(id int, name name);

-- View the control file test.ctl.
LOAD DATA
TRUNCATE INTO TABLE test_loader
(
  id integer external,
  name char
)

-- View the data file test.dat.
1 aaa
2 bbb
3 ccc

-- Import data.
gs_loader -p xxx host=xxx control=test.ctl data=test.dat -d testdb -W xxx

-- The import is successful. View the import result.
gaussdb=# select * from t1;
 id | name
----+------
  1 | aaa
  2 | bbb
  3 | ccc
(3 rows)
```

NOTE

If the column separator is not a standard horizontal tab character, you can set it using the *FIELDS TERMINATED BY* clause.

– The upstream data file is in FIXED format.

In FIXED format, each column has fixed length and are not separated by delimiters. Therefore, column data does not conflict with delimiters. However, if the column data contains newline characters, the data cannot be processed.

An import example is as follows:

```
-- Create a table.
gaussdb=# create table test_loader(id int, name name);

-- View the control file test.ctl.
LOAD DATA
TRUNCATE INTO TABLE test_loader
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(
  id POSITION(1:1) integer external,
  name POSITION(2:5) char
)

-- View the data file test.fixed.
1aaaa
2bb b
3cc,c

-- Import data.
gs_loader -p xxx host=xxx control=test.ctl data=test.fixed -d testdb -W xxx

-- The import is successful. View the import result.
gaussdb=# select * from t1;
 id |   name
----+-----------
  1 | aaaa
  2 | bb      b
  3 | cc,c
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9 User-defined Functions

When the database instance is started, the UDF master process is started in addition to the GaussDB main process. To execute a UDF in fenced mode, the UDF master process forks itself to UDF worker processes, and UDF worker processes execute the UDF in fenced mode.

9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can create calculation functions with complex conditions and use them to define operators or use them for index expressions.

SQL is used by most databases as a query language, which is portable and easy to learn. Each SQL statement must be executed independently by a database server.

This means that the client application performs the following processes for each query: send a query to the database server, wait for the query to be received, receive and process the result, perform related calculation, and then send more queries to the server. If the client and the database server are not on the same machine, this process also causes inter-process communication and network load.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced. The advantages of PL/SQL are as follows:

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in the SQL statements. The syntax for creating functions using PL/SQL is **CREATE FUNCTION**.

PL/SQL is a loadable procedural language. Its application method is similar to that of **Stored Procedure**. The difference is that **Stored Procedure** has no return value, and PL/SQL functions have return values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

XML data can be used as the input parameter, output parameter, user-defined variable, and return value of a user-defined function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10 Stored Procedure

10.1 Stored Procedures

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL and PL/SQL. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see **CREATE PROCEDURE**.

The application methods for PL/SQL functions mentioned in **PL/SQL Functions** are the same as those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. GaussDB consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform operations such as addition, subtraction, multiplication, and division on numeric data.

XML data can be used as input parameters, output parameters, user-defined variables, and return values of stored procedures, as well as stored procedures that support autonomous transactions.

10.2.1 User-defined Subtypes

In PL/SQL, SUBTYPE can be used to create its own subtypes. The base type can be any basic type or user-defined type. Subtypes can provide data type compatibility, display the intended use of data items of that type, and detect values that are out of range.

The basic definition syntax of SUBTYPE is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
SUBTYPE subtype_name IS base_type  [ { ( precision [, scale ] ) | RANGE low_value .. high_value } ] [ NOT NULL ]
```

Parameters:

- **SUBTYPE**: SUBTYPE keyword.
- **subtype_name**: name of the subtype to be defined.
- **base_type**: base type, which can be the base type or user-defined type based on which the subtype is created.
- **precision [, scale]**: typmod constraints that can be added.
- **RANGE low_value .. high_value**: range constraints that can be added.
- **NOT NULL**: NOT NULL constraints that can be added.

NOTE

- **base_type** supports basic types, user-defined data types, and subtypes.
- If the typmod constraint is specified, when a value is assigned to a variable of the SUBTYPE type, the system checks whether the value complies with the typmod constraint and whether the specified typmod constraint can be consistent with the base type.
- Range constraints can be specified only for the int types, including TINYINT, SMALLINT, MEDIUMINT, INTEGER, BINARY_INTEGER, BIGINT, and INT. If the range constraints are specified, the system checks whether the value is within the specified range when assigning a value to a subtype variable.
- The upper and lower limits of RANGE cannot exceed INT64.
- Currently, the RANGE constraints cannot be used when a variable is created.
- The constraint status is updated when the SUBTYPE type is nested or a variable of the SUBTYPE type is created.
- If **NOT NULL** is specified, variables of the SUBTYPE type must be initialized and cannot be assigned **NULL** values.
- The SUBTYPE type can be used as the input and output parameter types of stored procedures.
- Subtype variables can be specified using %type and %rowtype. %type supports all base types, and %rowtype supports tables but does not support sets.
- Subtypes support base type constructors.
- The specified character set is not supported.
- This command can be used only in A-compatible database.
- If a database is upgraded from a version that does not support subtypes to a version that supports subtypes and the upgrade is not committed, subtypes cannot be used.

Example 1: An unconstrained subtype is used.

```
gaussdb=# DECLARE
    SUBTYPE sint IS INT;
    a sint := 2147483647;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
 END;
 /
a = 2147483647
ANONYMOUS BLOCK EXECUTE
```

Example 2: Subtypes support typmod, range, and NOT NULL constraints.

```
-- typmod constraint
gaussdb=# DECLARE
    SUBTYPE sdec IS DECIMAL(3,2) NOT NULL;
    a sdec := 1.1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    b sdec(5,2) := 322.1;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
 END;
 /
a = 1.10
b = 322.10
ANONYMOUS BLOCK EXECUTE
-- NOT NULL constraint
gaussdb=# DECLARE
    SUBTYPE sint IS INT NOT NULL;
    a sint;
 BEGIN
    NULL;
 END;
 /
ERROR:  variables declared as NOT NULL must have a default value.
CONTEXT:  compilation of PL/pgSQL function "inline_code_block" near line 2
gaussdb=# DECLARE
    SUBTYPE age IS BINARY_INTEGER RANGE 0..100 NOT NULL;
    a age := 18;
    b age := 20;
 BEGIN
    DBE_OUTPUT.PUT_LINE('Age of a:' || a);
    DBE_OUTPUT.PUT_LINE('Age of b:' || b);
 END;
 /
Age of a: 18
Age of b: 20
ANONYMOUS BLOCK EXECUTE
```

Example 3: Subtypes nest user-defined data types and use the base type constructor.

```
gaussdb=# DECLARE
    TYPE arrint IS VARRAY(10) OF INTEGER;
    SUBTYPE sarrint IS arrint;
    -- a sarrint := sarrint(1,2,3,4): An error is reported. Only the base type constructor is supported.
    a sarrint := arrint(1,2,3,4);
 BEGIN
    FOR i IN 1..4 LOOP
       DBE_OUTPUT.PUT_LINE(a(i));
    END LOOP;
 END;
 /
1
2
3
4
ANONYMOUS BLOCK EXECUTE
```

Example 4: Subtypes support self-nesting, and the constraint condition is updated.

```
-- range constraint
gaussdb=# DECLARE
    SUBTYPE sint IS INTEGER RANGE 10..99;
    SUBTYPE ssint IS sint RANGE 0..9;
    a sint := 50;
    b ssint := 5;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
 END;
 /
a = 50
b = 5
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- typmod constraint
gaussdb=# DECLARE
    SUBTYPE word IS VARCHAR2(5);
    SUBTYPE sentence IS word(50);
    a word := 'Tom';
    b sentence := 'Tom and Jerry';
    c sentence(8) := 'Mountain';
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
    DBE_OUTPUT.PUT_LINE('c = ' || c);
 END;
 /
a = Tom
b = Tom and Jerry
c = Mountain
ANONYMOUS BLOCK EXECUTE
```

Example 5: User-defined data types nest subtypes.

```
gaussdb=# DECLARE
    SUBTYPE sint IS BINARY_INTEGER RANGE 0..99;
    TYPE tabint IS TABLE OF sint;
    a tabint := tabint();
 BEGIN
    a.EXTEND(10);
    a(1) := 50;
 END;
 /
ANONYMOUS BLOCK EXECUTE
```

10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (for example, INT and composite types), you can use the type conversion functions provided by GaussDB, such as the **CAST** function, to forcibly convert them.

Table 10-1 lists common implicit data type conversions in GaussDB.

NOTICE

The valid value range of **DATE** supported by GaussDB is from 4713 BC to 294276 AD.

Table 10-1 Implicit data type conversions

Raw Data Type	Target Data Type	Remarks
CHAR	VARCHAR2	-
CHAR	NUMBER	Raw data must consist of digits.
CHAR	DATE	Raw data cannot exceed the valid date range.
CHAR	RAW	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Raw Data Type	Target Data Type	Remarks
CHAR	CLOB	-
VARCHAR2	CHAR	-
VARCHAR2	NUMBER	Raw data must consist of digits.
VARCHAR2	DATE	Raw data cannot exceed the valid date range.
VARCHAR2	CLOB	-
NUMBER	CHAR	-
NUMBER	VARCHAR2	-
DATE	CHAR	-
DATE	VARCHAR2	-
RAW	CHAR	-
RAW	VARCHAR2	-
CLOB	CHAR	-
CLOB	VARCHAR2	-
CLOB	NUMBER	Raw data must consist of digits.
INT4	CHAR	-
INT4	BOOLEAN	-
BOOLEAN	INT4	-

10.4 Arrays, Collections, and Records

10.4.1 Arrays

Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The **size** supports only the syntax and does not support the function.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in O-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, if a varray array is created in a package and invoked outside the package, the restrictions for the length or precision become invalid.

GaussDB supports access to array elements by using parentheses, and it also supports the **extend**, **count**, **first**, **last**, **prior**, **exists**, **trim**, **next**, and **delete** functions.

NOTE

- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, or **DELETE**), you are advised to use square brackets to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- Exercise caution when using the **DELETE** statement to delete a single element. Otherwise, the element sequence may be incorrect.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or raise info in a stored procedure.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  --Declare the variable of the array type.
BEGIN
    ARRINT.extend(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    IF ARRINT.EXISTS(10) THEN
        DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
        DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure.
gaussdb=# CALL array_proc();

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;
```

10.4.1.1 Use of Array Types

Before the use of arrays, an array type needs to be defined:

Syntax

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

Precautions

- GaussDB supports access to array elements using index syntax (enclosed by parentheses ()) and provides various dedicated functions (such as EXTEND, COUNT, FIRST, LAST, PRIOR, EXISTS, TRIM, NEXT, and DELETE) for flexible array operations and management.
- In GaussDB, the array automatically increases. If out-of-bounds access occurs, a **NULL** value is returned and no error is reported. After the **varray_compat** parameter is enabled, the index check is added. If out-of-bounds access occurs, an error is reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The size information is recorded in the pg_type system catalog. After the **varray_compat** parameter is enabled, the length and index of array operations are checked. If the parameter is disabled, the size information is not used.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When **data_type** is collection, multi-dimensional arrays are not supported.
- The constructors of the array type can be used only in A-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- If the elements of an array are of the collection type and **data_type** of the array is set to **VARCHAR** or **NUMERIC** that can define the length and precision, you need to enable the **tableof_elem_constraints** option for GUC parameter **behavior_compat_options** to verify the element length of the array or convert the element to the corresponding precision.
- After the **varray_compat** option is enabled for the GUC parameter **behavior_compat_options**, the array type defined in the anonymous block cannot be used after ROLLBACK is executed or EXCEPTION occurs in the anonymous block.
- After **enable_recordtype_check_strict** is set to **on**, if the member is of the record type and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during stored procedure or package compilation.
- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, and **DELETE**), you are advised to use square brackets ([]) to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or RAISE INFO in a stored procedure.
- NOT NULL syntax is not supported.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;-- Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  -- Declare the variable of the array type.
BEGIN
    ARRINT.extend(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();

    IF ARRINT.EXISTS(10) THEN
       DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
       DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/
```

gaussdb=# DROP PROCEDURE array_proc;
```

10.4.1.2 Functions Supported by Arrays

NOTE

- The following describes the behavior differences of array functions before and after the GUC parameter **varray_compat** is enabled:
  - If the count, extend, trim, delete, first, last, next, or prior function is applied to an uninitialized array, that is, the array is NULL, the "Reference to uninitialized collection" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the extend(count) and extend(count, idx) functions, if the sum of *count* and the number of existing elements in the array exceeds the defined array size, the "Subscript outside of limit" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the extend(count, idx) function, if the index *idx* is invalid, the "Subscript outside of limit" or "Subscript beyond count" error is reported after the parameter is enabled.
  - For the trim(n) function, if *n* is greater than the number of array elements, the "Subscript beyond count" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the delete(idx) function, if the index *idx* is invalid, the "Subscript outside of limit" or "Subscript beyond count" error is reported after the parameter is enabled. If the parameter is disabled, the original array is returned.
- The following is an example in A-compatible mode. In the function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- If the error "Cannot change the guc status while in the same session" is reported during the execution of the following example, you need to switch the session and execute the example again.
- In an inner expression, functions of the array type cannot be called in nesting mode.

- extend[([count])]

  Parameter: *count* is of the int4 type.

  Return value: No value is returned.

  Description: Extends one or *count* elements at the end of a varray variable. The default value is **NULL**.

  Example 1: The extend is used to extend one element. The default value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend;
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /
0
1
ANONYMOUS BLOCK EXECUTE
```

Example 2: The extend(count) is used to extend the *count* elements. The default value is **NULL**.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(3);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /
0
3
ANONYMOUS BLOCK EXECUTE
```

Example 3: When the **varray_compat** parameter is enabled, an error is reported if the array size exceeds the defined size after the extend is used.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(3);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(8); -- error
gaussdb$# end;
gaussdb$# /
0
3
ERROR:  Subscript outside of limit
CONTEXT:  PL/SQL function inline_code_block line 8 at assignment
```

Example 4: When the **varray_compat** parameter is enabled, an error is reported if the array is not initialized.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-# begin
gaussdb$#     arrint.extend(3);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/pgSQL function inline_code_block line 4 at assignment
```

- extend(count, idx)

  Parameters: *idx* and *count* are of the int4 type.

  Return value: No value is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Description: Extends *count* elements at the end of a varray variable, and the value of the extended element is equal to the value of the given *idx* index element.

Example 1: The extend(count, idx) is used to extend the element at the *idx* position.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2);
gaussdb-# begin
gaussdb$#     arrint.extend(2, 1);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     for i in 1..arrint.count loop
gaussdb$#         dbe_output.print_line(arrint(i));
gaussdb$#     end loop;
gaussdb$# end;
gaussdb$# /
4
1
2

1
ANONYMOUS BLOCK EXECUTE
```

Example 2: extend(count, idx). If the **varray_compat** parameter is enabled and *idx* is out of range, an error is reported.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     arrint.extend(10, 1); -- error index.
gaussdb$# end;
gaussdb$# /
ERROR:  Subscript beyond count
CONTEXT:  PL/SQL function inline_code_block line 5 at assignment
```

Example 3: extend(count, idx). If the **varray_compat** parameter is enabled and the array is not initialized, an error is reported.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-# begin
gaussdb$#     arrint.extend(10, 1);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/pgSQL function inline_code_block line 4 at assignment
```

- count[()]

  Parameter: none.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return value: int4 type.

Description: Returns the number of elements in an array.

Example 1: View the number of initialized array elements.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-#     len int;
gaussdb-# begin
gaussdb$#     arrint := array_integer(1, 2, 3);
gaussdb$#     len := arrint.count();
gaussdb$#     dbe_output.print_line(len);
gaussdb$# end;
gaussdb$# /
3
ANONYMOUS BLOCK EXECUTE
```

Example 2: When the **varray_compat** parameter is enabled, an error is reported if the array is not initialized.

```
gaussdb=# set behavior_compat_options = 'varray_compat';

gaussdb$#     dbe_output.print_line(len);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/SQL function inline_code_block line 6 at assignment
```

- trim[(n)]

  Parameter: *n* is of the int4 type.

  Return value: No value is returned.

  Description: Deletes an element at the end of the array if there is no parameter. Alternatively, deletes a specified number of elements at the end of the array if the parameter *n* is specified.

  Example 1: Delete *n* elements from an array without enabling the **varray_compat** parameter.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;

gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/pgSQL function inline_code_block line 4 at assignment
```

- first[()]

  Parameter: none.

  Return value: int4 type.

  Description: Returns the index of the first element in an array. If there is no first element, NULL is returned.

  Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');

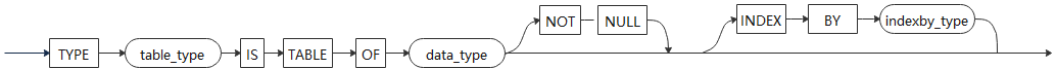
10.4.2 Collections

10.4.2.1 Use of Collection Types

Before the use of collections, a collection type must be defined.

Define a collection type immediately after the AS keyword in a stored procedure as follows.

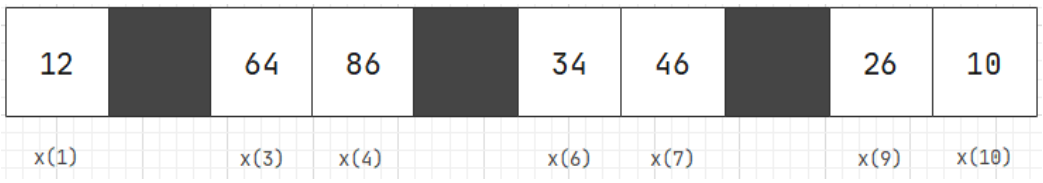


In the preceding information:

- **table_type**: indicates the name of the collection type to be defined.
- **data_type**: indicates the type of members in the collection to be created.
- **indexby_type**: indicates the type of the index set to be created.

Nest-Table Collection Type

Members of a specified data type are stored in a variable-length array. You can use the extend function to expand the storage space and use the trim function to release the storage space. For a collection variable *x* with 10 storage units whose member type is int, members are stored as shown in the following figure.



Members x(2), x(5), and x(8) are invalid, but their storage space is still reserved. You can assign values to them later without re-allocating space.

After a collection type is defined, use table_type as the type name to declare the variable.

```
var_name table_type [:= table_type([v1[,...]])];
```

You can use a type constructor to initialize the variable during or after declaration. If the variable is not initialized, the value of *var_name* is **NULL**.

After the variable is declared and initialized, you can access collection members through an index set or assign values to members. The index set range is [1,*upper*]. The value of *upper* is the size of the current space. If you attempt to access a deleted member, the error message "no data found" will be returned.

Constraints

- GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions. The collection functions support multiset union, intersect, except all, and distinct.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Collection types can be created only in A-compatible mode (**sql_compatibility** is set to **A**).
- In GaussDB, a nest-table collection does not automatically increase, and an error is reported when you attempt to access the index set out of the specified range.
- Collections can be defined in schemas, anonymous blocks, stored procedures, packages, and user-defined functions, among which the scopes of the collection types vary.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- Variables of a collection type cannot be assigned a value of another collection type, even if their member types are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int*; and **TYPE** *t2* **IS TABLE OF** *int*;, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int*; cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- Only the equal (=) and non-equal operations (<> or !=) between collections are supported. Other relational and arithmetic operations are not supported.
- Use IS [NOT] NULL to compare a collection type with **NULL**. The result of comparison with **NULL** using the equal operator (=) is inaccurate.
- Variables of the collection type can be used as parameters and return values of functions. In this case, the type of the parameters or return values must have been defined in a schema or package.
- When a nest-table collection is used as the input parameter of a function, an array with elements of the same type can be specified as the input parameter. Multi-dimensional arrays are not supported, and the array index set must start from 1. (This function is outdated and not recommended.) You can run the **set behavior_compat_options = 'disable_rewrite_nesttable';** command to disable the function.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on** and the member is of the record type and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during stored procedure or package compilation.

Index-By Table Collection Type

This collection type stores the index set and corresponding member values in a hash table as key-value pairs. All operations on variables of this type are actually operations on the hash table. Users do not need to expand or release storage space, but only need to assign values or delete members. The operations related to the collection type are described as follows:

1. Type definition

   When defining the index-by table collection type, specify both the member type **data_type** and index set type **indexby_type**. The index set type can only be integer or varchar.

2. Variable declaration and initialization

   After the index-by table collection type is declared, it can be initialized. There are three initialization scenarios: uninitialized, initialized to null, and initialized to specified index and member values. The effect of uninitialized variables is the same as that of initializing variables to null. If a variable is not initialized or is initialized to null, the variable is not **NULL**. You can assign a value to the variable later. Initializing a variable to specified index set and member values will save the specified index set and member values to the variable as key-value pairs.

3. Variable assignment

   Assignment to variables of the index-by table collection type is classified into member assignment and group assignment. Member assignment allows to assign a value to a member by specifying the index set. If the member does not have a value, the assigned value is used directly. If the member has a value, the member value is updated. Group assignment will clear the original members in the variable and save the new member values. In the group assignment scenario, **NULL** cannot be assigned to variables. Otherwise, an error is reported.

4. Variable value

   You can specify an index set to obtain the member value of the corresponding index in the variable. If the member cannot be found based on the index set, the error message "no data found" is returned.

Constraints

- Index-by table collection types can be created only in A-compatible mode (**sql_compatibility** is set to **A**).
- Index-by table collection types can be defined in anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary. Index-by table collection types cannot be defined in schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision. In the syntax of creating a collection containing elements of the CHAR, VARCHAR, NUMERIC, FLOAT, or NUMBER type, the syntax cannot restrict the element range. For example, **create type t1 is table of numeric(5) index by int;** is the same as **type t1 is table of numeric index by int;** and the range restriction does not take effect.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- The value of **indexby_type** can only be INTEGER or VARCHAR.
- When **indexby_type** is set to **varchar** and **tableof_elem_constraints** is enabled, the length of the index value is verified when a value is assigned to an index-by table collection type. The verification behavior is not affected by whether **char_coerce_compat** is enabled. If the index length is greater than the defined length, an error is reported. If the **tableof_elem_constraints** parameter is disabled, the index value length is not verified.
- An uninitialized variable of the index-by table collection type is not **NULL**.
- **NULL** cannot be assigned to a variable of the index-by table collection type. Otherwise, an error is reported.
- **NULL** and '' (single quotation marks) cannot be assigned to a variable of the index-by table collection type.
- Variables of the index-by table collection type cannot be assigned values of another index-by table collection type, even if their member type and index set type are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int*; and **TYPE** *t2* **IS TABLE OF** *int* **index by** *int*;, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int*; cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- An index-by table collection type does not support relational and arithmetic operations.
- When a variable of the index-by table collection type is assigned by executing **select... bulk collect into**, the index set must be of the integer type. The index set type cannot be varchar.
- Variables of the index-by table collection type can be used as the parameters and return values of functions. In this case, the type of the parameters or return values must be a collection type defined in the package.
- When an index-by table collection is used as the input parameter of a function, an array with elements of the same type can be passed as the input

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter. Multi-dimensional arrays are not supported, and the index type cannot be VARCHAR. (This function is outdated and not recommended. You can run the **SET behavior_compat_options = 'disable_rewrite_nesttable';** command to disable the function.)

- Currently, the type constructor supports only the collection type and the maximum number of parameters is the same as that of user-defined function parameters. For the index-by table collection type, the index value can only be a constant when the constructor is used.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- After the GUC parameter **enable_recordtype_check_strict** is set to **on**, if the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.

Examples

Example 1: nest-table collection type

```
-- Perform operations on a collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TABLEINT TABLE_INTEGER := TABLE_INTEGER();  -- Declare the variable of the collection type.
BEGIN
    TABLEINT.extend(10);
    FOR I IN 1..10 LOOP
       TABLEINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(TABLEINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(TABLEINT(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL table_proc();
CALL table_proc();
10
1
10
 table_proc
------------

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE table_proc;
DROP PROCEDURE
-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a collection type.
    NEST_TABLE_VAR NEST_TABLE_INTEGER := NEST_TABLE_INTEGER(); -- Declare a variable of the nest-
```

```
table collection type.
BEGIN
    NEST_TABLE_VAR.extend(10);
    FOR I IN 1..10 LOOP
        NEST_TABLE_VAR(I) := TABLE_INTEGER();
        NEST_TABLE_VAR(I).extend(10);
        NEST_TABLE_VAR(I)(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL nest_table_proc();
10
1
10
 nest_table_proc
-----------------

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE nest_table_proc;
DROP PROCEDURE
```

Example 2: index-by table collection type

```
-- Perform operations on an index-by table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE index_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
    TYPE TABLE_VARCHAR IS TABLE OF INTEGER INDEX BY VARCHAR; -- Define a collection type.
    TABLEINT_01 TABLE_INTEGER;                          -- Declare a variable of the collection type, which is
not initialized.
    TABLEINT_02 TABLE_INTEGER := TABLE_INTEGER();           -- Declare a variable of the collection type.
The initial value is null.
    TABLEINT_03 TABLE_INTEGER := TABLE_INTEGER(2=>3,3=>4);   -- Declare a variable of the collection
type and initialize it to the specified value.
    RES INTEGER;
BEGIN
    FOR I IN 1..10 LOOP
        TABLEINT_01(I) := I;     -- Assign values to members.
        TABLEINT_02(I) := I + 1; -- Assign values to members.
    END LOOP;
    TABLEINT_01 := TABLEINT_02;  -- Group assignment
    RES := TABLEINT_03(2);       -- Return the collection values.
    DBE_OUTPUT.PRINT_LINE(RES);
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL index_table_proc();

10.4.2.2 Collection Functions

Collection Operators

- =

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are equal.

  Example:

  ```
  gaussdb=# declare
   type nest is table of int;
   a nest := nest(1,2);
   b nest := nest(1,2);
   flag bool;
   begin
      flag := a = b;
      raise info '%', flag;
  end;
   /
  INFO:  t
  ANONYMOUS BLOCK EXECUTE
  ```

- <>

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

  ```
  gaussdb=# declare
    type nest is table of int;
    a nest := nest(1,2);
    b nest := nest(1,2);
    flag bool;
   begin
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  flag := a <> b;
  raise info '%', flag;
end;
/
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- IS [NOT] NULL

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Determines whether a collection is **NULL**.

  Example:

```
gaussdb=# declare
  type nest is table of int;
  a nest;
  b nest := NULL;
  c nest := nest(1,2);
  flag bool;
begin
   flag := a IS NULL;
   raise info '%', flag;
   flag := b IS NULL;
   raise info '%', flag;
   flag := c IS NULL;
   raise info '%', flag;
end;
/
INFO:  t
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- ^=

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2);
  b nest := nest(1,2);
  flag bool;
begin
  flag := a ^= b;
  raise info '%', flag;
end;
/
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- [NOT] IN

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Determines whether a collection is in the collection list.

  Example:

```
gaussdb=# declare
  type tab is table of varchar(10);
  tmp1 tab := tab('a', 'b');
  tmp2 tab := tab('a', 'b');
  flag bool;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
begin
  flag := tmp2 in (tmp1);
  raise info '%', flag;
end;
/
INFO:  t
ANONYMOUS BLOCK EXECUTE
```

MULTISET

- MULTISET UNION [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Union of two collection variables. The default value **ALL** indicates that duplicate elements are not removed, and **DISTINCT** indicates that duplicate elements are removed.

  Example 1: Calculate the union of two collection variables and do not remove duplicate elements. That is, MULTISET UNION ALL.

  ```
  gaussdb=# declare
    type nest is table of int;
    a nest := nest(1,2);
    b nest := nest(2,3);
  begin
    a := a MULTISET UNION ALL b;
    raise info '%', a;
  end;
  /
  INFO:  {1,2,2,3}
  ANONYMOUS BLOCK EXECUTE
  ```

  Example 2: Calculate the union of two collection variables and remove duplicate elements. That is, MULTISET UNION DISTINCT.

  ```
  gaussdb=# declare
     type nest is table of int;
     a nest := nest(1,2);
     b nest := nest(2,3);
  begin
     a := a MULTISET UNION DISTINCT b;
     raise info '%', a;
  end;
  /
  INFO:  {1,2,3}
  ANONYMOUS BLOCK EXECUTE
  ```

- MULTISET EXCEPT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Difference of two collection variables. Take A MULTISET EXCEPT B as an example. **ALL** indicates that elements that both A and B have in A are removed and returned. The number of elements to be removed is calculated. For a specific element, if A appears *m* times and B appears *n* times (m > n), the number of elements removed from A is *m* minus *n*. If m ≤ n, *m* elements are removed from A. **DISTINCT** indicates that elements that both A and B have in A are removed and returned. The number of elements to be removed is not calculated. If specific elements appear in A and B, all such elements in A are removed. **ALL** is the default value.

  Example 1: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is calculated. That is, MULTISET EXCEPT ALL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,2);
  b nest := nest(2,3);
 begin
  a := a MULTISET EXCEPT ALL b;
  raise info '%', a;
 end;
 /
INFO:  {1,2}
ANONYMOUS BLOCK EXECUTE
```

Example 2: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is not calculated. That is, MULTISET EXCEPT DISTINCT.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,2);
  b nest := nest(2,3);
 begin
  a := a MULTISET EXCEPT DISTINCT b;
  raise info '%', a;
 end;
 /
INFO:  {1}
ANONYMOUS BLOCK EXECUTE
```

- MULTISET INTERSECT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Intersection of two collection variables. For example, A MULTISET INTERSECT B: ALL indicates that all duplicate elements (including elements that are repeated for multiple times) are retained. DISTINCT indicates that the intersection of unique values is returned and duplicate elements are removed. **ALL** is the default value.

  Example 1: Calculate the intersection of two collection variables and do not remove duplicate elements. That is, MULTISET INTERSECT ALL.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,2);
  b nest := nest(2,2,3);
 begin
  a := a MULTISET INTERSECT ALL b;
  raise info '%', a;
 end;
 /
INFO:  {2,2}
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Calculate the intersection of two collection variables and remove duplicate elements. That is, MULTISET INTERSECT DISTINCT.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,2);
  b nest := nest(2,2,3);
 begin
  a := a MULTISET INTERSECT DISTINCT b;
  raise info '%', a;
 end;
 /
INFO:  {2}
ANONYMOUS BLOCK EXECUTE
```

Functions of the Collection Type

NOTE

- In the following function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- In an inner expression, functions of the collection type cannot be called in nesting mode.

- exists(idx)

  Parameter: *idx* is of the INT4 or VARCHAR type.

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether a valid element exists in a specified position.

  Example:

```
gaussdb=# declare
  type nest is table of varchar2;
  a nest := nest('happy','?');
  flag bool;
 begin
  flag := a.exists(1);
  raise info '%', flag;
  flag := a.exists(10);
  raise info '%', flag;
 end;
 /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
  type nest is table of varchar2 index by varchar2;
  a nest;
  flag bool;
 begin
  a('1') := 'Be';
  a('2') := 'happy';
  a('3') := '.';
  flag := a.exists('1');
  raise info '%', flag;
  flag := a.exists('ddd');
  raise info '%', flag;
 end;
 /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- extend[(count[, idx])]

  Parameters: *idx* and *count* are of the INT4 type.

  Return value: No value is returned.

  Description: Supports only variables of the nest-table type. One or *count* elements are extended at the end of the nest-table variable. If index set element *idx* exists, *count* index elements are copied to the end of the variable.

  Example 1: A nest-table variable extends 1 element and the extended element value is **NULL**.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1);
 begin
  raise info '%', a;
  a.extend;
  raise info '%', a;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  a.extend;
  raise info '%', a;
 end;
 /
INFO:  {1}
INFO:  {1,NULL}
INFO:  {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

Example 2: A nest-table variable extends *n* elements and the extended element value is **NULL**.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1);
 begin
  raise info '%', a;
  a.extend(2);
  raise info '%', a;
 end;
 /
INFO:  {1}
INFO:  {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

Example 3: A nest-table variable extends *n* elements and the extended element value is the value of the specified index element.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(9);
 begin
  raise info '%', a;
  a.extend(2,1);
  raise info '%', a;
 end;
 /
INFO:  {9}
INFO:  {9,9,9}
ANONYMOUS BLOCK EXECUTE
```

- delete[(idx1[, idx2])]

  Parameter: *idx1* and *idx2* are of the int4 or varchar2 type.

  Return value: No value is returned.

  Description: If there is no parameter, the variable of the nest-table type deletes all elements of the collection type and the space. If the space is used later, the space needs to be expanded. If there is no parameter, the variable of the index-by table type deletes all elements. If there is one parameter, the element in the specified position is deleted (the space is not deleted). If there are two parameters, all elements in the index interval are deleted (the space is not deleted).

  Example 1: Delete all elements and spaces of the collection type from the variable of the nest-table collection type.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,3,4,5);
 begin
  raise info '%', a;
  a.delete();
  raise info '%', a;
 end;
 /
INFO:  {1,2,3,4,5}
INFO:  {}
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example 2: Delete an element at a specified position from the variable of the nest-table collection type.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,3,4,5);
 begin
  raise info '%', a;
  a.delete(3);
  raise info '%', a;
  a(3) := 3;
  raise info '%', a;
 end;
 /
INFO:  {1,2,3,4,5}
INFO:  {1,2,4,5}
INFO:  {1,2,3,4,5}
ANONYMOUS BLOCK EXECUTE
```

Example 3: Delete elements in a specified interval from the variable of the nest-table collection type.

```
gaussdb=# declare
  type nest is table of int;
  a nest := nest(1,2,3,4,5);
 begin
  raise info '%', a;
  a.delete(2,4);
  raise info '%', a(1);
  raise info '%', a(5);
  raise info '%', a;
 end;
 /
INFO:  {1,2,3,4,5}
INFO:  1
INFO:  5
INFO:  {1,5}
ANONYMOUS BLOCK EXECUTE
```

Example 4: Delete all elements and spaces of the collection type from the variable of the index-by table collection type.

```
gaussdb=# declare
  type t1 is table of int index by varchar;
  v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
 begin
  v.delete();
  raise info '%', v.count();
 end;
 /
INFO:  0
ANONYMOUS BLOCK EXECUTE
```

Example 5: Delete an element at a specified position from the variable of the index-by table collection type.

```
gaussdb=# declare
  type t1 is table of int index by varchar;
  v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
 begin
  raise info '%', v('a');
  v.delete('a');
  raise info '%', v('a');
 end;
 /

```

- trim[(n)]

  Parameter: *n* is of the INT4 type.

  Return value: No value is returned.

  Description: Supports only variables of the nest-table type. If no parameter is specified, the last element space is deleted. If the input parameter is valid, the specified number of element spaces are deleted.

  Example:

```
gaussdb=# declare
   type nest is table of int;
   aa nest := nest(11,22,33,44,55);
 begin
   raise info 'aa:%' ,aa;
   aa.trim;  -- No parameter
   raise info 'aa:%' ,aa;
   aa.trim();  -- No parameter
   raise info 'aa:%' ,aa;
   aa.trim(2);  -- Valid parameter
   raise info 'aa:%' ,aa;
   aa.trim(2);  -- The collection element space is less than 2. An error is reported when the parameter
is invalid.
 end;
 /
INFO:  aa:{11,22,33,44,55}

ERROR:  Subscript beyond count
CONTEXT:  PL/pgSQL function inline_code_block line 11 at assignment
```

- count[()]

  Parameter: none

  Return value: INT type

  Description: Returns the number of valid elements in a collection.

  Example 1: Use the count function for the variable of the nest-table collection type.

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'count:%' ,aa.count;
 aa.delete(3);  -- Delete an element. The element whose index is 3 is invalid.

```

- first[()]

  Parameter: none

  Return value: INT or VARCHAR

  Description: Returns the index of the first valid element in a collection.

  Example 1: Use the first function for the variable of the nest-table collection type.

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'first:%' ,aa.first();
 aa.delete(1);

ANONYMOUS BLOCK EXECUTE
```

- last[()]

  Parameter: none

  Return value: INT or VARCHAR

  Description: Returns the index of the last valid element in a collection.

  Example 1: Use the last function for the variable of the nest-table collection type.

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'last:%' ,aa.last;
 aa.delete(5);

ANONYMOUS BLOCK EXECUTE
```

- prior(idx)

  Parameter: *idx* is of the INT or VARCHAR type.

  Return value: int or varchar type

  Description: Returns the index of a valid element before the given index in a collection.

  Example 1: Use the prior function for the variable of the nest-table collection type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'prior:%' ,aa.prior(3);
 end;
 /

 raise info 'prior:%' ,aa.prior('ddd');
 end;
 /
INFO:  prior:aaa
INFO:  prior:ccc
ANONYMOUS BLOCK EXECUTE
```

- next(idx)

  Parameter: *idx* is of the INT or VARCHAR type.

  Return value: INT or VARCHAR

  Description: Returns the index of a valid element following the given index in a collection.

  Example 1: Use the next function for the variable of the nest-table collection type.

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'next:%' ,aa.next(3);
 end;
 /
INFO:  next:4
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Use the next function for the variable of the index-by table collection type.

```
gaussdb=# declare
 type t1 is table of int index by int;
 aa t1;
 begin
 aa(3) := 111;
 aa(2) := 222;
 aa(1) := 333;
 raise info 'next:%' ,aa.next(2);
 raise info 'next:%' ,aa.next(-999);
 end;
 /
INFO:  next:3
INFO:  next:1
ANONYMOUS BLOCK EXECUTE
```

- limit

  Parameter: none

  Return value: null

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Description: Returns null values and only for variables of the nest-table type.

Example:

```
gaussdb=# declare
 type nest is table of int;
 aa nest:=nest(11,22,33,44,55);
 begin
 raise info 'limit:%' ,aa.limit;
 end;
 /
INFO:  limit:<NULL>
ANONYMOUS BLOCK EXECUTE
```

Collection-related Functions

- unnest_table (anynesttable) or unnest (anynesttable)

  Parameter: any nest-table collection type.

  Description: Returns the result set of all valid elements in a given nest-table. Multiple rows of data are returned.

  Return type: setof anyelement.

  Example:

```
If the element type of the collection is record and any element is NULL, the element is not returned. Instead, a non-null record value is returned. All columns of the record are NULL.
gaussdb=# create or replace procedure p1()
gaussdb-# as
gaussdb$#     type t1 is table of int;
gaussdb$#     v2 t1 := t1(null, 2, 3, 4, null);

10.4.3 Records

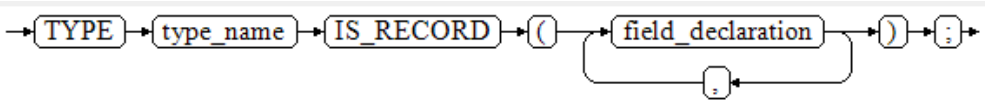
Record Variables

Define a record type and use this type to declare a variable, which is a record variable.

Syntax

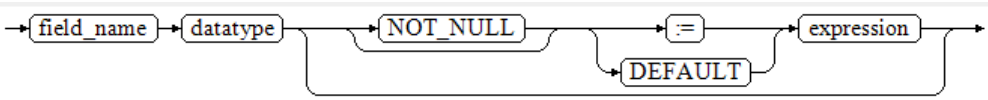
The syntax for defining the record type is as follows:

```
TYPE type_name IS_RECORD (field_declaration [,...] );
```



field_declaration is as follows:

```
field_name datatype [ [NOT_NULL] { := | DEFAULT } expression]
```



The syntax is described as follows:

- *type_name*: specifies the record type.
- *field_name*: specifies member variables of this type.
- *datatype*: specifies data types for the member variables.
- *expression*: specifies the expression for setting a default value.

Constraints

In GaussDB:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use SELECT INTO or FETCH to assign values to a record type.
  - Assign the **NULL** value to a record variable.
- The record type constructor can use => to assign values. The restrictions are as follows:
  - The => function is used when the record type constructor assigns values. This function is supported only when the A-compatible database is used (**sql_compatibility** is set to **'A'**).
  - The record type can be defined in a package.
  - The record type constructor uses the => function to assign values. This function is supported only when => is consecutively used to assign values to input parameters, for example, **record_name(elename1 => val1, elename2 => val2, elename3 => val3)** or **record_name(val1, elename2 => val2, elename3 => val3)**. Discontinuous use of => or => is not supported. For example, **record_name(elename1 => val1, elename2 => val2, val3)** or **record_name(val1, elename2 => val2, val3)**, where the last input parameter is not assigned a value.
- The INSERT and UPDATE statements cannot use a record variable to insert or update data.
- The constructor of the record type cannot be used as the default value of a function or stored procedure parameter.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.
- If a member has a record type, the default value of the inner record type cannot be not passed to the outer record type.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on** and the member is of the record type and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during stored procedure or package compilation.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on**, a package contains the record type, and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during creation or compilation.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on**, the NOT NULL function of the record type in the stored procedure takes effect.
- The data type can be the record type, array type, or collection type defined in a stored procedure (anonymous blocks are not supported).
- After the **proc_outparam_override** option is enabled for the GUC parameter **behavior_compat_options**:
  - Functions that contain the **out** output parameter and returns data of the record type can be called using SELECT and CALL in external SQL statements, and can be called using PERFORM and expressions in stored procedures.
  - If the function returns data of the undefined record type, at least one out parameter is required. If the function returns data of the defined record type, the out parameter is optional. For details, see **Examples**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Functions that contain the **out** output parameter and return data of the composite or record type, ensure that the expected return type of the function is the same as the actual return type.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# create table emp_rec(
gaussdb(#     empno numeric(4,0) not null,
gaussdb(#     ename varchar(10)
gaussdb(# );
CREATE TABLE
gaussdb=# insert into emp_rec values(111, 'aaa'), (222, 'bbb'), (333, 'ccc');
INSERT 0 3
-- The table is defined as follows:
gaussdb=# \d emp_rec
          Table "public.emp_rec"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 empno  | numeric(4,0)          | not null
 ename  | character varying(10) |

-- Perform record operations in the function.
gaussdb=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2) RETURNS VARCHAR2 AS $$
gaussdb$# DECLARE
gaussdb$#     -- Declare a record type.
gaussdb$#     type rec_type is record (name  varchar2(100), epno int);
gaussdb$#     employer rec_type;
gaussdb$#     -- Use %type to declare the record type.
gaussdb$#     type rec_type1 is record (name  emp_rec.ename%type, epno int :=10);
gaussdb$#     employer1 rec_type1;
gaussdb$#     -- Declare a record type with the default value.
gaussdb$#     type rec_type2 is record (
gaussdb$#         name varchar2 not null := 'SCOTT',
gaussdb$#         epno int not null :=10
gaussdb$#     );
gaussdb$#     employer2 rec_type2;

10.5 DECLARE Syntax

10.5.1 Basic Structure

Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- **DECLARE**: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.
  ```
  DECLARE
  ```
  NOTE

  This part is optional if no variable needs to be declared.
  - An anonymous block may omit the DECLARE keyword if no variable needs to be declared.
  - For a stored procedure, AS is used, which is equivalent to DECLARE. The AS keyword must be reserved even if there is no variable declaration section.
- **EXECUTION**: specifies procedure and SQL statements. It is the main part of a program. Mandatory.
  ```
  BEGIN
  ```
- Exception part: processes errors. Optional.
  ```
  EXCEPTION
  ```
- End. Mandatory.
  ```
  END;
  /
  ```

NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the gsql tool is executed with the **-r** parameter specified.

Category

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see **Figure 10-1**.
- Subprogram: a stored procedure, function, operator, or packages stored in a database. A subprogram created in a database can be called by other programs.

10.5.2 Anonymous Blocks

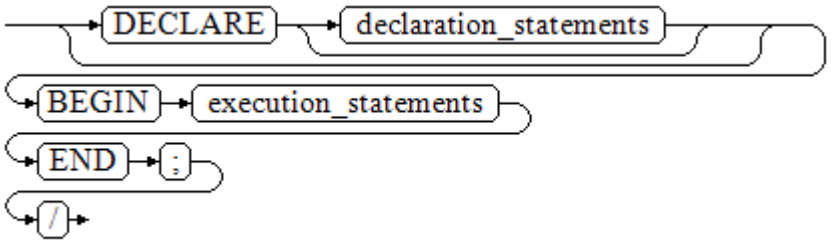
An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

Figure 10-1 shows the syntax diagrams for an anonymous block.

Figure 10-1 anonymous_block::=



Details about the syntax diagram are as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

  NOTICE

  The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. At least one statement, even a NULL statement, must be presented in any implementation blocks.

The following lists basic anonymous block programs:

```
-- Null statement block
gaussdb=# BEGIN
    NULL;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Display information on the console.
gaussdb=# BEGIN
    dbe_output.print_line('hello world!');
END;
/
hello world!
ANONYMOUS BLOCK EXECUTE
-- Display variable content on the console.
gaussdb=# DECLARE
    my_var VARCHAR2(30);
BEGIN
    my_var :='world';
    dbe_output.print_line('hello'||my_var);
END;
/
helloworld
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.5.3 Subprogram

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

10.5.3.1 Standalone Subprograms

Subprograms created in a schema include stored procedures, functions, and packages created in a schema.

For details, see:

- **CREATE PACKAGE**
- **CREATE FUNCTION**
- **CREATE PROCEDURE**

10.5.3.2 Package Subprograms

Subprograms created in a package include stored procedures and functions created and declared in a package.

For details, see **CREATE PACKAGE**.

10.5.3.3 Nested Subprograms

Subprograms created in a PL/SQL block include sub-stored-procedures or subfunctions declared and created in anonymous blocks, stored procedures, functions, and stored procedures and functions in packages.

Precautions

- This is used in the A compatibility database.
- The maximum number of nesting layers is specified by the **max_subpro_nested_layers** parameter. The default value is **3**, and the value range is 0 to 100. If a nested subprogram contains an anonymous block, the layer of anonymous block is not counted, but the nested subprograms in the anonymous block are counted in the total number of layers.
- Nested subprograms do not support overloading or SETOF.
- Nested subprograms cannot be defined as autonomous transactions. They can call stored procedures or functions that contain autonomous transactions.
- Subfunctions (FUNCTION) cannot be directly called and must have return values. Sub-stored-procedures (PROCEDURE) cannot be called in expressions.
- Nested subprograms cannot be called by PERFORM. Dynamic statements cannot contain nested subprograms.
- Currently, the following modifiers are supported for nested subprograms. Other modifiers are not supported.
  ```
  {IMMUTABLE  | STABLE  | VOLATILE }
  {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
  ```
- Only one qualifier can reference a nested subprogram or a variable of a nested subprogram.
- When the return value type of a subfunction (FUNCTION) is the record type customized by the function, subfunc().col cannot be used to access the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

column attribute of the return value of the subfunction. As a result, an error is reported during execution.

- The declaration of a nested subprogram must be at the end of the declaration part (declare the nested subprogram after the declaration of variables, cursors, and types is complete).
- Nested subprograms can be called only inside declared functions or stored procedures and cannot be used externally.
- The debugger breakpoint is not supported when nested subprograms are used. Step-by-step debugging is supported.
- Other precautions are the same as those for stored procedures and functions.

Syntax

- Syntax format for creating a sub-stored-procedure:

```
PROCEDURE procedure_name [ (parameters) ]
    [{IMMUTABLE  | STABLE  | VOLATILE }
     | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
    { IS | AS }
    [ declarations ]
BEGIN
    plsql_body
END;
```

- Syntax for creating a subfunction:

```
FUNCTION function_name  [ (parameters) ] RETURN rettype
    [{IMMUTABLE  | STABLE  | VOLATILE }
     | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
    { IS | AS }
    [ declarations ]
BEGIN
    plsql_body
END;
```

  In the **declarations** part, you can define the nested subprograms of the lower layer.

- Example:

```
-- Create a stored procedure.
CREATE OR REPLACE PROCEDURE proc_test() AS
    -- Declare and define a sub-stored-procedure.
    PROCEDURE proc_sub() IS
    BEGIN
        dbe_output.put_line('this is subpragram');
    END;
BEGIN
    dbe_output.put_line('this is a procedure');
    -- Call a sub-stored-procedure in an execution block.
    proc_sub();
END;
/
    -- Call a stored procedure externally.
BEGIN
    proc_test;
END;
/
-- Output the result.
this is a procedure
this is subpragram
ANONYMOUS BLOCK EXECUTE
```

Declaration and Definition Rules of Nested Subprograms

- Nested subprograms cannot be declared or defined repeatedly. Overloading is not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The identifier of a nested subprogram cannot be the same as the variable name or keyword.
- Declaration before definition is supported. The definition of subprogram declared first must be found in the subsequent declaration block.

Calling Rules of Nested Subprograms

- Nested subprograms can call themselves to achieve recursive calling effects.
- Nested subprograms can call upper-layer subprograms.
- Nested subprograms can call locally declared lower-layer subprograms, but cannot call nested subprograms in lower-layer subprograms.
- Nested subprograms can call subprograms declared earlier than themselves at the same layer.

Example:

```
-- Call itself.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE proc_sub(var2 int) IS
    BEGIN
        dbe_output.put_line('var = ' || var2);
        IF var2 > 1 THEN
            proc_sub(var2 - 1);
        END IF;
    END;
BEGIN
    proc_sub(var1);
END;
/
BEGIN
    proc_test(3);
END;
/
-- Output the result.
var = 3
var = 2
var = 1

-- Call the upper-layer subprogram.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE procsub_1(var2 int) IS
    BEGIN
    proc_test(var2 - 1);
    END;
BEGIN
    dbe_output.put_line('proc_test var1 = ' || var1);
    IF var1 > 1 THEN
          procsub_1(var1);
    END IF;
END;
/
BEGIN
    proc_test(3);
END;
/
-- Output the result.
proc_test var1 = 3
proc_test var1 = 2
proc_test var1 = 1

-- Call the lower-layer subprogram declared locally.
CREATE OR REPLACE PROCEDURE proc_test() AS
    PROCEDURE proc_sub1 IS
        PROCEDURE proc_sub2 IS
        BEGIN
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        dbe_output.put_line('--this is subpragram2 begin');
        dbe_output.put_line('--this is subpragram2 end');
    END;
  BEGIN
  dbe_output.put_line('this is subpragram1 begin');
  proc_sub2();
  dbe_output.put_line('this is subpragram1 end');
  END;
BEGIN
  dbe_output.put_line('this is a procedure begin');
  proc_sub1();
  dbe_output.put_line('this is a procedure end');
END;
/
BEGIN
  proc_test;
END;
/
-- Output the result.
this is a procedure begin
this is subpragram1 begin
--this is subpragram2 begin
--this is subpragram2 end
this is subpragram1 end
this is a procedure end
```

Variables of Nested Subprograms

Variable types include basic types, record types, TABLE OF types, cursor types, and varray types supported by PL/SQL.

- Accessible variables:
  - Variable declared by itself.
  - Variable declared by the upper-layer subprogram.
- Variable access rules:
  - If a variable does not contain a qualifier, the variable is first searched in the program. If the variable name does not exist, the variable is searched at the upper layer, and so on.
  - If a variable has a qualifier, it is searched in the area of the qualifier. Currently, only one qualifier can be called.

