Description: Constructs several **json_path**-**value** pairs from a variable-parameter list, appends a value to the path specified in **json**, and returns the modified **json**. json_append is the same as json_array_append. If any input parameter is null, the function will return null. An error will be reported if **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: The first input parameter must be JSON in the correct format, and the second input parameter must be a variable-parameter list. **json_path**-**value** pairs will be constructed from the variable-parameter list. For details, see **Table 7-67**.

Table 7-67 Parameters

Parameter	Type	Description	Value Range
json	json	JSON value to be modified.	The value must be in JSON format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
[VARIADIC "any"]	Variable any array	A variable-parameter list, including the number of variable **json_path**-**value** pairs.	**json_path** must be a valid path expression, and **value** can be any value.

Return type: json

Example:

```
gaussdb=# SELECT json_array_append('[1, [2, 3]]', '$[1]', 4, '$[0]', false, '$[0]', null, '$[0]',
current_timestamp);
                        json_array_append
------------------------------------------------------------------
 [[1, false, null, "2023-08-12 14:27:16.142355+08"], [2, 3, 4]]
(1 row)
```

json_array([VARIADIC "any"])

Description: Constructs an array from a variable-parameter list and returns a JSON array. If the function does not have any parameters, an empty JSON array is returned.

Parameter: a variable-parameter list, wherein values can be of any type.

Return type: json

Example:

```
-- If no input parameter is entered, an empty JSON array is returned.
gaussdb=# SELECT json_array();
 json_array
------------
 []
(1 row)

-- The input parameter can be of any type.
gaussdb=# SELECT json_array(TRUE, FALSE, NULL, 114, 'text', current_timestamp);
                          json_array
---------------------------------------------------------------
 [true, false, null, 114, "text", "2023-08-12 15:17:34.979294+08"]
(1 row)
```

json_array_insert(json, [VARIADIC "any"])

Description: Constructs one or more **json_path**-**value** pairs from a variable-parameter list, inserts a value into the array path specified by **json_path** in **json**, and returns a new JSON value. If there is already an existing value on the specified path, the value is inserted on the path and the existing value is moved backward. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-68**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-68 Parameters

Parameter	Type	Description	Value Range
json	json	JSON value to be modified.	The value must be in JSON format.
[VARIADIC "any"]	Variable any array	A variable-parameter list containing one or more **json_path**-**value** pairs.	**json_path** must be a valid path expression, and **value** can be any value.

Return type: json

Example:

```
-- Example of containing one json_path-value pair
gaussdb=# SELECT json_array_insert('[1, [2, 3]]', '$[1]', 4);
 json_array_insert
-------------------
 [1, 4, [2, 3]]
(1 row)

-- Example of containing multiple json_path-value pairs
gaussdb=# SELECT json_array_insert('{"x": 1, "y": [1, 2]}', '$.y[0]', NULL, '$.y[0]', 123, '$.y[3]',
current_timestamp);
                        json_array_insert
------------------------------------------------------------------
 {"x": 1, "y": [123, null, 1, "2023-08-14 14:54:12.85087+08", 2]}
(1 row)
```

json_contains(target_json, candidate_json[, json_path])

Description: The input parameters are two JSON objects and an optional JSON path. If no JSON path is specified, the function will check whether **target_json** contains **candidate_json**. If a path is specified, the function will check whether **candidate_json** is contained in the **json_path** specified in **target_json**. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-69**.

Table 7-69 Parameters

Parameter	Type	Description	Value Range
target_json	json	Target JSON object, which is used to check whether **candidate_json** is contained in the JSON object.	The value must be in JSON format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
candidate_json	json	JSON subobject, which is used to check whether it is contained in **target_json**.	The value must be in JSON format.
json_path	text	Specified JSON path. This parameter is optional. If this parameter is specified, the path specified by **json_path** in **target_json** is used to determine the inclusion relationship.	**json_path** must be a valid path expression.

Return type: bigint. If there is an inclusion relationship, **1** is returned. If there is no inclusion relationship, **0** is returned.

Example:

```
-- No path is specified.
gaussdb=# SELECT json_contains('[1, 2, {"x": 3}]', '{"x":3}');
 json_contains
---------------
             1
(1 row)

-- A path is specified.
gaussdb=# SELECT json_contains('[1, 2, {"x": 3},[1,2,3,4]]', '2','$[1]');
 json_contains
---------------
             1
(1 row)

gaussdb=# SELECT json_contains('[1, 2, {"x": 3},[1,2,3,4]]', '1','$[1]');
 json_contains
---------------
             0
(1 row)
```

json_contains_path(json, mode_str, [VARIADIC text])

Description: Checks whether a JSON object has a value on the specified path. There can be multiple paths. The first input parameter is a JSON object, and the second input parameter can be **one** or **all**, specifying whether to check all paths. The third input parameter is a variable-parameter list. All JSON paths are constructed from this list. If the path is detected based on the mode, the function will return **1**. If no path is detected, the function will return **0** instead. If **json** or **json_path** is null, the function will return null. If the **json** format is incorrect or **json_path** is an invalid path expression, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-70**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-70 Parameters

Parameter	Type	Description	Value Range
json	json	JSON object to be passed.	The value must be in JSON format.
mode_str	text	**one** means that the function will return **1** upon detecting a single path and **0** if no path is detected. **all** means that the function will return **1** only when it detects all paths; otherwise, it will return **0**.	The value must be **one** or **all**, which is case-insensitive.
[VARIADIC text]	Variable text array	A variable-parameter list from which all JSON paths will be constructed.	**json_path** must be a valid path expression.

Return type: bigint

Example:

```
-- In the all scenario, all paths must exist.
gaussdb=# SELECT json_contains_path('[1, 2, {"x": 3}]', 'all', '$[0]', '$[1]', '$[2]');
 json_contains_path
--------------------
                  1
(1 row)

gaussdb=# SELECT json_contains_path('[1, 2, {"x": 3}]', 'all', '$[0]', '$[1]', '$[6]');
 json_contains_path
--------------------
                  0
(1 row)

-- In the one scenario, at least one path must exist.
gaussdb=# SELECT json_contains_path('[1, 2, {"x": 3}]', 'one', '$[0]', '$[1]', '$[5]');
 json_contains_path
--------------------
                  1
(1 row)
```

json_depth(json)

Description: The input parameter is a JSON object. This function is used to return the maximum depth of the JSON object. If the input parameter is null, the function will return null.

Parameter: The input parameter is a JSON string whose depth needs to be queried. If the input parameter is not in valid JSON format, an error is reported.

Return type: int

Example:

```
-- The depth of an empty array is 1.
gaussdb=# SELECT json_depth('[]');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 json_depth
------------
          1
(1 row)

gaussdb=# SELECT json_depth('{"s":1, "x":2,"y":[1]}');
 json_depth
------------
          3
(1 row)
```

json_extract(json, [VARIADIC text])

Description: Extracts the data of JSON paths from a JSON object, merges this data into a JSON array and returns the array. These JSON paths are constructed from the variable-parameter list. Both the JSON paths and JSON object are specified in the input parameters. If **json** or **json_path** is null, the function will return null. If the **json** format is incorrect or **json_path** is an invalid path expression, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-71**.

Table 7-71 Parameters

Parameter	Type	Description	Value Range
json	json	JSON value from which paths are to be extracted.	The value must be in JSON format.
[VARIADIC text]	Variable text array	A variable-parameter list containing one or more JSON paths.	**json_path** must be a valid path expression.

Return type: json

Example:

```
-- One path is extracted.
gaussdb=# SELECT json_extract('[1, 2, {"x": 3}]', '$[2]');
 json_extract
--------------
 {"x": 3}
(1 row)

-- Multiple paths are extracted.
gaussdb=# SELECT json_extract('["a", ["b", "c"], "d"]', '$[1]', '$[2]', '$[3]');
   json_extract
--------------------
 [["b", "c"], "d"]
(1 row)
```

json_insert(json, [VARIADIC any])

Description: The input parameter is a JSON object, multiple JSON paths, and values to be inserted. JSON paths and values must be paired. This function inserts

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

value at the position specified by **json_path** in **json**. This function can only insert data to a position where no path exists. If the specified path already exists in **json**, no data will be inserted. If **json** or **json_path** is null, **null** is returned. In addition, **json_path** cannot contain wildcard characters * or **. Otherwise, an error is reported. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-72**.

Table 7-72 Parameters

Parameter	Type	Description	Value Range
json	json	JSON object to which a value is to be inserted.	The value must be in JSON format.
[VARIADIC any]	Variable any array	A variable-parameter list containing one or more **json_path**-**value** pairs.	**json_path** must be a valid path expression, and **value** can be any value.

Return type: json

Example:

```
gaussdb=# SELECT json_insert('[1, [2, 3], {"a": [4, 5]}]', '$[3]', 2);
         json_insert
------------------------------
 [1, [2, 3], {"a": [4, 5]}, 2]
(1 row)

gaussdb=# SELECT json_insert('[1, [2, 3], {"a": [4, 5]}]', '$[10]', 10,'$[5]', 5);
           json_insert
---------------------------------
 [1, [2, 3], {"a": [4, 5]}, 10, 5]
(1 row)
```

json_keys(json[, json_path])

Description: The input parameters are a JSON object and an optional JSON path. If no JSON path is specified, this function returns a JSON array of member key values of the top-layer object in the JSON object. If a JSON path is specified, this function returns the JSON array of the top-layer member key values in the JSON object corresponding to the path. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error.

Parameters: See **Table 7-73**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-73 Parameters

Parameter	Type	Description	Value Range
json	json	A JSON value.	The value must be in JSON format.
json_path	text	A JSON path, which is optional.	**json_path** must be a valid path expression.

Return type: json

Example:

```
gaussdb=# SELECT json_keys('{"x": 1, "y": 2, "z": 3}');
   json_keys
-----------------
 ["x", "y", "z"]
(1 row)

gaussdb=# SELECT json_keys('[1,2,3,{"name":"Tom"}]','$[3]');
 json_keys
-----------
 ["name"]
(1 row)
```

json_length(json[, json_path])

Description: The input parameters are a JSON object and an optional JSON path. If no JSON path is specified, this function returns the length of the specified JSON object. If a JSON path is specified, this function returns the length of the JSON object corresponding to the path. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error.

Parameters: See **Table 7-74**.

Table 7-74 Parameters

Parameter	Type	Description	Value Range
json	json	A JSON value.	The value must be in JSON format.
json_path	text	A JSON path, which is optional.	**json_path** must be a valid path expression.

Return type: int

Example:

```
gaussdb=# SELECT json_length('[1,2,3,4,5]');
 json_length
-------------
           5
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# SELECT json_length('{"name":"Tom", "age":24, "like":"football"}');
 json_length
-------------
           3
(1 row)
```

json_merge([VARIADIC any])

Description: Merges the JSON objects specified in the input parameters (more than two) and returns the result. These JSON objects are constructed from the variable-parameter list. If any input parameter is null, the function will return null. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameter: a variable-parameter list from which multiple JSON objects are constructed.

Return type: json

Example:

```
gaussdb=# SELECT json_merge('[1, 2]','[2]');
 json_merge
------------
 [1, 2, 2]
(1 row)

gaussdb=# SELECT json_merge('{"b":"2"}','{"a":"1"}','[1,2]');
          json_merge
-------------------------------
 [{"a": "1", "b": "2"}, 1, 2]
(1 row)
```

json_quote(text)

Description: The input parameter is of the text type. This function uses double quotation marks ("") to enclose the input parameter into a JSON string and returns the string.

Parameter: The input parameter is the character string to be enclosed.

Return type: json

Example:

```
gaussdb=# SELECT json_quote('gauss');
 json_quote
------------
 "gauss"
(1 row)
```

json_unquote(json)

Description: The input parameter is a JSON object. This function cancels the double quotation marks of the input parameter and returns the character string.

Parameter: a JSON value.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT json_unquote('"gauss"');
 json_unquote
--------------
 gauss
(1 row)
```

json_remove(json, [VARIADIC text])

Description: Deletes JSON paths from a JSON object and returns the resulting JSON object. These JSON paths are constructed from the variable-parameter list. Both the JSON paths and JSON object are specified in the input parameters. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-75**.

Table 7-75 Parameters

Parameter	Type	Description	Value Range
json	json	A JSON value.	The value must be in JSON format.
[VARIADIC text]	Variable text array	A variable-parameter list containing one or more JSON paths.	**json_path** must be a valid path expression.

Return type: json

Example:

```
gaussdb=# SELECT json_remove('[0, 1, 2, [3, 4]]', '$[0]', '$[2]');
 json_remove
-------------
 [1, 2]
(1 row)

gaussdb=# SELECT json_remove('[0, 1, 2, [3, 4]]', '$[0]', '$[0]','$[0]');
 json_remove
-------------
 [[3, 4]]
(1 row)
```

json_replace(json, [VARIADIC any])

Description: The input parameter is a JSON object, multiple JSON paths, and values to be replaced. The JSON paths and values must be in pairs. This function replaces data in a path specified by **json_path** in **json** with a specified value and returns the modified JSON object. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error. If the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-76**.

Table 7-76 Parameters

Parameter	Type	Description	Value Range
json	json	A JSON value.	The value must be in JSON format.
[VARIADIC any]	Variable any input parameter	A variable-parameter list containing one or more **json_path**-**value** pairs.	**json_path** must be a valid path expression, and **value** can be any value.

Return type: json

Example:

```
gaussdb=# SELECT json_replace('{"x": 1}', '$.x', 'true');
 json_replace
---------------
 {"x": "true"}
(1 row)

gaussdb=# SELECT json_replace('{"x": 1}', '$.x', true, '$.x', 123, '$.x', 'asd', '$.x', null);
 json_replace
--------------
 {"x": null}
(1 row)
```

json_search(json, mode_str, search_str, escape_char, json_path)

Description: Obtains the path of a given character string in **json**. The function returns a path string or an array of multiple paths. If **json**, **search_str**, or **json_path** is null, the function will return null. If the **json** format is incorrect or **json_path** is an invalid path expression, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-77**.

Table 7-77 Parameters

Parameter	Type	Description	Value Range
json	json	Target JSON object.	The value must be in JSON format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
mode_str	text	The value can be **one** or **all**. If the value is **one**, only the first matched path is obtained. If the value is **all**, all matched paths are obtained.	The value must be **one** or **all**, which is case-insensitive.
search_str	text	Character string to be searched for. In normal cases, the entire character string is matched. However, the wildcard % can be used to match any number of characters, and _ can be used to match any character.	-
escape_char	text	If **search_str** contains a wildcard, this parameter is defined as an escape character for the wildcard. This parameter is optional. The default value is **'\'**. If the character is added before the wildcard, the wildcard is not considered as a wildcard.	The value can be any single character.
json_path	text	If **json_path** is specified, the search is performed in the path. This parameter is optional.	**json_path** must be a valid path expression.

Return type: text

Example:

```
-- In the all mode:
gaussdb=# SELECT json_search('{"a":"abc","b":"abc"}','all','abc');
  json_search
----------------
 ["$.a", "$.b"]
(1 row)

-- In the one mode:
gaussdb=# SELECT json_search('{"a":"abc","b":"abc"}','one','abc');
 json_search
-------------
 "$.a"
(1 row)

-- The default escape character is used.
gaussdb=# SELECT json_search('{"a":"abc","b":"a%c"}','one','a\%c');
 json_search
-------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 "$.b"
(1 row)
```

json_set(json, [VARIADIC any])

Description: The input parameter is a JSON object, multiple JSON paths, and values to be set. The JSON paths and values must be in pairs. This function uses the specified value to update the data in the path specified by **json_path** in **json** and returns the modified JSON object. If the specified path does not have any value, the value is inserted into the corresponding path. If **json** or **json_path** is null, the function will return null. If **json** is in an incorrect format, **json_path** is an invalid path expression, or **json_path** includes * or **, the function will report an error. If the variable-parameter list contains both null values and format errors, the exceptions are processed in the order of their occurrence. For example, if a null value is encountered first, the function will return null. If a format error is detected first, the function will report an error.

Parameters: See **Table 7-78**.

Table 7-78 Parameters

Parameter	Type	Description	Value Range
json	json	A JSON value.	The value must be in JSON format.
[VARIADIC any]	Variable any array	A variable-parameter list containing one or more **json_path**-**value** pairs.	**json_path** must be a valid path expression, and **value** can be any value.

Return type: json

Example:

```
gaussdb=# SELECT json_set('{"s":3}','$.s','d');
  json_set
------------
 {"s": "d"}
(1 row)

gaussdb=# SELECT json_set('{"s":3}','$.a','d','$.a','1');
      json_set
--------------------
 {"a": "1", "s": 3}
(1 row)
```

json_type(json)

Description: The input parameter is a JSON object. This function returns a string, which represents the type of the given JSON value. If the input parameter is null, the function will return null.

Parameter: a JSON value. For details, see **Table 7-79**.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-79 Return value of json_type

Input Parameter Type	Return Value
JSON value of the array type	ARRAY
JSON value of the object type	OBJECT
JSON value of the character string type	STRING
JSON value of the numeric type	NUMBER
JSON value of the Boolean type	BOOLEAN
NULL	NULL

Example:

```
gaussdb=# SELECT json_type('{"w":{"2":3},"2":4}');
 json_type
-----------
 OBJECT
(1 row)

gaussdb=# SELECT json_type('[1,2,2,3,3,4,4,4,4,4,4,4,4]');
 json_type
-----------
 ARRAY
(1 row)
```

json_valid(json)

Description: Returns **0** or **1** to indicate whether the given parameter is a valid JSON object. If the input parameter is null, the function will return null.

Parameter: a JSON value.

Return type: bigint

Example:

```
gaussdb=# SELECT json_valid('{"name":"Tom"}');
 json_valid
------------
          1
(1 row)

gaussdb=# SELECT json_valid('[1,23,4,5,5]');
 json_valid
------------
          1
(1 row)

gaussdb=# SELECT json_valid('[1,23,4,5,5]}');
 json_valid
------------
          0
(1 row)
```

json_agg(any)

Description: Aggregates values into a JSON array.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: array-json

Example:

```
gaussdb=# CREATE TABLE classes(name varchar, score int);
CREATE TABLE
gaussdb=# INSERT INTO classes VALUES('A',2);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('A',3);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('D',5);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('D',null);
INSERT 0 1
gaussdb=# SELECT * FROM classes;
 name | score
------+-------
 A    |     2
 A    |     3
 D    |     5
 D    |
(4 rows)

gaussdb=# SELECT name, json_agg(score) score FROM classes GROUP BY name ORDER BY name;
 name |   score
------+-----------
 A    | [2, 3]
 D    | [5, null]
(2 rows)

gaussdb=# DROP TABLE classes;
DROP TABLE
```

json_object_agg(any, any)

Description: Aggregates values into a JSON object.

Return type: object-json

Example:

```
gaussdb=# CREATE TABLE classes(name varchar, score int);
CREATE TABLE
gaussdb=# INSERT INTO classes VALUES('A',2);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('A',3);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('D',5);
INSERT 0 1
gaussdb=# INSERT INTO classes VALUES('D',null);
INSERT 0 1
gaussdb=# SELECT * FROM classes;
 name | score
------+-------
 A    |     2
 A    |     3
 D    |     5
 D    |
(4 rows)

gaussdb=# SELECT json_object_agg(name, score) FROM classes GROUP BY name ORDER BY name;
    json_object_agg
-------------------------
 { "A" : 2, "A" : 3 }
 { "D" : 5, "D" : null }
(2 rows)

gaussdb=# DROP TABLE classes;
DROP TABLE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

jsonb_contained(jsonb, jsonb)

Description: Checks whether all elements in the first parameter are present at the top layer of the second parameter (same as the `<@` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_contained('[1,2,3]', '[1,2,3,4]');
 jsonb_contained
-----------------
 t
(1 row)
```

jsonb_contains(jsonb, jsonb)

Description: Checks whether all top-layer elements in the first parameter are contained in the second parameter (same as the `@>` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_contains('[1,2,3,4]', '[1,2,3]');
 jsonb_contains
----------------
 t
(1 row)
```

jsonb_exists(jsonb, text)

Description: Checks whether the second string parameter is present at the top layer of the first parameter in key\elem\scalar format (same as the `?` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_exists('["1",2,3]', '1');
 jsonb_exists
--------------
 t
(1 row)
```

jsonb_exists_all(jsonb, text[])

Description: Checks whether all elements of the second string array parameter are present at the top layer of the first parameter in key\elem\scalar format (same as the `?&` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_exists_all('["1","2",3]', '{1, 2}');
 jsonb_exists_all
------------------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

jsonb_exists_any(jsonb, text[])

Description: Checks whether any element of the second string array parameter is present at the top layer of the first parameter in key\elem\scalar format (same as the `?|` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_exists_any('["1","2",3]', '{1, 2, 4}');
 jsonb_exists_any
------------------
 t
(1 row)
```

jsonb_cmp(jsonb, jsonb)

Description: Compares values. A positive value indicates greater than, a negative value indicates less than, and **0** indicates equal.

Return type: integer

Example:

```
gaussdb=# SELECT jsonb_cmp('["a", "b"]', '{"a":1, "b":2}');
  jsonb_cmp
------------
        -1
(1 row)
```

jsonb_eq(jsonb, jsonb)

Description: Compares two values (same as the `=` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_eq('["a", "b"]', '{"a":1, "b":2}');
 jsonb_eq
----------
 f
(1 row)
```

jsonb_ne(jsonb, jsonb)

Description: Compares two values (same as the `<>` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_ne('["a", "b"]', '{"a":1, "b":2}');
 jsonb_ne
----------
 t
(1 row)
```

jsonb_gt(jsonb, jsonb)

Description: Compares two values (same as the `>` operator).

Return type: Boolean

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT jsonb_gt('["a", "b"]', '{"a":1, "b":2}');
 jsonb_gt
----------
 f
(1 row)
```

jsonb_ge(jsonb, jsonb)

Description: Compares two values (same as the `>=` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_ge('["a", "b"]', '{"a":1, "b":2}');
 jsonb_ge
----------
 f
(1 row)
```

jsonb_lt(jsonb, jsonb)

Description: Compares two values (same as the `<` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_lt('["a", "b"]', '{"a":1, "b":2}');
 jsonb_lt
----------
 t
(1 row)
```

jsonb_le(jsonb, jsonb)

Description: Compares two values (same as the `<=` operator).

Return type: Boolean

Example:

```
gaussdb=# SELECT jsonb_le('["a", "b"]', '{"a":1, "b":2}');
 jsonb_le
----------
 t
(1 row)
```

to_json(anyelement)

Description: Converts parameters into **`json`**.

Return type: json

Example:

```
gaussdb=# SELECT to_json('{1,5}'::text[]);
   to_json
-----------
 ["1","5"]
(1 row)
```

to_jsonb(anyelement)

Description: Converts the input anyelement parameter into the `jsonb` type.

Return type: jsonb

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- In A-compatible mode, if the parameter is an empty string (''), the function will return **NULL**. However, in PG-compatible mode, the function will return an empty string instead. This is because empty strings are treated as **NULL** in A-compatible mode.
- In A-compatible mode, if the parameter type is DATE, the function will return the hour, minute, and second. However, in PG-compatible mode, the function will not return the hour, minute, or second. This is because DATE will be replaced by TIMESTAMP(0) WITHOUT TIME ZONE in A-compatible mode.

Example:

```
gaussdb=# SELECT to_jsonb(ARRAY[1, 2, 3, 4]);
   to_jsonb
--------------
 [1, 2, 3, 4]
(1 row)
```

jsonb_hash(jsonb)

Description: Performs the hash operation on JSONB.

Return type: integer

Example:

```
gaussdb=# SELECT jsonb_hash('[1,2,3]');
 jsonb_hash
------------
 -559968547
(1 row)
```

Other Functions

Description: Internal functions used by JSON and JSONB aggregate functions.

```
json_agg_transfn
json_agg_finalfn
json_object_agg_transfn
json_object_agg_finalfn
```

7.6.14 HLL Functions and Operators

7.6.14.1 Hash Functions

hll_hash_boolean(bool)

Description: Hashes data of the Boolean type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_boolean(FALSE);
  hll_hash_boolean
---------------------
 -5451962507482445012
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_hash_boolean(bool, int32)

Description: Configures a hash seed (that is, changes the hash policy) and hashes data of the Boolean type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_boolean(FALSE, 10);
  hll_hash_boolean
--------------------
 -1169037589280886076
(1 row)
```

hll_hash_smallint(smallint)

Description: Hashes data of the smallint type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_smallint(100::smallint);
  hll_hash_smallint
---------------------
 962727970174027904
(1 row)
```

NOTE

If parameters with the same numeric value are hashed using different data types, the data will differ, because hash functions select different calculation policies for each type.

hll_hash_smallint(smallint, int32)

Description: Configures a hash seed (that is, changes the hash policy) and hashes data of the smallint type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_smallint(100::smallint, 10);
  hll_hash_smallint
---------------------
 -9056177146160443041
(1 row)
```

hll_hash_integer(integer)

Description: Hashes data of the integer type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_integer(0);
   hll_hash_integer
-----------------------
 5156626420896634997
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_hash_integer(integer, int32)

Description: Hashes data of the integer type and configures a hash seed (that is, changes the hash policy).

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_integer(0, 10);
  hll_hash_integer
--------------------
 -5035020264353794276
(1 row)
```

hll_hash_bigint(bigint)

Description: Hashes data of the bigint type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_bigint(100::bigint);
   hll_hash_bigint
---------------------
 -2401963681423227794
(1 row)
```

hll_hash_bigint(bigint, int32)

Description: Hashes data of the bigint type and configures a hash seed (that is, changes the hash policy).

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_bigint(100::bigint, 10);
   hll_hash_bigint
---------------------
 -2305749404374433531
(1 row)
```

hll_hash_bytea(bytea)

Description: Hashes data of the bytea type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_bytea(E'\\x');
 hll_hash_bytea
----------------
 0
(1 row)
```

hll_hash_bytea(bytea, int32)

Description: Hashes data of the bytea type and configures a hash seed (that is, changes the hash policy).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_bytea(E'\\x', 10);
  hll_hash_bytea
--------------------
 7233188113542599437
(1 row)
```

hll_hash_text(text)

Description: Hashes data of the text type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_text('AB');
   hll_hash_text
--------------------
 -5666002586880275174
(1 row)
```

hll_hash_text(text, int32)

Description: Hashes data of the text type and configures a hash seed (that is, changes the hash policy).

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_text('AB', 10);
hll_hash_text
--------------------
-2215507121143724132
(1 row)
```

hll_hash_any(anytype)

Description: Hashes data of any type.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_any(1);
    hll_hash_any
---------------------
 -1316670585935156930
(1 row)

gaussdb=# SELECT hll_hash_any('08:00:2b:01:02:03'::macaddr);
    hll_hash_any
---------------------
 -3719950434455589360
(1 row)
```

hll_hash_any(anytype, int32)

Description: Hashes data of any type and configures a hash seed (that is, changes the hash policy).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: hll_hashval

Example:

```
gaussdb=# SELECT hll_hash_any(1, 10);
    hll_hash_any
---------------------
 7048553517657992351
(1 row)
```

hll_hashval_eq(hll_hashval, hll_hashval)

Description: Compares two pieces of data of the hll_hashval type to check whether they are the same.

Return type: Boolean

Example:

```
gaussdb=# SELECT hll_hashval_eq(hll_hash_integer(1), hll_hash_integer(1));
 hll_hashval_eq
----------------
 t
(1 row)
```

hll_hashval_ne(hll_hashval, hll_hashval)

Description: Compares two pieces of data of the hll_hashval type to check whether they are different.

Return type: Boolean

Example:

```
gaussdb=# SELECT hll_hashval_ne(hll_hash_integer(1), hll_hash_integer(1));
 hll_hashval_ne
----------------
 f
(1 row)
```

7.6.14.2 Log Functions

There are three HLL modes: explicit, sparse, and full. When the data size is small, the explicit mode is used. In this mode, distinct values are calculated without errors. As the number of distinct values increases, the HLL mode is switched to the sparse and full modes in sequence. The two modes have no difference in the calculation result, but vary in the calculation efficiency of HLL functions and the storage space of HLL objects. The following functions can be used to view some HLL parameters:

hll_print(hll)

Description: Prints some debugging parameters of an HLL.

Example:

```
gaussdb=# SELECT hll_print(hll_empty());
                                hll_print
-------------------------------------------------------------------------------
 type=1(HLL_EMPTY), log2m=14, log2explicit=10, log2sparse=12, duplicatecheck=0
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_type(hll)

Description: Checks the type of the current HLL. The return values are described as follows: **0** indicates **HLL_UNINIT**, an HLL object that is not initialized. **1** indicates **HLL_EMPTY**, an empty HLL object. **2** indicates **HLL_EXPLICIT**, an HLL object in explicit mode. **3** indicates **HLL_SPARSE**, an HLL object in sparse mode. **4** indicates **HLL_FULL**, an HLL object in full mode. **5** indicates **HLL_UNDEFINED**, an invalid HLL object.

Example:

```
gaussdb=# SELECT hll_type(hll_empty());
 hll_type
----------
        1
(1 row)
```

hll_log2m(hll)

Description: Checks the value of **log2m** in the current HLL data structure. **log2m** is the logarithm of the number of buckets. This value affects the error rate of calculating distinct values by HLL. The error rate = ±1.04/√(2^log2m). When the value of **log2m** is explicitly set to a value from 10 to 16, HLL sets the number of buckets to 2^{log2m}. When the value of **log2explicit** is explicitly set to **–1**, the built-in default value is used.

Example:

```
gaussdb=# SELECT hll_log2m(hll_empty());
 hll_log2m
-----------
        14
(1 row)

gaussdb=# SELECT hll_log2m(hll_empty(10));
 hll_log2m
-----------
        10
(1 row)

gaussdb=# SELECT hll_log2m(hll_empty(-1));
 hll_log2m
-----------
        14
(1 row)
```

hll_log2explicit(hll)

Description: Queries the value of **log2explicit** in the current HLL data structure. Generally, the HLL changes from the explicit mode to the sparse mode and then to the full mode. This process is called the promotion hierarchy policy. You can change the value of **log2explicit** to change the policy. For example, if the value of **log2explicit** is **0**, the explicit mode will be skipped and the sparse mode is directly entered. When the value of **log2explicit** is explicitly set to a value ranging from 1 to 12, the HLL will switch to the sparse mode when the length of the data segment exceeds $2^{log2explicit}$. When the value of **log2explicit** is explicitly set to **–1**, the built-in default value is used.

Example:

```
gaussdb=# SELECT hll_log2explicit(hll_empty());
 hll_log2explicit
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------------
            10
(1 row)

gaussdb=# SELECT hll_log2explicit(hll_empty(12, 8));
 hll_log2explicit
------------------
             8
(1 row)

gaussdb=# SELECT hll_log2explicit(hll_empty(12, -1));
 hll_log2explicit
------------------
            10
(1 row)
```

hll_log2sparse(hll)

Description: Queries the value of **log2sparse** in the current HLL data structure. Generally, the HLL changes from the explicit mode to the sparse mode and then to the full mode. This process is called the promotion hierarchy policy. You can adjust the value of **log2sparse** to change the policy. For example, if the value of **log2sparse** is **0**, the system skips the sparse mode and directly enters the full mode. If the value of **log2sparse** is explicitly set to a value ranging from 1 to 14, the HLL will switch to the full mode when the length of the data segment exceeds $2^{log2sparse}$. When the value of **log2sparse** is explicitly set to **–1**, the built-in default value is used.

Example:

```
gaussdb=# SELECT hll_log2sparse(hll_empty());
 hll_log2sparse
----------------
          12
(1 row)

gaussdb=# SELECT hll_log2sparse(hll_empty(12, 8, 10));
 hll_log2sparse
----------------
          10
(1 row)

gaussdb=# SELECT hll_log2sparse(hll_empty(12, 8, -1));
 hll_log2sparse
----------------
          12
(1 row)
```

hll_duplicatecheck(hll)

Description: Specifies whether duplicate check is enabled. **0**: disable; **1**: enable. This function is disabled by default. If there are many duplicate values, you can enable this function to improve efficiency. When the value of **duplicatecheck** is explicitly set to **–1**, the built-in default value is used.

Example:

```
gaussdb=# SELECT hll_duplicatecheck(hll_empty());
 hll_duplicatecheck
--------------------
                  0
(1 row)

gaussdb=# SELECT hll_duplicatecheck(hll_empty(12, 8, 10, 1));
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 hll_duplicatecheck
--------------------
                  1
(1 row)

gaussdb=# SELECT hll_duplicatecheck(hll_empty(12, 8, 10, -1));
 hll_duplicatecheck
--------------------
                  0
(1 row)
```

7.6.14.3 Functional Functions

hll_empty()

Description: Creates an empty HLL.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_empty();
                                                          hll_empty
------------------------------------------------------------------------------------------------------------------
 \x484c4c00000000002b050000000000000000000000000000000000000000
(1 row)
```

hll_empty(int32 log2m)

Description: Creates an empty HLL and sets the **log2m** parameter. The parameter value ranges from 10 to 16. If the input is **–1**, the built-in default value is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_empty(10);
                                                          hll_empty
------------------------------------------------------------------------------------------------------------------
 \x484c4c00000000002b040000000000000000000000000000000000000000
(1 row)

gaussdb=# SELECT hll_empty(-1);
                                                          hll_empty
------------------------------------------------------------------------------------------------------------------
 \x484c4c00000000002b050000000000000000000000000000000000000000
(1 row)
```

hll_empty(int32 log2m, int32 log2explicit)

Description: Creates an empty HLL and sets the **log2m** and **log2explicit** parameters in sequence. The value of **log2explicit** ranges from 0 to 12. The value **0** indicates that the explicit mode is skipped. This parameter is used to set the threshold of the explicit mode. When the length of the data segment reaches $2^{log2explicit}$, the mode is switched to the sparse or full mode. If the input is **–1**, the built-in default value of **log2explicit** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_empty(10, 4);
                                                          hll_empty
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-------------------------------------------------------------
 \x484c4c0000000001304000000000000000000000000000000000000000
(1 row)

gaussdb=# SELECT hll_empty(10, -1);
                                                  hll_empty
-------------------------------------------------------------
 \x484c4c00000000002b040000000000000000000000000000000000000000
(1 row)
```

hll_empty(int32 log2m, int32 log2explicit, int64 log2sparse)

Description: Creates an empty HLL and sets the **log2m**, **log2explicit** and **log2sparse** parameters in sequence. The value of **log2sparse** ranges from 0 to 14. The value **0** indicates that the sparse mode is skipped. This parameter is used to set the threshold of the sparse mode. When the length of the data segment reaches $2^{log2sparse}$, the mode is switched to the full mode. If the input is **–1**, the built-in default value of **log2sparse** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_empty(10, 4, 8);
                                                  hll_empty
-------------------------------------------------------------
 \x484c4c0000000001204000000000000000000000000000000000000000
(1 row)

gaussdb=# SELECT hll_empty(10, 4, -1);
                                                  hll_empty
-------------------------------------------------------------
 \x484c4c0000000001304000000000000000000000000000000000000000
(1 row)
```

hll_empty(int32 log2m, int32 log2explicit, int64 log2sparse, int32 duplicatecheck)

Description: Creates an empty HLL and sets the **log2m**, **log2explicit**, **log2sparse**, and **duplicatecheck** parameters in sequence. The value of **duplicatecheck** is **0** or **1**, indicating whether the duplicate check mode is enabled. By default, this mode is disabled. If the input is **–1**, the built-in default value of **duplicatecheck** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_empty(10, 4, 8, 0);
                                                  hll_empty
-------------------------------------------------------------
 \x484c4c0000000001204000000000000000000000000000000000000000
(1 row)

gaussdb=# SELECT hll_empty(10, 4, 8, -1);
                                                  hll_empty
-------------------------------------------------------------
 \x484c4c0000000001204000000000000000000000000000000000000000
(1 row)
```

hll_add(hll, hll_hashval)

Description: Adds hll_hashval to an HLL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_add(hll_empty(), hll_hash_integer(1));
                                hll_add
-----------------------------------------------------------------------------
 \x484c4c08000002002b0900000000000000f03f3e2921ff133fbaed3e2921ff133fbaed00
(1 row)
```

hll_add_rev(hll_hashval, hll)

Description: Adds **hll_hashval** to an HLL. This function works the same as **hll_add**, except that the positions of parameters are switched.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_add_rev(hll_hash_integer(1), hll_empty());
                            hll_add_rev
-----------------------------------------------------------------------------
 \x484c4c08000002002b0900000000000000f03f3e2921ff133fbaed3e2921ff133fbaed00
(1 row)
```

hll_eq(hll, hll)

Description: Compares two HLLs to check whether they are the same.

Return type: Boolean

Example:

```
gaussdb=# SELECT hll_eq(hll_add(hll_empty(), hll_hash_integer(1)), hll_add(hll_empty(),
hll_hash_integer(2)));
 hll_eq
--------
 f
(1 row)
```

hll_ne(hll, hll)

Description: Compares two HLLs to check whether they are different.

Return type: Boolean

Example:

```
gaussdb=# SELECT hll_ne(hll_add(hll_empty(), hll_hash_integer(1)), hll_add(hll_empty(),
hll_hash_integer(2)));
 hll_ne
--------
 t
(1 row)
```

hll_cardinality(hll)

Description: Calculates the number of distinct values of an HLL.

Return type: int

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT hll_cardinality(hll_empty() || hll_hash_integer(1));
 hll_cardinality
-----------------
               1
(1 row)
```

hll_union(hll, hll)

Description: Performs the UNION operation on two HLL data structures to obtain one HLL.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_union(hll_add(hll_empty(), hll_hash_integer(1)), hll_add(hll_empty(),
hll_hash_integer(2)));
                                    hll_union
-------------------------------------------------------------------------------------------------
 \x484c4c10002000002b090000000000000000400000000000000000b3ccc49320cca1ae3e2921ff133fbaed00
(1 row)
```

7.6.14.4 Aggregate Functions

hll_add_agg(hll_hashval)

Description: Groups hashed data into HLL.

Return type: HLL

Example:

```
-- Prepare data:
gaussdb=# CREATE TABLE t_id(id int);
gaussdb=# INSERT INTO t_id VALUES(generate_series(1,500));
gaussdb=# CREATE TABLE t_data(a int, c text);
gaussdb=# INSERT INTO t_data SELECT mod(id,2), id FROM t_id;

-- Create a table and specify an HLL column:
gaussdb=# CREATE TABLE t_a_c_hll(a int, c hll);

-- Use GROUP BY on column a to group data, and insert the data to the HLL:
gaussdb=# INSERT INTO t_a_c_hll SELECT a, hll_add_agg(hll_hash_text(c)) FROM t_data GROUP BY a;

-- Calculate the number of distinct values for each group in the HLL:
gaussdb=# SELECT a, #c AS cardinality FROM t_a_c_hll ORDER BY a;
 a |   cardinality
---+------------------
 0 | 247.862354346299
 1 | 250.908710610377
(2 rows)
```

hll_add_agg(hll_hashval, int32 log2m)

Description: Groups hashed data into HLL and specifies the **log2m** parameter. The value ranges from 10 to 16. If the input is **–1** or **NULL**, the built-in default value is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_cardinality(hll_add_agg(hll_hash_text(c), 12)) FROM t_data;
 hll_cardinality
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------------
 497.965240179228
(1 row)
```

hll_add_agg(hll_hashval, int32 log2m, int32 log2explicit)

Description: Groups hashed data into HLL and specifies the **log2m** and **log2explicit** parameters in sequence. The value of **log2explicit** ranges from 0 to 12. The value **0** indicates that the explicit mode is skipped. This parameter is used to set the threshold of the explicit mode. When the length of the data segment reaches $2^{log2explicit}$, the mode is switched to the sparse or full mode. If the input is **–1** or **NULL**, the built-in default value of **log2explicit** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_cardinality(hll_add_agg(hll_hash_text(c), NULL, 1)) FROM t_data;
 hll_cardinality
------------------
 498.496062953313
(1 row)
```

hll_add_agg(hll_hashval, int32 log2m, int32 log2explicit, int64 log2sparse)

Description: Groups hashed data into HLL and sets the **log2m**, **log2explicit**, and **log2sparse** parameters in sequence. The value of **log2sparse** ranges from 0 to 14. The value **0** indicates that the sparse mode is skipped. This parameter is used to set the threshold of the sparse mode. When the length of the data segment reaches $2^{log2sparse}$, the mode is switched to the full mode. If the input is **–1** or **NULL**, the built-in default value of **log2sparse** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_cardinality(hll_add_agg(hll_hash_text(c), NULL, 6, 10)) FROM t_data;
 hll_cardinality
------------------
 498.496062953313
(1 row)
```

hll_add_agg(hll_hashval, int32 log2m, int32 log2explicit, int64 log2sparse, int32 duplicatecheck)

Description: Groups hashed data into HLL and specifies the **log2m**, **log2explicit**, **log2sparse**, and **duplicatecheck** parameters. The value of **duplicatecheck** can be **0** or **1**, indicating whether to enable this mode. By default, this mode is disabled. If the input is **–1** or **NULL**, the built-in default value of **duplicatecheck** is used.

Return type: HLL

Example:

```
gaussdb=# SELECT hll_cardinality(hll_add_agg(hll_hash_text(c), NULL, 6, 10, -1)) FROM t_data;
 hll_cardinality
------------------
 498.496062953313
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_union_agg(hll)

Description: Performs the UNION operation on multiple pieces of data of the HLL type to obtain one HLL.

Return type: HLL

Example:

```
-- Perform the UNION operation on data of the HLL type in each group to obtain one HLL, and calculate the number of distinct values:
gaussdb=# SELECT #hll_union_agg(c) AS cardinality FROM t_a_c_hll;
   cardinality
------------------
 498.496062953313
(1 row)

-- Drop tables.
gaussdb=# DROP TABLE t_id;
gaussdb=# DROP TABLE t_data;
gaussdb=# DROP TABLE t_a_c_hll;
```

NOTE

To perform the UNION operation on data in multiple HLLs, ensure that the HLLs have the same precision. Otherwise, **UNION** cannot be performed. This constraint also applies to the **hll_union(hll, hll)** function.

7.6.14.5 Deprecated Functions

Some old HLL functions are deprecated due to version upgrade. You can replace them with similar functions.

hll_schema_version(hll)

Description: Checks the schema version in the current HLL. In earlier versions, the schema version is fixed at **1**, which is used to verify the header of the HLL field. After refactoring, the HLL field is added to the header for verification. The schema version is no longer used.

hll_regwidth(hll)

Description: Queries the bucket size in the HLL data structure. In earlier versions, the value of **regwidth** ranges from 1 to 5, which has a large error and limits the upper limit of the cardinality estimation. After refactoring, the value of **regwidth** is fixed at **6** and the variable is not used.

hll_expthresh(hll)

Description: Obtains the value of **expthresh** in the current HLL. The hll_log2explicit(hll) function is used to replace similar functions.

hll_sparseon(hll)

Description: Specifies whether the sparse mode is enabled. Use hll_log2sparse(hll) to replace similar functions. The value **0** indicates that the sparse mode is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.6.14.6 Built-in Functions

HLL has a series of built-in functions for internal data processing. Generally, users do not need to know how to use these functions. For details, see **Table 1 Built-in functions**.

Table 7-80 Built-in functions

Name	Description
hll_in	Receives HLL data in string format.
hll_out	Sends HLL data in string format.
hll_recv	Receives HLL data in bytea format.
hll_send	Sends HLL data in bytea format.
hll_trans_in	Receives hll_trans_type data in string format.
hll_trans_out	Sends hll_trans_type data in string format.
hll_trans_recv	Receives hll_trans_type data in bytea format.
hll_trans_send	Sends hll_trans_type data in bytea format.
hll_typmod_in	Receives typmod data.
hll_typmod_out	Sends typmod data.
hll_hashval_in	Receives hll_hashval data.
hll_hashval_out	Sends hll_hashval data.
hll_add_trans0	Works similar to hll_add. No input parameter is specified during initialization. It is usually used on DNs in the first phase of aggregation operations.
hll_add_trans1	Works similar to hll_add. An input parameter is specified during initialization. It is usually used on DNs in the first phase of aggregation operations.
hll_add_trans2	Works similar to hll_add. Two input parameters are specified during initialization. It is usually used on DNs in the first phase of aggregation operations.
hll_add_trans3	Works similar to hll_add. Three input parameters are specified during initialization. It is usually used on DNs in the first phase of aggregation operations.
hll_add_trans4	Works similar to hll_add. Four input parameters are specified during initialization. It is usually used on DNs in the first phase of aggregation operations.
hll_union_trans	Works similar to hll_union and is used on DNs in the first phase of aggregation operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Description
hll_union_collect	Works similar to hll_union and is used on DNs in the second phase of aggregation operations to summarize the results of each DN.
hll_pack	Converts the user-defined hll_trans_type to the HLL type on DNs in the third phase of aggregation operations.
hll	Converts an HLL type to another HLL type. Input parameters can be specified.
hll_hashval	Converts the bigint type to the hll_hashval type.
hll_hashval_int4	Converts the int4 type to the hll_hashval type.

7.6.14.7 Operators

=

Description: Compares the values of the HLL or hll_hashval type to check whether they are the same.

Return type: Boolean

Example:

```
--hll
gaussdb=# SELECT (hll_empty() || hll_hash_integer(1)) = (hll_empty() || hll_hash_integer(1));
column
----------
 t
(1 row)

--hll_hashval
gaussdb=# SELECT hll_hash_integer(1) = hll_hash_integer(1);
 ?column?
----------
 t
(1 row)
```

<> or !=

Description: Compares the values of the HLL or hll_hashval type to check whether they are different.

Return type: Boolean

Example:

```
--hll
gaussdb=# SELECT (hll_empty() || hll_hash_integer(1)) <> (hll_empty() || hll_hash_integer(2));
 ?column?
----------
 t
(1 row)

--hll_hashval
gaussdb=# SELECT hll_hash_integer(1) <> hll_hash_integer(2);
 ?column?
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------
 t
(1 row)
```

||

Description: Represents the hll_add, hll_union, and hll_add_rev functions.

Return type: HLL

Example:

```
--hll_add
gaussdb=# SELECT hll_empty() || hll_hash_integer(1);
                              ?column?
--------------------------------------------------------------------------------
 \x484c4c08000002002b0900000000000000f03f3e2921ff133fbaed3e2921ff133fbaed00
(1 row)

--hll_add_rev
gaussdb=# SELECT hll_hash_integer(1) || hll_empty();
                              ?column?
--------------------------------------------------------------------------------
 \x484c4c08000002002b0900000000000000f03f3e2921ff133fbaed3e2921ff133fbaed00
(1 row)

--hll_union
gaussdb=# SELECT (hll_empty() || hll_hash_integer(1)) || (hll_empty() || hll_hash_integer(2));
                                        ?column?
-----------------------------------------------------------------------------------------------
 \x484c4c10002000002b0900000000000000004000000000000000000b3ccc49320cca1ae3e2921ff133fbaed00
(1 row)
```

#

Description: Calculates the number of distinct values of an HLL. It works the same as the hll_cardinality function.

Return type: int

Example:

```
gaussdb=# SELECT #(hll_empty() || hll_hash_integer(1));
 ?column?
----------
        1
(1 row)
```

7.6.15 SEQUENCE Functions

The sequence functions provide a simple method to ensure security of multiple users for users to obtain sequence values from sequence objects.

nextval(regclass)

Description: Specifies an increasing sequence and returns a new value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> To avoid blocking of concurrent transactions that obtain numbers from the same sequence, a nextval operation is never rolled back; that is, once a value is fetched, it is considered used, even if the transaction that did the nextval later aborts. This means that aborted transactions may leave unused "holes" in the sequence of assigned values. Therefore, the GaussDB sequence object cannot be used to obtain "holeless" sequences.

NOTICE

The **nextval** function can be executed only on the primary node. It is not supported on standby nodes.

Return type: numeric

The nextval function can be called in either of the following ways: (In example 2, the sequence name cannot contain a dot.)

```
gaussdb=# CREATE SEQUENCE seqDemo;
-- Example 1:
gaussdb=# SELECT nextval('seqDemo');
 nextval
---------
       1
(1 row)
-- Example 2:
gaussdb=# SELECT seqDemo.nextval;
 nextval
---------
       2
(1 row)
gaussdb=# DROP SEQUENCE seqDemo;
```

currval(regclass)

Description: Returns the last value of **nextval** in the current session. If nextval has not been called for the specified sequence in the current session, an error is reported when currval is called.

Return type: numeric

The currval function can be called in either of the following ways: (In example 2, the sequence name cannot contain a dot.)

```
gaussdb=# CREATE SEQUENCE seq1;
gaussdb=# SELECT nextval('seq1');
-- Example 1:
gaussdb=# SELECT currval('seq1');
 currval
---------
       1
(1 row)
-- Example 2:
gaussdb=# SELECT seq1.currval;
 currval
---------
       1
(1 row)
gaussdb=# DROP SEQUENCE seq1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

lastval()

Returns the last value of **nextval** in the current session. This function is equivalent to currval, except that it does not use sequence names as parameters. It fetches the sequence used by nextval last time in the current session. If nextval has not been called in the current session, an error is reported when lastval is called.

Return type: numeric

Example:

```
gaussdb=# CREATE SEQUENCE seq1;
gaussdb=# SELECT nextval('seq1');
gaussdb=# SELECT lastval();
 lastval
---------
       1
(1 row)
gaussdb=# DROP SEQUENCE seq1;
```

setval(regclass, numeric)

Description: Sets the current value of a sequence.

Return type: numeric

Example:

```
gaussdb=# CREATE SEQUENCE seqDemo;
gaussdb=# SELECT nextval('seqDemo');
gaussdb=# SELECT setval('seqDemo',5);
 setval
--------
      5
(1 row)
gaussdb=# DROP SEQUENCE seqDemo;
```

setval(regclass, numeric, Boolean)

Sets the current value of a sequence and the is_called sign.

Return type: numeric

Example:

```
gaussdb=# CREATE SEQUENCE seqDemo;
gaussdb=# SELECT nextval('seqDemo');
gaussdb=# SELECT setval('seqDemo',5,true);
 setval
--------
      5
(1 row)
gaussdb=# DROP SEQUENCE seqDemo;
```

NOTE

The current session will take effect immediately after **setval** is performed. If other sessions have buffered sequence values, **setval** will take effect only after the values are used up. Therefore, to prevent sequence value conflicts, you are advised to perform setval with caution.

Because the sequence is non-transactional, changes made by setval will not be canceled when a transaction rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The **nextval** function can be executed only on the primary node. It is not supported on standby nodes.

pg_sequence_last_value(sequence_oid oid, OUT cache_value int16, OUT last_value int16)

Description: Obtains the parameters of a specified sequence, including the cache value and current value.

Return type: int16, int16

gs_get_sequence_parameters(sequence_oid)

Description: Obtains the parameters of a specified sequence, including the start value, minimum value, maximum value, and incremental value.

Return type: int16, int16, int16, int16, Boolean

gs_get_sequence_last_value(sequence_oid oid, OUT cache_value int16, OUT last_value int16)

Description: Obtains the parameters of a specified sequence, including the cache value and current value.

Return type: int16, int16

last_insert_id()

Description: Gets the first auto-generated value that was last successfully inserted for an auto-increment column.

Return type: int16

Example:

```
gaussdb=# create database b_format_db with dbcompatibility = 'b';
gaussdb=# \c b_format_db;
b_format_db=# CREATE TABLE animals_test (
b_format_db=# id int PRIMARY KEY NOT NULL AUTO_INCREMENT,
b_format_db=# name CHAR(30) NOT NULL
b_format_db=# );
NOTICE:  CREATE TABLE will create implicit sequence "animals_test_id_seq" for serial column
"animals_test.id"
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "animals_test_pkey" for table
"animals_test"
CREATE TABLE
b_format_db=# SELECT last_insert_id();
 last_insert_id
----------------
              0
(1 row)
b_format_db=# INSERT INTO animals_test (name) VALUES ('dog');
INSERT 0 1
b_format_db=# SELECT last_insert_id();
 last_insert_id
----------------
              1
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
b_format_db=# DROP TABLE animals_test;
b_format_db=# \c postgres;
gaussdb=# DROP DATABASE b_format_db;
```

last_insert_id(int16)

Description: Sets the return value of the next last_insert_id() function and returns the value. If the parameter is **NULL**, set the return value of the next last_insert_id() function to **0**. This function returns **NULL**.

Return type: int16

Example:

```
gaussdb=# create database b_format_db with dbcompatibility = 'b';
gaussdb=# \c b_format_db;
b_format_db=# SELECT last_insert_id(100);
 last_insert_id
----------------
          100
(1 row)
b_format_db=# SELECT last_insert_id();
 last_insert_id
----------------
          100
(1 row)
b_format_db=# \c postgres;
gaussdb=# DROP DATABASE b_format_db;
```

NOTE

- last_insert_id() and last_insert_id(int16) are session-level functions. If no data is inserted into the auto-increment column in the current session, last_insert_id() returns **0**.
- last_insert_id() and last_insert_id(int16) are available only when **sql_compatibility** is set to **'B'**.

7.6.16 Array Functions and Operators

7.6.16.1 Array Operators

=

Description: Specifies whether two arrays are equal.

Example:

```
gaussdb=# SELECT ARRAY[1.1,2.1,3.1]::int[] = ARRAY[1,2,3] AS RESULT ;
 result
--------
 t
(1 row)
```

<>

Description: Specifies whether two arrays are not equal.

Example:

```
gaussdb=# SELECT ARRAY[1,2,3] <> ARRAY[1,2,4] AS RESULT;
 result
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 t
(1 row)
```

<

Description: Specifies whether an array is less than another.

Example:

```
gaussdb=# SELECT ARRAY[1,2,3] < ARRAY[1,2,4] AS RESULT;
 result
--------
 t
(1 row)
```

>

Description: Specifies whether an array is greater than another.

Example:

```
gaussdb=# SELECT ARRAY[1,4,3] > ARRAY[1,2,4] AS RESULT;
 result
--------
 t
(1 row)
```

<=

Description: Specifies whether an array is less than or equal to another.

Example:

```
gaussdb=# SELECT ARRAY[1,2,3] <= ARRAY[1,2,3] AS RESULT;
 result
--------
 t
(1 row)
```

>=

Description: Specifies whether an array is greater than or equal to another.

Example:

```
gaussdb=# SELECT ARRAY[1,4,3] >= ARRAY[1,4,3] AS RESULT;
 result
--------
 t
(1 row)
```

@>

Description: Specifies whether an array contains another.

Example:

```
gaussdb=# SELECT ARRAY[1,4,3] @> ARRAY[3,1] AS RESULT;
 result
--------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

<@

Description: Specifies whether an array is contained in another.

Example:

```
gaussdb=# SELECT ARRAY[2,7] <@ ARRAY[1,7,4,2,6] AS RESULT;
 result
--------
 t
(1 row)
```

&&

Description: Specifies whether an array overlaps another (have common elements).

Example:

```
gaussdb=# SELECT ARRAY[1,4,3] && ARRAY[2,1] AS RESULT;
 result
--------
 t
(1 row)
```

||

- Description: Array-to-array concatenation.

  Example:

  ```
  gaussdb=# SELECT ARRAY[1,2,3] || ARRAY[4,5,6] AS RESULT;
      result
  ---------------
   {1,2,3,4,5,6}
  (1 row)
  gaussdb=# SELECT ARRAY[1,2,3] || ARRAY[[4,5,6],[7,8,9]] AS RESULT;
            result
  ---------------------------
   {{1,2,3},{4,5,6},{7,8,9}}
  (1 row)
  ```

- Description: Element-to-array concatenation.

  Example:

  ```
  gaussdb=# SELECT 3 || ARRAY[4,5,6] AS RESULT;
    result
  -----------
   {3,4,5,6}
  (1 row)
  ```

- Description: Array-to-element concatenation.

  Example:

  ```
  gaussdb=# SELECT ARRAY[4,5,6] || 7 AS RESULT;
    result
  -----------
   {4,5,6,7}
  (1 row)
  ```

Array comparisons compare the array contents element-by-element, using the default B-tree comparison function for the element data type. In multidimensional arrays, the elements are accessed in row-major order. If the contents of two arrays are equal but the dimensionality is different, the first difference in the dimensionality information determines the sort order.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.6.16.2 Array Functions

array_append(anyarray, anyelement)

Description: Appends an element to the end of an array, and only supports one-dimensional arrays.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_append(ARRAY[1,2], 3) AS RESULT;
 result
---------
 {1,2,3}
(1 row)
```

array_prepend(anyelement, anyarray)

Description: Appends an element to the beginning of an array, and only supports one-dimensional arrays.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_prepend(1, ARRAY[2,3]) AS RESULT;
 result
---------
 {1,2,3}
(1 row)
```

array_cat(anyarray, anyarray)

Description: Concatenates two arrays. (Multidimensional arrays are supported.)

Return type: anyarray

Example:

```
gaussdb=# SELECT array_cat(ARRAY[1,2,3], ARRAY[4,5]) AS RESULT;
   result
-------------
 {1,2,3,4,5}
(1 row)

gaussdb=# SELECT array_cat(ARRAY[[1,2],[4,5]], ARRAY[6,7]) AS RESULT;
       result
---------------------
 {{1,2},{4,5},{6,7}}
(1 row)
```

array_union(anyarray, anyarray)

Description: Concatenates two arrays. (Only one-dimensional arrays are supported.) If any input parameter is null, the function will return the other input parameter.

Return type: anyarray

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT array_union(ARRAY[1,2,3], ARRAY[3,4,5]) AS RESULT;
   result
-------------
 {1,2,3,3,4,5}
(1 row)

gaussdb=# SELECT array_union(ARRAY[1,2,3], NULL) AS RESULT;
 result
---------
 {1,2,3}
(1 row)
```

array_union_distinct(anyarray, anyarray)

Description: Concatenates two arrays and deduplicates them. (Only one-dimensional arrays are supported.) If any input parameter is null, the function will return the other input parameter.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_union_distinct(ARRAY[1,2,3], ARRAY[3,4,5]) AS RESULT;
   result
-------------
 {1,2,3,4,5}
(1 row)

gaussdb=# SELECT array_union_distinct(ARRAY[1,2,3], NULL) AS RESULT;
 result
---------
 {1,2,3}
(1 row)
```

array_intersect(anyarray, anyarray)

Description: Intersects two arrays. (Only one-dimensional arrays are supported.) If any input parameter is null, the function will return null.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_intersect(ARRAY[1,2,3], ARRAY[3,4,5]) AS RESULT;
   result
-------------
 {3}
(1 row)

gaussdb=# SELECT array_intersect(ARRAY[1,2,3], NULL) AS RESULT;
 result
--------

(1 row)
```

array_intersect_distinct(anyarray, anyarray)

Description: Intersects two arrays and deduplicates them. (Only one-dimensional arrays are supported.) If any input parameter is null, the function will return null.

Return type: anyarray

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT array_intersect_distinct(ARRAY[1,2,2], ARRAY[2,2,4,5]) AS RESULT;
  result
-------------
 {2}
(1 row)

gaussdb=# SELECT array_intersect_distinct(ARRAY[1,2,3], NULL) AS RESULT;
 result
--------

(1 row)
```

array_except(anyarray, anyarray)

Description: Calculates the difference between two arrays. (Only one-dimensional arrays are supported.) If the first input parameter is null, the function will return null. If the second input parameter is null, the function will return the first input parameter.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_except(ARRAY[1,2,3], ARRAY[3,4,5]) AS RESULT;
  result
-------------
 {1,2}
(1 row)

gaussdb=# SELECT array_except(ARRAY[1,2,3], NULL) AS RESULT;
 result
---------
 {1,2,3}
(1 row)

gaussdb=# SELECT array_except(NULL, ARRAY[3,4,5]) AS RESULT;
 result
--------

(1 row)
```

array_except_distinct(anyarray, anyarray)

Description: Calculates the difference between two arrays and deduplicates them. (Only one-dimensional arrays are supported.) If the first input parameter is null, the function will return null. If the second input parameter is null, the function will return the first input parameter.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_except_distinct(ARRAY[1,2,2,3], ARRAY[3,4,5]) AS RESULT;
  result
-------------
 {1,2}
(1 row)

gaussdb=# SELECT array_except_distinct(ARRAY[1,2,3], NULL) AS RESULT;
 result
---------
 {1,2,3}
(1 row)

gaussdb=# SELECT array_except_distinct(NULL, ARRAY[3,4,5]) AS RESULT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 result
--------

(1 row)
```

array_ndims(anyarray)

Description: Returns the number of dimensions of an array.

Return type: int

Example:

```
gaussdb=# SELECT array_ndims(ARRAY[[1,2,3], [4,5,6]]) AS RESULT;
 result
--------
      2
(1 row)
```

array_dims(anyarray)

Description: Returns the low-order flag bits and high-order flag bits of each dimension in an array.

Return type: text

Example:

```
gaussdb=# SELECT array_dims(ARRAY[[1,2,3], [4,5,6]]) AS RESULT;
   result
------------
 [1:2][1:3]
(1 row)
```

array_length(anyarray, int)

Description: Returns the length of the requested array dimension. **int** is the requested array dimension.

Return type: int

Example:

```
gaussdb=# SELECT array_length(array[1,2,3], 1) AS RESULT;
 result
--------
      3
(1 row)

gaussdb=# SELECT array_length(array[[1,2,3],[4,5,6]], 2) AS RESULT;
 result
--------
      3
(1 row)
```

array_lower(anyarray, int)

Description: Returns lower bound of the requested array dimension. **int** is the requested array dimension.

Return type: int

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT array_lower('[0:2]={1,2,3}'::int[], 1) AS RESULT;
 result
--------
      0
(1 row)
```

NOTE

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

array_sort(anyarray)

Description: Returns an array in ascending order. Only one-dimensional array of the anyarray type supports sorting. Multidimensional arrays return **NULL**. Currently, the record, XML, XMLtype, and JSON arrays cannot be sorted.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_sort(ARRAY[5,1,3,6,2,7]) AS RESULT;
 result
-------------
{1,2,3,5,6,7}
(1 row)
gaussdb=# SELECT array_sort(array[array[1,23], array[1,34]]);
 array_sort
-------------
 {NULL,NULL}
(1 row)
```

array_upper(anyarray, int)

Description: Returns upper bound of the requested array dimension. **int** is the requested array dimension.

Return type: int

Example:

```
gaussdb=# SELECT array_upper(ARRAY[1,8,3,7], 1) AS RESULT;
 result
--------
      4
(1 row)
```

NOTE

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

array_to_string(anyarray, text [, text])

Description: Uses the first **text** as the new delimiter and the second **text** to replace **NULL** values.

Return type: text

Example:

```
gaussdb=# SELECT array_to_string(ARRAY[1, 2, 3, NULL, 5], ',', '*') AS RESULT;
  result
-----------
 1,2,3,*,5
(1 row)
```

array_delete(anyarray)

Description: Clears elements in an array and returns an empty array of the same type.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_delete(ARRAY[1,8,3,7]) AS RESULT;
 result
--------
 {}
(1 row)
```

NOTE

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

array_deleteidx(anyarray, int)

Description: Deletes specified index elements from an array and returns an array consisting of the remaining elements.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_deleteidx(ARRAY[1,2,3,4,5], 1) AS RESULT;
  result
-----------
 {2,3,4,5}
(1 row)
```

NOTE

- **array_deleteidx(anyarray, int)**: This function is disabled when **a_format_version** is **10c** and **a_format_dev_version** is **s1**.
- If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled.
- If the second parameter is null, the function will return the original array when the parameter is enabled or return null when the parameter is not enabled.
- If the second parameter is less than or equal to **0**, the function will report the "Subscript outside of limit" error when the parameter is enabled or return the original array when the parameter is not enabled.
- If the second parameter exceeds the maximum number of array elements or is **0** (indicating an empty array), the function will report the "Subscript outside of count" error when the parameter is enabled or return the original array when the parameter is not enabled.

array_extendnull(anyarray, int)

Description: Adds a specified number of null elements to the end of an array.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_extendnull(ARRAY[1,8,3,7],1) AS RESULT;
   result
--------------
{1,8,3,7,null}
(1 row)
```

NOTE

- If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.
- If the second parameter is null, the function will return the original array when the parameter is enabled or return null when the parameter is not enabled.
- If the second parameter is less than **0**, the function will report "numeric or value error" when the parameter is enabled or return the original array when the parameter is not enabled.

array_extendnull(anyarray, int, int)

Description: Adds a specified number of elements with a specified index to the end of an array.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_extendnull(ARRAY[1,8,3,7],2,2) AS RESULT;
   result
--------------
{1,8,3,7,8,8}
(1 row)
```

NOTE

The array_extendnull(anyarray, int, int) function takes effect when **a_format_version** is **10c** and **a_format_dev_version** is **s1**.

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

If the second or third parameter is null, the function will return the original array when the parameter is enabled or return null when the parameter is not enabled.

array_trim(anyarray, int)

Description: Deletes a specified number of elements from the end of an array.

Return type: anyarray

Example:

```
gaussdb=# SELECT array_trim(ARRAY[1,8,3,7],1) AS RESULT;
 result
---------
 {1,8,3}
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.
- If the second parameter is null, the function will return the original array when the parameter is enabled or return null when the parameter is not enabled.
- If the second parameter exceeds the maximum number of array elements or is **0** (indicating an empty array), the function will report the "Subscript outside of count" error when the parameter is enabled or return an empty array when the parameter is not enabled.
- If the second parameter is less than **0**, the function will report "numeric or value error" when the parameter is enabled or return the original array when the parameter is not enabled.

array_exists(anyarray, int)

Description: Checks whether the second parameter is a valid index of an array.

Return type: Boolean

Example:

```
gaussdb=# SELECT array_exists(ARRAY[1,8,3,7],1) AS RESULT;
 result
--------
 t
(1 row)
```

array_next(anyarray, int)

Description: Returns the index of the element following a specified index in an array based on the second input parameter.

Return type: int

Example:

```
gaussdb=# SELECT array_next(ARRAY[1,8,3,7],1) AS RESULT;
 result
--------
      2
(1 row)
```

NOTE

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

array_prior(anyarray, int)

Description: Returns the index of the element followed by a specified index in an array based on the second input parameter.

Return type: int

Example:

```
gaussdb=# SELECT array_prior(ARRAY[1,8,3,7],2) AS RESULT;
 result
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------
 1
(1 row)
```

NOTE

If the first parameter is null, the function will report the "Reference to uninitialized collection" error when the **varray_compat** parameter is enabled or return null when the parameter is not enabled.

string_to_array(text, text, [text])

Description: Uses the second **text** as the new delimiter and the third **text** as the substring to be replaced by **NULL** values. A substring can be replaced by **NULL** values only when it is the same as the third **text**.

Return type: text[]

Example:

```
gaussdb=# SELECT string_to_array('xx~^~yy~^~zz', '~^~', 'yy') AS RESULT;
   result
--------------
 {xx,NULL,zz}
(1 row)
gaussdb=# SELECT string_to_array('xx~^~yy~^~zz', '~^~', 'y') AS RESULT;
  result
------------
 {xx,yy,zz}
(1 row)
```

unnest(anyarray)

Description: Expands an array to a set of rows.

Return type: setof anyelement

Example:

```
gaussdb=# SELECT unnest(ARRAY[1,2]) AS RESULT;
 result
--------
      1
      2
(2 rows)
```

unnest(anynesttable)

Description: Returns a collection of elements in a nest-table.

Return type: setof anyelement

Restriction: The tableof type cannot be nested with the tableof type, or the tableof type cannot be nested with other types and then the tableof type.

Example:

```
CREATE OR REPLACE PROCEDURE f1()
AS
    TYPE t1 IS TABLE of INT;
    v2 t1 := t1(null, 2, 3, 4, null);
    tmp INT;
    CURSOR c1 IS SELECT * FROM unnest(v2);
BEGIN
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
OPEN c1;
FOR i IN 1 .. v2.count LOOP
    FETCH c1 INTO tmp;
    IF tmp IS null THEN
        dbe_output.print_line(i || ': is null');
    ELSE
        dbe_output.print_line(i || ': ' || tmp);
    END IF;
END LOOP;
CLOSE c1;
END;
/

gaussdb=# CALL f1();
1: is null
2: 2
3: 3
4: 4
5: is null
 f1
----

(1 row)
```

unnest(anyindexbytable)

Description: Returns the collection of elements in an index-by table sorted by index.

Return type: setof anyelement

Restriction: The tableof type cannot be nested with the tableof type, or the tableof type cannot be nested with other types and then the tableof type. Only the index by int type is supported. The index by varchar type is not supported.

Example:

```
CREATE OR REPLACE PROCEDURE f1()
AS
    TYPE t1 IS TABLE of INT INDEX BY INT;
    v2 t1 := t1(1=>1, -10=>(-10), 6=>6, 4=>null);
    tmp INT;
    CURSOR c1 IS SELECT * FROM unnest(v2);
BEGIN
OPEN c1;
FOR i IN 1 .. v2.count LOOP
    FETCH c1 INTO tmp;
    IF tmp IS null THEN
        dbe_output.print_line(i || ': is null');
    ELSE
        dbe_output.print_line(i || ': ' || tmp);
    END IF;
END LOOP;
CLOSE c1;
END;
/

gaussdb=# CALL f1();
1: -10
2: 1
3: is null
4: 6
 f1
----

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In **string_to_array**, if the delimiter parameter is **NULL**, each character in the input string will become a separate element in the resulting array. If the delimiter is an empty string, then the entire input string is returned as a one-element array. Otherwise, the input string is split at each occurrence of the delimiter string.

In **string_to_array**, if the null-string parameter is omitted or **NULL**, none of the substrings of the input will be replaced by **NULL**.

In **array_to_string**, if the null-string parameter is omitted or **NULL**, any null elements in the array are simply skipped and not represented in the output string.

_pg_keysequal

Description: Checks whether two smallint arrays are the same.

Parameter: smallint[], smallint[]

Return type: Boolean

NOTE

This function exists in the information_schema namespace.

cardinality(anyarray)

Description: Returns the total number of elements in each dimension of an array. If the array is empty, **0** is returned.

Return type: integer

Example:

```
gaussdb=# SELECT cardinality(array[[1, 2], [3, 4]]);
 cardinality
-------------
  4
(1 row)
```

array_positions(anyarray, anyelement)

Description: Returns an array of indexes of all second parameters that appear in the array given as the first parameter.

Return type: int[]

Example:

```
gaussdb=# SELECT array_positions(array[1, 2, 3, 1], 1) AS RESULT;
 result
---------
 {1,4}
(1 row)
```

NOTE

- The array must be one-dimensional.
- The second parameter can be set to **NULL**.
- If no second parameter is found in the array, an empty array is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.6.17 Range Functions and Operators

7.6.17.1 Range Operators

=

Description: Equals

Example:

```
gaussdb=# SELECT int4range(1,5) = '[1,4]'::int4range AS RESULT;
 result
--------
 t
(1 row)
```

<>

Description: Does not equal

Example:

```
gaussdb=# SELECT numrange(1.1,2.2) <> numrange(1.1,2.3) AS RESULT;
 result
--------
 t
(1 row)
```

<

Description: Is less than

Example:

```
gaussdb=# SELECT int4range(1,10) < int4range(2,3) AS RESULT;
 result
--------
 t
(1 row)
```

>

Description: Is greater than

Example:

```
gaussdb=# SELECT int4range(1,10) > int4range(1,5) AS RESULT;
 result
--------
 t
(1 row)
```

<=

Description: Is less than or equals

Example:

```
gaussdb=# SELECT numrange(1.1,2.2) <= numrange(1.1,2.2) AS RESULT;
 result
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------
 t
(1 row)
```

>=

Description: Is greater than or equals

Example:

```
gaussdb=# SELECT numrange(1.1,2.2) >= numrange(1.1,2.0) AS RESULT;
 result
--------
 t
(1 row)
```

@>

- Description: Contains range

  Example:

  ```
  gaussdb=# SELECT int4range(2,4) @> int4range(2,3) AS RESULT;
   result
  --------
   t
  (1 row)
  ```

- Description: Contains element

  Example:

  ```
  gaussdb=# SELECT '[2011-01-01,2011-03-01)'::tsrange @> '2011-01-10'::timestamp AS RESULT;
   result
  --------
   t
  (1 row)
  ```

<@

- Description: Range is contained by

  Example:

  ```
  gaussdb=# SELECT int4range(2,4) <@ int4range(1,7) AS RESULT;
   result
  --------
   t
  (1 row)
  ```

- Description: Element is contained by

  Example:

  ```
  gaussdb=# SELECT 42 <@ int4range(1,7) AS RESULT;
   result
  --------
   f
  (1 row)
  ```

&&

Description: Overlap (have points in common)

Example:

```
gaussdb=# SELECT int8range(3,7) && int8range(4,12) AS RESULT;
 result
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 t
(1 row)
```

<<

Description: Strictly left of

Example:

```
gaussdb=# SELECT int8range(1,10) << int8range(100,110) AS RESULT;
 result
--------
 t
(1 row)
```

>>

Description: Strictly right of

Example:

```
gaussdb=# SELECT int8range(50,60) >> int8range(20,30) AS RESULT;
 result
--------
 t
(1 row)
```

&<

Description: Does not extend to the right of

Example:

```
gaussdb=# SELECT int8range(1,20) &< int8range(18,20) AS RESULT;
 result
--------
 t
(1 row)
```

&>

Description: Does not extend to the left of

Example:

```
gaussdb=# SELECT int8range(7,20) &> int8range(5,10) AS RESULT;
 result
--------
 t
(1 row)
```

-|-

Description: Is adjacent to

Example:

```
gaussdb=# SELECT numrange(1.1,2.2) -|- numrange(2.2,3.3) AS RESULT;
 result
--------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

+

Description: Union

Example:

```
gaussdb=# SELECT numrange(5,15) + numrange(10,20) AS RESULT;
 result
--------
 [5,20)
(1 row)
```

*****

Description: Intersection

Example:

```
gaussdb=# SELECT int8range(5,15) * int8range(10,20) AS RESULT;
 result
---------
 [10,15)
(1 row)
```

-

Description: Difference

Example:

```
gaussdb=# SELECT int8range(5,15) - int8range(10,20) AS RESULT;
 result
--------
 [5,10)
(1 row)
```

The simple comparison operators **<**, **>**, **<=**, and **>=** compare the lower bounds first, and only if those are equal, compare the upper bounds.

The **<<**, **>>**, and **-|-** operators always return false when an empty range is involved; that is, an empty range is not considered to be either before or after any other range.

The union and difference operators will fail if the resulting range would need to contain two disjoint sub-ranges.

7.6.17.2 Range Functions

The lower and upper functions return null if the range is empty or the requested bound is infinite. The lower_inc, upper_inc, lower_inf, and upper_inf functions all return false for an empty range.

numrange(numeric, numeric, [text])

Description: Specifies a range.

Return type: range's element type

Example:

```
gaussdb=# SELECT numrange(1.1,2.2) AS RESULT;
 result
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------
[1.1,2.2)
(1 row)
gaussdb=# SELECT numrange(1.1,2.2, '()') AS RESULT;
 result
--------
(1.1,2.2)
(1 row)
```

lower(anyrange)

Description: Lower bound of a range

Return type: range's element type

Example:

```
gaussdb=# SELECT lower(numrange(1.1,2.2)) AS RESULT;
 result
--------
    1.1
(1 row)
```

upper(anyrange)

Description: Upper bound of a range

Return type: range's element type

Example:

```
gaussdb=# SELECT upper(numrange(1.1,2.2)) AS RESULT;
 result
--------
    2.2
(1 row)
```

isempty(anyrange)

Description: Is the range empty?

Return type: Boolean

Example:

```
gaussdb=# SELECT isempty(numrange(1.1,2.2)) AS RESULT;
 result
--------
 f
(1 row)
```

lower_inc(anyrange)

Description: Is the lower bound inclusive?

Return type: Boolean

Example:

```
gaussdb=# SELECT lower_inc(numrange(1.1,2.2)) AS RESULT;
 result
--------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

upper_inc(anyrange)

Description: Is the upper bound inclusive?