10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. This chapter describes basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

NOTE

You are advised not to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

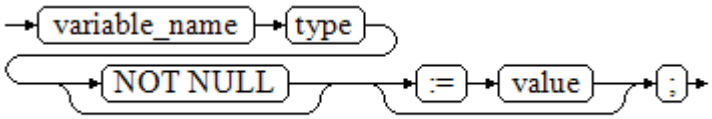
10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

Variable Declaration

For details about the variable declaration syntax, see **Figure 10-2**.

Figure 10-2 declare_variable::=



The syntax is described as follows:

- *variable_name* specifies the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

Example

```
gaussdb=# DECLARE
    emp_id  INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
    emp_id := 5*7784; -- Assign a value to the variable.
END;
/
ANONYMOUS BLOCK EXECUTE
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

%TYPE Attribute

%TYPE declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the *my_name* variable whose data type is the same as the data type of **firstname** in **employee**, you can define the variable as follows:

```
my_name employee.firstname%TYPE
-- Example
DROP TABLE IF EXISTS employee;
NOTICE:  table "employee" does not exist, skipping
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
CREATE TABLE
DECLARE
    my_name employee.firstname%TYPE;
BEGIN
    my_name = 'abc';
    DBE_OUTPUT.PRINT_LINE(my_name);
END;
/
abc
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In this way, you do not need to know the data type of **firstname** in **employee**. In addition, you do not need to change the data type of *my_name* again when the data type of **firstname** changes.

```
TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
my_employee employee_record;
my_id my_employee.id%TYPE;
my_id_copy my_id%TYPE;
-- Example
DECLARE
    TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
    my_employee employee_record;
    my_id my_employee.id%TYPE;
    my_id_copy my_id%TYPE;
BEGIN
    my_employee.id := 1;
    my_employee.firstname := 'ab2';
    my_id = 2;
    my_id_copy = 3;
    DBE_OUTPUT.PRINT_LINE(my_employee.id);
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_id);
    DBE_OUTPUT.PRINT_LINE(my_id_copy);
END;
/
1
ab2
2
3
ANONYMOUS BLOCK EXECUTE
```

%ROWTYPE Attribute

%ROWTYPE declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
-- Example
DROP TABLE IF EXISTS employee;
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
DECLARE
    my_employee employee%ROWTYPE;
BEGIN
    my_employee.firstname := 'ab1';
    my_employee.secondname := 'ab2';
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_employee.secondname);
END;
/
ab1
ab2
ANONYMOUS BLOCK EXECUTE
```

The attribute can also be used on the cursor. The column names and column data types of this set of data are the same as those of the **employee** table. For the cursor in a package, **%ROWTYPE** can be omitted. **%TYPE** can also reference the type of a column in the cursor. You can define the data as follows:

```
cursor cur is select * from employee;
my_employee cur%ROWTYPE
my_name cur.firstname%TYPE
my_employee2 cur -- For the cursor defined in a package, %ROWTYPE can be omitted.
-- Example
set behavior_compat_options = 'allow_procedure_compile_check';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
SET
DROP TABLE IF EXISTS employee;
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
CREATE TABLE
CREATE OR REPLACE procedure proc1()
IS
    cursor cur is select * from employee;
    my_employee cur%ROWTYPE;
    my_name cur.firstname%TYPE;
BEGIN
    my_employee.firstname := 'ab1';
    my_employee.secondname := 'ab2';
    my_name := 'ab3';
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_employee.secondname);
    DBE_OUTPUT.PRINT_LINE(my_name);
END;
/
CREATE PROCEDURE
```

NOTICE

- **%TYPE** can reference only the type of record variables across packages and cannot reference a column type of the cursor variable.
- If the GUC parameter **behavior_compat_options** is enabled and the value of this parameter contains **allow_procedure_compile_check**, **%TYPE** can reference a column type of the cursor variable.
- **%ROWTYPE** cannot reference the type of a composite variable or a record variable.
- The non-PACKAGE *record%TYPE* cannot be used as the variable type or input/output parameter type.
- *View%ROWTYPE* or **SCHEMA.***view%ROWTYPE* cannot be used as the input/output parameter type.
- The **PACKAGE.***record%TYPE* or **SCHEMA.PACKAGE.***record%TYPE* cannot be used as the input/output parameter type.
- *Table/View*.**column.***column%TYPE* or **SCHEMA.***Table/View*.**column.***column%TYPE* cannot be nested with one or more layers as variable types or input/output parameter type.
- *Record*.**column.***column%TYPE* and **PACKAGE.***record*.**column.***column%TYPE* cannot be nested with a column type of records at one or more layers as the variable type or input/output parameter type.
- The cursor variable of more levels, such as **PACKAGE.***cursor%ROWTYPE* and **SCHEMA.PACKAGE.***cursor%ROWTYPE*, cannot be used as the parameter type or input/output parameter type.
- When **%TYPE** is used to obtain the type from *record*.**column** and such type is defined by **%TYPE**, the constraint of the original type (such as NUMBER(3) and VARCHAR2(10)) are not retained.

Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

Example

```
gaussdb=# DECLARE
    emp_id  INTEGER :=7788; -- Define a variable and assign a value to it.
    outer_var  INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
    DECLARE
        emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
        inner_var  INTEGER :=6688; -- Define a variable and assign a value to it.
    BEGIN
        dbe_output.print_line('inner emp_id ='||emp_id); -- Display the value 7799.
        dbe_output.print_line('outer_var ='||outer_var); -- Reference a variable of an outer block.
    END;
    dbe_output.print_line('outer emp_id ='||emp_id); -- Display the value 7788.
END;
/
inner emp_id =7799
outer_var =6688
outer emp_id =7788
ANONYMOUS BLOCK EXECUTE
```

10.6.2 Assignment Statements

Variable Syntax

Figure 10-3 shows the syntax diagram for assigning a value to a variable.

Figure 10-3 assignment_value::=

The syntax is described as follows:

- *variable_name*: specifies the name of a variable.
- **value**: can be a value or an expression. The type of **value** must be compatible with the type of *variable_name*.

Example:

```
DECLARE
    emp_id  INTEGER := 7788; -- Assign a value.
BEGIN
    emp_id := 5; -- Assign a value.
    DBE_OUTPUT.PRINT_LINE(emp_id);
    emp_id := 5*7784;
    DBE_OUTPUT.PRINT_LINE(emp_id);
END;
/
-- The result is as follows:
5

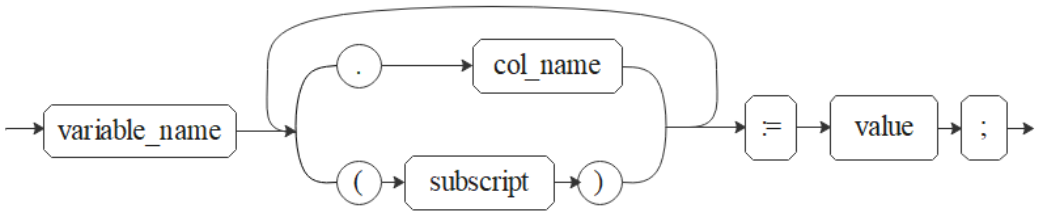
Nested Value Assignment

Figure 10-4 shows the syntax diagram for assigning a nested value to a variable.

Figure 10-4 nested_assignment_value::=



The syntax in **Figure 10-4** is described as follows:

- *variable_name*: specifies the name of a variable.
- *col_name*: specifies the column name.
- **subscript**: index, which is used for an array variable. The value can be a value or an expression and must be of the INT type.
- **value**: can be a value or an expression. The type of **value** must be compatible with the type of *variable_name*.

Example:

```
gaussdb=# CREATE TYPE o1 AS (a int, b int);
CREATE TYPE
gaussdb=# DECLARE
    TYPE r1 is VARRAY(10) of o1;
    emp_id  r1;
BEGIN
    emp_id(1).a := 5;-- Assign a value.
    emp_id(1).b := 5*7784;
END;
/
ANONYMOUS BLOCK EXECUTE
```

NOTICE

In INTO mode, values can be assigned only to the columns at the first layer. Two-dimensional or above arrays are not supported.

INTO/BULK COLLECT INTO

- Values returned by statements in a stored procedure are stored in variables. BULK COLLECT INTO allows some or all returned values to be temporarily stored in an array.
- An empty result set can be returned.

Syntax

```
SELECT select_expressions INTO [STRICT] target FROM ...
SELECT INTO [STRICT] target [FROM ..]
EXECUTE [IMMEDIATE] select_expressions BULK COLLECT INTO target ...
```

The syntax is described as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **select_expressions**: SQL statement for query. You can use basic SQL commands and INTO clauses to assign the result of a single row or multiple columns to a variable (such as record, row, or scalar variable list).
- **target**: target variable, which can be a record variable, a row variable, or a comma-separated list of simple variables and record/row fields.
- **STRICT** (Optional): If **behavior_compat_options** is set to **'select_into_return_null'** (disabled by default) and the **STRICT** option is specified, the query must return a non-empty result set. Otherwise, an error is reported: "NO_DATA_FOUND", "TOO_MANY_ROWS" or "QUERY_RETURNED_NO_ROWS". If the option is not specified, the empty result set can be returned.

NOTE

- BULK COLLECT INTO can only assign values to arrays or collections in batches. The collection type uses LIMIT properly to prevent performance deterioration caused by excessive operations on data.
- INTO and BULK COLLECT INTO support only direct nesting of record type value with less than four layers.
- To return an empty result set, you need to enable PG-compatible mode during database initialization. Set **behavior_compat_options** to **'select_into_return_null'**, the compatibility mode is enabled. If the GUC parameter **behavior_compat_options** is not set, the compatibility mode is disabled.
- For array variables, elements in parentheses () are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **select (1+3) into va(5)** cannot be written as **select into va(5) (1+3)** or **select into va[5] (1+3)**.
- INSERT INTO, UPDATE INTO, DELETE INTO, and EXECUTION INTO cannot return an empty result set.
- Multiple variables are not assigned values because the syntax of the subsequent variables is incorrect.
- BULK COLLECT INTO can be used only in the A-compatible database.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Example:

```
gaussdb=# DROP TABLE IF EXISTS customers;
NOTICE:  table "customers" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE customers(id int,name varchar);
CREATE TABLE
gaussdb=# INSERT INTO customers VALUES(1,'ab');
gaussdb=# DECLARE
    my_id integer;
BEGIN
    select id into my_id from customers limit 1; -- Assign a value.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# DECLARE
    type id_list is varray(6) of customers.id%type;
    id_arr id_list;
BEGIN
    select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# CREATE TABLE test(a integer);
CREATE TABLE
gaussdb=# INSERT INTO test VALUES(1);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

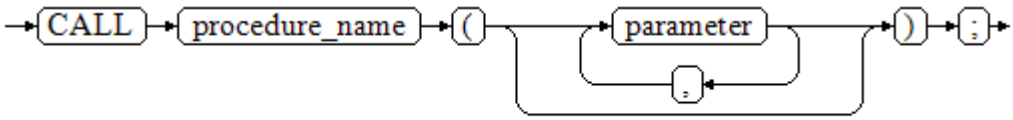
```
INSERT 0 1
gaussdb=# CREATE OR REPLACE FUNCTION check_test() RETURNS integer
    language plpgsql
    AS $function$
    DECLARE
        b integer;
    BEGIN
        SELECT INTO b FROM test WHERE a=1; -- Return an empty result set.
            RETURN b;
    END;
    $function$;
CREATE FUNCTION
gaussdb=# SELECT check_test();
 check_test
------------
          1
(1 row)
gaussdb=#  DECLARE
    TYPE id_list IS varray(6) OF customers.id%type;
    id_arr id_list;
    sql_qry varchar2(150);
BEGIN
    sql_qry := 'SELECT id FROM customers ORDER BY id DESC LIMIT 20';
    EXECUTE IMMEDIATE sql_qry BULK COLLECT INTO id_arr; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.6.3 Call Statements

Syntax

Figure 10-5 shows the syntax diagram for calling a clause.

Figure 10-5 call_clause::=



The above syntax diagram is explained as follows:

- **procedure_name** specifies the name of a stored procedure.
- **parameter** specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

Examples

```
-- Create a table.
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  section_id INTEGER,
  salary INTEGER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (30, 10);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (30, 20);
INSERT 0 1
-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
(
section     NUMBER(6),
salary_sum out NUMBER(8,2),
staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/
CREATE PROCEDURE

-- Create the stored procedure proc_return.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num);  -- Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN;  -- Return a statement.
END;
/
CREATE PROCEDURE
-- Call the stored procedure proc_return.
gaussdb=# CALL proc_return();
30#2.00
 proc_return
-------------

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
DROP PROCEDURE
gaussdb=# DROP PROCEDURE proc_return;
DROP PROCEDURE
```

10.7 Dynamic Statements

10.7.1 Executing Dynamic Query Statements

This section describes how to execute dynamic query statements. GaussDB provides two methods for dynamic query: EXECUTE IMMEDIATE and OPEN FOR. The former dynamically executes SELECT statements while the latter combines the use of cursors. If you need to store query results in a dataset, use OPEN FOR.

EXECUTE IMMEDIATE

Figure 10-6 shows the syntax diagram.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-6 EXECUTE IMMEDIATE dynamic_select_clause::=

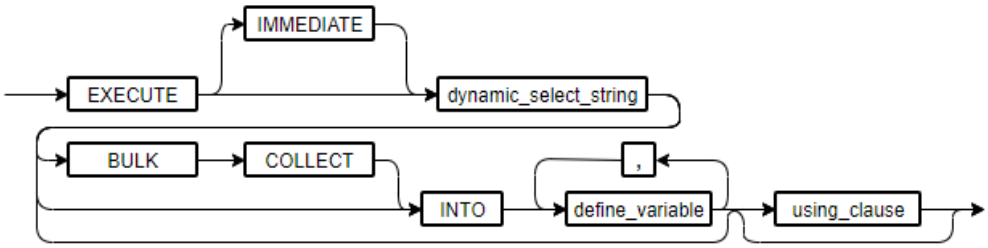


Figure 10-7 shows the syntax diagram for **using_clause**.

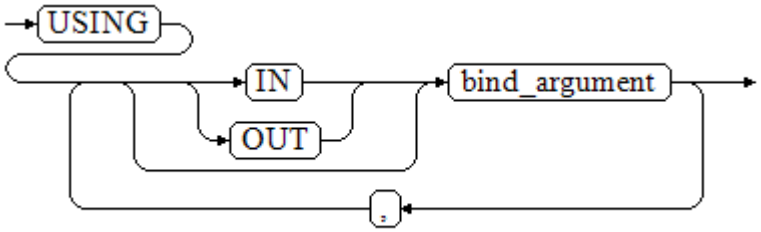
Figure 10-7 using_clause::=



The above syntax diagram is explained as follows:

- **define_variable**: specifies a variable to store query results.
- **USING IN** *bind_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic_select_string*.
- **USING OUT** *bind_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- In query statements, INTO and OUT cannot coexist.
- A placeholder name starts with a colon (:) and can be followed by digits, characters, or character strings (quoted digits, characters, or character strings cannot be used). A placeholder name corresponds to *bind_argument* in the USING clause.
- *bind_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument* in the USING clause. When the GUC parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Example:

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
NOTICE:  drop cascades to table staffs
DROP SCHEMA
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
  salary NUMBER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);
INSERT 0 1
-- Retrieve values from dynamic statements (INTO clause).
gaussdb=# DECLARE
   staff_count  VARCHAR2(20);
BEGIN
   EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
      INTO staff_count;
   dbe_output.print_line(staff_count);
END;
/
3
ANONYMOUS BLOCK EXECUTE
-- Pass and retrieve values (the INTO clause is used before the USING clause).
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
   staff_id     NUMBER(6) := 200;
   first_name   VARCHAR2(20);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  salary       NUMBER(8,2);
BEGIN
  EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
     INTO first_name, salary
     USING IN staff_id;
  dbe_output.print_line(first_name || ' ' || salary);
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
 dynamic_proc
--------------

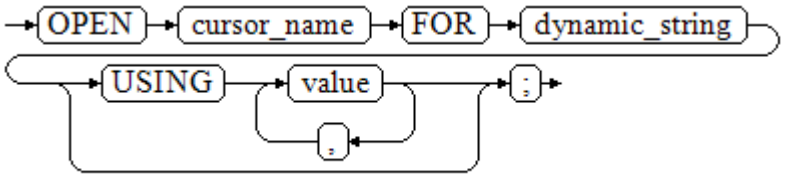
(1 row)
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
DROP PROCEDURE
```

OPEN FOR

Dynamic query statements can be executed by using OPEN FOR to open dynamic cursors.

Figure 10-8 shows the syntax diagram.

Figure 10-8 open_for::=



Parameter description:

- **cursor_name**: specifies the name of the cursor to be opened.
- **dynamic_string**: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in dynamic_string.

For the use of cursors, see **Cursors**.

Example:

```
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  section_id NUMBER,
  first_name VARCHAR2,
  phone_number VARCHAR2,
  salary NUMBER
  );
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (30, 'mike', '13567829252', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (40, 'john', '17896354637', 4000);
INSERT 0 1
gaussdb=# DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    name          VARCHAR2(20);
    phone_number  VARCHAR2(20);
    salary        NUMBER(8,2);
    sqlstr        VARCHAR2(1024);

    TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
    my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
    sqlstr := 'select first_name,phone_number,salary from hr.staffs
        where section_id = :1';
    OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
    FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
    WHILE my_cur%FOUND LOOP
        dbe_output.print_line(name||'#'||phone_number||'#'||salary);
        FETCH my_cur INTO name, phone_number, salary;
    END LOOP;
    CLOSE my_cur; -- Close the cursor.
END;
/
mike#13567829252#5800.00
ANONYMOUS BLOCK EXECUTE
```

10.7.2 Executing Dynamic Non-Query Statements

Syntax

Figure 10-9 shows the syntax diagram.

Figure 10-9 noselect::=

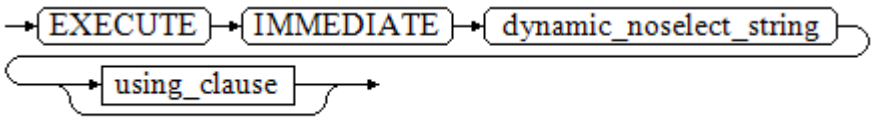


Figure 10-10 shows the syntax diagram for **using_clause**.

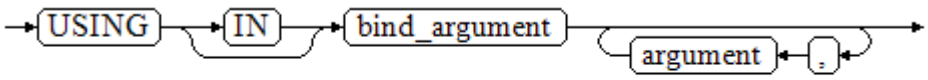
Figure 10-10 using_clause::=



The above syntax diagram is explained as follows:

USING IN *bind_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic_noselect_string*. That is, a placeholder is replaced by the corresponding *bind_argument* when a dynamic SQL statement is executed. Note that *bind_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument*. When the GUC

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the *bind_argument* in the USING clause is matched in the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder (placeholder names cannot contain quoted digits, characters, or strings).

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
  section       NUMBER(4) ,
  section_name  VARCHAR2(30),
  manager_id    NUMBER(6),
  place_id      NUMBER(4)
);
CREATE TABLE
-- Declare a variable.
gaussdb=# DECLARE
  section       NUMBER(4) := 280;
  section_name  VARCHAR2(30) := 'Info support';
  manager_id    NUMBER(6) := 103;
  place_id      NUMBER(4) := 1400;
  new_colname   VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
   EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
      USING section, section_name, manager_id,place_id;
-- Execute the query (duplicate placeholders).
   EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
      USING section, section_name, manager_id;
-- Run the ALTER statement. (You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.)
   EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Query data.
gaussdb=# SELECT * FROM sections_t1;
 section |   sec_name   | manager_id | place_id
---------+--------------+------------+----------
     280 | Info support |        103 |     1400
     280 | Info support |        103 |      280
(2 rows)
-- Drop the table.
gaussdb=# DROP TABLE sections_t1;
DROP TABLE
```

10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-11 shows the syntax diagram.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-11 call_procedure::=

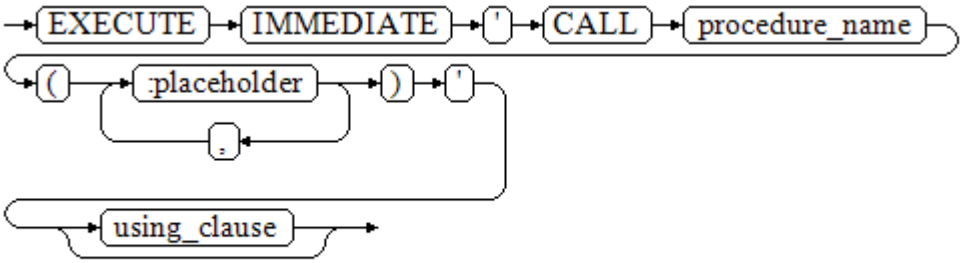


Figure 10-12 shows the syntax diagram for **using_clause**.

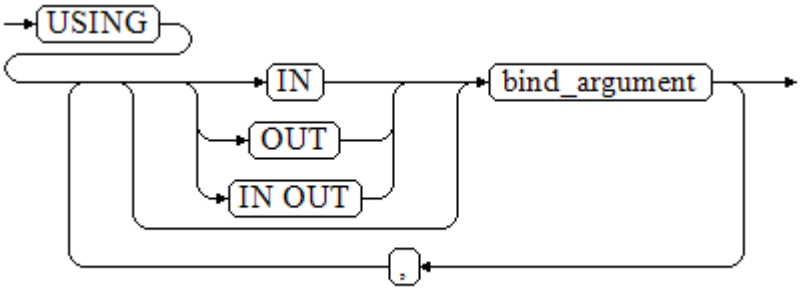
Figure 10-12 using_clause::=



The above syntax diagram is explained as follows:

- **CALL procedure_name**: calls the stored procedure.
- **[:placeholder1,:placeholder2, ...]**: indicates the list of placeholders for stored procedure parameters. Placeholder names cannot contain quoted digits, characters, or character strings. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]bind_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of *bind_argument* and of the corresponding parameter are the same.
- When a stored procedure is called, **=>** cannot be used to skip parameters.

Example:

```
-- Create the stored procedure proc_add.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add
(
    param1    in   INTEGER,
    param2    out  INTEGER,
    param3    in   INTEGER
)
AS
BEGIN
   param2:= param1 + param3;
END;
/
CREATE PROCEDURE
gaussdb=# DECLARE
    input1 INTEGER:=1;
    input2 INTEGER:=2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    statement  VARCHAR2(200);
    param2     INTEGER;
BEGIN
   -- Declare the call statement.
    statement := 'call proc_add(:col_1, :col_2, :col_3)';
   -- Execute the statement.
    EXECUTE IMMEDIATE statement
        USING IN input1, OUT param2, IN input2;
    dbe_output.print_line('result is: '||to_char(param2));
END;
/
result is: 3
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_add;
DROP PROCEDURE
```

10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-13 shows the syntax diagram.

Figure 10-13 call_anonymous_block::=

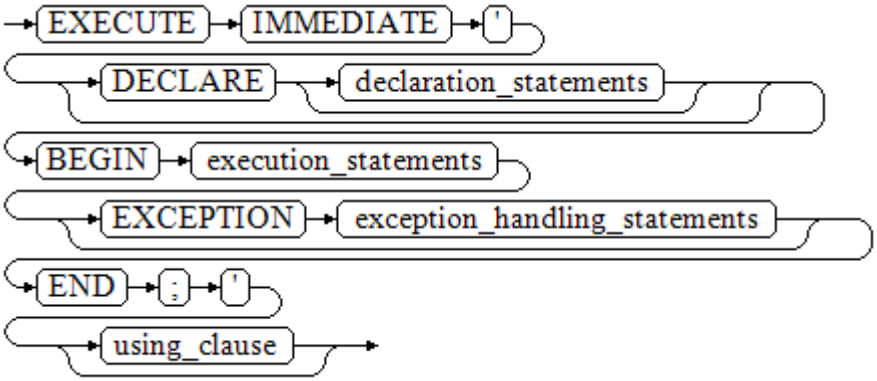


Figure 10-14 shows the syntax diagram for **using_clause**.

Figure 10-14 using_clause::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a BEGIN statement, has a break with an END statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.

NOTICE

- Parameters can be bound only when SQL statements and stored procedures are called in anonymous blocks. For example, expressions and cursors are used in anonymous blocks, and dynamic statements are called in nested mode in anonymous blocks.
- Output parameters cannot be bound when the SELECT INTO statement in an anonymous block calls FUNCTION/PROCEDURE that contains output parameters.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
- The PERFORM keyword cannot be used to call a stored procedure when parameters are bound.
- When a stored procedure is called, only bound parameters can be used as input and output parameters. Expressions (for example, 1+:va) cannot be used as input and output parameters. In addition, placeholder names cannot contain quoted digits, characters, or character strings.
- When the bound input parameter type is refcursor, the modification in the stored procedure is isolated from the input parameter.
- When the **dynamic_sql_check** parameter is enabled and the number of placeholders is the same as the number of parameters, an error is reported if placeholders with the same name are used as anonymous block parameters. In this case, you need to rename the placeholders. For details, see **Examples**.

Examples

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
  salary NUMBER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);
INSERT 0 1

```

10.8 Control Statements

10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

10.8.1.1 RETURN

Syntax

Figure 10-15 shows the syntax diagram for a return statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-15 return_clause::=

The above syntax diagram is explained as follows:

Assign the result returned by a stored procedure or function to the caller.

Examples

See **Examples** for call statement examples.

10.8.1.2 RETURN NEXT and RETURN QUERY

Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

return_next_clause::=

return_query_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use RETURN NEXT or RETURN QUERY to add results to the result set, and then continue to execute the next statement of the function. As the RETURN NEXT or RETURN QUERY statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

RETURN NEXT can be used for scalar and compound data types.

RETURN QUERY has a variant RETURN QUERY EXECUTE. You can add dynamic queries and add parameters to the queries by USING.

Examples

```
gaussdb=# DROP TABLE t1;
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  FOR r IN select * from t1
  LOOP
    RETURN NEXT r;
  END LOOP;
  RETURN;
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
$$ LANGUAGE plpgsql;
gaussdb=# call fun_for_return_next();
 a
---
 1
 10
(2 rows)

-- RETURN QUERY
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
   r t1%ROWTYPE;
BEGIN
   RETURN QUERY select * from t1;
END;
$$
language plpgsql;
gaussdb=# call fun_for_return_query();
 a
---
 1
 10
(2 rows)
```

10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of IF:

- IF_THEN

  Figure 10-16 IF_THEN::=

  
  IF_THEN is the simplest form of IF. If the condition is true, statements are executed. If it is false, they are skipped.

  Example:

  ```
  gaussdb=# DECLARE
      v_user_id integer default 1;
  BEGIN
  IF v_user_id <> 0 THEN
      raise info 'v_user_id is NOT 0';

  END IF;
  END;
  /
  INFO:  v_user_id is NOT 0
  ```

- IF_THEN_ELSE

  Figure 10-17 IF_THEN_ELSE::=

  
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

IF_THEN_ELSE has an ELSE branch and can be executed if the condition is false.

Example:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
    IF v_user_id <> 0 THEN
        raise info 'v_user_id is NOT 0';
    ELSE
        raise info 'v_user_id is 0';
    END IF;
END;
/
INFO:  v_user_id is NOT 0
```

- IF_THEN_ELSE IF

  IF statements can be nested in the following way:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSE
        IF v_user_id > 0 THEN
            raise info 'v_user_id > 0';
        END IF;
    END IF;
END;
/
INFO:  v_user_id > 0
```

  Actually, this is a way of an IF statement nesting in the ELSE part of another IF statement. Therefore, an END IF statement is required for each nesting IF statement and another END IF statement is required to end the parent IF-ELSE statement. To set multiple options, use the following form:

- IF_THEN_ELSIF_ELSE

  Figure 10-18 IF_THEN_ELSIF_ELSE::=

  Example:

```
gaussdb=# DECLARE
    v_user_id integer default NULL;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSIF v_user_id > 0 THEN
        raise info 'v_user_id > 0';
    ELSIF v_user_id < 0 THEN
        raise info 'v_user_id < 0';
    ELSE
        raise info 'v_user_id is NULL';
    END IF;
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
/
INFO:  v_user_id is NULL
```

- IF_THEN_ELSEIF_ELSE

  ELSEIF is an alias of ELSIF.

  Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
    BEGIN
        IF i > 0 THEN
            raise info 'i:% is greater than 0. ',i;
        ELSIF i < 0 THEN
            raise info 'i:% is smaller than 0. ',i;
        ELSE
            raise info 'i:% is equal to 0. ',i;
        END IF;
        RETURN;
    END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_control_structure(3);
INFO:  i:3 is greater than 0.
 proc_control_structure
------------------------

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_control_structure;
DROP PROCEDURE
```

10.8.3 Loop Statements

Simple LOOP Statements

Syntax diagram

Figure 10-19 loop::=

label declaration ::=

Example

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
    BEGIN
        count:=0;
        LOOP
        IF count > i THEN
            raise info 'count is %. ', count;
            EXIT;
        ELSE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
            count:=count+1;
        END IF;
        END LOOP;
    END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_loop(10,5);
INFO:  count is 11.
 count
-------
    11
(1 row)
```

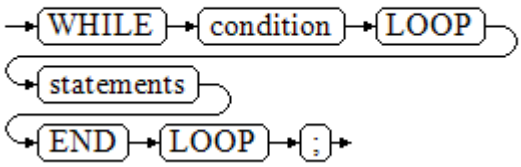
NOTICE

The loop must be exploited together with EXIT; otherwise, a dead loop occurs.

WHILE_LOOP Statements

Syntax diagram

Figure 10-20 while_loop::=



label declaration ::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

Example

```
gaussdb=# CREATE TABLE integertable(c1 integer) ;
CREATE TABLE
gaussdb=# CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
    DECLARE
    i int :=1;
    BEGIN
        WHILE i < maxval LOOP
            INSERT INTO integertable VALUES(i);
            i:=i+1;
        END LOOP;
    END;
/
CREATE PROCEDURE

-- Call the stored procedure.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL proc_while_loop(10);
 proc_while_loop
-----------------

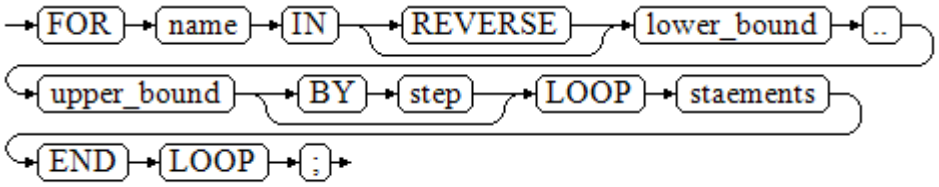
(1 row)

-- Drop the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_while_loop;
DROP PROCEDURE
gaussdb=# DROP TABLE integertable;
DROP TABLE
```

FOR_LOOP (integer Variable) Statements

Syntax diagram

Figure 10-21 for_loop::=



label declaration ::=

NOTE

- The variable *name* is automatically defined as the integer type and exists only in this loop. The value of *name* ranges from **lower_bound** to **upper_bound**.
- When the keyword REVERSE is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

Example

```
-- Loop from 0 to 5.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
   BEGIN
   FOR I IN 0..5 LOOP
      DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;') ;
   END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop();
It is 0 time;
It is 1 time;
It is 2 time;
It is 3 time;
It is 4 time;
It is 5 time;
 proc_for_loop
---------------

(1 row)
```

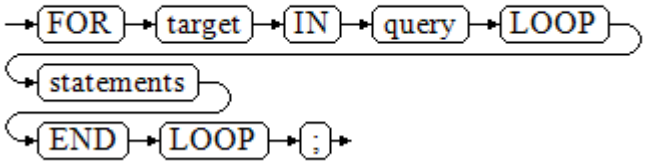
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop;
DROP PROCEDURE
```

FOR_LOOP Query Statements

Syntax diagram

Figure 10-22 for_loop_query::=



label declaration ::=

NOTE

- The variable *target* is automatically defined, its type is the same as that in the query result, and it is valid only in this loop. The value of *target* is the query result.
- You can use EXECUTE to add a dynamic query and use USING to insert parameters to the query. For details, see the dynamic query content in **Example**.

Example

```
-- Display the query result from the loop.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
    record VARCHAR2(50);
BEGIN
    FOR record IN SELECT spcname FROM pg_tablespace LOOP
    dbe_output.print_line(record);
    END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop_query();
pg_default
pg_global
 proc_for_loop_query
---------------------

(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop_query;
DROP PROCEDURE

-- Dynamic query.
gaussdb=# CREATE TABLE t1(id int);
gaussdb=# INSERT INTO t1 VALUES(1);
gaussdb=#
```

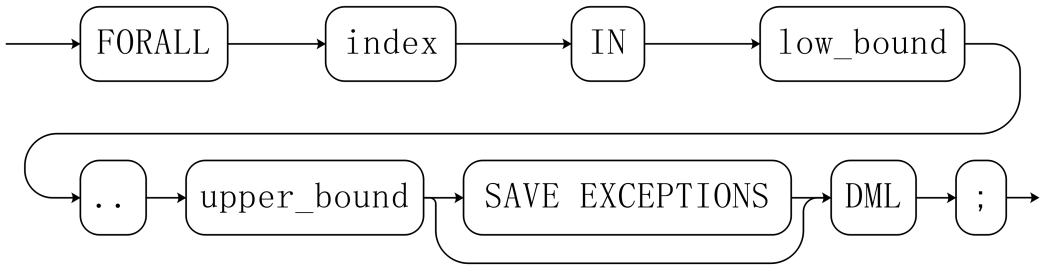
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DECLARE
a int := 1;
item t1%rowtype;
BEGIN
    FOR item IN EXECUTE 'SELECT * FROM t1 WHERE id = :1' USING a LOOP
        RAISE INFO '%', item;
    END LOOP;
END;
/
INFO:  (1)
ANONYMOUS BLOCK EXECUTE
gaussdb=# DROP TABLE t1;
```

FORALL Batch Query Statements

Syntax diagram

Figure 10-23 forall::=



label declaration ::=

NOTE

- The variable *index* is automatically defined as the integer type and exists only in this loop. The index value falls between low_bound and upper_bound.
- If **SAVE EXCEPTIONS** is specified, exceptions occurred during DML execution in the loop body are saved in **SQL%BULK_EXCEPTIONS** and an exception is thrown after the execution is complete. If there is no abnormal execution result in the loop, the loop will not be rolled back in the current subtransaction.
- When FORALL is used together with BULK COLLECT INTO, the INTO variable returns only the execution result of a single DML statement.

Example

```
gaussdb=# CREATE TABLE hdfs_t1 (
  title NUMBER(6),
  did VARCHAR2(20),
  data_period VARCHAR2(25),
  kind VARCHAR2(25),
  interval VARCHAR2(20),
  time DATE,
  isModified VARCHAR2(10)
);
CREATE TABLE

gaussdb=# INSERT INTO hdfs_t1 VALUES( 8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833',
to_date('21-06-1999', 'dd-mm-yyyy'), 'SH_CLERK' );
INSERT 0 1

gaussdb=# CREATE OR REPLACE PROCEDURE proc_forall()
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
AS
BEGIN
    FORALL i IN 100..120
        update hdfs_t1 set title = title + 100*i;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_forall();
 proc_forall
-------------

(1 row)

-- Query the calling result of the stored procedure.
gaussdb=# SELECT * FROM hdfs_t1;
 title  |  did   | data_period |   kind   |   interval   |        time         | ismodified
--------+--------+-------------+----------+--------------+---------------------+------------
 231008 | Donald | OConnell    | DOCONNEL | 650.507.9833 | 1999-06-21 00:00:00 | SH_CLERK
(1 row)

-- Drop the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_forall;
DROP PROCEDURE

gaussdb=# DROP TABLE hdfs_t1;
DROP TABLE
```

10.8.4 Branch Statements

Syntax

Figure 10-24 shows the syntax diagram for a branch statement.

Figure 10-24 case_when::=

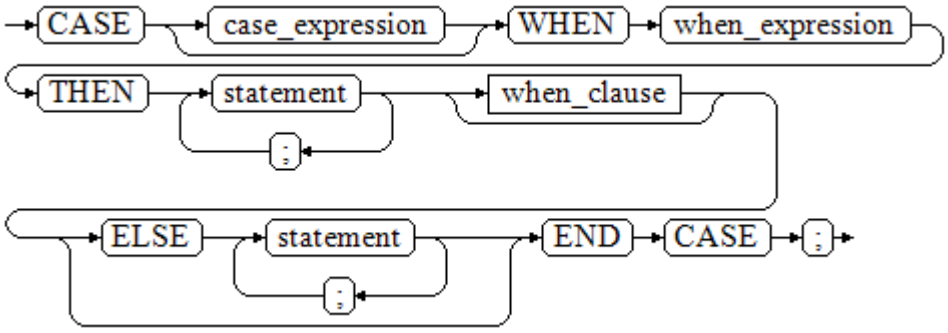


Figure 10-25 shows the syntax diagram for when_clause.

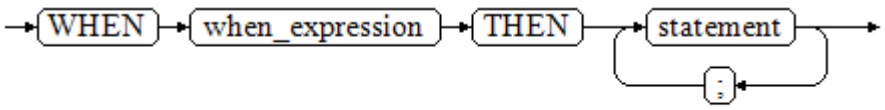
Figure 10-25 when_clause::=



Parameter description:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- *case_expression*: specifies the variable or expression.
- *when_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
   BEGIN
      CASE pi_result
         WHEN 1 THEN
            pi_return := 111;
         WHEN 2 THEN
            pi_return := 222;
         WHEN 3 THEN
            pi_return := 333;
         WHEN 6 THEN
            pi_return := 444;
         WHEN 7 THEN
            pi_return := 555;
         WHEN 8 THEN
            pi_return := 666;
         WHEN 9 THEN
            pi_return := 777;
         WHEN 10 THEN
            pi_return := 888;
         ELSE
            pi_return := 999;
      END CASE;
      raise info 'pi_return : %',pi_return ;
END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_case_branch(3,0);
INFO:  pi_return : 333
 pi_return
-----------
       333
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_case_branch;
DROP PROCEDURE
```

10.8.5 NULL Statements

In PL/SQL programs, NULL statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

Syntax

The following shows example use of NULL statements:

```
DECLARE
   ...
BEGIN
   ...
   IF v_num IS NULL THEN
      NULL; -- No data needs to be processed.
   END IF;
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter description:

- *v_num*: specifies the variable or expression.

Example

```
gaussdb=# DECLARE
    v_num integer default NULL;
BEGIN
    IF v_num IS NOT NULL THEN
        raise info 'v_num is NULL';
    ELSE
        NULL; -- No data needs to be processed.
    END IF;
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
    declarations]
BEGIN
    statements
EXCEPTION
    WHEN condition [OR condition ...] THEN
        handler_statements
    [WHEN condition [OR condition ...] THEN
        handler_statements
    ...]
END;
```

If no error occurs, this form of enclosing block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in SQL standard error codes. The special condition name **OTHERS** matches every error type except **QUERY_CANCELED**.

If a new error occurs within the selected **handler_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) ;
CREATE TABLE

gaussdb=# INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');
INSERT 0 1

gaussdb=# CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
    x INT :=0;
    y INT;
BEGIN
    UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
    x := x + 1;
    y := x / 0;
EXCEPTION
    WHEN division_by_zero THEN
        RAISE NOTICE 'caught division_by_zero';
        RETURN x;
END;$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# call fun_exp();
NOTICE:  caught division_by_zero
 fun_exp
---------
       1
(1 row)

gaussdb=# select * from mytab;
 id | firstname | lastname
----+-----------+----------
    | Tom       | Jones
(1 row)

gaussdb=# DROP FUNCTION fun_exp();
DROP FUNCTION

gaussdb=# DROP TABLE mytab;
DROP TABLE
```

When control reaches the assignment to **y**, it will fail with a **division_by_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

NOTE

- A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.
- In the following scenarios, the processing exception cannot be captured and the entire stored procedure is rolled back: 1. The node is faulty. 2. The thread of the node involved in the stored procedure exits due to a network fault. In addition, the structure of the source data is inconsistent with that of the target table in the COPY FROM operation. 3. Exceptions occur when EXCEPTION clears subtransactions. (For a stored procedure that contains the EXCEPTION statement, an implicit subtransaction is started when the statement is executed. After the statement is executed, the subtransaction is automatically cleared. During the clearing, exceptions may occur due to memory control.)

Example: Exceptions with **UPDATE**/**INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE db (a INT, b TEXT);
CREATE TABLE

gaussdb=# CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
    LOOP

-- First try to update the key
        UPDATE db SET b = data WHERE a = key;
        IF found THEN
            RETURN;
        END IF;
-- The key does not exist. Therefore, try to insert one. If someone else inserts the same key concurrently, the
unique key may fail to be obtained.
        BEGIN
            INSERT INTO db(a,b) VALUES (key, data);
            RETURN;
        EXCEPTION WHEN unique_violation THEN
        -- Do nothing, and loop to try the UPDATE again.
        END;
     END LOOP;
END;
$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# SELECT merge_db(1, 'david');
 merge_db
----------

(1 row)

gaussdb=# SELECT merge_db(1, 'dennis');
 merge_db
----------

(1 row)

-- Delete FUNCTION and TABLE.
gaussdb=# DROP FUNCTION merge_db;
DROP FUNCTION

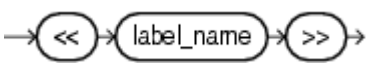
gaussdb=# DROP TABLE db;
DROP TABLE
```

10.8.7 GOTO Statements

A GOTO statement unconditionally transfers the control from the current statement to a labeled statement. The GOTO statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the EXCEPTION statement to handle issues in special scenarios. To execute a GOTO statement, the labeled statement must be unique.

Syntax

label declaration ::=



goto statement ::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
   v1  int;
BEGIN
   v1  := 0;
      LOOP
      EXIT WHEN v1 > 100;
            v1 := v1 + 2;
            if v1 > 25 THEN
                  GOTO pos1;
            END IF;
      END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %. ', v1;
END;
/
CREATE PROCEDURE

gaussdb=# call GOTO_test();
INFO:  v1 is 36.
 goto_test
-----------

(1 row)
```

Constraints

Using GOTO statements has the following constraints:

- Does not allow multiple labeled statements even if the statements are in different blocks.

  ```
  BEGIN
    GOTO pos1;
    <<pos1>>
    SELECT * FROM ...
    <<pos1>>
    UPDATE t1 SET ...
  END;
  ```

- Cannot transfer control to the IF, CASE, or LOOP statement.

  ```
  BEGIN
    GOTO pos1;
    IF valid THEN
      <<pos1>>
      SELECT * FROM ...
    END IF;
  END;
  ```

- Cannot transfer control from one IF clause to another, or from one WHEN clause in the CASE statement to another.

  ```
  BEGIN
    IF valid THEN
      GOTO pos1;
      SELECT * FROM ...
    ELSE
      <<pos1>>
      UPDATE t1 SET ...
    END IF;
  END;
  ```

- Cannot transfer control from an outer block to an inner BEGIN-END block.

  ```
  BEGIN
    GOTO pos1;
    BEGIN
      <<pos1>>
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    UPDATE t1 SET ...
  END;
END;
```

- Cannot transfer control from an exception handler to the current BEGIN-END block, but can transfer control to the upper-layer BEGIN-END block.

```
BEGIN
  <<pos1>>
  UPDATE t1 SET ...
  EXCEPTION
    WHEN condition THEN
      GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, you need to add the NULL statement.

```
DECLARE
  done  BOOLEAN;
BEGIN
  FOR i IN 1..50 LOOP
    IF done THEN
      GOTO end_loop;
    END IF;
    <<end_loop>>  -- You cannot run the GOTO statement to go here unless there is an executable
statement following it.
    NULL; -- The statement added here is used to avoid errors.
  END LOOP;  -- If the previous sentence NULL does not exist, an error is reported.
END;
/
```

10.9 Transaction Management

Calling a stored procedure automatically starts a transaction. When the calling is complete, the transaction is automatically committed, or rolled back upon an exception. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

Syntax

```
Define a savepoint.
   SAVEPOINT savepoint_name;
Roll back a savepoint.
   ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
   RELEASE [SAVEPOINT] savepoint_name;
```

Usage Scenarios

The applicable contexts are as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures that contain EXCEPTION.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
- A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
- A stored procedure that contains savepoints can be called in a subtransaction. That is, an externally defined savepoint is used in the stored procedure to roll back the transaction to the savepoint defined outside the stored procedure.
- A stored procedure is visible to a savepoint defined in the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
- COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.
- A stored procedure or function that contains COMMIT, ROLLBACK, or SAVEPOINT can be called in the return values and simple expression calculation of stored procedures.

The following content can be committed or rolled back:

- DDL statements after COMMIT/ROLLBACK can be committed or rolled back.
- DML statements after COMMIT/ROLLBACK can be committed.
- GUC parameters in stored procedures can be committed or rolled back.

Usage Restrictions

The following contexts are not applicable:

- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Python.
- COMMIT, ROLLBACK, SAVEPOINT and stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in functions.
- After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in EXECUTE statements.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
- Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
- Savepoints defined outside a stored procedure cannot be released in the stored procedure.
- An autonomous transaction and a stored procedure transaction are two independent transactions that cannot use the savepoints defined in each other.

The following content cannot be committed or rolled back:

- Variables declared or imported in stored procedures cannot be committed or rolled back.
- In stored procedures, GUC parameters that take effect only after a restart cannot be committed or rolled back.

Examples

- Example 1: COMMIT/ROLLBACK can be used in PL/SQL stored procedures. Subsequent examples depend on this case.

```
gaussdb=# DROP TABLE IF EXISTS EXAMPLE1;
NOTICE:  table "example1" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE EXAMPLE1(COL1 INT);
CREATE TABLE
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1(COL1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
END;
/
CREATE PROCEDURE
gaussdb=# CALL TRANSACTION_EXAMPLE();
 transaction_example
---------------------

(1 row)
```

- Example 2:

  COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.

  COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.

  DDL statements after COMMIT/ROLLBACK can be committed or rolled back.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT, B INT);
 INSERT INTO TEST_COMMIT SELECT 1, 1;
 COMMIT;
       CREATE TABLE TEST_ROLLBACK(A INT, B INT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
    WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 2, 2;
 ROLLBACK;
END;
/
CREATE PROCEDURE
gaussdb=# CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
NOTICE:  table "test_commit" does not exist, skipping
CONTEXT:  SQL statement "DROP TABLE IF EXISTS TEST_COMMIT"
PL/pgSQL function test_commit_insert_exception_rollback() line 3 at SQL statement
 test_commit_insert_exception_rollback
---------------------------------------

(1 row)
```

- Example 3: A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
gaussdb=# BEGIN;
    -- For the definition of TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK, see example 2.
    CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
 test_commit_insert_exception_rollback
---------------------------------------

(1 row)
COMMIT
```

- Example 4: COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
    DROP TABLE IF EXISTS TEST_COMMIT;
    CREATE TABLE TEST_COMMIT(A INT);
    FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
    END LOOP;

10.10 Other Statements

10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, ALTER TABLE cannot be executed on the same table.

For the complete lock operations, see **LOCK**.

10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see **Explicit Cursor**.

10.11 Cursors

10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When a stored procedure uses returns to return a cursor, if JDBC is used to call the stored procedure, the returned cursor is unavailable. Using **out** to output parameters is not affected.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.
- After table data is modified in a stored procedure, the cursor related to the table is started, and the data in the FETCH cursor continues after rollback. In this case, an error is reported.
- When a cursor in a PACKAGE modifies data, if the transaction is rolled back due to an exception, the cursor can no longer be executed.

Cursors are classified into explicit cursors and implicit cursors. Table 10-2 shows the usage conditions of explicit and implicit cursors for different SQL statements.

Table 10-2 Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

Step 1 Define a static cursor: Define a cursor name and its corresponding SELECT statement.

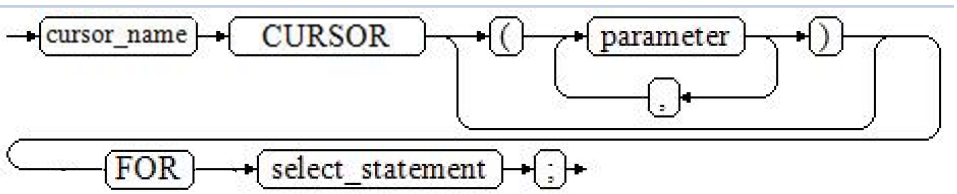
Figure 10-26 shows the syntax diagram for defining a static cursor.

Figure 10-26 static_cursor_define::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

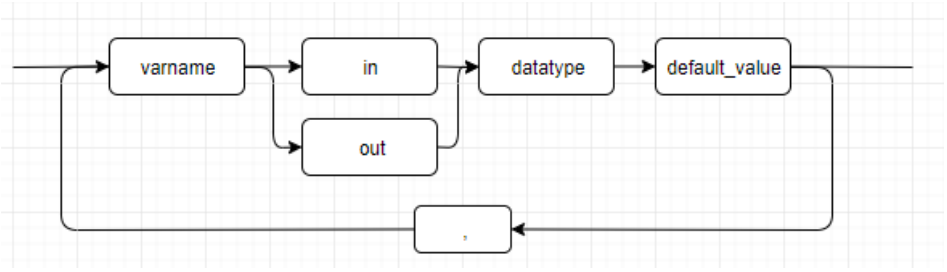
or

Figure 10-27 static_cursor_define::=



Parameters:

- *cursor_name*: defines a cursor name.
- **parameter**: cursor parameter, which can only be an input parameter. The default value can be defined by **:=**, **=**, or **default**. The format is as follows.



- *select_statement*: specifies a query statement.

NOTE

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.
- It is automatically disabled in the exception.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a SELECT statement through OPEN FOR when the cursor is opened.

Figure 10-28 and **Figure 10-29** show the syntax diagrams for defining a dynamic cursor.

Figure 10-28 cursor_typename::=

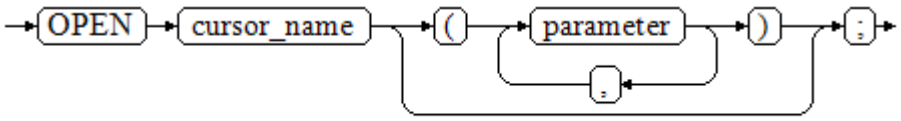
Figure 10-29 dynamic_cursor_define::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Open the static cursor: Execute the SELECT statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the OPEN statement locks the data rows corresponding to the cursor result set in the database table.

Figure 10-30 shows the syntax diagram for opening a static cursor.

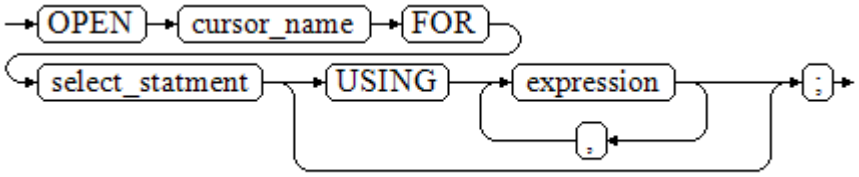
Figure 10-30 open_static_cursor::=



Open the dynamic cursor: Use the OPEN FOR statement to open the dynamic cursor and the SQL statement is dynamically bound.

Figure 10-31 shows the syntax diagrams for opening a dynamic cursor.

Figure 10-31 open_dynamic_cursor::=

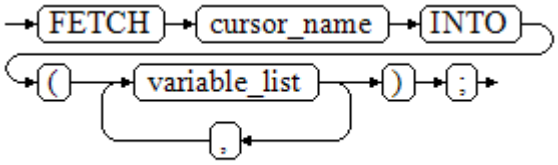


A PL/SQL program cannot use the OPEN statement to repeatedly open a cursor.

Step 3 Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

Figure 10-32 shows the syntax diagrams for fetching cursor data.

Figure 10-32 fetch_cursor::=



Step 4 Process the record.

Step 5 Continue to process until the active set has no record.

Step 6 Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the FETCH statement cannot be used to fetch data anymore. A closed cursor can be reopened by an OPEN statement.

Figure 10-33 shows the syntax diagram for closing a cursor.

Figure 10-33 close_cursor::=

----End

Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```

10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

NOTE

- INSERT, UPDATE, DELETE, and SELECT statements do not need defined cursors.
- In A-compatible mode, if the GUC parameter **behavior_compat_options** is set to **compat_cursor**, implicit cursors are valid across stored procedures.
- After SMP-related GUC parameters are enabled (the GUC parameter **query_dop** is set to a value greater than 1 and **plsql_beta_feature** is set to **enable_plsql_smp**), query statements that do not involve INSERT, UPDATE, and DELETE in cursors can be executed on SMP.
- Implicit cursor attributes are not affected by the commit or rollback operation. When the **behavior_compat_options** is set to **'compat_cursor'**, implicit cursor attributes are affected by savepoint, commit, and rollback operations. Related attributes are reset to default values.

Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

Examples

```
-- Delete all employees in a department from the hr.staffs table. If the department has no employees, delete the department from the hr.department table.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
   DECLARE
   V_DEPTNO NUMBER(4) := 100;
   BEGIN
      DELETE FROM hr.staffs WHERE section_id = V_DEPTNO;
      -- Proceed based on cursor status.
      IF SQL%NOTFOUND THEN
      DELETE FROM hr.department WHERE section_id = V_DEPTNO;
      END IF;
   END;
/
CREATE PROCEDURE
gaussdb=# CALL proc_cursor3();
 proc_cursor3
--------------

(1 row)

-- Drop the stored procedure and the temporary table.
gaussdb=# DROP PROCEDURE proc_cursor3;
DROP PROCEDURE
-- If SELECT implicit cursors need to be executed concurrently, enable the following GUC parameters:
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SET query_dop=4;
SET
gaussdb=# SET sql_beta_feature= 'enable_plsql_smp';

-- Select the name of the employee whose ID is 1 from the employee table hr.staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE prc_cursor_smp()
AS
    name varchar(20);
BEGIN
   SELECT first_name FROM hr.staffs WHERE staff_id = 1 INTO name;
   dbe_output.print_line('result is: '|| name);
END;
/
CREATE PROCEDURE
-- Execute the stored procedure.
gaussdb=# CALL prc_cursor_smp();
result is: Tom
 prc_cursor_smp
----------------

(1 row)
```

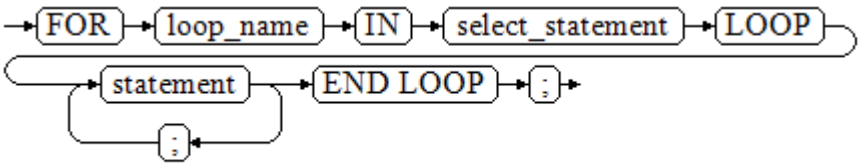
10.11.4 Cursor Loop

Use of cursors in WHILE and LOOP statements is called a cursor loop. Generally, OPEN, FETCH, and CLOSE statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

Syntax

Figure 10-34 shows the syntax diagram of the FOR AS loop.

Figure 10-34 FOR_AS_loop::=



Precautions

- The UPDATE operation for the queried table is not allowed in the loop statement.
- The variable *loop_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select_statement*. The value of *loop_name* is the query result of *select_statement*.
- The specific type of the *loop_name* variable is not parsed during compilation. If the specific type needs to be parsed (for example, *loop_name* is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported. To parse the specific type of a variable, set **behavior_compat_options** to **allow_procedure_compile_check**.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- You can enable the SMP-related GUC parameter (set the GUC parameter **query_dop** to a value greater than 1 and **plsql_beta_feature** to **'enable_plsql_smp'**) so that the cursor loop can be executed on the SMP.

Examples

```
-- If cursors need to be executed cyclically and concurrently, enable the following GUC parameters:
gaussdb=# SET query_dop=4;
SET
gaussdb=# SET sql_beta_feature='enable_plsql_smp';
SET
gaussdb=# BEGIN
FOR ROW_TRANS IN
        SELECT first_name FROM hr.staffs
    LOOP
        DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
    END LOOP;
END;
/
Tom
ANONYMOUS BLOCK EXECUTE

-- Create a table.

10.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.12.1 Basic Interfaces

10.12.1.1 PKG_SERVICE

Table 10-3 lists all APIs supported by the **PKG_SERVICE** package.

Table 10-3 PKG_SERVICE

API	Description
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE	Checks whether a context is registered.
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS	Deregisters all registered contexts.
PKG_SERVICE.SQL_REGISTER_CONTEXT	Registers a context.
PKG_SERVICE.SQL_UNREGISTER_CONTEXT	Deregisters a context.
PKG_SERVICE.SQL_SET_SQL	Sets an SQL statement for a context. Currently, only the SELECT statement is supported.
PKG_SERVICE.SQL_RUN	Executes the configured SQL statement on a context.
PKG_SERVICE.SQL_NEXT_ROW	Reads the next row of data in a context.
PKG_SERVICE.SQL_GET_VALUE	Reads a dynamically defined column value in a context.
PKG_SERVICE.SQL_SET_RESULT_TYPE	Dynamically defines a column of a context based on the type OID.
PKG_SERVICE.JOB_CANCEL	Removes a scheduled job by task ID.
PKG_SERVICE.JOB_FINISH	Disables or enables scheduled job execution.
PKG_SERVICE.JOB_SUBMIT	Commits a scheduled job. Job ID can be automatically generated by the system or specified manually.
PKG_SERVICE.JOB_UPDATE	Modifies user-defined attributes of a scheduled job, including the job content, next-execution time, and execution interval.
PKG_SERVICE.SUBMIT_ON_NODES	Commits a job to all nodes. The job ID is automatically generated by the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_SERVICE.ISUBMIT_ON_NODES	Commits a job to all nodes. The job ID is specified by the user.
PKG_SERVICE.SQL_GET_ARRAY_RESULT	Obtains the array value returned in the context.
PKG_SERVICE.SQL_GET_VARIABLE_RESULT	Obtains the column value returned in the context.

- PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE

  This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE function is as follows:

  ```
  PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
   context_id     IN INTEGER
  )
  RETURN BOOLEAN;
  ```

  Table 10-4 PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE API parameters

Parameter	Description
context_id	ID of the context to be queried

- PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS

  This function cancels all contexts.

  The prototype of the PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS function is as follows:

  ```
  PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
  )
  RETURN VOID;
  ```

- PKG_SERVICE.SQL_REGISTER_CONTEXT

  This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

  The prototype of the PKG_SERVICE.SQL_REGISTER_CONTEXT function is as follows:

  ```
  DBE_SQL.REGISTER_CONTEXT(
  )
  RETURN INTEGER;
  ```

- PKG_SERVICE.SQL_UNREGISTER_CONTEXT

  This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the PKG_SERVICE.SQL_UNREGISTER_CONTEXT function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
 context_id     IN INTEGER
)
RETURN INTEGER;
```

Table 10-5 PKG_SERVICE.SQL_UNREGISTER_CONTEXT API parameters

Parameter	Description
context_id	ID of the context to be closed.

- PKG_SERVICE.SQL_SET_SQL

  This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the SELECT query statement can be parsed. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

  The prototype of the PKG_SERVICE.SQL_SET_SQL function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id     IN INTEGER,
query_string   IN TEXT,
language_flag  IN INTEGER
)
RETURN BOOLEAN;
```

Table 10-6 PKG_SERVICE.SQL_SET_SQL API parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.
query_string	Query statement to be parsed.
language_flag	Version language number, which specifies the behavior of different versions. • **1**: incompatible version. • **2**: version in A-compatible mode.

- PKG_SERVICE.SQL_RUN

  This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the SELECT query statement can be executed.

  The prototype of the PKG_SERVICE.SQL_RUN function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-7 PKG_SERVICE.SQL_RUN API parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.

- PKG_SERVICE.SQL_NEXT_ROW

  This function returns the number of data rows returned after the SQL statement is executed. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the PKG_SERVICE.SQL_NEXT_ROW function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 10-8 PKG_SERVICE.SQL_NEXT_ROW API parameters

Parameter	Description
context_id	ID of the context to be executed

- PKG_SERVICE.SQL_GET_VALUE

  This function returns the context element value in a specified position of a context and accesses the data obtained by PKG_SERVICE.SQL_NEXT_ROW.

  The prototype of the PKG_SERVICE.SQL_GET_VALUE function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id          IN    INTEGER,
pos                 IN    INTEGER,
col_type            IN    ANYELEMENT
)
RETURN ANYELEMENT;
```

Table 10-9 PKG_SERVICE.SQL_GET_VALUE API parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
col_type	Variable of any type, which defines the return value type of columns.

- PKG_SERVICE.SQL_SET_RESULT_TYPE

  This function defines columns returned from a given context and can be used only for contexts defined by SELECT. The defined columns are identified by the relative positions in the query list. The prototype of PKG_SERVICE.SQL_SET_RESULT_TYPE is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id     IN INTEGER,
pos            IN INTEGER,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
coltype_oid    IN ANYELEMENT,
maxsize        IN INTEGER
)
RETURN INTEGER;
```

Table 10-10 PKG_SERVICE.SQL_SET_RESULT_TYPE API parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column

- PKG_SERVICE.JOB_CANCEL

  The stored procedure CANCEL deletes a specified task.

  The prototype of the PKG_SERVICE.JOB_CANCEL function is as follows:

  ```
  PKG_SERVICE.JOB_CANCEL(
  id  IN  INTEGER);
  ```

  Table 10-11 PKG_SERVICE.JOB_CANCEL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.

- PKG_SERVICE.JOB_FINISH

  The stored procedure FINISH disables or enables a scheduled job.

  The prototype of the PKG_SERVICE.JOB_FINISH function is as follows:

  ```
  PKG_SERVICE.JOB_FINISH(
  id         IN   INTEGER,
  broken     IN   BOOLEAN,
  next_time  IN   TIMESTAMP  DEFAULT  sysdate);
  ```

  Table 10-12 PKG_SERVICE.JOB_FINISH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
broken	boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- PKG_SERVICE.JOB_SUBMIT

  The stored procedure JOB_SUBMIT commits a scheduled job provided by the system.

  The prototype of the PKG_SERVICE.JOB_SUBMIT function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id           IN  BIGINT,
content      IN  TEXT,
next_time    IN  TIMESTAMP DEFAULT sysdate,
interval_time IN  TEXT  DEFAULT 'null',
job          OUT  INTEGER);
```

  NOTE

  When a scheduled job is created, the system binds the current database and the username to the job by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx;** before the SQL statement.

Table 10-13 PKG_SERVICE.JOB_SUBMIT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID. If the input ID is **NULL**, a job ID is generated internally.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	text	IN	No	Specifies the SQL statement to be executed. One or multiple DML statements, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **pkg_service.job_submit** is called using **select**, this parameter can be omitted.

- PKG_SERVICE.JOB_UPDATE

  The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the PKG_SERVICE.JOB_UPDATE function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id            IN  BIGINT,
next_time     IN  TIMESTAMP,
interval_time IN  TEXT,
content       IN  TEXT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-14 PKG_SERVICE.JOB_UPDATE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.

Example:

```
CREATE TABLE test_table(a int);
CREATE TABLE

CREATE OR REPLACE PROCEDURE test_job(a in int) IS
BEGIN
INSERT INTO test_table VALUES(a);
COMMIT;
END;
/
CREATE PROCEDURE

--PKG_SERVICE.JOB_SUBMIT
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call test_job(1);', to_date('20180101','yyyymmdd'),'sysdate
+1');
 job_submit
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

(1 row)

--PKG_SERVICE.JOB_CANCEL
CALL PKG_SERVICE.JOB_CANCEL(101);
 job_cancel
------------

(1 row)

DROP TABLE test_table;
DROP TABLE
```

- PKG_SERVICE.SUBMIT_ON_NODES

  Creates a scheduled job on a node. Only SYSADMIN and MONADMIN have this permission.

  The prototype of the PKG_SERVICE.SUBMIT_ON_NODES function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name    IN   NAME,
database     IN   NAME,
what         IN   TEXT,
next_date    IN   TIMESTAMP WITHOUT TIME ZONE,
job_interval IN   TEXT,
job          OUT  INTEGER);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-15 PKG_SERVICE.SUBMIT_ON_NODES API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
node_name	text	IN	No	Job execution node. Currently, the value can only be **'ALL_NODE'**, indicating that the job is executed on all nodes.
database	text	IN	No	Database used by a database instance job. When the node type is **'ALL_NODE'**, the value can only be **'postgres'**.
what	text	IN	No	Specifies the SQL statement to be executed. One or multiple DML statements, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
job_interval	text	IN	No	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **NULL**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When dbms.submit_on_nodes is called using the SELECT statement, this parameter can be omitted.

Example:

```
SELECT pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
 submit_on_nodes
-----------------
           25376
(1 row)
```

- PKG_SERVICE.ISUBMIT_ON_NODES

  ISUBMIT_ON_NODES has the same syntax function as SUBMIT_ON_NODES, but the first parameter of ISUBMIT_ON_NODES is an input parameter, that is,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a specified task ID. In contrast, that last parameter of ISUBMIT_ON_NODES is an output parameter, indicating the task ID automatically generated by the system. Only SYSADMIN and MONADMIN have this permission.

- PKG_SERVICE.SQL_GET_ARRAY_RESULT

  This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

  The prototype of the PKG_SERVICE.SQL_GET_ARRAY_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
    context_id in int,
    pos in VARCHAR2,
    column_value inout anyarray,
    result_type in anyelement
);
```

Table 10-16 PKG_SERVICE.SQL_GET_ARRAY_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
column_value	Return value
result_type	Return type

- PKG_SERVICE.SQL_GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

  The prototype of the PKG_SERVICE.SQL_GET_VARIABLE_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
    context_id in int,
    pos in VARCHAR2,
    result_type in anyelement
)
RETURNS anyelement;
```

Table 10-17 PKG_SERVICE.SQL_GET_VARIABLE_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
result_type	Return type

10.12.1.2 PKG_UTIL

Table 10-18 lists all APIs supported by the PKG_UTIL package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-18 PKG_UTIL

API	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.
PKG_UTIL.LOB_MATCH	Returns the position of the *M*th occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.LOB_GET_LENGTH	Obtains and returns the specified length of a LOB.
PKG_UTIL.LOB_READ_HUGE	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
PKG_UTIL.LOB_WRITEAPPEND_HUGE	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.
PKG_UTIL.LOB_APPEND_HUGE	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
PKG_UTIL.READ_BFILE_TO_BLOB	Loads the source BFILE file to the target BLOB and returns the target object.
PKG_UTIL.LOB_COPY_HUGE	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.BLOB_RESET	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
PKG_UTIL.CLOB_RESET	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
PKG_UTIL.LOADBLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOADCLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.
PKG_UTIL.BFILE_GET_LENGTH	Obtains and returns the specified length of a BFILE file.
PKG_UTIL.BFILE_OPEN	Opens a BFILE file and returns its file descriptor.
PKG_UTIL.BFILE_CLOSE	Closes a BFILE file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.LOB_WRITE_HUGE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of RAW data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts VARCHAR2 data to RAW data.
•PKG_UTIL.RAW_CAST_FROM_...	Converts binary integers to RAW data.
•PKG_UTIL.RAW_CAST_TO_BI...	Converts RAW data to binary integers.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to **mv** in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
PKG_UTIL.APP_READ_CLIENT_INFO	Reads the client information.
PKG_UTIL.APP_SET_CLIENT_INFO	Sets the client information.
PKG_UTIL.LOB_CONVERTTOBLOB	Converts the CLOB type to the BLOB type.
PKG_UTIL.LOB_CONVERTTOCLOB	Converts the BLOB type to the CLOB type.
PKG_UTIL.LOB_RAWTOTEXT	Converts the raw type to the TEXT type.
PKG_UTIL.LOB_RESET	Clears data of the LOB type.
PKG_UTIL.LOB_TEXTTORAW	Converts the TEXT type to the raw type.
PKG_UTIL.LOB_RAWTOTEXT	Converts the raw type to the TEXT type.
PKG_UTIL.LOB_WRITE	Writes data to the LOB type.
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY	Calculates the difference between two character strings.
PKG_UTIL.RAW_CAST_TO_VARCHAR2	Converts the raw type to the VARCHAR2 type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.SESSION_CLEAR_CONTEXT	Clears the attribute values in **session_context**.
PKG_UTIL.SESSION_SEARCH_CONTEXT	Searches for an attribute value.
PKG_UTIL.SESSION_SET_CONTEXT	Sets an attribute value.
PKG_UTIL.UTILITY_FORMAT_CALL_STACK	Displays the call stack of a stored procedure.
PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE	Displays the error stack of a stored procedure.
PKG_UTIL.UTILITY_FORMAT_ERROR_STACK	Displays the error information about a stored procedure.
PKG_UTIL.UTILITY_GET_TIME	Displays the Unix timestamp of the system.
PKG_UTIL.UTILITY_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the PL/SQL object is returned and the recompilation stops. This package has been discarded. **pkg_util.gs_compile_schema** is recommended.
PKG_UTIL.GS_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit. When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details about the error code description, see "Standard SQL Error Codes" in *Error Code Reference*.
PKG_UTIL.APP_SET_MODULE	Sets the value of a module.
PKG_UTIL.APP_READ_MODULE	Reads the value of a module.
PKG_UTIL.APP_SET_ACTION	Sets the value of an action.
PKG_UTIL.APP_READ_ACTION	Reads the value of an action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.MODIFY_PACKAGE_STATE	Modifies the PL/SQL status of the current session and releases all memory associated with each previously running PL/SQL program from the session.

- PKG_UTIL.LOB_GET_LENGTH

  Obtains the length of the input data.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob       IN   CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob       IN   BLOB
)
RETURN INTEGER;
```

  Table 10-19 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.LOB_READ

  Reads an object and returns the specified part.

  The prototype of the PKG_UTIL.LOB_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob       IN   ANYELEMENT,
len       IN   INT,
start     IN   INT,
mode      IN   INT
)
RETURN ANYELEMENT
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-20 PKG_UTIL.LOB_READ parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB / BLOB	IN	No	Specifies CLOB or BLOB data.
len	INT	IN	No	Specifies the length of the returned result.
start	INT	IN	No	Specifies the offset to the first character.
mode	INT	IN	No	Specifies the type of the read operation. **0** indicates **READ**, **1** indicates **TRIM**, and **2** indicates **SUBSTR**.

- PKG_UTIL.LOB_WRITE

  Writes the source object to the target object based on the specified parameters and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   BLOB,
src_lob     IN      RAW
len         IN      INT,
start_pos   IN      BIGINT
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   CLOB,
src_lob     IN      VARCHAR2
len         IN      INT,
start_pos       IN      BIGINT
)
RETURN CLOB;
```

Table 10-21 PKG_UTIL.LOB_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB / BLOB	INOUT	No	Specifies the target object that data will be written to.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	CLOB/BLOB	IN	No	Specifies the source object to be written.
len	INT	IN	No	Specifies the write length of the source object.
start_pos	BIGINT	IN	No	Specifies the write start position of the target object.

- PKG_UTIL.LOB_APPEND

  Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

  The prototype of the PKG_UTIL.LOB_APPEND function is as follows:

```
PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   BLOB,
src_lob     IN      BLOB,
len         IN      INT DEFAULT NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   CLOB,
src_lob     IN      CLOB,
len         IN      INT DEFAULT NULL
)
RETURN CLOB;
```

Table 10-22 PKG_UTIL.LOB_APPEND parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Specifies the target BLOB/CLOB that data will be written to.
src_lob	BLOB/CLOB	IN	No	Specifies the source BLOB/CLOB to be written.
len	INT	IN	Yes	Length read from *src* and appended to *dest*. The default value is null, indicating that all content of *src* is read and appended to *dest*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.LOB_COMPARE

  Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **–1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

  The prototype of the PKG_UTIL.LOB_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1        IN   ANYELEMENT,
lob2        IN   ANYELEMENT,
len         IN   INT DEFAULT 1073741771,
start_pos1      IN   INT DEFAULT 1,
start_pos2      IN   INT DEFAULT 1
)
RETURN INTEGER;
```

  Table 10-23 PKG_UTIL.LOB_COMPARE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob1	CLOB/ BLOB	IN	No	Indicates the character string for comparison.
lob2	CLOB/ BLOB	IN	No	Indicates the character string for comparison.
len	INT	IN	No	Indicates the length to be compared.
start_pos1	INT	IN	No	Specifies the start offset of **lob1**.
start_pos2	INT	IN	No	Specifies the start offset of **lob2**.

- PKG_UTIL.LOB_MATCH

  Returns the position where a pattern is displayed in a LOB for the *match_n*th time.

  The prototype of the PKG_UTIL.LOB_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob         IN   ANYELEMENT,
pattern      IN   ANYELEMENT,
start       IN   INT,
match_nth    IN   INT DEFAULT 1
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-24 PKG_UTIL.LOB_MATCH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the character string for comparison.
pattern	CLOB/BLOB	IN	No	Specifies the pattern to be matched.
start	INT	IN	No	Specifies the start position for LOB comparison.
match_nth	INT	IN	No	Specifies the matching times.

- PKG_UTIL.LOB_RESET

  Clears a character string and resets the string to the value of **value**.

  The prototype of the PKG_UTIL.LOB_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob         INOUT   BLOB,
len         INOUT   INT,
start       IN   INT DEFAULT 1,
value        IN   INT DEFAULT 0
)
RETURN RECORD;
```

Table 10-25 PKG_UTIL.LOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	IN	No	Indicates the character string for reset.
len	INT	IN	No	Specifies the length of the string to be reset.
start	INT	IN	No	Specifies the start position for reset.
value	INT	IN	Yes	Sets characters. Default value: **'0'**

- PKG_UTIL.LOB_GET_LENGTH

  Obtains and returns the specified length of a LOB.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
   lob IN BLOB)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
RETURN BIGINT;

PKG_UTIL.LOB_GET_LENGTH(
   lob IN CLOB)
RETURN BIGINT;
```

Table 10-26 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/CLOB	IN	No	LOB type

- PKG_UTIL.LOB_READ_HUGE

  Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

  The prototype of the PKG_UTIL.LOB_READ_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
   lob       IN CLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   lob       IN BLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   fd        IN INTEGER,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;
```

Table 10-27 PKG_UTIL.LOB_READ_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/CLOB/INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode (**0**: read, **1**: trim, **2**: substr).

- PKG_UTIL.LOB_WRITEAPPEND_HUGE

  Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITEAPPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT CLOB,
   len      IN    INTEGER,
   src_lob  IN    VARCHAR2
)RETURN CLOB;

PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT BLOB,
   len      IN    INTEGER,
   src_lob  IN    RAW
)RETURN BLOB;
```

  Table 10-28 PKG_UTIL.LOB_WRITEAPPEND_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is **NULL**, the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.LOB_APPEND_HUGE

  Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

  The prototype of the PKG_UTIL.LOB_APPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT BLOB,
   src_lob  IN    BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT CLOB,
   src_lob  IN    CLOB)
RETURN CLOB;
```

  Table 10-29 PKG_UTIL.LOB_APPEND_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- PKG_UTIL.READ_BFILE_TO_BLOB

  Loads the source BFILE file to the target BLOB and returns the target object.

  The prototype of the PKG_UTIL.READ_BFILE_TO_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
   fd IN INTEGER
)RETURN BLOB;
```

  Table 10-30 PKG_UTIL.READ_BFILE_TO_BLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	Source BFILE file to be read.

- PKG_UTIL.LOB_COPY_HUGE

  Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_COPY_HUGE function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN CLOB;
```

Table 10-31 PKG_UTIL.LOB_COPY_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- PKG_UTIL.BLOB_RESET

  Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

  The prototype of the PKG_UTIL.BLOB_RESET function is as follows:

```
PKG_UTIL.BLOB_RESET(
   lob       INOUT BLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1,
   value     IN    INTEGER DEFAULT 0
)RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-32 PKG_UTIL.BLOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: **'0'**.

- PKG_UTIL.CLOB_RESET

  Sets a piece of data to spaces.

  The prototype of the PKG_UTIL.CLOB_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
   lob       INOUT CLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1
)RETURN RECORD;
```

Table 10-33 PKG_UTIL.CLOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is **1**.

- PKG_UTIL.LOADBLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
   dest_lob     INOUT  BLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

Table 10-34 PKG_UTIL.LOADBLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOADCLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

  The prototype of the PKG_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
   dest_lob     INOUT  CLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-35 PKG_UTIL.LOADCLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOBLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

  The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
   dest_lob    INOUT  BLOB,
   src_clob    IN     CLOB,
   amount      IN     BIGINT,
   dest_offset INOUT  BIGINT,
   src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-36 PKG_UTIL.LOB_CONVERTTOBLOB_HUGE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in characters.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOCLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

  The prototype of the PKG_UTIL.LOB_CONVERTTOCLOB_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
   dest_lob    INOUT  CLOB,
   src_blob    IN     BLOB,
   amount      IN     BIGINT,
   dest_offset INOUT  BIGINT,
   src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-37 PKG_UTIL.LOB_CONVERTTOCLOB_HUGE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in bytes.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.BFILE_GET_LENGTH

  Obtains and returns the specified length of a BFILE file.

  The prototype of the PKG_UTIL.BFILE_GET_LENGTH function is as follows:

  ```
  PKG_UTIL.BFILE_GET_LENGTH(
     fd INTEGER
  )RETURN BIGINT;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-38 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG_UTIL.BFILE_OPEN

  Opens a BFILE file and returns its file descriptor.

  The prototype of the PKG_UTIL.BFILE_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
    file_name TEXT,
    open_mode TEXT)
RETURN INTEGER;
```

Table 10-39 PKG_UTIL.BFILE_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to **r**, that is, the read mode.

- PKG_UTIL.BFILE_CLOSE

  Closes a BFILE file.

  The prototype of the PKG_UTIL.BFILE_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
    fd INTEGER)
RETURN bool;
```

Table 10-40 PKG_UTIL.BFILE_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG_UTIL.LOB_WRITE_HUGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG_UTIL.LOB_WRITE_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
   dest_lob  INOUT BLOB,
   len       IN INTEGER,
   start_pos IN BIGINT,
   src_lob   IN RAW
)RETURN BLOB;

PKG_UTIL.LOB_WRITE_HUGE(
   dest_lob  INOUT CLOB,
   len       IN INTEGER,
   start_pos IN BIGINT,
   src_lob   IN VARCHAR2
)RETURN CLOB;
```

Table 10-41 PKG_UTIL.LOB_WRITE_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
start_pos	BIGINT	IN	No	Offset position for writing data to *dest_lob*
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG_UTIL.IO_PRINT

  Outputs a string.

  The prototype of the PKG_UTIL.IO_PRINT function is as follows:

  ```
  PKG_UTIL.IO_PRINT(
  format       IN   TEXT,
  is_one_line  IN   BOOLEAN
  )
  RETURN void;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-42 PKG_UTIL.IO_PRINT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	TEXT	IN	No	Indicates the character string to be output.
is_one_line	BOOLEAN	IN	No	Specifies whether to output the string as a line.

- PKG_UTIL.RAW_GET_LENGTH

  Obtains the length of RAW data.

  The prototype of the PKG_UTIL.RAW_GET_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value       IN   RAW
)
RETURN INTEGER;
```

Table 10-43 PKG_UTIL.RAW_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	RAW	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.RAW_CAST_FROM_VARCHAR2

  Converts VARCHAR2 data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str       IN   VARCHAR2
)
RETURN raw;
```

Table 10-44 PKG_UTIL.RAW_CAST_FROM_VARCHAR2 parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	VARCHAR2	IN	No	Indicates the source data to be converted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER

  Converts BIGINT data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER(
value       IN   BIGINT,
endianess   IN   INTEGER
)
RETURN RAW;
```

  Table 10-45 PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	BIGINT	IN	No	Indicates the source data to be converted
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER

  Converts RAW data into BINARY_INTEGER.

  The prototype of the PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER(
value       IN   RAW,
endianess   IN   INTEGER
)
RETURN INTEGER;
```

  Table 10-46 PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	RAW	IN	No	Indicates the source data to be converted
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RANDOM_SET_SEED

  Sets a random seed.

  The prototype of the PKG_UTIL.RANDOM_SET_SEED function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_UTIL.RANDOM_SET_SEED(
seed        IN   INT
)
RETURN integer;
```

Table 10-47 PKG_UTIL.RANDOM_SET_SEED parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	INT	IN	No	Sets a random seed.

- PKG_UTIL.RANDOM_GET_VALUE

  Returns a 15-digit random number ranging from 0 to 1.

  The prototype of the PKG_UTIL.RANDOM_GET_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN NUMERIC;
```

- PKG_UTIL.FILE_SET_DIRNAME

  Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

  The prototype of the PKG_UTIL.FILE_SET_DIRNAME function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir  IN  TEXT
)
RETURN BOOL
```

Table 10-48 PKG_UTIL.FILE_SET_DIRNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dirname	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. Functions that involve **location** as parameters also comply with this rule.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.FILE_OPEN

  Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

  The prototype of the PKG_UTIL.FILE_OPEN function is as follows:

  ```
  PKG_UTIL.FILE_OPEN(
  file_name    IN  TEXT,
  open_mode    IN  INTEGER)
  ```

  Table 10-49 PKG_UTIL.FILE_OPEN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
open_mode	INTEGER	IN	No	File opening mode, including **r** (read), **w** (write), and **a** (append). **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_SET_MAX_LINE_SIZE

  Sets the maximum length of a line to be written to a file.

  The prototype of the PKG_UTIL.FILE_SET_MAX_LINE_SIZE function is as follows:

  ```
  PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
  max_line_size in INTEGER)
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-50 PKG_UTIL.FILE_SET_MAX_LINE_SIZE parameters

Parameter	Type	Input/OutputParameter	Can BeEmpty	Description
max_line_size	INTEGER	IN	No	Maximum number of characters in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- PKG_UTIL.FILE_IS_CLOSE

  Checks whether a file handle is closed.

  The prototype of the PKG_UTIL.FILE_IS_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file in INTEGER
)
RETURN BOOL
```

Table 10-51 PKG_UTIL.FILE_IS_CLOSE parameters

Parameter	Type	Input/OutputParameter	Can BeEmpty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_READ

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file     IN   INTEGER,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
buffer   OUT  TEXT,
len      IN   BIGINT DEFAULT 1024)
```

Table 10-52 PKG_UTIL.FILE_READ parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	TEXT	IN	No	Buffer used to receive data
len	BIGINT	IN	Yes	Number of bytes read from a file

- PKG_UTIL.FILE_READLINE

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(
file    IN  INTEGER,
buffer  OUT TEXT,
len     IN  INTEGER DEFAULT NULL)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-53 PKG_UTIL.FILE_READLINE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	TEXT	IN	No	Buffer used to receive data
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- PKG_UTIL.FILE_WRITE

  Writes the data specified in the buffer to a file.

  The prototype of the PKG_UTIL.FILE_WRITE function is as follows:

  ```
  PKG_UTIL.FILE_WRITE(
  file IN INTEGER,
  buffer IN TEXT
  )
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-54 PKG_UTIL.FILE_WRITE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle
buffer	TEXT	IN	No	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by PUT operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_NEWLINE

  Writes a line terminator to an open file. The line terminator is related to the platform.

  The prototype of the PKG_UTIL.FILE_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file IN INTEGER
)
RETURN BOOL
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-55 PKG_UTIL.FILE_NEWLINE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_WRITELINE

  Writes a line to a file.

  The prototype of the PKG_UTIL.FILE_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file IN INTEGER,
buffer IN TEXT
)
RETURN BOOL
```

Table 10-56 PKG_UTIL.FILE_WRITELINE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle
buffer	TEXT	IN	No	Content to be written.

- PKG_UTIL.FILE_READ_RAW

  Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.FILE_READ_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file      IN INTEGER,
length    IN INTEGER DEFAULT NULL
)
RETURN raw
```

Table 10-57 PKG_UTIL.FILE_READ_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
length	INTEGER	IN	Yes	Length of the data to be read. The default value is **NULL**. By default, all data in the file is read. The maximum size is 1 GB.

- PKG_UTIL.FILE_WRITE_RAW

  Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

  The prototype of the PKG_UTIL.FILE_WRITE_RAW function is as follows:

  ```
  PKG_UTIL.FILE_WRITE_RAW(
  file IN INTEGER,
  r    IN RAW
  )
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-58 PKG_UTIL.FILE_NEWLINE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle
r	RAW	IN	Yes	Data to be written to the file **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_FLUSH

  Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

  The prototype of the PKG_UTIL.FILE_FLUSH function is as follows:

  ```
  PKG_UTIL.FILE_FLUSH (
  file IN INTEGER
  )
  RETURN VOID
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-59 PKG_UTIL.FILE_FLUSH parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_CLOSE

  Closes an open file handle.

  The prototype of the PKG_UTIL.FILE_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file IN INTEGER
)
RETURN BOOL
```

Table 10-60 PKG_UTIL.FILE_CLOSE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_REMOVE

  Deletes a disk file. To perform this operation, you must have required permissions.

  The prototype of the PKG_UTIL.FILE_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(
file_name IN TEXT
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN VOID
```

Table 10-61 PKG_UTIL.FILE_REMOVE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
filen_ame	TEXT	IN	No	Name of the file to be deleted

- PKG_UTIL.FILE_RENAME

  Renames a file on the disk, similar to **mv** in Unix.

  The prototype of the PKG_UTIL.FILE_RENAME function is as follows:

  ```
  PKG_UTIL.FILE_RENAME(
  src_dir IN TEXT,
  src_file_name IN TEXT,
  dest_dir IN TEXT,
  dest_file_name IN TEXT,
  overwrite BOOLEAN DEFAULT FALSE)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-62 PKG_UTIL.FILE_RENAME parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_dir	TEXT	IN	Yes	Source file directory (case-sensitive) **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	Yes	Source file name
dest_dir	TEXT	IN	Yes	Target file directory (case-sensitive) **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	Yes	Target file name
overwrite	BOOLEAN	IN	No	The default value is **false**. If a file with the same name exists in the destination directory, the file will not be rewritten.

- PKG_UTIL.FILE_SIZE

  Returns the size of a specified file.

  The prototype of the PKG_UTIL.FILE_SIZE function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
BIGINT PKG_UTIL.FILE_SIZE(
file_name IN TEXT
)RETURN BIGINT
```

Table 10-63 PKG_UTIL.FILE_SIZE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_BLOCK_SIZE

  Returns the number of blocks contained in a specified file.

  The prototype of the PKG_UTIL.FILE_BLOCK_SIZE function is as follows:

  ```
  BIGINT PKG_UTIL.FILE_BLOCK_SIZE(
  file_name IN TEXT
  )RETURN BIGINT
  ```

  Table 10-64 PKG_UTIL.FILE_BLOCK_SIZE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_EXISTS

  Checks whether a file exists.

  The prototype of the PKG_UTIL.FILE_EXISTS function is as follows:

  ```
  PKG_UTIL.FILE_EXISTS(
  file_name IN TEXT
  )
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-65 PKG_UTIL.FILE_EXISTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_GETPOS

  Specifies the offset of a returned file, in bytes.

  The prototype of the PKG_UTIL.FILE_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file IN INTEGER
)
RETURN BIGINT
```

Table 10-66 PKG_UTIL.FILE_GETPOS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the PKG_UTIL.FILE_SEEK function is as follows:

```
VOID PKG_UTIL.FILE_SEEK(
file IN INTEGER,
start IN BIGINT
)
RETURN VOID
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-67 PKG_UTIL.FILE_SEEK parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
start	BIGINT	IN	No	File offset, in bytes.

- PKG_UTIL.FILE_CLOSE_ALL

  Closes all file handles opened in a session.

  The prototype of the PKG_UTIL.FILE_CLOSE_ALL function is as follows:

  ```
  PKG_UTIL.FILE_CLOSE_ALL(
  )
  RETURN VOID
  ```

  Table 10-68 PKG_UTIL.FILE_CLOSE_ALL parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
None	None	None	None	None

- PKG_UTIL.EXCEPTION_REPORT_ERROR

  Throws an exception.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.EXCEPTION_REPORT_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code INTEGER,
log TEXT,
flag BOOLEAN DEFAULT FALSE
)
RETURN INTEGER
```

Table 10-69 PKG_UTIL.EXCEPTION_REPORT_ERROR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
code	INTEGER	IN	No	Error code displayed when a running exception occurs.
log	TEXT	IN	No	Log information displayed when a running exception occurs.
flag	BOOLEAN	IN	Yes	Reserved. The default value is **false**.

- PKG_UTIL.APP_READ_CLIENT_INFO

  Reads the client information.

  The prototype of the PKG_UTIL.app_read_client_info function is as follows:

  ```
  PKG_UTIL.app_read_client_info(
  OUT buffer TEXT
  )RETURN TEXT
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-70 PKG_UTIL.APP_READ_CLIENT_INFO API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	IN	No	Client information returned.

- PKG_UTIL.APP_SET_CLIENT_INFO

  Sets the client information.

  The prototype of the PKG_UTIL.APP_SET_CLIENT_INFO function is as follows:

```
PKG_UTIL.APP_SET_CLIENT_INFO(
str TEXT
)
```

Table 10-71 PKG_UTIL.APP_SET_CLIENT_INFO API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str	TEXT	IN	No	Client information to be set.

- PKG_UTIL.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. **amount** indicates the conversion length.

  The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob BLOB,
src_clob CLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)RETURN RAW
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-72 PKG_UTIL.LOB_CONVERTTOBLOB API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	BLOB	IN	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.LOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. **amount** indicates the conversion length.

  The prototype of the PKG_UTIL.lob_converttoclob function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob CLOB,
src_blob BLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)RETURN TEXT
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-73 PKG_UTIL.LOB_CONVERTTOCLOB API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	CLOB	IN	No	Target LOB.
src_blob	BLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.LOB_TEXTTORAW

  Converts TEXT data into RAW data.

  The prototype of the PKG_UTIL.LOB_TEXTTORAW function is as follows:

  ```
  PKG_UTIL.LOB_TEXTTORAW(
  src_lob CLOB
  )
  RETURN RAW
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-74 PKG_UTIL.LOB_TEXTTORAW API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_lob	CLOB	IN	No	LOB to be converted.

- PKG_UTIL.LOB_RAWTOTEXT

  Converts RAW data to TEXT data.

  The prototype of the PKG_UTIL.LOB_RAWTOTEXT function is as follows:

```
PKG_UTIL.LOB_RAWTOTEXT(
src_lob IN BLOB
)
RETURN TEXT
```

Table 10-75 PKG_UTIL.LOB_RAWTOTEXT API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_lob	BLOB	IN	No	LOB to be converted.

- PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY

  Calculates the difference between two character strings.

  The prototype of the PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY function is as follows:

```
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY(
str1 TEXT,
str2 TEXT
)
RETURN INTEGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-76 PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str1	TEXT	IN	No	First character string.
str2	TEXT	IN	No	Second character string.

- PKG_UTIL.RAW_CAST_TO_VARCHAR2

  Converts RAW data into VARCHAR2 data.

  The prototype of the PKG_UTIL.RAW_CAST_TO_VARCHAR2 function is as follows:

  ```
  PKG_UTIL.RAW_CAST_TO_VARCHAR2(
  str RAW
  )
  RETURN VARCHAR2
  ```

  Table 10-77 PKG_UTIL.RAW_CAST_TO_VARCHAR2 API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str	RAW	IN	No	Hexadecimal string

- PKG_UTIL.SESSION_CLEAR_CONTEXT

  Clears the session context.

  The prototype of the PKG_UTIL.SESSION_CLEAR_CONTEXT function is as follows:

  ```
  PKG_UTIL.SESSION_CLEAR_CONTEXT(
  namespace TEXT,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
client_identifier TEXT,
attribute TEXT
)
RETURN INTEGER
```

Table 10-78 PKG_UTIL.SESSION_CLEAR_CONTEXT API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
client_identifier	TEXT	IN	No	Usually the value of this parameter is the same as that of **namespace**. If this parameter is set to **null**, all namespaces are modified by default.
attribute	TEXT	IN	No	Attribute to be cleared.

- PKG_UTIL.SESSION_SEARCH_CONTEXT

  Searches for an attribute value.

  The prototype of the PKG_UTIL.SESSION_SEARCH_CONTEXT function is as follows:

  ```
  PKG_UTIL.SESSION_SEARCH_CONTEXT(
  namespace TEXT,
  attribute TEXT
  )
  RETURN INTEGER
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-79 PKG_UTIL.SESSION_SEARCH_CONTEXT API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute value to be searched for.

- PKG_UTIL.SESSION_SET_CONTEXT

  Sets the attribute value.

  The prototype of the PKG_UTIL.SESSION_SET_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SET_CONTEXT(
namespace TEXT,
attribute TEXT,
value TEXT
)
RETURN INTEGER
```

Table 10-80 PKG_UTIL.SESSION_SET_CONTEXT API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute to be set.
value	TEXT	IN	No	Attribute value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.UTILITY_GET_TIME

  Prints the Unix timestamp.

  The prototype of the PKG_UTIL.UTILITY_GET_TIME function is as follows:

  ```
  PKG_UTIL.UTILITY_GET_TIME()
  RETURN BIGINT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE

  Displays the error stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_STACK

  Displays the error information about a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_STACK()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.UTILITY_COMPILE_SCHEMA function is as follows:

  ```
  PKG_UTIL.UTILITY_COMPILE_SCHEMA (
  schema IN VARCHAR2,
  compile_all IN BOOLEAN DEFAULT TRUE,
  reuse_settings IN BOOLEAN DEFAULT FALSE
  )
  RETURNS VOID
  ```

- PKG_UTIL.GS_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.GS_COMPILE_SCHEMA stored procedure is as follows:

  ```
  PKG_UTIL.GS_COMPILE_SCHEMA (
  schema_name IN VARCHAR2 DEFAULT NULL,
  compile_all IN BOOLEAN DEFAULT FALSE,
  retry_times IN INT DEFAULT 10
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-81 PKG_UTIL.GS_COMPILE_SCHEMA API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
schema_name	VARCHAR2	IN	Yes	Specifies the name of the namespace.
compile_all	BOOLEAN	IN	Yes	Specifies to compile all objects. • **false**: Compile the packages, functions, and stored procedures whose status is **false** in the **pg_object** table. • **true**: Compile all packages, functions, and stored procedures in the **pg_object** table.
retry_times	INT	IN	Yes	Specifies the number of retry times.

- PKG_UTIL.UTILITY_FORMAT_CALL_STACK

  Displays the call stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_CALL_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_CALL_STACK()
  RETURN TEXT
  ```

  Example:

  ```
  -- Delete a schema.
  drop schema if exists pkg_var_test cascade;
  -- Create a schema named pkg_var_test.
  create schema pkg_var_test;
  -- Set the schema and parameters.
  set current_schema = pkg_var_test;
  -- Create a package.
  create or replace package test_pkg as
      referenced_var int;
      unreferenced_var int;
  end test_pkg;
  /
  -- Create a function.
  create or replace function test_func return int
  is
  begin
    return 1;
  end;
  /
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a stored procedure.
create or replace procedure test_proc
is
  proc_var int;
begin
  proc_var := 1;
end;
/
-- Recompile package functions and stored procedures under pkg_var_test.
call pkg_util.utility_compile_schema('pkg_var_test');
Or
call pkg_util.gs_compile_schema(' ',false,2);
-- Delete pkg_var_test.
drop schema if exists pkg_var_test cascade;
```

- PKG_UTIL.APP_SET_MODULE

  Sets the value of a module.

  The prototype of the PKG_UTIL.APP_SET_MODULE stored procedure is as follows:

  ```
  PKG_UTIL.APP_SET_MODULE (
     str TEXT)
  RETURNS VOID
  ```

  Table 10-82 PKG_UTIL.APP_SET_MODULE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
text	TEXT	IN	Yes	Specifies the value of a module to be set.

  Example:

  ```
  CALL PKG_UTIL.APP_SET_MODULE('set module');
   app_set_module
  ----------------

  (1 row)
  ```

- PKG_UTIL.APP_READ_MODULE

  Reads the value of a module.

  The prototype of the PKG_UTIL.APP_READ_MODULE stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_MODULE(
  OUT BUFFER TEXT
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-83 PKG_UTIL.APP_READ_MODULE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	OUT	Yes	Specifies the value of a module to be returned.

Example:

```
DECLARE
    module VARCHAR2(64);
BEGIN
    PKG_UTIL.APP_READ_MODULE(module);
    DBE_OUTPUT.PRINT_LINE(module);
END;
/
set module
ANONYMOUS BLOCK EXECUTE
```

- PKG_UTIL.APP_SET_ACTION

  Sets the value of an action.

  The prototype of the PKG_UTIL.APP_SET_ACTION stored procedure is as follows:

  ```
  PKG_UTIL.APP_SET_ACTION (
     str TEXT)
  RETURNS VOID
  ```

Table 10-84 PKG_UTIL.APP_SET_ACTION API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
text	TEXT	IN	Yes	Specifies the value of an action to be set.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
CALL PKG_UTIL.APP_SET_ACTION('set action');
 app_set_action
----------------

(1 row)
```

- PKG_UTIL.APP_READ_ACTION

  Reads the value of an action.

  The prototype of the PKG_UTIL.APP_READ_ACTION stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_ACTION(
  OUT buffer TEXT
  )
  ```

  Table 10-85 PKG_UTIL.APP_READ_ACTION API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	OUT	Yes	Specifies the value of an action to be returned.

  Example:

  ```
  DECLARE
      action VARCHAR2(64);
  BEGIN
      PKG_UTIL.APP_READ_ACTION(action);
      DBE_OUTPUT.PRINT_LINE(action);
  END;
  /
  set action
  ANONYMOUS BLOCK EXECUTE
  ```

- PKG_UTIL.MODIFY_PACKAGE_STATE

  Modifies the PL/SQL status of the current session.

  The prototype of the PKG_UTIL.MODIFY_PACKAGE_STATE stored procedure is as follows:

  ```
  PKG_UTIL.MODIFY_PACKAGE_STATE (
     flags INT)
  RETURNS VOID
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-86 PKG_UTIL.MODIFY_PACKAGE_STATE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
flags	INT	INT	Yes	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL PKG_UTIL.MODIFY_PACKAGE_STATE(1);
 modify_package_state
----------------------

(1 row)
```

10.12.1.3 DBE_DESCRIBE

For details about the basic interfaces supported by DBE_DESCRIBE, see **Table 1 DBE_DESCRIBE basic interfaces**.

Table 10-87 DBE_DESCRIBE basic interfaces

Interface	Description
DBE_DESCRIBE.GET_PROCEDURE_NAME	This is an internal function and is not recommended. The name of a stored procedure or function is extracted from the original input of a user.
DBE_DESCRIBE.IS_NUMBER_TYPE	This is an internal function and is not recommended. It is used to determine whether the data type is numeric.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_DESCRIBE.GET_PROCEDURE_NAME

  This is an internal function and is not recommended. It is used to extract the name of a stored procedure or function from the original input of a user.

  The prototype of the DBE_DESCRIBE.GET_PROCEDURE_NAME function is as follows:

```
DBE_DESCRIBE.GET_PROCEDURE_NAME(
name IN VARCHAR2)
RETURNS VARCHAR2;
```

  Table 10-88 DBE_DESCRIBE.GET_PROCEDURE_NAME interface parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Entity name.

- DBE_DESCRIBE.IS_NUMBER_TYPE

  This is an internal function and is not recommended. It is used to check whether the type is numeric.

  The prototype of the DBE_DESCRIBE.IS_NUMBER_TYPE function is as follows:

```
DBE_DESCRIBE.IS_NUMBER_TYPE(
type_oid IN INTEGER)
RETURNS BOOLEAN;
```

  Table 10-89 DBE_DESCRIBE.IS_NUMBER_TYPE interface parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
type_oid	INTEGER	IN	Yes	OID of the type.

10.12.1.4 DBE_XML

Table 10-90 lists all APIs supported by DBE_XML.

Table 10-90 DBE_XML parameters

API	Description
DBE_XML.XML_FREE_PARSER	Frees a parser.
DBE_XML.XML_PARSER_GET_DOC	Obtains the parsed document node.
DBE_XML.XML_GET_VALIDATION_MODE	Obtains the validation attribute.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XML.XML_SET_VALIDATION_MODE	Creates a parser instance.
DBE_XML.XML_PARSE_BUFFER	Parses the VARCHAR string.
DBE_XML.XML_PARSE_CLOB	Parses the CLOB string.
DBE_XML.XML_SET_VALIDATION_MODE	Sets the validation attribute.
DBE_XML.XML_DOM_APPEND_CHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XML.XML_DOM_CREATE_ELEMENT	Returns the DOMElement object with the specified name.
DBE_XML.XML_DOM_CREATE_ELEMENT_NS	Returns the DOMElement object with the specified name and namespace.
DBE_XML.XML_DOM_CREATE_TEXT_NODE	Creates and returns a DOMText object.
DBE_XML.XML_DOM_FREE_DOCUMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_ELEMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_NODE	Frees a DOMNode node.
DBE_XML.XML_DOM_FREE_NODELIST	Frees a DOMNodeList node.
DBE_XML.XML_DOM_GET_ATTRIBUTE	Obtains the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_GET_ATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XML.XML_DOM_GET_CHILD_NODES	Converts several subnodes under a node into a node list.
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME	Obtains the list of specified subnodes of a specified XML DOM object.
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT	Returns the first subnode of the specified document.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XML.XML_DOM_GET_FIRST_CHILD	Returns the first subnode of a node.
DBE_XML.XML_DOM_GET_LAST_CHILD	Returns the last subnode of a node.
DBE_XML.XML_DOM_GET_LENGTH	Returns the number of nodes based on the content in the node of the specified type.
DBE_XML.XML_DOM_GET_LOCALNAME	Returns the local name of the given object.
DBE_XML.XML_DOM_GET_NAMED_ITEM	Returns the node specified by name.
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS	Returns the node specified by name and namespace.
DBE_XML.XML_DOM_GET_NEXT_SIBLING	Returns the next node of the specified node.
DBE_XML.XML_DOM_GET_NODE_NAME	Returns the name of a node.
DBE_XML.XML_DOM_GET_NODE_TYPE	Returns the type of a node.
DBE_XML.XML_DOM_GET_NODE_VALUE	Returns the value of a DOMNode node.
DBE_XML.XML_DOM_GET_PARENT_NODE	Returns the parent node of the given DOMNode node.
DBE_XML.XML_DOM_GET_TAGNAME	Obtains the tag name of a specified XML DOM object.
DBE_XML.XML_DOM_HAS_CHILD_NODES	Checks whether the DOMNode object has any subnode.
DBE_XML.XML_DOM_IMPORT_NODE	Copies a node to another node and mounts the copied node to a specified document.
DBE_XML.XML_DOM_IS_NULL	Checks whether the given object is null.
DBE_XML.XML_DOM_ITEM	Returns the element corresponding to the index in a list or map based on the index.
DBE_XML.XML_DOM_MAKE_ELEMENT	Returns the DOMElement object after conversion.
DBE_XML.XML_DOM_MAKENODE	Converts the given object to the DOMNode type.
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY	Returns a new DOMDocument object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
XML_DOM_NEW_DOM_DOCUMENT_CLOB	Returns a new DOMDocument instance object created from the specified CLOB type.
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE	Returns a new DOMDocument instance object created from the specified XMLType type.
DBE_XML.XML_DOM_SET_ATTRIBUTE	Sets the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_SET_CHARSET	Sets the character set for a DOMDocument object.
DBE_XML.XML_DOM_SET_DOCTYPE	Sets the external DTD of a DOMDocument object.
DBE_XML.XML_DOM_SET_NODE_VALUE	Sets the value of a node in the DOMNode object.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC	Writes the given DOMDocument object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE	Writes the given DOMNode object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC	Writes the given DOMDocument object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE	Writes the given DOMNode object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_GET_SESSION_TREE_NUM	Displays the number of DOM trees of all types in the current session.
DBE_XML.XML_DOM_GET_DOC_TREES_INFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO	Displays the number of nodes of each type for a specific document variable.

- DBE_XML.XML_FREE_PARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XML.XML_FREE_PARSER is as follows:

  ```
  DBE_XML.XML_FREE_PARSER(
  id IN RAW(13))
  RETURNS VOID;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-91 DBE_XML.XML_FREE_PARSER API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

- DBE_XML.XML_PARSER_GET_DOC

  Returns the root node of the DOM tree document constructed by the parser.