Return type: Boolean

Example:

```
gaussdb=# SELECT upper_inc(numrange(1.1,2.2)) AS RESULT;
 result
--------
 f
(1 row)
```

lower_inf(anyrange)

Description: Is the lower bound infinite?

Return type: Boolean

Example:

```
gaussdb=# SELECT lower_inf('(,)'::daterange) AS RESULT;
 result
--------
 t
(1 row)
```

upper_inf(anyrange)

Description: Is the upper bound infinite?

Return type: Boolean

Example:

```
gaussdb=# SELECT upper_inf('(,)'::daterange) AS RESULT;
 result
--------
 t
(1 row)
```

elem_contained_by_range(anyelement, anyrange)

Description: Determines whether an element is within the range.

Return type: Boolean

Example:

```
gaussdb=# SELECT elem_contained_by_range('2', numrange(1.1,2.2));
 elem_contained_by_range
-------------------------
 t
(1 row)
```

in_range_int16_int16(int16, int16, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int16_int16(1::int16, 1::int16, 1::int16, true, true);
 in_range_int16_int16
----------------------
 f
(1 row)

gaussdb=# SELECT in_range_int16_int16(1::int16, 4::int16, 2::int16, true, true);
 in_range_int16_int16
----------------------
 t
(1 row)
```

in_range_int8_int16(int8, int8, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_int16(1::int8, 1::int8, 1::int16, true, true);
 in_range_int8_int16
---------------------
 f
(1 row)

gaussdb=# SELECT in_range_int8_int16(1::int8, 4::int8, 2::int16, true, true);
 in_range_int8_int16
---------------------
 t
(1 row)
```

in_range_int4_int16(int4, int4, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT in_range_int4_int16(1::int4, 1::int4, 1::int16, true, true);
 in_range_int4_int16
---------------------
 f
(1 row)

gaussdb=# SELECT in_range_int4_int16(1::int4, 4::int4, 2::int16, true, true);
 in_range_int4_int16
---------------------
 t
(1 row)
```

in_range_int2_int16(int2, int2, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_int16(1::int2, 1::int2, 1::int16, true, true);
 in_range_int2_int16
---------------------
 f
(1 row)

gaussdb=# SELECT in_range_int2_int16(1::int2, 4::int2, 2::int16, true, true);
 in_range_int2_int16
---------------------
 t
```

in_range_int1_int16(int1, int1, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

```
gaussdb=# SELECT in_range_int1_int16(1::int1, 1::int1, 1::int16, true, true);
 in_range_int1_int16
---------------------
 f
(1 row)

gaussdb=# SELECT in_range_int1_int16(1::int1, 4::int1, 2::int16, true, true);
 in_range_int1_int16
---------------------
 t
(1 row)
```

in_range_float8_float8(float8, float8, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_float8(1.0::float8, 1.9::float8, 1.0::float8, true, true);
 in_range_float8_float8
------------------------
 f
(1 row)
```

in_range_float4_float8(float4, float4, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_float8(1.0::float4, 1.9::float4, 1.0::float8, true, true);
 in_range_float4_float8
------------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_numeric_numeric(numeric, numeric, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_numeric(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::numeric(10,4),
true, true);
 in_range_numeric_numeric
--------------------------
 f
(1 row)
```

in_range_interval_interval(interval, interval, interval, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_interval_interval(interval '13' hour, interval '10' hour, interval '3' hour, false,
true);
 in_range_interval_interval
----------------------------
 t
(1 row)
```

in_range_timestamp_interval(timestamp, timestamp, interval, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

```
gaussdb=# SELECT in_range_timestamp_interval('12-10-2010 11:25:00', '10-11-2010 11:26:00', interval '60'
day, false, true);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 in_range_timestamp_interval
-----------------------------
 t
(1 row)
```

in_range_timestamptz_interval(timestamptz, timestamptz, interval, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_timestamptz_interval('12-10-2010 11:25:00+00', '10-11-2010 11:26:00+00',
interval '60' day, false, true);
 in_range_timestamptz_interval
-------------------------------
 t
(1 row)
```

in_range_time_interval(time, time, interval, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_time_interval('00:00:00', '12:00:00', interval '13' hour, true, true);
 in_range_time_interval
------------------------
 f
(1 row)
```

in_range_timetz_interval(timetz, timetz, interval, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_timetz_interval('00:00:00+00', '12:00:00+00', interval '13' hour, true, true);
 in_range_timetz_interval
--------------------------
 f
(1 row)
```

in_range_int8_numeric(int8, int8, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_numeric(1::int8, 2::int8, 0.9::numeric(10,4), true, true);
 in_range_int8_numeric
-----------------------
 t
(1 row)
```

in_range_int4_numeric(int4, int4, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_numeric(1::int4, 2::int4, 0.9::numeric(10,4), true, true);
 in_range_int4_numeric
-----------------------
 t
(1 row)
```

in_range_int2_numeric(int2, int2, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_numeric(1::int2, 2::int2, 0.9::numeric(10,4), true, true);
 in_range_int2_numeric
-----------------------
 t
(1 row)
```

in_range_int1_numeric(int1, int1, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_numeric(1::int1, 2::int1, 0.9::numeric(10,4), true, true);
 in_range_int1_numeric
-----------------------
 t
(1 row)
```

in_range_numeric_float4(numeric, numeric, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_float4(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::float4, true, true);
 in_range_numeric_float4
-------------------------
 f
(1 row)
```

in_range_numeric_float8(numeric, numeric, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_float8(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::float8, true, true);
 in_range_numeric_float8
-------------------------
 f
(1 row)
```

in_range_int8_float8(int8, int8, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_float8(1::int8, 2::int8, 0.9::float8, true, true);
 in_range_int8_float8
----------------------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int4_float8(int4, int4, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_float8(1::int4, 2::int4, 0.9::float8, true, true);
 in_range_int4_float8
----------------------
 t
(1 row)
```

in_range_int2_float8(int2, int2, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_float8(1::int2, 2::int2, 0.9::float8, true, true);
 in_range_int2_float8
----------------------
 t
(1 row)
```

in_range_int1_float8(int1, int1, float8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_float8(1::int1, 2::int1, 0.9::float8, true, true);
 in_range_int1_float8
----------------------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_float8_int16(float8, float8, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_int16(1.0::float8, 1.9::float8, 1::int16, true, true);
 in_range_float8_int16
-----------------------
 f
(1 row)
```

in_range_float4_int16(float4, float4, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_int16(1.0::float4, 1.9::float4, 1::int16, true, true);
 in_range_float4_int16
-----------------------
 f
(1 row)
```

in_range_float8_int8(float8, float8, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_int8(1.0::float8, 1.9::float8, 1::int8, true, true);
 in_range_float8_int8
----------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_float4_int8(float4, float4, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_int8(1.0::float4, 1.9::float4, 1::int8, true, true);
 in_range_float4_int8
----------------------
 f
(1 row)
```

in_range_float8_int4(float8, float8, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_int4(1.0::float8, 1.9::float8, 1::int4, true, true);
 in_range_float8_int4
----------------------
 f
(1 row)
```

in_range_float4_int4(float4, float4, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_int4(1.0::float4, 1.9::float4, 1::int4, true, true);
 in_range_float4_int4
----------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_float8_int2(float8, float8, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_int2(1.0::float8, 1.9::float8, 1::int2, true, true);
 in_range_float8_int2
----------------------
 f
(1 row)
```

in_range_float4_int2(float4, int2, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_int2(1.0::float4, 1.9::float4, 1::int2, true, true);
 in_range_float4_int2
----------------------
 f
(1 row)
```

in_range_float8_int1(float8, float8, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_int1(1.0::float8, 1.9::float8, 1::int1, true, true);
 in_range_float8_int1
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------------------
 f
(1 row)
```

in_range_float4_int1(float4, float4, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_int1(1.0::float4, 1.9::float4, 1::int1, true, true);
 in_range_float4_int1
----------------------
 f
(1 row)
```

in_range_float8_float4(float8, float8, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_float4(1.0::float8, 1.9::float8, 1.0::float4, true, true);
 in_range_float8_float4
------------------------
 f
(1 row)
```

in_range_float4_float4(float4, float4, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT in_range_float4_float4(1.0::float4, 1.9::float4, 1.0::float4, true, true);
 in_range_float4_float4
------------------------
 f
(1 row)
```

in_range_float8_numeric(float8, float8, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float8_numeric(1.0::float8, 1.9::float8, 1.0::numeric(10,4), true, true);
 in_range_float8_numeric
-------------------------
 f
(1 row)
```

in_range_float4_numeric(float4, float4, numeric, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_float4_numeric(1.0::float4, 1.9::float4, 1.0::numeric(10,4), true, true);
 in_range_float4_numeric
-------------------------
 f
(1 row)
```

in_range_numeric_int16(numeric, numeric, int16, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_int16(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::int16, true, true);
 in_range_numeric_int16
------------------------
 f
(1 row)
```

in_range_numeric_int8(numeric, numeric, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_int8(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::int8, true, true);
 in_range_numeric_int8
------------------------
 f
(1 row)
```

in_range_numeric_int4(numeric, numeric, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_int4(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::int4, true, true);
 in_range_numeric_int4
-----------------------
 f
(1 row)
```

in_range_numeric_int1(numeric, numeric, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_numeric_int1(1.0::numeric(10,4), 1.9::numeric(10,4), 1.0::int1, true, true);
 in_range_numeric_int1
-----------------------
 f
(1 row)
```

in_range_int8_int8(int8, int8, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_int8(1::int8, 1::int8, 1::int8, true, true);
 in_range_int8_int8
--------------------
 f
(1 row)
```

in_range_int4_int8(int4, int4, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_int8(1::int4, 1::int4, 1::int8, true, true);
 in_range_int4_int8
--------------------
 f
(1 row)
```

in_range_int2_int8(int2, int2, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_int8(1::int2, 1::int2, 1::int8, true, true);
 in_range_int2_int8
--------------------
 f
(1 row)
```

in_range_int1_int8(int1, int1, int8, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_int8(1::int1, 1::int1, 1::int8, true, true);
 in_range_int1_int8
--------------------
 f
(1 row)
```

in_range_int8_int4(int8, int8, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_int4(1::int8, 1::int8, 1::int4, true, true);
 in_range_int8_int4
--------------------
 f
(1 row)
```

in_range_int4_int4(int4, int4, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_int4(1::int4, 1::int4, 1::int4, true, true);
 in_range_int4_int4
--------------------
 f
(1 row)
```

in_range_int2_int4(int2, int2, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_int4(1::int2, 1::int2, 1::int4, true, true);
 in_range_int2_int4
--------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int1_int4(int1, int1, int4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_int4(1::int1, 1::int1, 1::int4, true, true);
 in_range_int1_int4
--------------------
 f
(1 row)
```

in_range_int8_int2(int8, int8, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_int2(1::int8, 1::int8, 1::int2, true, true);
 in_range_int8_int2
--------------------
 f
(1 row)
```

in_range_int4_int2(int4, int4, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_int2(1::int4, 1::int4, 1::int2, true, true);
 in_range_int4_int2
--------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int2_int2(int2, int2, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_int2(1::int2, 1::int2, 1::int2, true, true);
 in_range_int2_int2
--------------------
 f
(1 row)
```

in_range_int1_int2(int1, int1, int2, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_int2(1::int1, 1::int1, 1::int2, true, true);
 in_range_int1_int2
--------------------
 f
(1 row)
```

in_range_int8_int1(int8, int8, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_int1(1::int8, 1::int8, 1::int1, true, true);
 in_range_int8_int1
--------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int4_int1(int4, int4, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_int1(1::int4, 1::int4, 1::int1, true, true);
 in_range_int4_int1
--------------------
 f
(1 row)
```

in_range_int2_int1(int2, int2, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_int1(1::int2, 1::int2, 1::int1, true, true);
 in_range_int2_int1
--------------------
 f
(1 row)
```

in_range_int1_int1(int1, int1, int1, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_int1(1::int1, 1::int1, 1::int1, true, true);
 in_range_int1_int1
--------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int8_float4(int8, int8, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int8_float4(1::int8, 2::int8, 0.9::float4, true, true);
 in_range_int8_float4
----------------------
 t
(1 row)
```

in_range_int4_float4(int4, int4, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int4_float4(1::int4, 2::int4, 0.9::float4, true, true);
 in_range_int4_float4
----------------------
 t
(1 row)
```

in_range_int2_float4(int2, int2, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int2_float4(1::int2, 2::int2, 0.9::float4, true, true);
 in_range_int2_float4
----------------------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in_range_int1_float4(int1, int1, float4, boolean, boolean)

Description: Checks whether the first parameter is within the range of the second parameter plus or minus the third parameter.

Parameters:

- The first parameter: It needs to be determined whether it is within a specific range.
- The second parameter: It specifies the start value of the current range.
- Third parameter: It is a range value, which must be a positive number.
- Fourth parameter: It specifies whether the current operation is a subtraction or addition operation.
  - TRUE: Compare the second parameter minus the third parameter with the first parameter.
  - FALSE: Compare the second parameter plus the third parameter with the first parameter.
- Fifth parameter: It compares the operation result of the second and third parameters with the first parameter.
  - TRUE: Check whether the result is greater than the first parameter. If the result is greater than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.
  - FALSE: Check whether the result is less than or equal to the first parameter. If the result is less than or equal to the first parameter, the return value of the function is TRUE. Otherwise, the return value of the function is FALSE.

Return type: Boolean

Example:

```
gaussdb=# SELECT in_range_int1_float4(1::int1, 2::int1, 0.9::float4, true, true);
 in_range_int1_float4
----------------------
 t
(1 row)
```

7.6.18 Aggregate Functions

7.6.18.1 Aggregate Functions

sum(expression)

Description: Sum of expression across all input values

Return type:

Generally, the output type is the same as the input type except in the following cases:

- For a SMALLINT or INT input, the output type is BIGINT.
- For a BIGINT input, the output type is NUMBER.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For a floating-point number input, the output type is DOUBLE PRECISION.

Example:

```
gaussdb=# CREATE TABLE tab(a int);
CREATE TABLE
gaussdb=# INSERT INTO tab values(1);
INSERT 0 1
gaussdb=# INSERT INTO tab values(2);
INSERT 0 1
gaussdb=# SELECT sum(a) FROM tab;
 sum
-----
   3
(1 row)
gaussdb=# DROP TABLE tab;
```

max(expression)

Description: Returns the maximum value of **expression** among all input rows.

Parameter type: any array, numeric, string, or date/time type

Return type: same as the input parameter type.

Example:

```
gaussdb=# CREATE TABLE max_t1(a int, b int);

gaussdb=# INSERT INTO max_t1 VALUES(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT MAX(a) FROM max_t1;
 max
-----
   4
(1 row)

gaussdb=# DROP TABLE max_t1;
```

min(expression)

Description: Returns the minimum value of **expression** among all input rows.

Parameter type: any array, numeric, string, or date/time type

Return type: same as the input parameter type.

Example:

```
gaussdb=# CREATE TABLE min_t1(a int, b int);

gaussdb=# INSERT INTO min_t1 VALUES(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT MIN(a) FROM min_t1;
 min
-----
   1
(1 row)

gaussdb=# DROP TABLE min_t1;
```

avg(expression)

Description: Average (arithmetic mean) of all input values

Return type:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NUMBER for any integer-type argument.

DOUBLE PRECISION for floating-point parameters.

Otherwise, it is the same as the input data type.

Example:

```
gaussdb=# CREATE TABLE avg_t1(a int, b int);

gaussdb=# INSERT INTO avg_t1 VALUES(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT AVG(a) FROM avg_t1;
        avg
--------------------
 2.5000000000000000
(1 row)

gaussdb=# DROP TABLE avg_t1;
```

count(expression)

Description: Returns the number of input rows for which the value of expression is not null.

Return type: BIGINT

Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE count_t1(a int, b int);

gaussdb=# INSERT INTO count_t1 VALUES (NULL,1),(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT COUNT(a) FROM count_t1;
 count
-------
     4
(1 row)

gaussdb=# DROP TABLE count_t1;
```

count(*)

Description: Returns the number of input rows.

Return type: BIGINT

Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE count_t1(a int, b int);

gaussdb=# INSERT INTO count_t1 VALUES (NULL,1),(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT COUNT(*) FROM count_t1;
 count
-------
     5
(1 row)

gaussdb=# DROP TABLE count_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

KEEP(DENSE_RANK { FIRST | LAST } ORDER BY expr)

Description: Sorts data rows in a query result based on specified rules and returns the first or last group of values. This can be used in aggregate or window functions.

Syntax:

```
aggregate_function KEEP ( DENSE_RANK { FIRST | LAST }  ORDER BY expr [ DESC | ASC ] [ NULLS { FIRST | LAST } ]
    [, expr [ DESC | ASC ] [ NULLS { FIRST | LAST } ]]...)
```

Return type: data type of the specified column in aggregate_function.

NOTE

- aggregate_function is an aggregate function. Currently, only MIN, MAX, SUM, AVG, COUNT, VARIANCE, and STDDEV are supported.
- The KEEP keyword is used for clearer semantics and is limited to aggregate functions and window functions.
- DENSE_RANK FIRST and DENSE_RANK LAST indicate that only rows after the minimum (FIRST) and maximum (LAST) dense ranking are aggregated, respectively.
- Vectorized plans cannot be generated for execution.

Example:

```
gaussdb=# CREATE TABLE keep_t1(a int, b int, c int);

gaussdb=# INSERT INTO keep_t1 values(2, 111, 333), (2, 11, 33), (2, 11, 3), (1, 22, 55), (1, 2, 5);

gaussdb=#  SELECT MIN(b) KEEP(DENSE_RANK FIRST ORDER BY a) MIN_FIRST,
        MIN(b) KEEP(DENSE_RANK LAST ORDER BY a) MIN_LAST,
        MAX(b) KEEP(DENSE_RANK FIRST ORDER BY a) MAX_FIRST,
        MAX(b) KEEP(DENSE_RANK LAST ORDER BY a) MAX_LAST FROM keep_t1;
 min_first | min_last | max_first | max_last
-----------+----------+-----------+----------
         2 |       11 |        22 |      111
(1 row)

gaussdb=# DROP TABLE keep_t1;
```

median(expression) [over (query partition clause)]

Description: Returns the median of an expression. **NULL** will be ignored by the median function during calculation. The DISTINCT keyword can be used to exclude duplicate records in an expression. The data type of the input expression can be numeric (including integer, double, and bigint) or interval. For other data types, the median cannot be calculated.

Return type: double or interval

Example:

```
gaussdb=# SELECT median(id) FROM (values(1), (2), (3), (4), (null)) test(id);
 median
--------
    2.5
(1 row)
```

default(column_name)

Description: Obtains the default output value of a table column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: text

Example:

```
-- Create a MySQL-compatible database.
gaussdb=# CREATE DATABASE gaussdb_m WITH DBCOMPATIBILITY 'B';

gaussdb=# \c gaussdb_m

gaussdb_m=# CREATE TABLE t1(id int DEFAULT 100, name varchar(20) DEFAULT 'tt');

gaussdb_m=# INSERT INTO t1 VALUES(1,'test');

-- Execute the query.
gaussdb_m=# SELECT default(id), default(name) FROM t1;
 default | default
---------+---------
     100 | tt
(1 row)

-- Delete the database.
gaussdb_m=# \c postgres
gaussdb=# DROP DATABASE gaussdb_m;
```

NOTE

- The default function takes effect only when **sql_compatibility** is **'B'**.
- If a table column does not have a default value, the default function returns a null value.
- If a table column is a hidden column (such as **xmin** or **cmin**), the default function returns a null value.
- If a table column is an auto-increment column, the default function returns **0**.
- GaussDB supports default values of partitioned tables, temporary tables, and multi-table join query.
- GaussDB supports the query of nodes whose column names contain character string values (indicating names) and A_Star nodes (indicating that asterisks (*) appear), for example, **default(tt.t4.id)** and **default(tt.t4.*)**. For invalid column names and A_Star nodes, the error information reported by GaussDB is different from that reported by B-compatible databases.
- When the default value of a column is created in GaussDB, the range of the column type is not verified. As a result, an error may be reported when the default function is used.
- If the default value of a column is a function expression, the default function of GaussDB will return the calculated value of the default expression set for the column during table creation. In contrast, the default function of B-compatible databases will return null in this scenario.

array_agg(expression)

Description: Input values, including nulls, concatenated into an array

Return type: array of the parameter type

Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE array_agg_t1(a int, b int);

gaussdb=# INSERT INTO array_agg_t1 VALUES (NULL,1),(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT ARRAY_AGG(a) FROM array_agg_t1;
  array_agg
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------------
 {NULL,1,2,3,4}
(1 row)

gaussdb=# DROP TABLE array_agg_t1;
```

string_agg(expression, delimiter)

Description: Input values concatenated into a string, separated by delimiter

Return type: same as the input parameter type.

When the XML data type is explicitly converted into the character type, operations are still supported.

Example:

```
gaussdb=# CREATE TABLE string_agg_t1(a int, b int);

gaussdb=# INSERT INTO string_agg_t1 VALUES (NULL,1),(1,2),(2,3),(3,4),(4,5);

gaussdb=# SELECT STRING_AGG(a,';') FROM string_agg_t1;
 string_agg
------------
 1;2;3;4
(1 row)

gaussdb=# DROP TABLE string_agg_t1;
```

listagg(expression [, delimiter]) WITHIN GROUP(ORDER BY order-list)

Description: Aggregation column data sorted according to the mode specified by WITHIN GROUP, and concatenated to a string using the specified delimiter

- **expression**: Required. It specifies an aggregation column name or a column-based, valid expression. It does not support the DISTINCT keyword and the parameters of VARIADIC.
- **delimiter**: Optional. It specifies a delimiter, which can be a string constant or a deterministic expression based on a group of columns. The default value is empty.
- **order-list**: Required. It specifies the sorting mode in a group.

Return type: text

Example:

The aggregation column is of the text character set type.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b text);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,'a1'),(1,'b2'),(1,'c3'),(2,'d4'),(2,'e5'),(3,'f6');

gaussdb=# SELECT a,LISTAGG(b,';') WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a | listagg
---+---------
 1 | b2;c3
 2 | d4;e5
 3 | f6
   | a1
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

The aggregation column is of the integer type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b int);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,1),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT a,LISTAGG(b,';') WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a | listagg
---+---------
 1 | 2;3
 2 | 4;5
 3 | 6
   | 1
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

The aggregation column is of the floating point type.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b float);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,1.111),(1,2.222),(1,3.333),(2,4.444),(2,5.555),(3,6.666);

gaussdb=# SELECT a,LISTAGG(b,';') WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a |      listagg
---+-------------------
 1 | 2.222000;3.333000
 2 | 4.444000;5.555000
 3 | 6.666000
   | 1.111000
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

The aggregation column is of the time type.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b timestamp);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,'2000-01-01'),(1,'2000-02-02'),(1,'2000-03-03'),
(2,'2000-04-04'),(2,'2000-05-05'),(3,'2000-06-06');

gaussdb=# SELECT a,LISTAGG(b,';') WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a |                 listagg
---+-----------------------------------------
 1 | 2000-02-02 00:00:00;2000-03-03 00:00:00
 2 | 2000-04-04 00:00:00;2000-05-05 00:00:00
 3 | 2000-06-06 00:00:00
   | 2000-01-01 00:00:00
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

The aggregation column is of the time interval type.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b interval);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,'1 days'),(1,'2 days'),(1,'3 days'),(2,'4 days'),(2,'5 days'),
(3,'6 days');

gaussdb=# SELECT a,LISTAGG(b,';') WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a |    listagg
---+---------------
 1 | 2 days;3 days
 2 | 4 days;5 days
 3 | 6 days
   | 1 day
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

By default, the delimiter is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b interval);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,'1 days'),(1,'2 days'),(1,'3 days'),(2,'4 days'),(2,'5 days'),
(3,'6 days');

gaussdb=# SELECT a,LISTAGG(b) WITHIN GROUP(ORDER BY b) FROM listagg_t1 group by a;
 a |   listagg
---+--------------
 1 | 2 days3 days
 2 | 4 days5 days
 3 | 6 days
   | 1 day
(4 rows)

gaussdb=# DROP TABLE listagg_t1;
```

When listagg is used as a window function, the OVER clause does not support the window sorting of ORDER BY, and the listagg column is an ordered aggregation of the corresponding groups.

```
gaussdb=# CREATE TABLE listagg_t1(a int, b interval);

gaussdb=# INSERT INTO listagg_t1 VALUES (NULL,'1 days'),(1,'2 days'),(1,'3 days'),(2,'4 days'),(2,'5 days'),
(3,'6 days');

gaussdb=# SELECT a,LISTAGG(b) WITHIN GROUP(ORDER BY b) OVER(PARTITION BY a) FROM listagg_t1;
 a |   listagg
---+--------------
 1 | 2 days3 days
 1 | 2 days3 days
 2 | 4 days5 days
 2 | 4 days5 days
 3 | 6 days
   | 1 day
(6 rows)

gaussdb=# DROP TABLE listagg_t1;
```

group_concat([DISTINCT | ALL] expression [,expression ...] [ORDER BY { expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS { FIRST | LAST }] } [,...]] [SEPARATOR str_val])

Description: The number of parameters is not fixed. Multiple columns can be concatenated. Aggregation columns are sorted based on the value of **ORDER BY** and concatenated into a character string using the specified separator. This function cannot be used as a window function.

- **DISTINCT**: Optional. It deduplicates the results after each row is concatenated.
- **expression**: Required. It specifies the aggregation column name or a valid column-based expression.
- **ORDER BY**: Optional. It is followed by a variable number of expressions and sorting rule. The group_concat function does not support the (ORDER BY + number) format.
- **SEPARATOR**: Optional. It is followed by a character or string. This separator is used to concatenate the expression results of two adjacent lines in a group. If it is not specified, the comma (,) is used by default.
- When both DISTINCT and ORDER BY are specified, all ORDER BY expressions must be in DISTINCT expressions. Otherwise, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Parameter **group_concat_max_len** is used to limit the maximum length of **GROUP_CONCAT**. If the length exceeds the maximum, the system truncates the length. Currently, the maximum length that can be returned is 1073741823.

Return type: text

Example:

Set **separator** to **';'**.

```
gaussdb=# CREATE TABLE group_concat_t1(a int, b int);

gaussdb=# INSERT INTO group_concat_t1 VALUES (NULL,1),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT a,group_concat(b separator ';') FROM group_concat_t1 GROUP BY a ORDER BY a;
 a | group_concat
---+--------------
 1 | 2;3
 2 | 4;5
 3 | 6
   | 1
(4 rows)

gaussdb=# DROP TABLE group_concat_t1;
```

By default, the separator is a comma (,).

```
gaussdb=# CREATE TABLE group_concat_t1(a int, b int);

gaussdb=# INSERT INTO group_concat_t1 VALUES (NULL,1),(1,2),(1,3),(2,4),(2,5),(3,6);

wm_concat(expression)

Description: Concatenates the expression data of a specified column or columns into a character string by commas (,) for output.

Return type: text

Example:

```
gaussdb=# CREATE TABLE wm_concat_t1(a int, b interval);
CREATE TABLE
gaussdb=# INSERT INTO wm_concat_t1 VALUES (NULL,'1 days'),(1,'2 days'),(1,'3 days'),(2,'4 days'),(2,'5
days'),(3,'6 days');
INSERT 0 6
gaussdb=# SELECT wm_concat(a) FROM wm_concat_t1;
 wm_concat
-----------

NOTE

The return value of this function is text, and the combined result is unordered.

covar_pop(Y, X)

Description: Overall covariance

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE covar_pop_t1(a int, b int);

gaussdb=# INSERT INTO covar_pop_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT COVAR_POP(a,b) FROM covar_pop_t1;
 covar_pop
-----------
       100
(1 row)

gaussdb=# DROP TABLE covar_pop_t1;
```

covar_samp(Y, X)

Description: Sample covariance

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE covar_samp_t1(a int, b int);

gaussdb=# INSERT INTO covar_samp_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT COVAR_SAMP(a,b) FROM covar_samp_t1;
 covar_samp
------------
        125
(1 row)

gaussdb=# DROP TABLE covar_samp_t1;
```

stddev_pop(expression)

Description: Overall standard difference

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE stddev_pop_t1(a int, b int);

gaussdb=# INSERT INTO stddev_pop_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT STDDEV_POP(a) FROM stddev_pop_t1;
    stddev_pop
--------------------
 7.4833147735478828
(1 row)

gaussdb=# DROP TABLE stddev_pop_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

stddev_samp(expression)

Description: Sample standard deviation of the input values

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE stddev_samp_t1(a int, b int);

gaussdb=# INSERT INTO stddev_samp_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT STDDEV_SAMP(a) FROM stddev_samp_t1;
    stddev_samp
--------------------
 8.3666002653407555
(1 row)

gaussdb=# DROP TABLE stddev_samp_t1;
```

var_pop(expression)

Description: Specifies the population variance of the input values (square of the population standard deviation).

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE var_pop_t1(a int, b int);

gaussdb=# INSERT INTO var_pop_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT VAR_POP(a) FROM var_pop_t1;
       var_pop
---------------------
 56.0000000000000000
(1 row)

gaussdb=# DROP TABLE var_pop_t1;
```

var_samp(expression)

Description: Specifies the sample variance of the input values (square of the sample standard deviation).

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE var_samp_t1(a int, b int);

gaussdb=# INSERT INTO var_samp_t1 VALUES (NULL,11),(11,21),(11,31),(21,41),(21,51),(31,61);

gaussdb=# SELECT VAR_SAMP(a) FROM var_samp_t1;
      var_samp
---------------------
 70.0000000000000000
(1 row)

gaussdb=# DROP TABLE var_samp_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

bit_and(expression)

Description: The bitwise AND of all non-null input values, or null if none

Return type: same as the input parameter type.

Example:

```
gaussdb=# CREATE TABLE bit_and_t1(a int, b int);

gaussdb=# INSERT INTO bit_and_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT BIT_AND(a) FROM bit_and_t1;
 bit_and
---------
       0
(1 row)

gaussdb=# DROP TABLE bit_and_t1;
```

bit_or(expression)

Description: The bitwise OR of all non-null input values, or null if none

Return type: same as the input parameter type.

Example:

```
gaussdb=# CREATE TABLE bit_or_t1(a int, b int);

gaussdb=# INSERT INTO bit_or_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT BIT_OR(a) FROM bit_or_t1;
 bit_or
--------
      3
(1 row)

gaussdb=# DROP TABLE bit_or_t1;
```

bool_and(expression)

Description: Its value is **true** if all input values are **true**, otherwise **false**.

Return type: Boolean

Example:

```
gaussdb=# SELECT bool_and(100 <2500);
 bool_and
----------
 t
(1 row)
```

bool_or(expression)

Description: Its value is **true** if at least one input value is **true**, otherwise **false**.

Return type: Boolean

Example:

```
gaussdb=# SELECT bool_or(100 <2500);
 bool_or
----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 t
(1 row)
```

corr(Y, X)

Description: Specifies the correlation coefficient.

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE corr_t1(a int, b int);

gaussdb=# INSERT INTO corr_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT CORR(a,b) FROM corr_t1;
       corr
------------------
 .944911182523068
(1 row)

gaussdb=# DROP TABLE corr_t1;
```

every(expression)

Description: Equivalent to **bool_and**

Return type: Boolean

Example:

```
gaussdb=# SELECT every(100 <2500);
 every
-------
 t
(1 row)
```

regr_avgx(Y, X)

Description: Specifies the average of the independent variable (**sum(X)/Y**).

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_t1(a int, b int);

gaussdb=# INSERT INTO regr_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_AVGX(a,b) FROM regr_t1;
 regr_avgx
-----------
         4
(1 row)

gaussdb=# DROP TABLE regr_t1;
```

regr_avgy(Y, X)

Description: Specifies the average of the dependent variable (**sum(Y)/X**).

Return type: double precision

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE regr_avgy_t1(a int, b int);

gaussdb=# INSERT INTO regr_avgy_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_AVGY(a,b) FROM regr_avgy_t1;
 regr_avgy
-----------
       1.8
(1 row)

gaussdb=# DROP TABLE regr_avgy_t1;
```

regr_count(Y, X)

Description: Specifies the number of input rows in which both expressions are non-null.

Return type: bigint

Example:

```
gaussdb=# CREATE TABLE regr_count_t1(a int, b int);

gaussdb=# INSERT INTO regr_count_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_COUNT(a,b) FROM regr_count_t1;
 regr_count
------------
          5
(1 row)

gaussdb=# DROP TABLE regr_count_t1;
```

regr_intercept(Y, X)

Description: y-intercept of the least-squares-fit linear equation determined by the (X, Y) pairs

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_intercept_t1(a int, b int);

gaussdb=# INSERT INTO regr_intercept_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_INTERCEPT(b,a) FROM regr_intercept_t1;
  regr_intercept
------------------
 .785714285714286
(1 row)

gaussdb=# DROP TABLE regr_intercept_t1;
```

regr_r2(Y, X)

Description: Specifies the square of the correlation coefficient.

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_r2_t1(a int, b int);

gaussdb=# INSERT INTO regr_r2_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT REGR_R2(b,a) FROM regr_r2_t1;
     regr_r2
------------------
 .892857142857143
(1 row)

gaussdb=# DROP TABLE regr_r2_t1;
```

regr_slope(Y, X)

Description: Slope of the least-squares-fit linear equation determined by the (X, Y) pairs

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_slope_t1(a int, b int);

gaussdb=# INSERT INTO regr_slope_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_SLOPE(b,a) FROM regr_slope_t1;
    regr_slope
-------------------
 1.78571428571429
(1 row)

gaussdb=# DROP TABLE regr_slope_t1;
```

regr_sxx(Y, X)

Description: **sum(Y^2) – sum(X)^2/N** (sum of squares of the independent variables)

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_sxx_t1(a int, b int);

gaussdb=# INSERT INTO regr_sxx_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_SXX(b,a) FROM regr_sxx_t1;
 regr_sxx
----------
      2.8
(1 row)

gaussdb=# DROP TABLE regr_sxx_t1;
```

regr_sxy(Y, X)

Description: **sum(X*Y) – sum(X) * sum(Y)/N** (sum of products of independent times dependent variable)

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_sxy_t1(a int, b int);

gaussdb=# INSERT INTO regr_sxy_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_SXY(b,a) FROM regr_sxy_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

 regr_sxy
----------
        5
(1 row)

gaussdb=# DROP TABLE regr_sxy_t1;
```

regr_syy(Y, X)

Description: **sum(Y^2) – sum(X)^2/N** (sum of squares of the dependent variable)

Return type: double precision

Example:

```
gaussdb=# CREATE TABLE regr_syy_t1(a int, b int);

gaussdb=# INSERT INTO regr_syy_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT REGR_SYY(b,a) FROM regr_syy_t1;
 regr_syy
----------
       10
(1 row)

gaussdb=# DROP TABLE regr_syy_t1;
```

stddev(expression)

Description: Alias of **stddev_samp**

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE stddev_t1(a int, b int);

gaussdb=# INSERT INTO stddev_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT STDDEV(a) FROM stddev_t1;
       stddev
----------------------
 .83666002653407554798
(1 row)

gaussdb=# DROP TABLE stddev_t1;
```

variance(expexpression,ression)

Description: Alias of **var_samp**

Return type: DOUBLE PRECISION for floating-point arguments, otherwise NUMERIC

Example:

```
gaussdb=# CREATE TABLE variance_t1(a int, b int);

gaussdb=# INSERT INTO variance_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT VARIANCE(a) FROM variance_t1;
      variance
----------------------
 .70000000000000000000
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# DROP TABLE variance_t1;
```

delta

Description: Returns the difference between the current row and the previous row.

Parameter: numeric

Return type: numeric

checksum(expression)

Description: Returns the CHECKSUM value of all input values. This function can be used to check whether the data in the tables is the same before and after the backup, restoration, or migration of GaussDB (databases other than GaussDB are not supported). Before and after database backup, database restoration, or data migration, you need to manually run SQL commands to obtain the execution results. Compare the obtained execution results to check whether the data in the tables before and after the backup or migration is the same.

NOTE

- For large tables, the execution of CHECKSUM function may take a long time.
- If the CHECKSUM values of two tables are different, it indicates that the contents of the two tables are different. Using the hash function in the CHECKSUM function may incur conflicts. There is low possibility that two tables with different contents may have the same CHECKSUM value. The same problem may occur when CHECKSUM is used for columns.
- If the time type is timestamp, timestamptz, or smalldatetime, ensure that the time zone settings are the same when calculating the CHECKSUM value.

- To calculate CHECKSUM for a column that can be converted into the TEXT type by default, set **expression** to the column name.
- To calculate CHECKSUM for a column that cannot be converted into the TEXT type by default, set **expression** to *Column name*::**TEXT**.
- To calculate CHECKSUM for all columns, set **expression** to *Table name*::**TEXT**.

The following data types can be converted into TEXT by default: char, name, int8, int2, int1, int4, raw, pg_node_tree, float4, float8, bpchar, varchar, nvarchar, nvarchar2, date, timestamp, timestamptz, numeric, and smalldatetime. Other types need to be forcibly converted into TEXT, such as XML.

Return type: numeric

Example:

The following calculates CHECKSUM for a column can be converted into the TEXT type by default:

```
gaussdb=# CREATE TABLE checksum_t1(a int, b int);

gaussdb=# INSERT INTO checksum_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT CHECKSUM(a) FROM checksum_t1;
  checksum
-------------
 18126842830
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# DROP TABLE checksum_t1;
```

The following calculates CHECKSUM for a column cannot be converted into the TEXT type by default. In this case, the CHECKSUM parameter is set to *Column name*::**TEXT**.

```
gaussdb=# CREATE TABLE checksum_t1(a int, b int);

gaussdb=# INSERT INTO checksum_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT CHECKSUM(a::TEXT) FROM checksum_t1;
  checksum
-------------
 18126842830
(1 row)

gaussdb=# DROP TABLE checksum_t1;
```

The following calculates CHECKSUM for all columns. In this case, the CHECKSUM parameter is set to *Table name without a schema*::**TEXT**.

```
gaussdb=# CREATE TABLE checksum_t1(a int, b int);

gaussdb=# INSERT INTO checksum_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT CHECKSUM(checksum_t1::TEXT) FROM checksum_t1;
  checksum
-------------
 11160522226
(1 row)

gaussdb=# DROP TABLE checksum_t1;
```

percentile_cont(percentile float)

Description: Sorts a given column by time series and returns a percentile value.

Return type: float

NOTE

- **percentile** is a decimal from 0 to 1. The value is of the floating point type and does not support the percent sign (%), for example, 95%.
- This parameter must be used together with WITHIN GROUP (ORDER BY) to specify the column to be calculated. The column must be of the numeric type.

Example:

```
gaussdb=# SELECT percentile_cont(0) WITHIN GROUP (ORDER BY value) FROM (VALUES (1),(2)) v(value);
 percentile_cont
-----------------
               1
(1 row)
```

mode() WITHIN GROUP (ORDER BY value anyelement)

Description: Returns the value with the highest occurrence frequency in a column. If multiple values have the same frequency, the smallest value is returned. The sorting mode is the same as the default sorting mode of the column type. The input parameter **value** can be of any type.

Return type: same as the input parameter type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT mode() WITHIN GROUP (ORDER BY value) FROM (values(1, 'a'), (2, 'b'), (2, 'c'))
v(value, tag);
 mode
------
    2
(1 row)
gaussdb=# SELECT mode() WITHIN GROUP (ORDER BY tag) FROM (values(1, 'a'), (2, 'b'), (2, 'c')) v(value,
tag);
 mode
------
 a
(1 row)
```

pivot_func(anyelement)

Description: Returns the only non-null value in a column. If there are two or more non-null values, an error is reported. The input parameter **value** can be of any type.

Return type: same as the input parameter type.

NOTE

This aggregate function is mainly used inside the pivot syntax.

Example:

```
gaussdb=# CREATE TABLE pivot_func_t1(a int, b int);

gaussdb=# INSERT INTO pivot_func_t1 VALUES (NULL,11),(1,2);

gaussdb=# SELECT PIVOT_FUNC(a) FROM pivot_func_t1;
 pivot_func
------------
          1
(1 row)

gaussdb=# DROP TABLE pivot_func_t1;
```

json_agg(any)

Description: Aggregates values into a JSON array.

Return type: array-json

Example:

```
gaussdb=# CREATE TABLE json_agg_t1(a int, b int);

gaussdb=# INSERT INTO json_agg_t1 VALUES (NULL,11),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT JSON_AGG(a) FROM json_agg_t1;
       json_agg
-----------------------
 [null, 1, 1, 2, 2, 3]
(1 row)

gaussdb=# DROP TABLE json_agg_t1;
```

json_object_agg(any, any)

Description: Aggregates values into a JSON object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: object-json

Example:

```
gaussdb=# CREATE TABLE json_object_agg_t1(a int, b int);

gaussdb=# INSERT INTO json_object_agg_t1 VALUES (11,NULL),(1,2),(1,3),(2,4),(2,5),(3,6);

gaussdb=# SELECT JSON_OBJECT_AGG(a,b) FROM json_object_agg_t1;
                    json_object_agg
-----------------------------------------------------------------
 { "11" : null, "1" : 2, "1" : 3, "2" : 4, "2" : 5, "3" : 6 }
(1 row)

gaussdb=# DROP TABLE json_object_agg_t1;
```

7.6.18.2 Aggregate Function Nesting

Description: Performs another aggregate function operation on the grouping calculation result of the aggregate function.

Generally, it can be described as follows:

```
SELECT AGG1(AGG2(column_name1)) FROM table_name GROUP BY column_name2;
```

It is equivalent to:

```
SELECT AGG1(value) FROM (SELECT AGG2(column_name1) value FROM table_name GROUP BY
column_name2);
```

In the preceding information:

- **AGG1()**: outer aggregate function.
- **AGG2()**: inner aggregate function.
- **table_name**: table name.
- **column_name1** and **column_name2**: column names.
- **value**: alias of the result of the inner aggregate function.

The overall meaning can be described as follows: The grouping calculation result of the inner aggregate function AGG2() is used as the input of the outer aggregate function AGG1() for recalculation.

NOTE

1. The nested aggregate function is located between SELECT and FROM. Otherwise, it is meaningless.
2. The SELECT statement that uses a nested aggregate function contains a GROUP BY clause.
3. Only the nested aggregate functions or constant expressions can be selected together with another nested aggregate function.
4. The aggregate function supports only one nesting operation.
5. Currently, the following aggregate functions can be nested: avg, max, min, sum, var_pop, var_samp, variance, stddev_pop, stddev_samp, stddev, median, regr_sxx, regr_syy, regr_sxy, regr_avgx, regr_avgy, regr_r2, regr_slope, regr_intercept, covar_pop, covar_samp, corr, and listagg.
6. The return type of the inner aggregate function must comply with the parameter type of the outer aggregate function.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE test1 (id INT,val INT);
CREATE TABLE
gaussdb=# INSERT INTO test1 VALUES (1, 1);
INSERT 0 1
gaussdb=# INSERT INTO test1 VALUES (1, null);
INSERT 0 1
gaussdb=# INSERT INTO test1 VALUES (2, 10);
INSERT 0 1
gaussdb=# INSERT INTO test1 VALUES (2, 55);
INSERT 0 1

gaussdb=# SELECT SUM(MIN(val)) FROM test1 GROUP BY id;
 sum
-----
  11
(1 row)

gaussdb=# DROP TABLE test1;
DROP TABLE
```

7.6.19 Window Functions

Window functions and the **OVER** clause are used together. The OVER clause is used for grouping data and sorting the elements in a group. Window functions are used for generating sequence numbers for the values in the group.

NOTE

order by in a window function must be followed by a column name. If it is followed by a number, the number is processed as a constant value and the target column is not ranked.

If a parent query contains filter criteria of a window function in a subquery, the filter criteria in the parent query can be pushed down to the subquery.

CAUTION

1. Only the <, <=, and = filter criteria of window functions in parent queries can be pushed down to subqueries.
2. The upper limit can be a constant, constant expression, parameter, non-VOLATILE function, or non-correlated sublink.
3. Only three window functions are supported: **ROW_NUMBER()**, **RANK()**, and **DENSE_RANK()**.

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE t2 (c1 INT, c2 INT);
-- Import data.
gaussdb=# INSERT INTO t2 SELECT generate_series, generate_series FROM generate_series(1, 1000000);
-- Execute the query. The query is normal, no error is reported, and the execution result is correct.
gaussdb=# EXPLAIN ANALYZE SELECT nc1 FROM (
SELECT row_number() over() rid,
t2.c1 nc1
FROM t2
) WHERE rid BETWEEN 1 AND (1 + 10 - 1);
                                                  QUERY PLAN
---------------------------------------------------------------------------------------------------------------------
 Subquery Scan on __unnamed_subquery__  (cost=0.00..0.42 rows=3 width=4) (actual time=0.201..0.228
rows=10 loops=1)
   Filter: (__unnamed_subquery__.rid >= 1)
   ->  WindowAgg  (cost=0.00..0.30 rows=10 width=4) (actual time=0.191..0.211 rows=10 loops=1)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        row_number_filter: (row_number() OVER () <= 10)
        ->  Seq Scan on t2  (cost=0.00..11977.45 rows=817445 width=4) (actual time=0.150..0.153 rows=11
loops=1)
 Total runtime: 0.539 ms
(6 rows)
-- Clear the environment to prevent data leakage.
gaussdb=# DROP TABLE t2;
```

RANK()

Description: The RANK function is used for generating non-consecutive sequence numbers for the values in each group. The same values have the same sequence number.

Return type: BIGINT.

Example:

```
gaussdb=# CREATE TABLE rank_t1(a int, b int);

gaussdb=# INSERT INTO rank_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,RANK() OVER(PARTITION BY a ORDER BY b) FROM rank_t1;
 a | b | rank
---+---+------
 1 | 1 |    1
 1 | 1 |    1
 1 | 2 |    3
 1 | 3 |    4
 2 | 4 |    1
 2 | 5 |    2
 3 | 6 |    1
(7 rows)

gaussdb=# DROP TABLE rank_t1;
```

ROW_NUMBER()

Description: The ROW_NUMBER function is used for generating consecutive sequence numbers for the values in each group. The same values have different sequence numbers.

Return type: BIGINT.

Example:

```
gaussdb=# CREATE TABLE row_number_t1(a int, b int);

gaussdb=# INSERT INTO row_number_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,ROW_NUMBER() OVER(PARTITION BY a ORDER BY b) FROM row_number_t1;
 a | b | row_number
---+---+------------
 1 | 1 |          1
 1 | 1 |          2
 1 | 2 |          3
 1 | 3 |          4
 2 | 4 |          1
 2 | 5 |          2
 3 | 6 |          1
(7 rows)

gaussdb=# DROP TABLE row_number_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DENSE_RANK()

Description: The DENSE_RANK function is used for generating consecutive sequence numbers for the values in each group. The same values have the same sequence number.

Return type: BIGINT.

Example:

```
gaussdb=# CREATE TABLE dense_rank_t1(a int, b int);

gaussdb=# INSERT INTO dense_rank_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,DENSE_RANK() OVER(PARTITION BY a ORDER BY b) FROM dense_rank_t1;
 a | b | dense_rank
---+---+------------
 1 | 1 |          1
 1 | 1 |          1
 1 | 2 |          2
 1 | 3 |          3
 2 | 4 |          1
 2 | 5 |          2
 3 | 6 |          1
(7 rows)

gaussdb=# DROP TABLE dense_rank_t1;
```

PERCENT_RANK()

Description: The PERCENT_RANK function is used for generating corresponding sequence numbers for the values in each group. That is, the function calculates the value according to the formula: Sequence number = (**rank** – 1) / (**totalrows** – 1). **rank** is the corresponding sequence number generated based on the **RANK** function for the value and **totalrows** is the total number of elements in a group.

Return type: DOUBLE PRECISION.

Example:

```
gaussdb=# CREATE TABLE percent_rank_t1(a int, b int);

gaussdb=# INSERT INTO percent_rank_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,PERCENT_RANK() OVER(PARTITION BY a ORDER BY b) FROM percent_rank_t1;
 a | b |    percent_rank
---+---+-----------------
 1 | 1 |                0
 1 | 1 |                0
 1 | 2 | .666666666666667
 1 | 3 |                1
 2 | 4 |                0
 2 | 5 |                1
 3 | 6 |                0
(7 rows)

gaussdb=# DROP TABLE percent_rank_t1;
```

CUME_DIST()

Description: The CUME_DIST function is used for generating accumulative distribution sequence numbers for the values in each group. That is, the function calculates the value according to the following formula: Sequence number = Number of rows preceding or peer with current row/Total rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: DOUBLE PRECISION.

Example:

```
gaussdb=# CREATE TABLE cume_dist_t1(a int, b int);

gaussdb=# INSERT INTO cume_dist_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,CUME_DIST() OVER(PARTITION BY a ORDER BY b) FROM cume_dist_t1;
 a | b | cume_dist
---+---+-----------
 1 | 1 |        .5
 1 | 1 |        .5
 1 | 2 |       .75
 1 | 3 |         1
 2 | 4 |        .5
 2 | 5 |         1
 3 | 6 |         1
(7 rows)

gaussdb=# DROP TABLE cume_dist_t1;
```

NTILE(num_buckets integer)

Description: The NTILE function is used for equally allocating sequential data sets to the buckets whose quantity is specified by **num_buckets** according to **num_buckets integer** and allocating the bucket number to each row. Divide the partition as evenly as possible.

Return type: INTEGER.

Example:

```
gaussdb=# CREATE TABLE ntile_t1(a int, b int);

gaussdb=# INSERT INTO ntile_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,NTILE(2) OVER(PARTITION BY a ORDER BY b) FROM ntile_t1;
 a | b | ntile
---+---+-------
 1 | 1 |     1
 1 | 1 |     1
 1 | 2 |     2
 1 | 3 |     2
 2 | 4 |     1
 2 | 5 |     2
 3 | 6 |     1
(7 rows)

gaussdb=# DROP TABLE ntile_t1;
```

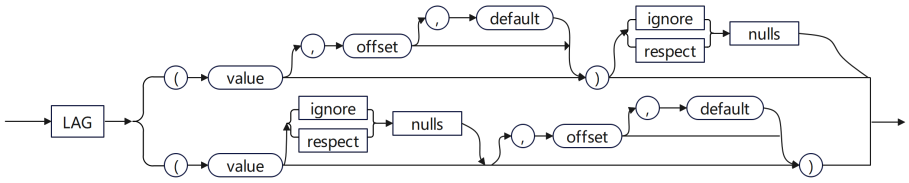
LAG

Description: The LAG function is used for generating lag values for the corresponding values in each group. That is, the value of the row obtained by moving forward the row corresponding to the current value by **offset** (integer) is the sequence number. If the row does not exist after the moving, the result value is the default value. If not specified, **offset** will default to **1**, and **default** will be null. The value of **default** must be of the same type as **value**.

Syntax:

```
LAG(value any [, offset integer [, default any ]])
LAG(value any ignore|respect nulls [, offset integer [, default any ]])
LAG(value any [, offset integer [, default any ]]) ignore|respect nulls
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



ignore|respect nulls determines whether null is included in the forward offset value. If not specified, the default value **respect nulls** is used. If **ignore nulls** is specified and **value** is null, null will not be included in the forward offset value. If **ignore nulls** is specified, the function performance deteriorates.

Return type: same as the input data type.

Example 1: Disable **ignore nulls**, and set **offset** to **3** and **default** to null.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE ta1 (hire_date date, last_name varchar(20), department_id int);
CREATE TABLE
gaussdb=# INSERT INTO ta1 VALUES('07-DEC-02', 'Raphaely', 30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 VALUES('24-JUL-05', 'Tobias',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 VALUES('24-DEC-05', 'Baida',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 VALUES('18-MAY-03', 'Khoo', 30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('15-NOV-06', 'Himuro',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('10-AUG-07', 'Colmenares',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('10-MAY-07', 'yq',  11);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('10-MAY-08', 'zi',  11);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('', 'yq1',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values(null, 'yq2',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values('10-DEC-07', 'yq3',  30);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values(null, null,  11);
INSERT 0 1
gaussdb=# INSERT INTO ta1 values(null, null,  11);
INSERT 0 1

-- Call LAG, and set offset to 3 and default to null.
gaussdb=# SELECT hire_date, last_name, department_id, lag(hire_date, 3, null)  OVER (PARTITION BY
department_id ORDER BY last_name) AS "NextHired" FROM ta1 ORDER BY department_id;
     hire_date      | last_name  | department_id |       NextHired

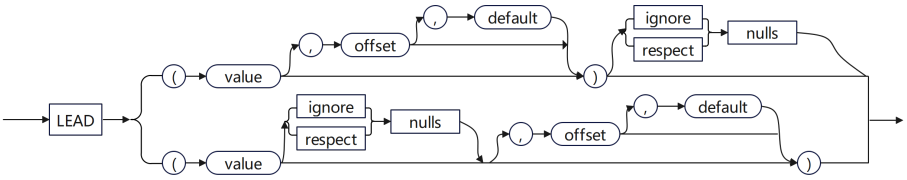
-- Drop the table.
gaussdb=# DROP TABLE ta1;
DROP TABLE
```

LEAD

Description: The LEAD function is used for generating leading values for the corresponding values in each group. That is, the value of the row obtained by moving backward the row corresponding to the current value by **offset** (integer) is the sequence number. If the row after the moving exceeds the total number of rows for the current group, the result value is the default value. If not specified, **offset** will default to **1**, and **default** will be null. The value of **default** must be of the same type as **value**.

Syntax:

```
LEAD(value any [, offset integer [, default any ]])
LEAD(value any ignore|respect nulls [, offset integer [, default any ]])
LEAD(value any [, offset integer [, default any ]]) ignore|respect nulls
```



ignore|respect nulls determines whether null is included in the backward offset value. If not specified, the default value **respect nulls** is used. If **ignore nulls** is specified and **value** is null, null will not be included in the backward offset value. If **ignore nulls** is specified, the function performance deteriorates.

Return type: same as the input data type.

Example 1: Disable **ignore nulls**, set **offset** to **2**, and do not specify **default**.

```
-- Drop the table.
gaussdb=# DROP TABLE ta1;
DROP TABLE
```

FIRST_VALUE()

Description: Returns the first value of each group.

Return type: same as the input data type.

Syntax:

```
FIRST_VALUE(value any)
FIRST_VALUE(value any IGNORE|RESPECT NULLS)
FIRST_VALUE(value any) IGNORE|RESPECT NULLS
```

IGNORE|RESPECT NULLS specifies whether to ignore null values. The default value is **RESPECT NULLS**. If **IGNORE NULLS** is enabled and the first value in the group is null, the function will keep querying backward until it finds a non-null value. If the query reaches the end of the group and the value remains null, the function will return null.

Example 1: **IGNORE NULLS** is disabled, meaning that null values are not ignored by default.

```
gaussdb=# CREATE TABLE first_value_t1(a int, b int);

gaussdb=# INSERT INTO first_value_t1 VALUES(1, NULL),(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,FIRST_VALUE(b) OVER(PARTITION BY a ORDER BY b) FROM first_value_t1;
 a | b | first_value
---+---+-------------
 1 | 1 |           1
 1 | 1 |           1
 1 | 2 |           1
 1 | 3 |           1
 1 |   |           1
 2 | 4 |           4
 2 | 5 |           4
 3 | 6 |           6
(8 rows)
gaussdb=# DROP TABLE first_value_t1;
```

Example 2: **IGNORE NULLS** is enabled.

```
gaussdb=# CREATE TABLE first_value_t1(a int, b int);

gaussdb=# INSERT INTO first_value_t1 VALUES(1, NULL),(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,FIRST_VALUE(b) IGNORE NULLS OVER(PARTITION BY a ORDER BY b DESC) FROM
first_value_t1;
 a | b | first_value

(8 rows)

gaussdb=# DROP TABLE first_value_t1;
```

LAST_VALUE()

Description: Returns the last value of each group.

Return type: same as the input data type.

Syntax:

```
LAST_VALUE(value any)
LAST_VALUE(value any IGNORE|RESPECT NULLS)
LAST_VALUE(value any) IGNORE|RESPECT NULLS
```

IGNORE|RESPECT NULLS specifies whether to ignore null values. The default value is **RESPECT NULLS**. If **IGNORE NULLS** is enabled and the last value in the group is null, the function will keep querying forward until it finds a non-null value. If the query reaches the beginning of the group and the value remains null, the function will return null.

Example 1: **IGNORE NULLS** is disabled, meaning that null values are not ignored by default.

```
gaussdb=# CREATE TABLE last_value_t1(a int, b int);

gaussdb=# INSERT INTO last_value_t1 VALUES(1, NULL),(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,LAST_VALUE(b) OVER(PARTITION BY a ORDER BY b) FROM last_value_t1;
 a | b | last_value
---+---+------------
 1 | 1 |          1
 1 | 1 |          1
 1 | 2 |          2
 1 | 3 |          3
 1 |   |
 2 | 4 |          4
 2 | 5 |          5
 3 | 6 |          6
(8 rows)

gaussdb=# DROP TABLE last_value_t1;
```

Example 2: **IGNORE NULLS** is enabled.

```
gaussdb=# CREATE TABLE last_value_t1(a int, b int);

gaussdb=# INSERT INTO last_value_t1 VALUES(1, NULL),(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,LAST_VALUE(b) IGNORE NULLS OVER(PARTITION BY a ORDER BY b) FROM
last_value_t1;
 a | b | last_value
---+---+------------
 1 | 1 |          1
 1 | 1 |          1
 1 | 2 |          2
 1 | 3 |          3
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 1 |   |         3
 2 | 4 |         4
 2 | 5 |         5
 3 | 6 |         6
(8 rows)

gaussdb=# DROP TABLE last_value_t1;
```

DELTA

Description: Returns the difference between the current row and the previous row.

Parameter: **numeric**.

Return type: numeric.

RATIO_TO_REPORT(column_name)

Description: Calculates the ratio of the value in a column to the total value in the group to which the column belongs.

Parameter: numeric or any type that can be implicitly converted into the numeric type.

Return type: If the input parameter is float4 or float8, the return type will match the input type. For other input types, the return type will be numeric.

NOTE

When RATIO_TO_REPORT(column_name) is used together with OVER(), the input parameters of OVER() support only **PARTITION BY** and **NULL**.

Example 1:

```
gaussdb=# CREATE TABLE ratio_to_report_t1(a int, b int);

gaussdb=# INSERT INTO ratio_to_report_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,RATIO_TO_REPORT(b) OVER(PARTITION BY a) FROM ratio_to_report_t1;
 a | b |     ratio_to_report
---+---+-------------------------
 1 | 1 |  .14285714285714285714
 1 | 1 |  .14285714285714285714
 1 | 2 |  .28571428571428571429
 1 | 3 |  .42857142857142857143
 2 | 4 |  .44444444444444444444
 2 | 5 |  .55555555555555555556
 3 | 6 | 1.00000000000000000000
(7 rows)

gaussdb=# DROP TABLE ratio_to_report_t1;
```

Example 2: Nest this function with other functions.

```
gaussdb=# CREATE TABLE ratio_to_report_t1(a int, b int);

gaussdb=# INSERT INTO ratio_to_report_t1 VALUES(1,1),(1,1),(1, 2),(1, 3),(2, 4),(2, 5),(3,6);

gaussdb=# SELECT a,b,TO_CHAR(RATIO_TO_REPORT(b) OVER(PARTITION BY a), '$999eeee') FROM
ratio_to_report_t1;
 a | b | to_char

gaussdb=# DROP PROCEDURE ratio_to_report_proc;

gaussdb=# DROP TABLE ratio_to_report_t1;
```

NTH_VALUE()

Description: Returns the *n*th row in a group. If the row does not exist, **NULL** is returned by default.

Return type: same as the input data type.

Syntax:

```
NTH_VALUE(value any, nth integer)
NTH_VALUE(value any, nth integer) IGNORE|RESPECT NULLS
```

IGNORE|RESPECT NULLS specifies whether to ignore null values. The default value is **RESPECT NULLS**. If **IGNORE NULLS** is enabled, the function will keep querying backward until it finds the *n*th non-null value. If the query reaches the end of the group without finding the *n*th non-null value, the function will return null.

Example 1: **IGNORE NULLS** is disabled, meaning that null values are not ignored by default.

```
gaussdb=# CREATE TABLE nth_value_t1(a int, b int);

gaussdb=# INSERT INTO nth_value_t1 VALUES(1, NULL),(1, NULL),(1, NULL),(1,1),(1,1),(1, 2),(1, 3),(2, 4),
(2, 5),(3,6);

gaussdb=# SELECT a,b,NTH_VALUE(b, 2) OVER(PARTITION BY a ORDER BY b) FROM nth_value_t1;
```

gaussdb=# DROP TABLE nth_value_t1;
```

KEEP(DENSE_RANK { FIRST | LAST } ORDER BY expr)

Description: Sorts data rows in a query result based on specified rules and returns the first or last group of values. This can be used in aggregate or window functions.

Syntax:

```
aggregate_function KEEP ( DENSE_RANK { FIRST | LAST }  ORDER BY expr [ DESC | ASC ] [ NULLS { FIRST |
LAST } ]
     [, expr [ DESC | ASC ] [ NULLS { FIRST | LAST } ]]...)
OVER ( [query_partition_clause] ) ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: same as the data type of the specified column in aggregate_function.

Example:

```
gaussdb=# CREATE TABLE keep_t1(a int, b int, c int, d int);

gaussdb=# INSERT INTO keep_t1 values(2, 111, 333, 10), (2, 11, 33, 10), (2, 11, 3, 1), (1, 22, 55, 10), (1, 2,
5, 100);

gaussdb=#  SELECT MIN(d) KEEP(DENSE_RANK FIRST ORDER BY b) OVER (PARTITION BY a) MIN_FIRST,
   MIN(b) KEEP(DENSE_RANK LAST ORDER BY b) OVER (PARTITION BY a) MIN_LAST,
   MAX(b) KEEP(DENSE_RANK FIRST ORDER BY b) OVER (PARTITION BY a) MAX_FIRST,
   MAX(b) KEEP(DENSE_RANK LAST ORDER BY b) OVER (PARTITION BY a) MAX_LAST FROM keep_t1;
 min_first | min_last | max_first | max_last
-----------+----------+-----------+----------
       100 |       22 |         2 |       22
       100 |       22 |         2 |       22
         1 |      111 |        11 |      111
         1 |      111 |        11 |      111
         1 |      111 |        11 |      111
(5 rows)
gaussdb=# DROP TABLE keep_t1;
```

7.6.20 Security Functions

gs_encrypt_aes128(encryptstr,keystr)

Description: Encrypts **encryptstr** strings using **keystr** as the encryption password and returns encrypted strings. The value of **keystr** ranges from 8 to 16 bytes and contains at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.

Return type: text

Length of the return value: At least 92 bytes and no more than (4*[*Len*/3]+68) bytes, where *Len* indicates the length of the data before encryption (unit: byte).

Example:

```
gaussdb=# SELECT gs_encrypt_aes128('MPPDB','Asdf1234');

                            gs_encrypt_aes128
--------------------------------------------------------------------------------
kbJdlK5LSlAzqNjVvuHUPCphlkuSeD5n2Hel0HiGaSbDQdCmsz1Ky5ZneOurUr56/jtE/U
+BmCw9BgTR2wjQD9440m8=
(1 row)
```

NOTE

An encryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in **gsql** by paging up and down.

gs_encrypt(encryptstr,keystr, encrypttype)

Description: Encrypts **encryptstr** strings using **keystr** as the encryption password and returns encrypted strings based on **encrypttype**.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
encryptstr	text	Data to be encrypted	-
keystr	text	Encryption password	The value ranges from 8 to 16 bytes and contains at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.
encrypttype	text	Encryption/ Decryption type (case-insensitive)	aes128, sm4, aes128_cbc_sha256, aes256_cbc_sha256, aes128_gcm_sha256, aes256_gcm_sha256, and sm4_ctr_sm3

Example:

```
gaussdb=#  SELECT gs_encrypt('MPPDB', 'Asdf1234', 'sm4');
       gs_encrypt
 ------------------------------
 ZBzOmaGA4Bb+coyucJ0B8AkIShqc
(1 row)
```

NOTE

An encryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in **gsql** by paging up and down.

aes128 and **sm4** are compatible with earlier versions. The **aes128** algorithm uses the AES-128-CBC mode and performs integrity check with SHA1. The **sm4** algorithm uses the SM4-CTR mode and does not perform integrity check.

gs_encrypt_bytea(encryptstr, keystr, encrypttype)

Description: Encrypts **encryptstr** strings using **keystr** as the encryption password and returns encrypted strings based on **encrypttype**.

Return type: bytea

Parameter	Type	Description	Value Range
encryptstr	text	Data to be encrypted	-
keystr	text	Encryption password	The value ranges from 8 to 16 bytes and contains at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
encrypttype	text	Encryption/Decryption type (case-insensitive)	aes128_cbc_sha256, aes256_cbc_sha256, aes128_gcm_sha256, aes256_gcm_sha256, and sm4_ctr_sm3

Example:

```
gaussdb=#  SELECT gs_encrypt_bytea('MPPDB', 'Asdf1234', 'sm4_ctr_sm3');
                                    gs_encrypt_bytea
 ------------------------------------------------------------------------------------------------------------------

\x90e286971c2c70410def0a2814af4ac44c737926458b66271d9d1547bc937395ca018d7755672fa9dc3cdc6ec4
a76001dc0e137f3bc5c8a5c51143561f1d09a848bfdebfec5e
(1 row)
```

NOTE

An encryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in **gsql** by paging up and down.

gs_decrypt_aes128(decryptstr,keystr)

Description: Decrypts **decrypt** strings using **keystr** as the decryption password and returns decrypted strings. The **keystr** used for decryption must be consistent with that used for encryption. **keystr** cannot be empty.

NOTE

This parameter needs to be used with the **gs_encrypt_aes128** encryption function.

Return type: text

Example:

```
gaussdb=# SELECT
gs_decrypt_aes128('kbJdlK5LSlAzqNjVvuHUPCphlkuSeD5n2Hel0HiGaSbDQdCmsz1Ky5ZneOurUr56/jtE/U
+BmCw9BgTR2wjQD9440m8=','Asdf1234');
 gs_decrypt_aes128
-------------------
 MPPDB
(1 row)
```

NOTE

A decryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in gsql by paging up and down.

gs_decrypt(decryptstr, keystr, decrypttype)

Description: Decrypts **decrypt** strings using **keystr** as the decryption password and returns decrypted strings based on **decrypttype**. The **decrypttype** and **keystr** used for decryption must be consistent with **encrypttype** and **keystr** used for encryption. **keystr** cannot be empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This function needs to be used with the **gs_encrypt** encryption function.

Return type: text

Parameter	Type	Description	Value Range
decryptstr	text	Data to be decrypted	-
keystr	text	Decryption password	The value ranges from 8 to 16 bytes and contains at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.
decrypttype	text	Encryption/ Decryption type (case-insensitive)	aes128, sm4, aes128_cbc_sha256, aes256_cbc_sha256, aes128_gcm_sha256, aes256_gcm_sha256, and sm4_ctr_sm3

Example:

```
gaussdb=# SELECT gs_decrypt('ZBzOmaGA4Bb+coyucJ0B8AkIShqc', 'Asdf1234', 'sm4');
 gs_decrypt
------------
 MPPDB
(1 row)
```

NOTE

A decryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in gsql by paging up and down.

aes128 and **sm4** are compatible with earlier versions. The **aes128** algorithm uses the AES-128-CBC mode and performs integrity check with SHA1. The **sm4** algorithm uses the SM4-CTR mode and does not perform integrity check.

gs_decrypt_bytea(decryptstr, keystr, decrypttype)

Description: Decrypts **decrypt** strings using **keystr** as the decryption password and returns decrypted strings based on **decrypttype**. The **decrypttype** and **keystr** used for decryption must be consistent with **encrypttype** and **keystr** used for encryption. **keystr** cannot be empty.

This function needs to be used with the **gs_encrypt_bytea** encryption function.

Return type: text

Parameter	Type	Description	Value Range
decryptstr	bytea	Data to be decrypted	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
keystr	text	Decryption password	The value ranges from 8 to 16 bytes and contains at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.
decrypttype	text	Encryption/Decryption type (case-insensitive)	aes128_cbc_sha256, aes256_cbc_sha256, aes128_gcm_sha256, aes256_gcm_sha256, and sm4_ctr_sm3

Example:

```
gaussdb=# SELECT
gs_decrypt_bytea('\x90e286971c2c70410def0a2814af4ac44c737926458b66271d9d1547bc937395ca018d775
5672fa9dc3cdc6ec4a76001dc0e137f3bc5c8a5c51143561f1d09a848bfdebfec5e', 'Asdf1234', 'sm4_ctr_sm3');
 gs_decrypt_bytea
------------------
 MPPDB
(1 row)
```

NOTE

A decryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in gsql by paging up and down.

aes_encrypt(str, key_str, init_vector)

Description: Encrypts the string **str** using the encryption password **key_str** and initialization vector **init_vector** based on the AES algorithm.

Parameters in the command above are as follows:

- **str**: character string to be encrypted. If **str** is null, the function will return null.
- **key_str**: encryption password. If **key_str** is null, the function will return null. For security purposes, you are advised to use a 128-bit, 192-bit, or 256-bit secure random number as the key character string if the key length is 128 bits, 192 bits, or 256 bits (determined by the value of **block_encryption_mode**).
- **init_vector**: An initialization variable is provided for the required block encryption mode. The length is greater than or equal to 16 bytes. Bytes greater than 16 bytes are automatically ignored. If neither **str** nor **key_str** is null, this parameter cannot be null. Otherwise, an error will be reported. For security purposes, you are advised to ensure that the IV for each encryption is unique in OFB mode and that the IV for each encryption is unpredictable in CBC or CFB mode.

Return type: text

Example:

```
gaussdb=# SELECT aes_encrypt('huwei123','123456vfhex4dyu,vdaladhjsadad','1234567890123456');
 aes_encrypt
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-------------
 u*8\x05c?0
(1 row)
```

NOTE

- This function takes effect only when GaussDB is compatible with the MY type (that is, **sql_compatibility = 'B'**). For other types, this function is not supported.
- An encryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in gsql by paging up and down.
- Do not call this function during operations related to stored procedures, preventing the risk of sensitive information disclosure. In addition, when using the stored procedure that contains the function, you are advised to filter the parameter information of the function before providing the information for external maintenance personnel to locate the fault. Delete the logs after using them.
- Do not call the function when **debug_print_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the function in the log files generated when **debug_print_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.
- The SQL_ASCII setting is different from other settings. If the character set of the server is SQL_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to SQL_ASCII, no code conversion occurs. When this function calls the third-party OpenSSL library, the returned data is non-ASCII data. Therefore, when the character set of the database server is set to SQL_ASCII, the encoding of the client must also be set to SQL_ASCII. Otherwise, an error is reported. The database does not convert or verify non-ASCII characters.

aes_decrypt(pass_str, key_str, init_vector)

Description: Decrypts the string **str** using the decryption password **key_str** and initialization vector **init_vector** based on the AES algorithm.

Parameters in the command above are as follows:

- **pass_str**: character string to be decrypted. If **pass_str** is null, the function will return null.
- **key_str**: decryption password. If **key_str** is null, the function will return null. For security purposes, you are advised to use a 128-bit, 192-bit, or 256-bit secure random number as the key character string if the key length is 128 bits, 192 bits, or 256 bits (determined by the value of **block_encryption_mode**).
- **init_vector**: An initialization variable is provided for the required block decryption mode. The length is greater than or equal to 16 bytes. Bytes greater than 16 bytes are automatically ignored. If neither **pass_str** nor **key_str** is null, this parameter cannot be null. Otherwise, an error will be reported. For security purposes, you are advised to ensure that the IV for each encryption is unique in OFB mode and that the IV for each encryption is unpredictable in CBC or CFB mode.