  The prototype of the DBE_XML.XML_PARSER_GET_DOC function is as follows:

```
DBE_XML.XML_PARSER_GET_DOC(
id IN RAW(13))
RETURNS RAW(13);
```

Table 10-92 DBE_XML.XML_PARSER_GET_DOC API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

NOTE

- If the DBE_XML.XML_PARSER_GET_DOC function is empty, null is returned.
- If the parser input by the DBE_XML.XML_PARSER_GET_DOC function has not parsed any document, null is returned.

- DBE_XML.XML_GET_VALIDATION_MODE

  Obtains the parsing validation mode of a specified PARSER. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XML.XML_GET_VALIDATION_MODE function is as follows:

```
DBE_XML.XML_GET_VALIDATION_MODE(
id RAW(13))
RETURNS BOOL;
```

Table 10-93 DBE_XML.XML_GET_VALIDATION_MODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

- DBE_XML.XML_NEW_PARSER

  Creates a PARSER object and returns a new parser instance.

  The prototype of the DBE_XML.XML_NEW_PARSER function is as follows:

```
DBE_XML.XML_NEW_PARSER()
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XML.XML_PARSE_BUFFER

  Parses XML documents stored in strings.

  The stored procedure prototype of DBE_XML.XML_PARSE_BUFFER is as follows:

```
DBE_XML.XML_PARSE_BUFFER(
id RAW(13),
xmlstr VARCHAR2)
RETURNS VOID;
```

  Table 10-94 DBE_XML.XML_PARSE_BUFFER API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.
xmlstr	VARCHAR2	IN	No	A string that stores XML documents.

  NOTE

  - The maximum length of a character string that can be parsed by the XML_PARSE_BUFFER function is 32767. If the length exceeds the maximum, an error is reported.
  - Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
  - DTD validation differences:
    - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
    - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
  - Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
  - Difference in parsing XML predefined entities: **'** and **"** are parsed and escaped to characters. However, predefined entities in database A are not escaped to characters.

- DBE_XML.XML_PARSE_CLOB

  Parses XML documents stored in a CLOB.

  The stored procedure prototype of DBE_XML.XML_PARSE_CLOB is as follows:

```
DBE_XML.XML_PARSE_CLOB(
id IN RAW(13),
doc IN CLOB)
RETURNS VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-95 DBE_XML.XML_PARSE_CLOB API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.
doc	CLOB	IN	No	A string that stores XML documents.

NOTE

- xml_parse_clob cannot parse CLOBs greater than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and escaped to ' and ". However, predefined entities in database A are not escaped to characters.

- DBE_XML.XML_SET_VALIDATION_MODE

  Sets the parsing validation mode of a specified PARSER.

  The stored procedure prototype of DBE_XML.XML_SET_VALIDATION_MODE is as follows:

```
DBE_XML.XML_SET_VALIDATION_MODE(
id RAW(13),
validate BOOLEAN)
RETURNS VOID;
```

Table 10-96 DBE_XML.XML_SET_VALIDATION_MODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
validate	BOOLEAN	IN	Yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: DTD validation is disabled.

NOTE

- If the input parameter **validate** of the DBE_XML.XML_SET_VALIDATION_MODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- DBE_XML.XML_DOM_APPEND_CHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node.

  The stored procedure prototype of DBE_XML.XML_DOM_APPEND_CHILD is as follows:

```
DBE_XML.XML_DOM_APPEND_CHILD(
   parentid IN RAW(13),
   childid IN RAW(13)
)
RETURNS RAW(13);
```

  Table 10-97 DBE_XML.XML_DOM_APPEND_CHILD API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
parentId	RAW(13)	IN	No	XML DOM object.
childId	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_CREATE_ELEMENT

  Returns the DOMElement object with the specified name.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT(
   id IN RAW(13),
   tagname IN VARCHAR2
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-98 DBE_XML.XML_DOM_CREATE_ELEMENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
tagname	VARCHAR2	IN	No	Name of the new DOMElement object.

- DBE_XML.XML_DOM_CREATE_ELEMENT_NS

  Returns the DOMElement object with the specified name and namespace.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT_NS function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT_NS(
    id IN RAW(13),
    tagname IN VARCHAR2,
    ns IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-99 DBE_XML.XML_DOM_CREATE_ELEMENT_NS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
tagname	VARCHAR2	IN	No	Name of the new DOMElement object.
ns	VARCHAR2	IN	No	Namespace.

- DBE_XML.XML_DOM_CREATE_TEXT_NODE

  Creates and returns a DOMText object.

  The prototype of the DBE_XML.XML_DOM_CREATE_TEXT_NODE function is as follows:

```
DBE_XML.XML_DOM_CREATE_TEXT_NODE(
    id IN RAW(13),
    data IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-100 DBE_XML.XML_DOM_CREATE_TEXT_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
data	VARCHAR2	IN	No	Content of the new DOMText node.

- DBE_XML.XML_DOM_FREE_DOCUMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_DOCUMENT is as follows:

```
DBE_XML.XML_DOM_FREE_DOCUMENT(
    id RAW(13)
)
RETURNS VOID;
```

  Table 10-101 DBE_XML.XML_DOM_FREE_DOCUMENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_ELEMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_FREE_ELEMENT (
    id RAW(13)
)
RETURNS VOID;
```

  Table 10-102 DBE_XML.XML_DOM_FREE_ELEMENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_NODE

  Frees a DOMNode node.

  The prototype of the DBE_XML.XML_DOM_FREE_NODE function is as follows:

```
DBE_XML.XML_DOM_FREE_NODE (
    id RAW(13)
)
RETURNS VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-103 DBE_XML.XML_DOM_FREE_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_NODELIST

  Frees a DOMNodeList node.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_NODELIST is as follows:

```
DBE_XML.XML_DOM_FREE_NODELIST(
   id IN RAW(13)
)
RETURNS VOID
```

Table 10-104 DBE_XML.XML_DOM_FREE_NODELIST API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_ATTRIBUTE

  Obtains the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTE (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS VARCHAR2;
```

Table 10-105 DBE_XML.XML_DOM_GET_ATTRIBUTE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.

- DBE_XML.XML_DOM_GET_ATTRIBUTES

  Returns the attribute values of a DOMNode node as a map.

  The prototype of the DBE_XML.XML_DOM_GET_ATTRIBUTES function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_GET_ATTRIBUTES (
   id RAW(13)
)
RETURNS RAW(13);
```

Table 10-106 DBE_XML.XML_DOM_GET_ATTRIBUTES API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_CHILD_NODES

  Converts several subnodes under a node into a node list.

  The prototype of the DBE_XML.XML_DOM_GET_CHILD_NODES function is as follows:

```
DBE_XML.XML_DOM_GET_CHILD_NODES(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-107 DBE_XML.XML_DOM_GET_CHILD_NODES API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME

  Obtains the list of specified subnodes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS RAW(13);
```

Table 10-108 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS

  Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS (
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   ns      IN  VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-109 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.
ns	VARCHAR2	IN	Yes	String.

- DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT

  Returns the first subnode of the specified document.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT is as follows:

```
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT(
   id  RAW(13)
)
RETURNS RAW(13);
```

  Table 10-110 DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_FIRST_CHILD

  Returns the first subnode of a node.

  The prototype of the DBE_XML.XML_DOM_GET_FIRST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_FIRST_CHILD(
   id IN RAW(13)
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-111 DBE_XML.XML_DOM_GET_FIRST_CHILD API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_LAST_CHILD

  Returns the last subnode of a node.

  The prototype of the DBE_XML.XML_DOM_GET_LAST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_LAST_CHILD(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-112 DBE_XML.XML_DOM_GET_LAST_CHILD API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_LENGTH

  Returns the number of nodes based on the content in the node of the specified type.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LENGTH is as follows:

```
DBE_XML.XML_DOM_GET_LENGTH(
   id RAW(13)
)
RETURNS VOID;
```

Table 10-113 DBE_XML.XML_DOM_GET_LENGTH API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_LOCALNAME

  Returns the local name of the given object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LOCALNAME is as follows:

```
DBE_XML.XML_DOM_GET_LOCALNAME (
   id  RAW(13)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURNS VARCHAR2;
```

Table 10-114 DBE_XML.XML_DOM_GET_LOCALNAME API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_NAMED_ITEM

  Returns the node specified by name.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM(
    id IN RAW(13),
    nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-115 DBE_XML.XML_DOM_GET_NAMED_ITEM API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved.

- DBE_XML.XML_DOM_GET_NAMED_ITEM_NS

  Returns the node specified by name and namespace.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM_NS function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS(
    id  RAW(13),
    nodename IN VARCHAR2,
    ns IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-116 DBE_XML.XML_DOM_GET_NAMED_ITEM_NS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved.
ns	VARCHAR2	IN	Yes	Namespace.

- DBE_XML.XML_DOM_GET_NEXT_SIBLING

  Returns the next node of the specified node.

  The prototype of the DBE_XML.XML_DOM_GET_NEXT_SIBLING function is as follows:

```
DBE_XML.XML_DOM_GET_NEXT_SIBLING(
    id IN RAW(13)
)
RETURNS RAW(13);
```

  Table 10-117 DBE_XML.XML_DOM_GET_NEXT_SIBLING API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_NAME

  Returns the name of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_NAME function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_NAME(
    id IN RAW(13)
)
RETURNS VARCHAR2;
```

  Table 10-118 DBE_XML.XML_DOM_GET_NODE_NAME API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_TYPE

  Returns the type of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_TYPE function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_GET_NODE_TYPE(
   id IN RAW(13)
)
RETURNS INTEGER;
```

Table 10-119 DBE_XML.XML_DOM_GET_NODE_TYPE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_VALUE

  Returns the value of a DOMNode node.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_NODE_VALUE is as follows:

  ```
  DBE_XML.XML_DOM_GET_NODE_VALUE(
  id IN RAW(13))
  RETURNS VARCHAR2;
  ```

  Table 10-120 DBE_XML.XML_DOM_GET_NODE_VALUE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_PARENT_NODE

  Returns the parent node of the given DOMNode node.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_PARENT_NODE is as follows:

  ```
  DBE_XML.XML_DOM_GET_PARENT_NODE(
  id IN RAW(13))
  RETURNS RAW(13);
  ```

  Table 10-121 DBE_XML.XML_DOM_GET_PARENT_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_TAGNAME

  Obtains the tag name of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_TAGNAME is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_GET_TAGNAME (
   docid RAW(13)
)
RETURNS VARCHAR2;
```

Table 10-122 DBE_XML.XML_DOM_GET_TAGNAME API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_HAS_CHILD_NODES

  Checks whether the DOMNode object has any subnode.

  The stored procedure prototype of DBE_XML.XML_DOM_HAS_CHILD_NODES is as follows:

  ```
  DBE_XML.XML_DOM_HAS_CHILD_NODES(
  id IN RAW(13))
  RETURNS BOOLEAN
  ```

  Table 10-123 DBE_XML.XML_DOM_HAS_CHILD_NODES API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_IMPORT_NODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

  The prototype of the DBE_XML.XML_DOM_IMPORT_NODE function is as follows:

  ```
  DBE_XML.XML_DOM_IMPORT_NODE(
     doc_id IN RAW(13),
     node_id IN RAW(13),
     deep IN BOOLEAN
  )
  RETURNS RAW(13);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-124 DBE_XML.XML_DOM_IMPORT_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
doc_id	RAW(13)	IN	No	Document to which the node is mounted.
node_id	RAW(13)	IN	No	Node to be imported.
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. • If the value is **TRUE**, the node and all its subnodes are imported. • If the value is **FALSE**, the node itself is imported.

- DBE_XML.XML_DOM_IS_NULL

  Checks whether the given object is null. If it is null, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XML.XML_DOM_IS_NULL function is as follows:

```
DBE_XML.XML_DOM_IS_NULL (
   id  RAW(13)
)
RETURNS BOOLEAN;
```

Table 10-125 DBE_XML.XML_DOM_IS_NULL API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_ITEM

  Returns the element corresponding to the index in a list or map based on the index.

  The prototype of the DBE_XML.XML_DOM_ITEM function is as follows:

```
DBE_XML.XML_DOM_ITEM (
   id IN RAW(13),
   index IN INTEGER
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-126 DBE_XML.XML_DOM_ITEM API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
index	INTEGER	IN	No	Index of the element to be retrieved.

- DBE_XML.XML_DOM_MAKE_ELEMENT

  Returns the DOMElement object after conversion.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_MAKE_ELEMENT(
id IN RAW(13))
RETURNS RAW(13)
```

Table 10-127 DBE_XML.XML_DOM_MAKE_ELEMENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_MAKENODE

  Converts the given object to the DOMNode type.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKENODE is as follows:

```
DBE_XML.XML_DOM_MAKENODE(
  id    RAW(13)
)
RETURNS DOMNODE;
```

Table 10-128 DBE_XML.XML_DOM_MAKENODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY

  Returns a new DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY()
RETURNS RAW(13);
```

- XML_DOM_NEW_DOM_DOCUMENT_CLOB

  Returns a new DOMDocument instance object created from the specified CLOB type.

  The prototype of the XML_DOM_NEW_DOM_DOCUMENT_CLOB function is as follows:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-129 XML_DOM_NEW_DOM_DOCUMENT_CLOB API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type.

- DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE

  Returns a new DOMDocument instance object created from the specified XMLType type.

  The prototype of the DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE function is as follows:

```
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-130 DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type.

- DBE_XML.XML_DOM_SET_ATTRIBUTE

  Sets the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_SET_ATTRIBUTE(
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   value   IN  VARCHAR2
)
RETURNS VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-131 DBE_XML.XML_DOM_SET_ATTRIBUTE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.
value	VARCHAR2	IN	No	String.

- DBE_XML.XML_DOM_SET_CHARSET

  Sets the character set for a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_CHARSET function is as follows:

```
DBE_XML.XML_DOM_SET_CHARSET(
   id      IN RAW(13),
   charset IN VARCHAR2
)
RETURNS VOID;
```

Table 10-132 DBE_XML.XML_DOM_SET_CHARSET API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
charset	VARCHAR2	IN	No	Character set.

- DBE_XML.XML_DOM_SET_DOCTYPE

  Sets the external DTD of a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_DOCTYPE function is as follows:

```
dbe_xml.xml_dom_set_doctype(
   id          IN  RAW(13),
   dtd_name    IN  VARCHAR2,
   system_id   IN  VARCHAR2,
   public_id   IN  VARCHAR2
)
RETURNS VOID;
```

Table 10-133 DBE_XML.XML_DOM_SET_DOCTYPE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized.
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized.
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized.

- DBE_XML.XML_DOM_SET_NODE_VALUE

  Sets the value of a node in the DOMNode object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_NODE_VALUE is as follows:

  ```
  DBE_XML.XML_DOM_SET_NODE_VALUE(
  id IN RAW(13),
  node_value IN VARCHAR2)
  RETURNS VOID
  ```

  Table 10-134 DBE_XML.XML_DOM_SET_NODE_VALUE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object.

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC

  Writes the given DOMDocument object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC is as follows:

  ```
  DBE_XML.DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC(
  id IN RAW(13))
  RETURNS VARCHAR2;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-135 DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE

  Writes the given DOMNode object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE is as follows:

```
DBE_XML.DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE(
id IN RAW(13))
RETURNS VARCHAR2;
```

  Table 10-136 DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC

  Writes the given DOMDocument object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC(
    id IN RAW(13)
)
RETURNS VARCHAR2;
```

  Table 10-137 DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE

  Writes the given DOMNode object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE(
    id          IN  RAW(13)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURNS CLOB;
```

Table 10-138 DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_FILE_DOC

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2)
RETURNS VOID

DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2,
charset  IN  VARCHAR2)
RETURNS VOID PACKAGE
```

Table 10-139 DBE_XML.XML_DOM_WRITE_TO_FILE_DOC API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.
file_dir	VARCHAR2	IN	No	File to be written.
charset	VARCHAR2	IN	No	Specified character set.

- DBE_XML.XML_DOM_WRITE_TO_FILE_NODE

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE(
id IN  RAW(13),
filename IN  VARCHAR2)
RETURNS VOID
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-140 DBE_XML.XML_DOM_WRITE_TO_FILE_NODE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
filename	VARCHAR2	IN	No	Specified file address.

- DBE_XML.XML_DOM_GET_SESSION_TREE_NUM

  Queries the number of DOM trees of all types in the current session.

  The prototype of the DBE_XML.XML_DOM_GET_SESSION_TREE_NUM function is as follows:

  ```
  DBE_XML.XML_DOM_GET_SESSION_TREE_NUM()
  RETURNS INTEGER
  ```

- DBE_XML.XML_DOM_GET_DOC_TREES_INFO

  Queries the DOM tree information of the document type in the current session, such as the memory usage.

  The prototype of the DBE_XML.XML_DOM_GET_DOC_TREES_INFO function is as follows:

  ```
  DBE_XML.XML_DOM_GET_DOC_TREES_INFO()
  RETURNS VARCHAR2
  ```

- DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO

  Queries the number of subnodes of each type in the transferred document.

  The prototype of the DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO function is as follows:

  ```
  DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO(
  id IN  RAW(13))
  RETURNS VARCHAR2
  ```

  Table 10-141 DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

10.12.2.1 DBE_APPLICATION_INFO

Interface Description

Table 10-142 provides all interfaces supported by the **DBE_APPLICATION_INFO** package. **DBE_APPLICATION_INFO** applies to the current session.

Table 10-142 DBE_APPLICATION_INFO

Interface	Description
DBE_APPLICATION_INFO.SET_CLIENT_INFO	Writes client information.
DBE_APPLICATION_INFO.READ_CLIENT_INFO	Reads client information.
DBE_APPLICATION_INFO.SET_MODULE	Sets the name of the currently running module to the new module. You can set the module and action.
DBE_APPLICATION_INFO.READ_MODULE	Reads the values of the module and action columns of the current session.
DBE_APPLICATION_INFO.SET_ACTION	Sets the name of the current action in the current module.

- DBE_APPLICATION_INFO.SET_CLIENT_INFO

  Writes client information. The prototype of the DBE_APPLICATION_INFO.SET_CLIENT_INFO function is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
    str text
)returns void;
```

  Table 10-143 DBE_APPLICATION_INFO.SET_CLIENT_INFO interface parameters

Parameter	Description
str	Client information to be written. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

- DBE_APPLICATION_INFO.READ_CLIENT_INFO

  The prototype of the DBE_APPLICATION_INFO.READ_CLIENT_INFO function is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-144 DBE_APPLICATION_INFO.READ_CLIENT_INFO interface parameters

Parameter	Description
client_info	Client information

- DBE_APPLICATION_INFO.SET_MODULE

  Sets the name of the currently running module to the new module. The prototype of the DBE_APPLICATION_INFO.SET_MODULE function is as follows:

```
DBE_APPLICATION_INFO.SET_MODULE(
    IN module_name text,
    IN action_name text
);
```

Table 10-145 DBE_APPLICATION_INFO.SET_MODULE parameters

Parameter	Description
module_name	Name of the running module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

  Example:

```
CALL dbe_application_info.set_module('module_name','action_name');
 set_module
------------

(1 row)
```

- DBE_APPLICATION_INFO.READ_MODULE

  Reads the values of the module and action columns of the current session. The prototype of the DBE_APPLICATION_INFO.READ_MODULE function is as follows:

```
DBE_APPLICATION_INFO.READ_MODULE(
    OUT module_name text,
    OUT action_name text
);
```

Table 10-146 DBE_APPLICATION_INFO.READ_MODULE parameters

Parameter	Description
module_name	Name of the running module.
action_name	Name of the current action in the current module.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
DECLARE
 module varchar2(64);
 action varchar2(64);
BEGIN
 dbe_application_info.read_module(module,action);
 dbe_output.print_line(module);
 dbe_output.print_line(action);
END;
/
module_name
action_name
ANONYMOUS BLOCK EXECUTE
```

- DBE_APPLICATION_INFO.SET_ACTION

  Sets the name of the current action in the current module. The prototype of the DBE_APPLICATION_INFO.SET_ACTION function is as follows:

```
DBE_APPLICATION_INFO.SET_ACTION(
      IN action_name text
);
```

Table 10-147 DBE_APPLICATION_INFO.SET_ACTION parameters

Parameter	Description
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

Examples

```
CALL dbe_application_info.set_action('action_name');
 set_action
------------

(1 row)
```

10.12.2.2 DBE_COMPRESSION

API Description

Evaluates the sampling compression rate of a specified data object or obtains the compression type of a specified row of data based on the input parameters.

Table 10-148 DBE_COMPRESSION

API	Description
GET_COMPRESSION_RATIO	Evaluates the sampling compression rate of a specified data object based on input parameters.
GET_COMPRESSION_TYPE	Obtains the compression type of data in a specified row based on input parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_COMPRESSION.GET_COMPRESSION_RATIO

  Evaluates the sampling compression rate of a specified data object based on input parameters. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_RATIO(
SCRATCHTBSNAME IN VARCHAR2,
OWNNAME        IN VARCHAR2,
OBJNAME        IN VARCHAR2,
SUBOBJNAME     IN VARCHAR2,
COMPTYPE       IN NUMBER,
BLKCNT_CMP     OUT INTEGER,
BLKCNT_UNCMP   OUT INTEGER,
ROW_CMP        OUT INTEGER,
ROW_UNCMP      OUT INTEGER,
CMP_RATIO      OUT NUMBER,
COMPTYPE_STR   OUT VARCHAR2,
SAMPLE_RATIO   IN NUMBER DEFAULT 20,
OBJTYPE        IN INTEGER DEFAULT 1);
```

  Table 10-149 DBE_COMPRESSION.GET_COMPRESSION_RATIO API parameters

Parameter	Description
SCRATCHTBSNAME	Tablespace to which a data object belongs.
OWNNAME	Data object owner (schema to which the data object belongs).
OBJNAME	Data object name.
SUBOBJNAME	Name of a data subobject.
COMPTYPE	Compression type. The options are as follows: ● **1**: uncompressed. ● **2**: advanced compression.
BLKCNT_CMP	Number of blocks occupied by compressed samples.
BLKCNT_UNCMP	Number of blocks occupied by uncompressed samples.
ROW_CMP	Number of rows that can be contained in a single block after samples are compressed.
ROW_UNCMP	Number of rows that can be contained in a single block when samples are not compressed.
CMP_RATIO	Compression ratio, which is obtained by dividing BLKCNT_UNCMP by BLKCNT_CMP.
COMPTYPE_STR	Character string that describes the compression type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
SAMPLE_RATIO	Sampling ratio. The value is an integer or floating-point number ranging from 0 to 100, corresponding to the sampling ratio of *n* percent. The default value is **20**, indicating that 20% of the rows are sampled.
OBJTYPE	Object type. The options are as follows: ● **1**: table object.

- DBE_COMPRESSION.GET_COMPRESSION_TYPE

  This API is used to obtain the compression type of a specified row based on input parameters. This API is an O&M API and does not check the visibility. That is, if the input CTID is a deleted row, this API still returns the latest status of the current row on the page. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_TYPE(
OWNNAME    IN VARCHAR2,
TABNAME    IN VARCHAR2,
CTID       IN TEXT,
SUBOBJNAME IN VARCHAR2 DEFAULT NULL);
```

Table 10-150 DBE_COMPRESSION.GET_COMPRESSION_TYPE API parameters

Parameter	Description
OWNNAME	Data object owner (schema to which the data object belongs).
TABNAME	Data object name.
CTID	CTID of the target row.
SUBOBJNAME	Name of a data subobject.

Examples

```
gaussdb=# alter database set ilm = on;
gaussdb=# CREATE user user1 IDENTIFIED BY '********';
gaussdb=# CREATE user user2 IDENTIFIED BY '********';
gaussdb=# SET ROLE user1 PASSWORD '********';
gaussdb=# CREATE TABLE TEST_DATA (ORDER_ID INT, GOODS_NAME TEXT, CREATE_TIME TIMESTAMP)
  ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 1 DAYS OF NO MODIFICATION;
INSERT INTO TEST_DATA VALUES (1,'Snack gift basket A', NOW());

gaussdb=# SELECT DBE_COMPRESSION.GET_COMPRESSION_TYPE('user1', 'test_data', '(0,1)', NULL);
 get_compression_type
----------------------
                    1
(1 row)

DECLARE

```

10.12.2.3 DBE_FILE

The DBE_FILE package provides the capabilities of reading and writing operating system text files for stored procedures.

Precautions

- DBE_FILE requires that files opened using DBE_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE is used to read files. DBE_FILE requires that files opened using DBE_FILE.FOPEN_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE_NCHAR is used to read files.
- When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.
- DBE_FILE requires that the character set encoding of the client be the same as that of the database.
- Assume that the database character set encoding is ASCII, the client character set encoding supports Chinese, and the client calls DBE_FILE.WRITE_NCHAR or DBE_FILE.WRITE_LINE_NCHAR to write Chinese content. If the entered content is in UTF-8 encoding format, the written content may not be encoded in UTF-8 format. An error may be reported when the DBE_FILE.READ_LINE_NCHAR is used.

Data Types

- DBE_FILE.FILE_TYPE

  Defines the representation of files in the DBE_FILE package. The fields in DBE_FILE.FILE_TYPE are private fields of the DBE_FILE package. Do not change the field value of the type defined in DBE_FILE.FILE_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
    id INTEGER,
    datatype INTEGER,
    byte_mode BOOLEAN
);
```

Table 10-151 DBE_FILE.FILE_TYPE columns

Parameter	Description
id	File handle.
datatype	File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, **1** is returned. For an NCHAR file, **2** is returned.
byte_mode	Indicates that the file is opened in binary mode (**TRUE**) or text mode (**FALSE**).

API Description

Table 10-152 lists all APIs supported by the **DBE_FILE** package.

Table 10-152 DBE_FILE

API	Description
DBE_FILE.OPEN/ DBE_FILE.FOPEN	Opens a file based on the specified directory and file name. The corresponding file handle or the DBE_FILE.FILE_TYPE type object encapsulated with the file handle is returned.
DBE_FILE.IS_CLOSE	Checks whether a file is closed.
DBE_FILE.IS_OPEN	Checks whether a file is opened.
DBE_FILE.READ_LINE	Reads a line of a specified length from an open file.
DBE_FILE.WRITE	Writes data to an open file.
DBE_FILE.NEW_LINE	Writes one or more line terminators to an open file.
DBE_FILE.WRITE_LINE	Writes data to an open file and automatically appends a line terminator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_FILE.FORMAT_WRITE	Writes data in a specified format to the buffer of an open file.
DBE_FILE.GET_RAW	Reads RAW data from an open file.
DBE_FILE.PUT_RAW	Writes RAW data to an open file.
DBE_FILE.FLUSH	Writes cached data to a physical file.
DBE_FILE.CLOSE	Closes an open file.
DBE_FILE.CLOSE_ALL	Closes all files opened in a session.
DBE_FILE.REMOVE	Deletes a disk file. To perform this operation, you must have required permissions.
DBE_FILE.RENAME	Renames a disk file, which is similar to the mv command of Unix.
DBE_FILE.COPY	Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.
DBE_FILE.GET_ATTR	Reads and returns the attributes of a disk file.
DBE_FILE.SEEK	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
DBE_FILE.GET_POS	Returns the current offset of a file, in bytes.
DBE_FILE.FOPEN_NCHAR	Opens a file of the NCHAR type based on the specified directory and file name.
DBE_FILE.WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type.
DBE_FILE.WRITE_LINE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type and automatically appends a line terminator.
DBE_FILE.FORMAT_WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type in a specified format.
DBE_FILE.READ_LINE_NCHAR	Reads a line of a specified length from an open file of the NCHAR type.

- DBE_FILE.OPEN/DBE_FILE.FOPEN

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the INTEGER

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

type. The function of DBE_FILE.FOPEN is similar to that of DBE_FILE.OPEN. It returns an object of the type defined in DBE_FILE.FILE_TYPE.

The prototypes of the DBE_FILE.OPEN and DBE_FILE.FOPEN functions are:

```
DBE_FILE.OPEN(
   dir          IN TEXT,
   file_name    IN TEXT,
   open_mode    IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;

DBE_FILE.FOPEN(
   dir          IN TEXT,
   file_name    IN TEXT,
   open_mode    IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

Table 10-153 DBE_FILE.OPEN/DBE_FILE.FOPEN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	text	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	text	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
open_mode	text	IN	No	Open mode of a specified file, including: • **r**: read text. • **w**: write text. • **a**: append text. • **rb**: read byte. • **wb**: write byte. • **ab**: append byte. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	integer	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.IS_CLOSE

  Checks whether a file handle is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_CLOSE(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-154 DBE_FILE.IS_CLOSE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_CLOSE API returns empty.

- DBE_FILE.IS_OPEN

  Checks whether a file handle is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_OPEN function is as follows:

```
DBE_FILE.IS_OPEN(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_OPEN(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-155 DBE_FILE.IS_OPEN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_OPEN API returns false.

- DBE_FILE.READ_LINE

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max_line_size** specified when the file is opened.

  The prototype of the DBE_FILE.READ_LINE stored procedure is as follows:

```
DBE_FILE.READ_LINE(
   file   IN  INTEGER,
   buffer OUT TEXT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;

DBE_FILE.READ_LINE(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT TEXT,
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;
```

Table 10-156 DBE_FILE.READ_LINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	text	OUT	No	Buffer for receiving data.
len	integer	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- DBE_FILE.WRITE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation does not write a line terminator.

  The prototype of the DBE_FILE.WRITE function is as follows:

```
DBE_FILE.WRITE(
   file   IN INTEGER,
   buffer IN TEXT)
RETURN BOOLEAN;

DBE_FILE.WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-157 DBE_FILE.WRITE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
buffer	text	IN	Yes	Text data to be written to a file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified when OPEN or FOPEN is used. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.NEW_LINE

  Writes one or more line terminators to the buffer corresponding to a file. The line terminators are related to the platform used.

  The prototype of the DBE_FILE.NEW_LINE function is as follows:

```
DBE_FILE.NEW_LINE(
   file      IN INTEGER,
   line_nums IN INTEGER DEFAULT 1)
RETURN BOOLEAN;

DBE_FILE.NEW_LINE(
   file      IN DBE_FILE.FILE_TYPE,
   line_nums IN INTEGER DEFAULT 1)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-158 DBE_FILE.NEW_LINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
line_nums	integer	IN	Yes	Number of line terminators written to a file. The default value is **1**. If this parameter is left blank, line terminators are not written.

- DBE_FILE.WRITE_LINE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation automatically adds a line terminator.

  The prototype of the DBE_FILE.WRITE_LINE function is as follows:

```
DBE_FILE.WRITE_LINE(
   file   IN INTEGER,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.WRITE_LINE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-159 DBE_FILE.WRITE_LINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
buffer	text	IN	Yes	Text data to be written to a file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified when OPEN or FOPEN is executed or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	boolean	IN	Yes	Specifies whether to flush data to disks after WRITE_LINE. The default value is **FALSE**.

- DBE_FILE.FORMAT_WRITE

  Writes formatted data to the buffer corresponding to an open file. It is a DBE_FILE.WRITE API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE function is as follows:

```
DBE_FILE.FORMAT_WRITE(
   file   IN INTEGER,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN BOOLEAN;

DBE_FILE.FORMAT_WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-160 DBE_FILE.FORMAT_WRITE API parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
format	text	IN	Yes	Formatted string, containing the text and format characters \n and %s. If this parameter is left blank, no data is written.
[arg1. . .arg6]	text	IN	Yes	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.GET_RAW

  Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

  The prototype of the DBE_FILE.GET_RAW stored procedure is as follows:

```
DBE_FILE.GET_RAW(
   file   IN  INTEGER,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN RAW;

DBE_FILE.GET_RAW(
   file   IN  DBE_FILE.FILE_TYPE,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-161 DBE_FILE.GET_RAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	OUT	No	Buffer for receiving RAW data.
length	INTEGER	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the value is **NULL**, the maximum length of the RAW type is used to specify the size.

- DBE_FILE.PUT_RAW

  Writes raw data to the buffer corresponding to a file.

  The prototype of the DBE_FILE.PUT_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
   file  IN INTEGER,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.PUT_RAW (
   file  IN DBE_FILE.FILE_TYPE,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-162 DBE_FILE.PUT_RAW API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	IN	No	RAW data to be written to a file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Specifies whether to flush data to disks after PUT_RAW. The default value is **FALSE**.

- DBE_FILE.FLUSH

  Writes cached data to a physical file. The cached data must have a line terminator.

  The prototype of the DBE_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH(
   file IN INTEGER)
RETURN VOID;

DBE_FILE.FLUSH(
   file IN DBE_FILE.FILE_TYPE)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-163 DBE_FILE.FLUSH API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE

  Closes an open file. When this function is called, if there is cached data to be written, exception information may be received and the return value is always **TRUE**.

  The prototype of the DBE_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE(
    file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.CLOSE(
    file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-164 DBE_FILE.CLOSE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE_ALL

  Closes all file handles opened in a session. This function can be used for emergency cleanup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_FILE.CLOSE_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL()
RETRUN VOID;
```

- DBE_FILE.REMOVE

  Deletes a disk file. To use this function, you must have the required permission.

  The prototype of the DBE_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE(
   dir       IN TEXT,
   file_name IN TEXT)
RETURN VOID;
```

Table 10-165 DBE_FILE.REMOVE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name.

- DBE_FILE.RENAME

  Renames a disk file. This function is similar to the **mv** command of Unix.

  The prototype of the DBE_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME(
   src_dir       IN TEXT,
   src_file_name  IN TEXT,
   dest_dir      IN TEXT,
   dest_file_name IN TEXT,
   overwrite     IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-166 DBE_FILE.RENAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the source file (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Source file to be renamed.
dest_dir	TEXT	IN	No	Target directory (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	text	IN	No	New file name.
overwrite	boolean	IN	Yes	Specifies whether to overwrite the file. If the parameter is left empty or not specified, the parameter is not overwritten. If a file with the same name exists in the target directory, the file will not be overwritten.

- DBE_FILE.COPY

  Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.

  The prototype of the DBE_FILE.COPY function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_FILE.COPY(
   src_dir        IN TEXT,
   src_file_name  IN TEXT,
   dest_dir       IN TEXT,
   dest_file_name IN TEXT,
   start_line     IN INTEGER DEFAULT 1,
   end_line       IN INTEGER DEFAULT NULL)
RETURN VOID;
```

Table 10-167 DBE_FILE.COPY API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the source file. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Name of the source file to be copied.
dest_dir	TEXT	IN	No	Directory of the destination file. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	No	Target file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
start_line	TEXT	IN	No	Number of the line where the copy starts. The default value is **1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
end_line	TEXT	IN	Yes	Number of the line where the copy ends. The default value is **NULL**, indicating the end of the file.

- DBE_FILE.GET_ATTR

  Reads and returns the attributes of a disk file.

  The prototype of the DBE_FILE.GET_ATTR stored procedure is as follows:

```
DBE_FILE.GET_ATTR(
    location    IN  TEXT,
    filename    IN  TEXT,
    fexists     OUT BOOLEAN,
    file_length OUT BIGINT,
    block_size  OUT INTEGER)
RETURN RECORD;
```

Table 10-168 DBE_FILE.GET_ATTR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
location	TEXT	IN	No	File directory. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
filename	TEXT	IN	No	File name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fexists	boolean	OUT	No	Specifies whether the file exists.
file_length	BIGINT	OUT	No	File length (unit: byte). If the file does not exist, **NULL** is returned.
block_size	INTEGE	OUT	No	Block size of the file system (unit: byte). If the file does not exist, **NULL** is returned.

- DBE_FILE.SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the DBE_FILE.SEEK function is as follows:

```
DBE_FILE.SEEK(
   file          IN INTEGER,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;

DBE_FILE.SEEK(
   file          IN DBE_FILE.FILE_TYPE,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-169 DBE_FILE.SEEK API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
absolute_start	BIGINT	IN	Yes	Absolute offset of a file. The default value is **NULL**.
relative_start	BIGINT	IN	Yes	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is **NULL**. If both **absolute_start** and this parameter are specified, the **absolute_start** parameter is used.

- DBE_FILE.GET_POS

  Returns the current offset of a file, in bytes.

  The prototype of the DBE_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS(
   file IN INTEGER)
RETURN BIGINT;

DBE_FILE.GET_POS(
   file IN DBE_FILE.FILE_TYPE)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-170 DBE_FILE.GET_POS API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.FOPEN_NCHAR

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a DBE_FILE.FILE_TYPE type object that encapsulates a file handle. This function opens a file in national character set mode for input or output.

  The prototype of the DBE_FILE.FOPEN_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
   dir           IN TEXT,
   file_name     IN TEXT,
   open_mode     IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-171 DBE_FILE.FOPEN_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the FOPEN_NCHAR function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	TEXT	IN	No	Open mode of a specified file, including: • **r**: read text. • **w**: write text. • **a**: append text. • **rb**: read byte. • **wb**: write byte. • **ab**: append byte. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	integer	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.WRITE_NCHAR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation does not write a line terminator. The text string is written in the UTF-8 character set format.

The prototype of the DBE_FILE.WRITE_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

Table 10-172 DBE_FILE.WRITE_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.
buffer	NVARCHAR2	IN	Yes	Text data to be written to a file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified by **FOPEN_NCHAR**. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.WRITE_LINE_NCHAR

  Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation automatically adds a line terminator. The text string is written in the UTF-8 character set format.

  The prototype of the DBE_FILE.WRITE_LINE_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-173 DBE_FILE.WRITE_LINE_NCHAR API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
buffer	NVARCHAR2	IN	Yes	Text data to be written to a file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified by FOPEN_NCHAR or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.FORMAT_WRITE_NCHAR

  Writes formatted data to the buffer of an open file. It is a DBE_FILE.WRITE_NCHAR API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   format IN NVARCHAR2,
   arg1   IN NVARCHAR2 DEFAULT NULL,
   . . .
   arg5   IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-174 DBE_FILE.FORMAT_WRITE_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
format	NVARCHAR2	IN	Yes	Formatted string, containing the text and format characters \n and %s.
[arg1. . .arg5]	NVARCHAR2	IN	Yes	Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.READ_LINE_NCHAR

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max_line_size** specified by FOPEN_NCHAR.

  The prototype of the DBE_FILE.READ_LINE_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT NVARCHAR2,
   len    IN  INTEGER DEFAULT NULL)
RETURN NVARCHAR2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-175 DBE_FILE.READ_LINE_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	NVARCHAR2	OUT	No	Buffer for receiving data.
len	INTEGER	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

Examples

```
-- Add the /tmp/ directory to the PG_DIRECTORY system catalog as a SYSADMIN.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Execution result:
CREATE DIRECTORY
-- Use the DBE_FILE advanced package.

10.12.2.4 DBE_HEAT_MAP

API Description

Returns information such as the last modification time of a row in the target data block based on the input parameters. The information is used to browse the basis for determining cold and hot rows. This API is an O&M API and has no visibility check. That is, if the input CTID is a deleted row, this API still returns the latest status of the current row on the page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-176 DBE_HEAT_MAP

API	Description
ROW_HEAT_MAP	Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID.

- DBE_HEAT_MAP.ROW_HEAT_MAP

  Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID. The prototype is as follows:

```
DBE_HEAT_MAP.ROW_HEAT_MAP(
OWNER           IN VARCHAR2,
SEGMENT_NAME    IN VARCHAR2,
PARTITION_NAME  IN VARCHAR2     DEFAULT NULL,
CTID            IN TEXT,
V_DEBUG         IN BOOL         DEFAULT FALSE);
```

Table 10-177 DBE_HEAT_MAP.ROW_HEAT_MAP parameters

Parameter	Description
OWNER	Schema to which a data object belongs.
SEGMENT_NAME	Data object name.
PARTITION_NAME	Data object partition name. This parameter is optional. The default value is **NULL**.
CTID	**ctid** of the target row, that is, **block_id** or **row_id**.
V_DEBUG	Debugging. Debug logs are recorded.

Table 10-178 Output parameters of DBE_HEAT_MAP.ROW_HEAT_MAP

Parameter	Description
OWNER	Owner of a data object.
SEGMENT_NAME	Data object name.
PARTITION_NAME	Name of a data object partition. This parameter is optional.
TABLESPACE_NAME	Name of the tablespace to which data belongs.
FILE_ID	ID of the absolute file to which a row belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RELATIVE_FNO	ID of the relative file to which a row belongs. (GaussDB does not have this logic. Therefore, the value is the same as the preceding value.)
CTID	**ctid** of a row, that is, **block_id** or **row_id**.
WRITETIME	Last modification time of a row.

Examples

```
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema HEAT_MAP_DATA;
gaussdb=# SET current_schema=HEAT_MAP_DATA;

gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1';
gaussdb=# CREATE TABLE HEAT_MAP_DATA.heat_map_table(id INT, value TEXT) TABLESPACE example1;
gaussdb=# INSERT INTO HEAT_MAP_DATA.heat_map_table VALUES (1, 'test_data_row_1');

gaussdb=# SELECT * from DBE_HEAT_MAP.ROW_HEAT_MAP(
    owner          =>  'heat_map_data',
    segment_name  =>  'heat_map_table',
    partition_name  => NULL,
    ctid           =>  '(0,1)');
     owner     |  segment_name  | partition_name | tablespace_name | file_id | relative_fno | ctid  | writetime
---------------+----------------+----------------+-----------------+---------+--------------+-------+-----------
 heat_map_data | heat_map_table |                | example1        |   17291 |        17291 | (0,1) |
(1 row)
```

10.12.2.5 DBE_ILM

API Description

Implements ILM policies, ILM policy evaluation, and API for stopping compression jobs.

Table 10-179 DBE_ILM

API	Description
EXECUTE_ILM	Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated.
STOP_ILM	Stops a compression job that is being executed based on parameters.

- DBE_ILM.EXECUTE_ILM

  Evaluates the ILM policy based on parameters. The prototype is as follows:

  ```
  DBE_ILM.EXECUTE_ILM(
  OWNER          IN VARCHAR2,
  OBJECT_NAME    IN VARCHAR2,
  TASK_ID        OUT NUMBER,
  SUBOBJECT_NAME IN VARCHAR2 DEFAULT NULL,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
POLICY_NAME    IN VARCHAR2 DEFAULT 'ALL POLICIES',
EXECUTION_MODE IN NUMBER DEFAULT 2);
```

Table 10-180 DBE_ILM.EXECUTE_ILM parameters

Parameter	Description
OWNER	Schema to which an object belongs.
OBJECT_NAME	Object name.
TASK_ID	Descriptor ID of the generated ADO task.
SUBOBJECT_NAME	Name of a data subobject.
POLICY_NAME	Policy name. You can query the GS_ADM_ILMOBJECTS view to obtain the policy name. The default value **DBE_ILM.ILM_ALL_POLICIES** indicates all policies on the object. The default value of **DBE_ILM.ILM_ALL_POLICIES** is **'ALL POLICIES'**. Lowercase letters are not supported.
EXECUTION_MODE	Execution mode. The online mode (ILM_EXECUTION_ONLINE) or offline mode (ILM_EXECUTION_OFFLINE) is not involved in this phase.

- DBE_ILM.STOP_ILM

  Stops an ILM policy that is being executed based on parameters. The prototype is as follows:

  ```
  DBE_ILM.STOP_ILM(
  TASK_ID            IN NUMBER DEFAULT -1,
  P_DROP_RUNNING_JOBS IN BOOLEAN DEFAULT FALSE,
  P_JOBNAME          IN VARCHAR2 DEFAULT NULL)
  ```

Table 10-181 DBE_ILM.STOP_ILM parameters

Parameter	Description
TASK_ID	Specifies the descriptor ID of the ADO task to be stopped.
P_DROP_RUNNING_JOBS	Determines whether to stop a task that is being executed. The value **true** indicates that the task is forcibly stopped, and the value **false** indicates that the task is not stopped.
P_JOBNAME	Specifies the name of the job to be stopped, which can be queried in the GS_MY_ILMEVALUATIONDETAILS view.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM.STOP_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
gaussdb=# ALTER DATABASE set ilm = on;

10.12.2.6 DBE_ILM_ADMIN

API Description

Implements ILM policies, and controls ADO background scheduling and concurrency control parameters.

Table 10-182 DBE_ILM_ADMIN

API	Description
CUSTOMIZE_ILM	Customizes ILM policy attributes based on input parameters.
DISABLE_ILM	Disables background scheduling.
ENABLE_ILM	Enables background scheduling.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

- DBE_ILM_ADMIN.CUSTOMIZE_ILM

  Customizes ILM policy attributes based on input parameters. The prototype is as follows:

  ```
  DBE_ILM_ADMIN.CUSTOMIZE_ILM(
  PARAM      IN  NUMBER,
  VAL        IN  NUMBER);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-183 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter	Description
PARAM	Sequence number of a parameter.
VAL	Parameter value.

NOTE

In B- or M-compatible mode, if the input **VAL** is a non-numeric character when **DBE_ILM_ADMIN.CUSTOMIZE_ILM()** is called, for example, **DBE_ILM_ADMIN.CUSTOMIZE_ILM(13, '*')**, the input **VAL** is set to **0** by default.

Table 10-184 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Status of background scheduling. This parameter cannot be modified using DBE_ILM_ADMIN.CUSTOMIZE_ILM. Use DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Possible values are: ● **0**: ILM_POLICY_IN_DAYS (default value) ● **1**: ILM_POLICY_IN_SECONDS
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is **40**. The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the rate is not limited.
16	ENABLE_META_COMPRESSION	Specifies whether to enable header compression. The default value is **0**. The value can be **0** (disabled) or **1** (enabled). **NOTE** If this parameter is set to **1**, the compression ratio is improved for tables with short rows (less data in a single row), but the performance of accessing compressed rows greatly deteriorates. If most tables in the database have long rows, you are advised not to enable this parameter.
17	SAMPLE_MIN	Minimum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
18	SAMPLE_MAX	Maximum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
19	CONST_PRIO	Constant encoding priority. The default value is **40**. The value range is [0,100]. The value **100** indicates that constant encoding is disabled. Decimals can be entered and will be automatically rounded down.

Parameter ID	Parameter Value	Description
20	CONST_THRESHOLD	Constant encoding threshold. The default value is **90**. The value range is [1,100], indicating that constant encoding is performed when the proportion of constant values in a column exceeds the threshold. Decimals can be entered and will be automatically rounded down.
21	EQVALUE_PRIO	Equivalent encoding priority. The default value is **60**. The value range is [0,100]. The value **100** indicates that equivalent encoding is disabled. Decimals can be entered and will be automatically rounded down.
22	EQVALUE_THRESHOLD	Equivalent encoding threshold. The default value is **80**. The value range is [1,100], indicating that equivalent encoding is performed when the ratio of equal values in two columns exceeds the threshold. Decimals can be entered and will be automatically rounded down.
23	ENABLE_DELTA_ENCODE_SWITCH	Specifies whether to enable difference encoding. The default value is **1**. The value **0** indicates that difference encoding is disabled, and the value **1** indicates that difference encoding is enabled. Decimals can be entered and will be automatically rounded down.
24	LZ4_COMPRESSION_LEVEL	LZ4 compression level. The default value is **0**. The value range is [0,16]. Decimals can be entered and will be automatically rounded down.
25	ENABLE_LZ4_PARTIAL_DECOMPRESSION	Specifies whether to enable partial decompression. The default value is **1**. The value **0** indicates that partial decompression is disabled, and the value **1** indicates that partial decompression is enabled. Decimals can be entered and will be automatically rounded down.

- DBE_ILM_ADMIN.DISABLE_ILM

  Disables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.DISABLE_ILM();
  ```

- DBE_ILM_ADMIN.ENABLE_ILM

  Enables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.ENABLE_ILM();
  ```

  Note: To make background scheduling take effect, you need to enable the GUC parameter **enable_ilm** on the database O&M platform.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
gaussdb=# CALL DBE_ILM_ADMIN.CUSTOMIZE_ILM(1, 15);
 customize_ilm
---------------

(1 row)
gaussdb=# select * from gs_adm_ilmparameters;
              name               | value
---------------------------------+-------
 EXECUTION_INTERVAL              |    15
 RETENTION_TIME                  |    30
 ENABLED                         |     1
 POLICY_TIME                     |     0

10.12.2.7 DBE_LOB

API Description

Table 10-185 lists all APIs supported by the DBE_LOB package.

NOTE

- In database A, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a centralized environment, the maximum size of a CLOB, BLOB, and BFILE is 32 TB.
- LOBMAXSIZE supports a maximum of 1073741771 bytes.

Table 10-185 DBE_LOB

API	Description
DBE_LOB.GET_LENGTH	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
DBE_LOB.LOB_GET_LENGTH	Obtains and returns the length of a specified LOB or BFILE object.
DBE_LOB.OPEN	Opens a LOB and returns a LOB descriptor.
DBE_LOB.READ	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
DBE_LOB.LOB_READ	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_LOB.WRITE	Copies content in the buffer to a LOB based on the specified length and initial position offset.
DBE_LOB.WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.
DBE_LOB.LOB_WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.
DBE_LOB.COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.LOB_COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.ERASE	Deletes content in a LOB (less than or equal to 1 GB) based on the specified length and initial position offset.
DBE_LOB.LOB_ERASE	Deletes content in a LOB based on the specified length and initial position offset.
DBE_LOB.CLOSE	Closes a LOB descriptor.
DBE_LOB.MATCH	Returns the position of the *N*th occurrence of a character string in a LOB.
DBE_LOB.COMPARE	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
DBE_LOB.SUBSTR	Reads a LOB substring and returns the read substring.
DBE_LOB.LOB_SUBSTR	Reads a LOB or BFILE substring and returns the read substring.
DBE_LOB.STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.LOB_STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.CREATE_TEMPORARY	Creates a temporary BLOB or CLOB.
DBE_LOB.APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.LOB_APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.FREETEMPORARY	Deletes a temporary BLOB or CLOB.
DBE_LOB.FILEOPEN	Opens a database BFILE file and returns its file descriptor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_LOB.FILECLOSE	Closes a BFILE file that is opened by **FILEOPEN**.
DBE_LOB.BFILEOPEN	Opens a database BFILE file.
DBE_LOB.BFILECLOSE	Closes a BFILE file that is opened by **BFILEOPEN**.
DBE_LOB.LOADFROMFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
DBE_LOB.LOADFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
DBE_LOB.LOADBLOBFROMFILE	Loads an external database file of the specified length in the specified location to a BLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADBLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
DBE_LOB.LOADCLOBFROMFILE	Loads an external database file of the specified length in the specified location to a CLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADCLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
DBE_LOB.CONVERTTOBLOB	Converts a CLOB file to a BLOB file (less than or equal to 1 GB).
DBE_LOB.CONVERTTOCLOB	Converts a BLOB file to a CLOB file (less than or equal to 1 GB).
DBE_LOB.LOB_CONVERTTOBLOB	Converts a CLOB file to a BLOB file.
DBE_LOB.LOB_CONVERTTOCLOB	Converts a BLOB file to a CLOB file.
DBE_LOB.GETCHUNKSIZE	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
DBE_LOB.LOB_WRITE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
DBE_LOB.BFILENAME	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.GET_LENGTH

  Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

  The prototype of the DBE_LOB.GET_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
   blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
   clob_obj IN CLOB)
RETURN INTEGER;
```

  Table 10-186 DBE_LOB.GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- DBE_LOB.LOB_GET_LENGTH

  Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

  The prototype of the DBE_LOB.LOB_GET_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
   blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

  Table 10-187 DBE_LOB.LOB_GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- DBE_LOB.OPEN

  Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

  The prototype of the DBE_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
   lob INOUT BLOB);

DBE_LOB.OPEN (
   lob INOUT CLOB);

DBE_LOB.OPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'null');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-188 DBE_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.
open_mode	Operation mode. Currently, the range is [R,W,A,RB,WB,AB].

- DBE_LOB.READ

  Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

  The prototype of the DBE_LOB.READ function is as follows:

```
DBE_LOB.READ (
   blob_obj IN  BLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT RAW);

DBE_LOB.READ (
   clob_obj IN  CLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT VARCHAR2);
```

Table 10-189 DBE_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Length of read content **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.LOB_READ

  Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_READ function is as follows:

```
DBE_LOB.LOB_READ(
   blob_obj IN    BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT,
   out_put  OUT   RAW);

DBE_LOB.LOB_READ(
   clob_obj IN    CLOB,
   amount   INOUT BIGINT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  off_set  IN    BIGINT,
  out_put  OUT   VARCHAR2);

DBE_LOB.LOB_READ(
  bfile   IN    DBE_LOB.BFILE,
  amount  INOUT BIGINT,
  off_set IN    BIGINT,
  out_put OUT   RAW);
```

Table 10-190 DBE_LOB.LOB_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.WRITE

  Writes content in the source to a LOB based on the specified length and initial position.

  The prototype of the DBE_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
  blob_obj INOUT BLOB,
  amount   IN    INTEGER,
  off_set  IN    INTEGER,
  source   IN    RAW);

DBE_LOB.WRITE (
  clob_obj INOUT CLOB,
  amount   IN    INTEGER,
  off_set  IN    INTEGER,
  source   IN    VARCHAR2);
```

Table 10-191 DBE_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

- DBE_LOB.WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.WRITE_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
   blob_obj   INOUT BLOB,
   amount     IN    INTEGER,
   source_obj IN    RAW);

DBE_LOB.WRITE_APPEND (
   clob_obj   INOUT CLOB,
   amount     IN    INTEGER,
   source_obj IN    VARCHAR2);
```

  Table 10-192 DBE_LOB.WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE_LOB.LOB_WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.LOB_WRITE_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
   blob_obj    INOUT BLOB,
   amount      IN    INTEGER,
   source_obj  IN    RAW);

DBE_LOB.LOB_WRITE_APPEND (
   clob_obj    INOUT CLOB,
   amount      IN    INTEGER,
   source_obj  IN    VARCHAR2);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-193 DBE_LOB.LOB_WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE_LOB.COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
   dest_lob   INOUT BLOB,
   src_lob    IN    BLOB,
   len        IN    INTEGER,
   dest_start IN    INTEGER DEFAULT 1,
   src_start  IN    INTEGER DEFAULT 1);
```

Table 10-194 DBE_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted.
src_lob	LOB from which the buffer content is to be copied.
len	Length of the copied data.
dest_start	Start position for pasting the buffer content to the target LOB (**dest_lob**), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB (**src_lob**), that is, the offset bytes to the initial position of LOB content.

- DBE_LOB.LOB_COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
   blob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
   clob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  amount      IN    BIGINT,
  dest_offset IN    BIGINT DEFAULT 1,
  src_offset  IN    BIGINT DEFAULT 1);
```

Table 10-195 DBE_LOB.LOB_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted.
source_obj	LOB from which the buffer content is to be copied.
amount	Length of the copied data. **NOTE** If the length to copy is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1, an error is reported.

- DBE_LOB.ERASE

  Deletes the content in a BLOB (not greater than 1 GB) based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

  The prototype of the DBE_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT INTEGER,
   off_set  IN    INTEGER DEFAULT 1);
```

Table 10-196 DBE_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content. The value cannot be greater than 1 GB. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE_LOB.LOB_ERASE

  Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

  The prototype of the DBE_LOB.LOB_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_ERASE (
   clob_obj INOUT CLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);
```

Table 10-197 DBE_LOB.LOB_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
off_set	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE_LOB.CLOSE

  Closes the LOB descriptor that has been opened.

  The prototype of the DBE_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
   lob IN BLOB);

DBE_LOB.CLOSE (
   lob IN CLOB);

DBE_LOB.CLOSE (
   file IN INTEGER);
```

Table 10-198 DBE_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE_LOB.MATCH

  Returns the Mth occurrence position of a string in a LOB or BFILE file. **NULL** is returned for an invalid input. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
   blob_obj    IN BLOB,
   blob_obj2   IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   clob_obj    IN CLOB,
   clob_obj2   IN VARCHAR2,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   bfile       IN DBE_LOB.BFILE,
   blob_obj2     IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-199 DBE_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using **DBE_LOB.BFILEOPEN** first). If this parameter is left blank, null is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, null is returned.
beg_inde x	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If a value out of the range is input, null is returned.
occur_ind ex	Number of pattern matching times. The minimum value is 1. **NOTE** If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, **0** is returned. If the value is out of the range from 1 to *LOBMAXSIZE*, null is returned.

- DBE_LOB.COMPARE

  Compares LOBs or BFILE objects.

  - If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
  - If the first LOB is smaller than the second, **–1** is returned. If the first LOB is larger than the second, **1** is returned.
  - If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
  - If both the values of **start_pos1** and **start_pos2** exceed the LOB/BFILE length, **0** is returned.

  The prototype of the DBE_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
   lob1       IN BLOB,
   lob2       IN BLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
   lob1       IN CLOB,
   lob2       IN CLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
DBE_LOB.COMPARE (
   file1      IN DBE_LOB.BFILE,
   file2      IN DBE_LOB.BFILE,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-200 DBE_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
len	Number of characters or bytes to be compared. The default value is **1073741312**.
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- DBE_LOB.SUBSTR

  Reads a LOB substring and returns the read substring.

  The prototype of the DBE_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR(
   lob_loc IN BLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
   lob_loc IN CLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN VARCHAR2;
```

Table 10-201 DBE_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.LOB_SUBSTR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE can be up to 32 TB.

The prototype of the DBE_LOB.LOB_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
   lob_loc IN BLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
   lob_loc IN CLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
   bfile   IN DBE_LOB.BFILE,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN RAW;
```

Table 10-202 DBE_LOB.LOB_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE__LOB.BFILEOPEN first. For BLOBs/ BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

  The prototype of the DBE_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
   lob_loc INOUT BLOB,
   newlen  IN INTEGER);

DBE_LOB.STRIP(
   lob_loc INOUT CLOB,
   newlen  IN INTEGER);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-203 DBE_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- DBE_LOB.LOB_STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.LOB_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
   lob_loc INOUT BLOB,
   newlen  IN    BIGINT);

DBE_LOB.LOB_STRIP(
   lob_loc INOUT CLOB,
   newlen  IN    BIGINT);
```

Table 10-204 DBE_LOB.LOB_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs. **NOTE** If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- DBE_LOB.CREATE_TEMPORARY

  Creates a temporary BLOB or CLOB. This API is used only for syntax compatibility.

  The prototype of the DBE_LOB.CREATE_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT BLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT CLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-205 DBE_LOB.CREATE_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE_LOB.APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
   blob_obj INOUT BLOB,
   source_obj  IN    BLOB);

DBE_LOB.APPEND (
   clob_obj INOUT CLOB,
   source_obj  IN    CLOB);
```

Table 10-206 DBE_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.LOB_APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.LOB_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
   blob_obj   INOUT BLOB,
   source_obj IN    BLOB);

DBE_LOB.LOB_APPEND(
   clob_obj   INOUT CLOB,
   source_obj IN    CLOB);
```

Table 10-207 DBE_LOB.LOB_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.FREETEMPORARY

  Frees LOB files created by CREATE_TEMPORARY.

  The prototype of the DBE_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
   blob INOUT BLOB);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_LOB.FREETEMPORARY (
   clob INOUT CLOB);
```

Table 10-208 DBE_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE_LOB.FILEOPEN

  Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session. The BFILE type is defined as follows:

  ```
  DBE_LOB.BFILE (
     directory TEXT,
     filename  TEXT,
     fd        INTEGER);
  ```

  The prototype of the DBE_LOB.FILEOPEN function is as follows:

  ```
  DBE_LOB.FILEOPEN (
     bfile     IN DBE_LOB.BFILE,
     open_mode IN TEXT)
  RETURN INTEGER;
  ```

  Table 10-209 DBE_LOB.FILEOPEN parameters

Parameter	Description
bfile	External database file to be opened. For a BFILE file, this parameter specifies the file path , file name, and file descriptor. **NOTE** The *file* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

- DBE_LOB.FILECLOSE

  Closes an external BFILE file.

  The prototype of the DBE_LOB.FILECLOSE function is as follows:

  ```
  DBE_LOB.FILECLOSE (
     file IN INTEGER);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-210 DBE_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE_LOB.BFILEOPEN

  Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

  The prototype of DBE_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'R');
```

Table 10-211 DBE_LOB.BFILEOPEN parameters

Parameter	Description
bfile	Opened database BFILE file as the INOUT parameter. **NOTE** The *bfile* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

Examples

```
-- Obtain the substring of the BFILE (the file content is ABCD).
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 1, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
NOTICE:  res:41
ANONYMOUS BLOCK EXECUTE
```

- DBE_LOB.BFILECLOSE

  Closes an external database BFILE file.

  The prototype of DBE_LOB.BFILECLOSE is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_LOB.BFILECLOSE (
   bfile INOUT DBE_LOB.BFILE);
```

Table 10-212 DBE_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- DBE_LOB.LOADFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
   dest_lob    IN BLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

Table 10-213 DBE_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADFROMBFILE

  Loads an external BFILE file to a LOB.

  The prototype of the DBE_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT BLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
   src_offset  IN    BIGINT DEFAULT 1)
RETURN BLOB;

DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1)
RETURN CLOB;
```

Table 10-214 DBE_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by **DBE_LOB.BFILEOPEN** first. The LOB can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the target LOB **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob    IN BLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-215 DBE_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMBFILE

  Loads an external BFILE file to a BLOB.

  The prototype of the DBE_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob     INOUT BLOB,
   src_file     IN     DEB_LOB.BFILE,
   amount       IN     BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-216 DBE_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

Parameter	Description
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMFILE

  Loads an external BFILE file to a CLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
   dest_lob    IN CLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

  Table 10-217 DBE_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMBFILE

  Loads an external BFILE file to a CLOB.

  The prototype of the DBE_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DEB_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-218 DBE_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.CONVERTTOBLOB

  Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
   dest_blob   IN BLOB,
   src_clob    IN CLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-219 DBE_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
   dest_blob   INOUT BLOB,
   src_clob    IN    CLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

  Table 10-220 DBE_LOB.LOB_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.CONVERTTOCLOB

  Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOCLOB function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_LOB.CONVERTTOCLOB(
   dest_clob   IN CLOB,
   src_blob    IN BLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN text;
```

Table 10-221 DBE_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
   dest_clob    INOUT CLOB,
   src_blob    IN    BLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-222 DBE_LOB.LOB_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.GETCHUNKSIZE

  Returns *TOAST_MAX_CHUNK_SIZE*. When LOB data is stored in the database, TOAST is used internally.

  The prototype of the DBE_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
   lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
   lob_loc IN BLOB
)RETURN INTEGER
```

  Table 10-223 DBE_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE_LOB.LOB_WRITE

  Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

  The prototype of the DBE_LOB.LOB_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
   clob_obj INOUT CLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
   blob_obj INOUT BLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    RAW
)
RETURN BLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-224 DBE_LOB.LOB_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
blob_obj/clob_obj	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to *blob_obj/clob_obj*
source	RAW/VARCHAR2	IN	No	Source object

- DBE_LOB.BFILENAME

  Constructs a BFILE based on the directory and file name.

  The prototype of DBE_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(
    directory IN TEXT,
    filename  IN TEXT)
RETURN DBE_LOB.BFILE;
```

Table 10-225 DBE_LOB.BFILENAME API parameters

Parameter	Description
directory	File path **NOTE** Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
filename	File name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');
 get_length
------------
          8
(1 row)

-- DBE_LOB.READ API
DECLARE
myraw  RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin

10.12.2.8 DBE_MATCH

API Description

Table 10-226 provides all APIs supported by the **DBE_MATCH** package.

Table 10-226 DBE_MATCH

API	Description
DBE_MATCH.EDIT_DISTANCE_SIMILARITY	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different.

- DBE_MATCH.EDIT_DISTANCE_SIMILARITY

  Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The prototype of the DBE_MATCH.EDIT_DISTANCE_SIMILARITY function is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
    str1 IN text,
    str2 IN text
)returns integer ;
```

Table 10-227 DBE_MATCH.EDIT_DISTANCE_SIMILARITY API parameters

Parameter	Description
str1	First character string. If the value is **null**, **0** is returned.
str2	Second character string. If the value is **null**, **0** is returned.

10.12.2.9 DBE_OUTPUT

NOTE

When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API Description

Table 10-228 provides all APIs supported by the **DBE_OUTPUT** package.

Table 10-228 DBE_OUTPUT

API	Description
DBE_OUTPUT.PRINT_LINE	Outputs the specified text with newline characters.
DBE_OUTPUT.PRINT	Outputs the specified text without newline characters.
DBE_OUTPUT.SET_BUFFER_SIZE	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
DBE_OUTPUT.DISABLE	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer.
DBE_OUTPUT.ENABLE	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.
DBE_OUTPUT.GET_LINE	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
DBE_OUTPUT.GET_LINES	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
DBE_OUTPUT.NEW_LINE	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
DBE_OUTPUT.PUT	Places an input string in the buffer without a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed.
DBE_OUTPUT.PUT_LINE	Places an input string in the buffer with a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_OUTPUT.PRINT_LINE

  Outputs the specified text and adds a newline character. The function prototype of **DBE_OUTPUT.PRINT_LINE** is as follows:

  ```
  DBE_OUTPUT.PRINT_LINE (
  format IN VARCHAR2);
  ```

  Table 10-229 DBE_OUTPUT.PRINT_LINE parameters

Parameter	Description
format	Output text.

- DBE_OUTPUT.PRINT

  Outputs the specified text without adding a newline character. The function prototype of **DBE_OUTPUT.PRINT** is as follows:

  ```
  DBE_OUTPUT.PRINT (
  format IN VARCHAR2);
  ```

  Table 10-230 DBE_OUTPUT.PRINT parameters

Parameter	Description
format	Output text.

- DBE_OUTPUT.SET_BUFFER_SIZE

  The stored procedure **SET_BUFFER_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE_OUTPUT.SET_BUFFER_SIZE** is as follows:

  ```
  DBE_OUTPUT.SET_BUFFER_SIZE (
  size IN INTEGER default 20000);
  ```

  Table 10-231 DBE_OUTPUT.SET_BUFFER_SIZE parameters

Parameter	Description
size	Sets the output buffer size.

- DBE_OUTPUT.DISABLE

  Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and clears the output buffer. The prototype of the DBE_OUTPUT.DISABLE function is as follows:

  ```
  DBE_OUTPUT.DISABLE;
  ```

- DBE_OUTPUT.ENABLE

  Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size. If the buffer size is not specified, 20,000 bytes are allowed by default. The prototype of the DBE_OUTPUT.ENABLE function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_OUTPUT.ENABLE (
   buffer_size IN INTEGER DEFAULT 20000
);
```

Table 10-232 DBE_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If **buffer_size** is set to **NULL**, the default value (20000 bytes) is used.

- DBE_OUTPUT.GET_LINE

  The stored procedure **GET_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE_OUTPUT.GET_LINE function is as follows:

  ```
  DBE_OUTPUT.GET_LINE (
     line   OUT VARCHAR2,
     status OUT INTEGER
  );
  ```

  Table 10-233 DBE_OUTPUT.GET_LINE parameters

Parameter	Description
line	Indicates the obtained character string.
status	Specifies whether the calling is normal. If a character string is obtained, the value is **0**. Otherwise, the value is **1**.

- DBE_OUTPUT.GET_LINES

  The stored procedure **GET_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE_OUTPUT.GET_LINES function is as follows:

  ```
  DBE_OUTPUT.GET_LINES (
     lines    OUT   VARCHAR[],
     numlines IN OUT INTEGER
  );
  ```

  Table 10-234 DBE_OUTPUT.GET_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of lines actually retrieved. If the output value is less than the input value, there are no more lines in the buffer.

- DBE_OUTPUT.NEW_LINE

  The stored procedure **NEW_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE_OUTPUT.NEW_LINE function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_OUTPUT.NEW_LINE;
```

- DBE_OUTPUT.PUT

  The stored procedure **PUT** places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT function is as follows:

  ```
  DBE_OUTPUT.PUT (
     item IN VARCHAR2);
  ```

  Table 10-235 DBE_OUTPUT.PUT parameters

Parameter	Description
item	Character or character string to be placed in the buffer.

- DBE_OUTPUT.PUT_LINE

  The stored procedure **PUT_LINE** places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT_LINE function is as follows:

  ```
  DBE_OUTPUT.PUT_LINE (
     item IN VARCHAR2);
  ```

  Table 10-236 DBE_OUTPUT.PUT_LINE parameters

Parameter	Description
item	Character or character string to be placed in the buffer.

Examples

```
BEGIN
    DBE_OUTPUT.SET_BUFFER_SIZE(50);
    DBE_OUTPUT.PRINT('hello, ');
    DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!"
END;
/

NOTE

When the character encoding type server_encoding of the server is not UTF-8, if the character encoding in the data is valid UTF-8 encoding, when processing the character encoding, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions convert the character encoding into the server_encoding encoding format based on the UTF8 encoding logic before performing subsequent operations, as a result, the return values of the functions may not meet the expectation or an error may be reported. After the GUC parameter **enable_convert_illegal_char** is enabled, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions process such codes in the same way as when the parameter is disabled. Special characters are not output as placeholders, therefore, you are advised not to use the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions for data containing special characters.

10.12.2.10 DBE_PROFILER

The plprofiler provides an API for analyzing applications of stored procedures. It can collect, store, and delete data related to stored procedures.

Overview

Finding performance problems in PL/SQL functions and stored procedures may be difficult. The only query visible in the system or extended view is sent from the client. This is just the outermost stored procedure call. The plprofiler extension can be used to quickly identify the most time-consuming stored procedures and view the time consumption of a single statement.

You can use this tool to create a stored procedure and related table information in a session, call the plprofiler API to profiling the stored procedure, and then execute the stored procedure. In this case, the analysis data of the stored procedure is generated. You can query the system catalog to obtain data. **Table 5 DBE_PROFILER.PL_PROFILING_FUNCTIONS** lists the stored procedures involved in the profiling. **Table 6 DBE_PROFILER.PL_PROFILING_DETAILS** records details about the execution time of each statement in a stored procedure. **Table 7 DBE_PROFILER.PL_PROFILING_CALLGRAPH** records call stack information and the overall execution time of each stored procedure. **Table 8 DBE_PROFILER.PL_PROFILING_TRACKINFO** records the execution time of each phase of the stored procedure. You can call DBE_PROFILER.PL_CLEAR_PROFILING to delete one piece of data or all data stored in the system catalog after profiling.

After pl_start_profiling is executed, the dbe_profiler tool initializes the memory to prepare for data recording, stubs the stored procedures that are executed subsequently, records detailed information at key points, and records the information in the memory. Data in the memory is written to the four system catalogs only after the transaction is committed. When using the dbe_profiler tool in a transaction, note that data in the memory is not written to the system catalog because the transaction is not committed during transaction execution. Data is written to the system catalog only after the commit operation is executed. Similarly, after the rollback operation is executed, all data is deleted.

Permissions

Common users can access the DBE_PROFILER.PL_PROFILING_FUNCTIONS, DBE_PROFILER.PL_PROFILING_DETAILS, DBE_PROFILER.PL_PROFILING_CALLGRAPH and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PROFILER.PL_PROFILING_TRACKINFO catalogs and have only the permission to query records.

APIs and System Catalogs

Table 1 DBE_PROFILER lists all APIs supported by the DBE_PROFILER advanced package.

Table 10-237 DBE_PROFILER

API	Description
DBE_PROFILER.PL_START_PLPROFILING	Allows users to perform profiling on target stored procedures.
DBE_PROFILER.PL_CLEAR_PROFILING	Deletes one piece of data or all data stored in system catalogs after profiling.

- DBE_PROFILER.PL_START_PLPROFILING

  Allows users to perform profiling on target stored procedures. The function prototype of the DBE_PROFILER.PL_START_PLPROFILING function is as follows:

  ```
  DBE_PROFILER.PL_START_PLPROFILING (run_id varchar2(64)) return void;
  ```

  Table 10-238 DBE_PROFILER.PL_START_PLPROFILING parameters

Parameter	Description
run_id	Execution ID of profiling. The system combines the session ID and execution ID into a character string in the format of sessionid_runid and writes the character string to the table as the unique ID of profiling.

- DBE_PROFILER.PL_CLEAR_PROFILING

  Deletes one piece of data or all data stored in system catalogs after profiling. The function prototype of the DBE_PROFILER.PL_CLEAR_PROFILING function is as follows:

  ```
  DBE_PROFILER.PL_CLEAR_PROFILING (run_id varchar2) return void;
  ```

  Table 10-239 DBE_PROFILER.PL_CLEAR_PROFILING parameters

Parameter	Description
run_id	If this parameter is not left empty, the unique ID of a profiling data record is deleted. If this parameter is left empty, all profiling data records are deleted.

The analysis data generated by the stored procedure is stored in the database system catalog. The catalog information is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-240 Catalog overview

Name
Table 5 DBE_PROFILER.PL_PROFILING_FUNCTIONS
Table 6 DBE_PROFILER.PL_PROFILING_DETAILS
Table 7 DBE_PROFILER.PL_PROFILING_CALLGRAPH
Table 8 DBE_PROFILER.PL_PROFILING_TRACKINFO

- Information about the DBE_PROFILER.PL_PROFILING_FUNCTIONS catalog is as follows:

  Table 10-241 DBE_PROFILER.PL_PROFILING_FUNCTIONS

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
schema	TEXT NOT NULL	Schema name.
funcname	TEXT NOT NULL	Stored procedure name.
total_occur	BIGINT	Total number of stored procedure execution times.
total_time	BIGINT	Total execution time of a stored procedure.

- Information about the DBE_PROFILER.PL_PROFILING_DETAILS catalog is as follows:

  Table 10-242 DBE_PROFILER.PL_PROFILING_DETAILS

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
line#	INTEGER NOT NULL	Line number.
source	TEXT	Stored procedure execution statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
cmd_type	TEXT	Statement type.
total_occur	BIGINT	Number of statement execution times.
total_time	BIGINT	Total execution time of a statement.
min_time	BIGINT	Minimum execution time of a statement.
max_time	BIGINT	Maximum execution time of a statement.

- Information about the DBE_PROFILER.PL_PROFILING_CALLGRAPH catalog is as follows:

  Table 10-243 DBE_PROFILER.PL_PROFILING_CALLGRAPH

Column	Type	Description
run_id	varchar2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
stack	text[] NOT NULL	Call stack.
self_time	bigint	Stored procedure execution time.

- Information about the DBE_PROFILER.PL_PROFILING_TRACKINFO catalog is as follows:

  Table 10-244 DBE_PROFILER.PL_PROFILING_TRACKINFO

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
step_name	TEXT NOT NULL	Execution phase name.
loops_count	INTEGER	Total number of execution times of the execution phase.
max_time	BIGINT	Maximum execution time of the execution phase.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
min_time	BIGINT	Minimum execution time of the execution phase.
avg_time	BIGINT	Average execution time of the execution phase.
total_time	BIGINT	Total execution time of the execution phase.

Constraints

- The dbe_profiler.pl_start_profiling cannot be used in a stored procedure. Calling it in a stored procedure does not take effect.
- The dbe_profiler.pl_start_profiling does not support the function of recording transaction failure statistics to the system catalog.
- The length of the input parameter **runid** of dbe_profiler.pl_start_profiling is limited to 64 characters. If the length exceeds 64 characters, an error is reported.
- If the input parameter of dbe_profiler.pl_start_profiling is the same as the value of **runid** in the profiler system catalog, an error is reported.
- The plprofiler does not support anonymous block statements, PACKAGE initialization statements, and statements in nested subprograms.
- Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. Therefore, the plprofiler cannot record information about stored procedures that contain autonomous transactions.

Examples

```
-- Step 1 Create tables and stored procedures.
gaussdb=# DROP TABLE IF EXISTS t1;
gaussdb=# CREATE TABLE t1 (i int);
gaussdb=# CREATE OR REPLACE PROCEDURE p1() AS
    sql_stmt varchar2(200);
    result number;
BEGIN
    for i in 1..1000 loop
      insert into t1 values(1);
    end loop;
    sql_stmt := 'select count(*) from t1';
    EXECUTE IMMEDIATE sql_stmt into result;
END;
/
gaussdb=# CREATE OR REPLACE PROCEDURE p2() AS
BEGIN
   p1();
END;
/
gaussdb=# CREATE OR REPLACE PROCEDURE p3() AS
BEGIN
    p2();
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Step 2 Call the plprofiler API to profile the stored procedures.
gaussdb=# SELECT dbe_profiler.pl_start_profiling('123');
gaussdb=# CALL p3();

-- Step 3 Query profiling information.
-- Query the dbe_profiler.pl_profiling_functions catalog to check the stored procedures involved in profiling.

10.12.2.11 DBE_RANDOM

Interface Description

Table 10-245 lists all interfaces supported by the **DBE_RANDOM** package.

Table 10-245 DBE_RANDOM interface parameters

Interface	Description
DBE_RANDOM.SET_SEED	Sets a seed for a random number.
DBE_RANDOM.GET_VALUE	Generates a random number between a specified **low** and a specified **high**.

- DBE_RANDOM.SET_SEED

  The stored procedure **SEED** is used to set a seed for a random number. The prototype of the **DBE_RANDOM.SET_SEED** function is as follows:

  ```
  DBE_RANDOM.SET_SEED (seed  IN  INTEGER);
  ```

  Table 10-246 DBE_RANDOM.SET_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE_RANDOM.GET_VALUE

  The GET_VALUE function generates a random number between a specified **low** and a specified **high**. The prototype of the **DBE_RANDOM.GET_VALUE** function is as follows:

  ```
  DBE_RANDOM.GET_VALUE(
  min  IN  NUMBER default 0,
  max  IN  NUMBER default 1)
  RETURN NUMBER;
  ```

  Table 10-247 DBE_RANDOM.GET_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to **min**.
max	Sets the high bound for a random number. The generated random number is less than **max**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The only requirement is that the parameter type is numeric regardless of the right and left bound values.
- **DBE_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);
    get_value
------------------
 .917468812743886
(1 row)

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
 trunc
-------
    26
(1 row)
```

10.12.2.12 DBE_RAW

The DBE_RAW package provides interfaces for operating RAW types.

NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

Interface Description

Table 10-248 provides all interfaces supported by the **DBE_RAW** package.

Table 10-248 DBE_RAW

Interface	Description
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW	Converts an INTEGER value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER	Converts a RAW value to an INTEGER value.
DBE_RAW.GET_LENGTH	Returns the length of a RAW value.
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW	Converts a VARCHAR2 value to a RAW value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_RAW.CAST_TO_VARCHAR2	Converts a RAW value to a VARCHAR2 value.
DBE_RAW.BIT_OR	Returns a RAW value after bitwise OR calculation.
DBE_RAW.SUBSTR	Returns the substring of a RAW value.
DBE_RAW.BIT_AND	Returns a RAW value after bitwise AND calculation.
DBE_RAW.BIT_COMPLEMENT	Returns a RAW value after bitwise complement calculation.
DBE_RAW.BIT_XOR	Returns a RAW value after bitwise XOR calculation.
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW	Converts a BINARY_DOUBLE value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE	Converts a RAW value to a BINARY_DOUBLE value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT	Converts a RAW value to a FLOAT4 value.
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW	Converts a FLOAT4 value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NUMBER	Converts a RAW value to a NUMERIC value.
DBE_RAW.CAST_FROM_NUMBER_TO_RAW	Converts a NUMERIC value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2	Converts a RAW value to an NVARCHAR2 value.
DBE_RAW.COMPARE	Returns the first different position of two RAW values.
DBE_RAW.CONCAT	Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.
DBE_RAW.CONVERT	Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.
DBE_RAW.COPIES	Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result.
DBE_RAW.OVERLAY	Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.
DBE_RAW.REVERSE	Reverses RAW data by byte.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_RAW.TRANSLATE	Converts or discards a specified byte of a RAW value.
DBE_RAW.TRANSLITERATE	Converts a specified byte of a RAW value.
DBE_RAW.XRANGE	Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

- DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW

  Converts an INTEGER value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(
    value     IN BIGINT,
    endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

  Table 10-249 DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW parameters

Parameter	Description
value	INTEGER value to be converted. **NOTE** The DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW expects to process values of the INTEGER type. For compatibility purposes, this parameter is defined as the BIGINT type. The BIGINT type has a larger range than the INTEGER type, which does not affect the interface use.
endianess	Endianness. The value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN). The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER

  Converts a RAW value to an INTEGER value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER(
    value     IN RAW,
    endianess IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-250 DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER parameters

Parameter	Description
value	RAW value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.GET_LENGTH

  Returns the length of a RAW value.

  The prototype of the DBE_RAW.GET_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
    value IN RAW)
RETURN INTEGER;
```

Table 10-251 DBE_RAW.GET_LENGTH parameters

Parameter	Description
value	RAW value.

- DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW

  Converts a VARCHAR2 value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW(
    str IN VARCHAR2)
RETURN RAW;
```

Table 10-252 DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE_RAW.CAST_TO_VARCHAR2

  Converts a RAW value to a VARCHAR2 value.

  The prototype of the DBE_RAW.CAST_TO_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
    str IN RAW)
RETURN VARCHAR2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-253 DBE_RAW.CAST_TO_VARCHAR2 parameters

Parameter	Description
str	RAW value to be converted.

- DBE_RAW.BIT_OR

  Returns the value of two RAW values after bitwise OR calculation.

  The prototype of the DBE_RAW.BIT_OR function is as follows:

```
DBE_RAW.BIT_OR(
   str1 IN TEXT,
   str2 IN TEXT)
RETURN TEXT;
```

Table 10-254 DBE_RAW.BIT_OR parameters

Parameter	Description
str1	First character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.
str2	Second character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.

- DBE_RAW.SUBSTR

  Truncates a RAW value based on the start position *bit off_set* and length *amount*.

  The prototype of the DBE_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
   IN lob_loc BLOB,
   IN off_set INTEGER DEFAULT 1,
   IN amount INTEGER DEFAULT 32767)
RETURN RAW;
```

Table 10-255 DBE_RAW.SUBSTR parameters

Parameter	Description
lob_loc	Source RAW value. **NOTE** Due to legacy reasons, this parameter is defined as the BLOB type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the BLOB type does not affect the processing of RAW values.
off_set	Start position of the substring. The default value is **1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
amount	Substring length. The default value is **32767**.

- DBE_RAW.BIT_AND

  Obtains the bitwise AND result of two RAW values.

  The prototype of the DBE_RAW.BIT_AND function is as follows:

```
DBE_RAW.BIT_AND(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

  Table 10-256 DBE_RAW.BIT_AND parameters

Parameter	Description
r1	The RAW value for the bitwise AND operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise AND operation with r1. The maximum length is 32767.

- DBE_RAW.BIT_COMPLEMENT

  Obtains the bitwise complement result of a RAW value.

  The prototype of the DBE_RAW.BIT_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
   r IN RAW)
RETURN RAW;
```

  Table 10-257 DBE_RAW.BIT_COMPLEMENT parameters

Parameter	Description
r	The RAW value for the bitwise complement operation. The maximum length is 32767.

- DBE_RAW.BIT_XOR

  Obtains the bitwise XOR result of two RAW values.

  The prototype of the DBE_RAW.BIT_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

  Table 10-258 DBE_RAW.BIT_XOR parameters

Parameter	Description
r1	The RAW value for the bitwise XOR operation with r2. The maximum length is 32767.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
r2	The RAW value for the bitwise XOR operation with r1. The maximum length is 32767.

- DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW

  Converts a BINARY_DOUBLE value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
   n         IN BINARY_DOUBLE,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

  Table 10-259 DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW parameters

Parameter	Description
n	BINARY_DOUBLE value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE

  Converts a RAW value to a BINARY_DOUBLE value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

  Table 10-260 DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE parameters

Parameter	Description
r	The RAW value to be converted. The value contains 8 to 32767 characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT

  Converts a RAW value to a FLOAT4 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

Table 10-261 DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT parameters

Parameter	Description
r	The RAW value to be converted. The value contains 4 to 32767 characters.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW

  Converts a FLOAT4 value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
   n         IN FLOAT4,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-262 DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW parameters

Parameter	Description
n	FLOAT4 value to be converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_NUMBER

  Converts a RAW value to a NUMERIC value.

  NOTE

  The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the raw data corresponding to the number-type data in database A. For details about the number-type data in GaussDB, see the example.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(
    r IN RAW)
RETURN NUMERIC;
```

  Table 10-263 DBE_RAW.CAST_FROM_RAW_TO_NUMBER parameters

Parameter	Description
r	The RAW value to be converted. The value contains 6 to 32767 characters.

- DBE_RAW.CAST_FROM_NUMBER_TO_RAW

  Converts a NUMERIC value to a RAW value.

  NOTE

  The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot restore the raw data corresponding to the number-type data in database A to the original number type in database A in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

  The prototype of the DBE_RAW.CAST_FROM_NUMBER_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(
    n IN NUMERIC)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-264 DBE_RAW.CAST_FROM_NUMBER_TO_RAW parameters

Parameter	Description
n	NUMERIC value to be converted.

- DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2

  Converts a RAW value to an NVARCHAR2 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(
   r IN RAW)
RETURN NVARCHAR2;
```

Table 10-265 DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.

- DBE_RAW.COMPARE

  Returns the first different position of two RAW values.

  The prototype of the DBE_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
RETURN INTEGER;
```

Table 10-266 DBE_RAW.COMPARE parameters

Parameter	Description
r1	First data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
r2	Second data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
pad	The first byte of **pad** is used to extend the shorter one of **r1** or **r2**. The maximum length is 32767. If this parameter is set to **NULL**, the length is 0, or the default value is used, the extended value is **0x00**.

- DBE_RAW.CONCAT

  Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(
   r1  IN RAW DEFAULT NULL,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  r2  IN RAW DEFAULT NULL,
  r3  IN RAW DEFAULT NULL,
  r4  IN RAW DEFAULT NULL,
  r5  IN RAW DEFAULT NULL,
  r6  IN RAW DEFAULT NULL,
  r7  IN RAW DEFAULT NULL,
  r8  IN RAW DEFAULT NULL,
  r9  IN RAW DEFAULT NULL,
  r10 IN RAW DEFAULT NULL,
  r11 IN RAW DEFAULT NULL,
  r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Table 10-267 DBE_RAW.CONCAT parameters

Parameter	Description
r1...r12	The RAW values to be concatenated.

- DBE_RAW.CONVERT

  Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.

  If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the pg_conversion system catalog for details.

  The prototype of the DBE_RAW.CONVERT function is as follows:

  ```
  DBE_RAW.CONVERT(
    r           IN RAW,
    to_charset   IN VARCHAR2,
    from_charset IN VARCHAR2)
  RETURN RAW;
  ```

  Table 10-268 DBE_RAW.CONVERT parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.
to_charset	Name of the target encoding character set.
from_charset	Name of the source encoding character set. In this encoding, **r** must be valid.

- DBE_RAW.COPIES

  Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.COPIES function is as follows:

  ```
  DBE_RAW.COPIES(
    r IN RAW,
    n IN NUMERIC)
  RETURN RAW;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-269 DBE_RAW.COPIES parameters

Parameter	Description
r	The RAW values to be copied.
n	Number of replications. The value must be a positive number. If the value is a decimal, the value is rounded off.

- DBE_RAW.OVERLAY

  Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

  The prototype of the DBE_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
RETURN RAW;
```

Table 10-270 DBE_RAW.OVERLAY parameters

Parameter	Description
overlay_str	Byte used for overwriting. The value cannot be NULL.
target	Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
pos	Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of **pos** must be greater than or equal to 1 and the value of **len+pos** must be less than or equal to 32767. The default value is **1**.
len	Length to be overlaid. The value of **len** must be greater than or equal to 0 and the value of **len+pos** must be less than or equal to 32767. The default value is the length of **overlay_str**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.REVERSE

  Reverses RAW data by byte.

  The prototype of the DBE_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
   r IN RAW
)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-271 DBE_RAW.REVERSE parameters

Parameter	Description
r	The RAW value to be reversed. The maximum length is 32767. If the value is **NULL**, **NULL** is returned.

- DBE_RAW.TRANSLATE

  Converts or discards a specified byte of a RAW value.

  The prototype of the DBE_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
RETURN RAW;
```

Table 10-272 DBE_RAW.TRANSLATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
from_set	Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be NULL. The bytes in **from_set** in the source byte string are replaced with the bytes in the corresponding positions in **to_set**. If **from_set** contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if **r[x]=from_set[n]**, **r[x]** is replaced with **to_set[n]**. If **to_set[n]** corresponding to **from_set[n]** does not exist (that is, the number of bytes of **to_set** does not exceed **n**), **r[x]** will be discarded.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The value cannot be NULL.

- DBE_RAW.TRANSLITERATE

  Converts a RAW value to a NUMERIC value.

  The prototype of the DBE_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
   r        IN RAW,
   from_set IN RAW DEFAULT NULL,
   to_set   IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-273 DBE_RAW.TRANSLITERATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The default value is **NULL**. If the value is **NULL**, all bytes in **r** that exist in **from_set** are converted to **pad**.
from_set	Bytecode to be converted in the source byte string **r**. The value is of the RAW type. The default value is **NULL**. If **from_set** is **NULL**, all bytes in the source byte string **r** are converted into equal-length data filled by **pad**. Otherwise, the bytes in **from_set** in the source byte string **r** are replaced with the bytes in the corresponding position in **to_set**. For example, if **r[x]=from_set[n]**, **r[x]** is converted to **to_set[n]**. If **to_set[n]** does not exist, **r[x]** will be converted to **pad**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.XRANGE

  Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

  The prototype of the DBE_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
   start_byte IN RAW,
   end_byte   IN RAW)
RETURN RAW;
```

Table 10-274 DBE_RAW.XRANGE parameters

Parameter	Description
start_byte	Start byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0x00** by default.
end_byte	End byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0xFF** by default. If **end_byte** is less than **start_byte**, **end_byte** is concatenated to **0XFF**, and then **0x00** is concatenated to **start_byte**.

Permissions

The DBE_RAW schema is a system catalog. Only the system administrator has the permission to create the DBE_RAW schema during database initialization. All users have the permission to use the schema and interfaces under the schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.12.2.13 DBE_SCHEDULER

API Description

The advanced package **DBE_SCHEDULER** supports more flexible creation of scheduled jobs through scheduling and programing. For details about all the supported APIs, see **Table 10-275**.

Table 10-275 DBE_SCHEDULER

API	Description
DBE_SCHEDULER.CREATE_JOB	Creates a scheduled job.
DBE_SCHEDULER.DROP_JOB	Deletes scheduled jobs.
DBE_SCHEDULER.DROP_SINGLE_JOB	Deletes a single scheduled job.
DBE_SCHEDULER.SET_ATTRIBUTE	Sets object attributes.
DBE_SCHEDULER.RUN_JOB	Runs a scheduled job.
DBE_SCHEDULER.RUN_BACKEND_JOB	Runs a scheduled job in the backend.
DBE_SCHEDULER.RUN_FOREGROUND_JOB	Runs a scheduled job in the frontend.
DBE_SCHEDULER.STOP_JOB	Stops scheduled jobs.
DBE_SCHEDULER.STOP_SINGLE_JOB	Stops a single scheduled job.
DBE_SCHEDULER.GENERATE_JOB_NAME	Generates a scheduled job name.
DBE_SCHEDULER.CREATE_PROGRAM	Creates a program.
DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT	Defines program parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SCHEDULER.DROP_PROGRAM	Deletes a program.
DBE_SCHEDULER.DROP_SINGLE_PROGRAM	Deletes a single program.
DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE	Sets scheduled job parameters.
DBE_SCHEDULER.CREATE_SCHEDULE	Creates a schedule.
DBE_SCHEDULER.DROP_SCHEDULE	Deletes schedules.
DBE_SCHEDULER.DROP_SINGLE_SCHEDULE	Deletes a single schedule.
DBE_SCHEDULER.CREATE_JOB_CLASS	Creates a scheduled job class.
DBE_SCHEDULER.DROP_JOB_CLASS	Deletes scheduled job classes.
DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS	Deletes a single scheduled job class.
DBE_SCHEDULER.GRANT_USER_AUTHORIZATION	Grants special permissions to a user.
DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION	Revokes special permissions from a user.
DBE_SCHEDULER.CREATE_CREDENTIAL	Creates a certificate.
DBE_SCHEDULER.DROP_CREDENTIAL	Destroys a certificate.
DBE_SCHEDULER.ENABLE	Enables an object.
DBE_SCHEDULER.ENABLE_SINGLE	Enables a single object.
DBE_SCHEDULER.DISABLE	Disables objects.
DBE_SCHEDULER.DISABLE_SINGLE	Disables a single object.
DBE_SCHEDULER.EVAL_CALENDAR_STRING	Analyzes the scheduled job period.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SCHEDULER.EVALUATE_CALENDAR_STRING	Analyzes the scheduled job period.

- DBE_SCHEDULER.CREATE_JOB

  Creates a scheduled job.

  The prototypes of the DBE_SCHEDULER.CREATE_JOB function are as follows:

```
-- Scheduled jobs of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created scheduled jobs of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created program and the scheduled job of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',

credential_name TEXT                DEFAULT NULL,
destination_name TEXT               DEFAULT NULL
)
```

NOTE

The scheduled job created through **DBE_SCHEDULER** does not conflict with the scheduled job in **DBE_TASK**.

The scheduled job created by **DBE_SCHEDULER** generates the corresponding **job_id**. However, the **job_id** is meaningless.

For the create API, the validity of input parameter types is not verified. Successful creation does not mean successful execution. You can query the execution status of the current job in the pg_job system catalog.

Table 10-276 DBE_SCHEDULER.CREATE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled job. In non-ILM scheduling scenarios, jobs prefixed with "ilmadowind$_" and "ilmjob$_" cannot be created.
job_type	text	IN	No	Inline program type of a scheduled job. The options are as follows: • **'PLSQL_BLOCK'**: fast anonymous stored procedure. • **'STORED_PROCEDURE'**: stored procedure that is saved. • **'EXTERNAL_SCRIPT'**: external script.
job_action	text	IN	No	Content executed by an inline program of a scheduled job.
number_of_arguments	integer	IN	No	Number of inline program parameters of a scheduled job.
program_name	text	IN	No	Name of the program referenced by a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
start_date	timestamp with time zone	IN	Yes	Inline scheduling start time of a scheduled job.
repeat_interval	text	IN	Yes	Inline scheduling period of a scheduled job. The options are as follows: ● 'interval N second/minute/hour/day/week/month/year' ● 'FREQ=secondly/miuntely/hourly/daily/weekly/monthly/yearly; INTERVAL=N' ● trunc(sysdate+N) + M/24 (indicating that schedule will be started in *M* hours after *N* days)
end_date	timestamp with time zone	IN	Yes	Inline scheduling expiration time of a scheduled job.
schedule_name	text	IN	No	Name of the schedule referenced by a scheduled job.
job_class	text	IN	No	Name of a scheduled job class.
enabled	boolean	IN	No	Status of a scheduled job.
auto_drop	boolean	IN	No	Automatic deletion of a scheduled job.
comments	text	IN	Yes	Comments.
job_style	text	IN	No	Behavior pattern of a scheduled job. Only **'REGULAR'** is supported.
credential_name	text	IN	Yes	Certificate name of a scheduled job.
destination_name	text	IN	Yes	Target name of a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

To create a scheduled job of the EXTERNAL_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- DBE_SCHEDULER.DROP_JOB

  Deletes scheduled jobs.

  The prototype of the DBE_SCHEDULER.DROP_JOB function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean                   default false,
defer boolean                   default false,
commit_semantics text      default 'STOP_ON_FIRST_ERROR'
)
```

  NOTE

  DBE_SCHEDULER.DROP_JOB can specify one or more jobs, or specify a job class to delete a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-277 DBE_SCHEDULER.DROP_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	One or more scheduled job names or classes. If you specify multiple scheduled jobs, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled job. ● **true**: The current scheduled job is stopped and then deleted. ● **false**: The scheduled job fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled job. ● **true**: A scheduled job can be deleted after it is complete. ● **false**: The scheduled job cannot be executed and is deleted.
commit_semantics	text	IN	No	Commit rules: ● **'STOP_ON_FIRST_ERROR'**: The deletion operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The deletion operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the deletion operation that is performed successfully.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

The **TRANSACTIONAL** option in **commit_semantic** takes effect only when **force** is set to **false**.

- DBE_SCHEDULER.DROP_SINGLE_JOB

  Deletes a scheduled job.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_JOB function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean                   default false,
defer boolean                   default false
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-278 DBE_SCHEDULER.DROP_SINGLE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Specifies the name of a scheduled job or scheduled job class.
force	boolean	IN	No	Specifies whether to delete a scheduled job. ● **true**: The current scheduled job is stopped and then deleted. ● **false**: The scheduled job fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled job. ● **true**: A scheduled job can be deleted after it is complete. ● **false**: The scheduled job cannot be executed and is deleted.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 0, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval ''3 minute''',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false,'test', 'style', NULL, NULL);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
 drop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.SET_ATTRIBUTE

  Modifies the attributes of a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototypes of the DBE_SCHEDULER.SET_ATTRIBUTE function are as follows:

```
DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               boolean
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               text
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               timestamp
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text                     default NULL
)
```

NOTE

name specifies any object in **DBE_SCHEDULER**.

Table 10-279 DBE_SCHEDULER.SET_ATTRIBUTE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
attribute	text	IN	No	Attribute name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	boolean/date/timestamp/timestamp with time zone/text	IN	No	Attribute value. The options are as follows: • Scheduled-job-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, ob_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style. • Program-related: program_action, program_type, number_of_arguments, and comments. • Scheduling-related: start_date, repeat_interval, end_date, and comments.
value2	text	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
 set_attribute
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
 set_attribute
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)
```

NOTICE

Do not use DBE_SCHEDULER.SET_ATTRIBUTE to leave the parameters empty.

The object name cannot be changed using DBE_SCHEDULER.SET_ATTRIBUTE.

- DBE_SCHEDULER.RUN_JOB

  Runs a scheduled job.

  The prototype of the DBE_SCHEDULER.RUN_JOB function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean             default true
)
```

  NOTE

  DBE_SCHEDULER.RUN_JOB is used to run scheduled jobs immediately. It is independent of the scheduling of scheduled jobs and can even run at the same time.

  Table 10-280 DBE_SCHEDULER.RUN_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	One or more scheduled job names. If you specify multiple scheduled jobs, separate them with commas (,).
use_current_session	boolean	IN	No	Specifies whether to run a scheduled job. • **true**: Use the current session to check whether the scheduled job can run properly. • **false**: Start the scheduled job in the backend. The execution result is recorded in logs.

  Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.run_job('job1', false);
 run_job
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

NOTICE

use_current_session cannot be used to record execution results.

- DBE_SCHEDULER.RUN_BACKEND_JOB

  Runs a scheduled job in the backend.

  The prototype of the DBE_SCHEDULER.RUN_BACKEND_JOB function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

Table 10-281 DBE_SCHEDULER.RUN_BACKEND_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled job.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_backend_job('job1');
 run_backend_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)
```

- DBE_SCHEDULER.RUN_FOREGROUND_JOB

  Runs a scheduled job in the current session.

  Only external jobs can be executed.

  Return value: text

  The prototype of the DBE_SCHEDULER.RUN_FOREGROUND_JOB function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

Table 10-282 DBE_SCHEDULER.RUN_FOREGROUND_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled job.

Example:

```
gaussdb=# create user test1 identified by '*********';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# select DBE_SCHEDULER.create_credential('cre_1', 'test1', '*********');
 create_credential
-------------------

(1 row)

gaussdb=# select DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_foreground_job('job1');
  run_foreground_job
---------------------------------
 Host key verification failed.\r+

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------------

(1 row)

gaussdb=# drop user test1;
DROP ROLE
```

- DBE_SCHEDULER.STOP_JOB

  Stops scheduled jobs.