Return type: text

Example:

```
gaussdb=# SELECT
aes_decrypt(aes_encrypt('huwei123','123456vfhex4dyu,vdaladhjsadad','1234567890123456'),'123456vfhex4d
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
yu,vdaladhjsadad','1234567890123456');
 aes_decrypt
-------------
 huwei123
(1 row)
```

NOTE

- This function takes effect only when GaussDB is compatible with the MY type (that is, **sql_compatibility = 'B'**). For other types, this function is not supported.
- A decryption password is required during the execution of this function. For security purposes, the gsql tool does not record the SQL statements containing the function name in the execution history. That is, the execution history of this function cannot be found in gsql by paging up and down.
- Do not call this function during operations related to stored procedures, preventing the risk of sensitive information disclosure. In addition, when using the stored procedure that contains the function, you are advised to filter the parameter information of the function before providing the information for external maintenance personnel to locate the fault. Delete the logs after using them.
- Do not call the function when **debug_print_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the function in the log files generated when **debug_print_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.
- To ensure successful decryption, ensure that the values of **block_encryption_mode**, **key_str** and IV are the same as those during encryption.
- Due to encoding differences, encrypted data cannot be directly copied from the gsql client for decryption. In this scenario, the decryption result may not be the character string before encryption.
- The SQL_ASCII setting is different from other settings. If the character set of the server is SQL_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to SQL_ASCII, no code conversion occurs. When this function calls the third-party OpenSSL library, the returned data is non-ASCII data. Therefore, when the character set of the database server is set to SQL_ASCII, the encoding of the client must also be set to SQL_ASCII. Otherwise, an error is reported. The database does not convert or verify non-ASCII characters.

gs_digest(input_string, hash_algorithm)

Description: Hashes the input string using the specified hash algorithm and returns a hexadecimal number.

Parameters in the command above are as follows:

- **input_string**: character string to be hashed. The value cannot be null.
- **hash_algorithm**: specifies the hash algorithm. Currently, SHA-256, SHA-384, SHA-512, and SM3 are supported. Both uppercase and lowercase letters are supported. If an unsupported hash algorithm is used, an error is reported.

Return type: text

Example:

```
gaussdb=# SELECT pg_catalog.gs_digest('gaussdb', 'sha256');
                            gs_digest
------------------------------------------------------------------
 4dc50d746f4e04f9b446986b34a0050e358fbfb8bc1fba314c54b52a417b0b8e
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_password_deadline

Description: Indicates the number of remaining days before the password of the current user expires.

Return type: interval

Example:

```
gaussdb=# SELECT gs_password_deadline();
  gs_password_deadline
------------------------
 83 days 17:44:32.196094
(1 row)
```

gs_password_notifytime()

Description: Specifies the number of days prior to password expiration that a user will receive a reminder.

Return type: int32

login_audit_messages(BOOLEAN)

Description: Queries login information about a login user.

Return type: tuple

Example:

- Check the date, time, and IP address of the last successful login.

  ```
  gaussdb=> SELECT * FROM login_audit_messages(true);
   username | database |       logintime        |    mytype     | result | client_conninfo
  ----------+----------+------------------------+---------------+--------+-----------------
   omm      | testdb | 2020-06-29 21:56:40+08 | login_success | ok     | gsql@[local]
  (1 row)
  ```

- Check the number, date, and time of failed attempts since the previous successful login.

  ```
  gaussdb=>  SELECT * FROM login_audit_messages(false);
   username | database |       logintime        |    mytype    | result |  client_conninfo
  ----------+----------+------------------------+--------------+--------+-------------------
   omm      | testdb | 2020-06-29 21:57:55+08 | login_failed | failed | [unknown]@[local]
   omm      | testdb | 2020-06-29 21:57:53+08 | login_failed | failed | [unknown]@[local]
  (2 rows)
  ```

login_audit_messages_pid

Description: Queries login information about a login user. Different from **login_audit_messages**, this function queries login information based on **backendid**. Information about subsequent logins of the same user does not alter the query result of previous logins and cannot be found using this function.

Return type: tuple

NOTE

When the thread pool is enabled, the **backendid** obtained in the same session may change due to thread switchover. As a result, the return values are different when the function is called for multiple times. You are advised not to call this function when the thread pool is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

- Check the date, time, and IP address of the last successful login.

```
gaussdb=> SELECT * FROM login_audit_messages_pid(true);
 username | database |       logintime        |     mytype     | result | client_conninfo |     backendid
----------+----------+------------------------+----------------+--------+-----------------+-----------------
 omm      | testdb | 2020-06-29 21:56:40+08 | login_success | ok     | gsql@[local]    | 139823109633792
(1 row)
```

- Check the number, date, and time of failed attempts since the previous successful login.

```
gaussdb=> SELECT * FROM login_audit_messages_pid(false);
 username | database |       logintime        |     mytype    | result |  client_conninfo  |     backendid
----------+----------+------------------------+---------------+--------+-------------------+-----------------
 omm      | testdb | 2020-06-29 21:57:55+08 | login_failed | failed | [unknown]@[local] |
139823109633792
 omm      | testdb | 2020-06-29 21:57:53+08 | login_failed | failed | [unknown]@[local] |
139823109633792
(2 rows)
```

inet_server_addr

Description: Displays the server IP address.

Return type: inet

Example:

```
gaussdb=# SELECT inet_server_addr();
 inet_server_addr
------------------
 10.10.0.13
(1 row)
```

NOTE

- The client IP address 10.10.0.50 and server IP address 10.10.0.13 are used as an example.
- If a local connection is used, the value is empty.

inet_client_addr

Description: Displays the client IP address.

Return type: inet

Example:

```
gaussdb=# SELECT inet_client_addr();
 inet_client_addr
------------------
 10.10.0.50
(1 row)
```

NOTE

- The client IP address 10.10.0.50 and server IP address 10.10.0.13 are used as an example.
- If a local connection is used, the value is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_query_audit(starttime, endtime, audit_log)

Description: Views audit logs of the primary database node. In the multi-tenancy scenario, global audit logs are returned if this function is called in a non-PDB, and audit logs related to a PDB are returned if this function is called in the PDB.

Parameters: **timestamptz starttime** and **timestamptz endtime[,audit_log]**

Return type: record

The following table describes return columns.

Name	Type	Description
time	timestamp with time zone	Operation time
type	text	Operation
result	text	Operation result
userid	oid	User ID
username	text	Name of the user who performs the operation
database	text	Database name
client_conninfo	text	Client connection information
object_name	text	Object name
detail_info	text	Operation details
node_name	text	Node name
thread_id	text	Thread ID
local_port	text	Local port
remote_port	text	Remote port

Example:

```
gaussdb=# SELECT * FROM gs_query_audit('2025-01-14 00:00:00','2025-01-14 00:01:00');
          time          |      type      | result | userid | username  | database |   client_conninfo   | object_name
|                        detail_info                         | node_name |            thread_i

```

gs_delete_audit(starttime, endtime)

Description: Deletes audit logs in a specified period. In the multi-tenancy scenario, global audit logs in a specified period can be deleted when this function is called in a non-PDB, and audit logs related to a PDB in a specified period can be deleted when this function is called in the PDB.

Parameters: **timestamptz starttime** and **timestamptz endtime**

Return type: void

Example:

```
gaussdb=# SELECT * FROM gs_delete_audit('2025-01-14 00:00:00','2025-01-14 00:01:00');
 gs_delete_audit
-----------------

(1 row)
```

pg_delete_audit(starttime, endtime)

Description: Deletes audit logs in a specified period. In the multi-tenancy scenario, global audit logs in a specified period can be deleted when this function is called in a non-PDB, and audit logs related to a PDB in a specified period can be deleted when this function is called in the PDB.

Parameters: **timestamptz starttime** and **timestamptz endtime**

Return type: void

Example:

```
gaussdb=# SELECT * FROM pg_delete_audit('2025-01-14 00:00:00','2025-01-14 00:01:00');
 pg_delete_audit
-----------------

(1 row)
```

alldigitsmasking

Description: Specifies the internal function of the masking policy, which is used to anonymize all characters.

Parameter: col text, letter character default '0'

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

creditcardmasking

Description: Specifies the internal function of the masking policy, which is used to anonymize all credit card information.

Parameter: col text, letter character default 'x'

Return type: text

randommasking

Description: Specifies the internal function of the masking policy. The random policy is used.

Parameter: col text

Return type: text

fullemailmasking

Description: Specifies the internal function of the masking policy, which is used to anonymize the text before the last period (.) except the at sign (@).

Parameter: col text, letter character default 'x'

Return type: text

basicemailmasking

Description: Specifies the internal function of the masking policy, which is used to anonymize the text before the first at sign (@).

Parameter: col text, letter character default 'x'

Return type: text

shufflemasking

Description: Specifies the internal function of the masking policy, which is used to sort characters out of order.

Parameter: col text

Return type: text

7.6.21 Ledger Database Functions

get_dn_hist_relhash(text, text)

Description: Returns the hash value of table-level data in a specified tamper-proof user table. This function is not supported in the centralized mode.

Parameter type: text

Return type: hash16

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ledger_hist_check(text, text)

Description: Verifies the consistency between the hash value of table-level data in a specified tamper-proof user table and that in the corresponding history table.

Parameter type: text

Return type: Boolean

Example:

```
-- Create a schema.
gaussdb=# CREATE SCHEMA ledgernsp WITH BLOCKCHAIN;
-- Create a table.
gaussdb=# CREATE TABLE ledgernsp.tab(a int, b text);
-- Insert data.
gaussdb=# INSERT INTO ledgernsp.tab values(generate_series(1, 10000), 'test');
gaussdb=# SELECT ledger_hist_check('ledgernsp','tab');
 ledger_hist_check
-------------------
 t
(1 row)
```

ledger_hist_repair(text, text)

Description: Restores the hash value of the history table corresponding to the specified tamper-proof user table to be the same as that of the user table, and returns the hash difference.

Parameter type: text

Return type: hash16

Example:

```
gaussdb=# SELECT ledger_hist_repair('ledgernsp','tab');
 ledger_hist_repair
--------------------
 0000000000000000
(1 row)
```

ledger_hist_archive(text, text)

Description: Archives the history table corresponding to a specified tamper-proof user table to the **hist_back** folder in the audit log directory. If the name of a user history table contains a slash (/), the slash (/) is replaced with an underscore (_) in the name of the file generated during archiving.

Parameter type: text

Return type: Boolean

Example:

```
gaussdb=# SELECT ledger_hist_archive('ledgernsp','tab');
 ledger_hist_archive
---------------------
 t
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ledger_gchain_check(text, text)

Description: Verifies the consistency between the history table hash corresponding to the specified tamper-proof user table and the relhash corresponding to the global history table.

Parameter type: text

Return type: Boolean

Example:

```
gaussdb=# SELECT ledger_gchain_check('ledgernsp','tab');
 ledger_gchain_check
---------------------
 t
(1 row)
```

ledger_gchain_repair(text, text)

Description: Restores relhash of a specified tamper-proof user table in the global history table so that the hash is the same as that in the history table, and returns the total hash value of the specified table.

Parameter type: text

Return type: hash16

Example:

```
gaussdb=# SELECT ledger_gchain_repair('ledgernsp','tab');
 ledger_gchain_repair
----------------------
 da30c1260af5be50
(1 row)
```

ledger_gchain_archive(void)

Description: Archives global history tables to the **hist_back** folder in the audit log directory.

Parameter type: void

Return type: Boolean

Example:

```
gaussdb=# SELECT ledger_gchain_archive();
 ledger_gchain_archive
-----------------------
 t
(1 row)
```

hash16in(cstring)

Description: Converts the input hexadecimal string into the internal hash16 format.

Parameter type: cstring

Return type: hash16

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hash16out(hash16)

Description: Converts internal hash16 data to hexadecimal cstring data.

Parameter type: hash16

Return type: cstring

hash32in(cstring)

Description: Converts the input hexadecimal string (32 characters) into the internal type hash32.

Parameter type: cstring

Return type: hash32

hash32out(hash32)

Description: Converts internal hash32 data to hexadecimal cstring data.

Parameter type: hash32

Return type: cstring

7.6.22 Encrypted Functions and Operators

byteawithoutorderwithequalcolin(cstring)

Description: Converts input data to the internal byteawithoutorderwithequalcol format.

Parameter type: cstring

Return type: byteawithoutorderwithequalcol

byteawithoutorderwithequalcolout(byteawithoutorderwithequalcol)

Description: Converts the internal byteawithoutorderwithequalcol type into the cstring type.

Parameter type: byteawithoutorderwithequalcol

Return type: cstring

byteawithoutorderwithequalcolsend(byteawithoutorderwithequalcol)

Description: Converts the byteawithoutorderwithequalcol type into the bytea type.

Parameter type: byteawithoutorderwithequalcol

Return type: bytea

byteawithoutorderwithequalcolrecv(internal)

Description: Converts the internal type into the byteawithoutorderwithequalcol type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: internal

Return type: byteawithoutorderwithequalcol

byteawithoutorderwithequalcoltypmodin(cstring[])

Description: Converts the cstring[] type into the byteawithoutorderwithequalcol type.

Parameter type: cstring[]

Return type: int4

byteawithoutorderwithequalcoltypmodout(int4)

Description: Converts the int4 type into the cstring type.

Parameter type: int4

Return type: cstring

byteawithoutordercolin(cstring)

Description: Converts the input data into the internal byteawithoutordercolin type.

Parameter type: cstring

Return type: byteawithoutordercol

byteawithoutordercolout(byteawithoutordercol)

Description: Converts the internal byteawithoutordercol type into the cstring type.

Parameter type: byteawithoutordercol

Return type: cstring

byteawithoutordercolsend(byteawithoutordercol)

Description: Converts the byteawithoutordercol type into the bytea type.

Parameter type: byteawithoutordercol

Return type: bytea

byteawithoutordercolrecv(internal)

Description: Converts the internal type into the byteawithoutordercol type.

Parameter type: internal

Return type: byteawithoutordercol

byteawithoutorderwithequalcolcmp(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Compares two byteawithoutorderwithequalcol parameters. If the first parameter is less than the second, the function will return **-1**. If the first parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

is greater, the function will return **1**. If the parameters are equal, the function will return **0**.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: int4

byteawithoutorderwithequalcolcmpbytear(byteawithoutorderwithequalcol, bytea)

Description: Compares a byteawithoutorderwithequalcol parameter with a bytea parameter. If the first parameter is less than the second, the function will return **-1**. If the first parameter is greater, the function will return **1**. If the parameters are equal, the function will return **0**.

Parameter type: byteawithoutorderwithequalcol, bytea

Return type: int4

byteawithoutorderwithequalcolcmpbyteal(bytea, byteawithoutorderwithequalcol)

Description: Compares a bytea parameter with a byteawithoutorderwithequalcol parameter. If the first parameter is less than the second, the function will return **-1**. If the first parameter is greater, the function will return **1**. If the parameters are equal, the function will return **0**.

Parameter type: bytea, byteawithoutorderwithequalcol

Return type: int4

byteawithoutorderwithequalcoleq(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether two byteawithoutorderwithequalcol parameters are the same. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

byteawithoutorderwithequalcoleqbyteal(bytea, byteawithoutorderwithequalcol)

Description: Checks whether a bytea parameter is the same as a byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: bytea, byteawithoutorderwithequalcol

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

byteawithoutorderwithequalcoleqbytear(byteawithoutorderwithequalcol, bytea)

Description: Checks whether a byteawithoutorderwithequalcol parameter is the same as a bytea parameter. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: byteawithoutorderwithequalcol, bytea

Return type: Boolean

byteawithoutorderwithequalcolne(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether two byteawithoutorderwithequalcol parameters are different. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

byteawithoutorderwithequalcolnebyteal(bytea, byteawithoutorderwithequalcol)

Description: Checks whether a bytea parameter is the same as a byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: bytea, byteawithoutorderwithequalcol

Return type: Boolean

byteawithoutorderwithequalcolnebytear(byteawithoutorderwithequalcol, bytea)

Description: Checks whether a byteawithoutorderwithequalcol parameter is the same as a bytea parameter. If so, the function will return **true**. If not, the function will return **false**.

Parameter type: byteawithoutorderwithequalcol, bytea

Return type: Boolean

hll_hash_byteawithoutorderwithequalcol(byteawithoutorderwithequalcol)

Description: Returns the hll hash value of byteawithoutorderwithequalcol.

Parameter type: byteawithoutorderwithequalcol

Return type: hll_hashval

tee_lt(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether a byteawithoutorderwithequalcol parameter is less than another byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**. This function is used for parsing

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the encrypted operator "<" only when the memory decryption emergency channel is enabled. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

tee_gt(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether a byteawithoutorderwithequalcol parameter is greater than another byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**. This function is used for parsing the encrypted operator ">" only when the memory decryption emergency channel is enabled. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

tee_le(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether a byteawithoutorderwithequalcol parameter is less than or equal to another byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**. This function is used for parsing the encrypted operator "<=" only when the memory decryption emergency channel is enabled. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

tee_ge(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether a byteawithoutorderwithequalcol parameter is greater than or equal to another byteawithoutorderwithequalcol parameter. If so, the function will return **true**. If not, the function will return **false**. This function is used for parsing the encrypted operator ">=" only when the memory decryption emergency channel is enabled. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

tee_like(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether byteawithoutorderwithequalcol parameters can be fuzzily matched. If so, the function will return **true**. If not, the function will return **false**. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tee_nlike(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Checks whether byteawithoutorderwithequalcol parameters cannot be fuzzily matched. If so, the function will return **true**. If not, the function will return **false**. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: Boolean

tee_calculation(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: General function for mathematical operations between byteawithoutorderwithequalcol types. This function cannot be directly used.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

tee_sortsupport(internal)

Description: Function used to support sorting, which is internally called during sorting and cannot be called by users.

Parameter type: internal

Return type: void

teegtsel(internal, oid, internal, integer)

Description: Selectivity of ciphertext greater than and greater than or equal to. The default value **0.3333333333333333** is returned. This function cannot be called by common users.

Parameter type: internal, oid, internal, integer

Return type: double precision

teeltsel(internal, oid, internal, integer)

Description: Selectivity of ciphertext less than and less than or equal to. The default value **0.3333333333333333** is returned. This function cannot be called by common users.

Parameter type: internal, oid, internal, integer

Return type: double precision

teelikesel(internal, oid, internal, integer)

Description: Selectivity of ciphertext fuzzy match. The default value **0.005** is returned. This function cannot be called by common users.

Parameter type: internal, oid, internal, integer

Return type: double precision

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

teenlikesel(internal, oid, internal, integer)

Description: Selectivity of ciphertext non-fuzzy-match. The default value **0.005** is returned. This function cannot be called by common users.

Parameter type: internal, oid, internal, integer

Return type: double precision

sum(byteawithoutorderwithequalcol)

Description: Aggregates the ciphertext sum. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

avg(byteawithoutorderwithequalcol)

Description: Aggregates the ciphertext average value. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

min(byteawithoutorderwithequalcol)

Description: Aggregates the ciphertext minimum value. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

max(byteawithoutorderwithequalcol)

Description: Aggregates the ciphertext maximum value. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

stddev_samp(byteawithoutorderwithequalcol)

Description: Aggregates the standard deviation of ciphertext samples. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

stddev_pop(byteawithoutorderwithequalcol)

Description: Aggregates the total standard deviation of ciphertext. It is not supported in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

var_samp(byteawithoutorderwithequalcol)

Description: Aggregates the variance of ciphertext samples. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

var_pop(byteawithoutorderwithequalcol)

Description: Aggregates the total variance of ciphertext. It is not supported in the current version.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

tee_trans(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Aggregates the internal processing function for ciphertext. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

tee_collect(byteawithoutorderwithequalcol, byteawithoutorderwithequalcol)

Description: Aggregates the internal processing function for ciphertext. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

tee_final(byteawithoutorderwithequalcol)

Description: Aggregates the internal processing function for ciphertext. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol

Return type: byteawithoutorderwithequalcol

security_tee_process()

Description: Manages the computational state in a secret trusted domain. It is not supported in the current version.

Parameter type: int

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ce_encrypt_deterministic(text, oid)

Description: Encrypts the plaintext of the text type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: text, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

For details, see "Migrate plaintext and ciphertext columns to each other." in "Memory Decryption Emergency Channel > Using gsql to Operate the Memory Decryption Emergency Channel" in *Feature Guide*.

ce_encrypt_deterministic(int1, oid)

Description: Encrypts the plaintext of the int1 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: int1, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(int2, oid)

Description: Encrypts the plaintext of the int2 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: int2, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(int4, oid)

Description: Encrypts the plaintext of the int4 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: int4, oid

Note: This is used only when the memory decryption emergency channel is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(int8, oid)

Description: Encrypts the plaintext of the int8 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: int8, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(float4, oid)

Description: Encrypts the plaintext of the float4 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: float4, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(float8, oid)

Description: Encrypts the plaintext of the float8 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: float8, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(numeric, oid)

Description: Encrypts the plaintext of the numeric type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: numeric, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ce_encrypt_deterministic(clob, oid)

Description: Encrypts the plaintext of the CLOB type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: clob, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(varchar, oid)

Description: Encrypts the plaintext of the varchar type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: varchar, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(nvarchar2, oid)

Description: Encrypts the plaintext of the nvarchar2 type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: nvarchar2, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_encrypt_deterministic(bpchar, oid)

Description: Encrypts the plaintext of the bpchar type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: bpchar, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ce_encrypt_deterministic(bytea, oid)

Description: Encrypts the plaintext of the bytea type to the encrypted equivalent structure. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: bytea, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: byteawithoutorderwithequalcol

ce_decrypt_deterministic(byteawithoutorderwithequalcol, oid)

Description: Decrypts the ciphertext of the encrypted equivalent structure to the plaintext data of the text type. The key OID is the value of **column_key_distributed_id** in the gs_column_keys system catalog. If the input parameter is null, the function will return null.

Parameter type: byteawithoutorderwithequalcol, oid

Note: This is used only when the memory decryption emergency channel is enabled.

Return type: text

For details, see "Migrate plaintext and ciphertext columns to each other." in "Memory Decryption Emergency Channel > Using gsql to Operate the Memory Decryption Emergency Channel" in *Feature Guide*.

NOTE

The following functions starting with ce_encrypt/ce_decrypt exist in the pg_catalog namespace.

ce_encrypt_text(text, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: text, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_varchar(varchar, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: varchar, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ce_encrypt_nvarchar2(nvarchar2, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: nvarchar2, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_bpchar(bpchar, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: bpchar, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_int1(int1, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: int1, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_int2(int2, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: int2, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_int4(int4, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: int4, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_int8(int8, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: int8, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_float4(float4, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: float4, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_float8(float8, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: float8, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_numeric(numeric, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: numeric, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_bytea(bytea, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: bytea, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_encrypt_clob(clob, int4, boolean, int4, internal)

Description: Encryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: clob, int4, Boolean, int4, internal

Return type: byteawithoutorderwithequalcol

ce_decrypt_text(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: text

ce_decrypt_varchar(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: varchar

ce_decrypt_nvarchar2(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: nvarchar2

ce_decrypt_bpchar(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: bpchar

ce_decrypt_int1(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: int1

ce_decrypt_int2(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: int2

ce_decrypt_int4(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: int4

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ce_decrypt_int8(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: int8

ce_decrypt_float4(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: float4

ce_decrypt_float8(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: float8

ce_decrypt_numeric(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: numeric

ce_decrypt_bytea(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: bytea

ce_decrypt_clob(byteawithoutorderwithequalcol, int4, boolean, int4, internal)

Description: Decryption function for fully-encrypted type conversion. This function cannot be called by common users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: byteawithoutorderwithequalcol, int4, Boolean, int4, internal

Return type: CLOB

Example

Encrypted equality functions such as byteawithoutorderwithequalcolin and byteawithoutorderwithequalcolout are read/write format conversion functions such as in, out, send, and recv specified by the data type byteawithoutorderwithequalcol in the database kernel. For details, see the byteain and byteaout functions of the bytea type. However, the local CEK is verified, and the function can be successfully executed only when the encrypted column contains a cekoid that exists on the localhost.

```
-- For example, if the int_type encrypted table exists, int_col2 is the encrypted column.

-- Use a non-encrypted client to connect to the database and query the ciphertext of the encrypted column.
gaussdb=# SELECT int_col2 FROM int_type;
                                                
```

7.6.23 Set Returning Functions

7.6.23.1 Series Generating Functions

generate_series(start, stop)

Description: Generates a series of values, from **start** to **stop** with a step size of one.

Parameter type: int, bigint, numeric

Return type: setof int, setof bigint, setof numeric (same as the parameter type)

generate_series(start, stop, step)

Description: Generates a series of values, from **start** to **stop** with a step size of **step**.

Parameter type: int, bigint, numeric

Return type: setof int, setof bigint, setof numeric (same as the parameter type)

generate_series(start, stop, step interval)

Description: Generates a series of values, from **start** to **stop** with a step size of **step**.

Parameter type: timestamp or timestamp with time zone

Return type: setof timestamp or setof timestamp with time zone (same as parameter type)

When **step** is positive, zero rows are returned if **start** is greater than **stop**. Conversely, when **step** is negative, zero rows are returned if **start** is less than **stop**. Zero rows are also returned for **NULL** inputs. It is an error for **step** to be zero.

Example:

```
gaussdb=# SELECT * FROM generate_series(2,4);
 generate_series
-----------------
               2
               3
               4
(3 rows)

gaussdb=# SELECT * FROM generate_series(5,1,-2);
 generate_series
-----------------
               5
               3
               1
(3 rows)

gaussdb=# SELECT * FROM generate_series(4,3);
 generate_series
-----------------
(0 rows)

-- This example applies to the date-plus-integer operator.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT current_date + s.a AS dates FROM generate_series(0,14,7) AS s(a);
   dates
------------
 2017-06-02
 2017-06-09
 2017-06-16
(3 rows)

gaussdb=# SELECT * FROM generate_series('2008-03-01 00:00'::timestamp, '2008-03-04 12:00', '10 hours');
   generate_series
---------------------
 2008-03-01 00:00:00
 2008-03-01 10:00:00
 2008-03-01 20:00:00
 2008-03-02 06:00:00
 2008-03-02 16:00:00
 2008-03-03 02:00:00
 2008-03-03 12:00:00
 2008-03-03 22:00:00
 2008-03-04 08:00:00
(9 rows)
```

gs_search_function_with_name(funcname)

Description: Obtains the OID of the funcname function.

Parameter type: cstring

Return type: SETOF oid

```
-- Basic usage
CREATE OR REPLACE FUNCTION proc_plpgsql(a int,b int, c int)
RETURNS int AS $BODY$
DECLARE
BEGIN
RETURN $1 + $2;
END;
$BODY$ language plpgsql;
CREATE OR REPLACE FUNCTION proc_plpgsql(int,int)
RETURNS int AS $BODY$
DECLARE
BEGIN
RETURN $1 + $2;
END;
$BODY$ language plpgsql;
gaussdb=# SELECT gs_search_function_with_name('proc_plpgsql');
 gs_search_function_with_name
------------------------------
                        16776
                        24576
(2 rows)
```

7.6.23.2 Index Generating Functions

generate_subscripts(array anyarray, dim int)

Description: Generates a series comprising the given array's indexes.

Return type: setof int

generate_subscripts(array anyarray, dim int, reverse boolean)

Description: Generates a series comprising the given array's indexes. When **reverse** is true, the series is returned in reverse order.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: setof int

generate_subscripts is a function that generates the set of valid indexes for the specified dimension of the given array. Zero rows are returned for arrays that do not have the requested dimension, or for NULL arrays (but valid indexes are returned for NULL array elements). Example:

```
-- Basic usage
gaussdb=# SELECT generate_subscripts('{NULL,1,NULL,2}'::int[], 1) AS s;
 s
---
 1
 2
 3
 4
(4 rows)
-- Unnest a 2D array.
gaussdb=# CREATE OR REPLACE FUNCTION unnest2(anyarray)
RETURNS SETOF anyelement AS $$
SELECT $1[i][j]
   FROM generate_subscripts($1,1) g1(i),
        generate_subscripts($1,2) g2(j);
$$ LANGUAGE sql IMMUTABLE;

gaussdb=# SELECT * FROM unnest2(ARRAY[[1,2],[3,4]]);
 unnest2
---------
       1
       2
       3
       4
(4 rows)

-- Delete the function.
gaussdb=# DROP FUNCTION unnest2;
```

7.6.24 Conditional Expression Functions

coalesce(expr1, expr2, ..., exprn)

Description:

Returns the first non-NULL value in the parameter list.

COALESCE(expr1, expr2) is equivalent to **CASE WHEN expr1 IS NOT NULL THEN expr1 ELSE expr2 END**.

Example:

```
gaussdb=# SELECT coalesce(NULL,'hello');
 coalesce
----------
 hello
(1 row)
```

Note:

- **NULL** is returned only if all parameters are **NULL**.
- It is often used to replace **NULL** with the default value.
- Like a **CASE** expression, **COALESCE** only evaluates the parameters that are needed to determine the result. That is, parameters to the right of the first non-NULL parameter are not evaluated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

decode(base_expr, compare1, value1, Compare2,value2, ... default)

Description: Compares **base_expr** with each **compare(n)** and **returns value(n)** if they are matched. If no matching result is found, the default value is returned.

Example:

```
gaussdb=# SELECT decode('A','A',1,'B',2,0);
 case
------
 1
(1 row)
```

Note:

- Operations on XML data are not supported.

nullif(expr1, expr2)

Description: Returns **NULL** only when **expr1** is equal to **expr2**. Otherwise, **expr1** is returned.

nullif(expr1, expr2) is equivalent to **CASE WHEN expr1 = expr2 THEN NULL ELSE expr1 END**.

NOTE

The nullif(expr1, expr2) function is a mapping function. Therefore, the corresponding function definition cannot be found in the pg_proc system catalog.

Example:

```
gaussdb=# SELECT nullif('hello','world');
 nullif
--------
 hello
(1 row)
```

Note:

- Operations on XML data are not supported.
- Assume the two parameter data types are different:
  - If applicable, the lower-priority data type will be implicitly converted into the higher-priority one. Upon successful conversion, the calculation will begin. If unsuccessful, an error will be reported. Below is an example:

    ```
    gaussdb=# SELECT nullif('1234'::VARCHAR,123::INT4);
     nullif
    --------
       1234
    (1 row)
    gaussdb=# SELECT nullif('1234'::VARCHAR,'2012-12-24'::DATE);
    ERROR:  invalid input syntax for type timestamp: "1234"
    ```

  - If implicit conversion is not applicable between two data types, an error will be reported. Below is an example:

    ```
    gaussdb=# SELECT nullif(1::bit, '1'::MONEY);
    ERROR:  operator does not exist: bit = money
    LINE 1: SELECT nullif(1::bit, '1'::MONEY);
                  ^
    HINT:  No operator matches the given name and argument type(s). You might need to add explicit type casts.
    CONTEXT:  referenced column: nullif
    ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

nvl(expr1, expr2)

Description:

- Returns the value of **expr2** if **expr1** is null.
- Returns the value of **expr1** if it is not null.

Example:

```
gaussdb=# SELECT nvl('hello','world');
  nvl
-------
 hello
(1 row)
```

Note: **expr1** and **expr2** can be of any data type. If they have different data types, the function will check whether **expr2** can be implicitly converted into **expr1**. If so, the function will return the data type of **expr1**. If not, the function will report an error.

nvl2(expr1, expr2, expr3)

Description:

- Returns the value of **expr3** if **expr1** is null.
- Returns the value of **expr2** if **expr1** is not null.

NOTE

This function takes effect when **a_format_version** is **10c** and **a_format_dev_version** is **s1**.

Example:

```
gaussdb=# SELECT nvl2('hello','world','other');
  case
-------
 world
(1 row)
```

Note: The **expr2** and **expr3** parameters can be of any type. If the last two parameters of NVL2 have different types, the function will check whether **expr3** can be implicitly converted into **expr2**. If not, an error will be reported. If the first parameter is of the numeric type, the function converts this parameter and other parameters to the numeric type, and then compares them. If the parameters cannot be converted, an error message is displayed. If the first parameter is of another type, the function converts other parameters to the type of the first parameter for comparison. If the parameters cannot be converted, an error message is displayed.

greatest(expr1 [, ...])

Description: Selects the largest value from a list of any number of expressions.

Return type:

Example:

```
gaussdb=# SELECT greatest(1*2,2-3,4-1);
 greatest
----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
      3
(1 row)
gaussdb=# SELECT greatest('HARRY', 'HARRIOT', 'HAROLD');
 greatest
----------
 HARRY
(1 row)
```

Note:

Operations on XML data are not supported.

NOTE

When **a_format_version** is **10c** and **a_format_dev_version** is **s1**, this function operates as follows:

- If any parameter is **NULL**, the function will return **NULL**.
- If the first parameter is of the numeric type, the function converts this parameter and other parameters to the numeric type, and then compares them. If the parameters cannot be converted, an error message is displayed. If the first parameter is of another type, the function converts other parameters to the type of the first parameter for comparison. If the parameters cannot be converted, an error message is displayed.

least(expr1 [, ...])

Description: Selects the smallest value from a list of any number of expressions.

Example:

```
gaussdb=# SELECT least(1*2,2-3,4-1);
 least
-------
    -1
(1 row)
gaussdb=# SELECT least('HARRY','HARRIOT','HAROLD');
 least
--------
 HAROLD
(1 row)
```

Note:

Operations on XML data are not supported.

NOTE

When **a_format_version** is **10c** and **a_format_dev_version** is **s1**, this function operates as follows:

- If any parameter is **NULL**, the function will return **NULL**.
- If the first parameter is of the numeric type, the function converts this parameter and other parameters to the numeric type, and then compares them. If the parameters cannot be converted, an error message is displayed. If the first parameter is of another type, the function converts other parameters to the type of the first parameter for comparison. If the parameters cannot be converted, an error message is displayed.

EMPTY_BLOB()

Description: Initiates a BLOB variable in an INSERT or an UPDATE statement to a null value.

Return type: BLOB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE blob_tb(b blob,id int);
-- Insert data.
gaussdb=# INSERT INTO blob_tb VALUES (empty_blob(),1);
-- Delete the table.
gaussdb=# DROP TABLE blob_tb;
```

Note: The length is 0 obtained using DBE_LOB.GET_LENGTH.

EMPTY_CLOB()

Description: Initiates a CLOB variable in an INSERT or UPDATE statement to a null value.

NOTE

This function takes effect when **a_format_version** is **10c** and **a_format_dev_version** is **s1**.

Return type: CLOB

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE clob_tb(c clob,id int);
-- Insert data.
gaussdb=# INSERT INTO clob_tb VALUES (empty_clob(),1);
-- Delete the table.
gaussdb=# DROP TABLE clob_tb;
```

Note: The length is 0 obtained using DBE_LOB.GET_LENGTH.

lnnvl(condition)

Description: Checks the condition in the WHERE clause of a query statement. If the condition is true, **false** is returned. If the condition is unknown or false, **true** is returned.

condition: The value must be a logical expression but cannot be used in composite conditions with keywords such as AND, OR, and BETWEEN.

Return type: Boolean

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE student_demo (name VARCHAR2(20), grade  NUMBER(10,2));
CREATE TABLE

-- Insert data.
gaussdb=# INSERT INTO student_demo VALUES ('name0',0);
INSERT 0 1
gaussdb=# INSERT INTO student_demo VALUES ('name1',1);
INSERT 0 1
gaussdb=# INSERT INTO student_demo VALUES ('name2',2);
INSERT 0 1

-- Call lnnvl.
gaussdb=# SELECT * FROM student_demo WHERE LNNVL(name = 'name1');
 name  | grade
-------+-------
 name0 |  0.00
 name2 |  2.00
(2 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the table.
gaussdb=# drop table student_demo;
DROP TABLE
```

NOTE

This function takes effect when **a_format_version** is **10c** and **a_format_dev_version** is **s2**.

isnull(expr)

Description: Checks whether **expr** is **NULL**. If so, the function will return **true**. If not, the function will return **false**. The isnull function is compatible in full mode.

Parameter: Any type of input is supported.

Return type: Boolean

Example:

```
gaussdb=# SELECT isnull(null);
 isnull
--------
 t
(1 row)

gaussdb=# SELECT isnull(1);
 isnull
--------
 f
(1 row)
```

if(expr1, expr2, expr3)

Description: Checks the value of **expr1**. If **expr1** is **true**, **expr2** is returned. Otherwise, **expr3** is returned.

if(expr1, expr2, expr3) is logically equivalent to CASE WHEN expr1 THEN expr2 ELSE expr3 END.

Parameters: See **Table 7-81**.

Table 7-81 Parameter types

Parameter	Valid Input Parameter Type	Description
expr1	BOOLEAN	Determines the return value of the if() function.
expr2	Any type	If **expr1** is **true**, **expr2** is returned.
expr3	Any type	If **expr1** is **false**, **expr3** is returned.

Return value type: related to the input parameter type. For details about the output rules, see the description.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- if(expr1, expr2, expr3) is supported only in B-compatible mode.
- If both **b_format_version** and **b_format_dev_version** are **''**, the return type of the if(expr1, expr2, expr3) function is consistent with that of CASE WHEN expr1 THEN expr2 ELSE expr3 END. If **b_format_version** is **'5.7'** and **b_format_dev_version** is **'s1'**, the return type is determined in the following descending order:
  - If both input parameters are of the same type, the return type will match the input parameter type.
  - If either input parameter is of the SET type, the return type will be TEXT.
  - If either input parameter is of the BLOB type, the return type will be BLOB.
  - If either input parameter is of the TEXT type, the return type will be TEXT.
  - If either input parameter is of the STRING type, the return type will be TEXT.
  - If both input parameters are of the time type, the return type will be TIMESTAMPTZ. If one input parameter is of the time type and the other is not, the return type will be TEXT.
  - If both input parameters are signed integers and one input parameter is of the BIGINT type, the return value is of the BIGINT type; otherwise, the return value is of the INT type.
  - If both input parameters are unsigned integers and one input parameter is of the UNSIGNED BIGINT type, the return value is of the UNSIGNED BIGINT type; otherwise, the return value is of the UNSIGNED INT type.
  - If the two input parameters are of the floating point type and integer type respectively, the return value is of the floating point type.
  - Except the preceding NUMERIC type combinations, the return value for other NUMERIC type combinations is of the NUMERIC type.
  - If implicit conversion is not applicable between the input parameter type and the return type, an error will be reported.
- If the input parameter **expr1** is null, the returned result is the same as when **expr1** is **FALSE**.
- The if(expr1, expr2, expr3) function is a mapping function. Therefore, the corresponding function definition cannot be found in the pg_proc system catalog.

Example:

```
-- expr1 is an expression.
gaussdb=# SELECT if(2>3, 'true', 'false');
 case
-------
 false
(1 row)

-- If the input parameter expr1 is NULL, the result is the same as that when expr1 is false, and the value of expr2 is returned.
gaussdb=# SELECT if(null, 'not null', 'is null');
  case
---------
 is null
(1 row)
```

ifnull(expr1, expr2)

Description: Returns the value of **expr2** if **expr1** is **NULL**; otherwise, returns the value of **expr1**.

ifnull(expr1, expr2) is logically equivalent to nvl(expr1, expr2).

Parameter: any type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return value type: related to the input parameter type. For details about the output rules, see the description.

NOTE

- ifnull(expr1, expr2) is supported only in B-compatible mode.
- If both **b_format_version** and **b_format_dev_version** are **''**, the return type of the ifnull(expr1, expr2) function is consistent with that of nvl(expr1, expr2). If **b_format_version** is **'5.7'** and **b_format_dev_version** is **'s1'**, the return type is determined in the following descending order:
  - If both input parameters are of the same type, the return type will match the input parameter type.
  - If either input parameter is of the SET type, the return type will be TEXT.
  - If either input parameter is of the BLOB type, the return type will be BLOB.
  - If either input parameter is of the TEXT type, the return type will be TEXT.
  - If either input parameter is of the STRING type, the return type will be TEXT.
  - If both input parameters are of the time type, the return type will be TIMESTAMPTZ. If one input parameter is of the time type and the other is not, the return type will be TEXT.
  - If both input parameters are NUMERIC, the higher-precision type will take precedence. For example, if one input parameter is TINYINT and the other is INT, the return type will be INT.
  - If implicit conversion is not applicable between the input parameter type and the return type, an error will be reported.
- If both input parameters are null, the function will return null. Otherwise, it will return the first non-null value.
- The ifnull(expr1, expr2) function is a mapping function. Therefore, the corresponding function definition cannot be found in the pg_proc system catalog.

Example:

```
-- If the input parameter is an empty string, the output is an empty string instead of NULL.
gaussdb=# SELECT ifnull('', null) is null as a;
 a
---
 f
(1 row)

-- If both input parameters are NULL, the output is NULL.
gaussdb=# SELECT ifnull(null, null) is null as a;
 a
---
 t
(1 row)

-- If the input parameters are NULL and a character string, the output is the first non-null value.
gaussdb=# SELECT ifnull(null, 'A') as a;
 a
---
 A
(1 row)
```

7.6.25 System Information Functions

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.6.25.1 Session Information Functions

SYS_CONTEXT()

Description: Returns the value of the parameter associated with the context namespace at the current time. This function has the same function as **USERENV()** when the first input parameter is **userenv**.

Currently, the following parameters can be used as the second input parameter.

'current_edition_name', 'current_schema', 'current_sql', 'current_user', 'current_userid', 'database_role', 'ip_address', 'is_apply_server', 'isdba', 'nls_currency', 'nls_date_format', 'nls_date_language', 'server_host', 'service_name', 'session_user', 'session_userid', 'db_name', 'db_unique_name', 'instance', 'instance_name', 'current_edition_id', 'current_schemaid', 'lang', 'language', and 'sid'

Return type: text

Example:

```
SELECT SYS_CONTEXT('userenv','NLS_CURRENCY');
 sys_context
-------------
 $
(1 row)

SELECT SYS_CONTEXT('userenv','NLS_DATE_FORMAT');
  sys_context
---------------
 ISO, MDY
(1 row)

SELECT SYS_CONTEXT('userenv','NLS_DATE_LANGUAGE');
 sys_context
-------------
 en_US.UTF-8
(1 row)
```

USERENV()

Description: Returns the value of the parameter associated with the context namespace at the current time. This function has the same function as **SYS_CONTEXT()** when the first input parameter is **userenv**.

Currently, the following input parameters are supported:

'current_edition_name', 'current_schema', 'current_sql', 'current_user', 'current_userid', 'database_role', 'ip_address', 'is_apply_server', 'isdba', 'nls_currency', 'nls_date_format', 'nls_date_language', 'server_host', 'service_name', 'session_user', 'session_userid', 'db_name', 'db_unique_name', 'instance', 'instance_name', 'current_edition_id', 'current_schemaid', 'lang', 'language', and 'sid'

Currently, the following input parameters are not supported:

'action', 'is_application_root', 'is_application_pdb', 'audited_cursorid', 'authenticated_identity', 'authentication_data', 'authentication_method', 'cdb_domain', 'cdb_name', 'client_identifier', 'con_id', 'con_name', 'current_sql_length', 'db_domain', 'db_supplemental_log_level', 'dblink_info',

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

'drain_status', 'entryid', 'enterprise_identity', 'fg_job_id', 'global_uid', 'identification_type', 'is_dg_rolling_upgrade', 'ldap_server_type', 'module', 'network_protocol', 'nls_calendar', 'nls_sort', 'nls_territory', 'oracle_home', 'os_user', 'platform_slash', 'policy_invoker', 'proxy_enterprise_identity', 'proxy_user', 'proxy_userid', 'scheduler_job', 'session_edition_id', 'session_edition_name', 'sessionid', 'statementid', 'terminal', 'unified_audit_sessionid', 'session_default_collation', 'client_info', 'bg_job_id', 'client_program_name', 'current_bind', 'global_context_memory', 'host', and 'current_sqln'

Return type: text

Example:

```
SELECT USERENV('sid');
 userenv
---------
 955
(1 row)

SELECT USERENV('instance');
 userenv
---------
 14524
(1 row)

SELECT USERENV('action');
 userenv
---------

(1 row)

SELECT USERENV('actijj');
ERROR:  unrecognized configuration parameter "actijj"
CONTEXT:  PL/pgSQL function userenv(text) line 114 at RETURN
referenced column: userenv
```

NOTE

If the input parameter is not supported, NULL is returned. If the input parameter is invalid, an error is reported.

current_catalog

Description: Name of the current database (called "catalog" in the SQL standard)

Return type: name

Example:

```
testdb=# SELECT current_catalog;
 current_database
------------------
 testdb
(1 row)
```

current_database()

Description: Name of the current database

Return type: name

Example:

```
testdb=# SELECT current_database();
 current_database
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------------
 testdb
(1 row)
```

current_query()

Description: Text of the currently executing query committed by the client (which might contain more than one statement)

Return type: text

Example:

```
gaussdb=# SELECT current_query();
      current_query
-------------------------
 SELECT current_query();
(1 row)
```

current_schema[()]

Description: Name of the current schema

Return type: name

Example:

```
gaussdb=# SELECT current_schema();
 current_schema
----------------
 public
(1 row)
```

Note: **current_schema** returns the first valid schema name in the search path. (If the search path is empty or contains no valid schema name, **NULL** is returned.) This is the schema that will be used for any tables or other named objects that are created without specifying a target schema.

current_schemas(Boolean)

Description: Name of a schema in the search path

Return type: name[]

Example:

```
gaussdb=# SELECT current_schemas(true);
   current_schemas
---------------------
 {pg_catalog,public}
(1 row)
```

Note:

current_schemas(Boolean) returns an array of the names of all schemas in the search path. The Boolean option specifies whether implicitly included system schemas such as pg_catalog are included in the returned search path.

NOTE

The search path can be altered at the run time. The command is as follows:

```
SET search_path TO schema [, schema, ...]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

database()

Description: Returns the name of the current schema.

Parameter: none

Return type: name

Example:

```
gaussdb=# SELECT database();
 database
----------
 public
(1 row)
```

NOTE

This function takes effect only when **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**.

current_user

Description: Username of current execution context

Return type: name

Example:

```
gaussdb=# SELECT current_user;
 current_user
--------------
 omm
(1 row)
```

Note: **current_user** is the user identifier used for permission check. Normally it is equal to the session user, but it can be changed by using **SET ROLE**. It also changes during the execution of functions with the **SECURITY DEFINER** attribute.

definer_current_user

Description: Username of current execution context

Return type: name

Example:

```
gaussdb=# SELECT definer_current_user();
 definer_current_user
----------------------
 omm
(1 row)
```

pg_current_sessionid()

Description: Session ID in the current execution environment.

Return type: text

Example:

```
gaussdb=# SELECT pg_current_sessionid();
   pg_current_sessionid
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------------------------
 1579228402.140190434944768
(1 row)
```

Note: **pg_current_sessionid()** is used to obtain the session ID in the current execution environment. The structure of the value is *Timestamp.Session ID*. When **enable_thread_pool** is set to **on**, the actual session ID is used. When **enable_thread_pool** is set to **off**, the session ID is the thread ID.

pg_current_sessid

Description: Session ID in the current execution environment.

Return type: text

Example:

```
gaussdb=# select pg_current_sessid();
pg_current_sessid
-------------------
140308875015936
(1 row)
```

Note: In thread pool mode, the session ID of the current session is obtained. In non-thread pool mode, the backend thread ID of the current session is obtained.

pg_current_userid

Description: Current user ID

Return type: text

```
gaussdb=# SELECT pg_current_userid();
pg_current_userid
-------------------
10
(1 row)
```

working_version_num()

Description: version number. It returns a version number related to system compatibility.

Return type: int

Example:

```
gaussdb=# SELECT working_version_num();
 working_version_num
---------------------
               92231
(1 row)
```

tablespace_oid_name(oid)

Description: Queries the tablespace name based on the tablespace OID.

Return type: text

Example:

```
gaussdb=# SELECT tablespace_oid_name(1663);
 tablespace_oid_name
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
---------------------
 pg_default
(1 row)
```

inet_client_addr()

Description: Remote connection address. **inet_client_addr** returns the IP address of the current client.

NOTE

It is available only in remote connection mode.

Return type: inet

Example:

```
gaussdb=# SELECT inet_client_addr();
 inet_client_addr
------------------
 10.10.0.50
(1 row)
```

inet_client_port()

Description: Remote connection port. **inet_client_port** returns the port number of the current client.

NOTE

This function is valid only in remote connection mode.

Return type: int

Example:

```
gaussdb=# SELECT inet_client_port();
 inet_client_port
------------------
            33143
(1 row)
```

inet_server_addr()

Description: Local connection address. **inet_server_addr** returns the IP address on which the server accepts the current connection.

NOTE

It is available only in remote connection mode.

Return type: inet

Example:

```
gaussdb=# SELECT inet_server_addr();
 inet_server_addr
------------------
 10.10.0.13
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

inet_server_port()

Description: Local connection port. **inet_server_port** returns the number of the port receiving the current connection. All these functions return **NULL** if the current connection is via a UDS.

NOTE

This function is valid only in remote connection mode.

Return type: int

Example:

```
gaussdb=# SELECT inet_server_port();
 inet_server_port
------------------
             8000
(1 row)
```

pg_backend_pid()

Description: Thread ID of the worker thread connected to the current session.

Return type: int

Example:

```
gaussdb=# SELECT pg_backend_pid();
 pg_backend_pid
-----------------
 140229352617744
(1 row)
```

pg_conf_load_time()

Description: Configures load time. **pg_conf_load_time** returns the timestamp when the server configuration files were last loaded.

Return type: timestamp with time zone

Example:

```
gaussdb=# SELECT pg_conf_load_time();
      pg_conf_load_time
-------------------------------
 2017-09-01 16:05:23.89868+08
(1 row)
```

pg_my_temp_schema()

Description: OID of the temporary schema of a session. The value is **0** if the OID does not exist.

Return type: oid

Example:

```
gaussdb=# SELECT pg_my_temp_schema();
 pg_my_temp_schema
-------------------
                 0
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: **pg_my_temp_schema** returns the OID of the current session's temporary schema, or **0** if it has no temporary schemas (because no temporary tables are created). **pg_is_other_temp_schema** returns **true** if the given OID is the OID of another session's temporary schema.

pg_is_other_temp_schema(oid)

Description: Specifies whether the schema is the temporary schema of another session.

Return type: Boolean

Example:

```
gaussdb=# SELECT pg_is_other_temp_schema(25356);
 pg_is_other_temp_schema
-------------------------
 f
(1 row)
```

pg_listening_channels()

Description: Name of the channel that the session is currently listening to.

Return type: setof text

Example:

```
gaussdb=# SELECT pg_listening_channels();
 pg_listening_channels
-----------------------
(0 rows)
```

Note: **pg_listening_channels** returns a set of names of channels that the current session is currently listening to.

pg_postmaster_start_time()

Description: Server start time. **pg_postmaster_start_time** returns the timestamp with time zone when the server is started.

Return type: timestamp with time zone

Example:

```
gaussdb=# SELECT pg_postmaster_start_time();
   pg_postmaster_start_time
-------------------------------
 2017-08-30 16:02:54.99854+08
(1 row)
```

pg_get_ruledef(rule_oid)

Description: Obtains the **CREATE RULE** command for a rule.

Return type: text

Example:

```
gaussdb=# SELECT * FROM pg_get_ruledef(24828);
                            pg_get_ruledef
-----------------------------------------------------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 CREATE RULE t1_ins AS ON INSERT TO t1 DO INSTEAD INSERT INTO t2 (id) VALUES (new.id);
(1 row)
```

sessionid2pid()

Description: Obtains PID information from a session ID (for example, the **sessid** column in **gs_session_stat**).

Return type: int8

Example:

```
gaussdb=# SELECT sessionid2pid(sessid::cstring) FROM gs_session_stat LIMIT 2;
  sessionid2pid
-----------------
 139973107902208
 139973107902208
(2 rows)
```

session_context('namespace' , 'parameter')

Description: Obtains and returns the parameter values of a specified namespace.

Return type: VARCHAR

Example:

```
gaussdb=# SELECT session_context('USERENV', 'CURRENT_SCHEMA');
session_context
------------------
  public
(1 row)
```

Note: Currently, the **current_user**, **current_schema**, **client_info**, **ip_address**, **sessionid**, and **sid** parameters are supported.

pg_trigger_depth()

Description: Nesting level of triggers.

Return type: int

Example:

```
gaussdb=# SELECT pg_trigger_depth();
 pg_trigger_depth
------------------
                0
(1 row)
```

session_user

Description: Session username.

Return type: name

Example:

```
gaussdb=# SELECT session_user;
 session_user
--------------
 omm
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: **session_user** usually specifies the initial user connected to the current database, but system administrators can change this setting by using **SET SESSION AUTHORIZATION**.

user

Description: Equivalent to current_user.

Return type: name

Example:

```
gaussdb=# SELECT user;
 current_user
--------------
 omm
(1 row)
```

getpgusername()

Description: Obtains the database username.

Return type: name

Example:

```
gaussdb=# SELECT getpgusername();
 getpgusername
---------------
 GaussDB_userna
(1 row)
```

getdatabaseencoding()

Description: Obtains the database encoding mode.

Return type: name

Example:

```
gaussdb=# SELECT getdatabaseencoding();
 getdatabaseencoding
---------------------
 SQL_ASCII
(1 row)
```

version()

Description: version information. **version** returns a string describing a server's version.

Return type: text

Example:

```
gaussdb=# SELECT version();
version
------------------------------------------------------------------------------------------------------------------------------------------------
-------------------------------
gaussdb (GaussDB Kernel XXX.X.XXX build fab4f5ea) compiled at 2021-10-24 11:58:22 commit 3086 last mr
6592 release
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

opengauss_version()

Description: openGauss version information.

Return type: text

The following is an example. Replace *x.x.x* in the query result with the actual value.

```
gaussdb=# SELECT opengauss_version();
 opengauss_version
-------------------
 x.x.x
(1 row)
```

gs_deployment()

Description: Information about the deployment mode of the current system.

Return type: text

Example:

```
gaussdb=# SELECT gs_deployment();
    gs_deployment
----------------------
 BusinessCentralized
(1 row)
```

get_hostname()

Description: Returns the host name of the current node.

Return type: text

Example:

```
gaussdb=# SELECT get_hostname();
 get_hostname
--------------
 linux-user
(1 row)
```

get_nodename()

Description: Returns the name of the current node.

Return type: text

Example:

```
gaussdb=# SELECT get_nodename();
 get_nodename
--------------
 datanode1
(1 row)
```

get_nodeinfo(text)

Description: Returns the value of the corresponding node information based on the search attribute. Currently, the search attributes include **node_name** and **node_type**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: text

Example:

```
gaussdb=# SELECT get_nodeinfo('node_type');
 get_nodeinfo
--------------
 CEN_DN
(1 row)
gaussdb=# SELECT get_nodeinfo('node_name');
 get_nodeinfo
--------------
 datanode1
(1 row)
```

get_schema_oid(cstring)

Description: Returns the OID of the queried schema.

Return type: OID

Example:

```
gaussdb=# SELECT get_schema_oid('public');
 get_schema_oid
----------------
           2200
(1 row)
```

get_client_info()

Description: Returns client information. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

pv_session_memory_detail()

Description: Collects session memory usage by the MemoryContext node. In the multi-tenancy scenario, the global statistics are returned if this function is called in a non-PDB, and only the statistics about a local PDB are returned if this function is called in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-82 Return value description

Name	Type	Description
sessid	text	• When the thread pool is disabled (**enable_thread_pool = off**), this column indicates the thread start time+session ID (string: **timestamp.sessionid**). • When the thread pool is enabled (**enable_thread_pool = on**): If the memory context is at the thread level, this column indicates the thread start time+thread ID (string: **timestamp.threadid**). If the memory context is at the session level, the column indicates the thread start time+session ID (string: **timestamp.sessionid**).
threadid	bigint	Thread ID bound to a session.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

7.6.25.2 Access Permission Query Functions

The DDL permissions, including ALTER, DROP, COMMENT, INDEX, and VACUUM, are inherent permissions implicitly owned by the owner.

The following access permission query function only queries whether a user has a certain permission on an object. That is, the permission on the object recorded in the **acl** column of the system catalog is returned.

has_any_column_privilege(user, table, privilege)

Description: Queries whether a specified user has access permissions on any column of a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-83 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
table	text, oid
privilege	text

Return type: Boolean

has_any_column_privilege(table, privilege)

Description: Queries whether the current user has access permissions on any column of a table. For details about the valid parameter types, see **Table 7-83**.

Return type: Boolean

Note: **has_any_column_privilege** checks whether a user can access any column of a table in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**, except that the desired access permission type must be some combination of SELECT, INSERT, UPDATE, COMMENT or REFERENCES.

NOTE

Note that having any of these permissions at the table level indicates that the permission is implicitly granted for each column of the table. Therefore, **has_any_column_privilege** always returns **true** if **has_table_privilege** has the same parameters. A success message is also returned if a column-level permission is granted for at least one column.

has_column_privilege(user, table, column, privilege)

Description: Queries whether a specified user has access permissions on a column.

Table 7-84 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
table	text, oid
column	text, smallint
privilege	text

Return type: Boolean

has_column_privilege(table, column, privilege)

Description: Queries whether the current user has access permissions on a column. For details about the valid parameter types, see **Table 7-84**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

has_column_privilege checks whether a user can access a column in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. Columns can be added either by name or by attribute number. The desired access permission type must be some combination of **SELECT**, **INSERT**, **UPDATE**, **COMMENT** or **REFERENCES**.

NOTE

Note that having any of these permissions at the table level indicates that the permission is implicitly granted for each column of the table.

has_cek_privilege(user, cek, privilege)

Description: Queries whether a specified user has access permissions on a CEK. The following table describes the parameters.

Table 7-85 Parameter type description

Parameter	Valid Input Parameter Type	Description	Value Range
user	name, oid	Users	Username or ID
cek	text, oid	CEK	Name or ID of a CEK
privilege	text	Permission	• **USAGE**: allows users to use the specified CEK. • **DROP**: allows users to delete the specified CEK.

Return type: Boolean

has_cmk_privilege(user, cmk, privilege)

Description: Queries whether a specified user has access permissions on a CMK. The following table describes the parameters.

Table 7-86 Parameter type description

Parameter	Valid Input Parameter Type	Description	Value Range
user	name, oid	Users	Username or ID
cmk	text, oid	CMK	Name or ID of the CMK

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Valid Input Parameter Type	Description	Value Range
privilege	text	Permission	• **USAGE**: allows users to use the specified CMK. • **DROP**: allows users to delete the specified CMK.

Return type: Boolean

has_database_privilege(user, database, privilege)

Description: Queries whether a specified user has access permissions on a database. The following table describes the parameters. PDB information cannot be queried in a non-PDB. This function cannot be used in a PDB.

Table 7-87 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
database	text, oid
privilege	text

Return type: Boolean

has_database_privilege(database, privilege)

Description: Queries whether the current user has access permissions on a database. For details about the valid parameter types, see **Table 7-87**. PDB information cannot be queried in a non-PDB. This function cannot be used in a PDB.

Return type: Boolean

Note: **has_database_privilege** checks whether a user can access a database in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The desired access permission type must be some combination of **CREATE**, **CONNECT**, **TEMPORARY**, **ALTER**, **DROP**, **COMMENT** or **TEMP** (which is equivalent to **TEMPORARY**).

has_directory_privilege(user, directory, privilege)

Description: Queries whether a specified user has access permissions on a directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-88 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
directory	text, oid
privilege	text

Return type: Boolean

has_directory_privilege(directory, privilege)

Description: Queries whether the current user has access permissions on a directory. For details about the valid parameter types, see **Table 7-88**.

Return type: Boolean

has_foreign_data_wrapper_privilege(user, fdw, privilege)

Description: Queries whether a specified user has access permissions on a foreign data wrapper.

Table 7-89 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
fdw	text, oid
privilege	text

Return type: Boolean

has_foreign_data_wrapper_privilege(fdw, privilege)

Description: Queries whether the current user has access permissions on a foreign data wrapper. For details about the valid parameter types, see **Table 7-89**.

Return type: Boolean

Note: **has_foreign_data_wrapper_privilege** checks whether a user can access a foreign data wrapper in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The desired access permission type must evaluate to USAGE.

has_function_privilege(user, function, privilege)

Description: Queries whether a specified user has access permissions on a function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-90 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
function	text, oid
privilege	text

Return type: Boolean

has_function_privilege(function, privilege)

Description: Queries whether the current user has access permissions on a function. For details about the valid parameter types, see **Table 7-90**.

Return type: Boolean

Note: **has_function_privilege** checks whether a user can access a function in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. When a function is specified by a text string rather than by an OID, the allowed input is the same as that for the regprocedure data type (see **Object Identifier Types**). The access permission type must be **EXECUTE**, **ALTER**, **DROP**, or **COMMENT**.

has_language_privilege(user, language, privilege)

Description: Queries whether a specified user has access permissions on languages.

Table 7-91 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
language	text, oid
privilege	text

Return type: Boolean

has_language_privilege(language, privilege)

Description: Queries whether the current user has access permissions on a language. For details about the valid parameter types, see **Table 7-91**.

Return type: Boolean

Note: **has_language_privilege** checks whether a user can access a procedural language in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The desired access permission type must evaluate to USAGE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

has_nodegroup_privilege(user, nodegroup, privilege)

Description: Queries whether a user has access permissions on a database node.

Return type: Boolean

Table 7-92 Parameter type description

Parameter	Valid Input Parameter Type
user	name, oid
nodegroup	text, oid
privilege	text

has_nodegroup_privilege(nodegroup, privilege)

Description: Queries whether a user has access permissions on a database node. Its parameter possibilities are analogous to those of **has_table_privilege**. The access permission type must be **USAGE**, **CREATE**, **COMPUTE**, **ALTER**, or **DROP**.

Return type: Boolean

has_schema_privilege(user, schema, privilege)

Description: Queries whether a specified user has access permissions on a schema.

Return type: Boolean

has_schema_privilege(schema, privilege)

Description: Queries whether the current user has access permissions on a schema.

Return type: Boolean

Note: **has_schema_privilege** checks whether a user can access a schema in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The desired access permission type must be **CREATE**, **USAGE**, **ALTER**, **DROP**, or **COMMENT**. If the check type contains the CREATE permission and the checked schema is a schema with the same name as the user, the function returns **TRUE** only when the user has the OWNER permission for the schema due to the special constraint of the schema with the same name.

has_server_privilege(user, server, privilege)

Description: Queries whether a specified user has access permissions on a foreign server.

Return type: Boolean

has_server_privilege(server, privilege)

Description: Queries whether the current user has access permissions on a foreign server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

Note: **has_server_privilege** checks whether a user can access a foreign server in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The access permission type must be USAGE, ALTER, DROP, or COMMENT.

has_table_privilege(user, table, privilege)

Description: Queries whether a specified user has access permissions on a table.

Return type: Boolean

has_table_privilege(table, privilege)

Description: Queries whether the current user has access permissions on a table.

Return type: Boolean

Note: **has_table_privilege** checks whether a user can access a table in a particular way. The user can be specified by name or by OID (**pg_authid.oid**), or be set to **public** which indicates the PUBLIC role. If this parameter is omitted, **current_user** is used. The table can be specified by name or by OID. When it is specified by name, the name can be schema-qualified if necessary. The desired access permission type is specified by a text string, which must be one of the values **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **TRUNCATE**, **REFERENCES**, **TRIGGER**, **ALTER**, **DROP**, **COMMENT**, **INDEX** or **VACUUM**. Optionally, **WITH GRANT OPTION** can be added to a permission type to test whether the permission is held with the grant option. Also, multiple permission types can be separated by commas (,), in which case the result will be **true** if any of the listed permissions is held.

Example:

```
gaussdb=# SELECT has_table_privilege('tpcds.web_site', 'select');
 has_table_privilege
---------------------
 t
(1 row)

gaussdb=# SELECT has_table_privilege('omm', 'tpcds.web_site', 'select,INSERT WITH GRANT OPTION ');
 has_table_privilege
---------------------
 t
(1 row)
```

has_tablespace_privilege(user, tablespace, privilege)

Description: Queries whether a specified user has access permissions on a tablespace.

Return type: Boolean

has_tablespace_privilege(tablespace, privilege)

Description: Queries whether the current user has access permissions on a tablespace.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: **has_tablespace_privilege** checks whether a user can access a tablespace in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**. The access permission type must be CREATE, ALTER, DROP, or COMMENT.

pg_has_role(user, role, privilege)

Description: Queries whether a specified user has access permissions on a role.

Return type: Boolean

pg_has_role(role, privilege)

Description: Queries whether the current user has access permissions on a role.

Return type: Boolean

Note: **pg_has_role** checks whether a user can access a role in a particular way. Its parameter possibilities are analogous to those of **has_table_privilege**, except that **public** cannot be used as a username. The desired access permission type must be some combination of MEMBER or USAGE. MEMBER denotes direct or indirect membership in the role (that is, permission SET ROLE), while USAGE denotes the usage permission on the role that is available without the SET ROLE permission.

has_any_privilege(user, privilege)

Description: Queries whether a specified user has certain ANY permission. If multiple permissions are queried at the same time, **true** is returned as long as one permission is obtained.

Return type: Boolean

Table 7-93 Parameter type description

Parameter	Valid Input Parameter Type	Description	Value Range
user	name	Users	Existing username

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Valid Input Parameter Type	Description	Value Range
privilege	text	ANY permission	Available values: • CREATE ANY TABLE [WITH ADMIN OPTION] • ALTER ANY TABLE [WITH ADMIN OPTION] • DROP ANY TABLE [WITH ADMIN OPTION] • SELECT ANY TABLE [WITH ADMIN OPTION] • INSERT ANY TABLE [WITH ADMIN OPTION] • UPDATE ANY TABLE [WITH ADMIN OPTION] • DELETE ANY TABLE [WITH ADMIN OPTION] • CREATE ANY SEQUENCE [WITH ADMIN OPTION] • CREATE ANY INDEX [WITH ADMIN OPTION] • CREATE ANY FUNCTION [WITH ADMIN OPTION] • EXECUTE ANY FUNCTION [WITH ADMIN OPTION] • CREATE ANY PACKAGE [WITH ADMIN OPTION] • EXECUTE ANY PACKAGE [WITH ADMIN OPTION] • CREATE ANY TYPE [WITH ADMIN OPTION]

7.6.25.3 Schema Visibility Query Functions

Each function performs the visibility check on one type of database objects. For functions and operators, an object in the search path is visible if there is no object of the same name and parameter data type earlier in the path. For operator classes, both name and associated index access methods are considered.

All these functions require OIDs to identify the objects to be checked. If you want to test an object by name, it is convenient to use the OID alias type (regclass, regtype, regprocedure, regoperator, regconfig, or regdictionary).

For example, a table is said to be visible if the schema where the table is located is in the search path and no table of the same name appears earlier in the search

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

path. This is equivalent to the statement that the table can be referenced by name without explicit schema qualification. To list the names of all visible tables, run the following command:

```
gaussdb=# SELECT relname FROM pg_class WHERE pg_table_is_visible(oid);
```

pg_collation_is_visible(collation_oid)

Description: Specifies whether the collation is visible in the search path.

Return type: Boolean

pg_conversion_is_visible(conversion_oid)

Description: Specifies whether the conversion is visible in the search path.

Return type: Boolean

pg_function_is_visible(function_oid)

Description: Specifies whether the function is visible in the search path.

Return type: Boolean

pg_opclass_is_visible(opclass_oid)

Description: Specifies whether the operator class is visible in the search path.

Return type: Boolean

pg_operator_is_visible(operator_oid)

Description: Specifies whether the operator is visible in the search path.

Return type: Boolean

pg_opfamily_is_visible(opclass_oid)

Description: Specifies whether the operator family is visible in the search path.

Return type: Boolean

pg_table_is_visible(table_oid)

Description: Specifies whether the table is visible in the search path.

Return type: Boolean

pg_ts_config_is_visible(config_oid)

Description: Specifies whether the text search configuration is visible in the search path.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_ts_dict_is_visible(dict_oid)

Description: Specifies whether the text search dictionary is visible in the search path.

Return type: Boolean

pg_ts_parser_is_visible(parser_oid)

Description: Specifies whether the text search parser is visible in the search path.

Return type: Boolean

pg_ts_template_is_visible(template_oid)

Description: Specifies whether the text search template is visible in the search path.

Return type: Boolean

pg_type_is_visible(type_oid)

Description: Specifies whether the type (or domain) is visible in the search path.

Return type: Boolean

7.6.25.4 System Catalog Information Functions

format_type(type_oid, typemod)

Description: Obtains the SQL name of a data type.

Return type: text

Note: **format_type** returns the SQL name of a data type based on the OID of the data type and possible modifiers. If the specific modifier is unknown, pass **NULL** at the position of the modifier. Modifiers are generally meaningful only for data types with length restrictions. The SQL name returned by **format_type** contains the length of the data type, which can be calculated by taking sizeof(int32) from actual storage length [actual storage len – sizeof(int32)] in the unit of bytes. 32-bit space is required to store the customized length set by users. Therefore, the actual storage length contains 4 bytes more than the customized length. In the following example, the SQL name returned by **format_type** is character varying(6), indicating the length of the varchar type is 6 bytes. Therefore, the actual storage length of the varchar type is 10 bytes.

```
gaussdb=# SELECT format_type((SELECT oid FROM pg_type WHERE typname='varchar'), 10);
    format_type
----------------------
 character varying(6)
(1 row)
```

getdistributekey(table_name)

Description: Gets a distribution key for a hash table. Distribution is not supported in a standalone system and the return value of this function is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_check_authid(role_oid)

Description: Checks whether a role name with given OID exists.

Return type: Boolean

Example:

```
gaussdb=# SELECT pg_check_authid(1);
pg_check_authid
-----------------
f
(1 row)
```

pg_describe_object(catalog_id, object_id, object_sub_id)

Description: Obtains the description of a database object.

Return type: text

Note: **pg_describe_object** returns the description of a database object specified by a catalog OID, an object OID, and a (possibly zero) sub-object ID. This is useful to determine the identity of an object stored in the pg_depend system catalog.

pg_get_constraintdef(constraint_oid)

Description: Obtains the definition of a constraint.

Return type: text

pg_get_constraintdef(constraint_oid, pretty_bool)

Description: Obtains the definition of a constraint.

Return type: text

Note: **pg_get_constraintdef** and **pg_get_indexdef** respectively reconstruct the creation command for a constraint and an index.

pg_get_expr(pg_node_tree, relation_oid)

Description: Decompiles the internal form of an expression, assuming that any Vars in it refer to the relationship indicated by the second parameter.

Return type: text

pg_get_expr(pg_node_tree, relation_oid, pretty_bool)

Description: Decompiles the internal form of an expression, assuming that any Vars in it refer to the relationship indicated by the second parameter.

Return type: text

Note: **pg_get_expr** decompiles the internal form of an individual expression, such as the default value of a column. This helps to check the content of system catalogs. If the expression might contain keywords, specify the OID of the relationship they refer to as the second parameter; if no keywords are expected, zero is sufficient.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_get_functiondef(func_oid)

Description: Obtains the definition of a function.

Return type: text

Example:

```
gaussdb=# SELECT * FROM pg_get_functiondef(598);
 headerlines |                  definition
-------------+-----------------------------------------------------
           4 | CREATE OR REPLACE FUNCTION pg_catalog.abbrev(inet)+
             |  RETURNS text                                     +
             |  LANGUAGE internal                                +
             |  IMMUTABLE STRICT NOT FENCED NOT SHIPPABLE        +
             | AS $function$inet_abbrev$function$                +
             |
(1 row)
```

pg_get_function_arguments(func_oid)

Description: Obtains argument list of function's definition (with default values).

Return type: text

Note: **pg_get_function_arguments** returns the parameter list of a function, in the form it would need to appear in CREATE FUNCTION.

pg_get_function_identity_arguments(func_oid)

Description: Obtains the parameter list to identify a function (without default values).

Return type: text

Note: **pg_get_function_identity_arguments** returns the parameter list necessary to identify a function, in the form it would need to appear in within ALTER FUNCTION. This form omits default values.

pg_get_function_result(func_oid)

Description: Obtains the RETURNS clause for a function.

Return type: text

Note: **pg_get_function_result** returns the appropriate RETURNS clause for the function.

pg_get_indexdef(index_oid)

Description: Obtains the **CREATE INDEX** command for an index.