  The prototype of the DBE_SCHEDULER.STOP_JOB function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-283 DBE_SCHEDULER.STOP_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	One or more scheduled job names or classes. If you specify multiple scheduled jobs, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled job. ● **true**: The scheduler sends a termination signal to end the job thread immediately. ● **false**: The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.
commit_semantics	text	IN	No	Commit rules: ● **'STOP_ON_FIRST_ERROR'**: The interrupt operation performed before the first error is reported is committed. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the interrupt operation that is performed successfully.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
 stop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.STOP_SINGLE_JOB

  Stops a single scheduled job.

  The prototype of the DBE_SCHEDULER.STOP_SINGLE_JOB function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
force boolean                    default false
)
```

Table 10-284 DBE_SCHEDULER.STOP_SINGLE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Specifies the name of a scheduled job or scheduled job class.
force	boolean	IN	No	Specifies whether to delete a scheduled job. • **true**: The scheduler sends a termination signal to end the job thread immediately. • **false**: The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
 stop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.GENERATE_JOB_NAME

  Generates a scheduled job name.

  The prototype of the DBE_SCHEDULER.GENERATE_JOB_NAME function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text                     default 'JOB$_'
)return text
```

Table 10-285 DBE_SCHEDULER.GENERATE_JOB_NAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	text	IN	No	Prefix of the generated name. The default value is **'JOB$_'**. Scheduled jobs that are repeatedly executed are named as follows: job$_1, job$_2, job$_3 ...

Example:

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
--------------------
 JOB$_1
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
--------------------
 JOB$_2
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
--------------------
 job3
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
-------------------
 job4
(1 row)
```

NOTICE

When DBE_SCHEDULER.GENERATE_JOB_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE_SCHEDULER.CREATE_PROGRAM

  Creates a program.

  The prototype of the DBE_SCHEDULER.CREATE_PROGRAM function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer          default 0,
enabled boolean                    default false,
comments text                      default NULL
)
```

Table 10-286 DBE_SCHEDULER.CREATE_PROGRAM API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Program name.
program_type	text	IN	No	Program type. The options are as follows: • **'PLSQL_BLOCK'**: fast anonymous stored procedure. • **'STORED_PROCEDURE'**: stored procedure that is saved. • **'EXTERNAL_SCRIPT'**: external script.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_action	text	IN	No	Program operation.
number_of_arguments	integer	IN	No	Number of parameters used by the program.
enabled	boolean	IN	No	Specifies whether the program is enabled.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT

  Defines program parameters.

  An API with the default value **default_value** will not convert characters to lowercase letters by default. In this version, characters are case-sensitive.

  The prototype of the DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
out_argument boolean                 default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
default_value text,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
out_argument boolean                default false
)
```

Table 10-287 DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Program name.
argument_position	integer	IN	No	Parameter location.
argument_name	text	IN	No	Parameter name.
argument_type	text	IN	No	Parameter type.
default_value	text	IN	No	Default value.
out_argument	boolean	IN	No	Reserved parameter.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)
```

- DBE_SCHEDULER.DROP_PROGRAM

  Deletes a program.

  The prototype of the DBE_SCHEDULER.DROP_PROGRAM function is as follows:

  ```
  DBE_SCHEDULER.drop_program(
  program_name text,
  force boolean                    default false
  )
  ```

  Table 10-288 DBE_SCHEDULER.DROP_PROGRAM API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
program_name	text	IN	No	Program name.
force	boolean	IN	No	Specifies whether to delete a program. ● **true**: Before a program is deleted, all jobs that use the program are disabled. ● **false**: The program cannot be referenced by any job. Otherwise, an error is sent.

  Example:

  ```
  gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
  pg_sleep(1);', 2, false, 'test');
  create_program
  ----------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
   drop_program
  --------------

  (1 row)
  ```

- DBE_SCHEDULER.DROP_SINGLE_PROGRAM

  Deletes a single program.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_PROGRAM function is as follows:

  ```
  DBE_SCHEDULER.drop_single_program(
  program_name text,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
force boolean                   default false
)
```

Table 10-289 DBE_SCHEDULER.DROP_SINGLE_PROGRAM API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Program name.
force	boolean	IN	No	Specifies whether to delete a program. • **true**: Before a program is deleted, all jobs that use the program are disabled. • **false**: The program cannot be referenced by any job. Otherwise, an error is sent.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
 drop_single_program
---------------------

(1 row)
```

- DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE

  Sets scheduled job parameters. The **argument_value** can be left empty.

  The prototype of the DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)

DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-290 DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled job.
argument_position	integer	IN	No	Parameter location.
argument_name	text	IN	Yes	Parameter name.
argument_value	text	IN	Yes	Parameter value.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','EXTERNAL_SCRIPT','begin insert into test1
values(12); end;',2,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
 set_job_argument_value
------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.CREATE_SCHEDULE

  Creates a schedule.

  The prototype of the DBE_SCHEDULER.CREATE_SCHEDULE function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone      default NULL,
repeat_interval text,
end_date timestamp with time zone       default NULL,
comments text                          default NULL
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-291 DBE_SCHEDULER.CREATE_SCHEDULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
start_date	timestamp with time zone	IN	Yes	Start time of a schedule.
repeat_interval	text	IN	No	Repetition frequency of a schedule.
end_date	timestamp with time zone	IN	Yes	End time of a schedule.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SCHEDULE

  Deletes schedules.

  The prototype of the DBE_SCHEDULER.DROP_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_schedule(
schedule_name text,
force boolean                    default false
)
```

Table 10-292 DBE_SCHEDULER.DROP_SCHEDULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
force	boolean	IN	No	Specifies whether to delete a schedule. • **true**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **false**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_SCHEDULE

  Deletes a single schedule.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean                   default false
)
```

Table 10-293 DBE_SCHEDULER.DROP_SINGLE_SCHEDULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
force	boolean	IN	No	Specifies whether to delete a schedule. • **true**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **false**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.CREATE_JOB_CLASS

  Creates a scheduled job class.

  The prototype of the DBE_SCHEDULER.CREATE_JOB_CLASS function is as follows:

```
DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text           default NULL,
service text                        default NULL,
logging_level integer                  default 0,
log_history integer                   default NULL,
comments text                          default NULL
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-294 DBE_SCHEDULER.CREATE_JOB_CLASS API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled job class.
resource_consumer_group	text	IN	Yes	Inline resource consumer group of a scheduled job class.
service	text	IN	Yes	Inline database service of a scheduled job class.
logging_level	integer	IN	No	Number of scheduled job records.
log_history	integer	IN	Yes	Number of days for storing scheduled job records.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_JOB_CLASS

  Deletes scheduled job classes.

  The prototype of the DBE_SCHEDULER.DROP_JOB_CLASS function is as follows:

```
DBE_SCHEDULER.drop_job_class(
job_class_name text,
force boolean                    default false
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-295 DBE_SCHEDULER.DROP_JOB_CLASS API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled job class.
force	boolean	IN	No	Specifies whether to delete a scheduled job class. • **true**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. • **false**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS

  Deletes a single scheduled job class.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS function is as follows:

  ```
  DBE_SCHEDULER.drop_single_job_class(
  job_class_name text,
  force boolean                    default false
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-296 DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled job class.
force	boolean	IN	No	Specifies whether to delete a scheduled job class. • **true**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. • **false**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.GRANT_USER_AUTHORIZATION

  Grants the scheduled job permissions to the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the DBE_SCHEDULER.GRANT_USER_AUTHORIZATION function is as follows:

  ```
  DBE_SCHEDULER.grant_user_authorization(
  username              text,
  privilege             text
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-297 DBE_SCHEDULER.GRANT_USER_AUTHORIZATION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	text	IN	No	Database username.
privilege	text	IN	No	Scheduled job permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION

  Revokes the scheduled job permissions from the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username              text,
privilege             text
)
```

Table 10-298 DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	text	IN	No	Database username.
privilege	text	IN	No	Scheduled job permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'create job');
 revoke_user_authorization
---------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.CREATE_CREDENTIAL

  Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the DBE_SCHEDULER.CREATE_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name         text,
username                text,
password                text            default NULL,
database_role           text            default NULL,
windows_domain          text            default NULL,
comments                text            default NULL
)
```

Table 10-299 DBE_SCHEDULER.CREATE_CREDENTIAL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	text	IN	No	Name of the authorization certificate.
username	text	IN	No	Database username.
password	text	IN	Yes	User password.
database_role	text	IN	Yes	Database system permission.
windows_domain	text	IN	Yes	Domain to which a Windows user belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

NOTICE

The **password** parameter of DBE_SCHEDULER.CREATE_CREDENTIAL must be set to **NULL** or **'******'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE_SCHEDULER.DROP_CREDENTIAL

  Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the DBE_SCHEDULER.DROP_CREDENTIAL function is as follows:

  ```
  DBE_SCHEDULER.drop_credential(
  credential_name  text,
  force            boolean default false
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-300 DBE_SCHEDULER.DROP_CREDENTIAL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	text	IN	No	Name of the authorization certificate.
force	boolean	IN	No	Specifies whether to delete the authorization certificate. ● **true**: The certificate will be deleted no matter whether it is referenced by any job. ● **false**: No job can reference the certificate. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

- DBE_SCHEDULER.ENABLE

  Enables an object.

  The prototype of the DBE_SCHEDULER.ENABLE function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text                default 'STOP_ON_FIRST_ERROR'
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-301 DBE_SCHEDULER.ENABLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name. You can specify one or more objects. If you specify multiple objects, separate them with commas (,).
commit_semantics	text	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The enabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The enabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the enabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('job1');
 enable
--------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
 enable
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.ENABLE_SINGLE

  Enables a single object.

  The prototype of the DBE_SCHEDULER.ENABLE_SINGLE function is as follows:

  ```
  DBE_SCHEDULER.enable_single(
  name text
  )
  ```

  Table 10-302 DBE_SCHEDULER.ENABLE_SINGLE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
name	text	IN	No	Object name.

  Example:

  ```
  gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
  end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
   create_job
  ------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.enable_single('job1');
   enable_single
  ---------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
   drop_job
  ----------

  (1 row)
  ```

- DBE_SCHEDULER.DISABLE

  Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object. Operations are synchronized only when operation synchronization is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_SCHEDULER.DISABLE function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-303 DBE_SCHEDULER.DISABLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
force	boolean	IN	No	Specifies whether to disable an object. ● **true**: The object is disabled regardless of whether other objects depend on it. ● **false**: No object can depend on the object. Otherwise, an error occurs.
commit_semantics	text	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The disabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The disabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the disabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('job1');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DISABLE_SINGLE

  Disables a single object.

  The prototype of the DBE_SCHEDULER.DISABLE_SINGLE function is as follows:

  ```
  DBE_SCHEDULER.disable_single(
  name text,
  force boolean                    default false
  )
  ```

  Table 10-304 DBE_SCHEDULER.DISABLE_SINGLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
force	boolean	IN	No	Specifies whether to disable an object. • **true**: The object is disabled regardless of whether other objects depend on it. • **false**: No object can depend on the object. Otherwise, an error occurs.

  Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable_single('job1', false);
 disable_single
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.EVAL_CALENDAR_STRING

  Analyzes the scheduled job period.

  Return type: timestamp with time zone

  The prototype of the DBE_SCHEDULER.EVAL_CALENDAR_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```

Table 10-305 DBE_SCHEDULER.EVAL_CALENDAR_STRING API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
calendar_string	text	IN	No	Date string of a scheduled job.
start_date	timestamp with time zone	IN	No	Start time of a scheduled job.
return_date_after	timestamp with time zone	IN	No	Date when a scheduled job is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate, sysdate);
  eval_calendar_string
------------------------
 2023-09-16 06:05:55+08
(1 row)
```

- DBE_SCHEDULER.EVALUATE_CALENDAR_STRING

  Analyzes the scheduled job period.

  Return type: timestamp with time zone

  The prototype of the DBE_SCHEDULER.EVALUATE_CALENDAR_STRING function is as follows:

  ```
  DBE_SCHEDULER.evaluate_calendar_string(
  IN calendar_string text,
  IN start_date timestamp with time zone,
  IN return_date_after timestamp with time zone,
  OUT next_run_date timestamp with time zone
  )return timestamp with time zone
  ```

  Table 10-306 DBE_SCHEDULER.EVALUATE_CALENDAR_STRING API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
calendar_string	text	IN	No	Date string of a scheduled job.
start_date	timestamp with time zone	IN	No	Start time of a scheduled job.
return_date_after	timestamp with time zone	IN	No	Date when a scheduled job is returned.
next_run_date	timestamp with time zone	OUT	No	The next date when a scheduled job is returned.

  Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
 DECLARE
    start_date        timestamp with time zone;
    return_date_after timestamp with time zone;
    next_run_date     timestamp with time zone;
 BEGIN
    start_date := '2003-2-1 10:30:00.111111+8'::timestamp with time zone;
    return_date_after := start_date;
    DBE_SCHEDULER.evaluate_calendar_string(
        calendar_str,
        start_date, return_date_after, next_run_date);
    DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
 END;
 /
CREATE PROCEDURE
gaussdb=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
 pr1

10.12.2.14 DBE_SESSION

Interface Description

Table 10-307 provides all interfaces supported by the **DBE_SESSION** package. DBE_SESSION takes effect at the session level.

Table 10-307 DBE_SESSION

Interface	Description
DBE_SESSION.SET_CONTEXT	Sets the value of an attribute in a specified context.
DBE_SESSION.CLEAR_CONTEXT	Clears the value of an attribute in a specified context.
DBE_SESSION.SEARCH_CONTEXT	Queries the value of an attribute in a specified context.
DBE_SESSION.MODIFY_PACKAGE_STATE	Changes the PL/SQL status of the current session.

- DBE_SESSION.SET_CONTEXT

  Sets the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.SET_CONTEXT** function is as follows:

  ```
  DBE_SESSION.SET_CONTEXT(
     namespace text,
     attribute text,
     value text
  )returns void;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-308 DBE_SESSION.SET_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.
value	TEXT	IN	No	Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

- DBE_SESSION.CLEAR_CONTEXT

  Clears the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.CLEAR_CONTEXT** function is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
    namespace text,
    client_identifier text default null,
    attribute text default null
)returns void ;
```

Table 10-309 DBE_SESSION.CLEAR_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
client_identifier	TEXT	IN	Yes	Client authentication. The default value is **null**. Generally, you do not need to manually set this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
attribute	TEXT	IN	Yes	Attribute to be cleared. The default value is **null**, indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. Note: To ensure forward compatibility, if the parameter value is **'null'**, all attributes of the specified context are cleared.

- DBE_SESSION.SEARCH_CONTEXT

  Queries the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.SEARCH_CONTEXT** function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
    namespace text,
    attribute text
)returns text;
```

Table 10-310 DBE_SESSION.SEARCH_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

Example:

```
DECLARE
    a text;
BEGIN
    DBE_SESSION.set_context('test', 'gaussdb', 'one');   --Set the gaussdb attribute in the test context to one.
    a := DBE_SESSION.search_context('test', 'gaussdb');
    DBE_OUTPUT.PRINT_LINE(a);
    DBE_SESSION.clear_context('test', 'test','gaussdb');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
-- Expected result:
one
ANONYMOUS BLOCK EXECUTE
```

- DBE_SESSION.MODIFY_PACKAGE_STATE

  Changes the PL/SQL status of the current session. The prototype of the DBE_SESSION.MODIFY_PACKAGE_STATE function is:

```
DBE_SESSION.MODIFY_PACKAGE_STATE (
    flags int);
```

Table 10-311 DBE_SESSION.MODIFY_PACKAGE_STATE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL dbe_session.modify_package_state(1);
 modify_package_state
----------------------

(1 row)
```

10.12.2.15 DBE_SQL

Data Types

- DBE_SQL.DESC_REC

  This type is a composite type and is used to store the description of the SQL_DESCRIBE_COLUMNS API.

  The prototype of the DBE_SQL.DESC_REC type is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
    col_type            int,
    col_max_len         int,
    col_name            VARCHAR2(32),
    col_name_len        int,
    col_schema_name     VARCHAR2(32),
    col_schema_name_len int,
    col_precision       int,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    col_scale          int,
    col_charsetid      int,
    col_charsetform    int,
    col_null_ok        BOOLEAN
);
```

- DBE_SQL.DESC_TAB

  This type is the TABLE type of DESC_REC and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DESC_TAB type is as follows:

  ```
  CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC INDEX BY INTEGER;
  ```

- DBE_SQL.DATE_TABLE

  This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DATE_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE INDEX BY INTEGER;
  ```

- DBE_SQL.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_SQL.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(32767) INDEX BY INTEGER;
  ```

- DBE_SQL.BLOB_TABLE

  This type is the TABLE type of BLOB and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.BLOB_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.BLOB_TABLE AS TABLE OF BLOB INDEX BY INTEGER;
  ```

API Description

Table 10-312 lists APIs supported by the **DBE_SQL** package.

Table 10-312 DBE_SQL

API	Description
DBE_SQL.REGISTER_CONTEXT	Opens a cursor.
DBE_SQL.SQL_UNREGISTER_CONTEXT	Closes an open cursor.
DBE_SQL.SQL_SET_SQL	Passes a set of SQL statements or anonymous blocks to a cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.SQL_RUN	Executes SQL statements or anonymous blocks in a given cursor.
DBE_SQL.NEXT_ROW	Reads a row of cursor data.
DBE_SQL.SET_RESULT_TYPE	Dynamically defines a column.
DBE_SQL.SET_RESULT_TYPE_CHAR	Dynamically defines a column of the CHAR type.
DBE_SQL.SET_RESULT_TYPE_INT	Dynamically defines a column of the INT type.
DBE_SQL.SET_RESULT_TYPE_LONG	Dynamically defines a column of the LONG type.
DBE_SQL.SET_RESULT_TYPE_RAW	Dynamically defines a column of the RAW type.
DBE_SQL.SET_RESULT_TYPE_BYTEA	Dynamically defines a column of the BYTEA type.
DBE_SQL.SET_RESULT_TYPE_TEXT	Dynamically defines a column of the TEXT type.
DBE_SQL.SET_RESULT_TYPE_UNKNOWN	Dynamically defines a column of an unknown type.
DBE_SQL.GET_RESULT	Reads a dynamically defined column value.
DBE_SQL.GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.
DBE_SQL.GET_RESULT_INT	Reads a dynamically defined column value of the INT type.
DBE_SQL.GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.GET_RESULT_BYTEA	Reads a dynamically defined column value of the BYTEA type.
DBE_SQL.GET_RESULT_TEXT	Reads a dynamically defined column value of the TEXT type.
DBE_SQL.GET_RESULT_UNKNOWN	Reads a dynamically defined column value of an unknown type.
DBE_SQL.DBE_SQL_GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.DBE_SQL_GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.DBE_SQL_GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.IS_ACTIVE	Checks whether a cursor is opened.
DBE_SQL.LAST_ROW_COUNT	Returns the cumulative count of obtained rows.
DBE_SQL.RUN_AND_NEXT	Reads data of a cursor after a set of dynamically defined operations are performed on the cursor.
DBE_SQL.SQL_BIND_VARIABLE	Binds a value to a variable in a statement.
DBE_SQL.SQL_BIND_ARRAY	Binds a group of values to a variable in a statement.
DBE_SQL.SET_RESULT_TYPE_INTS	Dynamically defines a column of the INT array type.
DBE_SQL.SET_RESULT_TYPE_TEXTS	Dynamically defines a column of the TEXT array type.
DBE_SQL.SET_RESULT_TYPE_RAWS	Dynamically defines a column of the RAW array type.
DBE_SQL.SET_RESULT_TYPE_BYTEAS	Dynamically defines a column of the BYTEA array type.
DBE_SQL.SET_RESULT_TYPE_CHARS	Dynamically defines a column of the CHAR array type.
DBE_SQL.SET_RESULTS_TYPE	Dynamically defines a column of the array type.
DBE_SQL.GET_RESULTS_INT	Reads a dynamically defined column value of the INT array type.
DBE_SQL.GET_RESULTS_TEXT	Reads a dynamically defined column value of the TEXT array type.
DBE_SQL.GET_RESULTS_RAW	Reads a dynamically defined column value of the RAW array type.
DBE_SQL.GET_RESULTS_BYTEA	Reads a dynamically defined column value of the BYTEA array type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.GET_RESULTS_CHAR	Reads a dynamically defined column value of the CHAR array type.
DBE_SQL.GET_RESULTS	Reads a dynamically defined column value.
DBE_SQL.SQL_DESCRIBE_COLUMNS	Describes the column information read by the cursor.
DBE_SQL.DESCRIBE_COLUMNS	Describes the column information read by the cursor.
DBE_SQL.BIND_VARIABLE	Binds parameters.
DBE_SQL.SQL_SET_RESULTS_TYPE_C	Dynamically defines a column of the array type.
DBE_SQL.SQL_GET_VALUES_C	Reads a dynamically defined column value.
DBE_SQL.GET_VARIABLE_RESULT	Reads the return value of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_CHAR	Reads the return value (of the CHAR type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_RAW	Reads the return value (of the RAW type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_TEXT	Reads the return value (of the TEXT type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_INT	Reads the return value (of the INT type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_TEXT	Reads the return value (of the TEXT array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_RAW	Reads the return value (of the RAW array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_CHAR	Reads the return value (of the CHAR array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_INT	Reads the return value (of the INT array type) of an SQL statement.
DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C	Dynamically defines a column of the tableof type.
DBE_SQL.SQL_GET_TABLEOF_VALUES_C	Reads a dynamically defined column value of the tableof type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You are advised to use **dbe_sql.set_result_type** and **dbe_sql.get_result** to define columns.
- If the size of the result set is greater than the value of **work_mem**, the result set will be spilled to a disk temporarily. The value of **work_mem** must be no greater than 512 MB.

- DBE_SQL.REGISTER_CONTEXT

  This function opens a cursor, which is the prerequisite for the subsequent **dbe_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

  CAUTION

  Cursors opened by DBE_SQL are session-level variables. Cross-session calling of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

  The prototype of the DBE_SQL.REGISTER_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- DBE_SQL.SQL_UNREGISTER_CONTEXT

  This function closes a cursor, which is the end of each **dbe_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

  The prototype of the DBE_SQL.SQL_UNREGISTER_CONTEXT function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
    context_id     IN INTEGER
)
RETURN INTEGER;
```

Table 10-313 DBE_SQL.SQL_UNREGISTER_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be closed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.SQL_SET_SQL

  Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the text type. The length cannot exceed 1 GB.

  The prototype of the **DBE_SQL.SQL_SET_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
   context_id    IN INTEGER,
   query_string  IN TEXT,
   language_flag IN INTEGER
)
RETURN BOOLEAN;
```

  Table 10-314 DBE_SQL.SQL_SET_SQL parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed
query_string	TEXT	IN	No	Query statement to be executed for parsing
language_flag	INTEGER	IN	No	Version language. The value **1** indicates an incompatible version, and the value **2** indicates a compatible version.

- DBE_SQL.SQL_RUN

  This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

  The prototype of the **DBE_SQL.SQL_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
   context_id    IN INTEGER,
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-315 DBE_SQL.SQL_RUN parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed

- DBE_SQL.NEXT_ROW

  This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the DBE_SQL.NEXT_ROW function is as follows:

```
DBE_SQL.NEXT_ROW(
   context_id    IN INTEGER,
)
RETURN INTEGER;
```

Table 10-316 DBE_SQL.NEXT_ROW parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.

- DBE_SQL.SET_RESULT_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.SET_RESULT_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
   context_id IN INTEGER,
   pos        IN INTEGER,
   column_ref IN ANYELEMENT,
   maxsize    IN INTEGER default 1024
)
RETURN INTEGER;
```

Table 10-317 DBE_SQL.SET_RESULT_TYPE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
column_ref	ANYELEMENT	IN	No	Variable of any type. You can select an appropriate API to dynamically define columns based on variable types.
maxsize	INTEGER	IN	Yes	Length of the defined column return type.

- DBE_SQL.SET_RESULT_TYPE_CHAR

  This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
   context_id  IN INTEGER,
   pos         IN INTEGER,
   column_ref  IN TEXT,
   column_size IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-318 DBE_SQL.SET_RESULT_TYPE_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
column_ref	TEXT	IN	No	Parameter to be defined
column_size	INTEGER	IN	No	Length of a dynamically defined column

- DBE_SQL.SET_RESULT_TYPE_INT

  This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-319 DBE_SQL.SET_RESULT_TYPE_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.SET_RESULT_TYPE_LONG

  This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
   context_id IN INTEGER,
   pos        IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-320 DBE_SQL.SET_RESULT_TYPE_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.SET_RESULT_TYPE_RAW

  This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
   context_id  IN INTEGER,
   pos         IN INTEGER,
   column_ref  IN RAW,
   column_size IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-321 DBE_SQL.SET_RESULT_TYPE_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
column_ref	RAW	IN	No	RAW variable
column_size	INTEGER	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_BYTEA

  Defines columns of the BYTEA type returned from a given cursor and can be used only for cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the DBE_SQL.SET_RESULT_TYPE_BYTEA function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_BYTEA(
    context_id  IN INTEGER,
    pos         IN INTEGER,
    column_ref  IN BYTEA,
    column_size IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-322 DBE_SQL.SET_RESULT_TYPE_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
column_ref	BYTEA	IN	No	BYTEA variable
column_size	INTEGER	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_TEXT

  This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
    context_id IN INTEGER,
    pos        IN INTEGER,
    maxsize    IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-323 DBE_SQL.SET_RESULT_TYPE_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
maxsize	INTEGER	IN	No	Maximum length of the defined TEXT type

- DBE_SQL.SET_RESULT_TYPE_UNKNOWN

  This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
    context_id IN INTEGER,
    pos        IN INTEGER,
    col_type   IN TEXT
)
RETURN INTEGER;
```

Table 10-324 DBE_SQL.SET_RESULT_TYPE_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
col_type	TEXT	IN	No	Dynamically defined parameter

- DBE_SQL.GET_RESULT

  This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
   context_id   IN    INTEGER,
   pos          IN    INTEGER,
   column_value INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

  Table 10-325 DBE_SQL.GET_RESULT parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANYELEMENT	INOUT	No	Return value of the query result of a specified column

- DBE_SQL.GET_RESULT_CHAR

  This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the DBE_SQL.GET_RESULT_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
    context_id    IN    INTEGER,
    pos           IN    INTEGER,
    tr            INOUT CHAR,
    err           INOUT NUMERIC,
    actual_length INOUT INTEGER
);
```

Table 10-326 DBE_SQL.GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
tr	CHAR	INOUT	No	Return value.
err	NUMERIC	INOUT	No	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INTEGER	INOUT	No	Length of a return value.

- The overloading of the DBE_SQL.GET_RESULT_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
    context_id IN    INTEGER,
    pos        IN    INTEGER,
    tr         INOUT CHAR
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-327 DBE_SQL.GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
tr	CHAR	INOUT	No	Return value.

- DBE_SQL.GET_RESULT_INT

  This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. The prototype of the DBE_SQL.GET_RESULT_INT function is as follows:

```
DBE_SQL.GET_RESULT_INT(
   context_id IN INTEGER,
   pos        IN INTEGER
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-328 DBE_SQL.GET_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
    context_id IN INTEGER,
    pos        IN    INTEGER,
    lgth       IN    INTEGER,
    off_set    IN    INTEGER,
    vl         INOUT TEXT,
    vl_length  INOUT INTEGER
)
RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-329 DBE_SQL.GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
lgth	INTEGER	IN	No	Length of a return value.
off_set	INTEGER	IN	No	Start position of a return value.
vl	TEXT	INOUT	No	Return value.
vl_length	INTEGER	INOUT	No	Length of a return value.

- DBE_SQL.GET_RESULT_RAW

  Returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
    context_id    IN    INTEGER,
    pos           IN    INTEGER,
    tr            INOUT RAW,
    err           INOUT NUMERIC,
    actual_length INOUT INTEGER
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-330 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
tr	RAW	INOUT	No	Returned column value.
err	NUMERIC	INOUT	No	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INTEGER	INOUT	No	Length of a return value. The value longer than this length will be truncated.

- The overloading of the DBE_SQL.GET_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
    context_id IN     INTEGER,
    pos        IN     INTEGER,
    tr         INOUT RAW
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-331 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
tr	RAW	INOUT	No	Returned column value.

- DBE_SQL.GET_RESULT_BYTEA

  Returns the value of the BYTEA type in a specified position of a cursor that is obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULT_BYTEA(
   context_id IN INTEGER,
   pos        IN INTEGER
)
RETURN BYTEA;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-332 DBE_SQL.GET_RESULT_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.GET_RESULT_TEXT

  This function returns the value of the TEXT type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_TEXT function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
    context_id IN  INTEGER,
    pos        IN  INTEGER
)
RETURN TEXT;
```

Table 10-333 DBE_SQL.GET_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.GET_RESULT_UNKNOWN

  This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

  The prototype of the DBE_SQL.GET_RESULT_UNKNOWN function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
    context_id IN INTEGER,
    pos        IN INTEGER,
    col_type   IN TEXT
)
RETURN TEXT;
```

Table 10-334 DBE_SQL.GET_RESULT_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
col_type	TEXT	IN	No	Returned parameter type

- DBE_SQL.DBE_SQL_GET_RESULT_CHAR

  This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. Different from **DBE_SQL.GET_RESULT_CHAR**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN CHARACTER;
```

  Table 10-335 DBE_SQL.DBE_SQL_GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.DBE_SQL_GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Different from **DBE_SQL.GET_RESULT_LONG**, the length of the return value is not set and the entire BIGINT value is returned.

The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN BIGINT;
```

Table 10-336 DBE_SQL.DBE_SQL_GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.DBE_SQL_GET_RESULT_RAW

  This function returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  Different from DBE_SQL.GET_RESULT_RAW, the length of the return value is not set and the entire string is returned.

  The prototype of the DBE_SQL.DBE_SQL_GET_RESULT_RAW function is as follows:

  ```
  DBE_SQL.GET_RESULT_RAW(
      context_id IN    INTEGER,
      pos        IN    INTEGER,
      tr         INOUT RAW
  )
  RETURN RAW;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-337 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed.
pos	INTEGER	IN	No	Position of a dynamically defined column in the query.
tr	RAW	INOUT	No	Returned column value.

- DBE_SQL.IS_ACTIVE

  This function returns the status of a cursor. When a cursor is opened, parsed, executed, or defined, the value is **TRUE**. When a cursor is closed, the value is **FALSE**. If the status is unknown, an error is reported. In other cases, the cursor is closed by default.

  The prototype of the DBE_SQL.IS_ACTIVE function is as follows:

```
DBE_SQL.IS_ACTIVE(
   context_id     IN   INTEGER
)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-338 DBE_SQL.IS_ACTIVE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be queried

- DBE_SQL.LAST_ROW_COUNT

  Returns the accumulated count of data rows obtained after the latest NEXT_ROW execution.

  The prototype of the DBE_SQL.LAST_ROW_COUNT function is as follows:

  ```
  DBE_SQL.LAST_ROW_COUNT(
  )
  RETURN INTEGER;
  ```

- DBE_SQL.RUN_AND_NEXT

  Equivalent to calling SQL_RUN and NEXT_ROW in sequence.

  The prototype of the DBE_SQL.RUN_AND_NEXT function is as follows:

  ```
  DBE_SQL.RUN_AND_NEXT(
     context_id IN INTEGER
  )
  RETURNS INTEGER;
  ```

Table 10-339 DBE_SQL.RUN_AND_NEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.SQL_BIND_VARIABLE

  This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

  The prototype of the DBE_SQL.SQL_BIND_VARIABLE function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
    context_id     IN int,
    query_string   IN text,
    language_flag  IN anyelement,
    out_value_size IN int default null
)
RETURNS void;
```

  Table 10-340 DBE_SQL.SQL_BIND_VARIABLE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
query_string	TEXT	IN	No	Name of the bound variable
language_flag	ANYELEMENT	IN	No	Bound value
out_value_size	INT	IN	Yes	Size of the return value. Default value: **NULL**. In A-compatible mode, the parameter behavior is the same as that of database A only when the parameter type of the value is VARCHAR or CHAR.

- DBE_SQL.SQL_BIND_ARRAY

  This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.SQL_BIND_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyarray,
    lower_index  IN int,
    higher_index IN int
)
RETURNS void;

DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyindexbytable
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyindexbytable,
    lower_index  IN int,
    higher_index IN int
)
RETURNS void;
```

Table 10-341 DBE_SQL.SQL_BIND_ARRAY parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
query_string	TEXT	IN	No	Name of the bound variable.
value	ANYINDEXBYTABLE	IN	No	Bound array.
lower_index	INT	IN	No	Minimum index of the bound array.
higher_index	INT	IN	No	Maximum index of the bound array.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> DBE_SQL.SQL_BIND_ARRAY does not support user-defined table types. Use the table types provided in **Data Types**.

- DBE_SQL.SET_RESULT_TYPE_INTS

  This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int
)
RETURNS integer;
```

Table 10-342 DBE_SQL.SET_RESULT_TYPE_INTS parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.

- DBE_SQL.SET_RESULT_TYPE_TEXTS

  This function defines columns of the TEXT array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_SQL.SET_RESULT_TYPE_TEXTS function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int
)
RETURNS integer;
```

Table 10-343 DBE_SQL.SET_RESULT_TYPE_TEXTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	No	Maximum length of the defined TEXT type

- DBE_SQL.SET_RESULT_TYPE_RAWS

  This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    column_size IN int
)
RETURNS integer;
```

Table 10-344 DBE_SQL.SET_RESULT_TYPE_RAWS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_BYTEAS

  This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-345 DBE_SQL.SET_RESULT_TYPE_BYTEAS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_CHARS

  This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-346 DBE_SQL.SET_RESULT_TYPE_CHARS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULTS_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULTS_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
) returns void;

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.number_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.varchar2_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 32767
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.date_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.blob_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 32767
);
```

Table 10-347 DBE_SQL.SET_RESULTS_TYPE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	DBE_SQL.BLOB_TABLE	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	Yes	Maximum length of the defined type

NOTE

DBE_SQL.SET_RESULTS_TYPE does not support user-defined table types. Use the table types provided in "Data Types".

- DBE_SQL.GET_RESULTS_INT

  This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.GET_RESULTS_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-348 DBE_SQL.GET_RESULTS_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE_SQL.GET_RESULTS_TEXT

  This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the DBE_SQL.GET_RESULTS_TEXT function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-349 DBE_SQL.GET_RESULTS_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE_SQL.GET_RESULTS_RAW

  This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-350 DBE_SQL.GET_RESULTS_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried

column_value	ANYARRAY	INOUT	No	Return value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.GET_RESULTS_BYTEA

  This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

  Table 10-351 DBE_SQL.GET_RESULTS_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE_SQL.GET_RESULTS_CHAR

  This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-352 DBE_SQL.GET_RESULTS_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE_SQL.GET_RESULTS

  This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  NOTE

  The bottom-layer mechanism of DBE_SQL.GET_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle Database.

  The prototype of the **DBE_SQL.GET_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.varchar2_table
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.number_table
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.date_table
);

DBE_SQL.GET_RESULTS(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  context_id   IN    int,
  pos          IN    int,
  column_value INOUT dbe_sql.blob_table
);
```

Table 10-353 DBE_SQL.GET_RESULTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

NOTE

DBE_SQL.GET_RESULTS does not support user-defined table types. Use the table types provided in **Data Types**.

- DBE_SQL.SQL_DESCRIBE_COLUMNS

  This function is used to describe column information and can be used only for cursors defined by **SELECT**.

  The prototype of the **DBE_SQL.SQL_DESCRIBE_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
  context_id IN    int,
  col_cnt    INOUT int,
  desc_t     INOUT dbe_sql.desc_tab
)RETURNS record ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-354 DBE_SQL.SQL_DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	INOUT	No	Number of columns returned
desc_t	DBE_SQL.DESC_TAB	INOUT	No	Description of the returned column

- DBE_SQL.DESCRIBE_COLUMNS

  Describes column information and can be used only for cursors defined by SELECT. This API is developed for compatibility purposes.

  The prototype of the DBE_SQL.DESCRIBE_COLUMNS function is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
   context_id IN  int,
   col_cnt    OUT int,
   desc_t     OUT dbe_sql.desc_tab
)
```

Table 10-355 DBE_SQL.DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	OUT	No	Number of columns returned

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
desc_t	DBE_SQL.DESC_TAB	OUT	No	Description of the returned column

- DBE_SQL.BIND_VARIABLE

  This function is used to bind parameters. You are advised to use **DBE_SQL.SQL_BIND_VARIABLE**.

- DBE_SQL.SQL_SET_RESULTS_TYPE_C

  This function is used to dynamically define a column of the array type. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_SET_RESULTS_TYPE_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    col_type   IN anyelement,
    maxsize    IN int
)return integer;
```

Table 10-356 DBE_SQL.SQL_SET_RESULTS_TYPE_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANYELEMENT	IN	No	Variable type corresponding to the returned array type
maxsize	INT	IN	No	Maximum length of the defined type

- DBE_SQL.SQL_GET_VALUES_C

  This function is used to read a dynamically defined column value. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_GET_VALUES_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
    context_id   IN    int,
    pos          IN    int,
    results_type INOUT anyarray,
    result_type  IN    anyelement
)return anyarray;
```

  Table 10-357 DBE_SQL.SQL_GET_VALUES_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Parameter position

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
results_type	ANYARRAY	INOUT	No	Obtained result
result_type	ANYELEMENT	IN	No	Type of the obtained result

- DBE_SQL.GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyelement
);
```

Table 10-358 DBE_SQL.GET_VARIABLE_RESULT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description

pos	VARCHAR2	IN	No	Name of the bound parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
column_value	ANYELEMENT	INOUT	No	Return value.

- DBE_SQL.GET_VARIABLE_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
    context_id IN int,
    pos        IN VARCHAR2
)
RETURNS char
```

Table 10-359 DBE_SQL.GET_VARIABLE_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
   context_id IN    int,
   pos       IN    VARCHAR2,
   value     INOUT anyelement
)
RETURNS anyelement
```

Table 10-360 DBE_SQL.GET_VARIABLE_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
value	ANYELEMENT	INOUT	No	Return value.

- DBE_SQL.GET_VARIABLE_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_TEXT** function is as follows:

  ```
  CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
     context_id IN int,
     pos       IN VARCHAR2
  )
  RETURNS text
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-361 DBE_SQL.GET_VARIABLE_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
    context_id IN     int,
    pos        IN     VARCHAR2,
    value      INOUT anyelement
)
RETURNS anyelement
```

Table 10-362 DBE_SQL.GET_VARIABLE_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
value	ANYELEMENT	INOUT	No	Return value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.GET_ARRAY_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

  Table 10-363 DBE_SQL.GET_ARRAY_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYARRAY	INOUT	No	Return value.

- DBE_SQL.GET_ARRAY_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-364 DBE_SQL.GET_ARRAY_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANY ARRAY	INOUT	No	Return value.

- DBE_SQL.GET_ARRAY_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

Table 10-365 DBE_SQL.GET_ARRAY_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANY ARRAY	IN OUT	No	Return value.

- DBE_SQL.GET_ARRAY_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

  Table 10-366 DBE_SQL.GET_ARRAY_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYARRAY	IN OUT	No	Return value.

- DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C

  Dynamically defines a column of the tableof type. You are advised not to use it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C function is as follows:

```
DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C(
    context_id IN int,
    pos        IN int,
    column_ref IN anyindexbytable,
    cnt        IN int,
    lower_bnd  IN int,
    col_type   IN anyelement,
    maxsize    IN int
)return integer;
```

Table 10-367 DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYINDEXBYTABLE	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANYELEMENT	IN	No	Variable type corresponding to the returned array type
maxsize	INT	IN	No	Maximum length of the defined type

- DBE_SQL.SQL_GET_TABLEOF_VALUES_C

  Reads a dynamically defined column value of the tableof type. You are advised not to use it.

  The function prototype of DBE_SQL.SQL_GET_TABLEOF_VALUES_C is as follows:

```
DBE_SQL.SQL_GET_TABLEOF_VALUES_C(
    context_id   IN    int,
    pos          IN    int,
    results_type INOUT anyindexbytable,
    result_type  IN    anyelement
)return anyindexbytable;
```

10.12.2.16 DBE_STATS

The advanced package DBE_STATS implements some capabilities of managing statistics information, including locking, unlocking, rolling back, and clearing historical statistics.

NOTE

The **DBE_STATS** advanced package does not support temporary tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API Description

Table 10-369 DBE_STATS API overview

API	Description
DBE_STATS.LOCK_TABLE_STATS	Locks table-level statistics.
DBE_STATS.LOCK_PARTITION_STATS	Locks partition-level statistics.
DBE_STATS.LOCK_COLUMN_STATS	Locks column-level statistics.
DBE_STATS.LOCK_SCHEMA_STATS	Locks statistics about all tables in a specified schema.
DBE_STATS.UNLOCK_TABLE_STATS	Unlocks table-level statistics.
DBE_STATS.UNLOCK_PARTITION_STATS	Unlocks partition-level statistics.
DBE_STATS.UNLOCK_COLUMN_STATS	Unlocks column-level statistics.
DBE_STATS.UNLOCK_SCHEMA_STATS	Unlocks statistics about all tables in a specified schema.
DBE_STATS.RESTORE_TABLE_STATS	Rolls back table-level statistics to a specified time point.
DBE_STATS.RESTORE_PARTITION_STATS	Rolls back partition-level statistics to a specified time point.
DBE_STATS.RESTORE_COLUMN_STATS	Rolls back column-level statistics to a specified time point.
DBE_STATS.RESTORE_SCHEMA_STATS	Rolls back statistics about all tables in a specified schema to a specified time point.
DBE_STATS.PURGE_STATS	Clears all historical statistics before a specified time point.
DBE_STATS.GET_STATS_HISTORY_RETENTION	Obtains the retention period of historical statistics.
DBE_STATS.GET_STATS_HISTORY_AVAILABILITY	Obtains the earliest available time of the current historical statistics.
DBE_STATS.CREATE_STAT_TABLE	Creates a statistics table for storing statistics.
DBE_STATS.DROP_STAT_TABLE	Deletes a statistics table for storing statistics.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_STATS.EXPORT_INDEX_STATS	Retrieves statistics for the specified index and stores them in the user statistics table.
DBE_STATS.EXPORT_TABLE_STATS	Retrieves statistics for the specified table and stores them in the user statistics table.
DBE_STATS.EXPORT_COLUMN_STATS	Retrieves statistics for the specified column and stores them in the user statistics table.
DBE_STATS.EXPORT_SCHEMA_STATS	Retrieves statistics for the specified schema and stores them in the user statistics table.
DBE_STATS.IMPORT_INDEX_STATS	Retrieves statistics for the specified index from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_TABLE_STATS	Retrieves statistics for the specified table from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_COLUMN_STATS	Retrieves statistics for the specified column from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_SCHEMA_STATS	Retrieves statistics for the specified schema from the user statistics table and writes it back to the system catalog.
DBE_STATS.SET_COLUMN_STATS	Sets column-related statistics, including single-column, multi-column, and expression statistics.
DBE_STATS.SET_INDEX_STATS	Sets index-related statistics.
DBE_STATS.SET_TABLE_STATS	Sets table-related statistics.
DBE_STATS.DELETE_COLUMN_STATS	Deletes column-related statistics, including single-column, multi-column, and expression statistics.
DBE_STATS.DELETE_INDEX_STATS	Deletes index-related statistics.
DBE_STATS.DELETE_TABLE_STATS	Deletes table-related statistics.
DBE_STATS.DELETE_SCHEMA_STATS	Deletes statistics about all tables, indexes, and columns in a schema.

- DBE_STATS.LOCK_TABLE_STATS

  Locks the statistics of a table. After the table is locked, the statistics of the table cannot be updated, and the indexes, partitions, and columns involved in the table are locked synchronously. This API does not return any value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_STATS.LOCK_TABLE_STATS function is as follows:

```
DBE_STATS.LOCK_TABLE_STATS(
   ownname   VARCHAR2,
   tabname   VARCHAR2
);
```

Table 10-370 DBE_STATS.LOCK_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the table to be locked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to be locked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can check stat_state in reloptions of the table to obtain the lock status of the table.
- When a table is locked, its statistics cannot be updated.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE t1(a int,b int);
CREATE TABLE

-- Lock the table and check its locking status.
gaussdb=# CALL DBE_STATS.LOCK_TABLE_STATS(ownname=>'dbe_stats_lock',tabname=>'t1');
 lock_table_stats
------------------

(1 row)
gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0  as exist_lock FROM
PG_CLASS WHERE relname='t1' and relnamespace = (SELECT oid FROM PG_NAMESPACE WHERE
nspname='dbe_stats_lock');
 relname | exist_lock
---------+------------
 t1      | t
(1 row)

-- An error is reported after the ANALYZE operation is performed.
gaussdb=# ANALYZE t1;
ERROR:  The statistics is locked, cannot be updated.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_PARTITION_STATS

  Locks the statistics of a partition. After the partition is locked, the statistics of the partition cannot be updated, and the indexes, partitions, and columns related to the partition are locked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_PARTITION_STATS function is as follows:

```
DBE_STATS.LOCK_PARTITION_STATS(
    ownname     VARCHAR2,
    tabname     VARCHAR2,
    partname    VARCHAR2
);
```

Table 10-371 DBE_STATS.LOCK_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the partition to be locked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the partition to be locked belongs.
partname	varchar2	No	Name of the partition to be locked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can view stat_state in reloptions of the partition to obtain the lock status of the table.
- When the partition or the table to which the table belongs is locked, its statistics cannot be updated.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE upart_table(a int, b int, c int) PARTITION BY RANGE(a)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 (
    PARTITION p1 VALUES LESS THAN(1200),
    PARTITION p2 VALUES LESS THAN(2400),
    PARTITION p3 VALUES LESS THAN(MAXVALUE)
 );
CREATE TABLE

-- Lock a partition. Other partitions and tables are not affected.
gaussdb=# CALL
DBE_STATS.LOCK_PARTITION_STATS(ownname=>'dbe_stats_lock',tabname=>'upart_table',partname=>'
p1');
 lock_partition_stats
----------------------

(1 row)

gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0 as exist_lock FROM
PG_CLASS WHERE relname='upart_table';
   relname   | exist_lock
-------------+------------
 upart_table | f
(1 row)

gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0 as exist_lock FROM
PG_PARTITION WHERE parentid='upart_table'::REGCLASS;
   relname   | exist_lock
-------------+------------
 upart_table | f
 p2          | f
 p3          | f
 p1          | t
(4 rows)

-- Delete a table or namespace.
gaussdb=# DROP TABLE upart_table;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_COLUMN_STATS

  Locks the statistics of a column. After the column is locked, the statistics of the column cannot be updated. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_COLUMN_STATS function is as follows:

```
DBE_STATS.LOCK_COLUMN_STATS(
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   colname     VARCHAR2,
   partname    VARCHAR2 DEFAULT NULL
);
```

Table 10-372 DBE_STATS.LOCK_COLUMN_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the column to be locked belongs. Null indicates that the current schema is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	varchar2	No	Name of the table to which the column to be locked belongs.
colname	varchar2	No	Name of the column to be locked.
partname	varchar2	Yes	Name of the partition to which the column to be locked belongs. The default value is **NULL**.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **partname** is **NULL**, the list-level statistics are locked by default.
- If the column-level statistics of the table do not exist, the locking can be executed successfully but does not take effect.
- You can view **stastate** in **PG_STATISTIC**/**PG_STATISTIC_EXT** to obtain the lock status.
- Before locking multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If a column is locked or the table or partition to which the column belongs is locked, the statistics cannot be updated. The locked information about the column is not displayed. You need to view the locked information by using logging_module of DBE_STATS at the DEBUG2 level in logs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE t1(a int,b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(generate_series(1,100),1);
INSERT 0 100
gaussdb=# ANALYZE t1;
ANALYZE

-- After locking a column, check the locking status of the column.
gaussdb=# CALL
DBE_STATS.LOCK_COLUMN_STATS(ownname=>'dbe_stats_lock',tabname=>'t1',colname=>'a');
 lock_column_stats
-------------------

(1 row)

gaussdb=# SELECT staattnum,stastate FROM PG_STATISTIC WHERE starelid='t1'::REGCLASS;
 staattnum | stastate
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------+----------
         2 | u
         1 | l
(2 rows)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_SCHEMA_STATS

  Locks statistics about all tables in a specified schema. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_SCHEMA_STATS function is as follows:

```
DBE_STATS.LOCK_SCHEMA_STATS(
    ownname     VARCHAR2
);
```

Table 10-373 DBE_STATS.LOCK_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the specified schema. Null indicates that the current schema is used by default.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are locked. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of locking schema statistics is the same as that of locking table statistics. The
following describes only the API calling method. For details, see the example of
DBE_STATS.LOCK_TABLE_STA....
gaussdb=# CALL DBE_STATS.LOCK_SCHEMA_STATS(ownname=>'dbe_stats_lock');
 lock_schema_stats
-------------------

(1 row)
```

- DBE_STATS.UNLOCK_TABLE_STATS

  Unlocks the statistics of a table. After the table is unlocked, the statistics of the table can be updated. The indexes, partitions, and columns involved in the table are unlocked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_TABLE_STATS function is as follows:

```
DBE_STATS.UNLOCK_TABLE_STATS(
   ownname    VARCHAR2,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  tabname   VARCHAR2
);
```

Table 10-374 DBE_STATS.UNLOCK_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the table to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to be unlocked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can check stat_state in reloptions of the table to obtain the lock status of the table.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking table statistics is the same as that of locking table statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_TABLE_STA... example.
gaussdb=# CALL DBE_STATS.UNLOCK_TABLE_STATS(ownname=>'dbe_stats_lock',tabname=>'t1');
 unlock_table_stats
--------------------

(1 row)
```

- DBE_STATS.UNLOCK_PARTITION_STATS

  Unlocks the statistics of a partition. After the partition is unlocked, the statistics of the partition can be updated. The indexes, partitions, and columns involved in the partition are unlocked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_PARTITION_STATS function is as follows:

```
DBE_STATS.UNLOCK_PARTITION_STATS(
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   partname    VARCHAR2
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-375 DBE_STATS.UNLOCK_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the partition to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the partition to be unlocked belongs.
partname	varchar2	No	Name of the partition to be unlocked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can view stat_state in reloptions of the partition to obtain the lock status of the table.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking partition statistics is the same as that of locking partition statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_PARTIION_... example.
gaussdb=# CALL DBE_STATS.UNLOCK_PARTITION_STATS(ownname=>'dbe_stats_lock',tabname=>'upart_table',partname=>'p1');
 unlock_partition_stats
------------------------

(1 row)
```

- DBE_STATS.UNLOCK_COLUMN_STATS

  Unlocks the statistics of a column. After being unlocked, the statistics of the column can be updated. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_COLUMN_STATS function is as follows:

```
DBE_STATS.LOCK_COLUMN_STATS(
    ownname     VARCHAR2,
    tabname     VARCHAR2,
    colname     VARCHAR2,
    partname    VARCHAR2 DEFAULT NULL
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-376 DBE_STATS.UNLOCK_COLUMN_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the column to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the column to be unlocked belongs.
colname	varchar2	No	Name of the column to be unlocked.
partname	varchar2	Yes	Name of the partition to which the column to be unlocked belongs. The default value is **NULL**.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **partname** is **NULL**, the list-level statistics and column-level statistics of the cascaded partition are unlocked by default.
- You can view the stastate bit in **PG_STATISTIC**/**PG_STATISTIC_EXT** to obtain the lock status.
- Before unlocking multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking column statistics is the same as that of locking column statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_COLUMN_STATS example.
gaussdb=# CALL DBE_STATS.UNLOCK_COLUMN_STATS(ownname=>'dbe_stats_lock',tabname=>'t1',colname=>'a');
 unlock_column_stats
---------------------

(1 row)
```

- DBE_STATS.UNLOCK_SCHEMA_STATS

  Locks statistics about all tables in a specified schema. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_SCHEMA_STATS function is as follows:

```
DBE_STATS.UNLOCK_SCHEMA_STATS(
    ownname     VARCHAR2
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-377 DBE_STATS.UNLOCK_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the specified schema. Null indicates that the current schema is used by default.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are unlocked. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking schema statistics is the same as that of unlocking table statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_TABLE_STATS example.
gaussdb=# CALL DBE_STATS.UNLOCK_SCHEMA_STATS(ownname=>'dbe_stats_lock');
 unlock_schema_stats
---------------------

(1 row)
```

- DBE_STATS.RESTORE_TABLE_STATS

  Rolls back table statistics to a specified time point. The last statistics collected before the time point are loaded to the system catalog, and the statistics of the lower-level partitions, indexes, and columns that are not locked are cascaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_TABLE_STATS function is as follows:

```
DBE_STATS.RESTORE_TABLE_STATS(
    ownname                 VARCHAR2,
    tabname                 VARCHAR2,
    as_of_timestamp         TIMESTAMPTZ,
    restore_cluster_index   BOOLEAN DEFAULT NULL,
    force                   BOOLEAN DEFAULT FALSE,
    no_invalidate           BOOLEAN DEFAULT NULL
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-378 DBE_STATS.RESTORE_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of the schema to which the table to be rolled back belongs. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Name of the table to be rolled back.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
restore_cluster_index	BOOLEAN	Yes	Not supported currently.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked. The default value is **FALSE**.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- When this API is called, the statistics of its lower-level partitions, indexes, and columns are rolled back at the same time. If the lower-level partitions or columns are locked, the statistics are skipped.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics twice.
gaussdb=# CREATE SCHEMA dbe_stats_restore;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_restore;
SET
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);

```

- DBE_STATS.RESTORE_PARTITION_STATS

  Rolls back partition statistics to a specified time point. The last statistics collected before the time point are loaded to the system catalog, and the statistics of the lower-level partitions, indexes, and columns that are not locked are cascaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_PARTITION_STATS function is as follows:

```
DBE_STATS.RESTORE_PARTITION_STATS(
    ownname                 VARCHAR2,
    tabname                 VARCHAR2,
    partname                VARCHAR2,
    as_of_timestamp           TIMESTAMPTZ,
    force                   BOOLEAN DEFAULT FALSE,
    no_invalidate           BOOLEAN DEFAULT NULL
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-379 DBE_STATS.RESTORE_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of the schema to which the partition to be rolled back belongs.
tabname	VARCHAR2	No	Name of the table to which the partition to be rolled back belongs.
partname	VARCHAR2	No	Name of the partition to be rolled back.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- When this API is called, the statistics of its lower-level partitions, indexes, and columns are rolled back.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of rolling back partition statistics is the same as that of rolling back table statistics. The following describes only the API calling method. For details, see the example of DBE_STATS.RESTORE_TABLE_STATS.
gaussdb=# CALL DBE_STATS.RESTORE_PARTITION_STATS(ownname=>'dbe_stats_restore',tabname=>'t1',partname=>'p1',as_of_timestamp=>((SELECT MIN(reltimestamp) FROM GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1 second'));
 restore_partition_stats
-------------------------

(1 row)
```

- DBE_STATS.RESTORE_COLUMN_STATS

  Rolls back the column statistics to a specified time point. The last statistics collected before the time point to the system catalog are loaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_COLUMN_STATS function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
RESTORE_COLUMN_STATS(
   ownname              VARCHAR2,

- DBE_STATS.RESTORE_SCHEMA_STATS

  Rolls back statistics of all tables in a specified schema to a specified time point. This API does not return any value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_STATS.RESTORE_SCHEMA_STATS function is as follows:

```
DBE_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp          TIMESTAMPTZ,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT NULL
);
```

Table 10-381 DBE_STATS.RESTORE_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of a schema.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are rolled back. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Roll back schema statistics, which is the same as rolling back table statistics.
-- Create a table, insert data, and collect statistics twice.
gaussdb=#CREATE SCHEMA dbe_stats_restore;
CREATE SCHEMA
gaussdb=#SET CURRENT_SCHEMA=dbe_stats_restore;

gaussdb=# DROP SCHEMA dbe_stats_restore;
DROP SCHEMA
```

- DBE_STATS.PURGE_STATS

  Clears all historical statistics before a specified time point. This API does not return any value.

  The prototype of the DBE_STATS.PURGE_STATS function is as follows:

```
DBE_STATS.PURGE_STATS(
   before_timestamp       TIMESTAMPTZ
);
```

Table 10-382 DBE_STATS.PURGE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
before_timestamp	timestamp with time zone	No	Time node for clearing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Only the initial user can call this API.

Example:

```
-- Create a table and collect statistics twice.
gaussdb=# CREATE SCHEMA dbe_stats_purge;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_purge;
SET
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE

-- View history tables.
gaussdb=# SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         3
 t1      |         6
(2 rows)

-- Clear the earlier history statistics and view the history table.
gaussdb=# CALL DBE_STATS.PURGE_STATS(before_timestamp=>((SELECT MIN(reltimestamp) FROM
GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1 second'));
 purge_stats
-------------

(1 row)

gaussdb=# SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         6
(1 row)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_purge;
DROP SCHEMA
```

- DBE_STATS.GET_STATS_HISTORY_RETENTION

  Obtains the retention period of historical statistics. The retention period set by DBE_STATS.ALTER_STATS_HISTORY_RETENTION is returned. This API does not have input parameters.

  The prototype of the DBE_STATS.GET_STATS_HISTORY_RETENTION function is as follows:

  ```
  DBE_STATS.GET_STATS_HISTORY_RETENTION()
  returns NUMBER;
  ```

  Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_STATS.GET_STATS_HISTORY_RETENTION();
 get_stats_history_retention
-----------------------------
                          31
(1 row)
```

- DBE_STATS.GET_STATS_HISTORY_AVAILABILITY

  Obtains the earliest available time of the current historical statistics. The earliest time of all historical statistics in the current database is returned. This API does not have input parameters.