Return type: text

Example:

```
gaussdb=# SELECT * FROM pg_get_indexdef(16416);
                          pg_get_indexdef
-------------------------------------------------------------------------
 CREATE INDEX test3_b_idx ON test3 USING btree (b) TABLESPACE pg_default
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_get_indexdef(index_oid, dump_schema_only)

Description: Obtains the **CREATE INDEX** command for indexes in dump scenarios. For an interval partitioned table that contains a local index, if **dump_schema_only** is set to **true**, the returned index creation statement does not contain the local index information of the automatically created partition. If **dump_schema_only** is set to **false**, the returned index creation statement contains the local index information of the automatically created partition. For a non-interval partitioned table or an interval partitioned table that does not contain a local index, the value of **dump_schema_only** does not affect the returned result of the function.

Return type: text

Example:

```
gaussdb=# CREATE TABLE sales
(prod_id NUMBER(6),
cust_id NUMBER,
time_id DATE,
channel_id CHAR(1),
promo_id NUMBER(6),
quantity_sold NUMBER(3),
amount_sold NUMBER(10,2))
PARTITION BY RANGE( time_id) INTERVAL('1 day')
(partition p1 VALUES LESS THAN ('2019-02-01 00:00:00'),
partition p2 VALUES LESS THAN ('2019-02-02 00:00:00')
);
CREATE TABLE
gaussdb=# CREATE INDEX index_sales ON sales(prod_id) local (PARTITION idx_p1 ,PARTITION idx_p2);
CREATE INDEX
gaussdb=# -- If the data to be inserted does not match any partition, create a partition and insert the data
into the new partition.
gaussdb=# INSERT INTO sales VALUES(1, 12, '2019-02-05 00:00:00', 'a', 1, 1, 1);
INSERT 0 1
gaussdb=# SELECT oid FROM pg_class WHERE relname = 'index_sales';
  oid
-------
 24632
(1 row)
gaussdb=# SELECT * FROM pg_get_indexdef(24632, true);
                                          pg_get_indexdef
-----------------------------------------------------------------------------------------------------------------------
 CREATE INDEX index_sales ON sales USING btree (prod_id) LOCAL(PARTITION idx_p1, PARTITION idx_p2)
TABLESPACE pg_default
(1 row)
gaussdb=# SELECT * FROM pg_get_indexdef(24632, false);
                                                    pg_get_indexdef

-----------------------------------------------------------------------------------------------------------------------
------
--------------------
 CREATE INDEX index_sales ON sales USING btree (prod_id) LOCAL(PARTITION idx_p1, PARTITION idx_p2,
PARTITION sys_p1_prod_id_idx)  TA
BLESPACE pg_default
(1 row
```

pg_get_indexdef(index_oid, column_no, pretty_bool)

Description: Obtains the **CREATE INDEX** command for an index, or definition of just one index column when the value of **column_no** is not zero.

Example:

```
gaussdb=# SELECT * FROM pg_get_indexdef(16416, 0, false);
                          pg_get_indexdef
-------------------------------------------------------------------------
 CREATE INDEX test3_b_idx ON test3 USING btree (b) TABLESPACE pg_default
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)
gaussdb=# select * from pg_get_indexdef(16416, 1, false);
 pg_get_indexdef
-----------------
 b
(1 row)
```

Return type: text

Note: **pg_get_functiondef** returns a complete CREATE OR REPLACE FUNCTION statement for a function.

pg_get_keywords()

Description: Obtains the list of SQL keywords and their categories. The function returns the records of SQL keywords identified by the server. The columns are as follows:

- The **word** column contains the keywords.
- The **catcode** column contains a category code: **U** for unreserved, **C** for column name, **T** for type or function name, or **R** for reserved.
- The **catdesc** column contains a possibly-localized string describing the category.

Return type: SETOF record

Note: The keyword range and type vary depending on the compatibility mode, and the return result of the function also varies. The records returned by the function do not contain the options configured in the **disable_keyword_options** parameter.

pg_get_userbyid(role_oid)

Description: Obtains the role name with a given OID.

Return type: name

Note: **pg_get_userbyid** extracts a role's name given its OID.

pg_check_authid(role_id)

Description: Checks whether a user exists based on **role_id**.

Return type: text

Example:

```
gaussdb=# SELECT pg_check_authid(20);
pg_check_authid
-----------------
f
(1 row)
```

pg_get_viewdef(view_name)

Description: Obtains the underlying **SELECT** command for a view.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_get_viewdef(view_name, pretty_bool)

Description: Obtains the underlying **SELECT** command for a view. Lines with columns are wrapped to 80 columns if **pretty_bool** is set to **true**.

Return type: text

Note: **pg_get_viewdef** reconstructs the SELECT query that defines a view. Most of these functions come in two forms. When the function has the **pretty_bool** parameter and the value is **true**, it can optionally "pretty-print" the result. The pretty-printed format is more readable. The other one is the default format which is more likely to be interpreted in the same way by future versions. Avoid using pretty-printed output for dump purposes. Passing **false** to the pretty-print parameter generates the same result as a variant without this parameter.

pg_get_viewdef(view_oid)

Description: Obtains the underlying **SELECT** command for a view.

Return type: text

pg_get_viewdef(view_oid, pretty_bool)

Description: Obtains the underlying **SELECT** command for a view. Lines with columns are wrapped to 80 columns if **pretty_bool** is set to **true**.

Return type: text

pg_get_viewdef(view_oid, wrap_column_int)

Description: Obtains the underlying **SELECT** command for a view. Lines with columns are wrapped to the specified number of columns and printing is implicit.

Return type: text

pg_get_tabledef(table_oid)

Description: Obtains the definition of a table based on **table_oid**.

Example:

```
gaussdb=# SELECT * FROM pg_get_tabledef(16384);
                            pg_get_tabledef
-----------------------------------------------------------------------------------------------
 SET search_path = public;                                                                    +
 CREATE TABLE t1 (                                                                           +
     c1 bigint DEFAULT nextval('serial'::regclass)                                                 +
 )                                                                                        +
 WITH (orientation=row, compression=no, storage_type=USTORE, segment=off);                    +
 ALTER TABLE t1 ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 1 DAYS OF NO
MODIFICATION;
(1 row)
```

Return type: text

pg_get_tabledef(table_name)

Description: Obtains a table definition based on **table_name**.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM pg_get_tabledef('t1');
                            pg_get_tabledef
-----------------------------------------------------------------------------------------------------
 SET search_path = public;                                                                           +
 CREATE TABLE t1 (                                                                                   +
     c1 bigint DEFAULT nextval('serial'::regclass)                                                   +
 )                                                                                                   +
 WITH (orientation=row, compression=no, storage_type=USTORE, segment=off);                           +
 ALTER TABLE t1 ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 1 DAYS OF NO
MODIFICATION;
(1 row)
```

Return type: text

Note: pg_get_tabledef reconstructs the CREATE statement of the table definition, including the table definition, index information, comments, and ILM policy (if exists). You need to separately create the dependent objects of the table, such as groups, schemas, tablespaces, and servers. The table definition does not include the statements for creating these dependent objects. If the ILM policy is inherited from the parent object, pg_get_tabledef does not return the ILM policy creation statement of the data object.

pg_options_to_table(reloptions)

Description: Obtains the set of storage option name/value pairs.

Return type: SETOF record

Note: **pg_options_to_table** returns the set of storage option name/value pairs (**option_name**/**option_value**) when **pg_class.reloptions** or **pg_attribute.attoptions** is passed.

pg_tablespace_databases(tablespace_oid)

Description: Obtains the set of database OIDs that have objects in the specified tablespace.

Return type: setof oid

Note: **pg_tablespace_databases** allows a tablespace to be checked. It returns the set of OIDs of databases that have objects stored in the tablespace. If this function returns any rows of data, the tablespace is not empty and cannot be dropped. To display the specific objects in the tablespace, you need to connect to the databases identified by pg_tablespace_databases and query their pg_class system catalogs.

pg_tablespace_location(tablespace_oid)

Description: Obtains the path in the file system that this tablespace is located in. When this function is called in a non-PDB in the multi-tenancy scenario, the file path of the non-PDB tablespace is returned. When this function is called in a PDB in the multi-tenancy scenario, the file path of the PDB tablespace is returned.

Return type: text

pg_typeof(any)

Description: Obtains the data type of any value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: regtype

Note: **pg_typeof** returns the OID of the data type of the value that is passed to it. This can be helpful for troubleshooting or dynamically constructing SQL queries. It is declared that the return type of this function is regtype, which is an OID alias type (see **Object Identifier Types**). It is the same as an OID for comparison purposes but displays as a type name.

Example:

```
gaussdb=# SELECT pg_typeof(33);
 pg_typeof
-----------
 integer
(1 row)

gaussdb=# SELECT typlen FROM pg_type WHERE oid = pg_typeof(33);
 typlen
--------
      4
(1 row)
```

collation for (any)

Description: Obtains the collation of the parameter.

Return type: text

Note: The expression COLLATION FOR returns the collation of the value that is passed to it.

The value might be quoted and schema-qualified. If no collation is derived for the parameter expression, then a null value is returned. If the argument is not of a collatable data type, then an error is raised.

Example:

```
gaussdb=# SELECT collation for (description) FROM pg_description LIMIT 1;
 pg_collation_for
------------------
 "default"
(1 row)
```

pg_extension_update_paths(name)

Description: Returns the version update path of the specified extension.

Return type: text(source text), text(path text), text(target text)

pg_get_serial_sequence(tablename, colname)

Description: Obtains the sequence of the corresponding table name and column name.

Return type: text

Example:

```
gaussdb=# select * from pg_get_serial_sequence('t1', 'c1');
 pg_get_serial_sequence
------------------------
 public.serial
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_sequence_parameters(sequence_oid)

Description: Obtains the parameters of a specified sequence, including the start value, minimum value, maximum value, and incremental value.

Return type: int16, int16, int16, int16, Boolean

Example:

```
gaussdb=# select * from pg_sequence_parameters(16420);
 start_value | minimum_value |     maximum_value     | increment | cycle_option
-------------+---------------+-----------------------+-----------+--------------
         101 |             1 | 9223372036854775807 |         1 | f
(1 row)
```

7.6.25.5 Comment Information Functions

col_description(table_oid, column_number)

Description: Obtains the comment for a table column.

Return type: text

Note: **col_description** returns the comment for a table column, which is specified by the OID of its table and its column number.

obj_description(object_oid, catalog_name)

Description: Obtains the comment for a database object.

Return type: text

Note: The two-parameter form of **obj_description** returns the comment for a database object specified by its OID and the name of the system catalog to which it belongs. For example, **obj_description(123456,'pg_class')** would retrieve the comment for the table with OID 123456. The one-parameter form of **obj_description** requires only the OID.

obj_description cannot be used for table columns since columns do not have OIDs of their own.

obj_description(object_oid)

Description: Obtains the comment for a database object.

Return type: text

shobj_description(object_oid, catalog_name)

Description: Obtains the comment for a shared database object.

Return type: text

Note: **shobj_description** is used just like **obj_description**, except that the former is used for shared objects. Some system catalogs are global to all databases in the cluster, and the comments for objects in them are stored globally as well.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.6.25.6 XIDs and Snapshots

Internal XIDs are 64 bits. txid_snapshot, data type used by these functions, stores information about XID visibility at a particular moment in time. **Table 7-94** describes the components.

Table 7-94 Snapshot components

Name	Description
xmin	Earliest XID (**txid**) that is still active. All earlier transactions will either be committed and visible, or rolled back.
xmax	First as-yet-unassigned **txid**. All txids greater than or equal to this are not yet started as of the time of the snapshot, so they are invisible.
xip_list	Active **txids** at the time of the snapshot. The list includes only those active **txids** between **xmin** and **xmax**; there might be active **txids** higher than **xmax**. A **txid** that is greater than or equal to **xmin** and less than **xmax** and that is not in this list was already completed at the time of the snapshot, and is either visible or rolled back according to its commit status. The list does not include **txids** of subtransactions.

The textual representation of **txid_snapshot** is **xmin:xmax:xip_list**.

For example, **10:20:10,14,15** means **xmin=10, xmax=20, xip_list=10, 14, 15**.

The following functions provide server transaction information in an exportable form. These functions are mainly used to determine which transactions were committed between two snapshots.

pgxc_is_committed(transaction_id)

Description: Specifies whether the given XID (**gxid**) of an ordinary table is committed or ignored. **NULL** indicates an unknown state (such as running, preparing, or freezing).

Return type: Boolean

pgxc_is_committed(transaction_id, bucketid)

Description: The hash bucket table is not supported in the current version in centralized mode. An error is reported when the function is called.

txid_current()

Description: Obtains the current XID.

Return type: bigint

gs_txid_oldestxmin()

Description: Obtains the minimum XID (specified by **oldesxmin**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: bigint

txid_current_snapshot()

Description: Obtains the current snapshot.

Return type: txid_snapshot

txid_snapshot_xip(txid_snapshot)

Description: Obtains in-progress XIDs in a snapshot.

Return type: setof bigint

txid_snapshot_xmax(txid_snapshot)

Description: Obtains **xmax** of snapshots.

Return type: bigint

txid_snapshot_xmin(txid_snapshot)

Description: Obtains **xmin** of snapshots.

Return type: bigint

txid_visible_in_snapshot(bigint, txid_snapshot)

Description: Specifies whether the XID is visible in a snapshot (do not use subtransaction IDs).

Return type: Boolean

get_local_prepared_xact()

Description: Obtains the two-phase residual transaction information of the current node, including the XID, GID of the two-phase transaction, prepared time, owner OID, database OID, and node name of the current node.

Return type: xid, text, timestamptz, oid, text

get_remote_prepared_xacts()

Description: Obtains the two-phase residual transaction information of all remote nodes, including the XID, GID of the two-phase transaction, prepared time, owner name, database name, and node name.

Return type: xid, text, timestamptz, name, text

global_clean_prepared_xacts(text, text)

Description: Concurrently cleans two-phase residual transactions. If this function is called, **false** is returned.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_get_next_xid_csn()

Description: Returns the values of **next_xid** and **next_csn** on all nodes globally.

For details about the return values, see **Table 7-95**.

Table 7-95 gs_get_next_xid_csn parameters

Column	Description
nodename	Node name.
next_xid	ID of the next transaction on the current node.
next_csn	Next CSN of the current node.

pg_control_system()

Description: Returns the status of the system control file.

Return type: SETOF record

pg_control_checkpoint()

Description: Returns the system checkpoint status

Return type: SETOF record

pv_builtin_functions

Description: Displays information about all built-in system functions.

Parameter: nan

Return type: proname name, pronamespace oid, proowner oid, prolang oid, procost real, prorows real, provariadic oid, protransform regproc, proisagg Boolean, proiswindow Boolean, prosecdef Boolean, proleakproof Boolean, proisstrict Boolean, proretset Boolean, provolatile "char", pronargs smallint, pronargdefaults smallint, prorettype oid, proargtypes oidvector, proallargtypes integer[], proargmodes "char"[], proargnames text[], proargdefaults pg_node_tree, prosrc text, probin text, proconfig text[], proacl aclitem[], prodefaultargpos int2vector, fencedmode Boolean, proshippable Boolean, propackage Boolean, and oid oid.

pv_thread_memory_detail

Description: Returns the memory information of each thread. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and an empty list is returned if this function is called in a PDB.

Parameter: nan

Return type: threadid text, tid bigint, thrdtype text, contextname text, level smallint, parent text, totalsize bigint, freesize bigint, usedsize bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_relation_compression_ratio

Description: Queries the compression rate of a table. By default, **1.0** is returned.

Parameter: text

Return type: real

pg_relation_with_compression

Description: Specifies whether a table is compressed.

Parameter: text

Return type: Boolean

pg_stat_file_recursive

Description: Lists all files in a path. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameter: location text

pg_shared_memory_detail

Description: Returns usage information about all generated shared memory contexts. For details about each column, see **GS_SHARED_MEMORY_DETAIL**.

Parameter: nan

Return type: contextname text, level smallint, parent text, totalsize bigint, freesize bigint, usedsize bigint

get_gtm_lite_status

Description: Returns the backup XID and CSN on the GTM for fault locating. This system function is not supported in GTM-FREE mode or centralized mode.

gs_stat_get_wlm_plan_operator_info

Description: Obtains operator plan information from the internal hash table.

Parameter: oid

Return type: datname text, queryid int8, plan_node_id int4, startup_time int8, total_time int8, actual_rows int8, max_peak_memory int4, query_dop int4, parent_node_id int4, left_child_id int4, right_child_id int4, operation text, orientation text, strategy text, options text, condition text, projection text

pg_stat_get_partition_tuples_hot_updated

Description: Returns statistics on the number of hot updated tuples in a partition with a specified partition ID.

Parameter: oid

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_session_memory_detail_tp

Description: Returns the memory usage of the session. For details, see **gs_session_memory_detail**.

Parameter: nan

Return type: sessid text, sesstype text, contextname text, level smallint, parent text, totalsize bigint, freesize bigint, usedsize bigint

gs_thread_memory_detail

Description: Returns the memory information of each thread.

Parameter: nan

Return type: threadid text, tid bigint, thrdtype text, contextname text, level smallint, parent text, totalsize bigint, freesize bigint, usedsize bigint

pg_stat_get_wlm_session_iostat_info()

Description: Returns the session load I/O information.

Parameter: nan

Return type: threadid bigint, maxcurr_iops integer, mincurr_iops integer, maxpeak_iops integer, minpeak_iops integer, iops_limits integer, io_priority integer, and curr_io_limits integer

adm_hist_snapshot_func()

Description: Returns information about the snapshot execution time. To access this function, set the **enable_wdr_snapshot** parameter to **on** and obtain the permission to access the **snapshot schema**, **snapshot table**, and **tables_snap_timestamp** tables.

Parameter: nan

Return type: snap_id bigint, dbid oid, begin_interval_time timestamp(3), end_interval_time timestamp(3), flush_elapsed interval day(5) to second(1), begin_interval_time_tz timestamp(3) with time zone, end_interval_time_tz timestamp(3) with time zone

gs_get_current_version()

Description: Returns the current compilation mode based on the current compilation macro. **'P'** is returned.

Parameter: nan

Return type: char

gs_get_kernel_info()

Description: Transaction information on DNs.

For details about the return values, see **Table 7-96**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-96 gs_get_kernel_info parameters

Name	Type	Description
node_name	text	Node name.
module	text	Module name, including: • **XACT** (transaction module) • **STANDBY** (standby module) • **UNDO** (undo module) • **HOTPATH** (hot patch module)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
name	text	Name of the key data in the memory state, including: • **startup_max_xid** (maximum XID when a thread is started) • **recent_local_xmin** (minimum XID of local active transactions) • **recent_global_xmin** (minimum XID of global active transactions) • **standby_xmin** (minimum XID of an active transaction on the standby node) • **standby_redo_cleanup_xmin** (minimum XID of cleanup logs during redo on the standby node) • **standby_redo_cleanup_xmin_lsn** (LSN of the minimum XID of cleanup logs during redo on the standby node) • **local_csn_min** (minimum CSN of a local active transaction) • **replication_slot_xmin** (minimum XID of a replication slot) • **replication_slot_catalog_xmin** (minimum XID of a catalog replication slot) • **global_recycle_xid** (minimum XID of a global undo recycling transaction) • **global_frozen_xid** (minimum XID of a globally frozen transaction) • **recent_xmin** (minimum XID of active transactions in the current session) • **next_csn** (CSN of the next transaction) • **hotpatch_additional_info** (reserved column for hot patches) • **stmt_session_discard_records** (data volume discarded by full SQL statements due to full slots supported by the kernel) • **stmt_shm_flush_discard_records** (data volume discarded by full SQL statements due to full ringbuf supported by the kernel) • idle_in_trans_timeout_records (accumulated data volume of idle transaction timeout counts supported by the kernel)
value	text	Value of the key data in the memory state.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM gs_get_kernel_info();
  node_name   | module  |              name               |  value
--------------+---------+---------------------------------+---------
 datanode1    | XACT    | startup_max_xid                 | 16488
 datanode1    | XACT    | recent_local_xmin               | 15805
 datanode1    | XACT    | recent_global_xmin              | 15805
 datanode1    | STANDBY | standby_xmin                    | 0
 datanode1    | STANDBY | standby_redo_cleanup_xmin       | 0
 datanode1    | STANDBY | standby_redo_cleanup_xmin_lsn | 0/0
 datanode1    | XACT    | local_csn_min                   | 6014225
 datanode1    | XACT    | replication_slot_xmin           | 0
 datanode1    | XACT    | replication_slot_catalog_xmin | 0
 datanode1    | UNDO    | global_recycle_xid              | 15805
 datanode1    | XACT    | global_frozen_xid               | 0
 datanode1    | XACT    | recent_xmin                     | 15805
 datanode1    | XACT    | next_csn                        | 6014226
 datanode1    | HOTPATH | hotpatch_additional_info        |
 datanode1    | FULL_SQL| stmt_session_discard_records  | 0
 datanode1    | FULL_SQL| stmt_shm_flush_discard_records| 0
 datanode1    | XACT    | idle_in_trans_timeout_records | 0
(17 row)
```

7.6.26 System Administration Functions

7.6.26.1 Configuration Settings Functions

Configuration setting functions are used for querying and modifying GUC parameters.

current_setting(setting_name)

Description: Specifies the current setting.

Return type: text

Note: **current_setting** obtains the current setting of **setting_name** by query. It is equivalent to the **SHOW** statement. For example:

```
gaussdb=# SELECT current_setting('datestyle');

 current_setting
-----------------
 ISO, MDY
(1 row)
```

set_working_grand_version_num_manually(tmp_version)

Description: Upgrades new features of the database by switching the authorization version.

Return type: void

shell_in(type)

Description: Inputs a route for the shell type that has not yet been filled.

Return type: void

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

shell_out(type)

Description: Outputs a route for the shell type that has not yet been filled.

Return type: void

set_config(setting_name, new_value, is_local)

Description: Sets the parameter and returns a new value.

Return type: text

Note: The **set_config** parameter sets the value of **setting_name** to **new_value**. If **is_local** is **true**, the new value applies only to the current transaction. If you want **new_value** to apply to the current session, use **false** instead. This function is equivalent to the SQL statement SET. Example:

```
gaussdb=# SELECT set_config('log_statement_stats', 'off', false);

 set_config
------------
 off
(1 row)
```

7.6.26.2 Universal File Access Functions

Universal file access functions provide local access APIs for files on a database server. Only files in the database directory and the **log_directory** directory can be accessed. A relative path is used for files in the database directory, and a path matching the **log_directory** configuration setting is used for log files. Only the database initial user can use these functions.

pg_ls_dir(dirname text)

Description: Lists files in a directory.

Return type: setof text

Note: **pg_ls_dir** returns all the names in the specified directory, except the special entries "." and "..".

Example:

```
gaussdb=# SELECT pg_ls_dir('./');
      pg_ls_dir
----------------------
 .gaussdb.conf.swp
 gaussdb.conf
 pg_tblspc
 PG_VERSION
 gs_ident.conf
 core
 server.crt
 pg_serial
 pg_twophase
 gaussdb.conf.lock
 pg_stat_tmp
 pg_notify
 pg_subtrans
 pg_ctl.lock
 pg_xlog
 pg_clog
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
base
pg_snapshots
postmaster.opts
postmaster.pid
server.key.rand
server.key.cipher
pg_multixact
pg_errorinfo
server.key
gs_hba.conf
pg_replslot
.gs_hba.conf.swp
cacert.pem
gs_hba.conf.lock
global
gaussdb.state
(32 rows)
```

pg_read_file(filename text, offset bigint, length bigint)

Description: Returns the content of a text file.

Return type: text

Note: **pg_read_file** returns part of a text file. It can return a maximum of *length* bytes from *offset*. The actual size of fetched data is less than *length* if the end of the file is reached first. If *offset* is negative, it is the length rolled back from the file end. If *offset* and *length* are omitted, the entire file is returned.

Example:

```
gaussdb=# SELECT pg_read_file('postmaster.pid',0,100);
            pg_read_file
----------------------------------------
 53078                                 +
/srv/BigData/hadoop/data1/dbnode+
 1500022474                            +
 8000                                 +
 /var/run/FusionInsight                +
 localhost                             +
  2
(1 row)
```

pg_read_binary_file(filename text [, offset bigint, length bigint,missing_ok boolean])

Description: Returns the content of a binary file. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: bytea

Note: **pg_read_binary_file** is similar to **pg_read_file**, except that the result is a **bytea** value; accordingly, no encoding checks are performed. In combination with the convert_from function, this function can be used to read a file in a specified encoding.

```
gaussdb=# SELECT convert_from(pg_read_binary_file('filename'), 'UTF8');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_read_binary_file_blocks(filename text, blocknum bigint, blockcount bigint)

Description: Returns the binary content of a specified page area of a compressed file. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: bytea

Note: pg_read_binary_file_blocks is used only to read the binary content of a compressed file.

pg_stat_file(filename text)

Description: Returns status information about a file.

Return type: record

Note: pg_stat_file returns a record containing the file size, last access timestamp, last modification timestamp, last file status change timestamp, and a Boolean value indicating if it is a directory. Typical usages are as follows:

```
gaussdb=# SELECT * FROM pg_stat_file('filename');
gaussdb=# SELECT (pg_stat_file('filename')).modification;
```

Example:

```
gaussdb=# SELECT convert_from(pg_read_binary_file('postmaster.pid'), 'UTF8');
             convert_from
----------------------------------------
 4881                                  +
 /srv/BigData/gaussdb/data1/dbnode+
 1496308688                            +
 25108                                 +
 /opt/user/Bigdata/gaussdb/gaussdb_tmp +
 *                                     +
  25108001  43352069                   +

(1 row)
gaussdb=# SELECT * FROM pg_stat_file('postmaster.pid');

 size |         access         |      modification      |         change
| creation | isdir
------+------------------------+------------------------+------------------------
+----------+-------
  117 | 2017-06-05 11:06:34+08 | 2017-06-01 17:18:08+08 | 2017-06-01 17:18:08+08
|          | f
(1 row)
gaussdb=# SELECT (pg_stat_file('postmaster.pid')).modification;
      modification
------------------------
 2017-06-01 17:18:08+08
(1 row)
```

7.6.26.3 Server Signal Functions

Server signal functions send control signals to other server threads. Only a system administrator has the permission to execute the following functions:

pg_cancel_backend(pid int)

Description: Cancels a statement that is being executed by a backend thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

Note: pg_cancel_backend sends a query cancellation (SIGINT) signal to the backend thread identified by **pid**. The PID of an active backend thread can be found in the **pid** column of the **PG_STAT_ACTIVITY** view, or can be found by listing the database thread using **ps** on the server. A user with the SYSADMIN permission, the owner of the database connected to the backend thread, the owner of the backend thread, or a user who inherits permissions of the built-in role gs_role_signal_backend can use this function.

pg_cancel_session(pid bigint, sessionid bigint)

Description: Cancels the statement that is being executed by an active session in thread pool mode. In the multi-tenancy scenario, sessions in a PDB can be canceled when this function is called in the PDB, and global sessions can be canceled when this function is called in a non-PDB.

Return type: Boolean

Note: The input parameters of pg_cancel_session can be queried using the **pid** and **sessionid** columns in pg_stat_activity. The input parameters can be used to cancel the statements that are being executed by active sessions in thread pool mode. When the input parameters **pid** and **sessionid** are the same and both are thread IDs, the function of pg_cancel_backend is the same as that of pg_cancel_backend.

pg_reload_conf()

Description: Causes all server threads to overload their configuration files. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: Boolean

Note: pg_reload_conf sends a SIGHUP signal to the server. As a result, all server threads overload their configuration files.

pg_rotate_logfile()

Description: Rotates the log files of the server. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: Boolean

Note: pg_rotate_logfile sends a signal to the log file manager, instructing the manager to immediately switch to a new output file. This function works only when redirect_stderr is used for log output. Otherwise, no log file manager sub-thread is generated.

pg_terminate_backend(pid int)

Description: Terminates a backend thread.

Return type: Boolean

Note: Each of these functions returns **true** if they are successful and **false** otherwise. A user with the SYSADMIN permission, the owner of the database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

connected to the backend thread, the owner of the backend thread, or a user who inherits permissions of the built-in role gs_role_signal_backend can use this function. If the target session fails to be terminated after this function is executed, the socket connection between the session and the client is forcibly closed.

NOTICE

This function can terminate non-thread pool threads and active thread pool threads, but cannot terminate inactive thread pool threads.

Example:

```
gaussdb=# SELECT pid from pg_stat_activity;
       pid
-----------------
 140657876268816
(1 rows)

gaussdb=# SELECT pg_terminate_backend(140657876268816);
 pg_terminate_backend
----------------------
 t
(1 row)
```

pg_terminate_session(pid int64, sessionid int64)

Description: Terminates a backend session in thread pool mode. In the multi-tenancy scenario, sessions in a PDB can be terminated when this function is called in the PDB, and global sessions can be terminated when this function is called in a non-PDB.

Return type: Boolean

Note: Each of these functions returns **true** if they are successful and **false** otherwise. A user with the SYSADMIN permission, the owner of the database connected to the session, the owner of the session, or a user who inherits permissions of the built-in role gs_role_signal_backend has the permission to use this function. If the target session fails to be terminated after this function is executed, the socket connection between the session and the client is forcibly closed.

NOTICE

When the input parameters **pid** and **sessionid** are the same and both are thread IDs, this function can terminate non-thread pool threads and active thread pool threads.

When the input parameters **pid** and **sessionid** are different, this function can terminate active sessions or close inactive sessions and the socket connection of the client.

pg_terminate_active_session_socket(pid int64, sessionid int64)

Description: Closes the socket connection between an active session and the client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

Note: Each of these functions returns **true** if they are successful and **false** otherwise. A user with the SYSADMIN permission, the owner of the database connected to the backend thread, the owner of the backend thread, or a user who inherits permissions of the built-in role gs_role_signal_backend can use this function.

terminate_session_has_temp_file()

Description: Interrupts all sessions where temporary files are being opened.

Return type: void

Remarks: Only a system administrator has the permission to execute this function. This function is automatically called by the CM component in a specific process. You are advised not to manually call this function.

7.6.26.4 Backup and Restoration Control Functions

7.6.26.4.1 Backup Control Functions

Backup control functions help with online backup.

pg_create_restore_point(name text)

Description: Creates a named point for performing a restore (requires an administrator role).

Return type: text

Note: **pg_create_restore_point** creates a named transaction log record that can be used as a restoration target, and returns the corresponding transaction log location. The given name can then be used with **recovery_target_name** to specify the point up to which restoration will proceed. Avoid creating multiple restoration points with the same name, since restoration will stop at the first one whose name matches the restoration target.

pg_current_xlog_location()

Description: Obtains the write position of the current transaction log.

Return type: text

Note: **pg_current_xlog_location** displays the write position of the current transaction log in the same format as those of the previous functions. Read-only operations do not require SYSADMIN permissions.

pg_current_xlog_insert_location()

Description: Obtains the insert position of the current transaction log.

Return type: text

Note: **pg_current_xlog_insert_location** displays the insert position of the current transaction log. The insertion point is the logical end of the transaction log at any

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

instant, while the write location is the end of what has been written out from the server's internal buffers. The write position is the end that can be detected externally from the server. This operation can be performed to archive only some of completed transaction log files. The insert position is mainly used for commissioning the server. Read-only operations do not require SYSADMIN permissions.

gs_current_xlog_insert_end_location()

Description: Obtains the insert position of the current transaction log.

Return type: text

Note: **gs_current_xlog_insert_end_location** displays the insert position of the current transaction log.

pg_start_backup(label text [, fast boolean])

Description: Starts to perform online backup. (An administrator, replication role, or O&M administrator must enable **operation_mode**.)

Return type: text

Note: pg_start_backup receives a user-defined backup label (usually the name of the position where the backup dump file is stored). This function writes a backup label file to the data directory of the database and then returns the starting position of backed up transaction logs in text mode. This function must be used together with pg_stop_backup(). If this function is called independently, backup_label remains. During WAL replay, the checkpoint is read based on backup_label. If the WAL file corresponding to the checkpoint has been reclaimed, the database cannot be started.

```
gaussdb=# SELECT pg_start_backup('label_goes_here');
 pg_start_backup
-----------------
 0/3000020
(1 row)
```

pg_stop_backup()

Description: Completes the online backup. (An administrator, replication role, or O&M administrator must enable **operation_mode**.)

Return type: text

Note: **pg_stop_backup** deletes the label file created by **pg_start_backup** and creates a backup history file in the transaction log archive area. The history file includes the label given to **pg_start_backup**, the start and end transaction log locations for the backup, and the start and end time of the backup. The return value is the backup's ending transaction log location. After the end position is calculated, the insert position of the current transaction log automatically goes ahead to the next transaction log file. The ended transaction log file can be immediately archived so that backup is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_switch_xlog()

Description: Switches to a new transaction log file. (An administrator or O&M administrator must enable **operation_mode**.)

Return type: text

Note: **pg_switch_xlog** moves to the next transaction log file so that the current log file can be archived (if continuous archive is used). The return value is the ending transaction log location + 1 within the just-completed transaction log file. If there has been no transaction log activity since the last transaction log switchover, pg_switch_xlog does not move but returns the start location of the transaction log file currently in use.

pg_xlogfile_name(location text)

Description: Converts the position string in a transaction log to a file name.

Return type: text

Note: **pg_xlogfile_name** extracts only the transaction log file name. If the given transaction log position is the transaction log file border, a transaction log file name will be returned for both the two functions. This is usually the desired behavior for managing transaction log archiving, since the preceding file is the last one that currently needs to be archived.

pg_xlogfile_name_offset(location text)

Description: Converts the position string in a transaction log to a file name and returns the byte offset in the file.

Return type: text, integer

Note: **pg_xlogfile_name_offset** can extract transaction log file names and byte offsets from the returned results of the preceding functions. Example:

```
gaussdb=# SELECT * FROM pg_xlogfile_name_offset(pg_stop_backup());
NOTICE:  pg_stop_backup cleanup done, waiting for required WAL segments to be archived
NOTICE:  pg_stop_backup complete, all required WAL segments have been archived
        file_name         | file_offset
--------------------------+-------------
000000010000000000000003  |         272
(1 row)
```

pg_xlog_location_diff(location text, location text)

Description: Calculates the difference in bytes between two transaction log locations.

Return type: numeric

pg_cbm_start_tracked_location()

Description: Queries the start LSN parsed by CBM.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_cbm_tracked_location()

Description: Queries the LSN location parsed by CBM.

Return type: text

pg_cbm_get_merged_file(startLSNArg text, endLSNArg text)

Description: Combines CBM files within the specified LSN range into one and returns the name of the combined file.

Return type: text

Note: Only SYSADMIN or OPRADMIN can obtain the CBM combination file.

pg_cbm_get_changed_block(startLSNArg text, endLSNArg text)

Description: Combines CBM files within the specified LSN range into a table and return records of this table. In the multi-tenancy scenario, the non-PDB runs properly when calling this function, and an empty list is returned if this function is called in a PDB.

Return type: records

Note: The table columns returned by pg_cbm_get_changed_block include the start LSN, end LSN, tablespace OID, database OID, table relfilenode, table fork number, whether the table is a system catalog, whether the table is deleted, whether the table is created, whether the table is truncated, number of pages in the truncated table, number of modified pages, and list of modified page numbers.

pg_cbm_recycle_file(targetLSNArg text)

Description: Deletes the CBM files that are no longer used and returns the first LSN after the deletion.

Return type: text

pg_cbm_force_track(targetLSNArg text,timeOut int)

Description: Forcibly executes the CBM trace to the specified Xlog position and returns the Xlog position of the actual trace end point.

Return type: text

pg_enable_delay_ddl_recycle()

Description: Enables DDL delay and returns the Xlog position of the enabling point. An administrator or O&M administrator must enable **operation_mode**.

Return type: text

pg_disable_delay_ddl_recycle(barrierLSNArg text, isForce bool)

Description: Disables DDL delay and returns the Xlog range where DDL delay takes effect. An administrator or O&M administrator must enable **operation_mode**.

Return type: records

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_enable_delay_xlog_recycle()

Description: Enables Xlog recycle delay. This function is used in primary database node restoration. An administrator or O&M administrator must enable **operation_mode**.

Return type: void

pg_disable_delay_xlog_recycle()

Description: Disables Xlog recycle delay. This function is used in primary database node restoration. An administrator or O&M administrator must enable **operation_mode**.

Return type: void

pg_cbm_rotate_file(rotate_lsn text)

Description: Forcibly switches the file after the CBM parses **rotate_lsn**. This function is called during the build process.

Return type: void

gs_roach_stop_backup(backupid text)

Description: Stops a backup started by the internal backup tool GaussRoach. It is similar to the **pg_stop_backup system** function but is more lightweight. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: text. The content is the insertion position of the current log.

gs_roach_enable_delay_ddl_recycle(backupid name)

Description: Enables DDL delay and returns the log position of the enabling point. It is similar to the **pg_enable_delay_ddl_recycle** system function but is more lightweight. In addition, different **backupid** values can be used to concurrently open DDL statements with delay.

Return type: text. The content is the log location of the start point.

gs_roach_disable_delay_ddl_recycle(backupid text)

Description: Disables DDL delay and returns the log range where DDL delay takes effect. It is similar to the **pg_enable_delay_ddl_recycle** system function but is more lightweight. In addition, different **backupid** values can be used to concurrently disable DDL statements with delay.

Return type: records. The content is the range of logs for which DDL is delayed to take effect.

gs_roach_switch_xlog(request_ckpt bool)

Description: Switches the currently used log segment file and triggers a full checkpoint if **request_ckpt** is set to **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: text. The content is the location of the segment log.

gs_block_dw_io(timeout int, identifier text)

Description: Blocks doublewrite page flushing.

Parameters:

- timeout

  Block duration.

  Value range: [0,3600], in seconds. The value **0** indicates that the block duration is 0s.

- identifier

  ID of the operation.

  Value range: a string, supporting only uppercase letters, lowercase letters, digits, and underscores (_).

Return type: Boolean

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**.

gs_is_dw_io_blocked()

Description: Checks whether disk flushing on the current doublewrite page is blocked. If disk flushing is blocked, **true** is returned.

Return type: Boolean

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**.

gs_pitr_advance_last_updated_barrier()

Description: In PITR mode, forcibly updates the global maximum archived recovery point uploaded to OBS/NAS last time to the current point. No input parameter is required.

Return type: text

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**. This parameter is valid only on the primary DN in a centralized system. The return value is the latest local maximum archived recovery point.

gs_pitr_clean_local_barrier_files('delete_timestamp')

Description: Clears locally cached barrier record files.

Value range: The **delete_timestamp** parameter is of the text type. It is a Linux timestamp and contains 10 characters.

Return type: text

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**. The returned

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

result is the start timestamp of the earliest barrier file on the localhost after the deletion.

gs_get_barrier_lsn(barrier_name text)

Description: Obtains the LSN corresponding to the barrier created using a backup.

Return type: text

Note: Currently, this function is not supported. Currently, only **gs_roach_full** and **gs_roach_inc** are supported. To call this function, the user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**.

gs_gbr_relation_associated_filenode(schemaName name, tableName name)

Description: Returns the relfilenode of all indexes, sequences, partitions, TOASTs, and TOAST indexes related to the input table.

Return type: records

Note: The table columns returned by gs_gbr_relation_associated_filenode include the file type relkind, namespace where the file is located, relation name corresponding to the file, OID of the database where the file is located, OID of the tablespace where the file is located, and relfilenode of the file.

gs_pitr_archive_xlog_manually(archive_slot_name cstring, archive_remote_ip cstring, archive_remote_port cstring, archive_remote_config cstring)

Description: Triggers a single DN to archive Xlogs (valid only for remote media). The function returns the location of the current archive slot. For details about the parameters, see **Table 7-97**.

Return type: text

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**. This is an internal function and cannot be called by users.

Table 7-97 gs_pitr_archive_xlog_manually parameters

Parameter	Type	Description
archive_slot_name	cstring	Specifies the archive slot name. The value contains a maximum of 64 characters.
archive_remote_ip	cstring	Specifies the IP address of the server where the remote third-party storage media is located.
archive_remote_port	cstring	Specifies the listening port of the server where the remote third-party storage media is located.
archive_remote_config	cstring	Specifies the remote third-party vendor configuration parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_pitr_archive_barrier_manually(archive_slot_name cstring, archive_remote_ip cstring, archive_remote_port cstring, archive_remote_config cstring, backup_info_list cstring)

Description: Triggers a single DN to archive barriers (valid only for remote media). The function returns whether barriers are successfully archived. For details about the parameters, see **Table 7-98**.

Return type: text

Note: To call this function, a user must have the SYSADMIN or OPRADMIN permission. An O&M administrator must enable **operation_mode**. This is an internal function and cannot be called by users.

Table 7-98 gs_pitr_archive_barrier_manually parameters

Parameter	Type	Description
archive_slot_name	cstring	Specifies the archive slot name. The value contains a maximum of 64 characters.
archive_remote_ip	cstring	Specifies the IP address of the server where the remote third-party storage media is located.
archive_remote_port	cstring	Specifies the listening port of the server where the remote third-party storage media is located.
archive_remote_config	cstring	Specifies the remote third-party vendor configuration parameters.
backup_info_list	cstring	Specifies the information about the backup key list based on which the archiving is performed. This parameter cannot be empty. The maximum length is 24576 bytes, that is 24 x 1024 bytes (Maximum number of backup keys x Length of each backup key information).

pg_create_physical_replication_slot_extern(slotname text, dummy_standby bool, extra_content text, need_recycle_xlog bool)

Description: Creates an OBS or a NAS archive slot. **slotname** indicates the name of the archive slot or recovery slot. The primary and standby slots must use the same slot name. **dummy_standby** is a reserved parameter. **extra_content** contains some information about the archive slot. For an OBS archive slot, the format is **OBS;obs_server_ip;obs_bucket_name;obs_ak;obs_sk;archive_path;is_recovery;is_vote_replicate**, in which **OBS** indicates the archive media of the archive slot, **obs_server_ip** indicates the IP address of OBS, **obs_bucket_name** indicates the bucket name, **obs_ak** indicates the AK of OBS, **obs_sk** indicates the SK of OBS, **archive_path** indicates the archive path, and **is_recovery** specifies whether the slot is an archive slot or a recovery slot (**0**: archive slot; **1**: recovery slot). **is_vote_replicate** specifies whether the voting copy is archived first. The value **0** indicates that the synchronous standby node is archived first, and the value **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

indicates that the voting copy is archived first. This column is reserved in the current version and is not adapted yet. For a NAS archive slot, the format is **NAS;archive_path;is_recovery;is_vote_replicate**. Compared with the OBS archive slot, the NAS archive slot does not have the OBS configuration information, while the meanings of other fields are the same.

If the media is not OBS or NAS, the OBS archive slot is used by default. The **extra_content** format is **obs_server_ip;obs_bucket_name;obs_ak;obs_sk;archive_path;is_recovery;is_vote_replicate**.

need_recycle_xlog specifies whether to recycle old archived logs when creating an archive slot. The value **true** indicates that old archived logs are recycled, and the value **false** indicates that old archived logs are not recycled.

Return type: records, including slotname and xlog_position.

Note: Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. Currently, multiple archive slots cannot be created.

Examples:

Create an OBS archive slot.

In the following command, *obs_server_ip*, *obs_bucket_name*, *obs_ak* and *obs_sk* indicate the OBS IP address, bucket name, AK, and SK, respectively. **gaussdb_uuid/dn1** indicates the log archive path in the OBS bucket. Replace it with the actual path as required.

```
gaussdb=# SELECT * FROM pg_create_physical_replication_slot_extern('uuid', false,
'OBS;obs_server_ip;obs_bucket_name;obs_ak;obs_sk;gaussdb_uuid/dn1;0;0', false);
 slotname | xlog_position
----------+---------------
 uuid     |
(1 row)
```

Create a NAS archive slot.

In the following command, **/data/nas/media/gaussdb_uuid/dn1** indicates the log archive path on the NAS. Replace it with the actual path as required.

```
gaussdb=# SELECT * FROM pg_create_physical_replication_slot_extern('uuid', false, 'NAS;/data/nas/media/
gaussdb_uuid/dn1;0;0',false);
 slotname | xlog_position
----------+---------------
 uuid     |
```

gs_set_obs_delete_location(delete_location text)

Description: Sets the location where OBS archived logs can be deleted. The value of **delete_location** is an LSN. The logs before this location have been replayed and flushed to disks and can be deleted on OBS.

Return type: xlog_file_name text, indicating the file name of the logs that can be deleted. The value of this parameter is returned regardless of whether OBS is deleted successfully.

```
gaussdb=# SELECT gs_set_obs_delete_location('0/54000000');
 gs_set_obs_delete_location
----------------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 000000010000000000000054_00
(1 row)
```

gs_set_obs_delete_location_with_slotname(cstring, cstring)

Description: Sets the location where OBS archived logs in a specified archived slot can be deleted. The first parameter indicates the LSN. The logs before this location have been replayed and flushed to disks and can be deleted on OBS. The second parameter indicates the name of the archive slot.

Return type: xlog_file_name text, indicating the file name of the logs that can be deleted. The value of this parameter is returned regardless of whether OBS is deleted successfully.

gs_get_global_barrier_status()

Description: gs_get_global_barrier_status is used to query the latest global barrier archived in OBS.

Return type: text

global_barrier_id: globally latest barrier ID.

global_achive_barrier_id: globally latest archived barrier ID.

gs_get_global_barriers_status()

Description: gs_get_global_barriers_status is used to query the latest global barrier archived in OBS.

Return type: text

slot_name: slot name.

global_barrier_id: globally latest barrier ID.

global_achive_barrier_id: globally latest archived barrier ID.

gs_set_archive_standby_name_on_primary(text)

Description: gs_set_archive_standby_name_on_primary is used to specify the standby node for archiving. After the setting, the specified standby node performs the archive operation. In DCF mode, the standby node cannot be specified. The input is the name of a standby node, for example, **dn_6002**.

Return type: Boolean

The value **true** indicates that the setting is successful, while the value **false** indicates that the setting fails.

7.6.26.4.2 Restoration Control Functions

Restoration control functions provide information about the status of standby nodes. These functions may be executed both during restoration and in normal running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_is_in_recovery()

Description: Returns **true** if restoration is still in progress.

Return type: Boolean

pg_last_xlog_receive_location()

Description: Obtains the last transaction log location received and synchronized to disk by streaming replication. While streaming replication is in progress, this will increase monotonically. If restoration has been completed, then this value will remain static at the value of the last WAL record received and synchronized to disk during restoration. If streaming replication is disabled or if it has not yet started, the function returns a null value.

Return type: text

pg_last_xlog_replay_location()

Description: Obtains last transaction log location replayed during restoration. If restoration is still in progress, this will increase monotonically. If restoration has been completed, then this value will remain static at the value of the last WAL record received during that restoration. When the server has been started normally without restoration, the function returns a null value.

Return type: text

pg_last_xact_replay_timestamp()

Description: Obtains the timestamp of last transaction replayed during restoration. This is the time to commit a transaction or abort a WAL record on the primary node. If no transactions have been replayed during restoration, this function will return a null value. If restoration is still in progress, this will increase monotonically. If restoration has been completed, then this value will remain static at the value of the last WAL record received during that restoration. If the server normally starts without manual intervention, this function will return a null value.

Return type: timestamp with time zone

Restoration control functions control restoration threads. These functions may be executed only during restoration.

pg_is_xlog_replay_paused()

Description: Returns **true** if restoration is paused.

Return type: Boolean

pg_xlog_replay_pause()

Description: Pauses restoration immediately. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: void

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_xlog_replay_resume()

Description: Restarts restoration if it was paused. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: void

gs_get_active_archiving_standby()

Description: Queries information about archive standby nodes in the same shard. The standby node name, archive location, and number of archived logs are returned.

Return type: text, int

gs_pitr_get_warning_for_xlog_force_recycle()

Description: Checks whether logs are recycled because a large number of logs are stacked in the archive slot after archiving is enabled.

Return type: Boolean

gs_pitr_clean_history_global_barriers(stop_barrier_timestamp cstring)

Description: Clears all barrier records generated before the specified time. The earliest barrier record is returned. The input parameter is of the cstring type and is a Linux timestamp. You need to perform this operation as an administrator or O&M administrator.

Return type: text

gs_pitr_archive_slot_force_advance(stop_barrier_timestamp cstring)

Description: Forcibly updates the archive slot and clears unnecessary barrier records. The new archive slot location is returned. The input parameter is of the cstring type and is a Linux timestamp. You need to perform this operation as an administrator or O&M administrator.

Return type: text

gs_recent_barrier_buffer_info(start_time text, end_time text)

Description: Queries barrier information based on the time range entered by the user to obtain time_stamp, CSN, LSN, and standard_time.

Return type: records

Note: To call this function, you must have the SYSADMIN or OPRADMIN permission. The input parameters **start_time** and **end_time** are in the format of year-month-day time, where the time is in the clock format. The maximum query time span is one day. If the time span exceeds the limit, the end time is automatically converted to the limit boundary based on the query start time. Example:

```
gaussdb=# SELECT * FROM gs_recent_barrier_buffer_info('2024-01-15 23:27:50', '2024-01-15 23:28:00');
 timestamp |       lsn        |   csn    |    standard_time
-----------+------------------+----------+---------------------
 1705332470 | 00000000/15FFBBA0 | 41020421 | 2024-01-15 23:27:50
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

(14 rows)
```

gs_show_obs_media_files(slot_name cstring, src cstring, offset int32, limit int32)

Description: Queries the OBS file list based on the archive slot (**slot_name**) and OBS directory address (**src**) entered by the user.

Return type: records

Note: To call this function, you must have the SYSADMIN or OPRADMIN permission. **offset** indicates the query result offset, and **limit** indicates the maximum number of output lines. All files in **src** are queried. Example:

```
gaussdb=# SELECT gs_show_obs_media_files('ssh','dn1/pg_xlog',0, 5);
                                gs_show_obs_media_files
-------------------------------------------------------------------------------------------
 (wstdist_ssh/archive/dn1/pg_xlog/000000010000000000000007_00_01_00000004_00000002_00000000)
 (wstdist_ssh/archive/dn1/pg_xlog/000000010000000000000007_00_01_00000103_00000003_00000000)
 (wstdist_ssh/archive/dn1/pg_xlog/000000010000000000000007_01_01_00000004_00000002_00000000)
 (wstdist_ssh/archive/dn1/pg_xlog/000000010000000000000007_01_01_00000103_00000003_00000000)
 (wstdist_ssh/archive/dn1/pg_xlog/000000010000000000000007_02_01_00000004_00000002_00000000)
(5 rows)
```

gs_upload_obs_media_file(slot_name cstring, src cstring, dest cstring, is_forced bool)

Description: Uploads OBS files based on the archive slot (**slot_name**), source address (**src**), OBS address (**dest**), and whether to forcibly upload files (**is_forced**).

Return type: void

Note: To call this function, you must have the SYSADMIN or OPRADMIN permission. The original file directory must be the directory specified by *$GAUSSLOG*. Example:

```
gaussdb=# SELECT * FROM gs_upload_obs_media_file('ssh', '/data/gauss/log/stwang/test/
000000010000000000000007_02_01_00000004_00000002_00000000', 'dn1/pg_xlog/
000000010000000000000019_02_01_00000000_00000000_00000003', true);
 gs_upload_obs_media_file
--------------------------

(1 row)
```

gs_download_obs_media_file(slot_name cstring, src cstring, dest cstring)

Description: Downloads OBS files based on the archive slot (**slot_name**), download source address (**src**), and local destination address (**dest**).

Return type: void

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: To call this function, you must have the SYSADMIN or OPRADMIN permission. The download directory must be the directory specified by *$GAUSSLOG*. Example:

```
gaussdb=# SELECT * FROM gs_download_obs_media_file('ssh','dn1/pg_xlog/
000000010000000000000019_02_01_00000000_00000000_00000003','/data/gauss/log/stwang/test');
 gs_download_obs_media_file
------------------------------

(1 row)
```

While restoration is paused, no further database changes are applied. In hot standby mode, all new queries will see the same consistent snapshot of the database, and no further query conflicts will be generated until restoration is resumed.

If streaming replication is disabled, the paused state may continue indefinitely without problem. While streaming replication is in progress, WAL records will continue to be received, which will eventually fill available disk space. This progress depends on the duration of the pause, the rate of WAL generation, and available disk space.

7.6.26.5 DR Control Functions for Dual-Database Instances

gs_streaming_dr_in_switchover()

Description: Truncates services during a planned switchover in the primary database instance in streaming replication-based remote DR solutions.

Return type: Boolean, indicating whether the service truncation is successful and whether the switchover process can be performed normally.

7.6.26.6 DR Query Functions for Dual-Database Instances

gs_get_local_barrier_status()

Description: If two-city 3DC DR is enabled, logs of the primary database instance and standby database instance for DR are synchronized. The progress of the primary database instance's archived logs and the standby database instance's log replay is determined by flushing barrier logs to the primary database instance and replaying them on the standby database instance. gs_get_local_barrier_status is used to query the current log replay status of each node of the standby database instance for DR.

Return type: text

barrier_id: latest barrier ID of a node of the standby database instance for DR.

barrier_lsn: LSN of the latest barrier ID returned by a node in the standby database instance for DR.

archive_lsn: location of archived logs obtained by a node in the standby database instance for DR. This parameter does not take effect currently.

flush_lsn: location of logs that have been flushed to disk on a node in the standby database instance for DR.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_hadr_in_recovery()

Description: Checks whether the current node is in barrier-based log restoration if two-city 3DC DR is enabled. If the current node is in barrier-based log restoration, **true** is returned. The standby database instance for DR can be promoted to the production database instance through the switchover process only after the log restoration is complete (the SYSADMIN permission is required).

Return type: Boolean

Note: This function is used only when a planned switchover is performed in the standby database instance for DR.

gs_streaming_dr_get_switchover_barrier()

Description: Checks whether the DN instance of the standby database instance for DR has received the switchover barrier logs and replayed the logs in two-city 3DC DR solutions based on streaming replication. If it has, **true** is returned. In the standby database instance for DR, the procedure for promoting the standby database instance for DR to the production database instance in the switchover process can be started only after the switchover barrier logs of all DN instances are replayed (the SYSADMIN permission is required).

Return type: Boolean

Note: This function is used only when a planned switchover is performed in the standby database instance in streaming DR solutions.

gs_streaming_dr_service_truncation_check()

Description: Checks whether the DN instance of the primary database instance has sent the switchover barrier logs in two-city 3DC DR solutions based on streaming replication. If it has, **true** is returned. The procedure for demoting the production database instance to the standby database instance for DR in the switchover process can be started only after the logs are sent (the SYSADMIN permission is required).

Return type: Boolean

Note: This function is used only when a planned switchover is performed in the standby database instance for DR.

gs_hadr_local_rto_and_rpo_stat()

Description: Displays the log flow control information about the primary and standby database instances in the streaming DR scenario. (This view can be used only on the primary DN of the primary database instance. Statistics cannot be obtained from the standby DN or the standby database instance.)

The return value type is record. The types and meanings of the columns are as described in **Table 7-99**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-99 gs_hadr_local_rto_and_rpo_stat parameters

Parameter	Type	Description
hadr_sender_node_name	text	Node name, including the primary database instance and the main standby node of the standby database instance.
hadr_receiver_node_name	text	Name of the main standby node of the standby database instance.
source_ip	text	IP address of the primary DN of the primary database instance.
source_port	int	Communication port of the primary DN of the primary database instance.
dest_ip	text	IP address of the main standby DN of the standby database instance.
dest_port	int	Communication port of the main standby DN of the standby database instance.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby database instances (unit: second).
target_rto	int	Flow control information, that is, the RTO time between the target primary and standby database instances (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby database instances (unit: second).
target_rpo	int	Flow control information, that is, the RPO time between the target primary and standby database instances (unit: second).
rto_sleep_time	int	RTO flow control information, that is, the expected sleep time (unit: μs) required by walsender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: μs) required by xlogInsert on the host to reach the specified RPO.

gs_hadr_remote_rto_and_rpo_stat()

Description: Displays the log flow control information of the primary database instance and standby database instance for DR of other non-local data shards in streaming DR mode. This function is not supported in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_hadr_create_recovery_pause_barrier()

Description: In production mode, the primary database instance generates a barrier that enables the standby database instance for DR to pause during replay. This is only effective after production mode is enabled.

gs_is_wal_truncate_complete()

Description: Queries whether the online log truncation of the current standby database instance for DR is complete after a production failure. If the online log truncation is complete, **true** is returned.

Return type: Boolean

gs_change_dorado_state(device_name cstring, dorado_state cstring, term int)

Description: Initializes user permissions to change the status of the Dorado shared volume channel.

Return type: Boolean

Category	Parameter	Type	Shared Volume Channel Name
Input parameter	device_name	text	Name of the shared volume channel.
Input parameter	dorado_state	text	Status of the shared volume.
Input parameter	term	int	The **term** value of the current database instance.

gs_get_dorado_state()

Description: Queries the health and running status of the Dorado shared volume channel.

Return type: record

Category	Parameter	Type	Description
Output parameter	device_name	text	Name of the shared volume channel.
Output parameter	dorado_health	text	Health status of the shared volume.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	dorado_state	text	Running status of the shared volume.

7.6.26.7 Snapshot Synchronization Functions

Snapshot synchronization functions save the current snapshot and return its identifier.

pg_export_snapshot()

Description: Saves the current snapshot and returns its identifier.

Return type: text

Note: **pg_export_snapshot** saves the current snapshot and returns a text string identifying the snapshot. This string must be passed to clients that want to import the snapshot. A snapshot can be imported when the **set transaction snapshot snapshot_id;** command is executed. Doing so is possible only when the transaction is set to the **SERIALIZABLE** or **REPEATABLE READ** isolation level. GaussDB does not support these two isolation levels currently. The output of the function cannot be used as the input of **set transaction snapshot**.

pg_export_snapshot_and_csn()

Description: Functions as a system function that saves the current snapshot and returns its identifier. Compared with **pg_export_snapshot()**, **pg_export_snapshot()** returns a CSN, indicating the CSN of the current snapshot.

Return type: text

7.6.26.8 Database Object Functions

7.6.26.8.1 Database Object Size Functions

Database object size functions calculate the actual disk space used by database objects.

pg_column_size(any)

Description: Specifies the number of bytes used to store a particular value (possibly compressed).

Return type: int

Note: **pg_column_size** displays the space for storing an independent data value.

```
gaussdb=# SELECT pg_column_size(1);
 pg_column_size
----------------
              4
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_database_size(oid)

Description: Specifies the disk space used by the database with the specified OID.

Return type: bigint

pg_database_size(name)

Description: Specifies the disk space used by the database with the specified name.

Return type: bigint

Note: **pg_database_size** receives the OID or name of a database and returns the disk space used by the corresponding object.

Example:

```
gaussdb=# SELECT pg_database_size('testdb');
 pg_database_size
------------------
         51590112
(1 row)
```

NOTE

The query time of the pg_database_size(oid/name) function is linearly related to the number of object files in the database corresponding to the OID/name. To evaluate the time required, perform the following steps:

1. Since the time required is related to the software and hardware environments, the test result of a certain database (the number of object files in the selected database should not be too large) is used as the benchmark. Calculate the time consumed by a single object file (**database_size_t**) based on the query time and the number of object files in the database.
2. Obtain the OID of the database to be queried using the command **SELECT oid, * FROM pg_database WHERE datname = 'database';**. In the **base** and **pg_tblspc** tablespace directories, count the total number of files (**database_obj_num**) in the directory corresponding to the OID. If the directory contains subdirectories, you need to enter it to view the number of object files. You can run **ls | wc -l** to query the number of files in the directory.
3. Calculate the estimated total time consumption based on **database_size_t** (time consumption of a single file) and **database_obj_num** (number of all object files in the database) in the benchmark test result. The total time consumption is equal to **database_size_t** multiplied by **database_obj_num**. If the estimated latency is too long, consider adjusting the execution timeout threshold to avoid unnecessary alarms.

pg_relation_size(oid)

Description: Specifies the disk space used by the table with a specified OID or index.

Return type: bigint

get_db_source_datasize()

Description: Estimates the total size of non-compressed data in the current database.

Return type: bigint

Note: ANALYZE must be performed before this function is called.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# analyze;
ANALYZE
gaussdb=# SELECT get_db_source_datasize();
 get_db_source_datasize
------------------------
            35384925667
(1 row)
```

pg_relation_size(text)

Description: Specifies the disk space used by the table with a specified name or index. The table name can be schema-qualified.

Return type: bigint

pg_relation_size(relation regclass, fork text)

Description: Specifies the disk space used by the specified bifurcating tree ('main', 'fsm', or 'vm') of a certain table or index.

Return type: bigint

pg_relation_size(relation regclass)

Description: Is an abbreviation of **pg_relation_size(..., 'main')**.

Return type: bigint

Note: **pg_relation_size** receives the OID or name of a table, an index, or a compressed table, and returns the size.

pg_partition_size(oid, oid)

Description: Specifies the disk space used by the partition with a specified OID. The first **oid** is the OID of the table and the second **oid** is the OID of the partition.

Return type: bigint

pg_partition_size(text, text)

Description: Specifies the disk space used by the partition with a specified name. The first **text** is the table name and the second **text** is the partition name.

Return type: bigint

pg_partition_indexes_size(oid, oid)

Description: Specifies the disk space used by the index of the partition with a specified OID. The first **oid** is the OID of the table and the second **oid** is the OID of the partition.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_partition_indexes_size(text, text)

Description: Specifies the disk space used by the index of the partition with a specified name. The first **text** is the table name and the second **text** is the partition name.

Return type: bigint

pg_indexes_size(regclass)

Description: Specifies the total disk space used by the index appended to the specified table.

Return type: bigint

pg_size_pretty(bigint)

Description: Converts a size in bytes expressed as a 64-bit integer into a human-readable format with size units.

Return type: text

pg_size_pretty(numeric)

Description: Converts a size in bytes expressed as a numeric value into a human-readable format with size units.

Return type: text

Note: **pg_size_pretty** formats the results of other functions into a human-readable format. KB, MB, GB, and TB can be used.

pg_table_size(regclass)

Description: Specifies the disk space used by the specified table, excluding indexes (but including TOAST, free space mapping, and visibility mapping).

Return type: bigint

pg_tablespace_size(oid)

Description: Specifies the disk space used by the tablespace with a specified OID.

Return type: bigint

pg_tablespace_size(name)

Description: Specifies the disk space used by the tablespace with a specified name.

Return type: bigint

Note:

pg_tablespace_size receives the OID or name of a database and returns the disk space used by the corresponding object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_total_relation_size(oid)

Description: Specifies the disk space used by the table with a specified OID, including the index and the compressed data.

Return type: bigint

pg_total_relation_size(regclass)

Description: Specifies the total disk space used by the specified table, including all indexes and TOAST data.

Return type: bigint

pg_total_relation_size(text)

Description: Specifies the disk space used by the table with a specified name, including the index and the compressed data. The table name can be schema-qualified.

Return type: bigint

Note: **pg_total_relation_size** receives the OID or name of a table or a compressed table, and returns the sizes of the data, related indexes, and the compressed table in bytes.

datalength(any)

Description: Specifies the number of bytes used by an expression of a specified data type (data management space, data compression, or data type conversion is not considered).

Return type: int

Note: **datalength** is used to calculate the space of an independent data value.

Example:

```
gaussdb=# SELECT datalength(1);
datalength
------------
4
(1 row)
```

The following table lists the supported data types and calculation methods.

Data Type			Storage Space
Numeric data types	Integer types	TINYINT	1
		SMALLINT	2
		INTEGER	4
		BINARY_INTEGER	4
		BIGINT	8

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data Type			Storage Space
	Arbitrary precision types	DECIMAL	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
		NUMERIC	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
		NUMBER	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
	Serial integers	SMALLSERIAL	2
		SERIAL	4
		BIGSERIAL	8
		LARGESERIAL	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
	Floating point types	FLOAT4	4
		DOUBLE PRECISION	8
		FLOAT8	8
		BINARY_DOUBLE	8
		FLOAT[(p)]	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
		DEC[(p[,s])]	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data Type			Storage Space
		INTEGER[(p[,s])]	Every four decimal digits occupy two bytes. The digits before and after the decimal point are calculated separately.
Boolean data types	Boolean type	BOOLEAN	1
Character data types	Character types	CHAR	n
		CHAR(n)	n
		CHARACTER(n)	n
		NCHAR(n)	n
		VARCHAR(n)	n
		CHARACTER	Actual number of bytes of a character
		VARYING(n)	Actual number of bytes of a character
		VARCHAR2(n)	Actual number of bytes of a character
		NVARCHAR(n)	Actual number of bytes of a character
		NVARCHAR2(n)	Actual number of bytes of a character
		TEXT	Actual number of bytes of a character
		CLOB	Actual number of bytes of a character
Time data types	Time types	DATE	8
		TIME	8
		TIMEZ	12
		TIMESTAMP	8
		TIMESTAMPZ	8
		SMALLDATETIME	8
		INTERVAL DAY TO SECOND	16
		INTERVAL	16

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data Type			Storage Space
		RELTIME	4
		ABSTIME	4
		TINTERVAL	12

7.6.26.8.2 Database Object Position Functions

pg_relation_filenode(relation regclass)

Description: Specifies the ID of a filenode with the specified relationship.

Return type: oid

Note: **pg_relation_filenode** receives the OID or name of a table, an index, a sequence, or a compressed table, and returns the ID of **filenode** allocated to it. **filenode** is the basic component of the file name used by the relationship. For most tables, the result is the same as that of **pg_class.relfilenode**. For a specified system directory, **relfilenode** is set to **0** and this function must be used to obtain the correct value. If a relationship that is not stored is passed, such as a view, this function returns a null value.

pg_relation_filepath(relation regclass)

Description: Specifies the name of a file path with the specified relationship. It can only be used for non-segment page relationships.

Return type: text

Description: **pg_relation_filepath** is similar to **pg_relation_filenode**, except that **pg_relation_filepath** returns the whole file path name (relative to the data directory **PGDATA** of the database) for the relationship.

For segment-page relationships, you are advised to use functions or views. For example:

```
SELECT e.*, f.file_name
FROM gs_seg_extents e, gs_seg_datafiles f
WHERE e.tablespace_name = f.tablespace_name ADN e.bucketnode = f.bucketnode ADN e.file_id = f.file_id
ADN e.forknum = f.forknum;
```

pg_filenode_relation(tablespace oid, filenode oid)

Description: Obtains the table names corresponding to the tablespace and relfilenode.

Return type: regclass

pg_partition_filenode(partition_oid)

Description: Obtains **filenode** corresponding to the OID lock of a specified partitioned table.

Return type: oid

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_partition_filepath(partition_oid)

Description: Specifies the file path name of a specified partition. It can only be used for non-segment page relationships.

Return type: text

Note: For segment-page relationships, you are advised to use functions or views. For example:

```
SELECT e.*, f.file_name
FROM gs_seg_extents e, gs_seg_datafiles f
WHERE e.tablespace_name = f.tablespace_name ADN e.bucketnode = f.bucketnode ADN e.file_id = f.file_id
ADN e.forknum = f.forknum;
```

7.6.26.8.3 Recycle Bin Object Functions

gs_is_recycle_object(classid, objid, objname)

Description: Determines whether an object is in the recycle bin.

Return type: Boolean

7.6.26.9 Advisory Lock Functions

Advisory lock functions manage advisory locks.

pg_advisory_lock(key bigint)

Description: Obtains an exclusive session-level advisory lock.

Return type: void

Note: **pg_advisory_lock** locks resources defined by an application. The resources can be identified using a 64-bit or two nonoverlapped 32-bit key values. If another session locks the resources, the function blocks the resources until they can be used. The lock is exclusive. Multiple locking requests are pushed into the stack. Therefore, if the same resource is locked three times, it must be unlocked three times so that it is released to another session.

pg_advisory_lock(key1 int, key2 int)

Description: Obtains an exclusive session-level advisory lock.

Return type: void

Note: Only users with the SYSADMIN permission can add session-level exclusive advisory locks to the key-value pair (65535, 65535).

pg_advisory_lock(lock_id int4, lock_id int4, datebase_name Name)

Description: Obtains the exclusive advisory lock of a specified database.

Return type: void

pg_advisory_lock_shared(key bigint)

Description: Obtains a shared session-level advisory lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: void

pg_advisory_lock_shared(key1 int, key2 int)

Description: Obtains a shared session-level advisory lock.

Return type: void

Note: **pg_advisory_lock_shared** works in the same way as **pg_advisory_lock**, except that **pg_advisory_lock_shared** obtains an advisory lock shared with other sessions requesting the lock, while **pg_advisory_lock** obtains an exclusive advisory lock.

pg_advisory_unlock(key bigint)

Description: Releases an exclusive session-level advisory lock.

Return type: Boolean

pg_advisory_unlock(key1 int, key2 int)

Description: Releases an exclusive session-level advisory lock.

Return type: Boolean

Note: **pg_advisory_unlock** releases the obtained exclusive advisory lock. If the release is successful, the function returns **true**. If the lock was not held, it will return **false**. In addition, an SQL warning will be reported by the server.

pg_advisory_unlock(lock_id int4, lock_id int4, datebase_name Name)

Description: Releases the exclusive advisory lock of a specified database.

Return type: Boolean

Note: If the release is successful, **true** is returned. If no lock is held, **false** is returned.

pg_advisory_unlock_shared(key bigint)

Description: Releases a shared session-level advisory lock.

Return type: Boolean

pg_advisory_unlock_shared(key1 int, key2 int)

Description: Releases a shared session-level advisory lock.

Return type: Boolean

Note: **pg_advisory_unlock_shared** works in the same way as **pg_advisory_unlock**, except it releases a shared session-level advisory lock.

pg_advisory_unlock_all()

Description: Releases all advisory locks owned by the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: void

Note: pg_advisory_unlock_all releases all advisory locks owned by the current session. The function is implicitly called when the session ends even if the client is abnormally disconnected.

pg_advisory_xact_lock(key bigint)

Description: Obtains an exclusive transaction-level advisory lock.

Return type: void

pg_advisory_xact_lock(key1 int, key2 int)

Description: Obtains an exclusive transaction-level advisory lock.

Return type: void

Note: **pg_advisory_xact_lock** works in the same way as **pg_advisory_lock**, except the lock is automatically released at the end of the current transaction and cannot be released explicitly. Only users with the SYSADMIN permission can add transaction-level exclusive advisory locks to the key-value pair (65535, 65535).

pg_advisory_xact_lock_shared(key bigint)

Description: Obtains a shared transaction-level advisory lock.

Return type: void

pg_advisory_xact_lock_shared(key1 int, key2 int)

Description: Obtains a shared transaction-level advisory lock.

Return type: void

Note: **pg_advisory_xact_lock_shared** works in the same way as **pg_advisory_lock_shared**, except the lock is automatically released at the end of the current transaction and cannot be released explicitly.

pg_try_advisory_lock(key bigint)

Description: Obtains an exclusive session-level advisory lock if available.

Return type: Boolean

Note: **pg_try_advisory_lock** is similar to **pg_advisory_lock**, except **pg_try_advisory_lock** does not block the resource until the resource is released. It either immediately obtains the lock and returns **true** or returns **false**, which indicates the lock cannot be performed currently.

pg_try_advisory_lock(key1 int, key2 int)

Description: Obtains an exclusive session-level advisory lock if available.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: Only users with the SYSADMIN permission can add session-level exclusive advisory locks to the key-value pair (65535, 65535).

pg_try_advisory_lock_shared(key bigint)

Description: Obtains a shared session-level advisory lock if available.

Return type: Boolean

pg_try_advisory_lock_shared(key1 int, key2 int)

Description: Obtains a shared session-level advisory lock if available.

Return type: Boolean

Note: **pg_try_advisory_lock_shared** works in the same way as **pg_try_advisory_lock**, except that **pg_try_advisory_lock_shared** attempts to obtain a shared lock instead of an exclusive lock.

pg_try_advisory_xact_lock(key bigint)

Description: Obtains an exclusive transaction-level advisory lock if available.

Return type: Boolean

pg_try_advisory_xact_lock(key1 int, key2 int)

Description: Obtains an exclusive transaction-level advisory lock if available.

Return type: Boolean

Note: **pg_try_advisory_xact_lock** works in the same way as **pg_try_advisory_lock**, except the lock, if acquired, is automatically released at the end of the current transaction and cannot be released explicitly. Only users with the SYSADMIN permission can add transaction-level exclusive advisory locks to the key-value pair (65535, 65535).

pg_try_advisory_xact_lock_shared(key bigint)

Description: Obtains a shared transaction-level advisory lock if available.

Return type: Boolean

pg_try_advisory_xact_lock_shared(key1 int, key2 int)

Description: Obtains a shared transaction-level advisory lock if available.

Return type: Boolean

Note: **pg_try_advisory_xact_lock_shared** works in the same way as **pg_try_advisory_lock_shared**, except the lock, if acquired, is automatically released at the end of the current transaction and cannot be released explicitly.

lock_cluster_ddl()

Description: Attempts to obtain a session-level exclusive advisory lock for all active primary database nodes in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

Note: Only users with the SYSADMIN permission can call this function.

unlock_cluster_ddl()

Description: Attempts to add a session-level exclusive advisory lock on the primary database node.

Return type: Boolean

7.6.26.10 Logical Replication Functions

NOTE

When using the logical replication functions, set the GUC parameter **wal_level** to **logical**. For details about the configuration, see "Logical Decoding > Logical Decoding by SQL Functions" in *Feature Guide*.

pg_create_logical_replication_slot('slot_name', 'plugin_name', 'output_order')

Description: Creates a logical replication slot. In the multi-tenancy scenario, non-PDB creates replication slots for the current database, while PDB creates replication slots for itself.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- plugin_name

  Indicates the name of the plug-in.

  Value range: a string. Currently, **mppdb_decoding**, **sql_decoding**, **parallel_binary_decoding**, **parallel_json_decoding**, and **parallel_text_decoding** are supported.

- output_order

  Indicates the output sequence of the replication slot decoding results. This parameter is optional.

  Value range: **0** and **1**. The default value is **0**.

  - **0**: The replication slot decoding results are sorted by transaction COMMIT LSN. In this case, the value of **confirmed_csn** of the replication slot is **0**. This replication slot is called an LSN-based replication slot.
  - **1**: The replication slot decoding results are sorted by transaction CSN. In this case, the value of **confirmed_csn** of the replication slot is a non-zero value. This replication slot is called a CSN-based replication slot.

Return type: name, text

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM pg_create_logical_replication_slot('slot_lsn','mppdb_decoding',0);
 slotname | xlog_position
----------+---------------
 slot_lsn | 0/6D08B58
(1 row)

gaussdb=# SELECT * FROM pg_create_logical_replication_slot('slot_csn','mppdb_decoding',1);
 slotname | xlog_position
----------+---------------
 slot_csn | 0/59AD800
(1 row)
```

Note: The first return value is the slot name, and the second one has different meanings in LSN-based replication slots and CSN-based replication slots. For an LSN-based replication slot, the value is **confirmed_flush** of the replication slot, indicating that transactions whose commit LSN is less than or equal to the value will not be decoded and output. For a CSN-based replication slot, the value is **confirmed_csn** of the replication slot, indicating that transactions whose CSN is less than or equal to the value will not be decoded and output. Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. Currently, this function can be called only on the primary node.

pg_create_physical_replication_slot('slot_name', 'isDummyStandby')

Description: Creates a physical replication slot. In the multi-tenancy scenario, PDB cannot create physical replication slots.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- isDummyStandby

  Reserved parameter.