  The prototype of the DBE_STATS.GET_STATS_HISTORY_AVAILABILITY function is as follows:

```
DBE_STATS.GET_STATS_HISTORY_AVAILABILITY()
returns TIMESTAMPTZ;
```

  Example:

```
gaussdb=# ANALYZE;
ANALYZE
gaussdb=# CALL DBE_STATS.GET_STATS_HISTORY_AVAILABILITY();
 get_stats_history_availability
--------------------------------
 2023-08-27 02:07:04.065217+08
(1 row)
```

  NOTE

  All the preceding function prototypes are the C_FUNCTION function prototypes with the same data types and columns, and are named **DBE_STATS.***XXXX*_**C_FUNCTION**.

  The DBE_STATS advanced package API is valid only for ordinary tables.

- DBE_STATS.CREATE_STAT_TABLE

  Creates a statistics table for storing user statistics. This API does not return any value.

  The prototype of the DBE_STATS.CREATE_STAT_TABLE function is as follows:

```
DBE_STATS.CREATE_STAT_TABLE (
   ownname          VARCHAR2,
   stattab          VARCHAR2,
   tblspace         VARCHAR2 DEFAULT NULL,
   global_temporary BOOLEAN DEFAULT NULL
);
```

Table 10-383 DBE_STATS.CREATE_STAT_TABLE API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the created statistics table is located. Null indicates that the schema is created in the current schema by default.
stattab	VARCHAR2	No	Name of a statistics table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tblspace	VARCHAR2	Yes	Tablespace where the created statistics table is located. If not specified, the default tablespace is used.
global_temporary	BOOLEAN	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to create a statistics table, you must have the permission to create tables and indexes in the specified schema and tablespace.
- To distinguish ordinary tables from statistics tables, the **statstable** column in **reloptions** of a statistics table is not an empty string after the statistics table is created. Considering that the structure of the statistics table may be upgraded in the future, to implement forward compatibility, **statstable** is assigned the version information of the current statistics table.
- When this table is created, **gs_stattab_oid_statid_type_nameinfo_index index** is automatically generated for index scan. **oid** is the OID of the statistics table. If the index is deleted, the export and import APIs are unavailable.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a stattab statistics table in dbe_stats_create_drop_schema and manually insert a data record. You can query the data record in the new user statistics table.
gaussdb=# CREATE SCHEMA dbe_stats_create_drop_schema;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_create_drop_schema;
SET
gaussdb=# CALL DBE_STATS.CREATE_STAT_TABLE(ownname => 'dbe_stats_create_drop_schema',
stattab => 'stat_tab');
 create_stat_table
-------------------
(1 row)
gaussdb=# INSERT INTO stat_tab(statid, type, relname) VALUES('123', 't', 't1');
INSERT 0 1
gaussdb=# SELECT statid, type, relname FROM stat_tab;
 statid | type | relname
--------+------+---------
 123    | t    | t1
(1 row)
```

- DBE_STATS.DROP_STAT_TABLE

  Deletes the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.DROP_STAT_TABLE function is as follows:

```
DBE_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-384 DBE_STATS.DROP_STAT_TABLE API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the statistics table is located. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of a statistics table.

NOTE

- To call this procedure to delete a statistics table, you must have the permission to delete the table and index in the specified schema.
- Ordinary tables whose **statstable** attribute is empty cannot be deleted using this procedure.
- If an index is created on the user statistics table or other objects that depend on the table are created, all objects that depend on the table are deleted when this procedure is called.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Delete the created user statistics table and the new schema.
gaussdb=# CALL DBE_STATS.DROP_STAT_TABLE(ownname => 'dbe_stats_create_drop_schema',
stattab => 'stat_tab');
 drop_stat_table
-----------------
(1 row)
gaussdb=# DROP SCHEMA dbe_stats_create_drop_schema CASCADE;
DROP SCHEMA
```

- DBE_STATS.EXPORT_INDEX_STATS

  Searches the system catalog for the statistics of the specified index according to and store the result in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_INDEX_STATS function is:

```
DBE_STATS.EXPORT_INDEX_STATS (
ownname  VARCHAR2,
indname  VARCHAR2,
partname VARCHAR2 DEFAULT NULL,
stattab  VARCHAR2,
statid   VARCHAR2 DEFAULT NULL,
statown  VARCHAR2 DEFAULT NULL
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-385 DBE_STATS.EXPORT_INDEX_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema where the index is located. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Name of the index whose statistics are to be exported.
partname	VARCHAR2	Yes	Name of a partitioned index. If the index has been partitioned but **partname** is **null**, global and partitioned index statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export the reltuples (numrows), relpages (numlblks), and relallvisible (relallvisible) statistics of indexes.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

- DBE_STATS.EXPORT_TABLE_STATS

  Retrieves statistics for the specified table and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_TABLE_STATS function is as follows:

```
DBE_STATS.EXPORT_TABLE_STATS (
   ownname           VARCHAR2,
   tabname           VARCHAR2,
   partname          VARCHAR2 DEFAULT NULL,
   stattab           VARCHAR2,
   statid            VARCHAR2 DEFAULT NULL,
   cascade           BOOLEAN  DEFAULT TRUE,
   statown           VARCHAR2 DEFAULT NULL,
   stat_category     VARCHAR2 DEFAULT NULL
);
```

Table 10-386 DBE_STATS.EXPORT_TABLE_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table whose statistics are to be exported.
partname	VARCHAR2	Yes	Table partition name. If the table has been partitioned but **partname** is **null**, global and partitioned table statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
cascade	BOOLEAN	Yes	Specifies whether to export statistics about columns, indexes, multiple columns, and index expressions. The default value is **TRUE**.
statown	VARCHAR2	Yes	Not supported currently.
stat_category	VARCHAR2	Yes	Not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export the reltuples (numrows), relpages (numblks), and relallvisible (relallvisible) statistics of tables. For details about how to export column-level and index-level statistics in cascading mode, see the statistics of the **EXPORT_INDEX_STATS** and **EXPORT_COLUMN_STATS** APIs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of exporting table statistics is the same as that of exporting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.EXPORT_INDEX_STATS example.
gaussdb=# CALL DBE_STATS.EXPORT_TABLE_STATS(ownname => 'dbe_stats_export', tabname => 't2', partname =>null, stattab => 'export_table', statid => 't1_t', cascade => true);
 export_table_stats
--------------------
(1 row)
```

- DBE_STATS.EXPORT_COLUMN_STATS

  Retrieves statistics for the specified columns (multiple columns or expressions) and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_COLUMN_STATS function is:

```
DBE_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL
);
```

Table 10-387 DBE_STATS.EXPORT_COLUMN_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table (index name corresponding to the expression) to which the column whose statistics are to be exported belongs.
colname	VARCHAR2	No	Column name or multiple column names (If tabname is an index, **colname** is an expression name.)
partname	VARCHAR2	Yes	Partition name. If the table or index has been partitioned but **partname** is **null**, global and partitioned key, multiple columns, and index statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You can query **PG_STATISTIC** or **PG_STATISTIC_EXT** to export column-level statistics.
- Before exporting the statistics of multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_export;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_export;
SET
gaussdb=# CREATE TABLE IF NOT EXISTS t1 (a int, b int, c int);
CREATE TABLE
gaussdb=# CREATE INDEX idx_t1_expr on t1((a*a), (a+a), (a*b));
CREATE INDEX
gaussdb=# INSERT INTO t1 VALUES (100, 300, 1);

```

- DBE_STATS.EXPORT_SCHEMA_STATS

  Retrieves statistics for the specified schema and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_SCHEMA_STATS function is:

```
DBE_STATS.EXPORT_TABLE_STATS (
  ownname         VARCHAR2,
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT NULL);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-388 DBE_STATS.EXPORT_SCHEMA_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
stat_category	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export statistics about all tables on which the current user has permission in the specified schema. Tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of exporting schema statistics is the same as that of exporting table statistics. The following describes only the API calling method. For details, see the DBE_STATS.EXPORT_TABLE_STATS example.
gaussdb=# CALL DBE_STATS.EXPORT_SCHEMA_STATS(ownname => 'dbe_stats_export', stattab => 'export_table', statid => 's1');
 export_schema_stats
---------------------
(1 row)
```

- DBE_STATS.IMPORT_INDEX_STATS

  Retrieves statistics for the specified index from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_INDEX_STATS function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_STATS.IMPORT_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT NULL,
   force          BOOLEAN DEFAULT FALSE
);
```

Table 10-389 DBE_STATS.IMPORT_INDEX_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Name of the index whose statistics are to be imported.
partname	VARCHAR2	Yes	Name of the index partition. If the index has been partitioned but **partname** is **null**, global and partitioned index statistics are imported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import the reltuples (numrows), relpages (numlblks), and relallvisible (relallvisible) statistics of indexes.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_import;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_import;
SET
gaussdb=# CREATE TABLE t2(a int, b int, c int) PARTITION BY RANGE(a) SUBPARTITION BY RANGE(b)

- DBE_STATS.IMPORT_TABLE_STATS

  Retrieves statistics for the specified table from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_TABLE_STATS function is as follows:

```
DBE_STATS.IMPORT_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   cascade       BOOLEAN  DEFAULT TRUE,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT NULL,
   force         BOOLEAN  DEFAULT FALSE,
   stat_category VARCHAR2 DEFAULT NULL
);
```

Table 10-390 DBE_STATS.IMPORT_TABLE_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	No	Name of the schema. Null indicates that the current schema is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	varchar2	No	Name of the table whose statistics are to be imported.
partname	varchar2	Yes	Table partition name. If the table has been partitioned but **partname** is **null**, global and partitioned table statistics are imported.
stattab	varchar2	No	Name of the user table that stores statistics.
statid	varchar2	Yes	(Optional) Identifier that points to statistics in stattab.
cascade	Boolean	Yes	Specifies whether to import statistics about columns, indexes, multiple columns, and index expressions. The default value is **true**.
statown	varchar2	Yes	Not supported currently.
no_invalidate	Boolean	Yes	Not supported currently.
force	Boolean	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.
stat_category	varchar2	Yes	Not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import the reltuples (numrows), relpages (numblks), and relallvisible (relallvisible) statistics of tables. For details about column-level and index-level statistics imported in cascading mode, see the statistics of the **IMPORT_INDEX_STATS** and **IMPORT_COLUMN_STATS** APIs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of importing table statistics is the same as that of importing index statistics. The following describes only the API calling method. For details, see the DBE_STATS.IMPORT_INDEX_STATS example.
gaussdb=# CALL DBE_STATS.IMPORT_TABLE_STATS(ownname => 'dbe_stats_import', tabname => 't2', partname => 'p1', stattab => 'export_table', statid => 't1_t', cascade => true, force => false);
 import_table_stats
--------------------
(1 row)
```

- DBE_STATS.IMPORT_COLUMN_STATS

  Retrieves statistics for the specified columns (multiple columns or expressions) from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_COLUMN_STATS function is as follows:

```
DBE_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT NULL,
   force         BOOLEAN DEFAULT FALSE
);
```

Table 10-391 DBE_STATS.IMPORT_COLUMN_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table (index name corresponding to the expression) to which the column whose statistics are to be imported belongs.
colname	VARCHAR2	No	Column name or multiple column names (If tabname is an index, **colname** is an expression name.)
partname	VARCHAR2	Yes	Partition name. If the table or index has been partitioned but **partname** is **null**, global and partitioned key, multiple columns, and index statistics are imported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You can query **PG_STATISTIC** or **PG_STATISTIC_EXT** to import column-level statistics.
- Before importing multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

- DBE_STATS.IMPORT_SCHEMA_STATS

  Retrieves statistics for the specified schema from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_SCHEMA_STATS function is as follows:

```
DBE_STATS.IMPORT_SCHEMA_STATS (
  ownname       VARCHAR2,
  stattab       VARCHAR2,
  statid        VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT NULL,
  force         BOOLEAN DEFAULT FALSE,
  stat_category VARCHAR2 DEFAULT NULL);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-392 DBE_STATS.IMPORT_SCHEMA_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.
stat_category	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import statistics about all tables on which the current user has permission in the specified schema. Tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of importing schema statistics is the same as that of importing table statistics. This section describes only the API calling method. For details, see the DBE_STATS.IMPORT_TABLE_STATS
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
example.
gaussdb=# CALL DBE_STATS.IMPORT_SCHEMA_STATS(ownname => 'dbe_stats_import', stattab =>
'export_table', statid => 's1',force => false);
 import_schema_stats
---------------------
(1 row)
```

- DBE_STATS.SET_COLUMN_STATS

  Sets column-related statistics, including single-column, multi-column, and expression statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_COLUMN_STATS function is as follows:

```
DBE_STATS.SET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2    DEFAULT NULL,
    stattab          VARCHAR2    DEFAULT NULL,
    statid           VARCHAR2    DEFAULT NULL,
    distcnt          NUMBER      DEFAULT NULL,
    density          NUMBER      DEFAULT NULL,
    nullcnt          NUMBER      DEFAULT NULL,
    srec             VARCHAR2    DEFAULT NULL,
    avgclen          NUMBER      DEFAULT NULL,
    flags            NUMBER      DEFAULT NULL,
    statown          VARCHAR2    DEFAULT NULL,
    no_invalidate    BOOLEAN     DEFAULT NULL,
    force            BOOLEAN     DEFAULT FALSE
);
```

Table 10-393 DBE_STATS.SET_COLUMN_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
colname	VARCHAR2	No	Column name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be set. If the table has been partitioned and **partname** is null, global column–level statistics are set.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
distcnt	NUMBER	Yes	Number of NDVs in the column.
density	NUMBER	Yes	Not supported currently.
nullcnt	NUMBER	Yes	Number of null values in the column.
srec	VARCHAR2	Yes	This parameter is not supported currently.
avgclen	NUMBER	Yes	Average length (in bytes) of the fields in the column.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	NUMBER	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure sets the value even if the column-level statistics are locked. The default value is **FALSE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- To call this procedure to set column-level statistics for a table, you must have the same permissions as the ANALYZE statement on the tables involved in the column. For details, see **ANALYZE | ANALYSE**.
- This API can be used to set expression statistics. Expression creation depends on indexes. Therefore, when this API is called to set expression statistics, **tabname** must be set to the index name.
- Currently, only NDV (distcnt), nullfrac (nullcnt) and width (avgclen) statistics of columns can be set.
- After the statistics of a single column or expression are deleted, this API can still be called to set the statistics of the corresponding single column or expression. In this case, new data is inserted into the **PG_STATISTIC** system catalog. After the multi-column statistics are deleted, this API cannot be used to reset the statistics.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_set_schema;

- DBE_STATS.SET_INDEX_STATS

  Sets index-related statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_INDEX_STATS function is:

```
DBE_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  statid        VARCHAR2  DEFAULT NULL,
  numrows       NUMBER    DEFAULT NULL,
  numlblks      NUMBER    DEFAULT NULL,
  relallvisible NUMBER    DEFAULT NULL,
  numdist       NUMBER    DEFAULT NULL,
  avglblk       NUMBER    DEFAULT NULL,
  avgdblk       NUMBER    DEFAULT NULL,
  clstfct       NUMBER    DEFAULT NULL,
  indlevel      NUMBER    DEFAULT NULL,
  flags         NUMBER    DEFAULT NULL,
  statown       VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT NULL,
  guessq        NUMBER    DEFAULT NULL,
  cachedblk     NUMBER    DEFAULT NULL,
  cachehit      NUMBER    DEFAULT NULL,
  force         BOOLEAN   DEFAULT FALSE
);
```

Table 10-394 DBE_STATS.SET_INDEX_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema to which the index belongs. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Index name.
partname	VARCHAR2	Yes	Name of the index partition whose statistics are to be set. If the index has been partitioned and **partname** is null, global index–level statistics are set.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
numrows	NUMBER	Yes	Number of rows in an index.
numlblks	NUMBER	Yes	Number of pages in an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
relallvisible	NUMBER	Yes	Number of pages marked as all visible in the index.
numdist	NUMBER	Yes	This parameter is not supported currently.
avglblk	NUMBER	Yes	This parameter is not supported currently.
avgdblk	NUMBER	Yes	This parameter is not supported currently.
clstfct	NUMBER	Yes	This parameter is not supported currently.
indlevel	NUMBER	Yes	This parameter is not supported currently.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
guessq	NUMBER	Yes	This parameter is not supported currently.
cachedblk	NUMBER	Yes	This parameter is not supported currently.
cachehit	NUMBER	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **TRUE**, the procedure sets the value even if the index-level statistics are locked. The default value is **FALSE**.

NOTE

- To call this procedure to set index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Currently, only reltuples (numrows), relpages (numlblks) and relallvisible (relallvisible) statistics of indexes can be set.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_set_schema;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_set_schema;
SET
gaussdb=# DROP TABLE IF EXISTS t1;
NOTICE:  table "t1" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE IF NOT EXISTS t1 (a int, b int, c int);
CREATE TABLE
gaussdb=# CREATE INDEX idx_t1_a on t1(a);
CREATE INDEX
gaussdb=# INSERT INTO t1 VALUES (100, 300, 1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES (150, 550, 1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES (250, 150, 1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
-- Set index statistics.
-- View the current index statistics.
gaussdb=# SELECT reltuples,relpages,relallvisible FROM PG_CLASS WHERE relname='idx_t1_a';
 reltuples | relpages | relallvisible
-----------+----------+---------------
         3 |        2 |             0
(1 row)
-- Set the statistics and query again.
gaussdb=# CALL DBE_STATS.SET_INDEX_STATS(indname => 'idx_t1_a', ownname =>
'dbe_stats_set_schema', numrows => 1, numlblks => 3, relallvisible => 6);
 set_index_stats
-----------------
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT reltuples,relpages,relallvisible FROM PG_CLASS WHERE relname='idx_t1_a';
 reltuples | relpages | relallvisible
-----------+----------+---------------
         1 |        3 |             6
(1 row)
-- Delete a table or namespace.
gaussdb=# DROP INDEX idx_t1_a;
DROP INDEX
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_set_schema CASCADE;
DROP SCHEMA
```

- DBE_STATS.SET_TABLE_STATS

  Sets table-level statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_TABLE_STATS function is as follows:

```
DBE_STATS.SET_TABLE_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2  DEFAULT NULL,
   statid          VARCHAR2  DEFAULT NULL,
   numrows         NUMBER    DEFAULT NULL,
   numblks         NUMBER    DEFAULT NULL,
   relallvisible   NUMBER    DEFAULT NULL,
   avgrlen         NUMBER    DEFAULT NULL,
   flags           NUMBER    DEFAULT NULL,
   statown         VARCHAR2  DEFAULT NULL,
   no_invalidate   BOOLEAN   DEFAULT NULL,
   cachedblk       NUMBER    DEFAULT NULL,
   cachehit        NUMBER    DEFAULT NULL,
   force           BOOLEAN   DEFAULT FALSE,
   im_imcu_count   NUMBER    DEFAULT NULL,
   im_block_count NUMBER     DEFAULT NULL,
   scanrate        NUMBER    DEFAULT NULL
);
```

Table 10-395 DBE_STATS.SET_TABLE_STATS API parameters

Parameter	Parameter	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Parameter	Whether NULL Is Allowed	Description
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be set. If the table has been partitioned and **partname** is null, global table–level statistics are set.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
numrows	NUMBER	Yes	Number of rows in a table.
numblks	NUMBER	Yes	Number of pages in a table.
relallvisible	NUMBER	Yes	Number of pages marked as all visible in a table.
avgrlen	NUMBER	Yes	This parameter is not supported currently.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
cachedblk	NUMBER	Yes	This parameter is not supported currently.
cachehit	NUMBER	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Parameter	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **TRUE**, the procedure sets the value even if the table statistics are locked. The default value is **FALSE**.
im_imcu_count	NUMBER	Yes	This parameter is not supported currently.
im_block_count	NUMBER	Yes	This parameter is not supported currently.
scanrate	NUMBER	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to set table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Currently, only reltuples (numrows), relpages (numblks) and relallvisible (relallvisible) statistics of tables can be set.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The procedure for setting index statistics is similar to that for setting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.SET_INDEX_STATS API example.
-- Set table-level statistics.
gaussdb=# CALL DBE_STATS.SET_TABLE_STATS(tabname => 't1', ownname => 'dbe_stats_set_schema', numrows => 1, numblks => 3, relallvisible => 6);
 set_table_stats
-----------------

(1 row)
```

- DBE_STATS.DELETE_COLUMN_STATS

  Deletes column-related statistics, including single-column, multi-column, and expression statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_COLUMN_STATS function is as follows:

```
DBE_STATS.DELETE_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  colname        VARCHAR2,
  partname       VARCHAR2 DEFAULT NULL,
  stattab        VARCHAR2 DEFAULT NULL,
  statid         VARCHAR2 DEFAULT NULL,
  cascade_parts  BOOLEAN  DEFAULT TRUE,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT NULL,
  force          BOOLEAN  DEFAULT FALSE,
  col_stat_type  VARCHAR2 DEFAULT NULL
);
```

Table 10-396 DBE_STATS.DELETE_COLUMN_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
colname	VARCHAR2	No	Column name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be deleted. If the table has been partitioned and **partname** is **null**, global column–level statistics are deleted. If **cascade_parts** is **true**, column-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all partitions under a column when deleting the column-level statistics. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the column statistics even if they are locked. The default value is **false**.
col_stat_type	VARCHAR2	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- To call this procedure to delete column statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- This API can be used to delete expression statistics. Expression creation depends on indexes. Therefore, when this API is called to delete expression statistics, **tabname** must be set to the index name.
- If the table is a level-2 partitioned table and **partname** is set to the level-1 partition name, and **cascade_parts** is set to **true**, statistics on all level-2 partitions under the level-1 partition will be deleted.
- Before deleting the statistics of multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_delete_schema;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_delete_schema;
SET

- DBE_STATS.DELETE_INDEX_STATS

  Deletes index-related statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_INDEX_STATS function is:

```
DBE_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT NULL,
  stattype         VARCHAR2 DEFAULT NULL,
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT NULL
)
```

Table 10-397 DBE_STATS.DELETE_INDEX_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema to which the index belongs. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Index name.
partname	VARCHAR2	Yes	Name of the index partition whose statistics are to be deleted. If the index has been partitioned and **partname** is **null**, global index–level statistics are deleted. If **cascade_parts** is **true**, index-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all partitions under an index when deleting the index-level statistics. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
stattype	VARCHAR2	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the index statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Deleting index statistics is equivalent to set **reltuples**, **relpages**, and **relallvisible** to **0**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table.
gaussdb=# CREATE SCHEMA dbe_stats_delete_schema;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

- DBE_STATS.DELETE_TABLE_STATS

  Deletes table-level statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_TABLE_STATS function is:

```
DBE_STATS.DELETE_TABLE_STATS (
   ownname              VARCHAR2,
   tabname              VARCHAR2,
   partname             VARCHAR2 DEFAULT NULL,
   stattab              VARCHAR2 DEFAULT NULL,
   statid               VARCHAR2 DEFAULT NULL,
   cascade_parts        BOOLEAN  DEFAULT TRUE,
   cascade_columns      BOOLEAN  DEFAULT TRUE,
   cascade_indexes      BOOLEAN  DEFAULT TRUE,
   statown              VARCHAR2 DEFAULT NULL,
   no_invalidate        BOOLEAN  DEFAULT NULL,
   force                BOOLEAN  DEFAULT FALSE,
   stat_category        VARCHAR2 DEFAULT NULL
)
```

Table 10-398 DBE_STATS.DELETE_TABLE_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be deleted. If the table has been partitioned and **partname** is **null**, global table–level statistics are deleted. If **cascade_parts** is **true**, table-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
statid	VARCHAR2	Yes	This parameter is not supported currently.
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all table partitions when deleting the table-level statistics. The default value is **true**.
cascade_columns	BOOLEAN	Yes	Specifies whether to call delete_column_stats to delete all column-level statistics of the table. The default value is **true**.
cascade_indexes	BOOLEAN	Yes	Specifies whether to call delete_index_stats to delete all index-level statistics of the table. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the table statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **cascade_columns** or **cascade_indexes** is set to **true**, **cascade_parts** also determines whether to delete the statistics of the corresponding partition key or index in cascading mode. For example, if **cascade_parts** is set to **true**, not only table-level statistics of all partitions of a partitioned table are deleted, but also column-level and index-level statistics of all partitions are deleted.
- Deleting table statistics is equivalent to clearing the information of reltuples, relpages, and relallvisible.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The procedure for deleting table-level index statistics is similar to that for deleting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.DELETE_INDEX_STATS example.
-- Delete table-level statistics, including all column and index statistics of a table.
gaussdb=# CALL DBE_STATS.DELETE_TABLE_STATS(ownname => 'dbe_stats_delete_schema', tabname => 't2', cascade_columns => true, cascade_indexes => true);
 delete_table_stats
--------------------
(1 row)
```

- DBE_STATS.DELETE_SCHEMA_STATS

  Deletes all table-level, index-level, and column-level statistics in a schema. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_SCHEMA_STATS function is:

```
DBE_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT NULL,
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT NULL
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-399 DBE_STATS.DELETE_SCHEMA_STATS API parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema name. Null indicates that the current schema is used by default.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If you delete statistics in a schema, that is, delete all tables on which the current user has permission in the specified schema, tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Only API calling is displayed here. For details about the implementation cases, see
DBE_STATS.DELETE_TABLE_STATS.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_STATS.DELETE_SCHEMA_STATS(ownname => 'dbe_stats_delete_schema');
 delete_schema_stats
---------------------
(1 row)
```

10.12.2.17 DBE_TASK

API Description

Table 10-400 lists all APIs supported by the **DBE_TASK** package.

Table 10-400 DBE_TASK

API	Description
DBE_TASK.SUBMIT	Commits a scheduled job. The job ID is automatically generated by the system.
DBE_TASK.JOB_SUBMIT	Same as DBE_TASK.SUBMIT. However, It provides syntax compatibility parameters.
DBE_TASK.ID_SUBMIT	Commits a scheduled job. The job ID is specified by the user.
DBE_TASK.CANCEL	Deletes a scheduled job by job ID.
DBE_TASK.RUN	Runs a scheduled job.
DBE_TASK.FINISH	Disables or enables scheduled job execution.
DBE_TASK.UPDATE	Modifies attributes of a scheduled job, including the job content, next-execution time, and execution interval.
DBE_TASK.CHANGE	Same as DBE_TASK.UPDATE. However, It provides syntax compatibility parameters.
DBE_TASK.CONTENT	Modifies the content attribute of a scheduled job.
DBE_TASK.NEXT_TIME	Modifies the next-execution time attribute of a scheduled job.
DBE_TASK.INTERVAL	Modifies the execution interval attribute of a scheduled job.

- DBE_TASK.SUBMIT

  The stored procedure SUBMIT commits a scheduled job provided by the system.

  The prototype of the DBE_TASK.SUBMIT function is as follows:

```
DBE_TASK.SUBMIT(
what          IN   TEXT,
next_time     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
id            OUT  INTEGER
)RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

When a scheduled job is created (using **DBE_TASK**), the system binds the current database and the username to the job by default. The function can be called using CALL or SELECT. If the function is called using CALL, you do not need to set the output parameter. If the function is called using SELECT, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx;** before the SQL statement.

Table 10-401 DBE_TASK.SUBMIT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
what	Text	IN	No	Specifies the SQL statement to be executed. One or multiple DDL operations (excluding database-related operations), DML operations, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_time	Timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
interval_time	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
id	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');
 submit
--------
  31031
(1 row)

gaussdb=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
 submit
--------
    512
(1 row)

gaussdb=# DECLARE
gaussdb-#     jobid int;
gaussdb-# BEGIN
gaussdb$#     PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval ''5 minute''', jobid);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.JOB_SUBMIT

  The stored procedure SUBMIT commits a scheduled job provided by the system. In addition, it provides additional compatibility parameters.

  The prototype of the DBE_TASK.JOB_SUBMIT function is as follows:

```
DBE_TASK.JOB_SUBMIT(
job           OUT  INTEGER,
what           IN   TEXT,
next_date      IN   TIMESTAMP  DEFAULT sysdate,
job_interval  IN   TEXT       DEFAULT 'null',
no_parse       IN   BOOLEAN    DEFAULT false,
instance       IN   INTEGER    DEFAULT 0,
force          IN   BOOLEAN    DEFAULT false
)RETURN INTEGER;
```

Table 10-402 DBE_TASK.JOB_SUBMIT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When dbe.job_submit is called by using the SELECT statement, this parameter can be omitted.
what	Text	IN	No	Specifies the SQL statement to be executed. One or multiple DDL operations (excluding database-related operations), DML operations, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_date	Timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
job_interval	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
no_parse	Boolean	IN	Yes	The default value is **FALSE**, which is used only for syntax compatibility.
instance	Integer	IN	Yes	The default value is **0**, which is used only for syntax compatibility.
force	Boolean	IN	Yes	The default value is **FALSE**, which is used only for syntax compatibility.

Example:

```
gaussdb=# DECLARE
gaussdb-#     id integer;
gaussdb-# BEGIN
gaussdb$#     id = DBE_TASK.JOB_SUBMIT(
gaussdb$#         what => 'insert into t1 values (1, 2)',
gaussdb$#         job_interval => 'sysdate + 1' --daily
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.ID_SUBMIT

  ID_SUBMIT has the same syntax function as SUBMIT, but the first parameter of ID_SUBMIT is an input parameter, that is, a specified job ID. In contrast, that last parameter of ID_SUBMIT is an output parameter, indicating the job ID automatically generated by the system.

  ```
  DBE_TASK.ID_SUBMIT(
  id            IN   BIGINT,
  what          IN   TEXT,
  next_time     IN   TIMESTAMP DEFAULT sysdate,
  interval_time IN   TEXT  DEFAULT 'null');
  ```

  Example:

  ```
  gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
   id_submit
  -----------

  (1 row)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_TASK.CANCEL

  The stored procedure CANCEL deletes a scheduled job.

  The prototype of the DBE_TASK.CANCEL function is as follows:

  ```
  CANCEL(id  IN  INTEGER);
  ```

  Table 10-403 DBE_TASK.CANCEL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

  Example:

  ```
  gaussdb=# CALL dbe_task.cancel(101);
   cancel
  --------

  (1 row)
  ```

- DBE_TASK.RUN

  The stored procedure runs a scheduled job.

  The prototype of the DBE_TASK.RUN function is as follows:

  ```
  DBE_TASK.RUN(
  job          IN   BIGINT,
  force        IN   BOOLEAN DEFAULT FALSE);
  ```

  Table 10-404 DBE_TASK.RUN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

  Example:

  ```
  gaussdb=# BEGIN
  gaussdb$#     DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
  gaussdb$#     DBE_TASK.RUN(12345);
  gaussdb$# END;
  gaussdb$# /
  ANONYMOUS BLOCK EXECUTE
  ```

- DBE_TASK.FINISH

  The stored procedure FINISH disables or enables a scheduled job.

  The prototype of the DBE_TASK.FINISH function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_TASK.FINISH(
id          IN   INTEGER,
broken      IN   BOOLEAN,
next_time   IN   TIMESTAMP  DEFAULT  sysdate);
```

Table 10-405 DBE_TASK.FINISH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	Timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 id_submit
-----------

(1 row)

gaussdb=# CALL dbe_task.finish(101, true);
 finish
--------

(1 row)
```

- DBE_TASK.UPDATE

  The stored procedure UPDATE modifies attributes of a scheduled job, including the job content, next-execution time, and execution interval.

  The prototype of the DBE_TASK.UPDATE function is as follows:

```
DBE_TASK.UPDATE(
id             IN     INTEGER,
content        IN     TEXT,
next_time      IN     TIMESTAMP,
interval_time  IN  TEXT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-406 DBE_TASK.UPDATE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.
next_time	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.

Example:

```
gaussdb=# CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440')
 update
--------

(1 row)

gaussdb=# CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate +
1.0/1440');
 update
--------

(1 row)
```

- DBE_TASK.CHANGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure UPDATE modifies attributes of a scheduled job, including the job content, next-execution time, and execution interval.

The prototype of the DBE_TASK.CHANGE function is as follows:

```
DBE_TASK.CHANGE(
job             IN    INTEGER,
what            IN    TEXT       DEFAULT NULL,
next_date       IN    TIMESTAMP  DEFAULT NULL,
job_interval    IN    TEXT       DEFAULT NULL,
instance        IN    INTEGER    DEFAULT NULL,
force           IN    BOOLEAN    DEFAULT false);
```

Table 10-407 DBE_TASK.CHANGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	IN	No	Specifies the job ID.
what	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **what** parameter for the specified job. Otherwise, the system updates the **what** parameter for the specified job.
next_date	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_date** parameter for the specified job.
job_interval	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **job_interval** parameter for the specified job. Otherwise, the system updates the **job_interval** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
instance	Integer	IN	Yes	Used only for syntax compatibility.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
force	Boolean	IN	No	Used only for syntax compatibility.

Example:

```
gaussdb=# BEGIN
gaussdb$#     DBE_TASK.CHANGE(
gaussdb$#         job => 101,
gaussdb$#         what => 'insert into t2 values (2);'
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.CONTENT

  The stored procedure CONTENT modifies the job content attribute of a scheduled job.

  The prototype of the DBE_TASK.CONTENT function is as follows:

```
DBE_TASK.CONTENT(
id          IN     INTEGER,
content      IN TEXT);
```

Table 10-408 DBE_TASK.CONTENT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	No	Specifies the name of the stored procedure or SQL statement block that is executed.

NOTE

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as INSERT and UPDATE, a schema name must be added in front of the table name.

Example:

```
gaussdb=# CALL dbe_task.content(101, 'call userproc();');
 content
---------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
 content
---------

(1 row)
```

- DBE_TASK.NEXT_TIME

  The stored procedure NEXT_TIME modifies the next-execution time attribute of a scheduled job.

  The prototype of the DBE_TASK.NEXT_TIME function is as follows:

```
DBE_TASK.NEXT_TIME(
id          IN    BIGINT,
next_time   IN    TEXT);
```

Table 10-409 DBE_TASK.NEXT_TIME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID.
next_time	Text	IN	No	Specifies the next execution time.

NOTE

If the specified **next_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
gaussdb=# CALL dbe_task.next_time(101, sysdate);
 next_time
-----------

(1 row)
```

- DBE_TASK.INTERVAL

  The stored procedure INTERVAL modifies the execution interval attribute of a scheduled job.

  The prototype of the DBE_TASK.INTERVAL function is as follows:

```
DBE_TASK.INTERVAL(
id              IN      INTEGER,
interval_time       IN   TEXT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-410 DBE_TASK.INTERVAL API parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward. The job interval must be of a valid time type or interval type.

Example:

```
gaussdb=# CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
 interval
----------

(1 row)

gaussdb=# CALL dbe_task.cancel(101);
 cancel
--------

(1 row)
```

NOTE

For a job that is currently running (that is, **job_status** is **'r'**), it is not allowed to use the cancel, update, next_time, content, or interval API to delete or modify job parameters.

Constraints

1. You can create, update, and delete jobs only using the procedures provided by the **dbe_task** package. These procedures synchronize job information between different primary database nodes and associate primary keys between the pg_job and pg_job_proc catalogs. If you use DML statements to add, delete, or modify records in the pg_job catalog, job information will become inconsistent between primary database nodes and system catalogs may fail to be associated, compromising internal job management.
2. Each task created by a user is bound to a primary database node. If the primary database node fails while a task is being executed, the task status cannot be updated in real time and will stay at **'r'**. The task status will be updated to **'s'** only after the primary database node recovers. When a primary database node fails, all tasks on this primary database node cannot be scheduled or executed until the primary database node is restored manually, or deleted and then replaced.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. For each job, the bound primary database node updates the real-time job information (including the job status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the pg_job system catalog, and synchronizes the information to other primary database nodes, ensuring consistent job information between different primary database nodes. In the case of primary database node failures, job information synchronization is reattempted by the hosting primary database nodes, which increases job execution time. Although job information fails to be synchronized between primary database nodes, job information can still be properly updated in the pg_job table on the hosting primary database nodes, and jobs can be executed successfully. After a primary database node recovers, job information such as job execution time and status in its pg_job table may be incorrect and will be updated only after the jobs are executed again on related primary database nodes.
4. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

10.12.2.18 DBE_UTILITY

API Description

Table 10-411 provides all APIs supported by the **DBE_UTILITY** package.

Table 10-411 DBE_UTILITY

API	Description
DBE_UTILITY.FORMAT_ERROR_BACKTRACE	Outputs the call stack of an abnormal stored procedure.
DBE_UTILITY.FORMAT_ERROR_STACK	Outputs detailed information about a stored procedure exception.
DBE_UTILITY.FORMAT_CALL_STACK	Outputs the call stack of a stored procedure.
DBE_UTILITY.GET_TIME	Outputs the current time, which is used to obtain the execution duration.
DBE_UTILITY.CANONICALIZE	Canonicalizes the character string of a table name.
DBE_UTILITY.COMMA_TO_TABLE	Converts a comma-delimited string of names into a PL/SQL table of names.
DBE_UTILITY.DB_VERSION	Returns the version number and compatibility version number of the database.
DBE_UTILITY.EXEC_DDL_STATEMENT	Executes DDL statements entered by users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_UTILITY.EXPAND_SQL_TEXT_PROC	Expands the view of the SQL query.
DBE_UTILITY.GET_CPU_TIME	Returns the measured value of the current CPU processing time.
DBE_UTILITY.GET_ENDIANNESS	Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.
DBE_UTILITY.GET_HASH_VALUE	Returns the hash value of a given string.
DBE_UTILITY.GET_SQL_HASH	Outputs the hash value of a given string. This stored procedure is used when **proc_outparam_override** is not enabled.
DBE_UTILITY.IS_BIT_SET	Checks whether parameter **n** exists in **r**.
DBE_UTILITY.IS_CLUSTER_DATABASE	Determines whether the current database is running in database cluster mode.
DBE_UTILITY.NAME_RESOLVE	Parses the given object name, including synonym translation and necessary authorization checks.
DBE_UTILITY.NAME_TOKENIZE	Parses the name in the **a [. b [. c]][@ dblink]** format.
DBE_UTILITY.OLD_CURRENT_SCHEMA	Returns the name of the database schema in the current user environment.
DBE_UTILITY.OLD_CURRENT_USER	Returns the name of the current user.
DBE_UTILITY.TABLE_TO_COMMA	Converts a PL/SQL table of names into a comma-delimited string of names.
DBE_UTILITY.GET_SQL_HASH_FUNC	Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when **proc_outparam_override** is enabled.
DBE_UTILITY.EXPAND_SQL_TEXT	This is an internal function and is not recommended.
DBE_UTILITY.CANONICALIZE_RET	This is an internal function and is not recommended.
DBE_UTILITY.COMMA_TO_TABLE_FUN	This is an internal function and is not recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_UTILITY.COMPILE_SCH....	This is an internal function and is not recommended. You are advised to use pkg_util.gs_compile_schema.
DBE_UTILITY.NAME_SEPARATE	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.PRIVILEGE_CHECK	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SECHEMA	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_SYNONM_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.TABLE_TO_COMMA_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.USER_NAME	This is an internal function and is not recommended.

- DBE_UTILITY.FORMAT_ERROR_BACKTRACE

  Returns the call stack where an error occurs during execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
  RETURN TEXT;
  ```

- DBE_UTILITY.FORMAT_ERROR_STACK

  Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_STACK()
  RETURN TEXT;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_UTILITY.FORMAT_CALL_STACK

  Sets the call stack of the output function. The prototype of the DBE_UTILITY.FORMAT_CALL_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_CALL_STACK()
  RETURN TEXT;
  ```

- DBE_UTILITY.COMPILE_SCHEMA

  Recompiles the PL/SQL packages and functions (except the packages and functions provided by the system) under a specified schema. The prototype of the DBE_UTILITY.COMPILE_SCHEMA function is as follows:

  ```
  DBE_UTILITY.COMPILE_SCHEMA (
  SCHEMA IN VARCHAR2,
  COMPILE_ALL IN BOOLEAN DEFAULT TRUE,
  REUSE_SETTINGS IN BOOLEAN DEFAULT FALSE
  )
  RETURNS VOID;
  For details about the example, see the usage of the pkg_util.utility_compile_schema function in 11.12.1.2. To call the schema, run the following command:
  call DBE_UTILITY.compile_schema('pkg_var_test');
  ```

- DBE_UTILITY.GET_TIME

  Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE_UTILITY.GET_TIME function is as follows:

  ```
  DBE_UTILITY.GET_TIME()
  RETURN BIGINT;
  ```

- DBE_UTILITY.CANONICALIZE

  Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE_UTILITY.CANONICALIZE function is as follows:

  ```
  DBE_UTILITY.CANONICALIZE(
     name       IN   VARCHAR2,
     canon_name OUT  VARCHAR2,
     canon_len  IN   BINARY_INTEGER DEFAULT 1024
  );
  ```

  Table 10-412 DBE_UTILITY.CANONICALIZE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be canonicalized.
canon_name	VARCHAR2	OUT	Yes	Canonicalized character string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
canon_len	BINARY_INTEGER	IN	Yes	Length of the string to be canonicalized. The default value is **1024** (in bytes). If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte.

- DBE_UTILITY.COMMA_TO_TABLE

  Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBE_UTILITY.COMMA_TO_TABLE function is as follows:

```
DBE_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT VARCHAR2[]
);
```

  Table 10-413 DBE_UTILITY.COMMA_TO_TABLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
list	VARCHAR2	IN	No	A comma-delimited string of names.
tablen	BINARY_INTEGER	OUT	Yes	Number of names in the table.
tab	VARCHAR2	OUT	Yes	Table which contains the string of names.

- DBE_UTILITY.DB_VERSION

  Returns the version number and compatibility version number of the database. The prototype of the DBE_UTILITY.DB_VERSION function is as follows:

```
DBE_UTILITY.DB_VERSION (
   version OUT VARCHAR2
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-414 DBE_UTILITY.DB_VERSION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
version	VARCHAR2	OUT	No	Output parameter, which indicates the internal database software version. The value is a character string.

- DBE_UTILITY.EXEC_DDL_STATEMENT

  Executes DDL statements entered by users. DBE_UTILITY. The prototype of the EXEC_DDL_STATEMENT function is as follows:

```
DBE_UTILITY. EXEC_DDL_STATEMENT (
    parse_string IN TEXT
);
```

Table 10-415 DBE_UTILITY.EXEC_DDL_STATEMENT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parse_string	TEXT	IN	Yes	DDL statements to be executed.

- DBE_UTILITY.EXPAND_SQL_TEXT_PROC

  Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The prototype of the DBE_UTILITY.EXPAND_SQL_TEXT_PROC function is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
    input_sql_text  IN  CLOB,
    output_sql_text OUT CLOB
);
```

Table 10-416 DBE_UTILITY.EXPAND_SQL_TEXT_PROC API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
input_sql_text	CLOB	IN	No	Input SQL text.
output_sql_text	CLOB	OUT	No	Output SQL text of the expanded view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> In the **input_sql_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. If **behavior_compat_options** is set to **bind_procedure_searchpath**, you do not need to forcibly specify the schema prefix.

- DBE_UTILITY.GET_CPU_TIME

  Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE_UTILITY.GET_CPU_TIME function is as follows:

  ```
  DBE_UTILITY.GET_CPU_TIME()
  RETURN BIGINT;
  ```

- DBE_UTILITY.GET_ENDIANNESS

  Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. The prototype of the DBE_UTILITY.GET_ENDIANNESS function is as follows:

  ```
  DBE_UTILITY.GET_ENDIANNESS
  RETURN INTEGER;
  ```

- DBE_UTILITY.GET_HASH_VALUE

  Returns the hash value of a given string. The prototype of the DBE_UTILITY.GET_HASH_VALUE function is as follows:

  ```
  DBE_UTILITY.GET_HASH_VALUE(
     name      IN VARCHAR2(n),
     base      IN INTEGER,
     hash_size IN INTEGER)
  RETURN INTEGER;
  ```

  Table 10-417 DBE_UTILITY.GET_HASH_VALUE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
base	INTEGER	IN	No	Start value of the returned hash value.
hash_size	INTEGER	IN	No	Size of the hash table to which the hash is mapped.

- DBE_UTILITY.GET_SQL_HASH

  Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE_UTILITY.GET_SQL_HASH function is as follows:

  ```
  DBE_UTILITY.GET_SQL_HASH(
     name       IN  VARCHAR2,
     hash       OUT RAW,
     last4bytes OUT BIGINT
  );
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-418 DBE_UTILITY.GET_SQL_HASH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

NOTE

After setting **behavior_compat_options** to a value other than **proc_outparam_override** (Contact an administrator for parameter setting.), call the DBE_UTILITY.GET_SQL_HASH function. If DBE_UTILITY.GET_SQL_HASH_FUNC is called, the value assignment fails.

- DBE_UTILITY.IS_BIT_SET

  Checks whether parameter **n** exists in **r**. The prototype of the DBE_UTILITY.IS_BIT_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
   r IN RAW,
   n IN INTEGER)
RETURN INTEGER;
```

Table 10-419 DBE_UTILITY.IS_BIT_SET API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
r	RAW	IN	No	4 bytes plus the actual hexadecimal string.
n	INTEGER	IN	No	Determines whether the value exists in the binary system.

- DBE_UTILITY.IS_CLUSTER_DATABASE

  Determines whether the current database is running in database cluster mode. The prototype of the DBE_UTILITY.IS_CLUSTER_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_UTILITY.NAME_RESOLVE

  Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE_UTILITY.NAME_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
   name          IN   VARCHAR2,
   context       IN   INTEGER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT INTEGER,
   object_number OUT OID
);
```

Table 10-420 DBE_UTILITY.NAME_RESOLVE API parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name of the object to be parsed. The structure is [[a.]b.]c[@d].
context	INTEGER	IN	No	Start value of the returned hash value.
schema	VARCHAR2	OUT	No	Schema of an object.
part1	VARCHAR2	OUT	No	First part of the name. The type of this column is specified by **part1_type**.
part2	VARCHAR2	OUT	Yes	If this column is not empty, the value is the subprogram name.
dblink	VARCHAR2	OUT	Yes	Database link.
part1_type	INTEGER	OUT	No	Part 1 types: • **5**: synonym • **7**: procedure (top level) • **8**: function (top level) • **9**: package

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
object_number	OID	OUT	No	Object ID. In database A, **object_number** is of the numeric type, indicating the object ID. In GaussDB, **object_number** is of the OID type and does not support implicit conversion from a number to an OID.

- DBE_UTILITY.NAME_TOKENIZE

  Parses names in the **a [. b [. c]][@ dblink]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE_UTILITY.NAME_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name    IN  VARCHAR2,
a       OUT VARCHAR2,
b       OUT VARCHAR2,
c       OUT VARCHAR2,
dblink  OUT VARCHAR2,
nextpos OUT INTEGER
);
```

Table 10-421 DBE_UTILITY.NAME_TOKENIZE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name, consisting of SQL identifiers (for example, **scott.foo@dblink**).
a	VARCHAR2	OUT	No	First token of the name.
b	VARCHAR2	OUT	Yes	Second token of the name.
c	VARCHAR2	OUT	Yes	Third token of the name.
dblink	VARCHAR2	OUT	Yes	Database link.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
nextpos	INTEGER	OUT	No	Next position of a parsed character string.

- DBE_UTILITY.OLD_CURRENT_SCHEMA

  Returns the name of the database schema in the current user environment. The prototype of the DBE_UTILITY.OLD_CURRENT_SCHEMA function is as follows:

```
DBE_UTILITY.OLD_CURRENT_SCHEMA()
RETURN VARCHAR;
```

- DBE_UTILITY.OLD_CURRENT_USER

  Returns the name of the current user. The prototype of the DBE_UTILITY.OLD_CURRENT_USER function is as follows:

```
DBE_UTILITY.OLD_CURRENT_USER()
RETURN TEXT;
```

- DBE_UTILITY.TABLE_TO_COMMA

  Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE_UTILITY.TABLE_TO_COMMA function is as follows:

```
DBE_UTILITY.TABLE_TO_COMMA (
   tab    IN  VARCHAR2[],
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2
);
```

Table 10-422 DBE_UTILITY.TABLE_TO_COMMA API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
tab	VARCHAR2[]	IN	No	Structure table array that contains table names.
tablen	BINARY_INTEGER	OUT	No	Number of tables in a structure table.
list	VARCHAR2	OUT	No	A comma-delimited string of names.

- DBE_UTILITY.GET_SQL_HASH_FUNC

  Uses the MD5 algorithm to output the hash value of a given character string. The prototype of the DBE_UTILITY.GET_SQL_HASH_FUNC function is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
   name       IN  VARCHAR2,
   hash       OUT RAW,
   last4bytes OUT BIGINT
)RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-423 DBE_UTILITY.GET_SQL_HASH_FUNC API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

NOTE

After setting **behavior_compat_options** to **'proc_outparam_override'**, call the DBE_UTILITY.GET_SQL_HASH_FUNC function. If you call the DBE_UTILITY.GET_SQL_HASH function, a parameter mismatch error is reported.

Examples

```
-- Example 1

10.12.2.19 DBE_XMLDOM

API Description

The advanced function package DBE_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package DBE_XMLDOM, see **Table 10-424**. For details about all APIs supported by DBE_XMLDOM, see **Table 10-425**.

NOTE

When the character set of the database is set to **SQL_ASCII** and the **DBE_XMLDOM** advanced package is used, an error message is displayed if the input characters exceed the ASCII range.

Table 10-424 DBE_XMLDOM data types

Type	Description
DOMATTR	Implements the DOMAttributes API.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Type	Description
DOMDOCUMENT	Implements the DOMDocument API.
DOMELEMENT	Implements the DOMElement API.
DOMNAMEDNODEMAP	Implements the DOMNamedNodeMap API.
DOMNODELIST	Implements the DOMNodeList API.
DOMNODE	Implements the DOMNode API.
DOMTEXT	Implements the DOMText API.

Table 10-425 DBE_XMLDOM parameters

API	Description
DBE_XMLDOM.APPENDCHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XMLDOM.CREATEELEMENT	Creates a DOMElement object with the specified name.
DBE_XMLDOM.CREATETEXTNODE	Creates a DOMText node.
DBE_XMLDOM.FREEDOCUMENT	Frees resources related to DOMDocument nodes.
DBE_XMLDOM.FREEELEMENT	Frees resources related to DOMElement nodes.
DBE_XMLDOM.FREENODE	Frees resources related to DOMNode nodes.
DBE_XMLDOM.FREENODELIST	Frees resources related to DOMNodeList nodes.
DBE_XMLDOM.GETATTRIBUTE	Returns the attribute values of a DOMElement object by name.
DBE_XMLDOM.GETATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XMLDOM.GETCHILDNODES	Converts several subnodes under a node into a node list.
DBE_XMLDOM.GETCHILDRENBYTAGNAME	Returns the subnodes of a DOMElement node by name.
DBE_XMLDOM.GETDOCUMENTELEMENT	Returns the first subnode of the specified document.
DBE_XMLDOM.GETFIRSTCHILD	Returns the first subnode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XMLDOM.GETLASTCHILD	Returns the last subnode.
DBE_XMLDOM.GETLENGTH	Obtains the number of subnodes under a specified node.
DBE_XMLDOM.GETLOCALNAME	Returns the local name of a node.
DBE_XMLDOM.GETNAMEDITEM	Returns the node specified by name.
DBE_XMLDOM.GETNEXTSIBLING	Returns the next node of the specified node.
DBE_XMLDOM.GETNODENAME	Returns the name of a node.
DBE_XMLDOM.GETNODETYPE	Returns the type of a node.
DBE_XMLDOM.GETNODEVALUE	Obtains the value of a node, depending on its type.
DBE_XMLDOM.GETPARENTNODE	Returns the parent node of a node.
DBE_XMLDOM.GETTAGNAME	Returns the tag name of the specified DOMElement node.
DBE_XMLDOM.HASCHILDNODES	Checks whether the DOMNode object has any subnode.
DBE_XMLDOM.IMPORTNODE	Copies a node and specifies the document to which the node belongs.
DBE_XMLDOM.ISNULL	Checks whether a node is null.
DBE_XMLDOM.ITEM	Returns the item corresponding to the index parameter in the mapping.
DBE_XMLDOM.MAKEELEMENT	Converts a DOMNode object to the DOMElement type.
DBE_XMLDOM.MAKENODE	Forcibly converts a node to the DOMNode type.
DBE_XMLDOM.NEWDOMDOCUMENT	Returns a new DOMDocument object.
DBE_XMLDOM.SETATTRIBUTE	Sets the value of the DOMElement attribute by name.
DBE_XMLDOM.SETCHARSET	Sets the character set for a DOMDocument object.
DBE_XMLDOM.SETDOCTYPE	Sets the external DTD of a DOMDocument object.
DBE_XMLDOM.SETNODEVALUE	Sets the value of a node in the DOMNode object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XMLDOM.WRITETOBUFFER	Writes an XML node to a specified buffer.
DBE_XMLDOM.WRITETOCLOB	Writes an XML node to a specified CLOB.
DBE_XMLDOM.WRITETOFILE	Writes an XML node to a specified file.
DBE_XMLDOM.GETSESSIONTREENUM	Displays the number of DOM trees of all types in the current session.
DBE_XMLDOM.GETDOCTREESINFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XMLDOM.GETDETAILDOCTREEINFO	Displays the number of nodes of each type for a specific document variable.
DBE_XMLDOM.GETELEMENTSBYTAGNAME	Returns the list of DOMNodeList nodes that matches TAGNAME.

- DBE_XMLDOM.APPENDCHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE_XMLDOM.APPENDCHILD function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
   n IN DOMNode,
   newchild IN DOMNode)
RETURN DOMNODE;
```

  Table 10-426 DBE_XMLDOM.APPENDCHILD parameters

Parameter	Description
n	Node to be added
newchild	New node added

  NOTE

  1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database A does not report an error in this scenario, but the mounting fails.
  2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database A does not report an error in this scenario, but the mounting fails.
  3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

  Example:

```
-- Add a DOMNode node to a specified DOC tree and use DBE_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.
DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    doc DBE_XMLDOM.DOMDocument;
    doc1 DBE_XMLDOM.DOMDocument;
    root DBE_XMLDOM.DOMElement;
    rootnode DBE_XMLDOM.DOMNode;
    child1 DBE_XMLDOM.DOMElement;
    child2 DBE_XMLDOM.DOMElement;
    attr DBE_XMLDOM.DOMAttr;
    text DBE_XMLDOM.DOMTEXT;
    node DBE_XMLDOM.DOMNode;
    child1_node DBE_XMLDOM.DOMNode;
    attr_node DBE_XMLDOM.DOMNode;
    parent DBE_XMLDOM.DOMNode;
    buf varchar2(1000);
BEGIN
    doc := DBE_XMLDOM.newDOMDocument();
    root := DBE_XMLDOM.createElement(doc, 'root');
    rootnode := DBE_xmldom.makeNode(root);
    node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc), rootnode);
    child1 := DBE_XMLDOM.createElement(doc, 'child1');
    child1_node := DBE_XMLDOM.makeNode(child1);
    node := DBE_XMLDOM.appendChild(rootnode, child1_node);
    attr := DBE_XMLDOM.createAttribute(doc, 'abc');
    attr_node := DBE_XMLDOM.makeNode(attr);
    node := DBE_XMLDOM.appendChild(child1_node, attr_node);
    IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
        DBE_OUTPUT.print_line('HAS CHILD NODES');
    ELSE
        DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
    END IF;
    parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
    buf := DBE_XMLDOM.GETNODENAME(parent);
    DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
NOT HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATEELEMENT

  Returns the DOMElement object with the specified name. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc        IN      DOMDOCUMENT,
  tagName    IN      VARCHAR2)
 RETURN DOMELEMENT;
```

  Returns the DOMElement object with the specified name and namespace. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc        IN     DOMDOCUMENT,
  tagName    IN     VARCHAR2,
  ns         IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Table 10-427 DBE_XMLDOM.CREATEELEMENT parameters

Parameter	Description
doc	Specified DOMDocument object
tagName	Name of the new DOMElement object
ns	Namespace

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- 1. Create a DOMElement object with the specified name.
DECLARE
  doc dbe_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMATTR;
  buf varchar2(1010);
BEGIN
   doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
      <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
      <ram>32GBx2 DDR4 3200MHz</ram>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATETEXTNODE

  Creates and returns a DOMText object. The prototype of the DBE_XMLDOM.CREATETEXTNOD function is as follows:

```
DBE_XMLDOM.CREATETEXTNODE(
  doc IN DOMDocument,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  data IN VARCHAR2)
RETURN DOMTEXT;
```

Table 10-428 DBE_XMLDOM.CREATETEXTNODE parameters

Parameter	Description
doc	Specified DOMDocument object
data	Content of the DOMText node

NOTE

1. You can enter an empty string or null value for **data**.
2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- Add a DOMText node to the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc DBE_XMLDOM.DOMDOCUMENT;
  doctext DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNODE;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>

```
      dbe_output.print_line('NOT NULL');
  END IF;
  dbe_xmldom.FREEELEMENT(elem);
  IF DBE_XMLDOM.ISNULL(elem) THEN
       dbe_output.print_line('IS NULL');
  ELSE
       dbe_output.print_line('NOT NULL');
  END IF;
END;
/
-- Expected result:
NOT NULL
IS NULL
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREENODE

  Frees a DOMNode node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
  n IN DOMNODE);
```

Table 10-431 DBE_XMLDOM.FREENODE parameters

Parameter	Description
n	Specified DOMNode node

NOTE

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database A performs the FREENODE operation, the freed node is available again and becomes another node.
2. When other APIs call the freed DOMNode node, the calling is different from that in database A.

Example:

```
-- Obtain a DOMNode node from the DOC tree and free the node. Check whether the node is empty
before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>
       <heading>Reminder</heading>
       <body>Don''t forget me this weekend!</body>
     </note>');
  node := dbe_xmldom.makenode(doc);
  node := dbe_xmldom.GETFIRSTCHILD(node);
  IF DBE_XMLDOM.ISNULL(node) THEN
       dbe_output.print_line('IS NULL');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ELSE
        dbe_output.print_line('NOT NULL');
  END IF;
  DBE_XMLDOM.FREENODE(node);
  IF DBE_XMLDOM.ISNULL(node) THEN
        dbe_output.print_line('IS NULL');
  ELSE
        dbe_output.print_line('NOT NULL');
  END IF;
END;
/
-- Expected result:
NOT NULL
IS NULL
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREENODELIST

  Frees a DOMNodeList node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nl     IN    DOMNODELIST);
```

Table 10-432 DBE_XMLDOM.FREENODELIST parameters

Parameter	Description
nl	Specified DOMNodeList node

NOTE

1. A DOMNodeList node will be completed freed by FREENODELIST.
2. When other APIs call the freed DOMNodelist node, the calling is different from that in database A.
3. The input parameter **freenodelist** cannot be empty.

Example:

```
-- Obtain a DOMNodeList node from the DOC tree and free the node. Check the node length before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>

NOTICE:  len :  0
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.GETATTRIBUTE

  Returns the attribute values of a DOMElement object by name. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem       IN      DOMELEMENT,
  name       IN      VARCHAR2)
RETURN VARCHAR2;
```

  Returns the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem      IN     DOMELEMENT,
  name      IN     VARCHAR2,
  ns        IN     VARCHAR2)
RETURN VARCHAR2;
```

Table 10-433 DBE_XMLDOM.GETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
ns	Namespace

NOTE

1. The **ns** parameter of the DBE_XMLDOM.GETATTRIBUTE API does not support the asterisk (*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE_XMLDOM.GETATTRIBUTE API.

Example:

```
-- 1. Return the attribute values of a DOMElement object by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;

- DBE_XMLDOM.GETLENGTH

  Returns the number of subnodes under a DOMNamedNodeMap node. The prototype of the DBE_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nnm      IN     DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

  Returns the number of subnodes under a DOMNodeList node. The prototype of the DBE_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nl     IN    DOMNODELIST)
 RETURN NUMBER;
```

Table 10-440 DBE_XMLDOM.GETLENGTH parameters

Parameter	Description

- DBE_XMLDOM.GETNAMEDITEM

  Returns the node specified by name. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2)
RETURN DOMNODE;
```

  Returns the node specified by name and namespace. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2,
  ns IN VARCHAR2)
RETURN DOMNODE;
```

Table 10-442 DBE_XMLDOM.GETNAMEDITEM parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap object
name	Name of the element to be retrieved
ns	Namespace

NOTE

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

Example:

```
-- 1. Return the node specified by name.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.IMPORTNODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
  doc IN DOMDOCUMENT,
  importedNode IN DOMNODE,
  deep IN BOOLEAN)
RETURN DOMNODE;
```

Table 10-450 DBE_XMLDOM.IMPORTNODE parameters

Parameter	Description
doc	Document to which the node is mounted
importedNode	Node to be imported
deep	Specifies whether to perform recursive import. • If the value is **TRUE**, the node and all its subnodes are imported. • If the value is **FALSE**, the node itself is imported.

Example:

```
-- Obtain the root2_node node in the DOC2 tree, copy it, and mount it to the DOC tree.
DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    doc dbe_xmldom.domdocument;
    doc2 dbe_xmldom.domdocument;
    doc_node dbe_xmldom.domnode;

- DBE_XMLDOM.ISNULL

  Checks whether the given DOMAttr node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

  ```
  DBE_XMLDOM.ISNULL(
    a       IN     DOMATTR)
  RETURN BOOLEAN;
  ```

  Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

  ```
  DBE_XMLDOM.ISNULL(
    doc       IN     DOMDOCUMENT)
  RETURN BOOLEAN;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Checks whether the given DOMElement node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  elem     IN     DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nnm      IN     DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  n      IN     DOMNODE)
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nl       IN     DOMNODELIST)
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  t      IN     DOMTEXT)
RETURN BOOLEAN;
```

Table 10-451 DBE_XMLDOM.ISNULL parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMElement node
nnm	Specified DOMNamedNodeMap node
n	Specified DOMNode node
nl	Specified DOMNodeList node
t	Specified DOMText node

NOTE

Due to the implementation difference of DBE_XMLDOM.FREEDOCUMENT, an error is reported when the DBE_XMLDOM.ISNULL API calls the freed DOMDocument node.

Example:

```
-- 1. Use createAttribute to create a DOMAttr node and check whether the node is empty.
DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  doc DBE_XMLDOM.DOMDocument;

- DBE_XMLDOM.ITEM

  Returns the element corresponding to the index in a list based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nl IN DOMNODELIST,
  index IN NUMBER)
RETURN DOMNODE;
```

  Returns the element corresponding to the index in a map based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nnm IN DOMNAMEDNODEMAP,
  index IN NUMBER)
RETURN DOMNODE;
```

Table 10-452 DBE_XMLDOM.ITEM parameters

Parameter	Description
nl	Specified DOMNodeList object
nnm	Specified DOMNamedNodeMap object
index	Index of the element to be retrieved

NOTE

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

Example:

```
-- 1. Return the element corresponding to the index in a map based on the index.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

END;
/
-- Expected result:
aaa
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.MAKENODE

  Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    a       IN     DOMATTR)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    doc      IN     DOMDOCUMENT)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMElement node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    elem       IN     DOMELEMENT)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    t       IN     DOMTEXT)
  RETURN DOMNODE;
  ```

  Table 10-454 DBE_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMElement node
t	Specified DOMText node

  NOTE

  Due to syntax restrictions, when DBE_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

  ```
  return DBE_XMLDOM.MAKENODE(doc);
  ```

  You are advised to run the following command:

  ```
  tmp_node := DBE_XMLDOM.MAKENODE(doc );
  return tmp_node;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
-- 1. Use createattr to generate ATTR and convert it to a node.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  attr DBE_XMLDOM.DOMATTR;

- DBE_XMLDOM.NEWDOMDOCUMENT

  Returns a new DOMDocument object. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

  ```
  DBE_XMLDOM.NEWDOMDOCUMENT
  RETURN DOMDOCUMENT;
  ```

  Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

  ```
  DBE_XMLDOM.NEWDOMDOCUMENT(
    xmldoc    IN SYS.XMLTYPE)
  RETURN DOMDOCUMENT;
  ```

  Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

  ```
  DBE_XMLDOM.NEWDOMDOCUMENT(
    cl       IN    CLOB)
  RETURN DOMDOCUMENT;
  ```

  Table 10-455 DBE_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xmldoc	Specified XMLType type
cl	Specified CLOB type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The size of the input parameter must be less than 2 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database and database A, see **DBE_XMLPARSER.PARSECLOB**.

Example:

```
-- 1. Return a new DOMDocument object.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument();

- DBE_XMLDOM.SETATTRIBUTE

  Sets the value of the DOMElement attribute by name. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
  elem    IN  DOMELEMENT,
  name    IN  VARCHAR2,
  value   IN  VARCHAR2);
```

  Sets the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
  elem    IN  DOMELEMENT,
  name    IN  VARCHAR2,
  value   IN  VARCHAR2,
  ns      IN  VARCHAR2);
```

  Table 10-456 DBE_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
value	Attribute value
ns	Namespace

  NOTE

  Multiple attributes can be added through the DBE_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMElement node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

  Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- 1. Set the value of the DOMElement attribute by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETCHARSET

  Sets the character set for a DOMDocument object. The prototype of the DBE_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
  doc      IN     DOMDocument,
  charset  IN     VARCHAR2);
```

Table 10-457 DBE_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

NOTE

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

Example:

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
      <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
      <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
      <note><to>test</to><from>Jani</from><heading>Reminder</heading>
      <body>Don''t forget me this weekend!</body></note>');
  dbe_xmldom.setcharset(doc, 'utf-16');
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
  dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETDOCTYPE

  Sets the external DTD of a DOMDocument object. The prototype of the DBE_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Table 10-458 DBE_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCType to be initialized
sysid	ID of the system whose DOCType needs to be initialized
pubid	Public ID of the DOCType to be initialized

NOTE

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
begin
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>

- DBE_XMLDOM.SETNODEVALUE

  Sets the value of a node in the DOMNode object. The prototype of the DBE_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-459 DBE_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

NOTE

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

Example:

```
-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.
DECLARE
  buf VARCHAR2(1000);
  doc DBE_XMLDOM.DOMDocument;
  text DBE_XMLDOM.DOMText;
  elem2 DBE_XMLDOM.DOMElement;
  node DBE_XMLDOM.DOMNode;
BEGIN
  doc := DBE_XMLDOM.NEWDOMDOCUMENT();
  text := DBE_XMLDOM.createTextNode(doc, 'aaa');
  DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
  buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ccc
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.WRITETOBUFFER

  Writes an XML node to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

  ```
  DBE_XMLDOM.WRITETOBUFFER(
    doc       IN      DOMDOCUMENT,
    buffer    INOUT   VARCHAR2);
  ```

  Writes an XML document to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

  ```
  DBE_XMLDOM.WRITETOBUFFER(
    n         IN      DOMNODE,
    buffer    INOUT   VARCHAR2);
  ```

Table 10-460 DBE_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
buffer	Buffer for the write operation
n	Specified DOMNode node

NOTE

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
   doc dbe_xmldom.domdocument;
   elem DBE_XMLDOM.DOMELEMENT;
   buf varchar2(1000);
BEGIN
    doc := dbe_xmldom.newdomdocument();
    elem := dbe_xmldom.createelement(doc,'elem');
    DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
    DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:

- DBE_XMLDOM.WRITETOCLOB

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc     IN      DOMDOCUMENT,
  cl      INOUT  CLOB);
```

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n       IN      DOMNODE,
  cl      INOUT  CLOB);
```

  Table 10-461 DBE_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

  NOTE

  - The **doc** parameter is an input parameter. The value of **writetoclob** is less than 2 GB.
  - This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
  - By default, XML files are output in the UTF-8 character set.

  Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
  CL  CLOB;
  N   DBE_XMLDOM.DOMNODE;
BEGIN
  DBE_XMLDOM.WRITETOCLOB(N, CL);

- DBE_XMLDOM.WRITETOFILE

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

  Table 10-462 DBE_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the **DBE_XMLDOM.SETCHARSET** API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If newdomdocument() is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg_directory_name/file_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory. For details about how to create a directory, see **CREATE DIRECTORY**.

Example:

```
-- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory.
create directory dir as '/tmp';
-- 1. Write an XML node to a specified file using the database character set.
DECLARE
  FPATH VARCHAR2(1000);
  DOC   DBE_XMLDOM.DOMDOCUMENT;
BEGIN
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
    <A ATTR1="A_VALUE">
        <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>');
  FPATH := 'dir/simplexml.xml';
  DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Write an XML document to a specified file using the specified character set.
DECLARE
  SRC   VARCHAR(1000);
  FPATH VARCHAR2(1000);

  ELE   DBE_XMLDOM.DOMELEMENT;
BEGIN
  FPATH := 'dir/simplexml.xml';
  SRC := '<ROOT>
    <A ATTR1="A_VALUE">
        <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>';
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
  ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
  DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
  DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- Clean the environment.
drop directory dir;
```

- DBE_XMLDOM.GETSESSIONTREENUM

  Queries the number of DOM trees of all types in the current session. The prototype of the DBE_XMLDOM.GETSESSIONTREENUM function is as follows:

  ```
  DBE_XMLDOM.GETSESSIONTREENUM()
  RETURN INTEGER;
  ```

  NOTE

  For DOM trees that have used FREEElement and FREENode, this function still counts them.

  Example:

  ```
  -- Create three documents and obtain the number of DOM trees in the current session.
  DECLARE
    doc DBE_XMLDOM.DOMDocument;
    doc2 DBE_XMLDOM.DOMDocument;
    doc3 DBE_XMLDOM.DOMDocument;

    buffer varchar2(1010);
  BEGIN
  -- Create three documents.
    doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
  <root>
     <elem1 attr="attrtest">
        <elem2>Im text</elem2>
        <elem3>Im text too</elem3>

- DBE_XMLDOM.GETDETAILDOCTREEINFO

  Queries the number of subnodes of each type in the transferred document. The prototype of the DBE_XMLDOM.GETDETAILDOCTREEINFO function is as follows:

```
DBE_XMLDOM.GETDETAILDOCTREEINFO(
   doc     IN      DOMDOCUMENT
)
RETURN VARCHAR2;
```

Table 10-463 DBE_XMLDOM.GETDETAILDOCTREEINFO parameters

Parameter	Description
doc	Specified DOMDocument node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

This function collects statistics only on DOM tree nodes of the document type.

Example:

```
-- Create three documents and use this function to obtain the number of nodes of each type in each
document.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc2 DBE_XMLDOM.DOMDocument;
  doc3 DBE_XMLDOM.DOMDocument;

  buffer varchar2(1010);
BEGIN
-- Create three documents.
  doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
    <elem1 attr="attrtest">
        <elem2>Im text</elem2>
        <elem3>Im text too</elem3>
    </elem1>
    <elem4>Text</elem4>
</root>
');
  doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
    <cpu>Ryzen 9 3950X</cpu>

- DBE_XMLDOM.GETELEMENTSBYTAGNAME

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

```
DBE_XMLDOM.GETELEMENTSBYTAGNAME(
  doc        IN      DOMDOCUMENT,
  tagname    IN      VARCHAR2)
RETURN DOMNODELIST;
```

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

```
DBE_XMLDOM.GETELEMENTSBYTAGNAME(
  elem       IN      DOMELEMENT,
  tagname       IN      VARCHAR2)
RETURN DOMNODELIST;
```

  Searches for the DOMNodelist node by name and namespace in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

```
DBE_XMLDOM.GETELEMENTSBYTAGNAME(
  elem       IN      DOMELEMENT,
  tagname      IN      VARCHAR2,
  ns         IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Table 10-464 DBE_XMLDOM.GETELEMENTSBYTAGNAME API parameters

Parameter	Description
doc	Specified DOMDocument node
elem	Specified DOMElement node
tagname	Tag name. Using the wildcard (*) will match any tag.
ns	Namespace. Using the wildcard (*) will match any namespace.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- 1. Search the DOMDocument node by TAGNAME and return the matched DOMNodelist node list.
DECLARE

10.12.2.20 DBE_XMLPARSER

API Description

The DBE_XMLPARSER interface is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. **Table 10-465** lists all APIs supported by the DBE_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

NOTE

When the DBE_XMLPARSER advanced package is used in the database whose character set is set to **SQL_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE_XMLPARSER advanced package supports only the A-compatible mode.

Table 10-465 DBE_XMLPARSER parameters

API	Description
DBE_XMLPARSER.FREEPARSER	Frees a parser.
DBE_XMLPARSER.GETDOCUMENT	Obtains the parsed document node.
DBE_XMLPARSER.GETVALIDATIONMODE	Obtains the validation attribute.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XMLPARSER.NEWPARSER	Creates a parser instance.
DBE_XMLPARSER.PARSEBUFFER	Parses the VARCHAR string.
DBE_XMLPARSER.PARSECLOB	Parses the CLOB string.
DBE_XMLPARSER.SETVALIDATIONMODE	Sets the validation attribute.

- DBE_XMLPARSER.FREEPARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XMLPARSER.FREEPARSER is as follows:

  ```
  DBE_XMLPARSER.FREEPARSER (
    p     IN     parser);
  ```

  Table 10-466 DBE_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

  Example:

  ```
  -- Create a parser and then release it.
  DECLARE
    l_parser dbe_xmlparser.parser;
    BEGIN
    l_parser := dbe_xmlparser.newparser;
  -- Directly release the l_parser instance.
    dbe_xmlparser.freeparser(l_parser);
  END;
  /
  ```

  Result: The operation is successful.

- DBE_XMLPARSER.GETDOCUMENT

  Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

  The prototype of the DBE_XMLPARSER.GETDOCUMENT function is as follows:

  ```
  DBE_XMLPARSER.GETDOCUMENT (
    p     IN     parser)
   RETURN DOMDocument;
  ```

  Table 10-467 DBE_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, **NULL** is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, **NULL** is returned.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser;
-- The l_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);
-- Print the content in l_doc.
  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE_XMLPARSER.GETVALIDATIONMODE

  Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XMLPARSER.GETVALIDATIONMODE function is as follows:

  ```
  DBE_XMLPARSER.GETVALIDATIONMODE (
    p     IN     parser)
   RETURN BOOLEAN;
  ```

  Table 10-468 DBE_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

  Example:

```
-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
    if (dbe_xmlparser.GETVALIDATIONMODE(l_parser) = true) then
 RAISE NOTICE 'validation';
    else
    RAISE NOTICE 'no validation';
  end if;
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Execution result:

```
NOTICE:  validation
```

- DBE_XMLPARSER.NEWPARSER

  Creates a parser object and returns a new parser instance.

  The prototype of the DBE_XMLPARSER.NEWPARSER function is as follows:

  ```
  DBE_XMLPARSER.NEWPARSER
   RETURN Parser;
  ```

  Example:

  ```
  -- Create a parser to parse character strings and then free the parser.
  DECLARE
    -- Create a parser.
    l_parser dbe_xmlparser.parser;
    l_doc dbe_xmldom.domdocument;
    buffer varchar2(1000) :=
      '<?xml version="1.0" encoding="UTF-8"?>
      <note>
      <to>Tove</to>
      <from>Jani</from>
      <heading>Reminder</heading>
      <body>Donot forget me this weekend!</body>
      </note>';
    buffer2 varchar2(1000);
    BEGIN
    l_parser := dbe_xmlparser.newparser;
    -- Parse the document and create a new DOM document.
    dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

    dbe_xmlparser.freeparser(l_parser);
  END;
  /
  ```

  Result: The operation is successful.

- DBE_XMLPARSER.PARSEBUFFER

  Parses XML documents stored in strings.

  The stored procedure prototype of DBE_XMLPARSER.PARSEBUFFER is as follows:

  ```
  DBE_XMLPARSER.PARSEBUFFER (
    p     IN     parser,
    doc   IN VARCHAR2);
  ```

  Table 10-469 DBE_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
doc	A string that stores XML documents

NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser;
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);

  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XMLPARSER.PARSECLOB

  Parses XML documents stored in a CLOB.

  The stored procedure prototype of DBE_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
  p     IN     parser,
  doc   IN CLOB);
```

Table 10-470 DBE_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

NOTE

- PARSECLOB cannot parse CLOBs greater than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE

 l_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
 <note>
 <to>Tove</to>
 <from>Jani</from>
 <heading>Reminder</heading>
 <body>this weekend!</body>
 </note>';
 -- Create a parser.
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
 BEGIN
 l_parser := dbe_xmlparser.newparser;
 -- Parse the document and create a new DOM document.
 dbe_xmlparser.parseclob(l_parser, l_clob);
 l_doc := dbe_xmlparser.getdocument(l_parser);
 dbe_xmldom.writetobuffer(l_doc, buffer);
 RAISE NOTICE '%',buffer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
dbe_xmlparser.freeparser(l_parser);
dbe_xmldom.freedocument(l_doc);

END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>this weekend!</body>
</note>
```

- DBE_XMLPARSER.SETVALIDATIONMODE

  Sets the parsing validation mode of a specified parser.

  The stored procedure prototype of DBE_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
  p     IN     parser)
  yes   IN BOOLEAN);
```

Table 10-471 DBE_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: The validation is disabled.

NOTE

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

Example 1:

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true, an error is reported during parsing.
DECLARE
  l_clob clob :=
 '<!DOCTYPE note [
 <!ELEMENT note (to,from,heading,body)>
 <!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)>
 <!ELEMENT heading (#PCDATA)>
 <!ELEMENT body (#PCDATA)>
 ]>
 <table>
 <name attr1="WEB" attr2="web2">African Coffee Table</name>
 <width>80</width>
 <length>120</length>
 </table>';
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
buffer varchar2(1000);
 BEGIN
 l_parser := dbe_xmlparser.newparser;
 -- Set it to false for parsing.
   dbe_xmlparser.setValidationMode(l_parser, false);
   dbe_xmlparser.parseclob(l_parser, l_clob);
   l_doc := dbe_xmlparser.getdocument(l_parser);
   dbe_xmldom.writetobuffer(l_doc, buffer);
   RAISE NOTICE '%', buffer;
   dbe_xmlparser.freeparser(l_parser);
   dbe_xmldom.freedocument(l_doc);
 END;
 /
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>

]>
<table>
 <name attr1="WEB" attr2="web2">African Coffee Table</name>
 <width>80</width>
 <length>120</length>
 </table>
```

Example 2:

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
  l_clob clob :=
 '<!DOCTYPE note [
 <!ELEMENT note (to,from,heading,body)>
 <!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)>
 <!ELEMENT heading (#PCDATA)>
 <!ELEMENT body (#PCDATA)>
 ]>
 <table>
 <name attr1="WEB" attr2="web2">African Coffee Table</name>
 <width>80</width>
 <length>120</length>
 </table>';
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
  BEGIN
  l_parser := dbe_xmlparser.newparser;
  -- Set it to true for parsing.
--The XML character string does not match the DTD format. An error is expected.
    dbe_xmlparser.setValidationMode(l_parser, true);
    dbe_xmlparser.parseclob(l_parser, l_clob);
    l_doc := dbe_xmlparser.getdocument(l_parser);
    dbe_xmldom.writetobuffer(l_doc, buffer);
    dbe_xmlparser.freeparser(l_parser);
    dbe_xmldom.freedocument(l_doc);
  END;
  /
```

Execution result:

```
An error is reported during xmlparser parsing.
ERROR:  invalid XML document
```

10.12.2.21 DBE_DESCRIBE

Data Types

The advanced package **DBE_DESCRIBE** has two built-in data types. The two data types are created using user-defined types and are used for the return values of the DESCRIBE_PROCEDURE API.

- DBE_DESCRIBE.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_DESCRIBE.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.VARCHAR2_TABLE AS TABLE OF VARCHAR2(30) INDEX BY INTEGER;
  ```

API Description

The advanced package **DBE_DESCRIBE** provides the DESCRIBE_PROCEDURE API to return the parameter information (such as parameter names and parameter data types) of functions or stored procedures in a list.

Table 10-472 DBE_DESCRIBE overview

API	Description
DBE_DESCRIBE.DESCRIBE_PROCEDURE	Displays the parameters of a stored procedure or function.

- DBE_DESCRIBE.DESCRIBE_PROCEDURE

  The stored procedure DESCRIBE_PROCEDURE is used to display the parameter information of a stored procedure or function, such as the parameter name, parameter mode, and parameter location. The parameter information of a function or stored procedure is returned in a list.

  The prototype of the DBE_DESCRIBE.DESCRIBE_PROCEDURE function is as follows:

  ```
  DBE_DESCRIBE.DESCRIBE_PROCEDURE(
    object_name               IN  VARCHAR2,
    reserved1                 IN  VARCHAR2,
    reserved2                 IN  VARCHAR2,
    overload                  OUT DBE_DESCRIBE.NUMBER_TABLE,
    dataposition               OUT DBE_DESCRIBE.NUMBER_TABLE,
    datalevel                 OUT DBE_DESCRIBE.NUMBER_TABLE,
    argument_name                OUT DBE_DESCRIBE.VARCHAR2_TABLE,
    datatype                  OUT DBE_DESCRIBE.NUMBER_TABLE,
    default_value              OUT DBE_DESCRIBE.NUMBER_TABLE,
    in_out                    OUT DBE_DESCRIBE.NUMBER_TABLE,
    datalength                 OUT DBE_DESCRIBE.NUMBER_TABLE,
    dataprecision              OUT DBE_DESCRIBE.NUMBER_TABLE,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 scale                    OUT DBE_DESCRIBE.NUMBER_TABLE,
 radix                    OUT DBE_DESCRIBE.NUMBER_TABLE,
 spare                     OUT DBE_DESCRIBE.NUMBER_TABLE,
 include_string_constraints OUT BOOLEAN
);
```

Table 10-473 DBE_DESCRIBE.DESCRIBE_PROCEDURE API

Parameter	Type	Whether NULL Is Allowed	Description
object_name	varchar2	No	Stored procedure name. The syntax format of this parameter is [[*schema*.]*package*.]*function*[@*dblink*], in which: ● *schema* (optional): schema name. ● *package* (optional): package name. ● *function* (required): name of a function or stored procedure. ● *dblink* (optional): remote connection name.
reserved1	varchar2	Yes	Reserved parameter.
reserved2	varchar2	Yes	Reserved parameter.
overload	number_table	Yes	Unique ID assigned to a stored procedure or function. If a stored procedure or function is overloaded, overload is each overload of the stored procedure or function. Overload is numbered from 1 in ascending order based on the entire stored procedure or function. If a stored procedure or function is not overloaded, **overload** is set to **0**.
dataposition	number_table	Yes	Position of a specified parameter in the parameter list.
datalevel	number_table	Yes	It is set to **0**.
argument_name	varchar2_table	Yes	Name of the parameter associated with the specified stored procedure.
datatype	number_table	Yes	OID of the data type of the specified parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
default_value	number_table	Yes	If the specified parameter has a default value, the value is **1**. Otherwise, the value is **0**.
in_out	number_table	Yes	Parameter mode. The options are as follows: • **0**: IN • **1**: OUT • **2**: IN OUT
datalength	number_table	Yes	Not supported. Set it to **0** by default.
dataprecision	number_table	Yes	Not supported. Set it to **0** by default.
scale	number_table	Yes	Not supported. Set it to **0** by default.
radix	number_table	Yes	If the value is of the numeric type (such as **NUMBER** and **INTEGER**), **10** is returned. Otherwise, **0** is returned. For details about the numeric type, see **numeric types**.
spare	number_table	Yes	Reserved parameter. Set it to **0** by default.
include_string_constraints	Boolean	Yes	Reserved parameter, which does not need to be processed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The data type of the **datatype** parameter is different from that of the A-compatible database. The GaussDB returns the OID of the data type, and the A-compatible database returns the number of the data type in the A-compatible database.
- The **include_string_constraints** parameter does not take effect on the stored procedure. The value of the **include_string_constraints** parameter does not change, and the return values of other parameters are not affected.
- The OIDs of the data types created by the create type operation are uncertain. Therefore, do not use these OIDs for fixed judgment.
- For the **dataposition** parameter, if a stored procedure is specified, the return value starts from **1**. If a function is specified, the return value starts from **0**. **0** indicates the position sequence number of the return value of the function.
- For the **argument_name** parameter, if a function is specified, the first position of the return value is empty. This position indicates the name of the return value of the described function (that is, the empty name).
- Do not directly specify a package. Otherwise, an error is reported.
- If you do not have the execute permission on a stored procedure, function, or package, the system considers that the stored procedure, function, or package does not exist and reports an error.
- The input parameters **reserved1** and **reserved2** are not involved in internal processing. Entering any character string does not affect the returned result.
- The advanced package cannot specify the stored procedures or functions obtained through DBLINK.
- You are advised to add the schema prefix before the specified stored procedure or function. If the schema prefix is omitted, the advanced package uses the schema of the current session to search for the entity to which the advanced package belongs. In this case, you need to change the value of **behavior_compat_options** to **bind_procedure_searchpath** for the advanced package to take effect.
- If the %type operation is used to obtain the data type from a table column, the constraint on the data type (such as NUMBER(3) and VARCHAR2(10)) is not retained.

Example:

```
-- Create a stored procedure to encapsulate the advanced package for printing return values.
CREATE PROCEDURE PRINT_DESCRIBE (obj_name IN VARCHAR2)
AS
  a_overload      DBE_DESCRIBE.NUMBER_TABLE;
  a_position      DBE_DESCRIBE.NUMBER_TABLE;

10.12.2.22 PRVT_ILM

The PRVT_ILM API is an internal API of the ILM feature and cannot be directly called by users. Only the API names are listed and the API prototypes are not described.

API	Description
be_active_ado_window	The maintenance window updates the ilmadowindow triggering time and action.
be_create_ado_window_for_each_db	The maintenance window creates ilmadowindow in each database of the instance.
be_execute_ilm	The ilmadowind performs automatic evaluation.
flush_task_executestate	The automatic scheduled job updates the task status.
evaluate_obj_policy	Data objects are evaluated after scheduling is triggered.
change_be_ilm	dbe_ilm_admin.enable_ilm() and disable_ilm() help functions. This operation affects the overall ILM background scheduling of the cluster.
get_compression_ratio	dbe_compression.get_compression_ratio() help function.
get_compression_type	dbe_compression.get_compression_type() help function.
get_lastmodified_time	dbe_heat_map.row_heat_map() help function.
gs_ilm_ticker	The maintenance window performs an action, performs a dotting operation, and records the mapping between the LSN and time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
compress_blocks	prvt_ilm.ilm_job_action() help function.
compress_block_single	Do not use this API because it is discarded.
get_job_status	dbe_ilm.stop_ilm help function.
ilm_job_action	Executor of a compression task.
query_unfinishedjob_num	Queries whether there are jobs that are not complete, including jobs in the initial and running states.
ilm_seq_nextval	Obtains the next sequence value of the ILM.
ilm_seq_setval	Sets the current sequence value of the ILM.
check_compatibility	Specifies a function used to determine a database compatibility mode in a unified manner.
set_pg_settings	Specifies a function used to set the GUC parameters for setting a database compatibility mode.

10.12.2.23 DBE_XMLGEN

API Description

The **DBE_XMLGEN** system package converts the result of an SQL query into a standard XML format and returns the result. For details about all supported APIs, see **Table 2 DBE_XMLGEN**.

Table 10-474 DBE_XMLGEN data type

Type	Description
DBE_XMLGEN.CTXHANDLE	Data type used to store the XML output status.

NOTE

1. A maximum of 65,535 context handles can exist in a session. Closing the context handle does not reclaim the number.
2. The case of the table column and type in the output XML file is the same as that of the table field and type created by the user. If you need to write a large field and type name, use double quotation marks ("") to enclose the field and type name.
3. During NEWCONTEXTFROMHIERARCHY initialization, the SETNULLHANDLING, USENULLATTRIBUTEINDICATOR, and SETCONVERTSPECIALCHARS methods are used to set this parameter, but the setting does not take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-475 DBE_XMLGEN

API	Description
DBE_XMLGEN.CONVERT	Encodes or decodes the input character string in XML format.
DBE_XMLGEN.NEWCONTEXT	Initializes the common context handle.
DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY	Initializes the context handle with recursive elements.
DBE_XMLGEN.SETCONVERTSPECIALCHARS	Specifies whether the output XML file needs to be encoded.
DBE_XMLGEN.SETNULLHANDLING	Sets how to display the null value in the XML file.
DBE_XMLGEN.SETROWSETTAG	Sets the name of the XML root node.
DBE_XMLGEN.SETROWTAG	Sets the tag name of each row of data in the XML file.
DBE_XMLGEN.USENULLATTRIBUTEINDICATOR	Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.
DBE_XMLGEN.USEITEMTAGSFORCOLL	Adds the suffix '**_item**' to the element where the variable of the array type is located.
DBE_XMLGEN.GETNUMROWSPROCESSED	Views the number of data rows returned by getxml or getxmltype last time.
DBE_XMLGEN.SETMAXROWS	Sets the maximum number of rows returned by getxml.
DBE_XMLGEN.SETSKIPROWS	Sets the number of SQL rows to be skipped.
DBE_XMLGEN.RESTARTQUERY	Restarts the SQL.
DBE_XMLGEN.GETXMLTYPE	Returns the XML text of the XMLTYPE type.
DBE_XMLGEN.GETXML	Returns the XML text of the CLOB type.
DBE_XMLGEN.CLOSECONTEXT	Disables the context handle.

- DBE_XMLGEN.CONVERT
  Encodes or decodes the input character string in XML format.
  The conversion is performed according to the following rules.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-476 XML encoding rules

Original Value	Code Value
&	&
<	<
>	>
"	"
'	'

Function prototype:

```
DBE_XMLGEN.CONVERT(XMLSTR IN VARCHAR2, FLAG IN NUMBER := 0) RETURNS VARCHAR2;
DBE_XMLGEN.CONVERT(XMLCLOB IN CLOB, FLAG IN NUMBER := 0) RETURNS CLOB;
```

Parameter description

Table 10-477 DBE_XMLGEN.CONVERT parameters

Parameter	Description
XMLSTR	XML character string to be converted. The value is of the VARCHAR2 type.
XMLCLOB	XML character string to be converted. The value is of the CLOB type.
FLAG	Transcodes or decodes character strings. **0**: encoding. **1**: decoding.

Example:

```
-- XML decoding
SELECT DBE_XMLGEN.CONVERT('<foo/>', 1);
 convert
---------
 <foo/>
(1 row)
-- XML encoding
SELECT DBE_XMLGEN.CONVERT('<foo><qwe</foo>', 0);
            convert
--------------------------------
 &lt;foo&gt;&lt;qwe&lt;/foo&gt;
(1 row)
```

- DBE_XMLGEN.NEWCONTEXT

  Initializes the common context handle.

  Function prototype:

```
DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN VARCHAR2) RETURNS DBE_XMLGEN.CTXHANDLE;
DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN SYS_REFCURSOR) RETURNS
DBE_XMLGEN.CTXHANDLE;
```

Parameter description

Table 10-478 DBE_XMLGEN.NEWCONTEXT parameters

Parameter	Description
QUERYSTRING	Queries SQL statement or SYS_REFCURSOR used to generate XML files.

Example:

```
-- Preset data.
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);

 <department_name>!@#$%^&amp;*()+-=&lt;&gt;/\"a3_a</department_name>
</row>
</rowset>
```

- DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY

  Initializes the context handle with recursive elements.

  The data format must contain two columns. The first column is of the numeric type, and the second column is of the XML or XMLTYPE type. Generally, the value is generated by the connect by statement. The first column specifies the generation level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The number of nested layers in the generated XML file cannot exceed 50 million.

Function prototype:

```
DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY(QUERYSTRING IN VARCHAR2);
```

Parameter description

Table 10-479 DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY parameters

Parameter	Description
QUERYSTRING	XML character string to be converted. The value is of the VARCHAR2 type.

Example:

```
-- Preset data.
CREATE TABLE tree_list(id NUMBER, name VARCHAR2(30), fid NUMBER);
INSERT INTO tree_list VALUES(1, 'a', NULL);
INSERT INTO tree_list VALUES(6, 'a-1-2', 2);
INSERT INTO tree_list VALUES(2, 'a-1', 1);
INSERT INTO tree_list VALUES(3, 'a-2', 1);
INSERT INTO tree_list VALUES(4, 'a-3', 1);
INSERT INTO tree_list VALUES(5, 'a-1-1', 2);
INSERT INTO tree_list VALUES(7, 'a-2-1', 3);
INSERT INTO tree_list VALUES(8, 'a-2-2', 3);
INSERT INTO tree_list VALUES(9, 'a-3-1', 4);
INSERT INTO tree_list VALUES(10, 'a-3-2', 4);
INSERT INTO tree_list VALUES(11, 'a-3-2-1', 10);
INSERT INTO tree_list VALUES(12, 'a-3-2-1-1', 11);

```

- DBE_XMLGEN.SETCONVERTSPECIALCHARS

  Specifies whether the output XML file needs to be encoded. If XML encoding is canceled, XML injection may occur. If the XML is secured and the performance is considered, XML encoding is not required.

  Function prototype:

  ```
  DBE_XMLGEN.SETCONVERTSPECIALCHARS(CTX IN DBE_XMLGEN.CTXHANDLE, CONV IN BOOLEAN);
  ```

  Parameter description:

  Table 10-480 DBE_XMLGEN.SETCONVERTSPECIALCHARS parameters

Parameter	Description
CTX	Context handle.
CONV	Specifies whether to encode the output XML file. ● **true**: yes ● **false**: no

  Example:

  ```
  -- Preset data.
  CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);
INSERT INTO department VALUES(13, 'ccc', 400, 1600);
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
INSERT INTO department VALUES(15, NULL, 500,1600);

```

- DBE_XMLGEN.SETSKIPROWS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets the number of SQL rows to be skipped.

Function prototype:

```
DBE_XMLGEN.SETSKIPROWS(CTX IN DBE_XMLGEN.CTXHANDLE, SKIPROWS IN NUMBER);
```

Parameter description:

Table 10-488 DBE_XMLGEN.SETSKIPROWS parameters

Parameter	Description
CTX	Context handle.
SKIPROWS	Number of SQL header rows that are skipped.

Example:

```
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);
INSERT INTO department VALUES(13, 'ccc', 400, 1600);
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
INSERT INTO department VALUES(15, NULL, 500,1600);
INSERT INTO department VALUES(16, '!@#$ %^&*()+-=<>/\"a3_a', 400, 1600);
-- Use setskiprows to skip five rows.
declare
    result CLOB;
    qryctx DBE_XMLGEN.CTXHANDLE;
BEGIN
 qryctx:=DBE_XMLGEN.NEWCONTEXT('SELECT * from department');
 DBE_XMLGEN.SETSKIPROWS(qryctx, 5);
 result:=DBE_XMLGEN.GETXML(qryctx);
 DBE_OUTPUT.PUT_LINE(result);
 DBE_XMLGEN.CLOSECONTEXT(qryctx);
END;
/
<?xml version="1.0"?>