  Type: bool

Return type: name, text

NOTE

- Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication.
- The physical replication slot created by this function does not have **restart_lsn**. Therefore, the slot is considered invalid and will be automatically deleted when the checkpoint is performed.

pg_drop_replication_slot('slot_name')

Description: Deletes a streaming replication slot. In the multi-tenancy scenario, non-PDB can delete replication slots for both non-PDB and PDB, while PDB can only delete replication slots for itself.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

Return type: void

Note: Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. Currently, this function can be called only on the primary node.

pg_logical_slot_peek_changes('slot_name', 'upto_lsn', upto_nchanges, 'options_name', 'options_value')

Description: Performs decoding but does not go to the next streaming replication slot. (The decoded result will be returned again during the next decoding.) In the multi-tenancy scenario, non-PDB can only operate replication slots for itself, and PDB can only operate replication slots for itself.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- upto_lsn

  For the CSN-based logical replication slot, the decoding is complete until the transaction whose CSN is less than or equal to the value is decoded (a transaction whose CSN is greater than the specified CSN may be decoded). For the LSN-based replication slot, the decoding is complete until the first transaction whose COMMIT LSN is greater than or equal to the value is decoded.

  Value range: a string, for example, '1/2AAFC60', '0/A060', or '3A/0' (a hexadecimal uint64 value containing two uint32 values separated by a slash (/); if any uint32 value is **0**, **0** is displayed.) **NULL** indicates that the end position of decoding is not specified.

- upto_nchanges

  Indicates the number of decoded records (including the **begin** and **commit** timestamps). Assume that there are three transactions, which involve 3, 5, and 7 records, respectively. If **upto_nchanges** is set to **4**, 8 records of the first two transactions will be decoded. Specifically, decoding is stopped when the number of decoded records exceeds the value of **upto_nchanges** after decoding in the first two transactions is finished.

  Value range: a non-negative integer

  > NOTE
  >
  > If any of the **upto_lsn** and **upto_nchanges** values is reached, decoding ends.

- **options**: Specifies optional parameters, consisting of multiple pairs of **options_name** and **options_value**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- include-xids

  Specifies whether the decoded **data** column contains XID information.

  Value range: Boolean. The default value is **true**.

  - **false**: The decoded **data** column does not contain XID information.
  - **true**: The decoded **data** column contains XID information.

- skip-empty-xacts

  Specifies whether to ignore empty transaction information during decoding.

  Value range: Boolean. The default value is **false**.

  - **false**: The empty transaction information is not ignored during decoding.
  - **true**: The empty transaction information is ignored during decoding.

- include-timestamp

  Specifies whether decoded information contains the **commit** timestamp.

  Value range: Boolean. The default value is **true**.

  - **false**: The decoded information does not contain the **commit** timestamp.
  - **true**: The decoded information contains the **commit** timestamp.

- only-local

  Specifies whether to decode only local logs.

  Value range: Boolean. The default value is **true**.

  - **false**: Non-local logs and local logs are decoded.
  - **true**: Only local logs are decoded.

- force-binary

  Specifies whether to output the decoding result in binary format.

  Value range: Boolean. The default value is **false**.

  - **false**: The decoding result is output in text format.
  - The value cannot be set to **true** currently.

- white-table-list

  Whitelist parameter, including the schema and table name to be decoded.

  Value range: a string that contains table names in the whitelist. Different tables are separated by commas (,). An asterisk (*) is used to fuzzily match all tables. Schema names and table names are separated by periods (.). No space character is allowed. The following is an example:

  ```
  SELECT * FROM pg_logical_slot_peek_changes('slot1', NULL, 4096, 'white-table-list',
  'public.t1,public.t2');
  ```

- max-txn-in-memory

  Memory control parameter. The unit is MB. If the memory occupied by a single transaction is greater than the value of this parameter, data is flushed to disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.

- max-reorderbuffer-in-memory

  Memory control parameter. The unit is GB. If the total memory (including the cache) of transactions being concatenated in the sender thread is greater than the value of this parameter, the current decoding transaction is flushed to disk.

  Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.

- desc-memory-limit

  A memory control parameter, in MB. When the total memory of table metadata maintained by a logical decoding task is greater than the value of this parameter, some table metadata will be evicted.

  Value range: an integer ranging from 10 to 1024. The default value is **100**.

- include-user

  Specifies whether the BEGIN logical log of a transaction records the username of the transaction.

  Value range: Boolean. The default value is **false**.

  - **false**: The BEGIN logical log of a transaction does not record the username of the transaction.
  - **true**: The BEGIN logical log of a transaction records the username of the transaction.

- exclude-userids

  Specifies the OID of a blacklisted user.

  Value range: OIDs of blacklisted users. Multiple OIDs are separated by commas (,). The system does not check whether the OIDs exist.

- exclude-users

  Specifies the name of a blacklisted user.

  Value range: names of blacklisted users. Multiple names are separated by commas (,). **dynamic-resolution** specifies whether to dynamically parse and identify usernames. If the decoding is interrupted because the user does not exist and the corresponding blacklisted user does not exist at the time when logs are generated, you can set **dynamic-resolution** to **true** or delete the username from the blacklist to start decoding and continue to obtain logical logs.

- dynamic-resolution

  Specifies whether to dynamically parse the names of blacklisted users.

  Value range: Boolean. The default value is **true**.

  - **false**: An error is reported and the logical decoding exits when the decoding detects that a user does not exist in blacklist **exclude-users**.
  - **true**: Decoding continues when it detects that a user does not exist in blacklist **exclude-users**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- enable-ddl-decoding

  Specifies whether to enable logical decoding for DDL statements.

  Value range: Boolean. The default value is **false**.

  - **false**: Logical decoding of DDL statements is disabled.
  - **true**: Logical decoding of DDL statements is enabled.

- enable-ddl-json-format

  Specifies the DDL statement reverse parsing process and output format for logical decoding.

  Value range: Boolean. The default value is **false**.

  - **false**: The DDL statement reverse parsing result is output in text format.
  - **true**: The DDL statement reverse parsing result is output in JSON format.

- skip-generated-columns

  Specifies whether to skip stored generated columns in the logical decoding result. This parameter is invalid for UPDATE and DELETE on old tuples, and the corresponding tuples always output the stored generated columns.

  Value range: Boolean. The default value is **false** or **off**.

  - **true**/**on**: The decoding result of stored generated columns is not output.
  - **false**/**off**: The decoding result of stored generated columns is output.

  Virtual generated columns are not controlled by this parameter. The DML decoding result does not output virtual generated columns.

- **restart-lsn**:

  Specifies the decoding start point, which is a logical decoding control parameter. A consistency LSN will be found from the **restart-lsn** to start decoding and output data. The found consistency LSN is flushed to disk and recorded in the replication slot file. If **restart-lsn** is not specified when pg_logical_slot_peek_changes is called next time, data is output from the consistency lsn recorded in the replication slot file.

  Value range: a string in the format of "XXXXXXXX/XXXXXXXX". The value **0/0** is invalid.

  > NOTE
  >
  > This option is available only for replication slots of the multi-version data dictionary type.

- decode-sequence

  Specifies whether to output the decoding result of the change log of the sequence value, which is a logical decoding control parameter.

  Value range: Boolean. The default value is **false**.

  - The value cannot be set to **true** currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **false**: The decoding result of the change log of the sequence value is not output.

NOTICE

Currently, **decode-sequence** can only be set to **false**. If **decode-sequence** is set to **true**, an error is reported when decoding is started and the decoding process exits.

NOTE

For details about other configuration options, see "Logical Replication > Logical Decoding > Logical Decoding Options" in the *Feature Guide*.

Return type: text, xid, text

Example:

```
gaussdb=# SELECT * FROM pg_logical_slot_peek_changes('slot_lsn',NULL,4096,'skip-empty-xacts','on');
 location  |  xid  |                                                
```

The decoding result returned by the function contains three columns, corresponding to the preceding return value types, which are the LSN (for an LSN-based replication slot) or CSN (for a CSN-based replication slot), XID, and decoded content, respectively. If the **location** column indicates the CSN, the value of the **location** column is updated only when the commit logs are decoded.

Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication.

pg_logical_slot_get_changes('slot_name', 'upto_lsn', upto_nchanges, 'options_name', 'options_value')

Description: Performs decoding and goes to the next streaming replication slot. In the multi-tenancy scenario, non-PDB can only operate replication slots for itself, and PDB can only operate replication slots for itself.

Parameters: This function has the same parameters as **pg_logical_slot_peek_changes**. For details, see **pg_logical_slot_peek_changes**.

Note: Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. This function can be called on the primary or standby node. If this function is called on the standby node, the corresponding logical replication slot number on the primary node is updated.

NOTE

If this function is executed on the standby node, a WAL sender of the primary node is occupied when the replication slot number on the primary node is updated. The logical decoding function reserves a WAL sender for each logical replication slot. Therefore, if this function is executed in normal scenarios, the logical replication slot number on the primary node is updated normally. If this function is executed continuously in a short period of time, the primary node fails to update the slot number and no error is reported.

pg_logical_slot_peek_binary_changes('slot_name', 'upto_lsn', upto_nchanges, 'options_name', 'options_value')

Description: Performs decoding in binary mode and does not go to the next streaming replication slot. (The decoded data can be obtained again during the next decoding.) In the multi-tenancy scenario, non-PDB can only operate replication slots for itself, and PDB can only operate replication slots for itself.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- upto_lsn

  For the CSN-based logical replication slot, the decoding is complete until the transaction whose CSN is less than or equal to the value is decoded (a transaction whose CSN is greater than the specified CSN may be decoded). For the LSN-based replication slot, the decoding is complete until the first

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

transaction whose COMMIT LSN is greater than or equal to the value is decoded.

Value range: a string, for example, '1/2AAFC60', '0/A060', or '3A/0' (a hexadecimal uint64 value containing two uint32 values separated by a slash (/); if any uint32 value is **0**, **0** is displayed.) **NULL** indicates that the end position of decoding is not specified.

- upto_nchanges

  Indicates the number of decoded records (including the **begin** and **commit** timestamps). Assume that there are three transactions, which involve 3, 5, and 7 records, respectively. If **upto_nchanges** is set to **4**, 8 records of the first two transactions will be decoded. Specifically, decoding is stopped when the number of decoded records exceeds the value of **upto_nchanges** after decoding in the first two transactions is finished.

  Value range: a non-negative integer

  NOTE

  If any of the **upto_lsn** and **upto_nchanges** values is reached, decoding ends.

- **options**: Specifies optional parameters, consisting of multiple pairs of **options_name** and **options_value**.
  - include-xids

    Specifies whether the decoded **data** column contains XID information.

    Value range: Boolean. The default value is **true**.

    - **false**: The decoded **data** column does not contain XID information.
    - **true**: The decoded **data** column contains XID information.
  - skip-empty-xacts

    Specifies whether to ignore empty transaction information during decoding.

    Value range: Boolean. The default value is **false**.

    - **false**: The empty transaction information is not ignored during decoding.
    - **true**: The empty transaction information is ignored during decoding.
  - include-timestamp

    Specifies whether decoded information contains the **commit** timestamp.

    Value range: Boolean. The default value is **true**.

    - **false**: The decoded information does not contain the **commit** timestamp.
    - **true**: The decoded information contains the **commit** timestamp.
  - only-local

    Specifies whether to decode only local logs.

    Value range: Boolean. The default value is **true**.

    - **false**: Non-local logs and local logs are decoded.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **true**: Only local logs are decoded.
- force-binary

  This parameter is useless for the function.

  Value range: Boolean. The result is output in binary format.
- white-table-list

  Whitelist parameter, including the schema and table name to be decoded.

  Value range: a string that contains table names in the whitelist. Different tables are separated by commas (,). An asterisk (*) is used to fuzzily match all tables. Schema names and table names are separated by periods (.). No space character is allowed. Example: **select * from pg_logical_slot_peek_binary_changes('slot1', NULL, 4096, 'white-table-list', 'public.t1,public.t2');**
- max-txn-in-memory

  Memory control parameter. The unit is MB. If the memory occupied by a single transaction is greater than the value of this parameter, data is flushed to disk.

  Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.
- max-reorderbuffer-in-memory

  Memory control parameter. The unit is GB. If the total memory (including the cache) of transactions being concatenated in the sender thread is greater than the value of this parameter, the current decoding transaction is flushed to disk.

  Value range: an integer ranging from 0 to 100. The default value is **0**, indicating that memory control is disabled.
- desc-memory-limit

  A memory control parameter, in MB. When the total memory of table metadata maintained by a logical decoding task is greater than the value of this parameter, some table metadata will be evicted.

  Value range: an integer ranging from 10 to 1024. The default value is **100**.
- include-user

  Specifies whether the BEGIN logical log of a transaction records the username of the transaction.

  Value range: Boolean. The default value is **false**.

  - **false**: The BEGIN logical log of a transaction does not record the username of the transaction.
  - **true**: The BEGIN logical log of a transaction records the username of the transaction.
- exclude-userids

  Specifies the OID of a blacklisted user.

  Value range: OIDs of blacklisted users. Multiple OIDs are separated by commas (,). The system does not check whether the OIDs exist.
- exclude-users

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a blacklisted user.

Value range: names of blacklisted users. Multiple names are separated by commas (,). **dynamic-resolution** specifies whether to dynamically parse and identify usernames. If the decoding is interrupted because the user does not exist and the corresponding blacklisted user does not exist at the time when logs are generated, you can set **dynamic-resolution** to **true** or delete the username from the blacklist to start decoding and continue to obtain logical logs.

- dynamic-resolution

  Specifies whether to dynamically parse the names of blacklisted users.

  Value range: Boolean. The default value is **true**.

  - **false**: An error is reported and the logical decoding exits when the decoding detects that a user does not exist in blacklist **exclude-users**.
  - **true**: Decoding continues when it detects that a user does not exist in blacklist **exclude-users**.

- **restart-lsn**:

  Specifies the decoding start point, which is a logical decoding control parameter. A consistency LSN will be found from the **restart-lsn** to start decoding and output data. The found consistency LSN is flushed to disk and recorded in the replication slot file. If **restart-lsn** is not specified when pg_logical_slot_peek_binary_changes is called next time, data is output from the consistency lsn recorded in the replication slot file.

  Value range: a string in the format of "XXXXXXXX/XXXXXXXX". The value **0/0** is invalid.

  NOTE

  This option is available only for replication slots of the multi-version data dictionary type.

- decode-sequence

  Specifies whether to output the decoding result of the change log of the sequence value, which is a logical decoding control parameter.

  Value range: Boolean. The default value is **false**.

  - The value cannot be set to **true** currently.
  - **false**: The decoding result of the change log of the sequence value is not output.

NOTICE

Currently, **decode-sequence** can only be set to **false**. If **decode-sequence** is set to **true**, an error is reported when decoding is started and the decoding process exits.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> Some configuration options do not take effect even if they are configured in functions. For details, see "Logical Replication > Logical Decoding > Logical Decoding Options" in the *Feature Guide*.

Return type: text, xid, bytea

Note: The function returns the decoding result. Each decoding result contains three columns, corresponding to the above return types and indicating the LSN position, XID, and decoded content in binary format, respectively. Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication.

pg_logical_slot_get_binary_changes('slot_name', 'upto_lsn', upto_nchanges, 'options_name', 'options_value')

Description: Performs decoding in binary mode and does not go to the next streaming replication slot. In the multi-tenancy scenario, non-PDB can only operate replication slots for itself, and PDB can only operate replication slots for itself.

Parameters: This function has the same parameters as **pg_logical_slot_peek_binary_changes**. For details, see **•pg_logical_slot_peek_bi...**.

Note: Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. Currently, this function can be called only on the primary node.

pg_replication_slot_advance ('slot_name', 'upto_lsn')

Description: Directly goes to the streaming replication slot for a specified **upto_lsn**, without outputting any decoded result. In the multi-tenancy scenario, the PDB on the primary node updates its own replication slot, while an error is reported when the PDB on the standby node updates its own replication slot.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- upto_lsn

  For the CSN-based logical replication slot, it indicates the target CSN before which logs are decoded. During the next decoding, only the transaction results whose CSN is greater than this value will be output. If the input CSN is smaller than the value of **confirmed_csn** recorded in the current streaming replication slot, the function directly returns the decoded result. If the input CSN is greater than the latest CSN that can be obtained or no CSN is input, the latest CSN will be used for decoding.

  For the LSN-based logical replication slot, it indicates the target LSN before which logs are decoded. During the next decoding, only the transaction results

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

whose LSN is greater than this value will be output. If the input LSN is smaller than the position recorded in the current streaming replication slot, an error is reported. If the input LSN is greater than the LSN of the current physical log or no LSN is input, the latest LSN will be directly used for decoding.

Value range: a string, for example, **'1/2AAFC60'**, **'0/A060'**, or **'3A/0'** (a hexadecimal uint64 value containing two uint32 values separated by a slash (/); if any uint32 value is **0**, **0** is displayed.) **NULL** indicates that the end position of decoding is not specified.

Return type: name, text

Note: A return result contains the slot name and LSN or CSN that is actually used for decoding. Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication. This function can be called on the primary or standby node. When this function is called on the standby node, the corresponding logical replication slot number on the primary node is updated.

NOTE

This function can be executed on the standby node to synchronously update the corresponding logical replication slot number on the primary node. If this function is executed on the standby node, a WAL sender of the primary node is occupied when the replication slot number on the primary node is updated. The logical decoding function reserves a WAL sender for each logical replication slot. Therefore, if this function is executed in normal scenarios, the logical replication slot number on the primary node is updated normally. If this function is executed continuously in a short period of time, the primary node fails to update the slot number and no error is reported.

pg_logical_get_area_changes('start_lsn', 'upto_lsn', upto_nchanges, 'decoding_plugin', 'xlog_path', 'options_name', 'options_value')

Description: Specifies an LSN range or an Xlog file for decoding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The constraints are as follows:

- The current network and hardware environment are normal.
- It is recommended that the size of a single tuple be less than or equal to 500 MB. If the size ranges from 500 MB to 1 GB, an error is reported.
- Data page replication is not supported for log decoding that does not fall into Xlogs.
- When the API is called, only when **wal_level** is set to **logical**, the generated log files can be parsed. If the used Xlog file is not of the logical level, the decoded content does not have the corresponding value and type, and there is no other impact. If **wal_level** is not set to **logical**, an error is reported and decoding is not performed.
- The Xlog file can be parsed only by a copy of a fully homogeneous DN to ensure that the metadata corresponding to the data can be found.
- Do not read too many Xlog files at a time. If no file is specified for decoding within a specified range, you are advised to read one Xlog file each time. Generally, the memory occupied by an Xlog file during decoding is about two to three times the size of the Xlog file.
- Logs before VACUUM FULL cannot be decoded.
- The Xlog file before scale-out cannot be decoded.
- In this decoding mode, the content that can be decoded is decoded based on the Xlog text record data, and the decoding is not performed based on transactions. Therefore, data that is not in the Xlog cannot be decoded. If related Xlogs are missing, the missing logs cannot be decoded.
- When **enable-ddl** is disabled: If no decoding file is specified from the decoding point, the system checks whether a DDL operation occurs between the decoding start point and the latest redo value. If the DDL operation occurs, the system does not decode all data. If a decoding file is specified, the system checks whether a DDL operation occurs between the start point of the decoding file and the last readable content of the file and between the start point of the Xlog in the data directory and the latest redo value. If the DDL operation is detected, the system does not decode all tables.
- When **enable-ddl** is disabled, columns of the TOAST, CLOB, and BLOB types cannot be decoded. When **enable-ddl** is enabled, columns of related types can be decoded.
- When **enable-ddl** is enabled, decoding of DDL statements is supported in the range and DDL statements can be output. For details about the output DDL statement range, see "Logical Replication > Logical Decoding > Logical Decoding of DDL Statements" in *Feature Guide*.
- To parse the update and delete statements of a table, you need to configure the REPLICA IDENTITY attribute for the table. If the table does not have a primary key, set the REPLICA IDENTITY attribute to FULL. For details, see the REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING } column in **ALTER TABLE**.

Note: When separation-of-duties is enabled, only the initial database user can call the function. When separation-of-duties is disabled, the SYSADMIN permission is required.

Parameters:

- start_lsn

  Specifies the LSN at the start of decoding.

  Value range: a string, in the format of *xlogid*/*xrecoff*, for example, **'1/2AAFC60'**. **NULL** indicates that the start position of decoding is not specified.

- upto_lsn

  Specifies the LSN at the end of decoding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string, in the format of *xlogid*/*xrecoff*, for example, **'1/2AAFC60'**. **NULL** indicates that the end position of decoding is not specified.

- upto_nchanges

  Indicates the number of decoded records (including the **begin** and **commit** timestamps). Assume that there are three transactions, which involve 3, 5, and 7 records, respectively. If **upto_nchanges** is set to **4**, 8 records of the first two transactions will be decoded. Specifically, decoding is stopped when the number of decoded records exceeds the value of **upto_nchanges** after decoding in the first two transactions is finished.

  Value range: a non-negative integer

  NOTE

  If any of the **LSN** and **upto_nchanges** values are reached, decoding ends.

- decoding_plugin

Decoding plug-in, which is a .so plug-in that specifies the output format of the decoded content.

Value range: **mppdb_decoding** and **sql_decoding**.

- xlog_path

Decoding plug-in, which specifies the Xlog absolute path and file level of the decoding file.

Value range: **NULL** or a character string of the absolute path of the Xlog file.

- **options**: Specifies optional parameters, consisting of multiple pairs of **options_name** and **options_value**. You can retain the default values.
  - include-xids

    Specifies whether the decoded **data** column contains XID information.

    Value range: Boolean. The default value is **true**.

    false: The decoded **data** column does not contain XID information.

    true: The decoded **data** column contains XID information.
  - include-timestamp

    Specifies whether decoded information contains the **commit** timestamp.

    Value range: Boolean. The default value is **true**.

    false: The decoded information does not contain the **commit** timestamp.

    true: The decoded information contains the **commit** timestamp.
  - only-local

    Specifies whether to decode only local logs.

    Value range: Boolean. The default value is **true**.

    false: Non-local logs and local logs are decoded.

    true: Only local logs are decoded.
  - force-binary

    Specifies whether to output the decoding result in binary format.

    Value range: Boolean. The default value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

false: The decoding result is output in text format.

The value cannot be set to **true** currently.

– white-table-list

Whitelist parameter, including the schema and table name to be decoded. Value range: a string that contains table names in the whitelist. Different tables are separated by commas (,). An asterisk (*) is used to fuzzily match all tables. Schema names and table names are separated by periods (.). No space character is allowed.

– white-database-list

Whitelist parameter, including names of databases to be decoded. Value range: a character string that contains database names in the whitelist. Different database names are separated by commas (,). No space character is allowed. If **white-database-list** is not set, only the database Xlogs of the current connection are decoded. If **white-database-list** is set, only the database Xlogs specified in **white-database-list** are decoded. If the system database is decoded, ordinary table data in the system database can be retrieved.

– enable-ddl

Decoding that contains DDL syntax is supported. If the DDL syntax exists between the start position and the latest log, the function is not affected. The value ranges from 0 to 1.

- **1**: enabled. This function supports decoding of DDL syntax.
- **0**: disabled by default. This function does not support decoding of DDL syntax. If a DDL statement is detected, the function exits directly.

– data-limit

Specifies the amount of output data after decoding. The unit is KB.

Value range: an integer greater than or equal to 0. The default value is **0**, indicating that the size of the decoding result is not limited.

The input parameter **data-limit** of this function is used together with the GUC parameter **data-limit**. The decoding stops if it exceeds either of the **data-limit** values.

Rules:

i. If the GUC parameter **data-limit** is set to **0**, and **data-limit** for function decoding is not set or is set to **0**, the decoding result has no upper limit.

ii. If the GUC parameter **data-limit** is not set, and **data-limit** for function decoding is set to **0**, the upper limit of the decoding result is 10 GB.

iii. If the GUC parameter **data-limit** is set, and **data-limit** for function decoding is not set or is set to **0**, the upper limit of the decoding result is the value of the GUC parameter **data-limit**.

iv. If both the GUC parameter **data-limit** and **data-limit** of the function are set, the smaller value is used as the upper limit of the decoding result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The size of a decoding result file may exceed the value of **data-limit**.

- xlog_dir

  The archive log folder can be decoded, and the folder name is the same as the first eight digits of the WAL file. Decoding can be performed only when **enable-ddl** is set to **1** and the input **start_lsn** and **upto_lsn** are valid intervals. Value range: full path of the folder.

  For details, see "Logical Replication > Logical Decoding > Logical Decoding Data Retrieval" in *Feature Guide*.

  ```
  gaussdb=# SELECT * FROM pg_logical_get_area_changes('1/F9FC24C8', '1/FA67B2A0', NULL, 'sql_decoding', NULL ,'enable-ddl','1','xlog_dir','/base/username/xlog_dir/00000000');
  ```

- decode-sequence

  Specifies whether to output the decoding result of the change log of the sequence value, which is a logical decoding control parameter.

  Value range: Boolean. The default value is **false**.

  - The value cannot be set to **true** currently.
  - **false**: The decoding result of the change log of the sequence value is not output.

NOTICE

Currently, **decode-sequence** can only be set to **false**. If **decode-sequence** is set to **true**, an error is reported when decoding is started.

NOTE

pg_logical_get_area_changes takes effect only for the preceding parameters. It does not take effect for the other parameters such as **max-txn-in-memory**, **include-user**, **exclude-userids**, **exclude-users** and **dynamic-resolution** (for details, see pg_logical_slot_peel_changes).

Example:

```
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# SELECT pg_current_xlog_location();
 pg_current_xlog_location
--------------------------
 0/5ECBCD48
(1 row)

gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# UPDATE t1 SET b = 2 WHERE a = 1;

pg_get_replication_slots()

Description: Obtains the replication slot list. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and PDB data is returned if this function is called in a PDB.

Return type: text, text, text, oid, Boolean, xid, xid, text, Boolean, text, xid, and text

Example:

```
gaussdb=# SELECT * FROM pg_get_replication_slots();
 slot_name |     plugin     | slot_type | datoid | active | xmin | catalog_xmin | restart_lsn | dummy_standby |
confirmed_flush | confirmed_csn | dictionary_csn_min | slot_dictionary_type
-----------+----------------+-----------+--------+--------+------+--------------+-------------+---------------
+-----------------+---------------+--------------------+----------------------
 dn_6002   |                | physical  |      0 | t      |      |              | 0/3622B528  | f             |

(4 rows)
```

Note: In the returned value, **slot_name** indicates the name of the replication slot, **plugin** indicates the name of the output plug-in corresponding to the logical replication slot, **slot_type** indicates the type of the replication slot (**physical** indicates the physical replication slot, and **logical** indicates the logical replication slot), **datoid** indicates the OID of the database where the replication slot resides, **active** specifies whether the replication slot is activated (**f**: not activated; **t**: activated), **xmin** indicates the transaction ID of the earliest transaction reserved by the database for the replication slot, **catalog_xmin** indicates the transaction ID of the earliest transaction related to the system catalog reserved by the database for the logical replication slot, **restart_lsn** indicates the physical location of the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

earliest Xlog required by the replication slot, **dummy_standby** is a reserved parameter, **confirmed_csn** indicates that the client confirms the CSN corresponding to the last transaction in the received log (This parameter is dedicated to logical replication slots.), **confirmed_flush** indicates that the client confirms the location of the received log (dedicated for logical replication slots), **dictionary_csn_min** indicates the CSN of the earliest transaction involving the dictionary table that the database must reserve for the logical replication slot, and **slot_dictionary_type** indicates the type of the logical replication slot.

NOTICE

When a query is performed on a DN, the **confirmed_csn** query result of the LSN-based logical replication slot is empty, and the **confirmed_flush** query result of the CSN-based logical replication slot is empty.

gs_get_parallel_decode_status()

Description: Monitors the length of the read log queue and decoding result queue of each decoder thread to locate the concurrent decoding performance bottleneck. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and PDB data is returned if this function is called in a PDB.

Table 7-100 Description

Column	Return Type	Description
slot_name	text	Replication slot name.
parallel_decode_num	int4	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Current length of the log queue read by each decoder thread.
decode_change_queue_length	text	Current length of the decoding result decoded by each decoder thread.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	int8	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	int8	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	TimestampTz	Specifies the time of the latest WAL decoded by the replication slot.
reader_toast_memory	int8	Memory occupied by the TOAST of the current reader thread, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Return Type	Description
large_transactions	text	Large transaction information decoded in the current replication slot (a maximum of 511 bytes).
out_buf_memory	int8	Memory occupied by the out buffer used by the current sender thread, in bytes.

Example:

```
gaussdb=# SELECT * FROM gs_get_parallel_decode_status();
-[ RECORD 1 ]--------------+-----------------------------------------
slot_name                  | slot1
parallel_decode_num        | 4
read_change_queue_length   | queue0: 0, queue1: 0, queue2: 0, queue3: 0
decode_change_queue_length | queue0: 0, queue1: 0, queue2: 0, queue3: 0
reader_lsn                 | 0/DB2E4C0
working_txn_cnt            | 0
working_txn_memory         | 0
decoded_time               | 2024-04-26 09:57:48+08
reader_toast_memory        | 0
large_transactions         | [xid, first_lsn, memory, entry num] : NULL
out_buf_memory             | 0
```

NOTICE

The value of **decoded_time** comes from checkpoint logs and transaction commit logs, which has a certain error. If no log containing the time is decoded, "2000-01-01 08:00:00+08" (depending on the time zone set in the database) is displayed.

gs_get_slot_decoded_wal_time(slot_name)

Description: Queries the time of the latest WAL decoded by a replication slot. In the multi-tenancy scenario, a non-PDB can view information about a replication slot of either the non-PDB or the PDB. When a PDB calls this function, it returns information about a replication slot of the PDB itself.

Parameters:

- slot_name

  Specifies the name of the replication slot to be queried.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

Example:

```
gaussdb=# SELECT * FROM gs_get_slot_decoded_wal_time('replication_slot');
 gs_get_slot_decoded_wal_time
------------------------------
 2023-01-10 11:25:22+08
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: The returned values indicate the time of the latest WAL decoded by the replication slot.

NOTICE

The returned time comes from checkpoint logs and transaction commit logs, which has a certain error. If no log containing the time is decoded, "2000-01-01 08:00:00+08" (depending on the time zone set in the database) is displayed. When you query the latest decoded WAL time of a logical replication slot that does not exist, **NULL** is returned. In gsql, the display of **NULL** is related to the setting, which can be set using **\pset null'null'**.

gs_get_logical_decode_parameter()

Description: Queries the parameter options of active parallel logical decoding tasks. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and PDB data is returned if this function is called in a PDB.

Table 7-101 Description

Column	Return Type	Description
slot_name	text	Replication slot name.
include_xids	bool	Specifies whether the decoding information contains xid.
include_timestamp	bool	Specifies whether decoded information contains the timestamp.
skip_empty_xacts	bool	Specifies whether to ignore empty transactions in the decoding result.
only_local	bool	Specifies whether to decode only the data generated in the current database.
include_username	bool	Specifies whether the BEGIN log of a transaction contains the username.
enable_ddl_decoding	bool	Specifies whether to enable the decoding of DDL statements.
enable_ddl_json_format	bool	Specifies whether to enable the JSON output format of DDL reverse parsing.
max_txn_in_memory	int64	Maximum memory occupied by transactions. (This parameter is deprecated and does not take effect.)
max_reorderbuffer_in_memory	int64	Maximum memory for the current decoding task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Return Type	Description
decode_style	char	Decoding format.
parallel_decode_num	int64	Number of decoder threads for parallel decoding.
sending_batch	int64	Specifies whether to send messages in batches.
parallel_queue_size	int64	Specifies the length of the queue for interaction between parallel logical decoding threads.
enable_heartbeat	bool	Specifies whether to generate heartbeat logs
slice_id	int64	Specifies the shard ID of the replication table.
output_start_csn	int64	CSN position where the output starts.
output_start_lsn	int64	LSN position where the output starts.
logical_reader_bind_cpu	int64	ID of the CPU bound to the reader thread.
logical_decoder_bind_cpu_index	int64	Index of the CPU bound to the decoder thread.
auto_advance	bool	Specifies whether to automatically update.
skip_generated_columns	bool	Specifies whether to skip the result output of the generated column.
big_transaction_limit	int64	Memory usage limit for determining whether a transaction is a large transaction, in bytes.
exclUser	text	Specifies the name list of blacklisted users.
table_white_list	text	Whitelist table parameter.

Example:

```
test=# select * from gs_get_logical_decode_parameter();
-[ RECORD
1 ]----------------------
```

```
max_reorderbuffer_in_memory: 1, decode_style: j, parallel_decode_num: 4, sending_batch: 0,
parallel_queue_size: 128, enable_heartbeat: 0, slice_id: -1, output_start_csn: 0, output_start_lsn: 0,
logical_reader_bind_cpu: -1, logical_decoder_bind_cpu_index: -1, auto_advance: 0, skip_generated_columns:
0, big_transaction_limit: 10, exclUser: , table_white_list:
```

gs_logical_parallel_decode_status('slot_name')

Description: Obtains the decoding statistics of a replication slot for parallel logical decoding, including 26 rows of statistical items. In the multi-tenancy scenario, when a non-PDB calls this function, it returns information about a replication slot of either the PDB or the non-PDB. When a PDB calls this function, it returns data from a replication slot of the PDB itself.

The descriptions of the statistical items are listed in the following table.

```
Record - (stat_id int, stat_name TEXT, value TEXT)
```

Table 7-102 Description

Statistical Item	Description
slot_name	Name of the logical replication slot.
reader_lsn	Location of the logical logs to be decoded.
wal_read_total_time	Time required for loading the log module.
wal_wait_total_time	Time required for waiting for log decoding.
parser_total_time	Processing duration of the reader thread.
decoder_total_time	Processing duration of all decoder threads.
sender_total_time	Processing duration of the sender thread.
net_send_total_time	Time required for the network to send logical logs.
net_wait_total_time	Time required for the network to wait for sending logical logs.
net_send_total_bytes	Number of logical log bytes sent by the network.
transaction_count	Number of transactions.
big_transaction_count	Number of large transactions.
max_transaction_tuples	Maximum number of transaction operation tuples.
sent_transaction_count	Number of transactions sent (by the local database).
spill_disk_transaction_count	Number of flushed transactions.
spill_disk_bytes	Total number of bytes flushed to disk.
spill_disk_count	Number of disk flushing times.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Statistical Item	Description
input_queue_full_count	Total number of times that the input queues of all decoder threads are full.
output_queue_full_count	Total number of times that the output queues of all decoder threads are full.
dml_count	Total number of DML statements in WALs decoded by each decoder thread in the local database.
dml_filtered_count	Total number of DML statements in WALs decoded and filtered by each decoder thread in the local database.
toast_count	Number of modified TOAST table rows.
candidate_catalog_xmin	Indicates the **catalog_xmin** candidate point of the current logical replication slot.
candidate_xmin_lsn	Updates the log confirmation receiving point required by **catalog_xmin**.
candidate_restart_valid	Updates the log confirmation receiving point required by **restart_lsn**.
candidate_restart_lsn	Indicates the **restart_lsn** candidate point of the current logical replication slot.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

Return type: int, text, text

Example:

```
gaussdb=# SELECT * FROM gs_logical_parallel_decode_status('replication_slot');
 stat_id |          stat_name           |      value
---------+------------------------------+------------------
       1 | slot_name                    | replication_slot
       2 | reader_lsn                   | 0/357E180
       3 | wal_read_total_time          | 266694599
       4 | wal_wait_total_time          | 266691307
       5 | parser_total_time            | 39971
       6 | decoder_total_time           | 81216
       7 | sender_total_time            | 48193
       8 | net_send_total_time          | 19388
       9 | net_wait_total_time          | 0
      10 | net_send_total_bytes         | 266897
      11 | transaction_count            | 7
      12 | big_transaction_count        | 1
      13 | max_transaction_tuples       | 4096
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    14 | sent_transaction_count       | 7
    15 | spill_disk_transaction_count | 1
    16 | spill_disk_bytes             | 244653
    17 | spill_disk_count             | 4096
    18 | input_queue_full_count       | 0
    19 | output_queue_full_count      | 0
    20 | dml_count                    | 4097
    21 | dml_filtered_count           | 0
    22 | toast_count                  | 0
    23 | candidate_catalog_xmin       | 17152
    24 | candidate_xmin_lsn           | 0/420A598
    25 | candidate_restart_valid      | 0/420A598
    26 | candidate_restart_lsn        | 0/420A598
(26 rows)
```

Note: According to the definitions of statistical items, they must meet the following requirements:

wal_read_total_time >= wal_wait_total_time;

transaction_count >= big_transaction_count;

transaction_count >= sent_transaction_count;

transaction_count >= spill_disk_transaction_count;

dml_count >= dml_filtered_count;

dml_count >= toast_count;

If spill_transaction_count == 0, then spill_disk_bytes == 0;

However, frequent locking and unlocking are required, which greatly affects the performance. As a result, the preceding constraints may not be met in extreme cases.

transaction_count indicates the number of transactions in all databases.

sent_transaction_count indicates the number of transactions sent by the local database because transactions that are not in the local database will not be sent.

If the value of **slot_name** does not exist, the function does not report an error and the return value is empty.

gs_logical_parallel_decode_reset_status('slot_name')

Description: Resets indicators in **gs_logical_parallel_decode_status('slot_name')**. In the multi-tenancy scenario, a non-PDB can reset both the PDB's and non-PDB's replication slot metrics, while a PDB can reset its own replication slot metrics.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

Return type: text

Example:

```
gaussdb=# SELECT * FROM gs_logical_parallel_decode_reset_status('replication_slot');
 gs_logical_parallel_decode_reset_status
-----------------------------------------
 OK
(1 row)

gaussdb=# SELECT * FROM gs_logical_parallel_decode_status('replication_slot');
 stat_id |          stat_name           |      value
---------+------------------------------+------------------
       1 | slot_name                    | replication_slot
       2 | reader_lsn                   | 0/357E420
       3 | wal_read_total_time          | 0
       4 | wal_wait_total_time          | 0
       5 | parser_total_time            | 0
       6 | decoder_total_time           | 0
       7 | sender_total_time            | 0
       8 | net_send_total_time          | 0
       9 | net_wait_total_time          | 0
      10 | net_send_total_bytes         | 0
      11 | transaction_count            | 0
      12 | big_transaction_count        | 0
      13 | max_transaction_tuples       | 0
      14 | sent_transaction_count       | 0
      15 | spill_disk_transaction_count | 0
      16 | spill_disk_bytes             | 0
      17 | spill_disk_count             | 0
      18 | input_queue_full_count       | 0
      19 | output_queue_full_count      | 0
      20 | dml_count                    | 0
      21 | dml_filtered_count           | 0
      22 | toast_count                  | 0
      23 | candidate_catalog_xmin       | 0
      24 | candidate_xmin_lsn           | 0/0
      25 | candidate_restart_valid      | 0/420A598
      26 | candidate_restart_lsn        | 0/420A598
(26 rows)
```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is **invalid slot name**.

Do not reset a replication slot that is being observed. The error information is as follows:

1. If **slot_name** is empty, the following error is reported: "ERROR: inputString should not be NULL".
2. If **slot_name** is not empty but does not exist, no error is reported but "invalid slot name" is displayed.
3. If **slot_name** is not empty but the replication slot corresponding to **slot_name** is being observed, no error is reported but "can't reset during observing! use gs_logical_decode_stop_observe to stop" is displayed.

gs_logical_decode_start_observe('slot_name', window, interval)

Description: Enables logical replication performance sampling. In the multi-tenancy scenario, a non-PDB can enable logical replication performance metric sampling for both PDB and non-PDB, while a PDB can enable only its own logical replication performance metric sampling.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- window

  Specifies the sampling window.

  Value range: an integer ranging from 2 to 1024. Sampling data in the latest *interval* x *window* period is collected.

- interval

  Specifies the performance monitoring interval, in seconds.

  Value range: interval type. The minimum value is 1s and the maximum value is 1 minute. Sampling data in the latest *interval* x *window* period is collected.

  Return type: text

Example:

```
gaussdb=# SELECT * FROM gs_logical_decode_start_observe('replication_slot',20,5);
 gs_logical_decode_start_observe
---------------------------------
 OK
(1 row)

gaussdb=# select * from gs_logical_decode_start_observe('replication_slot',20,5);
 gs_logical_decode_start_observe
---------------------------------
 observe has started!
(1 row)
```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is **invalid slot name**.

Do not enable the observe function for a replication slot that is being observed. The error information is as follows:

1. If **slot_name** is empty, the following error is reported: "ERROR: inputString should not be NULL".
2. If **slot_name** is not empty but does not exist, no error is reported but "invalid slot name" is displayed.
3. If the value of **window** is less than **2**, "window has to be >= 2" is displayed.
4. If the value of **window** is greater than **1024**, "window has to be <= 1024" is displayed.
5. If the value of **interval** is less than 1s, "sample interval has to be >= 1s" is displayed.
6. If the value of **interval** is greater than 60s, "sample interval has to be <= 60s" is displayed.
7. If **slot_name** is not empty but the observe function has been enabled for the replication slot corresponding to **slot_name**, no error is reported and the message "observe has started!" is displayed.

gs_logical_decode_stop_observe('slot_name')

Description: Stops logical replication performance sampling. In the multi-tenancy scenario, a non-PDB can disable logical replication performance metric sampling for both PDB and non-PDB, while a PDB can disable only its own logical replication performance metric sampling.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- Return type: text

Example:

```
gaussdb=# SELECT * FROM gs_logical_decode_stop_observe('replication_slot');
 gs_logical_decode_stop_observe
--------------------------------
 OK
(1 row)

gaussdb=# SELECT * FROM gs_logical_decode_stop_observe('replication_slot');
 gs_logical_decode_stop_observe
--------------------------------
 observe not started!
(1 row)
```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is **invalid slot name**.

Do not disable the observe function for a replication slot that is not observed. The error information is as follows:

1. If **slot_name** is empty, the following error is reported: "ERROR: inputString should not be NULL".
2. If **slot_name** is not empty but does not exist, no error is reported but "invalid slot name" is displayed.
3. If **slot_name** is not empty but the observe function has been disabled for the replication slot corresponding to **slot_name**, no error is reported and the message "observe not started!" is displayed.

gs_logical_decode_observe_data('slot_name')

Description: Displays the original logical replication performance sampling data. In the multi-tenancy scenario, when a non-PDB calls this function, it returns information about a replication slot of either the PDB or the non-PDB. When a PDB calls this function, it returns data from a replication slot of the PDB itself.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- Return type: SETOF record

Example:

```
gaussdb=# SELECT * FROM gs_logical_decode_observe_data('replication_slot');
 slot_name |          sample_time          | reader_lsn | wal_read_total_time | wal_wait_total_time |
parser_total_time | decoder_total_time | sender_total_time | net_send_total_time | net_send_total_bytes |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is an empty record.

gs_logical_decode_observe('slot_name')

Description: Displays logical replication performance data. In the multi-tenancy scenario, a PDB displays only its own logical replication performance metrics, while a non-PDB displays the metrics of both non-PDB and PDB.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Return type: SETOF record

Example:

```
gaussdb=# SELECT * FROM gs_logical_decode_observe('replication_slot');
    slot_name     |          sample_time          | logical_decode_rate | wal_read_rate | parser_rate  |
decoder_rate  |  sender_rate  | net_send_rate
------------------+-------------------------------+---------------------+---------------+--------------+----------------
+---------------+--------------

1152000000.000 | 144000000.000 | 0.000
```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is an empty record. If the denominator is 0, the latest collected valid data is returned. If the denominator is not 0 and the numerator is 0, **0** is returned.

Formula:

logical_decode_rate = (reader_lsn1 - reader_lsn2) / (sample_time1 - sample_time2)

wal_read_rate = (reader_lsn1 - reader_lsn2) / (wal_read_total_time1 - wal_read_total_time2) - (wal_wait_total_time1 - wal_wait_total_time2)

parser_rate = (reader_lsn1 - reader_lsn2) / (parser_total_time1 - parser_total_time2)

decoder_rate= (reader_lsn1 - reader_lsn2) / avg(decoder_total_time1[i]-decoder_total_time2[i])

sender_rate = (reader_lsn1 - reader_lsn2) / (sender_total_time1 - sender_total_time2) - (net_send_total_time1 - net_send_total_time2)

net_send_rate = (net_sent_bytes1 - net_sent_bytes2) / (net_send_total_time1 - net_send_total_time2) - (net_wait_total_time1 - net_wait_total_time2)

gs_logical_decode_observe_status('slot_name')

Description: Queries the monitoring status of a specified logical decoding task. In the multi-tenancy scenario, a PDB can view only the monitoring status of its own logical decoding task, while a non-PDB can view the monitoring status of both non-pdb and PDB logical decoding tasks.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- Return type: text

Example:

```
gaussdb=# SELECT * FROM gs_logical_decode_observe_status('replication_slot');
 gs_logical_decode_observe_status
----------------------------------
 START
(1 row)

gaussdb=# SELECT * FROM gs_logical_decode_observe_status('replication_slot');
 gs_logical_decode_observe_status
----------------------------------
 invalid slot name
(1 row)

gaussdb=# SELECT * FROM gs_logical_decode_stop_observe('replication_slot');
 gs_logical_decode_stop_observe
--------------------------------
 OK
(1 row)

gaussdb=# SELECT * FROM gs_logical_decode_observe_status('replication_slot');
 gs_logical_decode_observe_status
----------------------------------
 STOP
(1 row)
```

Note: If the value of **slot_name** does not exist, the function does not report an error and the return value is **invalid slot name**.

gs_get_parallel_decode_thread_info()

Description: Executes on the DN where parallel decoding is performed and returns the thread information of parallel decoding. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and PDB data is returned if this function is called in a PDB.

Return type: int64, text, text, int

Example:

```
gaussdb=# SELECT * FROM gs_get_parallel_decode_thread_info();
    thread_id    | slot_name | thread_type | seq_number
-----------------+-----------+-------------+------------
 140335364699904 | slot1     | sender      |          1
 140335214098176 | slot1     | reader      |          1
 140335325312768 | slot1     | decoder     |          1
 140335291750144 | slot1     | decoder     |          2
 140335274968832 | slot1     | decoder     |          3
 140335258187520 | slot1     | decoder     |          4
 140335165404928 | slot2     | sender      |          1
 140335022864128 | slot2     | reader      |          1
 140335129818880 | slot2     | decoder     |          1
 140335113037568 | slot2     | decoder     |          2
(10 rows)
```

Note: In the return values, **thread_id** indicates the thread ID, **slot_name** indicates the replication slot name, **thread_type** indicates the thread type (including the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sender, reader and decoder), and **seq_number** indicates the sequence number of each thread with same type in the current replication slot. Each parallel decoding connection only has one sender and reader. Therefore, the sequence numbers of the sender and reader are both 1. The sequence numbers of the decoder are arranged from 1 to the decoding degree of parallelism (DOP) of the current replication slot.

pg_replication_origin_create (node_name)

Description: Creates a replication source with a given external name and returns the internal ID assigned to it.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Name of the replication source to be created.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

Return type: oid

pg_replication_origin_drop (node_name)

Description: Deletes a previously created replication source, including any associated replay progress.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Name of the replication source to be deleted.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

pg_replication_origin_oid (node_name)

Description: Searches for a replication source by name and returns the internal ID. If no such replication source is found, an error is thrown.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Specifies the name of the replication source to be queried.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

Return type: oid

pg_replication_origin_session_setup (node_name)

Description: Marks the current session for replaying from a given origin, allowing you to track replay progress. This parameter can be used only when no origin is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

selected. Run the **pg_replication_origin_session_reset** command to cancel the configuration.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Name of the replication source.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

pg_replication_origin_session_reset ()

Description: Cancels the **pg_replication_origin_session_setup()** effect.

Note: The user who calls this function must have the SYSADMIN permission.

pg_replication_origin_session_is_setup ()

Description: Returns a true value if a replication source is selected in the current session.

Note: The user who calls this function must have the SYSADMIN permission.

Return type: Boolean

pg_replication_origin_session_progress (flush)

Description: Returns the replay position of the replication source selected in the current session.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- flush

  Determines whether the corresponding local transaction has been written to disk.

  Value range: Boolean

Return type: LSN

pg_replication_origin_xact_setup (origin_lsn, origin_timestamp)

Description: Marks the current transaction as recommitted at a given LSN and timestamp. This function can be called only when **pg_replication_origin_session_setup** is used to select a replication source.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- origin_lsn

  Position for replaying the replication source.

  Value range: LSN

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- origin_timestamp

  Time point when a transaction is committed.

  Value range: timestamp with time zone

pg_replication_origin_xact_reset ()

Description: Cancels the **pg_replication_origin_xact_setup()** effect.

Note: The user who calls this function must have the SYSADMIN permission.

pg_replication_origin_advance (node_name, lsn)

Description:

Sets the replication progress of a given node to a given position. This is primarily used to set the initial position, or to set a new position after a configuration change or similar change.

Note: Improper use of this function may cause inconsistent replication data.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Name of an existing replication source.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

- lsn

  Position for replaying the replication source.

  Value range: LSN

pg_replication_origin_progress (node_name, flush)

Description: Returns the position for replaying the given replication source.

Note: The user who calls this function must have the SYSADMIN permission.

Parameters:

- node_name

  Name of the replication source.

  Value range: a string, supporting only letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.).

- flush

  Determines whether the corresponding local transaction has been flushed to disk.

  Value range: Boolean

pg_show_replication_origin_status()

Description: Displays the replication status of the replication source.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: The user who calls this function must have the SYSADMIN permission.

Return type:

- **local_id**: OID, which specifies the ID of the replication source.
- **external_id**: text, which specifies the name of the replication source.
- **remote_lsn**: LSN of the replication source.
- **local_lsn**: local LSN.

gs_get_distribute_decode_status()

Description: Obtains the decoding status details (by replication slot) on the current node. This function is not supported in the current version, and an error is reported.

Return type: text, int, int, bigint, xid, xid, text, text, text

gs_get_distribute_decode_status_detail()

Description: Obtains the decoding status details (by DN) on the current node. This function is not supported in the current version, and an error is reported.

Return type: text, int, bigint, int, int, xid

gs_logical_dictionary_baseline()

Description: Baselines the data dictionary data for logical decoding. If the operation is successful, the time required is returned. If the operation fails, the failure cause is returned. In the multi-tenancy scenario, when this function is called within a non-PDB, it baselines existing data on all non-PDBs; when called within a PDB, it baselines existing data only on the current session's PDB.

Return type: text

gs_logical_dictionary_disabled()

Description: Disables the logical decoding data dictionary function and stops decoding incremental DDL statements. If the operation is successful, "OK" is returned. If the operation fails, the failure cause is returned. In the multi-tenancy scenario, when this function is called within a non-PDB, it disables the logical decoding data dictionary feature for all non-PDBs; when called within a PDB, it only disables the logical decoding data dictionary feature for the current session's PDB.

Return type: text

gs_logical_decode_lock()

Description: Specifies the lock placing API for upgrading and managing the logical decoding component. If the lock is placed, **t** is returned. If the lock fails to be placed, **f** is returned. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameter: **wait_time** specifies the lock waiting time. Value range: a non-negative number, in seconds. If no parameter is input, the lock waiting time is 0 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

gs_logical_decode_unlock()

Description: Specifies the lock releasing API for upgrading and managing the logical decoding component. There is no input parameter. If the lock is released, **t** is returned. If the lock fails to be released, **f** is returned. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: Boolean

gs_logical_decode_gaussdb_version()

Description: Specifies the query API for logical decoding component, which is used to view the commit records of the decoding component. There is no input parameter. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

gs_get_inter_cluster_version_info()

Description: Queries the version number of primary and standby databases, the version of the logical decoding component, and the replication type (logical replication or physical replication). There is no input parameter. This is an internal function used for rolling upgrade of a two-cluster major version and is not recommended for users. In the multi-tenancy scenario, this function is disabled in a PDB. Five columns are returned: 1. **remote_working_version** (remote kernel version); 2. **remote_logical_decoding_version** (remote decoding component version); 3. **local_working_version** (kernel version of the current node); 4. **local_logical_decoding_version** (decoding component version of the current node); 5. **replication_type** (replication type, **logic** indicating logical replication; **physic** indicating physical replication).

Return type: int, text, int, text, text

gs_get_logical_decoding_version()

Description: Views the current logical decoding component version and the baseline logical decoding component version. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameters:

- **current**: displays the version of the current logical decoding component.
- **basic**: displays the version of the baseline logical decoding component.

Return type: text

gs_add_logical_decoding_position_xlog()

Description: After this function is executed, Xlogs of the XLOG_STANDBY_DECODE_POSITION type are generated. The logs will be read by

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a decoding task in the current database to feed back the decoding position. Only users with the SYSADMIN, replication, or OPRADMIN permission can call this function; otherwise, the call fails. The execution frequency of this function is calculated based on the database statistics. The frequency of calling this function by each database is controlled by node. The minimum calling interval is 1 second.

Return type: text

gs_prepare_logical_standby_on_primary()

Description: Prepares for the physical-to-logical conversion on a primary node, writing logical standby metadata to physical logs. There is no input parameter. A UUID is returned. This function is for internal use only and can be executed only by administrators. You are advised not to use it. If a long transaction is not committed, no response is returned for a long time. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

gs_get_logical_standby_meta_for_switchover()

Description: Specifies the metadata required for preparing the logical standby node during a logical DR switchover. There is no input parameter or return value. This function is for internal use only and can be executed only by administrators. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Remarks: This is a high-risk operation function in logical DR scenarios. This function generates a logical standby node status file in the data directory. If this function is executed during a non-logical cluster switchover, the database instance status will be abnormal.

Return type: text

gs_get_logical_standby_info()

Description: Queries logical standby metadata. There is no input parameter, and five columns are returned. Column 1: current confirmed_csn of the logical standby node. Column 2: current restart_lsn of the logical standby node. Column 3: checksum corresponding to restart_lsn. Column 4: length recorded by restart_lsn. Column 5: UUID of each version metadata. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

gs_get_logical_data_dictionary_column_num()

Description: Obtains the version information of the decoding data dictionary. There is no input parameter, and two columns are returned. Column 1: system catalog name of a data dictionary. Column 2: the number of columns in a data dictionary table. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_get_current_lgc_state()

Description: Obtains the status of the current logical standby node. There is no input parameter. This function is for internal use only. You are advised not to use it. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

gs_stop_sqlapply()

Description: Manually stops the logical standby node. After the logical standby node is stopped, you need to use the gs_start_sqlapply() system function to start it again. After the logical standby node is manually stopped, it will not be restarted even if **sql_apply_autorun** is set to **on**. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: Boolean

gs_start_sqlapply()

Description: Manually starts the logical standby node. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: Boolean

gs_get_sqlapply_replaying_status()

Description: Queries the replay status of the current logical standby node. In the multi-tenancy scenario, this function is disabled in a PDB.

Table 7-103 Description

Column	Description
oldest_commited_txn_xid	XID of the latest committed transaction among the currently committed transactions.
oldest_commited_txn_csn	CSN of the latest committed transaction among the currently committed transactions.
oldest_commited_txn_sn	Sequence number of the latest committed transaction among the currently committed transactions.
restart_lsn	restart_lsn of the current logical standby node.
confirmed_csn	confirmed_csn of the current logical standby node.
playback_confirmed_csn	confirmed_csn of the transaction corresponding to the array head in the replay file of the logical standby node.
last_sec_replay_txn_cnt	Number of transactions replayed in the last second.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
conflict_record_start_txn_sn	Start transaction ID of the row modified in conflict detection records.
conflict_record_total_num	Total number of rows modified in conflict detection records.
max_committed_txn_sn	Maximum ID of the committed transaction.
schedule_txn_xid	XID of the current scheduling transaction.
schedule_txn_sn	ID of the current scheduling transaction.
schedule_txn_commit_csn	commit_csn of the current scheduling transaction.
schedule_txn_depend_txn_max_sn	Maximum ID of the transaction on which the current scheduling transaction depends.
schedule_txn_number	Number of times the current transaction is scheduled.
replay_txn_total_number	Total number of replayed transactions.
replay_txn_total_time	Total time required for replaying all transactions. (unit: μs)
replay_txn_max_time	Maximum duration for replaying a single transaction. (unit: μs)
replay_txn_max_change_number	Maximum number of changes that can be replayed for a single transaction.
wait_schedule_txn_count	Number of waiting times for transaction scheduling.
wait_schedule_txn_total_time	Waiting time for transaction scheduling. (unit: μs)
free_sqlapply_worker_count	Number of idle replayer threads.
need_analyze_txn_count	Number of transactions to be concurrently analyzed in the analyzer thread queue.
need_schedule_txn_count	Number of transactions to be scheduled in the dispatcher thread queue.
is_dispatcher_suspended	Specifies whether the dispatcher thread is suspended.
dispatcher_suspended_start_time	Start time when the dispatcher thread is suspended.
log_receive_thread_restart_times	Number of restart times of the logical replay logs receiving thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
sqlapply_failover_status	Current failover status of logical replay. Value range: • **FAILOVER_INIT**: A failover has not been performed. This is the initial state. • **FAILOVER_NOTICE_KILL**: notifies the WAL receiver to exit. • **FAILOVER_CHECK_SQL_APPLY_END**: checks whether the logical standby node has exited. • **FAILOVER_COPY_XLOG**: copies log for failover. • **FAILOVER_SUCCESS**: The failover is successful.
sqlapply_cache_session_count	Number of cached sessions for logical replay.
sqlapply_recycle_log_ptr	Position of the last recycled log for logical replay.
sqlapply_receive_log_ptr	Position of the received log for logical replay.
sqlapply_end_ptr	End position of logical replay failover (or switchover).
sqlapply_decode_log_read_ptr	Read position of logical replay decoding log.
sqlapply_decode_txn_max_commit_csn	Maximum commit_csn of decoded transactions during logical replay.
sqlapply_init_dorado_write_log_ptr	Write position of the Dorado disk initialization log during a failover or switchover.
sqlapply_failover_start_time	Start time of a logical replay failover (or switchover).
sqlapply_logical_init_time	Time when the logical standby device is initialized.
sqlapply_thread_status	The status of threads related to SQL apply.
sqlapply_manual_stop	Specifies whether threads related to SQL apply have been manually stopped.

Example:

```
gaussdb=# SELECT * FROM gs_get_sqlapply_replaying_status();
 stat_id |             stat_name              |              value
---------+------------------------------------+---------------------------------
       1 | oldest_commited_txn_xid            | 51675053
       2 | oldest_commited_txn_csn            | 51676580
       3 | oldest_commited_txn_sn             | 50847157
       4 | restart_lsn                        | 1A/5E9E2560
       5 | confirmed_csn                      | 829423
```

rows)
```

gs_get_sqlapply_playback_progress()

Description: Queries the array information in the replay file of the logical standby node. The query result is the remote transaction information from the head position to the tail position in the replay file of the current logical standby node. All remote transactions before the head position have been replayed. Transaction in the tail position is the latest remote transaction that needs to be replayed in the current array. Remote transactions from the head position to the tail position have or have not been replayed. In the multi-tenancy scenario, this function is disabled in a PDB.

Note: If the current database instance is not a logical standby database instance, the query result is inaccurate and some fields use the default values.

Table 7-104 Description

Column	Description
xid	XID of the current remote transaction.
sequence_number	Sequence number of the current remote transaction that is being replayed.
remote_csn	CSN of the current remote transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
begin_time	Start time of the current remote transaction replay on the logical standby node.
end_time	End time of the current remote transaction replay on the logical standby node.
status	Specifies whether the remote transaction has been replayed on the logical standby node. **t** indicates that the replay is complete, and **f** indicates that the replay is not complete.

Example:

```
gaussdb=# SELECT * FROM gs_get_sqlapply_playback_progress();
  xid   | sequence_number | remote_csn |          begin_time           |          end_time             | status

```

gs_change_replication_slot_plugin('slot_name', 'plugin_name')

Description: Modifies the plug-in type of a logical replication slot. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameters:

- slot_name

  Indicates the name of the streaming replication slot.

  Value range: a string, supporting only lowercase letters, digits, underscores (_), question marks (?), hyphens (-), and periods (.). One or two periods cannot be used alone as the replication slot name.

- plugin_name

  Indicates the name of the plug-in.

  Value range: a string. Currently, **mppdb_decoding**, **sql_decoding**, **parallel_binary_decoding**, **parallel_json_decoding**, and **parallel_text_decoding** are supported.

Return type: Boolean. The default value is **true**.

Example:

Query information about the current replication slot.

```
gaussdb=# SELECT * FROM pg_get_replication_slots();
 slot_name |          plugin           | slot_type | datoid | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn | dictionary_csn_min | slot_dictionary_type
-----------+---------------------------+-----------+--------+--------+------+--------------+-------------+---------------
+-----------------+---------------+--------------------+----------------------
 slot1     | parallel_json_decoding    | logical   |  12834 | f      |      |              | 0/125A15E0  | f             |
0/125E84D0      |                 |                7787 | dictionary table
 slot2     | parallel_binary_decoding | logical   |  12834 | f      |      |              | 0/E9C71B0   | f             | 0/
```

```

gs_logicalstandby_skip(stmt text, dbname text, schema text, object text, dump text)

Description: Configures a rule for skipping objects during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to handle logical replay blocking issues. In the multi-tenancy scenario, this function is disabled in a PDB.

If any of the parameters, that is, **stmt**, **dbname**, **schema**, and **object**, differs from an existing configured rule, calling this function will add a new rule.

If all parameters, that is, **stmt**, **dbname**, **schema**, and **object**, are the same as those of an existing configured rule, calling this function will update the **dump** value.

Parameters:

- stmt

  Type of a statement to be skipped during replay.

  Value range: a string. For details about the supported types, see **Table 7-105**.

  Table 7-105 Level-1 and level-2 statements that can be skipped

Level-1 Statement Type	Level-2 Statement Type
dml	insert/update/delete

- dbname

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name of a database to be skipped during replay.

Value range: a string. The value is the same as that of **database_name** in CREATE DATABASE.

- schema

  Name of a schema to be skipped during replay.

  Value range: a string. The value is the same as that of **schema_name** in CREATE SCHEMA.

- object

  Name of an object to be skipped during replay. Currently, only the database table name is supported.

  Value range: a string.

- dump

  Mode of recording transaction details.

  Value range: a string. The supported types are as follows: **all** records details of the entire transaction, **no** does not record details of the transaction, and **skip** records details of the transaction skip change.

  This parameter can be left empty. The default value is **skip**.

Return type: Boolean. The default value is **true**.

Example:

- Set a rule to skip all DML statements for the **systest** database, **public** schema, and table **t1**, with **dump** set to **all**.

```
gaussdb=# SELECT gs_logicalstandby_skip('dml', 'systest', 'public', 't1', 'all');
 gs_logicalstandby_skip
------------------------
 t
(1 row)
```

- Set a rule to skip INSERT statements for the **systest** database, **schema_test** schema, and table **t2**, with **dump** left empty.

```
gaussdb=# SELECT gs_logicalstandby_skip('insert', 'systest', 'schema_test', 't2');
 gs_logicalstandby_skip
------------------------
 t
(1 row)
```

gs_logicalstandby_unskip(stmt text, dbname text, schema text, object text)

Description: Cancels a rule for skipping objects during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to cancel the skipping rules during logical replay. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameters:

- stmt

  Type of a statement to be skipped during replay.

  Value range: a string. For details about the supported types, see **Table 7-105**.

- dbname

  Name of a database to be skipped during replay.

  Value range: a string. The value is the same as that of **database_name** in CREATE DATABASE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- schema

  Name of a schema to be skipped during replay.

  Value range: a string. The value is the same as that of **schema_name** in CREATE SCHEMA.

- object

  Name of an object to be skipped during replay. Currently, only the database table name is supported.

  Value range: a string.

Return type: Boolean. The default value is **true**.

Example:

- Cancel a rule that skips all DML statements for the **systest** database, **public** schema, and table **t1**.

```
gaussdb=# SELECT gs_logicalstandby_unskip('dml', 'systest', 'public', 't1');
 gs_logicalstandby_unskip
--------------------------
 t
(1 row)
```

gs_logicalstandby_skip_txn(csn int64, xid int64, dump text)

Description: Configures a rule for skipping transactions during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to handle logical replay blocking issues. In the multi-tenancy scenario, this function is disabled in a PDB.

If any of the parameters, that is, **csn** and **xid**, differs from an existing configured rule, calling this function will add a new rule.

If all parameters, that is, **csn** and **xid**, are the same as those of an existing configured rule, calling this function will update the **dump** value.

Parameters:

- csn

  CSN of the transaction to be skipped.

  Value range: a 64-bit integer ranging from 1 to 2^63 – 1.

- xid

  ID of the transaction to be skipped.

  Value range: a 64-bit integer ranging from 3 to 2^63 – 1.

- dump

  Mode of recording transaction details.

  Value range: a string. The supported types are as follows: **all** records details of the entire transaction, **no** does not record details of the transaction, and **skip** records details of the transaction skip change.

  This parameter can be left empty. The default value is **skip**.

  Values **'all'** and **'skip'** of **dump** in this system function are equivalent.

Return type: Boolean. The default value is **true**.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Set a rule to skip transaction with CSN **123456** and ID **345678**, with **dump** set to **all**.

```
gaussdb=# SELECT gs_logicalstandby_skip_txn(123456, 345678, 'all');
 gs_logicalstandby_skip_txn
----------------------------
 t
(1 row)
```

- Set a rule to skip transaction with the CSN **123456** and ID **345678**, with **dump** left empty.

```
gaussdb=# SELECT gs_logicalstandby_skip_txn(123456, 345678);
 gs_logicalstandby_skip_txn
----------------------------
 t
(1 row)
```

gs_logicalstandby_unskip_txn(csn int64, xid int64)

Description: Cancels a rule for skipping transactions during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to cancel the skipping rules during logical replay. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameters:

- csn

  CSN of the transaction to be skipped.

  Value range: a 64-bit integer ranging from 1 to 2^63 – 1.

- xid

  ID of the transaction to be skipped.

  Value range: a 64-bit integer ranging from 3 to 2^63 – 1.

Return type: Boolean. The default value is **true**.

Example:

- Cancel a rule that skips transaction with the CSN **123456** and ID **345678**.

```
gaussdb=# SELECT gs_logicalstandby_unskip_txn(123456, 345678);
 gs_logicalstandby_unskip_txn
------------------------------
 t
(1 row)
```

gs_logicalstandby_skip_err(stmt text, dbname text, schema text, object text, dump text)

Description: Configures a rule for skipping transactions where error statements exist during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to handle logical replay blocking issues. In the multi-tenancy scenario, this function is disabled in a PDB.

If any of the parameters, that is, **stmt**, **dbname**, **schema**, and **object**, differs from an existing configured rule, calling this function will add a new rule.

If all parameters, that is, **stmt**, **dbname**, **schema**, and **object**, are the same as those of an existing configured rule, calling this function will update the **dump** value.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- stmt

  Type of a statement to be skipped during replay.

  Value range: a string. For details about the supported types, see **Table 7-105**.

- dbname

  Name of a database to be skipped during replay.

  Value range: a string. The value is the same as that of **database_name** in CREATE DATABASE.

- schema

  Name of a schema to be skipped during replay.

  Value range: a string. The value is the same as that of **schema_name** in CREATE SCHEMA.

- object

  Name of an object to be skipped during replay. Currently, only the database table name is supported.

  Value range: a string.

- dump

  Mode of recording transaction details.

  Value range: a string. The supported types are as follows:

  – **all**: records details of the entire transaction.

  – **no**: does not record details of the transaction.

  – **skip**: records details of the transaction skip change.

  This parameter can be left empty. The default value is **skip**.

Return type: Boolean. The default value is **true**.

Example:

- Set a rule to skip error DML statements for the **systest** database, **public** schema, and table **t1**, with **dump** set to **all**.

```
gaussdb=# SELECT gs_logicalstandby_skip_err('dml', 'systest', 'public', 't1', 'all');
 gs_logicalstandby_skip_err
----------------------------
 t
(1 row)
```

- Set a rule to skip error INSERT statements for the **systest** database, **schema_test** schema, and table **t2**, with **dump** left empty.

```
gaussdb=# SELECT gs_logicalstandby_skip_err('insert', 'systest', 'schema_test', 't2');
 gs_logicalstandby_skip_err
----------------------------
 t
(1 row)
```

gs_logicalstandby_unskip_err(stmt text, dbname text, schema text, object text)

Description: Cancels the rule for skipping transactions where error statements exist during logical replay. It can only be executed by an administrator on the primary node of a standby database for DR to cancel the skipping rules during logical replay. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- stmt

  Type of a statement to be skipped during replay.

  Value range: a string. For details about the supported types, see **Table 7-105**.

- dbname

  Name of a database to be skipped during replay.

  Value range: a string. The value is the same as that of **database_name** in CREATE DATABASE.

- schema

  Name of a schema to be skipped during replay.

  Value range: a string. The value is the same as that of **schema_name** in CREATE SCHEMA.

- object

  Name of an object to be skipped during replay. Currently, only the database table name is supported.

  Value range: a string.

Return type: Boolean. The default value is **true**.

Example:

- Cancel a rule that skips error DML statements for the **systest** database, **public** schema, and table **t1**.

```
gaussdb=# SELECT gs_logicalstandby_unskip_err('dml', 'systest', 'public', 't1');
 gs_logicalstandby_unskip_err
------------------------------
 t
(1 row)
```

7.6.26.11 Segment-Page Storage Functions

NOTE

To create a segment-page table on the Astore, you need to set **segment** to **on** when creating the table. For example:

```
CREATE TABLE t1(id int) WITH (segment=on, storage_type=astore);
```

- The values of the fields related to the segment-page storage function are described as follows:

  a. **forknum**: data file fork.

     Value range: [**0**: mainfork; **1**: fsmfork; **2**: vm fork].

  b. **file id**: data file ID.

     Value range: [**1**: metadata file; **2**–**5**: data file].

  c. **blocks**: extent size.

     Value range: [1: No.1 file; 8: No.2 file; 128: No.3 file; 1024: No.4 file; 4096: No.5 file].

  d. **file_block_id**/**head_block_id**/**block_id**: offset page number of the physical page in the data file and other fields that indicate the page number.

     Value range: [0,4294967294]

  e. **page_ type**: page type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

Meta pages: **file head**/**file_header**: file header; **spc head**/**spc_header**: space header; **map head**/**map_header**: mapping header; **map page**/**map_pages**: mapping page; **reverse pointer page**/**inverse pointer page**/**ip pages**: reverse pointer page; **segment head page**/**segment head**: segment header page; **level1 page**: level-1 page; **data_pages**/**data extent**: data page; **fork head**: fork header.

Data pages: **heap**, **uheap**, **btree**, and **ubtree**.

Unknown pages: **unknown(data extent)**: all-zero segment page whose type cannot be determined; **unknown(fsm indexurq)**: fsm or indexurq page.

f. **contents**: storage content of a data file.

Value range: **permanent** (permanent), **unlogged** (no log), **temporary** (global temporary), and **temporary2** (local temporary)

local_space_shrink(tablespacename TEXT, databasename TEXT)

Description: Shrinks specified physical segment-page space on the current node. Only the currently connected database can be shrank.

Return value: empty

gs_space_shrink(tablespace int4, database int4, extent_type int4, forknum int4)

Description: Works similar to **local_space_shrink**, that is, shrinks specified physical segment-page space. However, the parameters are different. The input parameters are the OIDs of the tablespace and database, and the value of **extent_type** is an integer ranging from 2 to 5. Note: The value **1** of **extent_type** indicates segment-page metadata. Currently, the physical file that contains the metadata cannot be shrunk. This function is used only by tools. You are advised not to use it directly.

Return value: empty

gs_stat_remain_segment_info()

Description: Runs on the primary node to query extents on the local node with residual data due to faults. By default, only the initial user, users with the SYSADMIN attribute, and users with the OPRADMIN attribute in the O&M mode can view the information. Other users can view the information only after being granted permissions. This function can be executed only on the primary node. Residual extents are classified into two types: segments that are allocated but not used and extents that are allocated but not used. The main difference is that a segment contains multiple extents. During reclamation, all extents in the segment need to be recycled.

The following describes the return types.

Name	Description
node_name	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Description
space_id	Tablespace ID.
db_id	Database ID.
block_id	Extent ID.
type	Extent type. The options are as follows: **ALLOC_SEGMENT**, **DROP_SEGMENT**, and **SHRINK_EXTENT**.

The values of **type** are described as follows:

- **ALLOC_SEGMENT**: When a user creates a segment-page table and the segment is just allocated but the transaction of creating a table is not committed, the node is faulty. As a result, the segment is not used after being allocated.
- **DROP_SEGMENT**: When a user deletes a segment-page table and the transaction is successfully committed, the bit corresponding to the segment page of the table is not reset and a fault, such as power failure, occurs. As a result, the segment is not used or released.
- **SHRINK_EXTENT**: When a user shrinks a segment-page table and does not release the idle extent, a fault, such as power failure, occurs. As a result, the extent remains and cannot be reused.

  Example:

```
gaussdb=# SELECT * FROM gs_stat_remain_segment_info();

   node_name   | space_id | db_id | block_id |     type
---------------+----------+-------+----------+---------------
    dn_6001    |    16804 | 16803 |     4157 | ALLOC_SEGMENT
(1 row)
```

gs_free_remain_segment()

Description: Runs on the primary node to free segments queried by using the gs_stat_remain_segment_info function in the current database. By default, only the initial user, users with the SYSADMIN permission, and users with the OPRADMIN permission in the O&M mode can execute it. Other users can view the information only after being granted permissions. This function can be executed only on the primary node.

Return type: Boolean

gs_local_stat_remain_segment_info()

Description: Runs on the primary node to query the residual segment page information of the current node. For details about user permissions and return values, see gs_stat_remain_segment_info.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_local_free_remain_segment()

Description: Runs on the primary node to clear the residual segment page information of the current database on the current node. For details about user permissions and return values, see gs_free_remain_segment.

gs_seg_dump_page(tablespace_name name, file_id int4, bucketnode int4, file_block_id bigint, forknum int4 default 0)

Description: Parses a specified page in segment-page mode and returns the parsed content. Only users with the SYSADMIN attribute and users with the OPRADMIN attribute in O&M mode can execute this function. This function is used to parse physical pages. The parsing result of one page is returned each time. The returned result does not contain the actual user data. This function does not require users to enter the page type. During implementation, the system attempts to determine the page type. If the page type cannot be determined, the system outputs possible parsing results.

The following describes the parameters.

Name	Type	Description
table_space_name	NAME	Tablespace to which a segment object belongs. Value range: a valid tablespace name.
file_id	INTEGER	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
file_block_id	BIGINT	Offset page number of the physical page in the data file. Value range: [0,4294967294]
forknum	INTEGER DEFAULT 0	Fork number of a data file. The default value is **0**. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

The following describes the return types.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
page_type	TEXT	Page type. Value range: • Service pages: **heap**, **uheap**, **btree**, **ubtree**, **gsivfflat_index**, and **gsdiskann_index** • Segment-page metapages: **bucket main head**, **file head**, **spc head**, **map head**, **map page**, **reverse pointer page**, **segment head page** and **level1 page**. • Unknown pages: – **unknown(data extent)**: all-zero segment page whose type cannot be determined. – **unknown(fsm indexurq)**: fsm or indexurq page.
result	TEXT	Parsing result.

For example, perform the following operations after creating a segment-page ordinary table:

```
gaussdb=# SELECT * FROM gs_seg_dump_page('pg_default', 1, 1024, 4157);
    page_type     |                                result
------------------+-----------------------------------------------------------------------------
 segment head page | Page information of block 4157/4157                                        +
                   |         pd_lsn: 0/2C90608 ,len 8 ,offset 0                                 +
                   |                                                                            +
                   |         pd_checksum: 0x8A7F, verify success,len 2, offset 8                +
                   |         pd_flags:                                                          +
                   |         pd_lower: 24, empty, len 2, offset 12                              +
                   |         pd_upper: 8192, old, len 2, offset 14                              +
                   |         pd_special: 8192, size 0, len 2, offset 16                         +
                   |         Page size & version: 8192, 8, len 2, offset 18                     +
                   |         pd_xid_base: 0, len 8, offset 24 pd_multi_base: 0, len 8, offset 32+
                   |         pd_prune_xid: 0, len 4 ,offset 20                                  +
                   |                                                                            +
                   |         Segment head information on this page                              +
                   |               magic: 44414548544E454D                                      +
                   |               lsn is: 0/2C90540                                            +
                   |               nblocks: 0                                                   +
                   |               total_blocks: 8                                              +
                   |               reserved: 0                                                  +
                   |               Level 0 slots information on this page                       +
                   |                     The BlockNumber of level0 slots 0 is: 4157             +
                   |               fork head information on this page                          +
                   |                     4157(valid)                                            +
                   |                     4294967295(invalid)                                    +
                   |                     4294967295(invalid)
(1 row)
```

gs_seg_dump_page(relid oid, bucketnode int, block_id bigint, partition bool default false, forknum int4 default 0)

Description: Parses a specified page in segment-page mode and returns the parsed content. This function is executed on DNs. Only users with the SYSADMIN attribute and users with the OPRADMIN attribute in O&M mode can execute this function. This function is used to parse logical pages. The parsing result of one page is returned each time. The returned result does not contain the actual user

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

data. This function does not require users to enter the page type. During implementation, the system attempts to determine the page type. If the page type cannot be determined, the system outputs possible parsing results.

The following describes the parameters.

Name	Type	Description
relid	OID	Segment object ID. Value range: a valid segment-page object ID. Otherwise, an error is reported.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
block_id	BIGINT	Logical page number. Value range: [0,4294967294]
partition	BOOLEAN DEFAULT FALSE	Specifies whether the segment object is a partition. The default value is **false**. Value range: bool, indicating whether the object corresponding to the input OID is a partition.
forknum	INTEGER DEFAULT 0	Fork number of a data file. The default value is **0**. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

Return values

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
page_type	TEXT	Page type. Value range: • Service pages: **heap**, **uheap**, **btree**, **ubtree**, **gsivfflat_index**, and **gsdiskann_index** • Segment-page metapages: **bucket main head**, **file head**, **spc head**, **map head**, **map page**, **reverse pointer page**, **segment head page** and **level1 page**. • Unknown pages: – **unknown(data extent)**: all-zero segment page whose type cannot be determined. – **unknown(fsm indexurq)**: fsm or indexurq page.
result	TEXT	Parsing result.

In the following example, **relid** must be a valid OID of a multipart page object, and the object must have data so that the page information can be queried:

```
gaussdb=# SELECT * FROM gs_seg_dump_page(16788, 1024, 0);
 page_type |                                                result
-----------
+-----------------------------------------------------------------------------------------------------------------------------
 heap      | Page information of block 6021/6021                                                                                +
           |       pd_lsn: 0/4463418 ,len 8 ,offset 0                                                                          +
           |                                                                                                                   +
           |       pd_checksum: 0xD4CD, verify success,len 2, offset 8                                                         +
           |       pd_flags:                                                                                                   +
           |       pd_lower: 44, non-empty, len 2, offset 12                                                                   +
           |       pd_upper: 8160, old, len 2, offset 14                                                                       +
           |       pd_special: 8192, size 0, len 2, offset 16                                                                  +
           |       Page size & version: 8192, 6, len 2, offset 18                                                              +
           |       pd_xid_base: 17049, len 8, offset 24 pd_multi_base: 0, len 8, offset
32                                 +
           |       pd_prune_xid: 17049, len 4 ,offset 20                                                                       +
           |                                                                                                                   +
           |       Heap tuple information on this page                                                                         +
           |                                                                                                                   +
           |             Tuple #1 is normal: length 28, offset 8160                                                            +

gs_seg_get_spc_location(tablespace_name NAME, bucketnode INTEGER, head_block_id BIGINT, block_id BIGINT)

Description: Calculates the physical location given a segment and logical page number. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace to which a segment object belongs.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	BIGINT	Page number of a segment header.
block_id	BIGINT	Logical page number.

Return values

Name	Type	Description
extent_id	INTEGER	Logical extent number of the logical page.
extent_size	INTEGER	Size of the logical extent where the logical page is located.
file_id	INTEGER	ID of the data file where the physical page is located. Value range: an int4 value in the range [1,5].
file_block_id	BIGINT	Offset page number of the physical page in the data file.

For example, perform the following operations after creating a page-based ordinary table in the tablespace and inserting data:

```
gaussdb=# SELECT * FROM gs_seg_get_spc_location('pg_default', 1024, 4157, 0);
 extent_id | extent_size | file_id | file_block_id
-----------+-------------+---------+---------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
     0 |         8 |      2 |         4157
(1 row)
```

gs_seg_get_spc_location(relid OID, bucketnode INTEGER, block_id BIGINT, partition BOOLEAN DEFAULT FALSE, forknum INTEGER DEFAULT 0)

Description: Calculates the physical location given a segment and logical page number. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
relid	OID	Segment object ID.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
block_id	BIGINT	Logical page number.
partition	BOOLEAN DEFAULT FALSE	Specifies whether the segment object is a partition. The default value is **FALSE**.
forknum	INTEGER DEFAULT 0	Fork of a segment object. The default value is **0**. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

Return values

Name	Type	Description
extent_id	INTEGER	Logical extent number of the logical page.
extent_size	INTEGER	Size of the logical extent where the logical page is located.
file_id	INTEGER	ID of the data file where the physical page is located. Value range: an int4 value in the range [1,5].

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_block_id	BIGINT	Offset page number of the physical page in the data file.

In the following example, **relid** must be a valid OID of a multipart page object, and the object must have data:

```
gaussdb=# SELECT * FROM gs_seg_get_spc_location(24578,1024,0);
 extent_id | extent_size | file_id | file_block_id
-----------+-------------+---------+---------------
         0 |           8 |       2 |          4157
(1 row)
```

gs_seg_get_location(block_id BIGINT, as_extent BOOLEAN DEFAULT FALSE)

Description: Calculates the physical location given a segment and logical page number. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
block_id	BIGINT	Logical page number.
as_extent	BOOLEAN DEFAULT FALSE	Specifies whether the **block_id** parameter is an extent number. The default value is **FALSE**.

Return values

Name	Type	Description
extent_id	BIGINT	Extent number.
extent_size	INTEGER	Extent size.
extent_offset	INTEGER	Extent offset block number.
level0_slots_idx	INTEGER	Index of the extent in the level-0 slot array in the segment header.
level1_slots_idx	INTEGER	Index of the extent in the level-1 slot array in the segment header.
level1_page_offset	INTEGER	Offset of the extent on the level-1 slot page in the segment header.
segment_blocks	BIGINT	Number of pages containing this page or extended segments.
relative_fno	INTEGER	Number of the relative file that contains this page or extent.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM gs_seg_get_location(4157);
 extent_id | extent_size | extent_offset | level0_slots_idx | level1_slots_idx | level1_page_offset |
segment_blocks | relative_fno
-----------+-------------+---------------+------------------+------------------+--------------------+----------------
+--------------
        47 |         128 |            61 |               47 |                  |                    |           4158 |            3
(1 row)
```

gs_seg_get_segment_layout()

Description: Outputs the static segment layout. Only an administrator can query the information.

Return values

Name	Type	Description
version	TEXT	Segment-page version. The default value is **1.0**.
section_id	INTEGER	ID of the data section divided by a segment.
section_type	TEXT	Extent type of the segment data section. Value range: ● **meta**: segment header. ● **data**: data.
extent_size	INTEGER	Extent size. The unit is byte.
extent_page_count	INTEGER	Number of extent pages.
extent_count_start	BIGINT	Start extent number.
extent_count_end	BIGINT	End extent number.
total_size	BIGINT	Size of the segment data section. The unit is byte.

Example:

```
gaussdb=# SELECT * FROM gs_seg_get_segment_layout();
 version | section_id | section_type | extent_size | extent_page_count | extent_count_start | extent_count_end
|   total_size
---------+------------+--------------+-------------+-------------------+--------------------+------------------
+----------------
 1.0     |          1 | meta         |        8192 |                 1 |                  0 |                0 |             8192
 1.0     |          2 | data         |       65536 |                 8 |                  1 |               16 |          1048576
 1.0     |          3 | data         |     1048576 |               128 |                 17 |              143 |        134217728
 1.0     |          4 | data         |     8388608 |              1024 |                144 |              255 |       1073741824
 1.0     |          5 | data         |    33554432 |              4096 |                256 |          1025255 | 34394366541824
(5 rows)
```

gs_seg_get_datafile_layout()

Description: Queries the static layout of data files 1 to 5. Only an administrator can query the information.

Return values

Name	Type	Description
version	TEXT	Segment-page version. The default value is **1.0**.
seg_storage_type	TEXT	• **segment** indicates common segment-page data. • **hashbucket** indicates hash bucket data.
file_id	INTEGER	Data file ID. Value range: an int4 value in the range [1,5].
section_id	INTEGER	Data section ID of a data file.
section_type	TEXT	Type of the data file section. Value range: • **file_header** indicates the file header. • **spc_header** indicates the space header. • **map_header** indicates the mapping header. • **map_pages** indicates the mapping page. • **ip_pages(inverse pointer pages)** indicates the reverse pointer page. • **data_pages** indicates the data page.
page_start	BIGINT	Start page number of the data section.
page_end	BIGINT	End page number of the data section.
page_count	BIGINT	Number of pages in the data section.
total_size	BIGINT	Size of the data section. The unit is byte.

Example:

```
gaussdb=# SELECT * FROM gs_seg_get_datafile_layout();

... (There is a large amount of data. Only part of the data is displayed.)
 version | seg_storage_type | file_id | section_id | section_type |  page_start  |   page_end   | page_count  |
total_size
---------+------------------+---------+------------+--------------+--------------+--------------+-------------
+-----------------
 1.0     | segment          |       1 |          0 | file_header  |            0 |            0 |           1 |           8192
 1.0     | segment          |       1 |          1 | spc_header   |            1 |            1 |           1 |           8192
 1.0     | segment          |       1 |          2 | map_header   |            2 |            2 |           1 |           8192
 1.0     | segment          |       1 |          3 | map_pages    |            3 |           66 |          64 |         524288
 1.0     | segment          |       1 |          4 | ip_pages     |           67 |         4156 |        4090 |       33505280
 1.0     | segment          |       1 |          5 | data_pages   |         4157 |      4147260 |     4143104 |
33940307968
```

gs_seg_get_slice_layout(file_id INTEGER,bucketnode INTEGER, slice_id INTEGER)

Description: Outputs the static layout of a given data file fragment. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
file_id	INTEGER	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
slice_id	INTEGER	Slice file ID.

Return values

Name	Type	Description
version	TEXT	Segment-page version. The default value is **1.0**.
section_id	INTEGER	Data section ID of a data file.
section_type	INTEGER	Type of the data file section. Value range: • **file_header** indicates the file header. • **spc_header** indicates the space header. • **map_header** indicates the mapping header. • **map_pages** indicates the mapping page. • **ip_pages(inverse pointer pages)** indicates the reverse pointer page. • **data_pages** indicates the data page.
page_start	BIGINT	Start page number of the data section.
page_end	BIGINT	End page number of the data section.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
page_count	BIGINT	Number of pages in the data section.
total_size	BIGINT	Size of the data section. The unit is byte.

Example:

```
gaussdb=# SELECT * FROM gs_seg_get_slice_layout(1,1024, 0);
 version | section_id | section_type | page_start | page_end | page_count | total_size
---------+------------+--------------+------------+----------+------------+------------
 1.0     |          0 | file_header  |          0 |        0 |          1 |       8192
 1.0     |          1 | spc_header   |          1 |        1 |          1 |       8192
 1.0     |          2 | map_header   |          2 |        2 |          1 |       8192
 1.0     |          3 | map_pages    |          3 |       66 |         64 |     524288
 1.0     |          4 | ip_pages     |         67 |     4156 |       4090 |   33505280
 1.0     |          5 | data_pages   |       4157 |   131071 |     126915 | 1039687680
(6 rows)
```

gs_seg_get_segment(tablespace_name NAME, bucketnode INTEGER, head_block_id BIGINT)

Description: Outputs the segment header information of the segment header page in the segment header file of the tablespace. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace to which a segment object belongs.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	BIGINT	Page number of the segment header.

Return values

Name	Type	Description
blocks	BIGINT	Number of logical pages of a segment.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

total_blocks	BIGINT	Number of physical pages of a segment.
extents	INTEGER	Number of logical extents of a segment.
total_extents	INTEGER	Number of physical extents of a segment.
head_lsn	TEXT	Segment header LSN.
level0_slots	BIGINT[]	Level-0 slot array of segment extent mapping.
level1_slots	BIGINT[]	Level-1 slot array of segment extent mapping.
fork_head	BIGINT[]	Fork head array of a segment.

For example, perform the following operations after creating a segment-page ordinary table:

```
gaussdb=# SELECT * FROM gs_seg_get_segment('pg_default', 1024, 4157);
 blocks | total_blocks | extents | total_extents | head_lsn | level0_slots | level1_slots |   fork_head
--------+--------------+---------+---------------+----------+--------------+--------------+---------------
      9 |           16 |       2 |             2 | 62211744 | {4157,4165}  | {}           | {4157,4158,-1}
(1 row)
```

gs_seg_get_segment(relid OID, bucketnode INTEGER, partition BOOLEAN DEFAULT FALSE, forknum INTEGER DEFAULT 0)

Description: Outputs the corresponding segment header information based on **relid** and **bucketnode**. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
relid	OID	Table OID.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
partition	BOOLEAN DEFAULT FALSE	Specifies whether the segment object is a partition. The default value is **false**. Value range: bool, indicating whether the object corresponding to the input OID is a partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	INTEGER DEFAULT 0	Fork number of a data file. The default value is **0**. Value range: ● **0**: main fork. ● **1**: FSM fork. ● **2**: VM fork.

Return values

Name	Type	Description
blocks	BIGINT	Number of logical pages of a segment.
total_blocks	BIGINT	Number of physical pages of a segment.
extents	INTEGER	Number of logical extents of a segment.
total_extents	INTEGER	Number of physical extents of a segment.
head_lsn	TEXT	Segment header LSN.
level0_slots	BIGINT[]	Level-0 slot array of segment extent mapping.
level1_slots	BIGINT[]	Level-1 slot array of segment extent mapping.
fork_head	BIGINT[]	Fork head array of a segment.

In the following example, **relid** must be a valid OID of a multipart page object:

```
gaussdb=# SELECT * FROM gs_seg_get_segment(16768, 1024);
 blocks | total_blocks | extents | total_extents | head_lsn | level0_slots | level1_slots |    fork_head
--------+--------------+---------+---------------+----------+--------------+--------------+-----------------
      9 |           16 |       2 |             2 | 62211744 | {4157,4165}  | {}           | {4157,4158,4294967295}
(1 row)
```

gs_seg_get_extents(tablespace_name NAME, bucketnode INTEGER, head_block_id BIGINT)

Description: Outputs all extents of the segment object on the segment header page in the segment header file of the tablespace, including **segment head**, **fork head**, **level1 page** in file 1, and data extents in files 2 to 5. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace to which a segment object belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	BIGINT	Page number of the segment header.

Return values

Name	Type	Description
extent_id	INTEGER	Logical extent number.
file_id	INTEGER	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	INTEGER	Fork of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	BIGINT	Start page number in the data file where the extent is located.
blocks	INTEGER	Extent size. Value range: • **1** indicates file 1. • **8** indicates file 2. • **128** indicates file 3. • **1024** indicates file 4. • **4096** indicates file 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usage_type	TEXT	Usage type of an extent. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.

For example, perform the following operations after creating a segment-page ordinary table in the tablespace:

```
gaussdb=# SELECT * FROM gs_seg_get_extents('pg_default', 1024, 4157);
 extent_id | file_id | forknum | block_id | blocks |  usage_type
-----------+---------+---------+----------+--------+--------------
           |       1 |       0 |     4157 |      1 | segment head
         0 |       2 |       0 |     4157 |      8 | data extent
         1 |       2 |       0 |     4165 |      8 | data extent
(3 rows)
```

gs_seg_get_extents(relid OID, bucketnode INTEGER, partition BOOLEAN DEFAULT FALSE, forknum INTEGER DEFAULT 0)

Description: Outputs all extents of the segment object on the segment header page in the corresponding segment header file, including **segment head**, **fork head**, **level1 page** in file 1 and, data extents in files 2 to 5. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
relid	OID	Table OID.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
partition	BOOLEAN DEFAULT FALSE	Specifies whether the segment object is a partition. The default value is **false**. Value range: bool, indicating whether the object corresponding to the input OID is a partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	INTEGER DEFAULT 0	Fork number of a data file. The default value is **0**. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

Return values

Name	Type	Description
extent_id	INTEGER	Logical extent number.
file_id	INTEGER	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	INTEGER	Fork of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	BIGINT	Start page number in the data file where the extent is located.
blocks	INTEGER	Extent size. Value range: • **1** indicates file 1. • **8** indicates file 2. • **128** indicates file 3. • **1024** indicates file 4. • **4096** indicates file 5.
usage_type	TEXT	Usage type of an extent. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.

In the following example, **relid** must be a valid OID of a multipart page object:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM gs_seg_get_extents(16768, 1024);
 extent_id | file_id | forknum | block_id | blocks |  usage_type
-----------+---------+---------+----------+--------+--------------
           |       1 |       0 |     4157 |      1 | segment head
         0 |       2 |       0 |     4157 |      8 | data extent
         1 |       2 |       0 |     4165 |      8 | data extent
(3 rows)
```

gs_seg_free_spc_remain_segment(tablespace_name NAME, head_file_id INTEGER, bucketnode INTEGER, head_block_id BIGINT)

Description: Releases the page occupied by the segment page-based residual segment in file 1 in a specified tablespace. You can query residual segments in the **GS_SEG_SPC_REMAIN_SEGMENTS** view. Only an administrator can query the information. This query can be executed only on the primary node.

NOTICE

- This function has a defect and is planned to be reconstructed in later versions to completely solve the residual segment-page problem. This function is an offline segment-page clearing method.
- To ensure the consistency between the queried residual segments and residual extents and the consistency of residual clearing, this function and the **GS_SEG_SPC_REMAIN_SEGMENTS** view must be executed in the DDL-\DML-restricted state. The current version does not provide the DML/DDL restriction capability. Therefore, when using this feature, ensure that the operating environment is in the DDL-\DML-restricted state.
- This function can be used only when **enable_segment_remain_cleanup** is set to **off**.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace name.
head_file_id	INTEGER	ID of a data file in which a segment header of a segment-page-type residual segment is located. Value range: **1**
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
head_block_id	BIGINT	Page number of a segment header.

Return type: void

Example:

```
gaussdb=# SELECT * FROM gs_seg_free_spc_remain_segment('pg_default', 1, 1024, 4159);
 gs_seg_free_spc_remain_segment
--------------------------------

(1 row)
```

gs_seg_free_spc_remain_extent(tablespace_name NAME, file_id INTEGER, bucketnode INTEGER, forknum INTEGER, block_id BIGINT)

Description: Releases residual segment-page-type isolated extents in a specified tablespace. Residual isolated extents can be queried in the **GS_SEG_SPC_REMAIN_EXTENTS** view. This function can also clear the segment header of the segment queried in the **GS_SEG_SPC_REMAIN_SEGMENTS** view. However, this action will expose other extents (such as **fork head**, **level1 page**, and **data extent**) in the segment where the cleared segment header is located in the **GS_SEG_SPC_REMAIN_EXTENTS** view. Only an administrator can query the information. This query can be executed only on the primary node.

NOTICE

- This function has a defect and is planned to be reconstructed in later versions to completely solve the residual segment-page problem. This function is an offline segment-page clearing method.
- To ensure the consistency between the queried residual segments and residual extents and the consistency of residual clearing, this function and the **GS_SEG_SPC_REMAIN_EXTENTS** view must be executed in the DDL- or DML-restricted state. The current version does not provide the DML/DDL restriction capability. Therefore, when using this feature, ensure that the operating environment is in the DDL-\DML-restricted state.
- This function can be used only when **enable_segment_remain_cleanup** is set to **off**.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace name.
file_id	INTEGER	ID of the data file where the segment-page-type residual extent is located. Value range: files 1 to 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	INTEGER	Fork number of a data file. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	BIGINT	Page number of a segment header.

Return type: void

Example:

```
gaussdb=# SELECT * FROM gs_seg_free_spc_remain_extent('pg_default', 1, 1024, 0, 4159);
 gs_seg_free_spc_remain_extent
-------------------------------

(1 row)
```

gs_seg_get_datafiles(database_name NAME)

Description: Displays information about all data files of an instance. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
database_name	NAME	Database name The default value is **current_database()**, indicating the name of the current database.

Return values

Name	Type	Description
file_name	TEXT	Data file name. Example: **base/17467/2_fsm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_id	INTEGER	Data file ID. Value range: files 1 to 5.
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	INTEGER	Fork type of a data file.
tablespace_name	NAME	Name of the tablespace to which a data file belongs.
contents	TEXT	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
extent_size	INTEGER	Extent size of a data file.
meta_blocks	BIGINT	Number of allocated metadata pages of a data file.
data_blocks	BIGINT	Number of allocated data pages of a data file.
total_blocks	BIGINT	Total number of physical pages in a data file.
high_water_mark	BIGINT	High watermark of the number of pages used by a data file.
utilization	REAL	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/ **total_blocks**.

For example, perform the following operations after creating a segment-page table:

```
gaussdb=# SELECT * FROM gs_seg_get_datafiles();
  file_name   | file_id | bucketnode | forknum | tablespace_name | contents  | extent_size | meta_blocks |
data_blocks | total_blocks | high_water_mark | utilization
--------------+---------+------------+---------+-----------------+-----------+-------------+-------------+-------------
+--------------+-----------------+-------------
```

```
 base/15949/1 |       1 |       1024 |       0 | pg_default     | permanent |          1 |       4157 |          1 |
16384 |      1048702976 | 2.24208e-44
 base/15949/2 |       2 |       1024 |       0 | pg_default     | permanent |          8 |       4157 |          8 |
16384 |      1048717312 | 2.24208e-44
(2 rows)
```

gs_seg_get_spc_extents(tablespace_name NAME, file_id INTEGER, bucketnode INTEGER, forknum INTEGER, skip_unused BOOLEAN DEFAULT TRUE)

Description: Obtains all extent information of a specified tablespace. Only an administrator can query the information.

The following describes the parameters.

Name	Type	Description
tablespace_name	NAME	Tablespace name.
file_id	INTEGER	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	INTEGER	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	INTEGER	Data file fork. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
skip_unused	BOOLEAN DEFAULT TRUE	Specifies whether to output only allocated extents. The default value is **TRUE**, indicating that only allocated extents are output.

Return values

Name	Type	Description
block_id	BIGINT	Start page number of a data extent.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blocks	INTEGER	Data extent size. Value range: • **1** indicates file 1. • **8** indicates file 2. • **128** indicates file 3. • **1024** indicates file 4. • **4096** indicates file 5.
contents	TEXT	Stores content. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	TEXT	Specifies whether a resource has been allocated. Value range: • **Y**: allocated. • **N**: not allocated.
mapblock_location	TEXT	Position of the extent in the map block. Format: (page_id, offset).
head_file_id	INTEGER	ID of the data file where the segment header is located.
head_block_id	BIGINT	Page number of the segment header.
usage_type	TEXT	Usage type of an extent. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	TEXT	Specifies whether it is a residual extent after the SHRINK operation. Value range: • **Y**: residual extent upon SHRINK. • **N**: not a residual extent upon SHRINK.
special_data	INTEGER	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	TEXT	Position of the reverse pointer corresponding to an extent. Format: (block_id, offset).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM gs_seg_get_spc_extents('pg_default', 1,1024, 0);
 block_id | blocks | contents  | in_used | mapblock_location | head_file_id | head_block_id |  usage_type  |
remain_flag | special_data | ipblock_location
----------+--------+-----------+---------+-------------------+--------------+---------------+--------------+-------------
+--------------+------------------
    4157 |      1 | permanent | Y       | (4157,0)          |            1 |          4157 | segment head | N
|            0 | (67,0)
    4158 |      1 | permanent | Y       | (4157,1)          |            1 |          4158 | fork head    | N           |
1 | (67,1)
(2 rows)
```

7.6.26.12 Hash Bucket System Functions

gs_redis_get_plan(origin_group_id OID, target_group_id OID)

Description: Obtains a complete migration plan. It is not supported in the current version.

gs_redis_get_bucket_statistics

Description: Obtains the log flow transmission status. It is not supported in the current version.

gs_redis_set_distributed_db(db_name CSTRING, bucketgroup SMALLINT)

Description: Sets the database and bucket group that are being redistributed using a hash bucket. It is not supported in the current version.

gs_redis_hashbucket_update_segment_header(origin_group_id OID, target_group_id OID)

Description: Updates the headers of all hash bucket tables in the current database. It is not supported in the current version.

gs_redis_local_get_segment_header(table_name REGCLASS, bucketlist OIDVECTOR_EXTEND)

Description: Obtains the header of a segment-page table. It is not supported in the current version.

gs_redis_local_update_segment_header(table_name REGCLASS, header_info CSTRING)

Description: Updates the header of a segment-page table. It is not supported in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_redis_hashbucket_update_inverse_pointer(buckets TEXT, origin_dn_name TEXT, new_dn_name TEXT)

Description: Updates the inverse pointers of buckets of this batch in all hash bucket tables in the current database. It is not supported in the current version.

gs_redis_local_get_inverse_pointer(buckets TEXT, origin_dn_name TEXT, new_dn_name TEXT)

Description: Obtains the inverse pointer. It is not supported in the current version.

gs_redis_local_update_inverse_pointer(table_name TEXT, header_info TEXT, bucketlist TEXT)

Description: Records Xlogs for updating inverse pointers. It is not supported in the current version.

gs_redis_local_set_hashbucket_frozenxid

Description: Changes the **relfrozenxid64** value of the hash bucket table in the system catalog. It is not supported in the current version.

gs_redis_set_hashbucket_frozenxid(origin_group_id OID, target_group_id OID)

Description: Changes the **relfrozenxid64** value of the hash bucket table in the system catalog on the new DN. It is not supported in the current version.

gs_redis_set_nextxid(xid BIGINT)

Description: Modifies the **next_xid** value of a DN. It is not supported in the current version.

gs_redis_set_csn(csn BIGINT)

Description: Changes the **next_csn** value of a DN. It is not supported in the current version.

gs_redis_check_bucket_flush(dn_array NAME[])

Description: Determines whether all private buffers for RTO replay are flushed. It is not supported in the current version.

gs_redis_get_flush_page_lsn(isclean bool)

Description: Queries the page refreshing information of bucket scale-out replay. It is not supported in the current version.

gs_redis_show_bucketxid(bucketid_list OIDVECTOR_EXTEND)

Description: Queries the bucketxid corresponding to a specified bucket. It is not supported in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_redis_drop_bucket_files(origin_group_id OID, target_group_id OID)

Description: Deletes the files that have been physically migrated from the source node. It is not supported in the current version.

gs_redis_parse_slicebucket_tranfer_file(plan_json CSTRING, type CSTRING)

Description: Obtains the slice bucket migration plan. It is not supported in the current version.

gs_redis_get_slicebucket_plan()

Description: Obtains the slice bucket migration plan of the current database. It is not supported in the current version.

gs_redis_slicebucket_update_segment_header()

Description: Updates the headers of all slice bucket tables in the current database. It is not supported in the current version.

gs_redis_drop_bucket_files(plan_json CSTRING)

Description: Deletes the range bucket files that have been physically migrated from the source node. It is not supported in the current version.

gs_redis_local_drop_bucket_files(bucketlist CSTRING, bucketnum SMALLINT)

Description: Deletes the corresponding bucket list. It is not supported in the current version.

gs_redis_local_drop_bucket_files(database_name NAME, bucketlist CSTRING, bucketnum SMALLINT)

Description: Deletes the bucket list of the corresponding database from the range bucket table. It is not supported in the current version.

7.6.26.13 Other Functions

plan_seed()

Description: Obtains the seed value of the previous query statement (internal use).

Return type: int

pg_stat_get_env()

Description: Obtains the environment variable information of the current node. Only users with the SYSADMIN or MONADMIN permission can access the environment variable information. In the multi-tenancy scenario, no information is returned in a PDB.

Return type: record

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT pg_stat_get_env();
                                                
```

pg_stat_get_sql_count()

Description: Provides the counts of the SELECT, UPDATE, INSERT, DELETE, and MERGE INTO statements executed by the user on the current node, as well as the counts of DDL, DML, and DCL statements. The DDL statements include the TRUNCATE, VACUUM, ANALYZE, CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), ALTER (excluding ALTER ROLE, ALTER USER, and ALTER DEFAULT PRIVILEGES), REINDEX, and COMMENT statements. The DML statements include the UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, SHOW, LOCK, COPY, CLUSTER, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE, and LOAD statements. The DCL statements include the CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, and SET statements. Users with the SYSADMIN or MONADMIN permission can view information about all users. Common users can view only their own statistics. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

pg_stat_get_data_senders()

Description: Provides detailed information about the data-copy sender thread active at the moment. In the multi-tenancy scenario, no information is returned in a PDB.

Return type: record

get_wait_event_info()

Description: Provides detailed information about the wait event.

Return type: record

generate_wdr_report(begin_snap_id bigint, end_snap_id bigint, report_type cstring, report_scope cstring, node_name cstring)

Description: Generates system diagnosis reports based on two snapshots. You need to run the command in the system database. By default, the initial user or users with the MONADMIN permission can access the database. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

Table 7-106 generate_wdr_report parameter description

Parameter	Description	Value Range
begin_snap_id	Snapshot ID that starts the diagnosis report period.	N/A

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Value Range
end_snap_id	Snapshot ID that ends the diagnosis report period. By default, the value of **end_snap_id** is greater than that of **begin_snap_id**.	N/A
report_type	Specifies the type of the generated report.	• **summary** • **detail** • **all**: Both **summary** and **detail** are included.
report_scope	Specifies the scope for a report to be generated.	• **cluster**: database-level information • **node**: node-level information
node_name	• If **report_scope** is set to **node**, this parameter is set to the name of the corresponding node. You can run the **SELECT * FROM pg_node_env;** command to query the node name. • If **report_scope** is set to **cluster**, this parameter can be omitted, left blank, or set to **NULL**.	• **cluster**: This value is omitted, left blank or set to **NULL**. • **node**: node name in GaussDB.

generate_wdr_db_report(db_name cstring, begin_snap_id bigint, end_snap_id bigint, report_type cstring, report_scope cstring, node_name cstring)

Description: Generates database-level system diagnosis reports based on two snapshots. You need to run the command in the system database. By default, the initial user or users with the MONADMIN permission can access the database. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

Table 7-107 generate_wdr_db_report parameters

Parameter	Description	Value Range
db_name	Specifies the name of a database.	N/A
begin_snap_id	Snapshot ID that starts the diagnosis report period.	N/A

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Value Range
end_snap_id	Snapshot ID that ends the diagnosis report period. By default, the value of **end_snap_id** is greater than that of **begin_snap_id**.	N/A
report_type	Specifies the type of the generated report.	• **summary** • **detail** • **all**: Both **summary** and **detail** are included.
report_scope	Specifies the scope for a report to be generated.	• **cluster**: database-level information • **node**: node-level information
node_name	• If **report_scope** is set to **node**, this parameter is set to the name of the corresponding node. You can run the **SELECT * FROM pg_node_env;** command to query the node name. • If **report_scope** is set to **cluster**, the value can be omitted, left blank, or **NULL**.	• **cluster**: This value is omitted, left blank or set to **NULL**. • **node**: node name in GaussDB.

create_wdr_snapshot()

Description: Manually generates system diagnosis snapshots. This function requires the SYSADMIN permission.

Return type: text

kill_snapshot()

Description: Kills the WDR snapshot backend thread. Users who call this function must have the SYSADMIN permission or the REPLICATION permission, or inherit permissions of the built-in role gs_role_replication.

Return type: void

generate_asp_report(start_time timestamp with time zone, end_time timestamp with time zone, slot_count bigint, node_name text)

Description: Generates ASP based on timestamps, which can be accessed by MONADMIN. **slot_count** indicates the number of time segments for displaying metrics. **node_name** is used to generate the ASP of a specified node. The value can be the name of a primary/standby CN or can be left empty. When the value is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

left empty, this function is used to generate the report of the current node. This function can be used only on the primary DN.

Return type: text

dbe_perf.get_active_session_profile(start_ts timestamp with time zone, end_ts timestamp with time zone, need_final boolean,node_name text)

Description: Queries data in the ASP memory and disk based on timestamps. **need_final** specifies whether to query blocking information. The default value is **false**. **node_name** is used to distinguish the active and standby DNs, for example, dn_6001 or dn_6002. This parameter cannot be left empty. In the multi-tenancy scenario, PDB data is visible in its own PDB, and global data is visible in a non-PDB.

Return type: record

capture_view_to_json(text,integer)

Description: Saves the view result to the directory specified by GUC: **perf_directory**. If **is_crossdb** is set to **1**, the view is accessed once for all databases. If the value of **is_crossdb** is **0**, the current database is accessed only once. Only users with the SYSADMIN or MONADMIN permission can execute this function.

Return type: int

reset_unique_sql(text,text,bigint)

Description: Clears the unique SQL statements in the memory of the database node. (The SYSADMIN or MONADMIN permission is required.) In the multi-tenancy scenario, only PDB data is cleared if this function is called in a PDB, and global data is cleared if this function is called in a non-PDB.

Return type: Boolean

Table 7-108 reset_unique_sql parameter description

Parameter	Type	Description
scope	text	Clearance scope type. The options are as follows: • **'GLOBAL'**: Clears all nodes. If the value is **'GLOBAL'**, this function can be executed only on the primary node. • **'LOCAL'**: Clears the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
clean_type	text	• **'BY_USERID'**: Clears unique SQL statements based on user IDs. This option is disabled in the multi-tenancy scenario. • **'BY_CNID'**: Clears unique SQL statements based on primary node IDs. • **'ALL'**: Clears all data.
clean_value	int8	Clearance value corresponding to the clearance type. If the second parameter is set to **ALL**, the third parameter does not take effect and can be set to any value.

wdr_xdb_query(db_name_str text, query text)

Description: Provides the capability of executing local cross-database queries. For example, when connecting to the **testdb** database, only the initial user has the permission to access the table in the **test** database. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

```
SELECT col1 FROM wdr_xdb_query('dbname=test','SELECT col1 FROM t1') AS dd(col1 int);
```

Return type: record

pg_wlm_jump_queue(pid int)

Description: Moves a task to the top of the queue of the primary node of the database.

Return type: Boolean

- **true**: success
- **false**: failure

gs_wlm_switch_cgroup(pid int, cgroup text)

Description: Moves a job to another Cgroup to change the job priority.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **true**: success
- **false**: failure

pv_session_memctx_detail(threadid tid, MemoryContextName text)

Description: Records information about the memory context **MemoryContextName** of the thread **tid** into the *threadid*_**timestamp.log** file in the *$GAUSSLOG*/**gs_log/***${node_name}*/**dumpmem** directory. *threadid* can be obtained from *sessid* in the **GS_SESSION_MEMORY_DETAIL** view. In the officially released version, only the **MemoryContextName** that is an empty string (two single quotation marks indicate that the input is an empty string) is accepted. In this case, all memory context information is recorded. Otherwise, no operation is performed. This function can be executed only by the administrator.

Return type: Boolean

- **true**: success
- **false**: failure

pg_shared_memctx_detail(MemoryContextName text)

Description: Records information about the memory context **MemoryContextName** into the *threadid*_**timestamp.log** file in the *$GAUSSLOG*/**gs_log/***${node_name}*/**dumpmem** directory. This function is provided only for internal development and test personnel to debug in the DEBUG version. Calling this function in the officially released version does not involve any operation. Only the administrator can execute this function.

Return type: Boolean

- **true**: success
- **false**: failure

local_aio_completer_stat()

Description: Displays statistics about the AIO Completer thread in the instance.

Return type: record

Table 7-109 Return values of local_aio_completer_stat

Parameter	Type	Description
node_name	text	Name of the current instance.
tid	int8	ID of the AIO Completer thread.
thread_type	text	AIO Completer thread type (read or write).
aio_submitted_num	int8	Number of committed asynchronous I/O requests of the AIO Completer thread.
aio_completed_num	int8	Number of completed asynchronous I/O requests of the AIO Completer thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
aio_incompleted_num	int8	Number of asynchronous I/O requests that are not completed of the AIO Completer thread.
slot_count_left	int8	Indicates the number of idle slots.

local_aio_slot_usage_status()

Description: Displays statistics about asynchronous I/O commit slots in the instance.

Return type: record

Table 7-110 Return values of local_aio_slot_usage_status

Parameter	Type	Description
nodename	text	Name of the current instance.
slot_id	int4	Slot ID.
slot_type	char	Slot type. The value can be **r** (read) or **w** (write).
status	bool	Slot usage status.
buffer_id	int8	Buffer ID corresponding to the slot.
relfilenode_blocknum	text	Position of the physical page where the buffer corresponding to the slot is located.
lsn	int8	LSN corresponding to the page.
submitted_time	int8	Time when a page is committed asynchronously.
elapsed_time	int8	Waiting time of the page.

gs_get_io_type()

Description: Displays the I/O mode of the instance.

Return type: text

- **BIO**: The instance is running in BIO mode (ADIO is disabled).
- **DIO**: The instance is running in DIO mode (ADIO is enabled).
- **BIO->DIO (In progress)**: The current instance is switching from the BIO mode to the DIO mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

local_bgwriter_stat()

Description: Displays the information about pages flushed by the bgwriter thread of this instance, number of pages in the candidate buffer chain, and buffer elimination information.

Return type: record

local_candidate_stat()

Description: Displays the number of pages in the candidate buffer chain of this instance and buffer elimination information, including the normal buffer pool and segment buffer pool.

Return type: record

local_ckpt_stat()

Description: Displays the information about checkpoints and flushing pages of the current instance. In the multi-tenancy scenario, the non-PDB runs properly when calling this function, and an empty list is returned if this function is called in a PDB.

Return type: record

local_double_write_stat()

Description: Displays the doublewrite file status of the current instance. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and an empty list is returned if this function is called in a PDB.

Return type: record

Table 7-111 local_double_write_stat parameters

Parameter	Type	Description
node_name	text	Instance name
curr_dwn	int8	Sequence number of the doublewrite file
curr_start_page	int8	Start page for restoring the doublewrite file
file_trunc_num	int8	Number of times that the doublewrite file is reused
file_reset_num	int8	Number of reset times after the doublewrite file is full
total_writes	int8	Total number of I/Os of the doublewrite file
low_threshold_writes	int8	Number of I/Os for writing doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
high_threshold_writes	int8	Number of I/Os for writing doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421)
total_pages	int8	Total number of pages that are flushed to the doublewrite file area
low_threshold_pages	int8	Number of pages that are flushed with low efficiency
high_threshold_pages	int8	Number of pages that are flushed with high efficiency
file_id	int8	ID of the current doublewrite file. Value range: an int4 value in the range [1,5].

local_single_flush_dw_stat()

Description: Displays the elimination of doublewrite files on a single page in the instance.

Return type: record

local_pagewriter_stat()

Description: Displays the page flushing information and checkpoint information of the current instance. In the multi-tenancy scenario, the non-PDB runs properly when calling this function, and an empty list is returned if this function is called in a PDB.

Return type: record

local_redo_stat()

Description: Displays the replay status of the current standby instance. In the multi-tenancy scenario, the non-PDB runs properly when calling this function, and an empty list is returned if this function is called in a PDB.

Return type: record

Note: The returned replay status includes the current replay position and the replay position of the minimum restoration point.

local_recovery_status()

Description: Displays log flow control information about the primary and standby nodes. In the multi-tenancy scenario, the non-PDB runs properly when calling this function, and an empty list is returned if this function is called in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_wlm_node_recover(boolean isForce)

Description: Obtains top SQL query statement-level statistics recorded in the current memory. If the input parameter is not **0**, the information is cleared from the memory.

Return type: record

gs_cgroup_map_ng_conf(group name)

Description: Reads the Cgroup configuration file of a specified logical database.

Return type: record

gs_wlm_switch_cgroup(sess_id int8, cgroup name)

Description: Switches the Cgroup of a specified session.

Return type: record

comm_client_info()

Description: Queries information about active client connections of a single node.

Return type: SETOF record

pg_get_flush_lsn()

Description: Returns the position of the Xlog flushed from the current node.

Return type: text

pg_get_sync_flush_lsn()

Description: Returns the position of the Xlog flushed by the majority on the current node.

Return type: text

dbe_perf.get_global_full_sql_by_timestamp(start_timestamp timestamp with time zone, end_timestamp timestamp with time zone)

Description: Obtains full SQL information at the database level. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

Table 7-112 dbe_perf.get_global_full_sql_by_timestamp parameter description

Parameter	Type	Description
start_timestamp	timestamp with time zone	Start point of the SQL start time range.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
end_timestamp	timestamp with time zone	End point of the SQL start time range. An error is reported during function execution if **start_timestamp** is greater than or equal to **end_timestamp**.

dbe_perf.get_global_slow_sql_by_timestamp(start_timestamp timestamp with time zone, end_timestamp timestamp with time zone)

Description: Obtains slow SQL information at the database level. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

Table 7-113 dbe_perf.get_global_slow_sql_by_timestamp parameter description

Parameter	Type	Description
start_timestamp	timestamp with time zone	Start point of the SQL start time range.
end_timestamp	timestamp with time zone	End point of the SQL start time range. An error is reported during function execution if **start_timestamp** is greater than or equal to **end_timestamp**.

statement_detail_decode(detail text, format text, pretty boolean)

Description: Parses the **detail** column in a full or slow SQL statement. The result can be queried only in the system database but cannot be queried in the user database.

Return type: text

Table 7-114 statement_detail_decode parameter description

Parameter	Type	Description
detail	text	Set of events generated by the SQL statement (unreadable).
format	text	Parsing output format. The value is **plaintext**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
pretty	Boolean	Specifies whether to display the text in pretty format when **format** is set to **plaintext**. The options are as follows: • The value **true** indicates that **\n** is used to separate events. • The value **false** indicates that events are separated by commas (,).

pgxc_get_csn(tid)

Description: Returns the transaction commit sequence number (CSN) corresponding to a given transaction ID.

Return type: int8

pgxc_get_csn(tid, bucketid)

Description: The hash bucket table is not supported in the current version in centralized mode. An error is reported when the function is called.

pg_control_system()

Description: Returns the status of the system control file.

Return type: SETOF record

pg_control_checkpoint()

Description: Returns the system checkpoint status.

Return type: SETOF record

get_prepared_pending_xid()

Description: Returns nextxid when restoration is complete.

Parameter: nan

Return type: text

pg_clean_region_info()

Description: Clears the regionmap.

Parameter: nan

Return type: character varying

pg_get_replication_slot_name

Description: Obtains the slot name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: nan

Return type: text

pg_get_running_xacts()

Description: Obtains running xact. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Parameter: nan

Return type: handle integer, gxid xid, state tinyint, node text, xmin xid, vacuum Boolean, timeline bigint, prepare_xid xid, pid bigint, and next_xid xid, and dbid oid

pg_get_variable_info()

Description: Obtains the shared memory variable *cache*.

Parameter: nan

Return type: node_name text, nextOid oid, nextXid xid, oldestXid xid, xidVacLimit xid, oldestXidDB oid, lastExtendCSNLogpage xid, startExtendCSNLogpage xid, nextCommitSeqNo xid, latestCompletedXid xid, and startupMaxXid xid

pg_get_xidlimit()

Description: Obtains XID information from the shared memory.

Parameter: nan

Return type: nextXid xid, oldestXid xid, xidVacLimit xid, xidWarnLimit xid, xidStopLimit xid, xidWrapLimit xid, and oldestXidDB oid

pg_relation_compression_ratio()

Description: Queries the compression rate of a table. By default, **1.0** is returned.

Parameter: text

Return type: real

pg_relation_with_compression()

Description: Queries whether a table is compressed.

Parameter: text

Return type: Boolean

pg_stat_file_recursive()

Description: Lists all files in a path. In the multi-tenancy scenario, this function is disabled in a PDB.

Parameter: location text

Return type: path text, filename text, size bigint, and isdir Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_activity_for_temptable()

Description: Returns records of backend threads related to the temporary table.

Parameter: nan

Return type: datid oid, timelineid integer, tempid integer, and sessionid bigint

pg_stat_get_activity_ng()

Description: Returns records of backend threads related to nodegroup.

Parameter: pid bigint

Return type: datid oid, pid bigint, sessionid bigint, and node_group text

pg_stat_get_cgroup_info()

Description: Returns Cgroup information.

Parameter: nan

Return type: cgroup_name text, percent integer, usage_percent integer, shares bigint, usage bigint, cpuset text, relpath text, valid text, and node_group text

pg_stat_get_realtime_info_internal()

Description: Returns real-time information. Currently, this API is unavailable. **FailedToGetSessionInfo** is returned.

Parameter: oid, oid, bigint, cstring, and oid

Return type: text

pg_test_err_contain_err()

Description: Tests the error type and return information.

Parameter: integer

Return type: void

get_global_user_transaction()

Description: Returns transaction information about each user on all nodes. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: node_name name, usename name, commit_counter bigint, rollback_counter bigint, resp_min bigint, resp_max bigint, resp_avg bigint, resp_total bigint, bg_commit_counter bigint, bg_rollback_counter bigint, bg_resp_min bigint, bg_resp_max bigint, bg_resp_avg bigint, bg_resp_total bigint, and dbid oid

pg_collation_for()

Description: Returns the sorting rule corresponding to the input parameter string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: any (Explicit type conversion is required for constants.)

Return type: text

pgxc_unlock_for_sp_database(name Name)

This function is unavailable in the current version.

pgxc_lock_for_sp_database(name Name)

This function is unavailable in the current version.

copy_error_log_create()

Description: The error table required by the COPY FROM error tolerance mechanism has been changed to the system catalog created during initialization. Therefore, the current function always returns **true** for compatibility.

Return type: Boolean

Table 7-115 Error table pg_catalog.pgxc_copy_error_log

Column	Type	Description
relname	character varying	Table name in the form of *Schema name*.*Table name*
begintime	timestamp with time zone	Time when a data format error was reported.
filename	character varying	Name of the source data file where a data format error occurs.
lineno	bigint	Number of the row where a data format error occurs in a source data file.
rawrecord	text	Raw record of a data format error in the source data file.
detail	text	Error details.

dynamic_func_control(scope text, function_name text, action text, "{params}" text[])

Description: Dynamically enables built-in functions. Currently, only full SQL statements can be dynamically enabled.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-116 Parameter description of dynamic_func_control

Parameter	Type	Description
scope	text	Scope where the function is to be dynamically enabled. Currently, only **LOCAL** is supported.
function_name	text	Function name. Currently, only **STMT** is supported.
action	text	When **function_name** is set to **STMT**, the value of **action** can only be **TRACK**, **UNTRACK**, **LIST**, or **CLEAN**. • **TRACK**: records the full SQL information of normalized SQL statements. • **UNTRACK**: cancels the recording of full SQL information of normalized SQL statements. • **LIST**: lists normalized SQL information that is recorded in the current track. • **CLEAN**: cleans normalized SQL information that is recorded in the current track.
params	text[]	When **function_name** is set to **STMT**, the parameters corresponding to different actions are set as follows: • **TRACK**: **'{"Normalized SQLID", "L0/L1/L2"}'** • **UNTRACK**: **'{"Normalized SQLID"}'** • **LIST**: **'{}'** • **CLEAN**: **'{}'**

gs_parse_page_bypath(path text, blocknum bigint, relation_type text, read_memory boolean)

Description: Parses a specified table page and returns the path for storing the parsed content.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-117 gs_parse_page_bypath parameters

Parameter	Type	Description
path	text	• For an ordinary table or segment-page table, the relative path is *Tablespace name*/*Database OID*/*Relfilenode of the table (physical file name)*. For example, **base/16603/16394**. • For the visibility map of an ordinary table, the relative path is *Tablespace name*/*Database OID*/*Visibility map of the ordinary table*. For example, **base/16603/16394_vm**. • For the FSM file of an ordinary table, the relative path is *Tablespace name*/*Database OID*/*Relfilenode of the table (physical file name)*. For example, **base/16603/16394**. • For clog files, the parsed content is stored in the **pg_clog** directory. For example: 000000000000. • For csnlog files, the parsed content is stored in the **pg_csnlog** directory. For example: 000000000000. • For undo record files, the relative path is **undo/UNDOPERSISTENCE/zondid.segno** in the **undo** directory. Example: undo/permanent/00000.0000009. • For undo meta files, the relative path is **undo/UNDOPERSISTENCE/zondid.meta.segno** in the **undo** directory. Example: undo/permanent/00000.meta.0000004. • You can run the **pg_relation_filepath(table_name text)** command to query the relative path of the table file. To obtain the path of the partitioned table, view the pg_partition system catalog and call **pg_partition_filepath(partition_oid)**. • Valid path formats are as follows: – global/relNode – base/dbNode/relNode – pg_tblspc/spcNode/version_dir/dbNode/relNode

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
blocknum	bigint	• **–1**: information about all blocks (forcibly parsed from disks) • **0**–*MaxBlockNumber*: information about the corresponding block • For B-tree/UB-tree indexes, **0** indicates the index meta-page. • For undo record files, the logical block number is used. The block number of the corresponding file is greater than or equal to **segno** x 128 and less than (**segno** + 1) x 128. • For undo meta files, the logical block number is used. The block number of the corresponding file is greater than or equal to **segno** x 4 and less than (**segno** + 1) x 4.
relation_type	text	• **heap**: Astore table. • **uheap**: Ustore table. • **btree**: B-tree index. • **ubtree**: UB-tree index. • **vm**: visibility map of the Astore ordinary table. • **fsm**: freespace map file of a row-store table. • **clog** (commit log): transaction status log. • **csnlog** (commit sequence number log): snapshot timestamp log. • **undo_slot**: transaction slot information. • **undo_record**: undo record information. • **indexurq**: indexurq page. • **gsivfflat_index**: gsivfflat vector index. • **gsdiskann_index**: gsdiskann vector index.
read_memory	Boolean	• **false**: The system parses the page from the disk file. • **true**: The system attempts to parse the page from the shared buffer. If the page does not exist in the shared buffer, the system parses the page from the disk file.

Example:

```
# Parse the information of all pages in the B-tree index file.
# Before calling the function, ensure that the file path exists based on the parameter description.
gaussdb=# SELECT gs_parse_page_bypath('base/16603/16394', -1, 'btree',  false);
                    gs_parse_page_bypath
------------------------------------------------------------------------
 gs_log_dir/dump/1663_16603_16394_-1.page
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
# Parse the visibility result of all blocks in the visibility map file.
gaussdb=# SELECT gs_parse_page_bypath('base/12828/16771_vm', -1, 'vm', false);
                        gs_parse_page_bypath
-------------------------------------------------------------------------
 gs_log_dir/dump/1663_12828_16771_-1_vm.page
(1 row)

# Parse the commit log of block 0 in the Clog file.
gaussdb=# SELECT gs_parse_page_bypath('000000000000', 0, 'clog', false);
                       gs_parse_page_bypath
--------------------------------------------------------------------
 gs_log_dir/dump/000000000000.clog
(1 row)
```

The following is an example of an exception error:

```
# An error is reported when the value of the block number exceeds the value range.
gaussdb=# SELECT gs_parse_page_bypath('base/12828/16777', -10, 'heap', false);
ERROR:  Blocknum should be between -1 and 4294967294.
CONTEXT:  referenced column: gs_parse_page_bypath
```

gs_xlogdump_lsn(start_lsn text, end_lsn text)

Description: Parses Xlogs within the specified LSN range and returns the path for storing the parsed content. You can use pg_current_xlog_location() to obtain the current Xlog position.

Return type: text

Parameters: LSN start position and LSN end position

Note: Only SYSADMIN or OPRADMIN can execute this function.

gs_xlogdump_xid(c_xid xid)

Description: Parses Xlogs of a specified XID and returns the path for storing the parsed content. You can use txid_current() to obtain the current XID.

Parameter: XID

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

gs_xlogdump_tablepath(path text, blocknum bigint, relation_type text)

Description: Parses logs corresponding to a specified table page and returns the path for storing the parsed content. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-118 gs_xlogdump_tablepath parameters

Parameter	Type	Description
path	text	• For an ordinary table or segment-page table, the relative path is *Tablespace name*/*Database OID*/*Relfilenode of the table (physical file name)*. For example, **base/16603/16394**. • You can run the **pg_relation_filepath(table_name text)** command to query the relative path of the table file. To obtain the path of the partitioned table, view the pg_partition system catalog and call **pg_partition_filepath(partition_oid)**. • Valid path formats are as follows: – global/relNode – base/dbNode/relNode – pg_tblspc/spcNode/version_dir/dbNode/relNode
blocknum	bigint	• **–1**: information about all blocks (forcibly parsed from disks) • **0**–*MaxBlockNumber*: information about the corresponding block
relation_type	text	• **heap**: Astore table • **uheap**: Ustore table • **btree**: B-tree index • **ubtree**: UB-tree index • **segment**: segment-page mode

gs_xlogdump_parsepage_tablepath(path text, blocknum bigint, relation_type text,read_memory boolean)

Description: Parses the specified table page and logs corresponding to the table page and returns the path for storing the parsed content. It can be regarded as one execution of **gs_parse_page_bypath** and **gs_xlogdump_tablepath**. The prerequisite for executing this function is that the table file exists. To view logs of deleted tables, call **gs_xlogdump_tablepath**. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-119 gs_xlogdump_parsepage_tablepath parameters

Parameter	Type	Description
path	text	• For an ordinary table or a segment-page ordinary table, the relative path is *Tablespace name*/*Database OID*/*Relfilenode of the table (physical file name)*, for example, **base/16603/16394**. • You can run the **pg_relation_filepath(table_name text)** command to query the relative path of the table file. To obtain the path of the partitioned table, view the pg_partition system catalog and call **pg_partition_filepath(partition_oid)**. • Valid path formats are as follows: – global/relNode – base/dbNode/relNode – pg_tblspc/spcNode/version_dir/dbNode/relNode
blocknum	bigint	• **–1**: information about all blocks (forcibly parsed from disks) • **0**–*MaxBlockNumber*: information about the corresponding block
relation_type	text	• **heap**: Astore table • **uheap**: Ustore table • **btree**: B-tree index • **ubtree**: UB-tree index • **indexurq**: indexurq page
read_memory	Boolean	• **false**: The system parses the page from the disk file. • **true**: The system attempts to parse the page from the shared buffer. If the page does not exist in the shared buffer, the system parses the page from the disk file.

gs_shared_storage_xlogdump_lsn(start_lsn text, end_lsn text, xlog_file_path text)

Description: Parses Xlogs within the specified LSN range of a specified shared disk and returns the path for storing the parsed content. You can use pg_current_xlog_location() to obtain the current Xlog position.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-120 gs_shared_storage_xlogdump_lsn parameters

Parameter	Type	Description
start_lsn	text	Start LSN of the Xlog to be parsed.
end_lsn	text	End LSN of the Xlog to be parsed.
xlog_file_path	text	(Optional) Path of the shared volume where the Xlog to be parsed is located. If not specified, Xlogs of all shared disks on the current DN are parsed.

gs_shared_storage_ctlinfo()

Description: Obtains information about the metadata of the shared volume on the current DN.

Return type: record

Table 7-121 gs_shared_storage_ctlinfo parameters

Category	Parameter	Type	Description
Output parameter	xlog_file_path	text	Path of the shared volume.
Output parameter	system_id	text	The **system_id** value stored on the current shared volume.
Output parameter	term	text	The **term** value stored on the current shared volume.
Output parameter	xlog_file_size	text	Size of the space for storing Xlogs on the shared volume.
Output parameter	insert_tail	text	Minimum valid LSN on the shared volume.
Output parameter	insert_head	text	Maximum valid LSN on the shared volume.
Output parameter	shared_storage_flush_lsn	text	LSN that has been flushed to disk on the shared volume.

gs_index_verify(oid oid, uint32 blkno)

Description: Checks whether the sequence of keys on the UB-tree index page or index tree is correct.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-122 gs_index_verify parameters

Parameter	Type	Description
oid	oid	• Index file relfilenode, which can be queried using **select relfilenode from pg_class where relname='***Index file name***'**.
blkno	uint32	• **0**: indicates that all pages in the index tree are checked. • If the value is greater than 0, the index page whose page code is equal to the value of **blkno** is checked.

gs_index_recycle_queue(Oid oid, int type, uint32 blkno)

Description: Parses the UB-tree index recycling queue information.

Return type: record

Table 7-123 gs_index_recycle_queue parameters

Parameter	Type	Description
oid	oid	• Index file relfilenode, which can be queried using **select relfilenode from pg_class where relname='***Index file name***'**.
type	int	• **0**: The entire queue to be recycled is parsed. • **1**: The entire empty page queue is parsed. • **2**: A single page is parsed.
blkno	uint32	• ID of the recycling queue page. This parameter is valid only when **type** is set to **2**. The value of **blkno** ranges from 1 to 4294967294.

gs_stat_wal_entrytable(int64 idx)

Description: Exports the content of the write-ahead log insertion status table in the Xlog.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-124 gs_stat_wal_entrytable parameters

Category	Parameter	Type	Description
Input parameter	idx	int64	• **–1**: queries all elements in an array. • **0**–*Maximum value*: content of a specific array element.
Output parameter	idx	uint64	Records the subscripts in the corresponding array.
Output parameter	endlsn	uint64	Records the LSN label. Determines whether the Xlog corresponding to the current entry has been completely copied to the WAL buffer. • **0**: Not copied. • Other values: Copied.
Output parameter	lrc	int32	Records the corresponding LRC.
Output parameter	status	uint32	This parameter is deprecated in the current version. The query result is **0**.

gs_walwriter_flush_position()

Description: Outputs the refresh position of write-ahead logs.

Return type: record

Table 7-125 gs_walwriter_flush_position parameters

Category	Parameter	Type	Description
Output parameter	last_flush_status_entry	int32	Index obtained after the Xlog flushes the tblEntry of the last flushed disk.
Output parameter	last_scanned_lrc	int32	LRC obtained after the Xlog flushes the last tblEntry scanned last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	curr_lrc	int32	Latest LRC usage in the WALInsertStatusEntry status table. The LRC indicates the LRC value corresponding to the WALInsertStatusEntry when the next Xlog record is written.
Output parameter	curr_byte_pos	uint64	The latest Xlog position after the Xlog is written to the WAL file, which is also the next Xlog insertion point.
Output parameter	prev_byte_size	uint32	Length of the previous Xlog record.
Output parameter	flush_result	uint64	Position of the current global Xlog flush.
Output parameter	send_result	uint64	Xlog sending position on the current host.
Output parameter	shm_rqst_write_pos	uint64	The write position of the LogwrtRqst request in the XLogCtl recorded in the shared memory.
Output parameter	shm_rqst_flush_pos	uint64	The flush position of the LogwrtRqst request in the XLogCtl recorded in the shared memory.
Output parameter	shm_result_write_pos	uint64	The write position of the LogwrtResult request in the XLogCtl recorded in the shared memory.
Output parameter	shm_result_flush_pos	uint64	The flush position of the LogwrtResult request in the XLogCtl recorded in the shared memory.
Output parameter	curr_time	text	Current time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_walwriter_flush_stat(int operation)

Description: Collects statistics on the frequency of writing and synchronizing WALs, data volume, and Xlog file information.

Return type: record

Table 7-126 gs_walwriter_flush_stat parameters

Category	Parameter	Type	Description
Input parameter	operation	int	• **–1** (default): disables the statistics function. • **0**: enables the statistics function. • **1**: queries statistics. • **2**: resets statistics.
Output parameter	write_times	uint64	Number of times that the Xlog calls the write API.
Output parameter	sync_times	uint64	Number of times that the Xlog calls the sync API.
Output parameter	total_xlog_sync_bytes	uint64	Total number of backend thread requests for writing data to Xlogs.
Output parameter	total_actual_xlog_sync_bytes	uint64	Total number of Xlogs that call the sync API for disk flushing.
Output parameter	avg_write_bytes	uint32	Number of Xlogs written each time the XLogWrite API is called.
Output parameter	avg_actual_write_bytes	uint32	Number of Xlogs written each time the write API is called.
Output parameter	avg_sync_bytes	uint32	Average number of Xlogs for each sync request.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	avg_actual_sync_bytes	uint32	Actual Xlog amount of disk flushing by calling sync each time.
Output parameter	total_write_time	uint64	Total time for calling the write operation (unit: μs).
Output parameter	total_sync_time	uint64	Total time for calling the sync operation (unit: μs).
Output parameter	avg_write_time	uint32	Average time for calling the write API each time (unit: μs).
Output parameter	avg_sync_time	uint32	Average time for calling the sync API each time (unit: μs).
Output parameter	curr_init_xlog_segno	uint64	ID of the latest Xlog segment file.
Output parameter	curr_open_xlog_segno	uint64	ID of the Xlog segment file that is being written.
Output parameter	last_reset_time	text	Time when statistics were last collected.
Output parameter	curr_time	text	Current time.

gs_catalog_attribute_records()

Description: Returns the definition of each column in a system catalog specified by OID. Only ordinary system catalogs whose OIDs are less than 10000 are supported. Indexes and TOAST tables are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: OID of the system catalog

Return type: record

gs_comm_proxy_thread_status()

Description: Collects statistics on data packets sent and received by the proxy communications library **comm_proxy** when a user-mode network is configured for the database instance.

Parameter: nan

Return type: record

NOTE

The query result of this function is displayed only when the user-mode network is deployed in a centralized environment and **enable_dfx in comm_proxy_attr** is set to **true**. In other scenarios, an error message is displayed, indicating that queries are not supported.

pg_ls_tmpdir()

Description: Returns the name, size, and last modification time of each file in the temporary directory (**pgsql_tmp**) of the default tablespace.

Parameter: nan

Return type: record

Note: Only SYSADMIN or MONADMIN can execute this function.

Category	Parameter	Type	Description
Output parameter	name	text	File name.
Output parameter	size	int8	File size (unit: byte).
Output parameter	modification	timestamptz	Last file modification time.

pg_ls_tmpdir(oid)

Description: Returns the name, size, and last modification time of each file in the temporary directory (**pgsql_tmp**) of the specified tablespace.

Parameter: oid

Return type: record

Note: Only SYSADMIN or MONADMIN can execute this function.

Category	Parameter	Type	Description
Input parameter	oid	oid	Tablespace ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	name	text	File name.
Output parameter	size	int8	File size (unit: byte).
Output parameter	modification	timestamptz	Last file modification time.

pg_ls_waldir()

Description: Returns the name, size, and last modification time of each file in the WAL directory.

Parameter: nan

Return type: record

Note: Only SYSADMIN or MONADMIN can execute this function.

Category	Parameter	Type	Description
Output parameter	name	text	File name.
Output parameter	size	int8	File size (unit: byte).
Output parameter	modification	timestamptz	Last file modification time.

gs_stat_anti_cache()

Description: Returns AntiCache statistics.

Parameter: nan

Return type: record

Category	Parameter	Type	Description
Output parameter	table_nums	int8	Number of partitions.
Output parameter	table_init_size	int8	Initial size of a partition.
Output parameter	table_max_size	int8	Upper limit of the partition size.
Output parameter	anti_cache_upper_limit_size	int8	Upper limit of the AntiCache size.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	anti_cache_size	int8	Real-time AntiCache size.
Output parameter	anti_cache_max_table_size	int8	Real-time maximum partition size.
Output parameter	anti_cache_min_table_size	int8	Real-time minimum partition size.

gs_stat_vlog_buffer()

Description: Returns verifyLog buffer statistics.

Parameter: nan

Return type: record

Category	Parameter	Type	Description
Output parameter	vbuffer_write_offset	int8	Vlog write location.
Output parameter	vbuffer_flushed_offset	int8	Vlog disk flushing location.
Output parameter	max_vbuffer_flushed_value	int8	Maximum number of bytes for vlog flushing.
Output parameter	min_vbuffer_flushed_vlaue	int8	Minimum number of bytes for vlog flushing.
Output parameter	ave_vbuffer_flushed_vlaue	int8	Average number of bytes for vlog flushing.
Output parameter	vbuffer_flush_latency	int8	Vlog refresh delay.

gs_stat_vlog_related_io()

Description: Returns I/O statistics about read and write operations on the verifylog file.

Parameter: nan

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	read_data_iops	float8	Number of pages read from files per second.
Output parameter	vlog_read_iops	float8	Number of pages read from vlogs per second.
Output parameter	vlog_write_iops	float8	Number of pages written to vlogs per second.

gs_write_term_log(void)

Description: Writes a log to record the current **term** value of a DN. The standby DN returns **false**. After the data is successfully written to the primary DN, **true** is returned.

Return type: Boolean

gs_stat_space(bool init)

Description: Queries the status of extended pages when the INSERT operation is performed on a Ustore table.

Return type: record

Category	Parameter	Type	Description
Input parameter	init	bool	Specifies whether to reset the statistics.
Output parameter	access_func	int8	Total number of access times of the relation_get_buffer_for_utuple API.
Output parameter	cache_blk	int8	Number of times that the relation_get_buffer_for_utuple API obtains buffers.
Output parameter	cache_succ	int8	Number of times that the relation_get_buffer_for_utuple API successfully obtains buffers.
Output parameter	nblk_first	int8	Number of times that relation_get_buffer_for_utuple obtains **nblocks-1** for the first time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	nblk_first_succ	int8	Number of times that relation_get_buffer_for_utuple obtains **nblocks-1** successfully for the first time.
Output parameter	nblk_second	int8	Number of times that relation_get_buffer_for_utuple obtains **nblocks-1** for the second time.
Output parameter	nblk_second_succ	int8	Number of times that relation_get_buffer_for_utuple obtains **nblocks-1** successfully for the second time.
Output parameter	fsm_first	int8	Number of times that FSM is accessed for the first time.
Output parameter	fsm_first_success	int8	Number of times that FSM is accessed successfully for the first time.
Output parameter	fsm_rewrite	int8	Number of FSM writeback times.
Output parameter	fsm_second	int8	Number of times that FSM is accessed for the second time.
Output parameter	fsm_second_sucess	int8	Number of times that FSM is accessed successfully for the second time.
Output parameter	prune_count	int8	Number of prune times in relation_get_buffer_for_utuple.
Output parameter	prune_space	int8	Total prune space in relation_get_buffer_for_utuple.
Output parameter	coprune_count	int8	Number of times that joint prune is performed.
Output parameter	coprune_scan_blocks	int8	Total number of pages scanned for joint prune.
Output parameter	coprune_prune_count	int8	Number of joint prune times.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	coprune_prune_space	int8	Total space for joint prune.
Output parameter	con_extend_count	int8	Number of concurrent extended pages.
Output parameter	con_extend_time	int8	Total time for concurrent page extension.
Output parameter	single_extend_time	int8	Number of single-page extension times.

Example:

```
gaussdb=# SELECT * FROM gs_stat_space(false);
 access_func | cache_blk | cache_succ | nblk_first | nblk_first_succ | nblk_sencond | nblk_sencond_succ |
fsm_first | fsm_first_success | fsm_rewrite | fsm_
second | fsm_second_success | prune_count | prune_space | coprune_count | coprune_scan_blocks |
coprune_prune_count | coprune_prune_space | con_extend_count
 | con_extend_time | single_extend_count
-------------+-----------+------------+------------+-----------------+--------------+-------------------+-----------
+------------------+-------------+-----
-------+-------------------+-------------+-------------+---------------+---------------------+---------------------
+---------------------+-----------------
-+-----------------+---------------------
    10082397 |  10082397 |   10082235 |        88 |            78 |       47021 |           47021 |       162
|              74 |      360996 |
360996 |           270948 |        6711 |          0 |        45497 |            222619 |                0 |
0 |            3675
 |       25542884 |             26791
(1 row)
```

Note: Pay special attention to the value of **cache_succ**. If it is small, the system cache is invalid. If the value of **prune_space** is small, the Ustore data page cleaning mechanism may be faulty. If the value of **con_extend_time** is too large, the Ustore concurrent page extension takes a long time.

gs_index_dump_read(int8 reset, text out_type)

Description: Queries the buffer read information generated in the cyclic queue when an index is used to obtain a new page. The buffer read information traverses leaf pages from left to right using the same key as the index page. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	reset	int8	• **0**: The statistics are reset to the initial value 0 and the statistics are collected again. • **1**: The current statistics are displayed.
Input parameter	out_type	text	• **urq**: outputs statistics about cyclic queues. • **ubtree**: outputs statistics on index pages. • **all**: outputs all statistics about cyclic queues and index pages.
Output parameter	relfilenode	oid	Index relfilenode corresponding to the maximum buffer read value.
Output parameter	max_count	int8	Maximum buffer read value.
Output parameter	ave_count	int8	Average buffer read value.

NOTE

- Currently, this API supports only Ustore index tables.
- When this API is executed, the reset operation is performed to clear all records and set all records to **0**. If you query the information again, the query result is always 0 until the information is collected next time. The following are query examples:

```
gaussdb=# SELECT * FROM gs_index_dump_read(0, 'all');
relfilenode | max_count | ave_count
--------------+-------------+-------------
|                 |
(1 row)
gaussdb=# SELECT * FROM gs_index_dump_read(1, 'all');
relfilenode | max_count | ave_count
--------------+-------------+-------------
0 |               0 |               0
0 |               0 |               0
(2 rows)
```

gs_redo_upage(directory_path text, backup_path text, blocknum bigint, relation_type text, xlog_path text, lsn text)

Description: Redoes a specific Ustore data page that is backed up to a specified LSN and verifies the page in this process. If a damaged page is detected, the page is flushed to the disk and the disk flushing path, page LSN, and damage information is returned; otherwise, the page is redone to the specified LSN and flushed to the disk, and the result is returned. Only SYSADMIN or OPRADMIN can

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

execute this function. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: record

Category	Parameter	Type	Description
Input parameter	directory_path	text	Specifies the directory for storing the backup file.
Input parameter	backup_path	text	Relative path of the backup table file, which is combined with the directory where the backup file is located to form the complete path of the table file, for example, **base/15635/12488**. If the backup file does not exist, set this parameter to null.
Input parameter	blocknum	bigint	**0** to *MaxBlockNumber*: block number of the corresponding page.
Input parameter	relation_type	text	• **uheap**: Ustore data page • **ubtree**: Ustore index page • **indexurq**: URQ page • **undo_record**: undo record page • **undo_slot**: transaction slot page
Input parameter	xlog_path	text	Absolute path of the archive log directory.
Input parameter	lsn	text	The LSN consists of two hexadecimal numbers (32 bits each), which are separated by a slash (/), for example, 2/962D1DF8. If the value is **0**, the latest version is used.
Output parameter	output_filename	text	Path and name of the file to be flushed to the disk.
Output parameter	output_lsn	text	LSN of the last page redo.
Output parameter	corruption_desc	text	Page damage description.

gs_xlogdump_bylastlsn(last_lsn text, blocknum bigint, relation_type text)

Description: Inputs a page LSN and block number, parses the WAL corresponding to the LSN, obtains the last LSN of the corresponding block number, continues parsing until the last LSN is 0 or the WAL of an earlier version has been reused and recycled, and flushes the parsed log to a specified path. Only SYSADMIN or OPRADMIN can execute this function. This system function cannot be called by the standby node.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	last_lsn	text	Parses the LSN of a specified page in hexadecimal notation, for example, 12BA/32CDEDDD. The LSN can be obtained using a page parsing tool (such as gs_parse_page_bypath).
Input parameter	blocknum	bigint	Specifies the logical block number of a page. Value range: **–1** to *MaxBlockNumber*. If the block number is set to **–1**, the default block number is obtained from the WAL.
Input parameter	relation_type	text	Specifies the type of the page to be parsed. Valid value: **uheap**, **ubtree**, **heap**, **btree**, **undo_record**, and **undo_slot**.
Output parameter	output_filepath	text	Specifies the path for flushing WAL parsing results to disks.

Example:

```
# Obtain the page LSN.
# Before calling the function, ensure that the file path exists based on the parameter description.
gaussdb=# SELECT * FROM gs_parse_page_bypath('base/15833/16768', 0, 'uheap', false);
                    output_filepath
-----------------------------------------------------------------
 data1/database/cluster/primary/data/1663_15833_16768_0.page
(1 row)
gaussdb=# SELECT * FROM gs_xlogdump_bylastlsn('0/4593570', -1, 'uheap');
                    output_filepath
-----------------------------------------------------------------------
 /data1/database/cluster/primary/data/gs_log/dump/4593570_-1.xlog
(1 row)
gaussdb=# SELECT * FROM gs_xlogdump_bylastlsn('0/4593570', 0, 'ubtree');
ERROR:  The input lsn 0/4593570 related xlog is not ubtree.
```

gs_shared_storage_flush_stat(int operation)

Description: Collects statistics on the amount of written data, write speed, write time, amount of read data, read speed, and read time of shared disks. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	operation	int	• **–1**: disables the statistics function. • **0** (default): enables the statistics function. • **1**: queries statistics. • **2**: resets statistics. After the statistics function is disabled and then enabled again, the previous statistics are cleared.
Output parameter	stat_switch	bool	Specifies whether the statistics function is enabled.
Output parameter	write_times	uint64	Number of times that the shared_storage_xlog_copy thread calls the dorado_write_xlog API.
Output parameter	avg_write_bytes	uint32	Amount of Xlogs to be written each time the dorado_write_xlog API is called, in byte.
Output parameter	avg_actual_write_bytes	uint32	Actual amount of Xlogs to be written each time the dorado_write_xlog API is called, in byte.
Output parameter	total_write_time	uint64	Total time for calling the dorado_write_xlog API, in μs.
Output parameter	avg_write_time	uint32	Average time for calling the dorado_write_xlog API each time, in μs.
Output parameter	avg_write_speed	uint32	Average speed of calling the dorado_write_xlog API to write Xlogs, in KB/s.
Output parameter	avg_actual_write_speed	uint32	Actual average speed of calling the dorado_write_xlog API to write Xlogs, in KB/s.
Output parameter	total_write_sleep_time	uint64	Total sleep time of the shared_storage_xlog_copy thread.
Output parameter	read_times	uint64	Number of times that the WAL receiver thread calls the dorado_read_xlog API.
Output parameter	avg_read_bytes	uint32	Amount of Xlogs to be written each time the dorado_read_xlog API is called, in byte.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	avg_actual_read_bytes	uint32	Actual amount of Xlogs to be written each time the dorado_read_xlog API is called, in byte.
Output parameter	total_read_time	uint64	Total time for calling the dorado_read_xlog API, in μs.
Output parameter	avg_read_time	uint32	Average time for calling the dorado_read_xlog API each time, in μs.
Output parameter	avg_read_speed	uint32	Average speed of calling the dorado_read_xlog API to write Xlogs, in KB/s.
Output parameter	avg_actual_read_speed	uint32	Actual average speed of calling the dorado_read_xlog API to write Xlogs, in KB/s.
Output parameter	total_read_sleep_time	uint64	Total sleep time of the WAL receiver thread.
Output parameter	stat_start_time	timestamptz	Start time of the statistics. If the statistics are not reset, the value is the start time of GaussDB. If the statistics are reset, the value is the last reset time.
Output parameter	stat_end_time	timestamptz	End time of the current statistics collection. If the statistics collection function is enabled, the value is the current time. If the statistics collection function is disabled, the value is the last time when the statistics collection function is disabled.

Example:

```
gaussdb=# SELECT * FROM gs_shared_storage_flush_stat(1);
 stat_switch | write_times | avg_write_bytes | avg_actual_write_bytes | total_write_time | avg_write_time |
avg_write_speed | avg_actual_write_speed | total_write_sleep_time | read_times | avg
_read_bytes | avg_actual_read_bytes | total_read_time | avg_read_time | avg_read_speed |
avg_actual_read_speed | total_read_sleep_time |         stat_start_time         |          stat_end_time

dbe_perf.get_full_sql_by_parent_id_and_timestamp(parent_id bigint, start_timestamp timestamp with time zone, end_timestamp timestamp with time zone)

Description: Obtains the records of database-level full SQL statements and their substatements that execute a stored procedure in a specified period based on **parent_id**. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

Parameter	Type	Description
parent_id	bigint	Specifies the unique_sql_id of the statement calling a stored procedure.
start_timestamp	timestamp with time zone	Start point of the SQL start time range.
end_timestamp	timestamp with time zone	End point of the SQL start time range.

Example:

```
gaussdb=# CREATE TABLE test(a int,b int);
CREATE TABLE
gaussdb=# INSERT INTO test values(1,1);
INSERT 0 1
gaussdb=# CREATE PROCEDURE mypro1() as num int;
gaussdb$# begin
gaussdb$# INSERT INTO test values(2,2);
gaussdb$# DELETE FROM test where a = 2;
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE

-- Enable the parameter to trace the substatements of the stored procedure.
gaussdb=# SET instr_unique_sql_track_type = 'all';
SET

-- Enable the parameter. Full statement records are generated in the dbe_perf.statement_history table.
gaussdb=# SET track_stmt_stat_level = 'L0,L0';
SET

gaussdb=# CALL mypro1();
 mypro1

```

gin_clean_pending_list(index regclass)

Description: Clears the pending list of a specified UGIN index, moves items in the pending list to the primary index page in batches, and returns the number of cleared pages. If the fastupdate option is not enabled for the index, the pending list will not be cleared, and the result is **0**.

Return type: bigint

gs_stat_freespace(Oid relid, Oid partid, char type, int sample_ratio)

Description: Estimates the bloat rate of a table, partitioned table, or index based on statistics or sampling, and outputs space usage statistics and bloat rate information.

Return type: record

Category	Parameter	Type	Description
Input parameter	relation_oid	OID	OID of a data table, main table of the partitioned table, or index to be queried.
Input parameter	partation_oid	OID	OID of a partitioned table, level-2 partitioned table, or local partitioned index. • If **relation_oid** refers to a non-partitioned table, non-local partitioned index, or GPI, this parameter is meaningless. • If **relation_oid** refers to a partitioned table, level-2 partitioned table, or local partitioned index, and **partition_oid** is set to **0**, information about all partitions is output.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	relation_type	CHAR	Table type: • **'r'**: indicates that the target table is a row-store data table. • **'i'**: indicates that the target table is a row-store index table.
Input parameter	sample_ratio	INT8	Sampling ratio. The value ranges from 0 to 100. • When **sample_ratio** is set to **0**, **INFO** indicates the bloat rate estimated based on statistics. • When the value of **sample_ratio** ranges from 1 to 100, **INFO** indicates the bloat rate estimated through sampling.
Input parameter	read_memory	BOOL	Specifies whether to read pages from the memory. • **true**: indicates that the page is read from the memory. • **false**: indicates that pages are read from disks. Currently, the value can only be **false**.
Output parameter	OID	OID	OID of a data table, partitioned table, level-2 partitioned table, or index to be queried.
Output parameter	INFO	TEXT	• When **sample_ratio** is set to **0**, **INFO** indicates the estimated page bloat rate. • When the value of **sample_ratio** is greater than 0, **INFO** indicates the page usage statistics based on sampling, including the page header length, average tuple length, average number of normal tuples, average number of dead tuples, average number of unused tuples, average number of redirected tuples, and average number of TDs per page (for Ustore data tables), average potential_freespace per page, actual freespace (page upper – page lower), total number of pages in the relation, estimated space occupied by data tables/indexes based on sampling information, and estimated bloat rate of the data table/index based on sampling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Currently, this API supports only row-store tables. Column-store tables, time series tables, segment-page tables, hash bucket tables, local temporary tables, and global temporary tables are not supported.

Example:

```
-- Query ordinary table information.
Create a table:
drop table if exists t;
create table t(a int) with (storage_type=ustore);
insert into t values(generate_series(1, 110000));

Update statistics:
vacuum analyze t;

Estimate bloat rate:
gaussdb=# select * from gs_stat_freespace((select oid from pg_class where relname='t'), 0, 'r', 0, false);
  oid  |                                                
```

```
-------+---------+----------
 16805 | t       | r
 16806 | p1      | p
 16807 | p2      | p
(3 rows)

Estimate bloat rate:

gs_undo_meta(type, zoneId, location)

Description: Specifies metadata of a module in the undo system.

Parameters:

- **type** (metadata type)
  - **0**: indicates metadata corresponding to an undo zone (record).
  - **1**: indicates metadata corresponding to an undo zone(transaction slot).
  - **2**: indicates metadata corresponding to an undo space (record).
  - **3**: indicates metadata corresponding to an undo space(transaction slot).
- **zoneId** (undo zone ID)
  - **–1**: indicates metadata of all undo zones.
  - **0** to 1024 x 1024 – 1: indicates the metadata of the corresponding zone ID.
- **location** (read location)
  - **0**: indicates that data is read from the current memory.
  - **1**: indicates that data is read from a physical file.

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

Table 7-127 gs_undo_meta parameters

Category	Parameter	Type	Description
Output parameter	zoneId	oid	ID of an undo zone.
Output parameter	persistType	oid	Persistence level.
Output parameter	insert	text	Position of the next undo record to be inserted.
Output parameter	discard	text	Position of the undo record that is recycled in common mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	end	text	Position of the undo record that is forcibly recycled. Values smaller than the value of this parameter indicate that the record has been recycled.
Output parameter	used	text	Undo space that has been used.
Output parameter	lsn	text	Modifies the LSN of an undo zone.
Output parameter	pid	oid	ID of a thread bound to an undo zone.

gs_undo_translot(location, zoneId)

Description: Specifies transaction slot information of the undo system.

Parameters:

- **location** (read location)
  - **0**: indicates that data is read from the current memory.
  - **1**: indicates that data is read from a physical file.
- **zoneId** (undo zone ID)
  - **–1**: indicates metadata of all undo zones.
  - **0** to 1024 x 1024 – 1: indicates the metadata of the corresponding zone ID.

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

Table 7-128 gs_undo_translot parameters

Category	Parameter	Type	Description
Output parameter	groupId	oid	Undo zone ID that is used.
Output parameter	xactId	text	Transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	startUndoPtr	text	Position where an undo record is inserted at the start of a transaction corresponding to a transaction slot.
Output parameter	endUndoPtr	text	Position where an undo record is inserted at the end of a transaction corresponding to a transaction slot.
Output parameter	lsn	text	Transaction slot pointer.
Output parameter	slot_states	oid	Transaction status. • **0** indicates that the transaction has been committed. • **1** indicates that the task is being executed. • **2** indicates that the rollback is in progress. • **3** indicates that the rollback is complete.

gs_stat_undo([bool init])

Description: Collects undo statistics.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-129 gs_stat_undo parameters

Category	Parameter	Type	Description
Input parameter	init	bool	(Optional) Specifies whether to clear statistics and restart statistics collection.
Output parameter	curr_used_zone_count	int	Number of used undo zones.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	top_used_zones	text	Information about the first three undo zones with the maximum usage. The output format is as follows: • **zoneId1**: used size of zone 1. • **zoneId2**: used size of zone 2. • **zoneId3**: used size of zone 3.
Output parameter	curr_used_undo_size	int	Total size of the undo tablespace that is being used. The unit is MB.
Output parameter	undo_threshold	int	Calculation result of the value of the GUC parameter **undo_space_limit_size** x 80%. The unit is MB.
Output parameter	global_recycle_xid	xid	XID of the transaction recycled to the undo space. The undo records generated by the transaction whose XID is smaller than the value of XID are recycled.
Output parameter	oldest_xmin	xid	Oldest active transaction.
Output parameter	total_undo_chain_len	int8	Total length of all accessed undo chains.
Output parameter	max_undo_chain_len	int8	Maximum length of the accessed undo chain.
Output parameter	create_undo_file_count	uint32	Number of created undo files.
Output parameter	discard_undo_file_count	uint32	Number of deleted undo files.
Output parameter	info	text	If the input parameter is **false**, suggestions on the **undo_space_limit_size**, **undo_limit_size_per_transaction**, and **undo_retention_time** parameters are provided. If the input parameter is **true**, init (clearing statistics) is required, and only 'The statistics have been initialized.' is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example 1: Clear undo statistics.

```
gaussdb=# SELECT * FROM gs_stat_undo(true);
 curr_used_zone_count |    top_used_zones     | curr_used_undo_size | undo_threshold | global_recycle_xid |
oldest_xmin | total_undo_chain_len | max_undo_chain_len | create_undo_file_coun
t | discard_undo_file_count |                info
----------------------+-----------------------+---------------------+----------------+--------------------+-------------
+----------------------+----------------------+---------------------
--+-------------------------+-----------------------------------
                 3 | 0 : 0, 0 : 0, 0 : 0 |                   1 |         209715 |              15741 |       15741 |                   0
|                0 |
2 |                     0 | The statistics have been initialized.
(1 row)
```

Example 2: Output undo statistics.

```
gaussdb=# SELECT * FROM gs_stat_undo(false);
 curr_used_zone_count |    top_used_zones     | curr_used_undo_size | undo_threshold | global_recycle_xid |
oldest_xmin | total_undo_chain_len | max_undo_chain_len | create_undo_file_coun
t | discard_undo_file_count |
            info

----------------------+-----------------------+---------------------+----------------+--------------------+-------------
+----------------------+----------------------+---------------------
--+-------------------------
+-----------------------------------------------------------------------------------------------------------------------------------------------------
---------------------------------
-----------------------------------------------------------------------------------------------------------------------------------------------------
-------------------------------------------------------------
-
                 3 | 0 : 0, 0 : 0, 0 : 0 |                   1 |         209715 |              16253 |       16253 |                   0
|                0 |
2 |                     0 | Based on the statistic info from last initialization, undo_space_limit_size is
recommended to set >= 120953 blocks, undo_limit_size_per_transaction is
recommended to set <= 327150 blocks, undo_retention_time is recommended to set <= 259200 seconds.
Since last initialization, max undo space used by a single transaction is 32715 blocks.
(1 row)
```

gs_undo_record(undoptr)

Description: Parses undo records.

Parameters:

- **undoptr** (undo record pointer)

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

gs_undo_dump_parsepage_mv(relpath text, blkno bigint, reltype text, rmem boolean)

Description: Parses the page header information of the disk page in the Ustore table, header information of each tuple, flag bit information, and all historical undo version information that can be queried. In the multi-tenancy scenario, this function is disabled in a PDB.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Currently, this API supports only Ustore tables.

Table 7-130 gs_undo_dump_parsepage_mv parameters

Category	Parameter	Type	Description
Input parameter	relpath	text	Relative path of the Ustore table data file, in the format of *Tablespace name*/*Database OID*/*relfilenode*. For example, **base/16603/16384**. You can run the **pg_relation_filepath('tablename')** command to query the relative path.
Input parameter	blkno	int8	• **–1**: All block pages are parsed. • **0**–*MaxBlocNumber*: A specified block page is parsed.
Input parameter	reltype	text	Table type. Currently, only the Ustore table is supported. The value is **uheap**.
Input parameter	rmem	Boolean	• **false** • **true** Currently, the value can only be **false**, indicating that the corresponding page is parsed from the disk file.
Output parameter	output	text	Absolute path of the parsing result file.

gs_undo_meta_dump_zone(zone_id int, read_memory boolean)

Description: Parses undo zone metadata in an undo module.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-131 gs_undo_meta_dump_zone parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID. • **–1**: All undo zones are queried. • **0**–**1048575**: The undo zone metadata is queried based on the zone ID.
Input parameter	read_memory	Boolean	• **true**: Data is read from the current memory. • **false**: Data is read from the physical file.
Output parameter	zone_id	oid	Undo zone ID.
Output parameter	persist_type	oid	Persistence levels: • **0**: ordinary table • **1**: unlogged table • **2**: temporary table
Output parameter	insert	text	Position of the next undo record to be inserted.
Output parameter	discard	text	Position of the undo record that is recycled in common mode.
Output parameter	forcediscard	text	Position of the undo record that is forcibly recycled. Values smaller than the value of this parameter indicate that the record has been recycled.
Output parameter	lsn	text	Modifies the LSN of an undo zone.

Example:

```
gaussdb=# SELECT * FROM gs_undo_meta_dump_zone(-1,true);
 zone_id | persist_type | insert | discard | forcediscard |   lsn
---------+--------------+--------+---------+--------------+----------
       0 |            0 | 244577 | 244577  | 244577       | 43967224
       1 |            0 | 108    | 66      | 66           | 43967568
  349525 |            1 | 24     | 24      | 24           | 0
  349526 |            1 | 24     | 24      | 24           | 0
  699050 |            2 | 24     | 24      | 24           | 0
  699051 |            2 | 24     | 24      | 24           | 0
(6 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_undo_meta_dump_spaces(zone_id int, read_memory boolean)

Description: Parses metadata of an undo record space and a transaction slot space in an undo module.

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

Table 7-132 gs_undo_meta_dump_spaces parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID. • **–1**: All undo zones are queried. • **0–1048575**: The undo zone metadata is queried based on the zone ID.
Input parameter	read_memory	Boolean	• **true**: Data is read from the current memory. • **false**: Data is read from the physical file.
Output parameter	zone_id	int	Undo zone ID.
Output parameter	undorecord_space_tail	text	End position of the undo record space
Output parameter	undorecord_space_head	text	Start position of the undo record space
Output parameter	undorecord_space_lsn	text	Modifies the LSN of an undo record space.
Output parameter	undoslot_space_tail	text	End position of a transaction slot space.
Output parameter	undoslot_space_head	text	Start position of a transaction slot space.
Output parameter	undoreslot_space_lsn	text	Modifies the LSN of a transaction slot space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_undo_meta_dump_slot(zone_id int, read_memory boolean)

Description: Parses transaction slot metadata in an undo module.

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

Table 7-133 gs_undo_meta_dump_slot parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID. • **–1**: All undo zones are queried. • **0–1048575**: The undo zone metadata is queried based on the zone ID.
Input parameter	read_memory	Boolean	• **true**: Data is read from the current memory. • **false**: Data is read from the physical file.
Output parameter	zone_id	int	Undo zone ID.
Output parameter	allocate	text	Allocation position of the undo transaction slot.
Output parameter	recycle	text	Recycling position of the undo transaction slot.
Output parameter	frozen_xid	text	Frozen XID, which is used to determine the visibility.
Output parameter	global_frozen_xid	text	Minimum frozen XID in the system. Transactions whose XID is smaller than the value of this parameter are visible.
Output parameter	recycle_xid	text	Recycled XID. Transactions whose XID is smaller than the value of this parameter are recycled.
Output parameter	global_recycle_xid	text	Minimum recycled XID in the system. Transactions whose XID is smaller than the value of this parameter are recycled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_undo_translot_dump_slot(zone_id int, read_memory boolean)

Description: Parses a transaction slot in an undo zone.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-134 gs_undo_translot_dump_slot parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID. • **–1**: All undo zones are queried. • **0**–**1048575**: The undo zone metadata is queried based on the zone ID.
Input parameter	read_memory	Boolean	• **true**: Data is read from the current memory. • **false**: Data is read from the physical file.
Output parameter	zone_id	oid	Undo zone ID.
Output parameter	slot_xid	text	Transaction ID.
Output parameter	start_undoptr	text	Position where the undo record is inserted at the start of the transaction corresponding to a slot.
Output parameter	end_undoptr	text	Position where the undo record is inserted at the end of the transaction corresponding to a slot.
Output parameter	slot_ptr	text	Position of a transaction slot.
Output parameter	slot_states	oid	Transaction state. • **0**: committed • **1**: being executed • **2**: being rolled back • **3**: rolled back

Example:

```
gaussdb=# SELECT * FROM gs_undo_translot_dump_slot(-1,true);
 zone_id |     slot_xid     | start_undoptr   |   end_undoptr   |     slot_ptr     | slot_states
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
---------+------------------+------------------+------------------+------------------+-------------
       1 | 0000000000015758 | 0000000000000042 | 000000000000006C | 0000000000000038 |           0
(1 row)
```

gs_undo_translot_dump_xid(slot_xid xid, read_memory boolean)

Description: Parses a transaction slot in an undo zone based on the XID.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-135 gs_undo_translot_dump_xid parameters

Category	Parameter	Type	Description
Input parameter	slot_xid	xid	Transaction ID to be queried.
Input parameter	read_memory	Boolean	• **true**: Data is read from the current memory. • **false**: Data is read from the physical file.
Output parameter	zone_id	oid	Undo zone ID.
Output parameter	slot_xid	text	Transaction ID.
Output parameter	start_undoptr	text	Position where the undo record is inserted at the start of the transaction corresponding to a slot.
Output parameter	end_undoptr	text	Position where the undo record is inserted at the end of the transaction corresponding to a slot.
Output parameter	slot_ptr	text	Position of a transaction slot.
Output parameter	slot_states	oid	Transaction state. • **0**: committed • **1**: being executed • **2**: being rolled back • **3**: rolled back

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM gs_undo_translot_dump_xid('15758',false);
 zone_id |     slot_xid     |  start_undoptr   |   end_undoptr    |     slot_ptr     | slot_states
---------+------------------+------------------+------------------+------------------+-------------
       1 | 0000000000015758 | 0000000000000042 | 000000000000006C | 0000000000000038 |           0
(1 row)
```

gs_undo_dump_record(undoptr bigint)

Description: Parses the undo record information of a specified URP.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-136 gs_undo_dump_record parameters

Category	Parameter	Type	Description
Input parameter	undoptr	xid	Start position of the undo record to be parsed.
Output parameter	undoptr	xid	Start position of the undo record to be parsed.
Output parameter	xactid	xid	Transaction ID.
Output parameter	cid	text	Command ID.
Output parameter	reloid	text	Relation OID.
Output parameter	relfilenode	text	Relfinode of the file.
Output parameter	utype	text	Undo record type.
Output parameter	blkprev	text	Position of the previous undo record in the same block.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	blockno	text	Block number.
Output parameter	uoffset	text	Undo record offset.
Output parameter	prevurp	text	Position of the previous undo record.
Output parameter	payloadlen	text	Length of the undo record data.
Output parameter	oldxactid	text	Previous transaction ID.
Output parameter	partitionoid	text	Partition OID.
Output parameter	tablespace	text	Tablespace.
Output parameter	alreadyread_bytes	text	Length of the read undo record.
Output parameter	prev_undorec_len	text	Length of the previous undo record.
Output parameter	td_id	text	ID of the transaction directory.
Output parameter	reserved	text	Reserved flag of the old tuple stored in an undo record.
Output parameter	flag	text	Status flag of the old tuple stored in an undo record.
Output parameter	flag2	text	Number of old tuple columns stored in an undo record.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	t_hoff	text	Length of the undo record data header.

Example (If the undo record is not recycled, the input parameter undoptr can be queried after being converted to a decimal value using the output parameter **end_undoptr** of the gs_undo_translot_dump_slot function.):

```
gaussdb=# SELECT * FROM gs_undo_dump_record('0000000000000042');
 undoptr |   xactid   | cid | reloid | relfilenode | utype |  blkprev   | blockno | uoffset | prevurp | payloadlen |
oldxactid | partitionoid | tablespace | alreadyread_byt
es | prev_undorec_len | td_id | reserved | flag | flag2 | t_hoff
---------+------------+-----+--------+-------------+-------+------------+---------+---------+---------+------------
+-----------+--------------+------------+----------------
---+------------------+-------+----------+------+-------+--------
      42 | 1073807360 | 0   | 0      | 108986369   | 0     | 1024786474 | 0       | 0       | 0       | 0          | 0
0           | 0           | 36
   | 16390           | -1    | -1       | -1   | -1    | -1
(1 row)
```

gs_undo_dump_xid(undo_xid xid)

Description: Parses undo records based on the XID.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-137 gs_undo_dump_xid parameters

Category	Parameter	Type	Description
Input parameter	undo_xid	xid	Transaction ID.
Output parameter	undoptr	xid	Start position of the undo record to be parsed.
Output parameter	xactid	xid	Transaction ID.
Output parameter	cid	text	Command ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	reloid	text	Relation OID.
Output parameter	relfilenode	text	Relfinode of the file.
Output parameter	utype	text	Undo record type.
Output parameter	blkprev	text	Position of the previous undo record in the same block.
Output parameter	blockno	text	Block number.
Output parameter	uoffset	text	Undo record offset.
Output parameter	prevurp	text	Position of the previous undo record.
Output parameter	payloadlen	text	Length of the undo record data.
Output parameter	oldxactid	text	Previous transaction ID.
Output parameter	partitionoid	text	Partition OID.
Output parameter	tablespace	text	Tablespace.
Output parameter	alreadyread_bytes	text	Length of the read undo record.
Output parameter	prev_undorec_len	text	Length of the previous undo record.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	td_id	text	ID of the transaction directory.
Output parameter	reserved	text	Reserved flag of the old tuple stored in an undo record.
Output parameter	flag	text	Status flag of the old tuple stored in an undo record.
Output parameter	flag2	text	Number of old tuple columns stored in an undo record.
Output parameter	t_hoff	text	Length of the undo record data header.

Example:

```
gaussdb=# SELECT * FROM gs_undo_dump_xid('15779');
 undoptr | xactid | cid | reloid | relfilenode | utype | blkprev | blockno | uoffset | prevurp | payloadlen |
oldxactid | partitionoid | tablespace | alreadyread_bytes | pr
ev_undorec_len | td_id | reserved | flag | flag2 | t_hoff
---------+--------+-----+--------+-------------+-------+---------+---------+---------+---------+------------+-----------
+--------------+------------+-------------------+---
---------------+-------+----------+------+-------+--------
    108 |  15779 | 0   | 16767  | 16767       | 64    | 0       | 0       | 3       | 0       | 0          | 0         | 0           |
1663       | 40               | 42
             | -1    | -1       | -1   | -1    | -1
(1 row)
```

gs_verify_undo_record(type, start_idx, end_idx, location)

Description: Verifies undo records. Currently, only the disk verification mode is supported. Offline verification can be performed only when services are not running. Before the verification, you need to manually perform checkpoint flushing.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-138 gs_verify_undo_record parameters

Category	Parameter	Type	Description
Input parameter	type	text	Verification type. ● **'urp'**: verifies all undo records in a specified URP range. ● **'zone'**: verifies all undo records of all zones in a specified zone range.
Input parameter	start_idx	int8	Start position. ● When **type** is set to **'urp'**, this parameter indicates the start position of undo records. ● When **type** is set to **'zone'**, this parameter indicates the start undo zone ID.
Input parameter	end_idx	int8	End position. ● When **type** is set to **'urp'**, this parameter indicates the end position of undo records. ● When **type** is set to **'zone'**, this parameter indicates the end undo zone ID.
Input parameter	location	bool	● **0**: memory verification ● **1**: disk verification Currently, this parameter can only be set to **1**.
Output parameter	zone_id	int8	Undo zone ID.
Output parameter	detail	text	Verification error information.

Example 1: Verify the undo record whose URP is 24.

```
gaussdb=# SELECT * FROM gs_verify_undo_record('urp', 24, 24, 1);
zone_id | detail
--------+--------
(0 rows)
```

Example 2: Verify all undo records from zone 0 to zone 2 on the disk.

```
gaussdb=# SELECT * FROM gs_verify_undo_record('zone', 0, 2, 1);
zone_id | detail
--------+--------
(0 rows)
```

NOTE

If an error is reported when this view is called, contact Huawei technical support.

gs_verify_undo_slot(type, start_idx, end_idx, location)

Description: Verifies undo transaction slots. Currently, only the disk verification mode is supported. Offline verification can be performed only when services are not running. Before the verification, you need to manually perform checkpoint flushing.

Return type: record

NOTE

When rollback segments are stored in files in page storage mode, the following format is used.

Table 7-139 gs_verify_undo_slot parameters

Category	Parameter	Type	Description
Input parameter	type	text	Verification type. • **'zone'**: verifies all transaction slots of all zones in a specified zone range.
Input parameter	start_idx	int8	Start undo zone ID.
Input parameter	end_idx	int8	End undo zone ID.
Input parameter	location	bool	• **0**: memory verification • **1**: disk verification Currently, this parameter can only be set to **1**.
Output parameter	zone_id	int8	Undo zone ID.
Output parameter	detail	text	Verification error information.

Example: Verify all transaction slot records from zone 0 to zone 2 on the disk.

```
gaussdb=# select * from gs_verify_undo_slot('zone', 0, 2, 1);
zone_id | detail
--------+--------
(0 rows)
```

NOTE

If an error is reported when this view is called, contact Huawei technical support.

gs_verify_undo_meta(type, start_idx, end_idx, location)

Description: Verifies undo metadata. Currently, only the disk verification mode is supported. Offline verification can be performed only when services are not running. Before the verification, you need to manually perform checkpoint flushing.

Return type: record

NOTE

This system function supports only the rollback segments in page storage mode.

Table 7-140 gs_verify_undo_meta parameters

Category	Parameter	Type	Description
Input parameter	type	text	Verification type. The value of **type** can only be set to **'all'**. • **'all'**: verifies all meta information of all zones in a specified zone range.
Input parameter	start_idx	int64	Start undo zone ID.
Input parameter	end_idx	int64	End undo zone ID.
Input parameter	location	bool	• **0**: memory verification • **1**: disk verification Currently, this parameter can only be set to **1**.
Output parameter	zone_id	int64	Undo zone ID.
Output parameter	detail	text	Verification error information.

Example: Verify all meta information records from zone 0 to zone 2 on the disk.

```
gaussdb=# SELECT * FROM gs_verify_undo_meta('all', 0, 2, 1);
zone_id | detail
--------+--------
(0 rows)
```

NOTE

If an error is reported when this view is called, contact Huawei technical support.

gs_async_rollback_worker_status()

Description: Monitors the status of active asynchronous rollback threads. In the multi-tenancy scenario, no information is returned in a PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: record

Table 7-141 gs_async_rollback_worker_status parameters

Category	Parameter	Type	Description
Output parameter	datid	oid	Database ID.
Output parameter	pid	int8	Thread ID.
Output parameter	sessionid	int8	Session ID.
Output parameter	usesysid	oid	ID of the user who initiates the thread.
Output parameter	state	int	Thread status. **0**: undefined **1**: idle **2**: running
Output parameter	rollback_start_time	timestamptz	Timestamp when a thread is started.
Output parameter	idx	oid	Index of an asynchronous rollback thread in the array.
Output parameter	xid	xid	XID of the transaction that is being rolled back.
Output parameter	progress	text	Rollback progress of the transaction (number of undo records that have been rolled back/total number of undo records, in percentage).

gs_async_rollback_xact_status()

Description: Monitors the hash table of asynchronous rollback tasks. In the multi-tenancy scenario, PDB data is returned to its own PDB, and global data is visible in a non-PDB.

Return type: record

Table 7-142 gs_async_rollback_xact_status parameters

Category	Parameter	Type	Description
Output parameter	xid	xid	XID of the transaction that requires asynchronous rollback.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	start_undoptr	xid	Pointer to the start undo record of the transaction.
Output parameter	end_undoptr	xid	Pointer to the end undo record of the transaction.
Output parameter	dbid	uint32	ID of the database where the transaction is located.
Output parameter	slot_ptr	xid	Pointer to the transaction slot corresponding to the transaction.
Output parameter	launched	bool	Checks whether there is an active asynchronous rollback thread.

gs_undo_recycler_status()

Description: Monitors the status of asynchronous recycling threads.

Return type: record

Table 7-143 gs_undo_recycler_status parameters

Category	Parameter	Type	Description
Output parameter	datid	oid	Database ID.
Output parameter	pid	int8	Thread ID.
Output parameter	sessionid	int8	Session ID.
Output parameter	usesysid	oid	ID of the user who initiates the thread.
Output parameter	state	int	Thread status. **0**: undefined **1**: idle **2**: running
Output parameter	backend_start	timestamptz	Timestamp when a thread is started.
Output parameter	total_recycle_time	xid	Total recycling time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	max_recycle_time	xid	Maximum recycling time.
Output parameter	total_recycle_size	xid	Total recycled space.
Output parameter	total_recycle_count	xid	Total number of recycling times.
Output parameter	recycle_sleep_count	xid	Number of sleep times.
Output parameter	recycle_sleep_time	xid	Total sleep time.
Output parameter	max_recycle_sleep_time	xid	Maximum sleep time.
Output parameter	last_recycle_timestamp	timestamptz	Timestamp of the last successful recycling.
Output parameter	last_update_global_recycle_xid_timestamp	timestamptz	Timestamp of the last global recycling transaction.

gs_undo_launcher_status()

Description: Monitors the status of asynchronous rollback launcher threads.

Return type: record

Table 7-144 gs_undo_launcher_status parameters

Category	Parameter	Type	Description
Output parameter	datid	oid	Database ID.
Output parameter	pid	int64	Thread ID.
Output parameter	sessionid	int64	Session ID.
Output parameter	usesysid	oid	ID of the user who initiates the thread.
Output parameter	state	int32	Thread status. **0**: undefined **1**: idle **2**: running

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	backend_start	timestamptz	Timestamp when a thread is started.
Output parameter	total_async_rollback_task_count	uint64	Total number of asynchronous rollback tasks initiated after the database on the local node is started.
Output parameter	average_async_rollback_time	uint64	Average duration of an asynchronous rollback task.
Output parameter	max_async_rollback_time	uint64	Maximum duration of an asynchronous rollback task.
Output parameter	min_async_rollback_time	uint64	Minimum duration of an asynchronous rollback task.

7.6.26.15 Row-Store Compression System Functions

pg_get_ilmdef(pidx integer)

Description: Returns the corresponding policy information based on the input ILM policy index.

Return type: text

Table 7-145 pg_get_ilmdef parameters

Category	Parameter	Type	Description
Input parameter	pidx	integer	Index of an ILM policy.
Output parameter	ilm_policy_info	text	Policy information of an ILM policy.

7.6.26.16 HTAP System Functions

gs_htap_tmu_data(rel_oid oid, rowgroup_id integer)

Description: Views active transaction statistics in the real-time transaction unit TMU. If **rowgroup_id** is set to **0**, all active transaction statistics in the table are returned. If **rowgroup_id** is set to a non-zero value, the active transaction statistics in the specified row group in the table are returned.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note: Only SYSADMIN or OPRADMIN can execute this function.

CAUTION

This function affects OLTP services, and it is used only as an O&M API. You are advised not to run this function frequently.

Table 7-146 gs_htap_tmu_data parameters

Category	Parameter	Type	Description
Input parameter	rel_oid	oid	OID of the row-store table.
Input parameter	rowgroup_id	integer unsigned	Identifies a row group.
Output parameter	rel_oid	oid	OID of the row-store table.
Output parameter	rowgroup_id	integer unsigned	Identifies a row group.
Output parameter	xid	xid	ID of the transaction that operates the data.
Output parameter	ctid	cstring	Location of the data on the page.
Output parameter	flag	smallint unsigned	Binary flag bit. Each bit indicates an operation attribute recorded by the TMU. The details are as follows: • If the fourth digit is 1, an update operation is recorded. • If the third digit is 1, a delete operation is recorded. • If the second digit is 1, an insert operation is recorded.

Example:

- When **enable_htap** is set to **off**:

```
gaussdb=# select * from gs_htap_tmu_data(16796,0);
ERROR:  Query failed due to ENABLE_HTAP is not enabled.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When **enable_htap** is set to **on**:

```
gaussdb=# select * from gs_htap_tmu_data(16796,0);
 rel_oid | rowgroup_id |  xid  | ctid  | flag
---------+-------------+-------+-------+-------
   16796 | 1           | 78437 | (0,1) | 16385
   16796 | 1           | 78437 | (0,2) | 16385
   16796 | 1           | 78439 | (0,1) | 4097
   16796 | 1           | 78439 | (0,2) | 4097
(4 rows)
```

gs_htap_tmu_chunk_meta(rel_oid oid, rowgroup_id integer)

Description: Views the metadata of the real-time transaction unit TMU. If **rowgroup_id** is set to **0**, the data of real-time transaction unit TMU in all row groups is returned. If **rowgroup_id** is set to a non-zero value, the data of real-time transaction unit TMU in a specified row group in the table is returned.

Return type: record

Note: Only SYSADMIN or OPRADMIN can execute this function.

Table 7-147 gs_htap_tmu_chunk_meta parameters

Category	Parameter	Type	Description
Input parameter	rel_oid	oid	OID of the row-store table.
Input parameter	rowgroup_id	integer unsigned	Identifies a row group.
Output parameter	rel_oid	oid	OID of the row-store table.
Output parameter	rowgroup_id	integer unsigned	Identifies a row group.
Output parameter	status	smallint unsigned	TMU status. • The value **1** indicates that the TMU has not been cleared. • The value **2** indicates that the TMU has been cleared.
Output parameter	row_count	integer unsigned	Number of rows in the table.
Output parameter	buffer_count	integer unsigned	Number of contained buffers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	mem_usage	bigint	Size of the allocated memory
Output parameter	inprogress	cstring	The percentage of active TMU data insertion transactions.
Output parameter	completed	cstring	The percentage of committed or rolled back TMU data insertion transactions.

Example:

- When **enable_htap** is set to **off**:

```
gaussdb=# select * from gs_htap_tmu_chunk_meta(16796,0);
ERROR:  Query failed due to ENABLE_HTAP is not enabled.
```

- When **enable_htap** is set to **on**:

```
gaussdb=# select * from gs_htap_tmu_chunk_meta(16796,0);
 rel_oid | rowgroup_id | status | row_count | buffer_count | mem_usage | inprogress | completed
---------+-------------+--------+-----------+--------------+-----------+------------+-----------
   16796 | 1           | 1      | 4         | 1            |     65536 | 0.00%      | 100.00%
(1 row)
```

gs_imcv_bgworker_status()

Description: Displays the status of the bgworker rebuilt by IMCV tables.

Return type: record

Note: Only SYSADMIN or OPRADMIN can execute this function.

Table 7-148 gs_imcv_bgworker_status parameters

Category	Parameter	Type	Description
Output parameter	worker_pid	bigint	Thread ID
Output parameter	relation_id	oid	OID of the IMCV table that is being processed.
Output parameter	worker_status	cstring	Indicates three working states of the thread: idle, running, and finished.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	start_time	timestamp with time zone	Timestamp when rebuild starts.

Example:

- When **enable_htap** is set to **off**:

```
gaussdb=# select * from gs_imcv_bgworker_status();
ERROR:  Query failed due to ENABLE_HTAP is not enabled.
```

- When **enable_htap** is set to **on**:

```
gaussdb=# select * from gs_imcv_bgworker_status();
 worker_pid | relation_id | worker_status | start_time
------------+-------------+---------------+------------
          0 |           0 | finished      |
          0 |           0 | idle          |
          0 |           0 | idle          |
(3 rows)
```

gs_imcv_flush(reloid oid)

Description: Immediately rebuilds a specified IMCV table in the database and displays the rebuild result. During the rebuild, the IMCV table is refreshed, old data is removed, and inactive data in the current table is synchronized.

Return type: text

Note: Only SYSADMIN or OPRADMIN can execute this function.

CAUTION

When the data in an IMCV table is fresh enough, rebuild may be skipped. This function affects OLTP services, and it is used only as an O&M API. You are advised not to run this function frequently.

Table 7-149 gs_imcv_flush parameters

Category	Parameter	Type	Description
Input parameter	reloid	oid	OID of the row-store table.
Output parameter	output	text	Indicates the rebuild result. The number of row groups that are successfully rebuilt and the number of row groups that are skipped are displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

- When **enable_htap** is set to **off**:
```
gaussdb=# select * from gs_imcv_flush(16796);
ERROR:  Manual row group rebuilding failed due to ENABLE_HTAP is not enabled.
```
- When **enable_htap** is set to **on**:
```
gaussdb=# select * from gs_imcv_flush(16796);
                gs_imcv_flush
-----------------------------------------------
 2 row groups rebuilt successfully, 1 skipped.
(1 row)
```

gs_imcv_taskbuffer_view()

Description: Displays the usage of a rebuilt task queue in the HTAP service. The input parameter is empty.

Return type: record

Note: Only SYSADMIN or OPRADMIN can execute this function.

Table 7-150 gs_imcv_taskbuffer_view parameters

Category	Parameter	Type	Description
Output parameter	buffer_is_empty	boolean	Specifies whether the task queue is empty. The default value is **t**.
Output parameter	buffer_is_full	boolean	Specifies whether the task queue is full. The default value is **f**.
Output parameter	buffer_used_space	integer	Used space of the task. The default value is **0**.
Output parameter	buffer_free_space	integer	Remaining space of the task. The default value is **999**.

Example:

- When **enable_htap** is set to **off**:
```
gaussdb=# select * from gs_imcv_taskbuffer_view();
ERROR:  Query failed due to ENABLE_HTAP is not enabled.
```
- When **enable_htap** is set to **on**:
```
gaussdb=# select * from gs_imcv_taskbuffer_view();
 buffer_is_empty | buffer_is_full | buffer_used_space | buffer_free_space
-----------------+----------------+-------------------+-------------------
 t               | f              |                 0 |               999
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_imcu_meta(rel_name)

Description: gs_imcu_meta is used to display the IMCU metadata information in the IMCV table with the specified rel_name.

Return type: record

Table 7-151 gs_imcu_meta parameters

Category	Parameter	Type	Description
Input parameter	relname	text	IMCV table name.
Output parameter	reloid	oid	Table ID.
Output parameter	relname	text	Table name.
Output parameter	imcu_xmin	xid	Reserved.
Output parameter	imcu_id	integer	IMCU ID.
Output parameter	row_count	integer	Number of rows of the IMCU.
Output parameter	imcu_size	integer	IMCU size, in bytes.
Output parameter	imcu_mode	integer	Characteristics of column data loaded by the IMCU: • Common. • All of the data is empty. • The data has a same value. • There is no maximum/minimum value. • There is an empty row.
Output parameter	imcu_pointer	bigint	Reserved.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Output parameter	magic	integer	magic verified by IMCU.
Output parameter	attnum	smallint	attnum corresponding to the column loaded by IMCU.

Example:

```
gaussdb=# SELECT * FROM gs_imcu_meta('test2');
 reloid | relname | imcu_xmin | imcu_id | row_count | imcu_size | imcu_mode | imcu_pointer | magic | attnum
--------+---------+-----------+---------+-----------+-----------+-----------+--------------+-------+--------
 115114 | test2   |         0 |       1 |         9 |      8192 |         1 |            0 | 74802 |      0
 115114 | test2   |         0 |       1 |         9 |      8192 |         1 |            0 | 74802 |      1
 115114 | test2   |         0 |       1 |         9 |      8192 |         1 |            0 | 74802 |      2
 115114 | test2   |         0 |       1 |         9 |      8192 |         1 |            0 | 74802 |      3
 115114 | test2   |         0 |       1 |         9 |      8192 |         0 |            0 | 74802 |      4
 115114 | test2   |         0 |       1 |         9 |      8192 |         0 |            0 | 74802 |      5
(6 rows)
```

Note: This example indicates that there is one row group (**imcu_id** is **1**), each row represents a CU (the column whose **attnum** is **0** is the **ctid** column), and each CU has nine rows.

gs_imcv_status()

Description: gs_imcv_status displays the status of all IMCV tables.

Return type: record

Table 7-152 gs_imcv_status parameters

Parameter	Parameter	Type	Description
Output parameter	reloid	oid	Table ID.
Output parameter	relname	name	Table name.
Output parameter	dbname	name	Database name.
Output parameter	username	name	Username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Parameter	Type	Description
Output parameter	parentoid	oid	Parent table ID.
Output parameter	imcvstatus	char	IMCV table status: • **I**: POPULATE_STAT_INIT (initiate) • **L**: POPULATE_STAT_LOAD_START (start loading) • **M**: POPULATE_STAT_LOAD_META_DONE (load metadata) • **F**: POPULATE_STAT_LOAD_FINISH (loading completed) • **D**: POPULATE_STAT_DROP (deleted) • **E**: POPULATE_STAT_ERROR (abnormal)
Output parameter	imcvnattr	smallint	Number of loaded columns.
Output parameter	imcvkey	int2vector	Array of loaded columns.
Output parameter	priority	smallint	Loading priority.
Output parameter	rowgroup_num	integer	Number of row groups.
Output parameter	cu_num_in_mem	integer	Number of IMCUs in the memory.
Output parameter	cu_mem_size	bigint	Memory occupied by IMCU, in bytes.
Output parameter	cu_num_in_disk	integer	Not supported. The value is **0**.
Output parameter	cu_disk_size	bigint	Not supported. The value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM gs_imcv_status();
 reloid | relname |  dbname  | username | parentoid | imcvstatus | imcvnattr |  imcvkey  | priority |
rowgroup_num | cu_num_in_mem | cu_mem_size | cu_num_in_disk | cu_disk_size
--------+---------+----------+----------+-----------+------------+-----------+-----------+----------+--------------
+---------------+-------------+----------------+--------------
 115114 | test2   | postgres | lqy      |         0 | F          |         5 | 1 2 3 4 5 |        1 |            1 |            6 |
49152 |             0 |            0
(1 row)
```

gs_imcu_slot_status()

Description: gs_imcu_slot_status records the cache slot information of the IMCU in the IMCV table.

Return type: record

Table 7-153 gs_imcu_slot_status parameters

Category	Parameter	Type	Description
Output parameter	reloid	oid	Table ID.
Output parameter	cu_id	integer	IMCU ID.
Output parameter	col_id	integer	Column ID of the IMCU.
Output parameter	slot_id	integer	Slot ID of the cache.
Output parameter	block_size	integer	IMCU size, in bytes.
Output parameter	flag	char	Cache block flag.

Example (The value of **flag** is **\x01**, indicating that the cache slot contains valid data):

```
gaussdb=# SELECT * FROM gs_imcu_slot_status();
 reloid | cu_id | col_id | slot_id | block_size | flag
--------+-------+--------+---------+------------+------
 115114 |     1 |      1 |       0 |       8192 | \x01
 115114 |     1 |      2 |       1 |       8192 | \x01
 115114 |     1 |      3 |       2 |       8192 | \x01
 115114 |     1 |      4 |       3 |       8192 | \x01

7.6.26.17 VACUUM System Functions

- GS_STAT_PROGRESS_VACUUM(pid integer)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Description: Queries the VACUUM execution progress based on the PID of the VACUUM thread. AUTOVACUUM and manual VACUUM are supported.

Parameters: See **Table 7-154**.

Table 7-154 GS_STAT_PROGRESS_VACUUM input parameters and return values

Parameter	Type	Description
pid	IN bigint	PID of the VACUUM thread.
dataname	OUT text	Name of the database that is being vacuumed.
relid	OUT oid	OID of the table that is being vacuumed.
relname	OUT text	Name of the table that is being vacuumed.
phase	OUT text	Current VACUUM phase.
detail	OUT text	Vacuum progress details, including the total number of pages, number of scanned pages, number of vacuumed pages, and number of vacuumed indexes.

Return type: record

Example:

```
gaussdb=# select * from GS_STAT_PROGRESS_VACUUM(139988726445824);
       pid       | dataname | relid | relname |     phase     |
          detail
-----------------+----------+-------+---------+---------------
+-----------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------
--
 139988726445824 | postgres | 98304 | t1      | scanning heap | vacuum command "vacuum freeze t1;" starts
at 2025-02-07 13:48:51.189748-05, vacuumed 5/12 partitio
ns, current part "a_lt_6"; heap: scanned 348/883 blocks, skipped 0 blocks; info: found 0 dead tuples, already
run 0s, delay 0s.
(1 row)
```

7.6.27 SPM Functions

GS_SPM_EVOLUTE_PLAN(sql_hash, plan_hash)

Description: GS_SPM_EVOLUTE_PLAN belongs to the DBE_SQL_UTIL schema and is a function used by the SPM feature to plan evolution. As long as the table related to the plan baseline exists, the plan baseline can be evolved.

Parameters: See **Table 7-155**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-155 GS_SPM_EVOLUTE_PLAN input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Specifies a hash value of SQL text.	-
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.	-
evolute_status	OUT boolean	Determines whether the evolution is complete. **t** indicates normal. If an exception occurs, an error is reported.	t/f

Return type: Boolean

Example:

```
gaussdb=# SELECT * FROM dbe_sql_util.gs_spm_evolute_plan(107760189, 2284373089);
 evolute_status
----------------
 t
(1 row)
```

GS_SPM_SET_PLAN_STATUS(sql_hash, plan_hash, plan_status)

Description: GS_SPM_SET_PLAN_STATUS belongs to the DBE_SQL_UTIL schema and is a function used by the SPM feature to change the baseline status.

Parameters: See **Table 7-156**.

Table 7-156 GS_SPM_SET_PLAN_STATUS input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Specifies a hash value of SQL text.	-
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
plan_status	IN text	Specifies the status of a plan.	• **ACC**: indicates that the plan has been accepted. • **UNACC**: indicates that the plan is not accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
execute_status	OUT boolean	Determines whether the plan status change is complete. **t** indicates normal. If an exception occurs, an error is reported.	t/f

Return type: Boolean

Example:

```
gaussdb=# SELECT dbe_sql_util.gs_spm_set_plan_status(sql_hash, plan_hash, 'ACC') FROM
gs_spm_sql_baseline
where outline like '%BitmapScan%';
 gs_spm_set_plan_status
------------------------
 t
(1 row)
```

GS_SPM_DISPLAY_PLANS(sql_hash)

Description: GS_SPM_DISPLAY_PLANS belongs to the DBE_SQL_UTIL schema and is a function used by the SPM feature to view all baselines of a single SQL statement.

Parameters: See **Table 7-157**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-157 GS_SPM_DISPLAY_PLANS input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Unique ID of an SQL statement.	-
sql_hash	OUT bigint	Specifies a hash value of SQL text.	-
plan_hash	OUT bigint	Specifies a hash value of the outline text of the SQL plan.	-
outline	OUT text	Specifies the combination character string of all hints of the outline corresponding to the current plan.	-
cost	OUT double	Specifies the cost of the current plan.	-
status	OUT text	Specifies the status of the current plan.	• **ACC**: indicates that the plan has been accepted. • **UNACC**: indicates that the plan is not accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
gplan	OUT boolean	Determines whether the current plan is a gplan. **t** indicates gplan. If an exception occurs, an error is reported.	t/f

Return type: bigint, text, double, text, Boolean

Example:

```
select sql_hash, plan_hash, outline, status, gplan from dbe_sql_util.gs_spm_display_plans(107760189)
order by status, outline;
 sql_hash  |  plan_hash   |                  outline                   | status | gplan
-----------+------------+--------------------------------------------------+--------+-------
 107760189 | 2519317082 |  begin_outline_data                          +| ACC    | f
           |            |  IndexScan(@"sel$1" tb_a@"sel$1" tb_a_idx_c1) +|        |
           |            |  version("1.0.0")                            +|        |
           |            |  end_outline_data                              |        |
 107760189 | 2686653876 |  begin_outline_data                          +| UNACC  | f
           |            |  BitmapScan(@"sel$1" tb_a@"sel$1" tb_a_idx_c1)+|        |
           |            |  version("1.0.0")                            +|        |
           |            |  end_outline_data                              |        |
 107760189 | 2284373089 |  begin_outline_data                          +| UNACC  | f
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        |          | TableScan(@"sel$1" tb_a@"sel$1")           +|       |
        |          | version("1.0.0")                         +|       |
        |          | end_outline_data                           |       |
(3 rows)
```

GS_SPM_RELOAD_PLAN(sql_hash, plan_hash)

Description: GS_SPM_RELOAD_PLAN belongs to the DBE_SQL_UTIL schema and is a function used by the SPM feature to load a baseline in the baseline system catalog to the SPM global cache.

Parameters: See **Table 7-158**.

Table 7-158 GS_SPM_RELOAD_PLAN input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Specifies a hash value of SQL text.	-
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.	-
execute_status	OUT boolean	Determines whether the baseline loading is complete. **t** indicates normal. If an exception occurs, an error is reported.	t/f

Return type: Boolean

Example:

```
SELECT dbe_sql_util.gs_spm_reload_plan(sql_hash, plan_hash) from gs_spm_sql_baseline where outline like
'%IndexScan%';
 gs_spm_reload_plan
--------------------
 t
(1 row)
```

GS_SPM_VALIDATE_PLAN(sql_hash, plan_hash)

Description: GS_SPM_VALIDATE_PLAN belongs to the DBE_SQL_UTIL schema and is a function used by the SPM feature to verify plan availability.

Parameters: See **Table 7-159**.

Table 7-159 GS_SPM_VALIDATE_PLAN input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Specifies a hash value of SQL text.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.	-
execute_status	OUT boolean	Determines whether the verified plan is available: **t**: The verified plan is available. **f**: The verified plan is unavailable.	t/f

Return type: Boolean

Example:

```
SELECT dbe_sql_util.gs_spm_validate_plan(sql_hash, plan_hash) FROM gs_spm_sql_baseline WHERE outline
LIKE '%IndexScan%';
 gs_spm_validate_plan
----------------------
 f
(1 row)
```

GS_SPM_DELETE_PLAN(sql_hash, plan_hash)

Description: GS_SPM_DELETE_PLAN belongs to DBE_SQL_UTIL schema and is a function used by the SPM feature to delete the plan baseline. If the function is aborted during execution, the number of records in the gs_spm_baseline table may exceed the value of the GUC parameter **spm_plan_capture_max_plannum**.

Parameters: See **Table 7-160**.

Table 7-160 GS_SPM_DELETE_PLAN input parameters and return values

Parameter	Type	Description	Value Range
sql_hash	IN bigint	Specifies a hash value of SQL text.	-
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.	-
execute_status	OUT boolean	Determines whether the plan deletion is complete. **t** indicates normal. If an exception occurs, an error is reported.	t/f

Return type: Boolean

Example:

```
SELECT dbe_sql_util.gs_spm_delete_plan(sql_hash, plan_hash) FROM gs_spm_sql_baseline WHERE outline
LIKE '%IndexScan%';
 gs_spm_delete_plan
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------------------
 t
(1 row)
```

GS_SPM_GET_PLAN_HISTORY(sql_input_hash, history_time)

Description: GS_SPM_GET_PLAN_HISTORY belongs to the DBE_SQL_UTIL schema and is used by the SPM feature to view all historical plans of a specified query statement before a specified historical time point.

Parameters: See **Table 7-161**.

Table 7-161 GS_SPM_GET_PLAN_HISTORY input parameters and return values

Parameter	Type	Description	Value Range
sql_input_hash	IN bigint	Specifies a hash value of SQL text.	-
history_time	IN timestamp with time zone	Specifies a historical time point.	-
sql_hash	OUT bigint	Specifies a hash value of SQL text.	-
plan_hash	OUT bigtint	Specifies a hash value of the outline text of the SQL plan.	-
outline	OUT text	Specifies the combination character string of all hints of the outline corresponding to the current plan.	-
plan_status	OUT text	Specifies the status of the current plan.	• **ACC**: indicates that the plan has been accepted. • **UNACC**: indicates that the plan is not accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
gplan	OUT boolean	Determines whether the current plan is a gplan. **t** indicates gplan. If an exception occurs, an error is reported.	t/f
cost	OUT double	Specifies the cost of the current plan.	-
sql_text	OUT text	SQL text.	-
param_num	OUT integer	Number of SQL parameters.	-
source	OUT text	Baseline source.	• **AUTO**: The baseline is captured in AUTO mode. • **MANUAL**: The baseline is captured in MANUAL mode. • **STORE**: The baseline is captured in STORE mode.
history_creation_time	OUT timestamp with time zone	Time when the change history is created.	-
invalid	OUT boolean	Specifies whether the current baseline is invalid.	t/f

Return type: record

Example:

```
gaussdb=# SELECT dbe_sql_util.gs_spm_get_plan_history(sql_hash, creation_time + 1) FROM
pg_catalog.gs_spm_plan_history WHERE sql_hash IN (SELECT sql_hash FROM pg_catalog.gs_spm_baseline
WHERE sql_namespace = get_schema_oid(CURRENT_SCHEMA::cstring));
-[ RECORD 1 ]-----------
+-----------------------------------------------------------------------------------------------------------------------------------------------------------
-----------
gs_spm_get_plan_history | (812490094,1950233227," begin_outline_data
                        | TableScan(@""sel$1"" test_spm_gplan_change_perception.test_spm_perception_t1@""sel
$1"")
                        | version(""1.0.0"")
                        | end_outline_data",UNACC,t,180,"select * from test_spm_perception_t1 where a =

(4 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GS_SPM_ACCEPT_HISTORICAL_PLAN(sql_input_hash, history_time, plan_status)

Description: GS_SPM_ACCEPT_HISTORICAL_PLAN belongs to the DBE_SQL_UTIL schema and is used by the SPM feature to set the status of the latest historical plan of an executed query statement before a time point to a specified status.

Parameters: See **Table 7-162**.

Table 7-162 GS_SPM_ACCEPT_HISTORICAL_PLAN input parameters and return values

Parameter	Type	Description	Value Range
sql_input_hash	IN bigint	Specifies a hash value of SQL text.	-
history_time	IN bigint	Specifies a historical time point.	-
plan_status	IN text	Specifies the status of a plan.	• **ACC**: indicates that the plan has been accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
plan_hash_previous	OUT bigint	Specifies the hash value of the outline text of a specified plan.	-

Return type: bigint

Example:

```
gaussdb=# SELECT dbe_sql_util.gs_spm_accept_historical_plan(sql_hash, creation_time + 1, 'ACC') FROM gs_spm_plan_history where sql_hash IN (SELECT sql_hash FROM pg_catalog.gs_spm_baseline WHERE sql_namespace = get_schema_oid(CURRENT_SCHEMA::cstring));
 gs_spm_accept_historical_plan
-------------------------------
                     602237302
(1 row)
```

GS_SPM_DELETE_PLAN_HISTORY(sql_hash, plan_hash, plan_hash_previous, userid, creation_time)

Description: GS_SPM_DELETE_PLAN_HISTORY belongs to the DBE_SQL_UTIL schema and is used by the SPM feature to delete a specified record from PG_CATALOG.GS_SPM_PLAN_HISTORY.

Parameters: See **Table 7-163**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-163 GS_SPM_DELETE_PLAN_HISTORY input parameters and return values

Parameter	Type	Description
sql_hash	IN bigint	Specifies a hash value of SQL text.
plan_hash	IN bigint	Specifies a hash value of the outline text of the SQL plan.
plan_hash_previous	IN bigint	Specifies the hash value of the outline text of a plan used last time.
userid	IN oid	OID of a user.
creation_time	IN timestamp with time zone	Time when the change history is created.
delete_count	OUT bigint	Number of deleted records.

Return type: bigint

Example:

```
gaussdb=# SELECT dbe_sql_util.gs_spm_delete_plan_history(sql_hash, plan_hash, plan_hash_previous,
userid, creation_time) FROM pg_catalog.gs_spm_plan_history WHERE sql_hash IN (SELECT sql_hash FROM
pg_catalog.gs_spm_baseline WHERE sql_namespace = get_schema_oid(CURRENT_SCHEMA::cstring));
 gs_spm_delete_plan_history
----------------------------
                          1
(1 row)
```

7.6.28 Statistics Information Functions

7.6.28.1 Statistics Information Functions

Statistics information functions are divided into the following two categories: functions that access databases, using the OID of each table or index in a database to mark the database for which statistics are generated; functions that access servers, identified by the server thread ID, whose value ranges from 1 to the number of currently active servers.

pg_stat_get_db_conflict_tablespace(oid)

Description: Specifies the number of queries canceled due to a conflict between the restored tablespace and the deleted tablespace in the database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_db_conflict_truncate(oid)

Description: Number of queries canceled due to conflicts with TRUNCATE operations in the database that are being replayed. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_conflict_force_recycle(oid)

Description: Number of queries canceled due to forcible recycling triggered by read on standby (ROS) with ultimate RTO. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_conflict_standby_query_timeout(oid)

Description: Number of queries canceled because the query time exceeds the upper limit set by ROS with ultimate RTO. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_conflict_bufferpin(oid)

Description: Number of conflicting buffers.

Return type: bigint

pg_stat_get_db_conflict_snapshot(oid)

Description: Number of conflicting snapshots.

Return type: bigint

pg_stat_get_db_conflict_startup_deadlock(oid)

Description: Number of conflicting deadlocks.

Return type: bigint

pg_stat_get_db_conflict_all(oid)

Description: Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server).

Return type: bigint

pg_control_group_config()

Description: Prints Cgroup configurations on the current node. Only users with the SYSADMIN permission can execute this function. It is disabled in multi-tenancy scenarios.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_db_stat_reset_time(oid)

Description: Specifies the most recent time when database statistics were reset. It is initialized to the system time during the first connection to each database. The reset time is updated when you call **pg_stat_reset** on the database and execute **pg_stat_reset_single_table_counters** against any table or index in it. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: timestamptz

pg_stat_get_function_total_time(oid)

Description: Specifies the total wall clock time spent in the function, in microseconds. The time spent on this function calling other functions is included.

Return type: bigint

pg_stat_get_xact_tuples_returned(oid)

Description: Specifies the number of rows read through sequential scans when the parameter is a table in the current transaction or the number of index entries returned when the parameter is an index.

Return type: bigint

pg_lock_status()

Description: Queries information about locks held by open transactions. All users can execute this function. In the multi-tenancy scenario, PDB data is returned only to its own PDB, and global data is returned to a non-PDB.

Return type: For details, see **PG_LOCKS** which is obtained by querying this function.

gs_lwlock_status()

Description: Queries information about all lightweight locks in the database system, including lock waiting and lock holding information. All users can execute this function.

Return type: SETOF record

pg_stat_get_xact_numscans(oid)

Description: Specifies the number of sequential scans performed when the parameter is a table in the current transaction or the number of index scans performed when the parameter is an index.

Return type: bigint

pg_stat_get_xact_blocks_fetched(oid)

Description: Specifies the number of disk block fetch requests for a table or an index in the current transaction.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_xact_blocks_hit(oid)

Description: Specifies the number of disk block fetch requests for tables or indexes found in cache in the current transaction.

Return type: bigint

pg_stat_get_xact_function_calls(oid)

Description: Specifies the number of times the function is called in the current transaction.

Return type: bigint

pg_stat_get_xact_function_self_time(oid)

Description: Specifies the time spent on this function in the current transaction, excluding the time spent on this function internally calling other functions.

Return type: bigint

pg_stat_get_xact_function_total_time(oid)

Description: Specifies the total wall clock time (in microseconds) spent on the function in the current transaction, including the time spent on this function internally calling other functions.

Return type: bigint

pg_stat_get_wal_senders()

Description: Queries walsender information on the primary node. In the multi-tenancy scenario, no information is returned in a PDB.

Return type: SETOF record

The following table describes return columns.

Table 7-164 Return columns

Column	Type	Description
pid	bigint	Thread ID of the WAL sender.
sender_pid	integer	Lightweight thread ID of the WAL sender.
local_role	text	Type of the primary node.
peer_role	text	Type of the standby node.
peer_state	text	Status of the standby node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
state	text	Status of the WAL sender.
catchup_start	timestamp with time zone	Startup time of a catchup task.
catchup_end	timestamp with time zone	End time of a catchup task.
sender_sent_location	text	Sending position of the primary node.
sender_write_location	text	Writing position of the primary node.
sender_flush_location	text	Flushing position of the primary node.
sender_replay_location	text	Redo position of the primary node.
receiver_received_location	text	Receiving position of the standby node.
receiver_write_location	text	Writing position of the standby node.
receiver_flush_location	text	Flushing position of the standby node.
receiver_replay_location	text	Redo position of the standby node.
sync_percent	text	Synchronization percentage.
sync_state	text	Synchronization status.
sync_group	text	Group to which the synchronous replication belongs.
sync_priority	text	Priority of synchronous replication.
sync_most_available	text	Maximum availability mode.
channel	text	Channel information of the WAL sender.

get_paxos_replication_info()

Description: Queries the primary/standby node replication status in Paxos mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: SETOF record

The following table describes return columns.

Table 7-165 Return columns

Column	Type	Description
paxos_write_location	text	Location of the Xlog that has been written to the Distribute Consensus Framework (DCF).
paxos_commit_location	text	Location of the Xlog agreed in the DCF.
local_write_location	text	Path for storing data on a node.
local_flush_location	text	Flushing position of a node.
local_replay_location	text	Redo position of a node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
dcf_replication_info	text	DCF module information of a node. The character string is in JSON format. The fields in the character string are described as follows: **role**: role of the current node. The value can be **LEADER**, **FOLLOWER**, **LOGGER**, **PASSIVE**, or **UNKNOW**. **term**: election term. **run_mode**: DCF running mode. The value **0** indicates that the automatic election mode is enabled, the value **1** indicates the manual election mode, and the value **2** indicates that the automatic election mode is disabled. **work_mode**: DCF working mode. **hb_interval**: heartbeat interval between DCF nodes, in milliseconds. **elc_timeout**: DCF election timeout period, in milliseconds. **applied_index**: log location that is applied to the state machine. **commit_index**: log location that has been saved by most DCF nodes. Logs before **commit_index** have been made persistent. **first_index**: location of the first log saved on the DCF node. This location is moved backward when the DN calls **dcf_truncate**. The previous logs will be cleared. **last_index**: location of the last log saved by the DCF node. This log location contains the logs that are stored in the memory of the DCF node but are not made persistent. **cluster_min_apply_idx**: location of the log that has been applied and assumes the smallest index. **leader_id**: ID of the leader node. **leader_ip**: IP address of the leader node. **leader_port**: port of the leader node, for DCF internal use. **nodes**: information of other nodes in the cluster, including the node ID, IP address, port number, and role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# select * from get_paxos_replication_info();
 paxos_write_location | paxos_commit_location | local_write_location | local_flush_location |
local_replay_location |

                                                                dcf_replication_info

                                                                
```

pg_stat_get_db_numbackends(oid)

Description: Specifies the number of active server threads for a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: integer

pg_stat_get_db_xact_commit(oid)

Description: Specifies the number of transactions committed in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_xact_rollback(oid)

Description: Specifies the number of transactions rolled back in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_blocks_fetched(oid)

Description: Specifies the number of disk blocks fetch requests for a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_blocks_hit(oid)

Description: Specifies the number of disk block fetch requests found in cache for a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_tuples_returned(oid)

Description: Specifies the number of tuples returned for a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_tuples_fetched(oid)

Description: Specifies the number of tuples fetched for a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_tuples_inserted(oid)

Description: Specifies the number of tuples inserted in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_db_tuples_updated(oid)

Description: Specifies the number of tuples updated in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_blk_read_time(oid)

Description: Time spent in reading data file blocks by backends in this database (unit: ms).

Return type: double

pg_stat_get_db_blk_write_time(oid)

Description: Time spent in writing data file blocks by backends in this database (unit: ms).

Return type: double

pg_stat_get_db_tuples_deleted(oid)

Description: Specifies the number of tuples deleted in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_db_conflict_lock(oid)

Description: Specifies the number of lock conflicts in a database. Only information about the local PDB can be queried in the PDB.

Return type: bigint

pg_stat_get_db_deadlocks(oid)

Description: Specifies the number of deadlocks in a database. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Return type: bigint

pg_stat_get_numscans(oid)

Description: If the parameter is a table, the function returns the number of times the table has been read through sequential scans. If the parameter is an index, it returns the number of times index rows have been scanned.

Return type: bigint

pg_stat_get_role_name(oid)

Description: Obtains the username based on the user OID. Only users with the SYSADMIN or MONADMIN permissions can access the information.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT pg_stat_get_role_name(10);
 pg_stat_get_role_name
-----------------------
 aabbcc
(1 row)
```

pg_stat_get_tuples_returned(oid)

Description: If the parameter is a table, the function returns the number of live rows read through sequential scans. If the parameter is an index, it returns the number of live index rows.

Return type: bigint

pg_stat_get_tuples_fetched(oid)

Description: If the parameter is a table, the function returns the number of rows fetched through bitmap scans. If the parameter is an index, it returns the number of rows fetched from the original table using simple index scans.

Return type: bigint

pg_stat_get_tuples_inserted(oid)

Description: Specifies the number of rows inserted into a table.

Return type: bigint

pg_stat_get_tuples_updated(oid)

Description: Specifies the number of rows updated in a table.

Return type: bigint

pg_stat_get_tuples_deleted(oid)

Description: Specifies the number of rows deleted from a table.

Return type: bigint

pg_stat_get_tuples_changed(oid)

Description: Specifies the total number of inserted, updated, and deleted rows after a table was last analyzed or autoanalyzed.

Return type: bigint

pg_stat_get_tuples_hot_updated(oid)

Description: Specifies the number of rows hot updated in a table.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_live_tuples(oid)

Description: Specifies the number of live rows in a table.

Return type: bigint

pg_stat_get_dead_tuples(oid)

Description: Specifies the number of dead rows in a table. It indicates the number of inactive row pointers in Ustore tables.

Return type: bigint

pg_stat_get_blocks_fetched(oid)

Description: Specifies the number of disk block fetch requests for a table or an index.

Return type: bigint

pg_stat_get_blocks_hit(oid)

Description: Specifies the number of disk block requests found in cache for a table or an index.

Return type: bigint

pg_stat_get_xact_tuples_fetched(oid)

Description: Specifies the number of tuple rows scanned in a transaction.

Return type: bigint

pg_stat_get_xact_tuples_inserted(oid)

Description: Specifies the number of tuple inserted into the active subtransactions related to a table.

Return type: bigint

pg_stat_get_xact_tuples_deleted(oid)

Description: Specifies the number of deleted tuples in the active subtransactions related to a table.

Return type: bigint

pg_stat_get_xact_tuples_hot_updated(oid)

Description: Specifies the number of hot updated tuples in the active subtransactions related to a table.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_xact_tuples_updated(oid)

Description: Specifies the number of updated tuples in the active subtransactions related to a table.

Return type: bigint

pg_stat_get_last_vacuum_time(oid)

Description: Specifies the most recent time when the autovacuum thread is manually started to clear a table.

Return type: timestamptz

pg_stat_get_last_autovacuum_time(oid)

Description: Specifies the time of the last vacuum initiated by the autovacuum daemon thread on a table.

Return type: timestamptz

pg_stat_get_vacuum_count(oid)

Description: Specifies the number of times a table is manually cleared.

Return type: bigint

pg_stat_get_autovacuum_count(oid)

Description: Specifies the number of times the autovacuum daemon thread is started to clear a table.

Return type: bigint

pg_stat_get_last_analyze_time(oid)

Description: Specifies the last time when a table starts to be analyzed manually or by the autovacuum thread.

Return type: timestamptz

pg_stat_get_last_autoanalyze_time(oid)

Description: Specifies the time when the last analysis initiated by the autovacuum daemon thread on a table.

Return type: timestamptz

pg_stat_get_analyze_count(oid)

Description: Specifies the number of times a table is manually analyzed.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_autoanalyze_count(oid)

Description: Specifies the number of times the autovacuum daemon thread analyzes a table.

Return type: bigint

pg_total_autovac_tuples(bool)

Description: Returns tuple records related to the total autovac, such as **nodename**, **nspname**, **relname**, and tuple IUDs. The input parameter specifies whether to query the **relation** information.

Return type: SETOF record

Output parameters: See **Table 7-167**.

Table 7-167 Description

Return Parameter	Type	Description
nodename	name	Node name.
nspname	name	Name of a namespace.
relname	name	Name of an object, such as a table, an index, or a view.
partname	name	Partition name.
n_dead_tuples	bigint	Number of dead rows in a table partition. It indicates the number of inactive row pointers in Ustore tables.
n_live_tuples	bigint	Number of live rows in a table partition.
changes_since_analyze	bigint	Number of changes generated by ANALYZE.

pg_total_gsi_autovac_tuples(bool)

Description: The function is not supported in centralized mode.

Return type: SETOF record

pg_autovac_status(oid)

Description: Returns autovac information, such as **nodename**, **nspname**, **relname**, **analyze**, **vacuum**, thresholds for the ANALYZE and VACUUM operations, and the number of analyzed or vacuumed tuples. Only users with the SYSADMIN permission can use this function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: SETOF record

Output parameters: See **Table 7-168**.

Table 7-168 Description

Return Parameter	Type	Description
nspname	text	Name of a namespace.
relname	text	Name of an object, such as a table, an index, or a view.
nodename	text	Node name.
doanalyze	Boolean	Specifies whether to execute **ANALYZE**.
anltuples	bigint	Number of ANALYZE tuples.
anlthresh	bigint	ANALYZE threshold.
dovacuum	Boolean	Specifies whether to execute **VACUUM**.
vactuples	bigint	Number of VACUUM tuples.
vacthresh	bigint	VACUUM threshold.

pg_autovac_timeout(oid)

Description: Returns the number of consecutive timeouts during the autovac operation on a table. If the table information is invalid or the node information is abnormal, NULL is returned.

Return type: bigint

pg_stat_get_last_data_changed_time(oid)

Description: Returns the time when **INSERT**, **UPDATE**, **DELETE**, or **TRUNCATE** was last performed on a table, or the time when **EXCHANGE**, **TRUNCATE**, or **DROP** was last performed on a partition or subpartition. The data in the **last_data_changed** column of the **PG_STAT_ALL_TABLES** view is calculated by using this function. The performance of obtaining the last modification time by using the view is poor when the table has a large amount of data. In this case, you are advised to use functions. The input parameter is a table OID.

Return type: timestamptz

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_set_last_data_changed_time(oid)

Description: Manually changes the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE/TRUNCATE/DROP PARTITION** was last performed.

Return type: void

pg_stat_get_last_updated(oid, text)

Description: Returns the update time of monitoring indicator fields in each table in the DBE_PERF.stat_all_tables, DBE_PERF.stat_all_indexes, DBE_PERF.statio_all_indexes, and DBE_PERF.statio_all_tables views. The input parameter 1 is the table OID, and the input parameter 2 is of the text type. The value can be **"stat_table"**, **"stat_index"**, or **"stat_io"**.

Return type: timestamptz

pg_backend_pid()

Description: Specifies the thread ID of the server thread attached to the current session.

Return type: integer

pg_stat_get_activity(integer)

Description: Returns a record about the backend thread with the specified PID. A record for each active backend in the system is returned if **NULL** is specified. The returned result does not contain the **connection_info** column. The initial user, system administrators and users with the MONADMIN permission can view all data. Common users can only query their own results. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Example:

```
gaussdb=# SELECT * FROM pg_stat_get_activity(139881386280704);
 datid |       pid       | sessionid | usesysid | application_name | state  |                        query                        |
waiting |          xact_start          |          query_start          |
    backend_start         |         state_change          | client_addr | client_hostname | client_port | enqueue |
query_id      |   srespool   | global_sessionid | unique_sql_id | trace_id
-------+-----------------+-----------+----------+------------------+--------
+-----------------------------------------------------+---------+-------------------------------
+-------------------------------+-----
-------------------------+-------------------------------+-------------+-----------------+-------------+---------
+------------------+--------------+------------------+---------------+----------
 16545 | 139881386280704 |        69 |       10 | gsql             | active | select * from
pg_stat_get_activity(139881386280704); | f       | 2022-01-18 19:43:05.167718+08 | 2022-01-18
19:43:05.167718+08 | 2022
-01-18 19:42:33.513507+08 | 2022-01-18 19:43:05.16773+08 |              |                |         -1 |         |
72620543991624410 | default_pool | 1938253334#69#0  |    3751941862 |
(1 row)
```

Return type: SETOF record

Output parameters: See **Table 7-169**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-169 Description

Return Parameter	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
state	text	Overall status of the backend.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Parameter	Type	Description
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active** For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
state_change	timestamp with time zone	Time when **state** was last modified.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a UDS on the server or this is an internal thread, such as AUTOVACUUM.
client_hostname	text	Host name of the connected client, obtained by a reverse DNS lookup based on **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**–1** if a Unix socket is used).
enqueue	text	Unsupported currently.
query_id	bigint	ID of a query.
srespool	name	Name of the resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Parameter	Type	Description
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

pg_stat_get_activity_with_conninfo(integer)

Description: Returns a record about the backend thread with the specified PID. A record for each active backend in the system is returned if **NULL** is specified. The initial user, system administrators and users with the MONADMIN permission can view all data. Common users can only query their own results.

Return type: SETOF record

Return values: See **Table 7-170**.

Table 7-170 Return values

Return Value	Return Type	Return values
datid	oid	OID of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
state	text	Overall status of the backend.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value	Return Type	Return values
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active** For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
state_change	timestamp with time zone	Time when **state** was last modified.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a UDS on the server or this is an internal thread, such as AUTOVACUUM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value	Return Type	Return values
client_hostname	text	Host name of the connected client, obtained by a reverse DNS lookup based on **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used).
enqueue	text	Unsupported currently.
query_id	bigint	ID of a query.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and thread owner of the connected database.
srespool	name	Name of the resource pool.
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

gs_get_explain(integer)

Description: Returns a running plan for the backend thread with the specified PID. The PID cannot be empty. This function takes effect only when the GUC parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_activities is set to **on**. Only explainable SQL statements whose plans do not contain stream operators are supported. The details are as follows:

- If the GUC parameter **plan_collect_thresh** is set to **–1**, the return result of the function is always empty.
- If the GUC parameter **plan_collect_thresh** is set to **0**, the current SQL execution time is greater than or equal to the value of **log_min_duration_statement**, and the total number of tuples processed by all operators in the plan is greater than or equal to 10000, the system starts to collect plans in running state. Each time the total number of tuples processed by all operators exceeds 10000, a collection is performed.
- If the GUC parameter **plan_collect_thresh** is set to a value greater than 0, running plans are collected incrementally based on the threshold specified by this parameter.

The return value type is text. The following table describes the types and meanings of the fields.

Parameter	Type	Description
Character string of the plans in the running state	text	**A-rows** in the plan string indicates the number of rows returned by the operator in real time.

pg_stat_get_function_calls(oid)

Description: Specifies the number of times the function has been called.

Return type: bigint

pg_stat_get_function_self_time(oid)

Description: Specifies the time spent in only this function. The time spent on this function calling other functions is excluded.

Return type: bigint

pg_stat_get_backend_idset()

Description: Sets the number of currently active server threads (from 1 to the number of active server threads). In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: setofinteger

pg_stat_get_backend_pid(integer)

Description: Specifies the ID of the given server thread. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: bigint

pg_stat_get_backend_dbid(integer)

Description: Specifies the ID of the database connected to the given server thread. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: oid

pg_stat_get_backend_userid(integer)

Description: Specifies the user ID of the given server thread. This function can be called only by a system administrator. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: oid

pg_stat_get_backend_activity(integer)

Description: Active command of the given server thread, but only if the current user is a system administrator or the same user as that of the session being queried and **track_activities** is enabled. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: text

pg_stat_get_backend_waiting(integer)

Description: Returns true if the given server thread is waiting for a lock, but only if the current user is a system administrator or the same user as that of the session being queried and **track_activities** is enabled. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: Boolean

pg_stat_get_backend_activity_start(integer)

Description: Specifies the time when the given server thread's currently executing query is started only if the current user is a system administrator or the user of the session being queried and **track_activities** is enabled. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: timestamp with time zone

pg_stat_get_backend_xact_start(integer)

Description: Specifies the time when the given server thread's currently executing transaction is started only if the current user is a system administrator or the user

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of the session being queried and **track_activities** is enabled. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: timestamp with time zone

pg_stat_get_backend_start(integer)

Description: Specifies the time when the given server thread is started. If the current user is neither a system administrator nor the same user as that of the session being queried, **NULL** is returned. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: timestamp with time zone

pg_stat_get_backend_client_addr(integer)

Description: Specifies the IP address of a backend connected to a specified client. If the client is connected over a UDS, or if the current user is neither a system administrator nor the same user as that of the session being queried, **NULL** will be returned. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: inet

pg_stat_get_backend_client_port(integer)

Description: Specifies the TCP port of a backend connected to a specified client. If the client is connected over a UDS, **–1** will be returned. If the current user is neither a system administrator nor the same user as that of the session being queried, **NULL** will be returned. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: integer

pg_stat_get_bgwriter_timed_checkpoints()

Description: Specifies the time when the background writer thread starts scheduled checkpoints (because **checkpoint_timeout** has expired). In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_bgwriter_requested_checkpoints()

Description: Specifies the time when the background writer thread starts checkpoints based on requests from the backend because **checkpoint_segments** has been exceeded or the **CHECKPOINT** command has been executed. In the multi-tenancy scenario, a normal value is returned if this function is called in a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_bgwriter_buf_written_checkpoints()

Description: Specifies the number of buffers written by the background writer thread during checkpoints. In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_bgwriter_buf_written_clean()

Description: Specifies the number of buffers written by the background writer thread for routine cleaning of dirty pages. In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_bgwriter_maxwritten_clean()

Description: Specifies the time when the background writer thread stops its cleaning scan because it has written more buffers than specified in the **bgwriter_lru_maxpages** parameter. In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_buf_written_backend()

Description: Specifies the number of buffers written by the backend thread because they need to allocate a new buffer. In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

pg_stat_get_buf_alloc()

Description: Specifies the total number of the allocated buffers. In the multi-tenancy scenario, a normal value is returned if this function is called in a non-PDB, and the default value **0** is returned if this function is called in a PDB. (If a timestamp is used, the timestamp corresponding to **0s** is returned.)

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_clear_snapshot()

Description: Discards the current statistics snapshot. Only users with the SYSADMIN or MONADMIN permission can execute this function.

Return type: void

pg_stat_reset()

Description: Resets the statistics counter of the current database to **0** (the SYSADMIN permission is required).

Return type: void

pg_stat_reset_shared(text)

Description: Resets the statistics counter of the current database on each node in a shared cluster to **0** (the SYSADMIN permission is required).

Return type: void

pg_stat_reset_single_table_counters(oid)

Description: Resets the statistics counter of a specified table or index in the current database to **0** (the SYSADMIN permission is required).

Return type: void

pg_stat_reset_single_function_counters(oid)

Description: Resets the statistics counter of a specified function in the current database to **0** (the SYSADMIN permission is required).

Return type: void

fenced_udf_process(integer)

Description: Shows the number of local UDF Master and Work threads. If the input parameter is set to **1**, the number of Master threads is queried. If the input parameter is set to **2**, the number of Worker threads is queried. If the input parameter is set to **3**, all Worker threads are terminated.

Return type: text

total_cpu()

Description: Obtains the CPU time used by the current node, in jiffies.

Return type: bigint

mot_global_memory_detail()

Description: Checks the size of the MOT global memory, including data and indexes.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

mot_local_memory_detail()

Description: Checks the size of the MOT local memory, including data and indexes.

Return type: record

mot_session_memory_detail()

Description: Checks the MOT memory usage of all sessions.

Return type: record

total_memory()

Description: Obtains the size of the virtual memory used by the current node, in KB.

Return type: bigint

GS_ALL_NODEGROUP_CONTROL_GROUP_INFO(text)

Description: Provides the Cgroup information of all logical clusters. (This is a lab feature. cluster before using it.) Before calling this function, you need to specify the name of the logical cluster to be queried. For example, to query the Cgroup information for the **installation** logical cluster, run the following command:

```
SELECT * FROM GS_ALL_NODEGROUP_CONTROL_GROUP_INFO('installation')
```

Return type: record

The following table describes return columns.

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
limits	bigint	Limit of CPU resources allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Information about the CPU cores used by a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_bad_block(text, int, int, int, int, int, timestamp with time zone, timestamp with time zone)

Description: Obtains damage information about pages after the current node is started. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

Example:

```
SELECT * FROM pg_stat_bad_block();
```

pg_stat_bad_block_clear()

Description: Deletes the page damage information that is read and recorded on the node (the SYSADMIN permission is required). In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: void

gs_respool_exception_info(pool text)

Description: Queries the query rule of a specified resource pool.

Return type: record

gs_control_group_info(pool text)

Description: Queries information about Cgroups associated with a resource pool. Only users with the SYSADMIN permission can execute this function.

Return type: record

The command output is as follows:

Attribute	Value	Description
name	class_a:workload_a1	Class name and workload name.
class	class_a	Class Cgroup name.
workload	workload_a1	Workload Cgroup name.
type	DEFWD	Cgroup type (**Top**, **CLASS**, **BAKWD**, **DEFWD**, or **TSWD**).
gid	87	Cgroup ID.
shares	30	Percentage of CPU resources to those on the parent node.
limits	0	Percentage of CPU cores to those on the parent node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute	Value	Description
rate	0	Allocation ratio in Timeshare.
cpucores	0-3	Number of CPU cores.

gs_prepared_statements()

Description: Displays all available prepared statements of all sessions. Only users with the SYSADMIN permission can execute this function. The columns returned by this function are the same as those in **GS_ALL_PREPARED_STATEMENTS**. In the multi-tenancy scenario, PDB information is returned only to its own PDB, and global information is returned to a non-PDB.

Return type: record

gs_all_control_group_info()

Description: Collects information about all Cgroups in the database.

Return type: record

gs_get_control_group_info()

Description: Collects information about all Cgroups. For details about the columns returned by the function, see **GS_GET_CONTROL_GROUP_INFO**. Only users with the SYSADMIN permission can execute this function.

Return type: record

gs_get_session_sql_memory()

Description: Views the memory usage of currently running statements. For details about the columns returned by the function, see **SESSION_SQL_MEMORY**.

Return type: record

gs_blackbox_dump()

Description: Exports black box files from the system to the *$GAUSSLOG*/**gs_blackbox/***{nodename}* directory. If the command is successfully executed, the black box file names generated in the *$GAUSSLOG*/**gs_blackbox/***{nodename}* directory is returned.

Return type: text

gs_blackbox_show(blackBoxFile cstring)

Description: Parses black box files and displays them in a table.

The following lists related parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Value Range
blackBoxFile	The black box files to be parsed. If no parameter is specified, the black box files collected by the current process are displayed.	The value is a string or is not specified. If a valid black box file name is specified, the file with the specified name in the *$GAUSSLOG*/**gs_blackbox**/*nodename* directory is read. Only the file name is supported. An error is reported if the file with the specified name does not exist in the *$GAUSSLOG*/**gs_blackbox**/*nodename* directory.

Return type: SETOF record

The following table describes return values.

Return Value	Return Type	Return values
type	text	Black box field type.
tid	bigint	Thread ID.
sample_time	timestamp	Collection time.
value	text	Content recorded in the black box.

The following table describes query results.

type	tid	sample_time	value
ERRNUMBER	123456	2024-03-19 09:33:17.386	19460

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

type	tid	sample_time	value
BLACK_BOX_PLSQL_EXCEPTION	45678	2024-03-19 09:33:18.396	message: "Dropped rowtype entry for non-dropped column when make tuple." funcname: basic_make_tuple_from_row filename:pl_exec.cpp context:xxxx

gs_blackbox_list()

Description: Lists black box files in the black box directory of the current instance. The default directory is *$GAUSSLOG*/**gs_blackbox/***{nodename}*.

Return type: SETOF record

The following table describes return values.

Return Value	Return Type	Return values
file	text	Name of the black box file.

gs_plan_trace_delete(TIMESTAMPTZ)

Description: Deletes all plan traces earlier than or equal to **max_time** for the current user. All users can use this function, and as long as no exception occurs during the execution of this function, this function returns **t**.

Return type: Boolean

gs_plan_trace_watch_sqlid(bigint)

Description: Listens to a unique SQL ID for which plan traces are to be generated. The ID is obtained from the **unique_sql_id** column in the dbe_perf.statement system catalog. In addition, this function can be called only by the initial user and users with the SYSADMIN, OPRADMIN, or MONADMIN permission. If no exception occurs during the execution of this function, **t** is returned.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

1. In the database system, the unique SQL ID that is listened to is stored in a cyclic array whose length is 128. If the function is called too frequently, the unique SQL ID that is listened to but does not generate a plan trace may be overwritten.
2. If a unique SQL ID is listened only once, only one plan trace can be generated for the unique SQL ID. If the same unique SQL ID is listened for multiple times, multiple plan traces are generated for the unique SQL ID.

gs_plan_trace_show_sqlids()

Description: Queries the list of unique SQL IDs for which plan traces are to be generated in the current system. This function can be called only by the initial user and users with the SYSADMIN, OPRADMIN, or MONADMIN permission.

Return type: text

NOTICE

1. If there are two unique SQ IDs 730834934 and 730834935 for which plan traces are to be generated in the system, the result of using this function is a character string text "730834934,730834935,".
2. When this function is used, the unique SQL ID that is generating the plan trace cannot be viewed.

gs_standby_read_delay()

Description: Obtains the time difference when the logs generated by transactions on the primary node are replayed on the standby node. When a transaction is committed or rolled back on the primary node, the timestamp is added to the corresponding log. When the standby node replays such logs, the current system time minus the time recorded in the log is used to obtain the replay delay, that is, the synchronization delay.

Return type: bigint

get_instr_workload_info(integer)

Description: Obtains the transaction volume and time information on the primary database node. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

Attribute	Value	Description
resourcepool_oid	10	OID of the resource pool (the logic is equivalent to the load).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute	Value	Description
commit_counter	4	Number of frontend transactions that were committed.
rollback_counter	1	Number of frontend transactions that were rolled back.
resp_min	949	Minimum response time of frontend transactions (unit: μs).
resp_max	201891	Maximum response time of frontend transactions (unit: μs).
resp_avg	43564	Average response time of frontend transactions (unit: μs).
resp_total	217822	Total response time of frontend transactions (unit: μs).
bg_commit_counter	910	Number of backend transactions that were committed.
bg_rollback_counter	0	Number of backend transactions that were rolled back.
bg_resp_min	97	Minimum response time of backend transactions (unit: μs).
bg_resp_max	678080687	Maximum response time of backend transactions (unit: μs).
bg_resp_avg	327847884	Average response time of backend transactions (unit: μs).
bg_resp_total	298341575300	Total response time of backend transactions (unit: μs).
dbid	oid	Database ID.

pv_instance_time()

Description: Obtains the time consumed in each execution phase on the current node.

Return type: record

Stat_name Attribute	Value	Description
DB_TIME	1062385	Total end-to-end wall time consumed by all threads (unit: μs).
CPU_TIME	311777	Total CPU time consumed by all threads (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Stat_name Attribute	Value	Description
EXECUTION_TIME	380037	Total time consumed on the executor (unit: μs).
PARSE_TIME	6033	Total time consumed for parsing SQL statements (unit: μs).
PLAN_TIME	173356	Total time consumed for generating an execution plan (unit: μs).
REWRITE_TIME	2274	Total time consumed on query rewriting (unit: μs).
PL_EXECUTION_TIME	0	Total time consumed for executing PL/SQL statements (unit: μs).
PL_COMPILATION_TIME	557	Total time consumed for compiling SQL statements (unit: μs).
NET_SEND_TIME	1673	Total time consumed for sending data over network (unit: μs).
DATA_IO_TIME	426622	Total time consumed for data read and write (unit: μs).

DBE_PERF.get_global_instance_time()

Description: Provides the time consumed in each key phase in the entire databaseopenGauss. To query this function, you must have the MONADMIN permission.

Return type: record

get_instr_unique_sql()

Description: Obtains information about execution statements (normalized SQL statements) on the current node as a user with the MONADMIN permission. For details about the columns returned by the function, see **STATEMENT**. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

reset_unique_sql(text, text, bigint)

Description: Clears the unique SQL statements in the memory of the database node. (The SYSADMIN or MONADMIN permission is required.) In the multi-tenancy scenario, only PDB data is cleared if this function is called in a PDB, and global data is cleared if this function is called in a non-PDB.

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-171 reset_unique_sql parameters

Parameter	Type	Description
scope	text	Clearance scope type. The options are as follows: **'GLOBAL'**: Clears all CNs/DNs. If the value is **'GLOBAL'**, this function can be executed only on the CN. **'LOCAL'**: Clears the current node.
clean_type	text	**'BY_USERID'**: Clears unique SQL statements based on user IDs. This option is disabled in the multi-tenancy scenario. **'BY_CNID'**: Clears unique SQL statements based on CN IDs. **'ALL'**: Clears all data.
clean_value	int8	Clearance value corresponding to the clearance type. If the second parameter is set to **ALL**, the third parameter does not take effect and can be set to any value.

NOTE

This function involves distributed nodes. Currently, GaussDB is a centralized database, for which the function of the value **global** is the same as that of the value **local** and the second parameter cannot set to be **BY_CNID**.

get_instr_wait_event(NULL)

Description: Obtains the statistics on wait events of the current node.

Return type: record

get_instr_user_login()

Description: Obtains the number of user login and logout times on the current node. Only users with the SYSADMIN or MONADMIN permission can execute this function. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

get_instr_rt_percentile(integer)

Description: Obtains the distribution information about the response time of 80% and 95% SQL statements of the database. The distribution information about the response time of 80% and 95% SQL statements of the current PDB is returned if this function is executed in the PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

get_node_stat_reset_time()

Description: Obtains statistics about reset (restart, primary/standby switchover, and database deletion) time of the current node.

Return type: record

DBE_PERF.get_global_os_runtime()

Description: Displays the running status of the current OS. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_os_threads()

Description: Provides information about the threads under all normal nodes of the entire database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_summary_workload_sql_count()

Description: Provides statistics about the number of SELECT, UPDATE, INSERT, DELETE, DDL, DML, and DCL statements of different service loads in the entire database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_summary_workload_sql_elapse_time()

Description: Provides statistics about the number of SELECT, UPDATE, INSERT, and DELETE statements and response time information (TOTAL, AVG, MIN, and MAX) for different loads in the entire database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_global_workload_transaction()

Description: Obtains the transaction volume and time information on all nodes of the database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_session_stat()

Description: Obtains the session status information on all nodes of the database. To query this function, you must have the MONADMIN permission.

Return type: record

NOTE

The status information contains the following 14 items: commit, rollback, sql, table_scan, blocks_fetched, physical_read_operation, shared_blocks_dirtied, local_blocks_dirtied, shared_blocks_read, local_blocks_read, blocks_read_time, blocks_write_time, sort_imemory, and sort_idisk.

DBE_PERF.get_global_session_time()

Description: Provides the time consumed in each key phase of each node in the entire database. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_session_memory()

Description: Displays statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_session_memory_detail()

Description: Displays statistics about thread memory usage on each node by MemoryContext node. To query this function, you must have the MONADMIN permission.

Return type: record

gs_paxos_stat_replication()

Description: Queries the standby node information on the primary node.

Return type: SETOF record

The following table describes return columns.

Column	Type	Description
local_role	text	Role of the sender node.
peer_role	text	Role of the receiver node.
local_dcf_role	text	DCF role of the sender node.
peer_dcf_role	text	DCF role of the receiver node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
peer_state	text	Status of the receiver node.
sender_write_location	text	Location in the Xlog buffer where the sender node is written.
sender_commit_location	text	Barrier reached for the DCF logs of the sender node.
sender_flush_location	text	Location in the Xlog disk where the sender node is written.
sender_replay_location	text	Location where the sender node replays logs.
receiver_write_location	text	Location in the Xlog buffer where the receiver node is written.
receiver_commit_location	text	Barrier reached for the DCF logs of the receiver node.
receiver_flush_location	text	Location in the Xlog disk where the receiver node is written.
receiver_replay_location	text	Location where the receiver node replays Xlogs.
sync_percent	text	Synchronization percentage.
dcf_run_mode	int4	DCF synchronization mode.
channel	text	Channel information.

gs_wlm_get_user_info(int)

Description: Obtains information about all users. The input parameter is of the int type and can be any int value or **NULL**. Only users with the SYSADMIN permission can execute this function. An empty value is returned if this function is called in the multi-tenancy scenario.

Return type: record

gs_wlm_readjust_user_space(oid)

Description: Corrects the storage space usage of all users. Only the administrator can execute this function. This function is disabled in the multi-tenancy scenario.

Return type: record

gs_wlm_readjust_user_space_through_username(text name)

Description: Corrects the storage space usage of a specified user. Common users can use this function to modify only their own usage. Only the administrator can modify the usage of all users. If the value of **name** is **0000**, the usage of all users needs to be modified. This function is disabled in the multi-tenancy scenario.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: record

gs_wlm_readjust_user_space_with_reset_flag(text name, boolean isfirst)

Description: Corrects the storage space usage of a specified user. If the input parameter **isfirst** is set to **true**, statistics are collected from 0. Otherwise, statistics are collected from the previous result. Common users can use this function to modify only their own usage. Only the administrator can modify the usage of all users. If the value of **name** is **0000**, the usage of all users needs to be modified. This function is disabled in the multi-tenancy scenario.

Return type: record

gs_io_wait_status()

Description: This API does not support single-node systems or centralized systems and is unavailable currently.

global_stat_get_hotkeys_info()

Description: Obtains the statistics on hot keys in the entire database instance. This API does not support single-node systems or centralized systems and is unavailable currently.

global_stat_clean_hotkeys()

Description: Clears statistics on hot keys in the entire database instance. This API does not support single-node systems or centralized systems and is unavailable currently.

DBE_PERF.get_global_session_stat_activity()

Description: Displays information about threads that are running on each node in the database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_global_thread_wait_status()

Description: Displays the blocking status of backend threads and auxiliary threads on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_operator_history_table()

Description: Displays the operator-related records (persistent) generated after jobs are executed on the primary database node of the current user. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_operator_history()

Description: Displays the operator-related records generated after jobs are executed on the primary database node of the current user. To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: record

DBE_PERF.get_global_operator_runtime()

Description: Displays real-time operator-related records of jobs executed on the primary database node of the current user. To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: record

DBE_PERF.get_global_statement_complex_history()

Description: Displays the historical records of complex queries on the primary database node of the current user. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statement_complex_history_table()

Description: Displays the historical records (persistent) of complex queries on the primary database node of the current user. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statement_complex_runtime()

Description: Displays the real-time information of complex queries on the primary database node of the current user. To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: record

DBE_PERF.get_global_memory_node_detail()

Description: Displays the memory usage of a certain database on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_shared_memory_detail()

Description: Displays the usage information about all the shared memory contexts of all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_statio_all_indexes()

Description: Displays statistics about each index displayed in a row in the current database, showing I/O statistics about accesses to that specific index. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_all_tables()

Description: Displays statistics about a row in each table (including the TOAST table) in the aggregated data of each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_all_tables()

Description: Displays statistics about a row in each table (including the TOAST table) of data on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_local_toastname_and_toastindexname()

Description: Provides the mapping between the name and index of the local TOAST table and its joined table. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statio_all_indexes()

Description: Collects statistics about each index displayed in a row in the current databases of all nodes and displays the I/O statistics of a specific index. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_all_sequences()

Description: Provides the I/O status information about all sequences in the namespace. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_all_tables()

Description: Displays the I/O statistics about each table in databases on each node. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_summary_statio_all_tables()

Description: Collects the I/O statistics about each table in the database. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_local_toast_relation()

Description: Provides the mapping between the name of the local TOAST table and its joined table. After a cluster is created, you must have the MONADMIN permission by default to query this function.

Return type: record

DBE_PERF.get_global_statio_sys_indexes()

Description: Displays the I/O status information about all system catalog indexes in namespaces on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statio_sys_indexes()

Description: Collects the I/O status information about all system catalog indexes in namespaces on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_sys_sequences()

Description: Provides the I/O status information about all the system sequences in the namespace. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_sys_tables()

Description: Provides the I/O status information about all system catalogs in namespaces on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statio_sys_tables()

Description: Displays the I/O status information of all system catalogs in the namespace in the database. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_statio_user_indexes()

Description: Displays the I/O status information about all user relationship table indexes in namespaces on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statio_user_indexes()

Description: Displays the I/O status information about all user relationship table indexes in namespaces in the database. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_user_sequences()

Description: Displays the I/O status information about all user sequences in the namespace of each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_statio_user_tables()

Description: Displays the I/O status information about all user relationship tables in namespaces on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statio_user_tables()

Description: Displays the I/O status information about all user relationship tables in namespaces in the database. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_all_indexes()

Description: Displays statistics of each index in databases on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_all_indexes()

Description: Collects statistics of each index in all databases on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_stat_sys_tables()

Description: Displays statistics about the system catalogs of all the namespaces in **pg_catalog** and **information_schema** schemas on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_sys_tables()

Description: Collects statistics about the system catalogs of all the namespaces in pg_catalog and information_schema schemas on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_sys_indexes()

Description: Displays index status information about all the system catalogs in the pg_catalog and information_schema schemas on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_sys_indexes()

Description: Collects statistics about index status information about all the system catalogs in the pg_catalog and information_schema schemas on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_user_tables()

Description: Displays the status information about customized ordinary tables in all namespaces. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_user_tables()

Description: Collects statistics about the status information about customized ordinary tables in all namespaces. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_user_indexes()

Description: Displays the status information about the index of customized ordinary tables in all databases. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_summary_stat_user_indexes()

Description: Collects statistics about the status information about the index of customized ordinary tables in all databases. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_database()

Description: Displays database statistics of all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_database_conflicts()

Description: Collects statistics on the database of all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_xact_all_tables()

Description: Displays transaction status information about all ordinary tables and TOAST tables in all namespaces. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_xact_all_tables()

Description: Collects statistics about transaction status information about all ordinary tables and TOAST tables in all namespaces. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_xact_sys_tables()

Description: Displays transaction status information about all system catalogs in namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_xact_sys_tables()

Description: Collects statistics about transaction status information about all system catalogs in namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_stat_xact_user_tables()

Description: Displays the transaction status information of the user tables in the namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_stat_xact_user_tables()

Description: Collects statistics about the transaction status information of the user tables in the namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_user_functions()

Description: Displays the transaction status information of user-defined functions in the namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_xact_user_functions()

Description: Collects statistics about the transaction status information of user-defined functions in the namespaces on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_stat_bad_block()

Description: Displays information about table and index read failures on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_file_redo_iostat()

Description: Collects statistics on information about table and index read failures on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_file_iostat()

Description: Displays statistics about data file I/Os on all nodes. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB. The I/O statistics queried through this function in the PDB are not persisted and are cleared after the database is restarted.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_locks()

Description: Displays lock information of all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_replication_slots()

Description: Displays logical replication information on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.GET_GLOBAL_PARALLEL_DECODE_STATUS()

Description: Displays parallel decoding information of replication slots on the current node. To query this function, you must have the MONADMIN permission. The return value is the same as that of the view **GLOBAL_PARALLEL_DECODE_STATUS**.

Return type: record

DBE_PERF.GET_GLOBAL_PARALLEL_DECODE_THREAD_INFO()

Description: Displays parallel decoding thread information of replication slots on the current node. To query this function, you must have the MONADMIN permission. The return value is the same as that of the view **GLOBAL_PARALLEL_DECODE_THREAD_INFO**.

Return type: record

DBE_PERF.get_global_bgwriter_stat()

Description: Displays statistics about the background writer thread's activities on all nodes. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_replication_stat()

Description: Displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB. Currently, PDB-level log synchronization is not supported. Therefore, an empty list is returned.

Return type: record

DBE_PERF.get_global_transactions_running_xacts()

Description: Displays information about running transactions on each node. To query this function, you must have the MONADMIN permission. In the multi-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_summary_transactions_running_xacts()

Description: Collects statistics of information about running transactions on each node. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_global_transactions_prepared_xacts()

Description: Displays information about transactions that are currently prepared for two-phase commit on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_transactions_prepared_xacts()

Description: Collects statistics information about transactions that are currently prepared for two-phase commit on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_summary_statement()

Description: Displays the status information of the historically executed statements on each node. To query this function, you must have the MONADMIN permission. For details about the columns returned by the function, see **SUMMARY_STATEMENT**. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

DBE_PERF.get_global_statement_count()

Description: Displays the number of SELECT, UPDATE, INSERT, and DELETE statements and response time information (**TOTAL**, **AVG**, **MIN**, and **MAX**) on each node. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DBE_PERF.get_global_config_settings()

Description: Displays GUC parameter configuration information on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_global_wait_events()

Description: Displays the wait event status information on each node. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.get_statement_responsetime_percentile()

Description: Obtains the distribution information about the response time of 80% and 95% SQL statements of the database. To query this function, you must have the MONADMIN permission. The information about the current PDB is returned if this function is queried in the PDB.

Return type: record

DBE_PERF.get_summary_user_login()

Description: Collects statistics about number of user login and logout times on each node in the database. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the information about the current PDB is returned if this function is queried in the PDB.

Return type: record

DBE_PERF.get_global_record_reset_time()

Description: Displays the statistics about reset (restart, primary/standby switchover, and database deletion) time of the database. To query this function, you must have the MONADMIN permission.

Return type: record

DBE_PERF.standby_statement_history(only_slow[, time1, time2])

Description: Queries full SQL statements on the standby node. The primary node queries full SQL statements using the statement_history table, while the standby node queries using this function. To query this function, you must have the MONADMIN permission. For details about the columns returned by the function, see **STATEMENT_HISTORY**.

Parameters: See **Table 7-172**.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-172 standby_statement_history parameters

Parameter	Type	Description
only_slow	Boolean	Specifies whether to query only slow SQL statements. • **true** indicates yes, which is equivalent to **SELECT ... WHERE is_slow_sql = true;**. • **false** or **NULL** indicates that all SQL statements are queried, that is, **is_slow_sql** is not used as a filter condition.
time1	timestamptz	Minimum time specified by **finish_time** for querying SQL statements. This parameter is optional.
time2	timestamptz	Maximum time specified by **finish_time** for querying SQL statements. This parameter is optional. An error is reported during function execution if **time1** is greater than or equal to **time2**.

NOTE

- The two time parameters **time1** and **time2** indicate the time segment to which **finish_time** of the queried SQL statement belongs. They indicate the start time and end time respectively. If **NULL** or no value is entered, there is no limit. The function of **time1** and **time2** is the same as that of **SELECT ... WHERE finish_time BETWEEN time1 AND time2;**.
- The data generated from this function on the standby node is not stored in a table, and there is no index on the **start_time** column. You are advised to use the parameter to search for **finish_time**.
- Full/Slow SQL statements on the standby node are stored asynchronously. Therefore, the storage of user SQL information may be delayed. You are advised to query this API to expand the query time range.

pg_stat_get_mem_mbytes_reserved(tid)

Description: Collects statistics on variables related to resource management, which is used only for fault locating.

Parameter: thread ID

Return type: text

pg_stat_get_file_stat()

Description: Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB. The I/O statistics queried through this function in the PDB are not persisted and are cleared after the database is restarted.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_redo_stat()

Description: Displays statistics on the replay of session thread logs.

Return type: record

pg_stat_get_status(int8)

Description: Tests the blocking status about the backend thread and auxiliary thread of the current instance. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

get_local_rel_iostat()

Description: Queries the accumulated I/O status of data files on the current node. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB. The I/O statistics queried through this function in the PDB are persistent. After the database is restarted, the I/O statistics are not cleared and are accumulated continuously.

Return type: record

DBE_PERF.get_global_rel_iostat()

Description: Displays statistics about data file I/Os on all nodes. To query this function, you must have the MONADMIN permission. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB. The I/O statistics queried through this function in the PDB are persistent. After the database is restarted, the I/O statistics are not cleared and are accumulated continuously.

Return type: record

DBE_PERF.global_threadpool_status()

Description: Displays the status of worker threads and sessions in thread pools on all nodes. For details about the columns returned by the function, see **GLOBAL_THREADPOOL_STATUS**. To query the function, you must have the MONADMIN permission.

In the multi-tenancy scenario, global data is visible in a non-PDB. On a primary node, PDB data is visible in its own PDB. Thread group isolation is not performed on a standby node, and no data is returned when data is queried in a PDB.

Return type: record

pv_os_run_info()

Description: Displays the running status of the current OS. For details about the columns, see **GS_OS_RUN_INFO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: nan

Return type: SETOF record

pv_session_stat()

Description: Collects session status information by session thread or AutoVacuum thread. For details about the columns, see **GS_SESSION_STAT**.

Parameter: **nan**

Return type: SETOF record

pv_session_time()

Description: Collects statistics on the running time of session threads and the time consumed in each execution phase. For details about the columns, see **GS_SESSION_TIME**.

Parameter: **nan**

Return type: SETOF record

pg_stat_get_db_temp_bytes()

Description: Collects statistics on the total amount of data written to temporary files through database query. All temporary files are counted regardless of their creation reason and are not affected by the **log_temp_files** setting. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Parameter: **oid**

Return type: bigint

pg_stat_get_db_temp_files()

Description: Queries the number of temporary files created in the database. All temporary files are counted regardless of their creation reason (such as sorting or hashing) and are not affected by the **log_temp_files** setting. In the multi-tenancy scenario, PDB data can be queried only in its own PDB.

Parameter: **oid**

Return type: bigint

remote_candidate_stat()

Description: Displays the checkpoint information and log flushing information about all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

remote_ckpt_stat()

Description: Displays the checkpoint information and log flushing information about all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

remote_single_flush_dw_stat()

Description: Displays the single-page doublewrite file status of all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

remote_double_write_stat()

Description: Displays doublewrite file status of all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

remote_pagewriter_stat()

Description: Displays the page flushing information and checkpoint information about all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

remote_recovery_status()

Description: Displays log flow control information about the primary and standby nodes (except the current node). Centralized systems are not supported.

Return type: record

remote_redo_stat()

Description: Displays the log replay status of all instances in the database (except the current node). Centralized systems are not supported.

Return type: record

DBE_PERF.gs_stat_activity_timeout(int)

Description: Obtains information about query jobs whose execution time exceeds the timeout threshold on the current node. The correct result can be returned only when the GUC parameter **track_activities** is set to **on**. The timeout threshold ranges from 0 to 2147483. To query this function, you must have the MONADMIN permission.

Return type: SETOF record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
database	name	Name of the database to which a user session is connected.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
query	text	Query that is being executed on the backend.
xact_start	timestamptz	Time when the current transaction is started.
query_start	timestamptz	Time when the current query starts For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
query_id	bigint	ID of a query.

gs_wlm_user_resource_info(name text)

Description: Queries a user's resource quota and resource usage. Common users can query only their own information. Administrators can query information about all users.

Return type: record

local_redo_time_count()

Description: Returns the time consumption statistics on each process of each replayer thread on the current node (valid data exists only on the standby node).

The return values are as follows.

Column	Description
thread_name	Thread name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
step1_total	Total duration of step 1. The process of each thread is as follows: ● Ultimate RTO: **redo batch**: obtains a log from a queue. **redo manager**: obtains a log from a queue. **redo worker**: obtains a log from a queue. **trxn manager**: reads a log from a queue. **trxn worker**: reads a log from a queue. **read worker**: reads an Xlog page (overall) from a file. **read page worker**: obtains a log from a queue. **startup**: obtains a log from a queue. ● Parallel replay: **page redo**: obtains a log from a queue. **startup**: reads a log.
step1_count	Number of accumulated execution times of step 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
step2_total	Total duration of step 2. The process of each thread is as follows: ● Ultimate RTO: **redo batch**: processes logs (overall). **redo manager**: processes logs (overall). **redo worker**: processes logs (overall). **trxn manager**: processes logs (overall). **trxn worker**: processes logs (overall). **read worker**: specifies the time required for reading the Xlog page. **read page worker**: generates and sends LSN forwarders. **startup**: checks whether to replay to the specified position. ● Parallel replay: **page redo**: processes logs (overall). **startup**: checks whether to replay to the specified position.
step2_count	Number of accumulated execution times of step 2.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
step3_total	Total duration of step 3. The process of each thread is as follows: ● Ultimate RTO: **redo batch**: updates the standby state. **redo manager**: processes data logs. **redo worker**: replays page logs (overall). **trxn manager**: updates the flushing LSN. **trxn worker**: replays logs. **read worker**: updates the Xlog segment. **read page worker**: obtains a new item. **startup**: collects statistics on the wait time of delayed replay feature. ● Parallel replay: **page redo**: updates the standby state. **startup**: collects statistics on the wait time of delayed replay feature.
step3_count	Number of accumulated execution times of step 3.
step4_total	Total duration of step 4. The process of each thread is as follows: ● Ultimate RTO: **redo batch**: parses Xlogs. **redo manager**: processes DDL operations. **redo worker**: reads data pages. **trxn manager**: synchronizes the wait time. **trxn worker**: updates the LSN of the current thread. **read page worker**: stores logs in the distribution thread. **startup**: distributes logs (overall). ● Parallel replay: **page redo**: replays undo logs. **startup**: distributes logs (overall).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
step4_count	Number of accumulated execution times of step 4.
step5_total	Total duration of step 5. The process of each thread is as follows: • Ultimate RTO: **redo batch**: distributes to the redo manager. **redo manager**: distributes logs to redo workers. **redo worker**: replays data page logs. **trxn manager**: distributes data to the trxn worker. **trxn worker**: forcibly synchronizes the wait time. **read page worker**: updates the LSN of the current thread. **startup**: decodes logs. • Parallel replay: **page redo**: replays shared transaction logs. **startup**: replays logs.
step5_count	Number of accumulated execution times of step 5.
step6_total	Total duration of step 6. The process of each thread is as follows: • Ultimate RTO: **redo worker**: replays non-data page logs. **trxn manager**: updates global LSNs. **redo manager**: performs CRC verification for data page logs stored in hash tables. • Parallel replay: **page redo**: replays synctrxn logs. **startup**: forcibly synchronizes the wait time.
step6_count	Number of accumulated execution times of step 6.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
step7_total	Total duration of step 7. The process of each thread is as follows: ● Ultimate RTO: **redo manager**: creates tablespaces. **redo worker**: updates FSM. ● Parallel replay: **page redo**: replays a single log.
step7_count	Number of accumulated execution times of step 7.
step8_total	Total duration of step 8. The process of each thread is as follows: ● Ultimate RTO: **redo worker**: forcibly synchronizes the wait time. ● Parallel replay: **page redo**: replays all workers do logs.
step8_count	Number of accumulated execution times of step 8.
step9_total	Total duration of step 9. The process of each thread is as follows: ● Ultimate RTO: **redo manager**: distributes logs to the page redo thread. ● Parallel replay: **page redo**: replays multi-worker do logs.
step9_count	Number of accumulated execution times of step 9.

local_xlog_redo_statics()

Description: Returns the statistics on each type of logs that have been replayed on the current node (valid data exists only on the standby node).

The return values are as follows.

Table 7-173 local_xlog_redo_statics parameters

Column	Description
xlog_type	Log types.
rmid	Resource manager ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
info	Xlog operation.
num	Number of logs.
extra	Valid values are available for page replay logs and xact logs. • Number of pages read from the disk if the log is of the page type. • Number of deleted files if the log is of the xact type.

gs_get_shared_memctx_detail(text)

Description: Returns the memory allocation details of the specified memory context, including the file, line number, and size of each memory allocation (the size of the same line in the same file is accumulated). Only the memory context queried through the **GS_SHARED_MEMORY_DETAIL** view can be queried. The input parameter is the memory context name (that is, the **contextname** column in the result returned by **GS_SHARED_MEMORY_DETAIL**). To query this function, you must have the SYSADMIN or MONADMIN permission. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and an empty list is returned if this function is called in a PDB.

Return type: SETOF record

Name	Type	Description
file	text	Name of the file where the memory is applied for.
line	int8	Line number of the code in the file where the requested memory is located.
size	int8	Size of the applied memory. The value is accumulated if the memory is applied for multiple times in the same line of the same file.

gs_get_session_memctx_detail(text)

Description: Returns the memory allocation details of the specified memory context, including the file, line number, and size of each memory allocation (the size of the same line in the same file is accumulated). This parameter is valid only in thread pool mode. Only the memory context queried through the **GS_SESSION_MEMORY_CONTEXT** view can be queried. The input parameter is the memory context name (that is, the **contextname** column in the result returned by **GS_SESSION_MEMORY_CONTEXT**). To query this function, you must have the SYSADMIN or MONADMIN permission. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and an empty list is returned if this function is called in a PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: SETOF record

Name	Type	Description
file	text	Name of the file where the memory is applied for.
line	int8	Line number of the code in the file where the requested memory is located.
size	int8	Size of the allocated memory, in bytes. The value is accumulated if the memory is allocated for multiple times to the same line of the same file.

NOTE

This view takes effect only in thread pool mode.

gs_get_history_memory_detail(cstring)

Description: Queries historical memory snapshot information. The input parameter type is cstring. The value can be **NULL** or the name of the memory snapshot log file.

1. If the value of the input parameter is **NULL**, the list of all memory snapshot log files on the current node is displayed.
2. If the value of the input parameter is the name of the memory snapshot log file in the list queried in **1**, the detailed information about the memory snapshot recorded in the log file is displayed.
3. If you enter any other input parameter, the system displays a message indicating that the input parameter is incorrect or the file fails to be opened.

To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: text

Name	Type	Description
memory_info	text	Memory information. If the input parameter of the function is set to **NULL**, the memory snapshot file list is displayed. If the input parameter is set to the name of the memory snapshot file, the content of the file is displayed.

gs_stack()

Description: Displays the call stack of a thread. To query this function, you must have the SYSADMIN or MONADMIN permission.

Parameter: tid, which indicates the thread ID. **tid** is an optional parameter. If it is specified, the function returns the call stack of the thread corresponding to **tid**. If it is not specified, the function returns the call stacks of all threads.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return value: If **tid** is specified, the return value is of the TEXT type. If **tid** is not specified, the return value is a SETOF record.

Example:

Obtain the call stack of a specified thread.

```
gaussdb=# SELECT * FROM gs_stack(139663481165568);
                        gs_stack
------------------------------------------------------------------------
 __poll + 0x2d                                                         +
 WaitLatchOrSocket(Latch volatile*, int, int, long) + 0x29f        +
 WaitLatch(Latch volatile*, int, long) + 0x2e                    +
 JobScheduleMain() + 0x90f                                     +
 int GaussDbThreadMain<(knl_thread_role)9>(knl_thread_arg*) + 0x456+
 InternalThreadFunc(void*) + 0x2d                               +
 ThreadStarterFunc(void*) + 0xa4                                +
 start_thread + 0xc5                                          +
 clone + 0x6d                                                 +
(1 row)
```

Obtain the call stacks of all threads.

```
gaussdb=# SELECT * FROM gs_stack();
-[ RECORD 1 ]-----------------------------------------------------------------------------------------------------------
tid   | 139670364324352
lwtid | 308
stack | __poll + 0x2d
      | CommWaitPollParam::caller(int (*)(pollfd*, unsigned long, int), unsigned long) + 0x34
      | int comm_socket_call<CommWaitPollParam, int (*)(pollfd*, unsigned long,
int)>(CommWaitPollParam*, int (*)(pollfd*, unsigned long
, int)) + 0x28
      | comm_poll(pollfd*, unsigned long, int) + 0xb1
      | ServerLoop() + 0x72b
      | PostmasterMain(int, char**) + 0x314e
      | main + 0x617
      | __libc_start_main + 0xf5
      | 0x55d38f8db3a7
[ RECORD 2 ]-----------------------------------------------------------------------------------------------------------

      | WaitLatchOrSocket(Latch volatile*, int, int, long) + 0x29f
      | SysLoggerMain(int) + 0xc86
      | int GaussDbThreadMain<(knl_thread_role)17>(knl_thread_arg*) + 0x45d
      | InternalThreadFunc(void*) + 0x2d
      | ThreadStarterFunc(void*) + 0xa4
      | start_thread + 0xc5
      | clone + 0x6d
```

gs_perf_start(duration integer[, freq integer])

Description: Collects the stack call data of the on-CPU flame graph of each thread on the current node. The function returns the storage path of the flame graph. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type	Range
duration	Stack collection duration, in seconds. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	1–60

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Type	Range
freq	(Optional) Stack collection frequency, in Hz. The default value is **100**. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	10–1000

Return type: text

Example:

Set the frequency to 100 Hz and collect on-CPU stack information for 10s.

```
gaussdb=# SELECT gs_perf_start(10,100);
                                gs_perf_start
-------------------------------------------------------------------------------
 Successfully collected perf flamegraph data, the result filepaths are :          +
 $GAUSSLOG/gs_flamegraph/dn_6001/flamegraph-manual-oncpu-2025-02-28_175628.html.gz;+
 Record 29427 cpu clock samples.                                                  +

(1 row)
```

NOTICE

Before executing this function and the following gs_perf_start_offcpu(), gs_perf_start_all(), and gs_perf_start_detail() functions, ensure that gs_perf_service is running properly. During data collection, gs_perf_service needs to apply for a ring buffer. The buffer size is controlled by **/proc/sys/kernel/perf_event_mlock_kb** in the OS. If the error message "perf mmap failed" is displayed during the collection, adjust the size of **/proc/sys/kernel/perf_event_mlock_kb** and perform the collection again.

gs_perf_start_offcpu(duration integer)

Description: Collects the stack call data of the off-CPU flame graph of each thread on the current node. The function returns the storage path of the flame graph. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type	Range
duration	Stack collection duration, in milliseconds. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	50~3000

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

Collect off-CPU stack information for 2000 ms.

```
gaussdb=# SELECT gs_perf_start_offcpu(2000);
                                gs_perf_start_offcpu
-------------------------------------------------------------------------------------
 Successfully collected perf flamegraph data, the result filepaths are :          +
 $GAUSSLOG/gs_flamegraph/dn_6001/flamegraph-manual-offcpu-2025-02-28_175828.html.gz;+
 Record 482670 sched switch samples.                                              +

(1 row)
```

gs_perf_start_detail(duration integer[, freq integer])

Description: Collects the on-CPU and off-CPU call stack details of all threads on all CPU cores on the host where the current node is located. The function returns the address of the compressed file of multi-core and multi-thread raw data. Each time this command is executed, the historical multi-core and multi-thread data is deleted. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type	Range
duration	Stack collection duration, in milliseconds. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	50~3000
freq	(Optional) Stack collection frequency, in Hz. The default value is **100**. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	10–1000

Return type: text

Example:

Collect multi-core and multi-thread flame graph data for 2000 ms.

```
gaussdb=# SELECT gs_perf_start_detail(2000);
                                gs_perf_start_detail
-------------------------------------------------------------------------------------------------------
 Successfully collected perf detail data, the result filepath is :                                  +
 $GAUSSLOG/gs_flamegraph/dn_6001/detail-2025-03-03_100929.lz4                                       +
 Please save the file locally, otherwise the file will be deleted during the next data collection.+
 Record 1965659 samples.                                                                          +

gs_perf_start_all(duration integer[, freq integer])

Description: Collects the stack call data of the on-CPU and off-CPU flame graphs on all nodes of the host where the current node is located. The function returns

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the storage path of the flame graph files generated on all nodes. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type	Range
duration	Stack collection duration, in milliseconds. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	50~3000
freq	(Optional) Stack collection frequency, in Hz. The default value is **100**. If a floating-point number is entered, the first digit after the decimal point is rounded off.	integer	10–1000

Return type: text

Example:

Set the frequency to 100 Hz and collect the on-CPU and off-CPU flame graph data on all nodes of the host where the current node is located for 1000 ms.

```
gaussdb=# SELECT gs_perf_start_all(1000,100);
                                                                                                                gs_perf_start_all
----------------------------------------------------------------------------------------------------------------------------------
 Successfully collected perf flamegraph data, the result filepaths are :                                                       +

```

gs_perf_list()

Description: Views the collected on-CPU and off-CPU flame graph data saved on the current node. The multi-core and multi-thread flame graph records are not displayed.

Parameter: nan

Return type: SETOF record

The following table describes the fields returned by the function.

Name	Type	Description
nodename	text	Name of a collection node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
filename	text	Name of the file that stores the collected data.
collect_type	text	Collection type.

Example:

Query the flame graph generation records saved on the current node.

```
gaussdb=# SELECT * FROM gs_perf_list() limit 10;
 nodename |                        filename                        | collect_type

gs_perf_query([filename text])

Description: Queries the historical on-CPU and off-CPU flame graph stack call data. The function collects the function call stacks of each thread, sums up the function running time, and returns the collection result. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type
filename	Name of a historically collected file. This parameter is optional. The default value is the latest manually collected flame graph.	text

Return type: SETOF record

The following table describes the fields returned by the function.

Name	Type	Description
backtrace	text	Stack name (in a tree structure).
period	bigint	Execution time of a stack.
level	integer	Level of the stack call tree where a stack is located.
sequence	integer	Sequence in the stack call tree after sorting.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
thread_name	text	Name of the thread where a stack is located.
overhead	float	Percentage of the stack execution time.

Example:

Query the collected stack information.

```
gaussdb=# SELECT * FROM gs_perf_query() WHERE overhead > 2 AND level < 10;
                                backtrace                                |   period    | level | sequence |  thread_name  |

gs_perf_query_general([filename text])

Description: Queries the percentage of functions called by stacks in the historical on-CPU and off-CPU flame graphs. The sum of the percentages may not be 1 due to calculation precision. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type
filename	Name of a historically collected file. This parameter is optional. The default value is the latest manually collected flame graph.	text

Return type: SETOF record

The following table describes the fields returned by the function.

Name	Type	Description
function_name	text	Stack function name.
percentage	float	Percentage of stack function calls.

Example:

Query the percentage of flame graph function calls generated in the latest manual collection.

```
gaussdb=# SELECT * FROM gs_perf_query_general();
        function_name         | percentage
------------------------------+------------

```

gs_perf_query_detail([filename text])

Description: Queries the stack function call percentage and call stack details of the historical on-CPU and off-CPU flame graphs. The sum of the percentages may not be 1 due to calculation precision. To query this function, you must have the SYSADMIN or MONADMIN permission.

The parameters are described as follows.

Parameter	Description	Type
filename	Name of a historically collected file. This parameter is optional. The default value is the latest manually collected flame graph.	text

Return type: SETOF record

The following table describes the fields returned by the function.

Name	Type	Description
function_name	text	Stack function name.
percentage	float	Percentage of stack function calls.
function_callstack	text	Stack function call stack.
function_callstack_percentage	float	Percentage of stack function call stacks.

Example:

Query the percentage and details of flame graph calls generated in the last manual collection.

```
testdb3=# SELECT * FROM gs_perf_query_detail();
     function_name       | percentage
|
function_callstack
                                                
```

gs_get_thread_memctx_detail(tid,text)

Description: Returns the memory allocation details of the specified memory context, including the file, line number, and size of each memory allocation (the size of the same line in the same file is accumulated). Only the memory context queried through the **GS_THREAD_MEMORY_CONTEXT** view can be queried. The first input parameter is the thread ID (the **tid** column of the data returned by **GS_THREAD_MEMORY_CONTEXT**), and the second parameter is the memory context name (the **contextname** column of the data returned by **GS_THREAD_MEMORY_CONTEXT**). To query this function, you must have the SYSADMIN or MONADMIN permission. In the multi-tenancy scenario, all information is returned if this function is called in a non-PDB, and an empty list is returned if this function is called in a PDB.

Return type: SETOF record

Name	Type	Description
file	text	Name of the file where the memory is applied for.
line	int8	Line number of the code in the file where the requested memory is located.
size	int8	Size of the allocated memory, in bytes. The value is accumulated if the memory is allocated for multiple times to the same line of the same file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_tpworker_execstmt_stat()

Description: Displays the runtime information of a statement. If the SYSADMIN or MONADMIN user runs the statement, the information about all the statements that are being executed is displayed. Common users can query only the information about the SQL statements executed by themselves.

Return type: SETOF record

Name	Type	Description
db_oid	oid	OID of the database that the user session connects to in the backend.
db_name	name	Name of the database that the user session connects to in the backend.
threadpool_worker	varchar	NUMA group to which a thread belongs and thread ID. The format is *numagroup_threadid*.
thread_id	bigint	Thread ID.
session_id	bigint	Session ID.
query_id	bigint	ID of the SQL statement that is being executed.
query_text	text	Content of the SQL statement that is being executed.
unique_sql_id	bigint	Unique ID generated by the SQL statement.
client_hostname	text	Host name of the connected client, obtained by a reverse DNS lookup based on **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_app_name	text	Name of the client app.
stmt_slow_time_threshold	int	Preset timeout interval for marking an SQL statement as a slow SQL statement, in milliseconds.
stmt_start_time	timestamp with time zone	Time when the statement starts to be executed for a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
stmt_elapse_time	int	Time elapsed since the query starts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stmt_control_status	varchar	Current statement state. • **Waiting**: The session access is successful but it is not executed by the thread. • **Running**: The current statement is executed properly. • **Control**: The current statement enters the resource control phase.
stmt_control_rule	text	Slow SQL control rule corresponding to the current language.
stmt_control_iostat	text	IOPS value and maximum IOPS of the current statement. The format is *curVal*/*maxVal*.
stmt_control_memstat	text	This field is reserved and is not supported currently.
stmt_control_cpustat	text	This field is reserved and is not supported currently.
stmt_control_netstat	text	This field is reserved and is not supported currently.

gs_tpworker_execslot_stat()

Description: Displays the thread running information. If the SYSADMIN or MONADMIN user runs the command, information about all threads is displayed. Common users can query only information about the threads where the SQL statements executed by themselves are located.

Return type: SETOF record

Name	Type	Description
numagroup	int	NUMA group to which the current thread belongs.
worker_id	int	Thread ID of the current thread.
worker_bind_type	text	Thread binding mode. The value can be **numabind**, **cpubind**, **allbind**, or **nobind**.
worker_cpu_affinity	text	Affinity between threads and CPU cores, that is, the range of CPU cores that can be scheduled by threads.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
worker_status	varchar	Current thread status. • **Waiting**: The session access is successful but it is not executed by the thread. • **Running**: The current statement is executed properly. • **Control**: The current statement enters the resource control phase.
served_query_id	bigint	ID of the SQL statement that is being executed.
served_query_text	text	Content of the SQL statement that is being executed.

gs_session_all_settings(sessionid bigint)

Description: Queries the full GUC parameter settings of the session corresponding to the session ID on the local node. This operation requires the SYSADMIN or MONADMIN permission. Only the data of the local PDB is returned in the PDB, and the global data is returned in the non-PDB.

Parameter: **sessionid**, indicating a session ID.

Return type: SETOF record

The following table describes return fields.

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

Example:

```
gaussdb=# SELECT sessionid FROM pg_stat_activity WHERE usename = 'testuser';
 sessionid
-----------
    788861
(1 row)

gaussdb=# SELECT * FROM gs_session_all_settings(788861) WHERE name = 'work_mem';
   name   | setting | unit
----------+---------+------
 work_mem | 131072  | kB
(1 row)
```

gs_session_all_settings()

Description: Queries full GUC parameter settings of all sessions on the local node. This operation requires the SYSADMIN or MONADMIN permission. In the multi-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tenancy scenario, PDB data is returned to its own PDB, and global data is returned to a non-PDB.

Return type: SETOF record

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

Example:

```
gaussdb=# SELECT * FROM gs_session_all_settings() WHERE name = 'work_mem';
    sessionid    |       pid       |   name   | setting | unit
-----------------+-----------------+----------+---------+------
 140550214145792 |           96974 | work_mem | 65536   | kB
 140550214145792 |           96971 | work_mem | 65536   | kB
 140549731735296 | 140549731735296 | work_mem | 65536   | kB
 140549764413184 | 140549764413184 | work_mem | 65536   | kB
(4 rows)
```

gs_local_wal_preparse_statistics()

Description: Queries the latest startup of the log pre-parsing thread on the local node as well as the pre-parsing logs. Only the user with the SYSADMIN permission can execute this function. The log pre-parsing thread is typically started by the CM component when the HA replication link of the standby DN is disconnected. If the log pre-parsing thread has been started, you can call this function to query the latest pre-parsing status. If the thread has not been started, this function returns the default value.

Return type: SETOF record

Name	Type	Description
preparser_term	text	Maximum term value obtained from the latest pre-parsing log.
preparser_start_time	timestamptz	Time when the latest pre-parsing is started.
preparser_end_time	timestamptz	End time of the latest pre-parsing.
preparser_start_location	text	Start position of the latest pre-parsing log.
preparser_end_location	text	End position of the latest pre-parsing log.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
preparser_total_bytes	int8	Number of latest pre-parsed logs, in bytes.
preparser_speed	int8	Latest pre-parsing speed, in bytes/ms.
is_valid	bool	Specifies whether the latest pre-parsing result can be used for leader selection.

The following is an example of the query result after the log pre-parsing thread is started:

```
gaussdb=# SELECT * FROM gs_local_wal_preparse_statistics();
 preparser_term |     preparser_start_time      |      preparser_end_time       | preparser_start_location |
preparser_end_location | preparser_total_bytes | preparser_speed | is_valid
----------------+-------------------------------+-------------------------------+--------------------------
+------------------------+-----------------------+-----------------+----------
 3107           | 2023-02-01 17:04:23.367946+08 | 2023-02-01 17:04:25.354434+08 | 00000003/C3EEA660
| 00000004/0BE60738      |            1207394520 |      1207394520 | f
(1 row)
```

The following is an example of the query result when the log pre-parsing thread has not been started:

```
gaussdb=# SELECT * FROM gs_local_wal_preparse_statistics();
 preparser_term |  preparser_start_time  |   preparser_end_time   | preparser_start_location |
preparser_end_location | preparser_total_bytes | preparser_speed | is_valid
----------------+------------------------+------------------------+--------------------------+------------------------
+-----------------------+-----------------+----------
 0              | 2000-01-01 08:00:00+08 | 2000-01-01 08:00:00+08 | 00000000/00000000        |
00000000/00000000      |                     0 |               0 | f
(1 row)
```

gs_wlm_respool_cpu_info()

Description: Displays the limit and usage of CPU resources in a resource pool. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
respool_name	name	Name of the resource pool.
control_group	name	Cgroup name.
cpu_affinity	name	Value of cores bound to the CPU.
cpu_usage	integer	CPU usage of a resource pool.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_RESPOOL_CPU_INFO();
 respool_name  |    control_group     | cpu_affinity | cpu_usage
---------------+----------------------+--------------+-----------
 respool_cpu_2 | respool_cpu_2:Medium | 0-95         |         78
 default_pool  | DefaultClass:Medium  | 0-32         |         65
(2 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_wlm_respool_connection_info()

Description: Displays the limit and usage of the number of connections in ta resource pool. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
respool_name	name	Name of the resource pool.
max_connections	name	Maximum number of connections to a resource pool.
curr_connections	integer	Number of existing connections in the current resource pool.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_RESPOOL_CONNECTION_INFO();
 respool_name  | max_connections | curr_connections
---------------+-----------------+------------------
 respool1      |              -1 |                0
 default_pool  |              -1 |                1
(2 rows)
```

gs_wlm_respool_memory_info()

Description: Displays the limit and usage of memory resources in a resource pool. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
respool_name	name	Name of the resource pool.
max_dynamic_memory	integer	Maximum dynamic memory that can be used.
current_dynamic_memory	integer	Used dynamic memory.
max_shared_memory	integer	Maximum shared memory that can be used.
current_shared_memory	integer	Shared memory that has been used.
shared_memory_hits_percent	integer	This function is unavailable and is reserved for future evolution. This column is reserved and the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> When the dynamic memory usage of the resource pool exceeds the maximum value, the returned value of the GUC parameter **current_dynamic_memory** may be greater than the value of **max_dynamic_memory**. This is normal because no memory is allocated.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_RESPOOL_MEMORY_INFO();
 respool_name   | max_dynamic_memory | current_dynamic_memory | max_shared_memory |
current_shared_memory | shared_memory_hits_percent
----------------+--------------------+------------------------+-------------------+------------------------
+----------------------------
 default_pool   | -1                 | 3383kB                 | -1                | 3848kB                 |                      0
 resource_pool_a | 30720kB           | 0kB                    | -1                | 0kB                    |                      0
(2 rows)
```

gs_wlm_respool_concurrency_info()

Description: Displays the limit and usage of concurrent resources in a resource pool. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
respool_name	name	Name of the resource pool.
max_concurrency	integer	Maximum number of concurrent queries allowed by the resource pool.
running_conurrency	integer	Number of concurrent tasks that are being executed in the current resource pool.
waiting_concurrency	integer	Number of concurrent tasks that are waiting in the current resource pool.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_RESPOOL_CONCURRENCY_INFO();
 respool_name   | max_concurrency | running_concurrency | waiting_concurrency
----------------+-----------------+---------------------+---------------------
 default_pool   |              -1 |                   1 |                   0
 resource_pool_a |             -1 |                   0 |                   0
(2 rows)
```

gs_wlm_respool_io_info()

Description: Displays the limit and usage of I/O resources in a resource pool. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
respool_name	name	Name of the resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_limits	integer	Upper limit of IOPS. The value **0** indicates there is no limit. Row-store: The unit is determined by GUC parameter **io_control_unit**, which is used to count the number of I/Os during I/O control. If the value of **io_control_unit** is **1**, it indicates one IOPS.
io_priority	text	I/O priority set for jobs that consume I/O resources. It takes effect when the I/O usage reaches 90%. **None** indicates there is no control.
current_iops	integer	Number of times that the current I/O has been triggered. The current I/O statistics occasionally exceed the upper limit, which is related to the I/O statistics algorithm and is normal.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_RESPOOL_IO_INFO();
 respool_name   | io_limits | io_priority | current_iops
----------------+-----------+-------------+--------------
 default_pool   |         0 | None        |            0
 resource_pool_a |         0 | Low         |            0
(2 rows)
```

gs_wlm_user_space_info()

Description: Displays the storage space usage of a user. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
user_name	name	Username.
max_permanent_space	bigint	Maximum permanent storage space that can be used by a user, in bytes.
current_ permanent_space	bigint	Permanent storage space used by the current user, in bytes.
max_temp_space	bigint	Maximum temporary storage space that can be used by a user, in bytes.
current_ temp_space	bigint	Temporary storage space used by the current user, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_spill_space	bigint	Maximum operator-level data flushing storage space that can be used by a user, in bytes.
current_ spill_space	bigint	Operator flushing storage space used by the current user, in bytes.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_USER_SPACE_INFO();
          user_name          | max_permanent_space | current_permanent_space | max_temp_space |
current_temp_space | max_spill_space | current_spill_space
-----------------------------+---------------------+-------------------------+----------------+--------------------
+-----------------+--------------------
 xy                          |                  -1 |                    2464 |             -1 |                  0 |              -1
|                 0
(1 rows)
```

gs_wlm_session_io_info()

Description: Displays the I/O usage of a session. This function is disabled in the multi-tenancy scenario.

Return type: SETOF record

Name	Type	Description
session_id	integer	Session ID.
io_limits	integer	Upper limit of IOPS. The value **0** indicates there is no limit. Row-store: The unit is determined by GUC parameter **io_control_unit**, which is used to count the number of I/Os during I/O control. If the value of **io_control_unit** is **1**, it indicates one IOPS.
io_priority	text	I/O priority set for jobs that consume I/O resources. It takes effect when the I/O usage reaches 90%. **None** indicates there is no control.
current_iops	integer	Number of times that the current I/O has been triggered. The current I/O statistics occasionally exceed the upper limit, which is related to the I/O statistics algorithm and is normal.
wait_time	integer	Total waiting time after the current I/O exceeds the upper limit.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_SESSION_IO_INFO();
  session_id    | io_limits | io_priority | current_iops | wait_time
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------------+-----------+-------------+--------------+-----------
 139976325986048 |        10 | None        |            0 |      2709
(1 row)
```

gs_wlm_session_memory_info()

Description: Displays the memory usage of a session. In the multi-tenancy scenario, PDB data is returned to its own PDB, and global data is returned to a non-PDB.

Return type: SETOF record

Name	Type	Description
session_id	integer	Session ID.
sess_used_dynamic_memory	bigint	Used dynamic memory.
sess_max_dynamic_memory	bigint	Maximum dynamic memory that can be used.

Example:

```
gaussdb=# SELECT * FROM GS_WLM_SESSION_MEMORY_INFO();
     sessid      | sess_used_dynamic_memory | sess_max_dynamic_memory
-----------------+--------------------------+-------------------------
 139976325986048 |                  4326056 |                      -1
 139976402532096 |                  4452664 |                      -1
(2 rows)
```

gs_hot_standby_space_info()

Description: Queries the total number and total size of files in the **standby_read/base_page**, **standby_read/block_info_meta** and **standby_read/lsn_info_meta** folders.

Return type: SETOF record

Name	Type	Description
base_page_file_num	xid	Total number of bage_page_files.
base_page_total_size	xid	Total size of bage_page_files.
lsn_info_meta_file_num	xid	Total number of lsn_info_meta_files.
lsn_info_meta_total_size	xid	Total size of the lsn_info_meta_files.
block_info_meta_file_num	xid	Total number of block_info_meta_files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_info_meta_total_size	xid	Total size of the block_info_meta_files.

Example:

```
gaussdb=# SELECT * FROM gs_hot_standby_space_info();
 base_page_file_num | base_page_total_size | lsn_info_meta_file_num | lsn_info_meta_total_size |
block_info_meta_file_num | block_info_meta_total_size
--------------------+----------------------+------------------------+--------------------------+--------------------------
+----------------------------
                 6 |               163840 |                      6 |                     3136 |                       16 |
147456
(1 row)
```

exrto_file_read_stat()

Description: Queries the number of disk access times and total access latency of new **base page files**, **lsn info meta files**, and **block info meta files** read on a standby node. Connect to the standby DN for query. In other cases, the query result is 0.

Return type: SETOF record

Name	Type	Description
lsn_info_page_disk_read_counter	int8	Number of disk access times of **lsn info meta files**.
lsn_info_page_disk_read_dur	int8	Total latency of **lsn info meta file** access to disks.
blk_info_meta_disk_read_counter	int8	Number of disk access times of **block info meta files**.
blk_info_meta_disk_read_dur	int8	Total latency of **block info meta file** access to disks.
base_page_read_disk_counter	int8	Number of disk access times of **base page files**.
base_page_read_disk_dur	int8	Total latency of **base page file** access to disks.

Example:

```
gaussdb=# SELECT * FROM exrto_file_read_stat();
 lsn_info_page_disk_read_counter | lsn_info_page_disk_read_dur | blk_info_meta_disk_read_counter |
blk_info_meta_disk_read_dur | base_page_read_disk_counter | base_page_read_disk_dur
---------------------------------+-----------------------------+---------------------------------
+-----------------------------+-----------------------------+-------------------------
                           14987 |                       92313 |                           23879 |                      129811
|                            0 |                           0
(1 row)
```

gs_exrto_recycle_info()

Description: Queries the resource recycling location, including the recycling LSN of each thread, global recycling LSN, and the earliest snapshot LSN of a query thread. Connect to the standby DN for query. In other cases, the query result is 0.

Return type: SETOF record

Name	Type	Description
page_redo_worker_thread_id	text	Reclamation LSN location of redo thread. **thread_id** indicates the redo thread ID.
global_recycle_lsn	text	LSN of global reclamation location.
exrto_snapshot_oldest_lsn	text	Earliest snapshot LSN of a query thread.

Example:

```
gaussdb=# SELECT * FROM gs_exrto_recycle_info();
            thread_id              | recycle_lsn
-----------------------------------+-------------
 page_redo_worker_140148895381248 | 0/7B4552E0
 page_redo_worker_140148872312576 | 0/7B4535B8
 global_recycle_lsn               | 0/7B4535B8
 exrto_snapshot_oldest_lsn        | 0/8488E6D0
(4 rows)
```

gs_stat_get_db_conflict_all(oid)

Parameter: **dbid(oid)**, indicating the OID of a database.

Description: Queries the number of sent replay conflict signals of different types.

Return type: SETOF record

Name	Type	Description
conflict_all	int8	Number of sent replay conflict signals.
conflict_tablespace	int8	Number of sent replay conflict signals of the tablespace type.
conflict_lock	int8	Number of sent replay conflict signals of the **lock** type.
conflict_snapshot	int8	Number of sent replay conflict signals of the snapshot type.
conflict_bufferpin	int8	Number of sent replay conflict signals of the bufferpin type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conflict_startup_deadlock	int8	Number of sent replay conflict signals of the **startup_deadlock** type.
conflict_truncate	int8	Number of sent replay conflict signals of the truncate type.
conflict_standby_query_timeout	int8	Number of sent replay conflict signals of the standby_query_timeout type.
conflict_force_recycle	int8	Number of sent replay conflict signals of the force_recycle type.

Example:

```
gaussdb=# SELECT * FROM gs_stat_get_db_conflict_all(12738);
 conflict_all | conflict_tablespace | conflict_lock | conflict_snapshot | conflict_bufferpin |
conflict_startup_deadlock | conflict_truncate | conflict_standby_query_timeout | conflict_force_recycle
--------------+---------------------+---------------+-------------------+--------------------+---------------------------
+-------------------+--------------------------------+-----------------------
            0 |                   0 |             0 |                 0 |                  0 |                         0 |
                0 |                         0 |                      0
(1 row)
```

gs_redo_stat_info()

Description: Queries redo information, including the buffer hit ratio of the redo thread, number of unlink_rels files executed, wait event information of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario, and wait event information of **wal_read_from_write_buffer**. The query must be executed by connecting to the standby DN.

Return type: SETOF record

Name	Type	Description
buffer_hit_rate	float8	Buffer hit ratio of the redo thread.
ddl_unlink_nrels_count	int8	Number of unlink rel files executed during the redo process of DDL statements.
read_buffer_io_counter	int8	Number of wait events of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.
read_buffer_io_total_dur	int8	Total wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.
read_buffer_io_avg_dur	int8	Average wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
read_buffer_io_min_dur	int8	Minimum wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.
read_buffer_io_max_dur	int8	Maximum wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.
read_wal_buf_counter	int8	Number of wait events triggered by **wal_read_from_write_buffer** in the ultimate RTO scenario.
read_wal_buf_total_dur	int8	Total wait event duration of **wal_read_from_write_buffer** in the ultimate RTO scenario.
read_wal_buf_avg_dur	int8	Average wait event duration of **wal_read_from_write_buffer** in the ultimate RTO scenario.
read_wal_buf_min_dur	int8	Minimum wait event duration of **wal_read_from_write_buffer** in the ultimate RTO scenario.
read_wal_buf_max_dur	int8	Maximum wait event duration of **wal_read_from_write_buffer** in the ultimate RTO scenario.

Example:

```
gaussdb=# SELECT * FROM gs_redo_stat_info();
-[ RECORD 1 ]------------+----------
buffer_hit_rate          | 70.5707
ddl_unlink_nrels_count   | 3
read_buffer_io_counter   | 1732
read_buffer_io_total_dur | 2850806
read_buffer_io_avg_dur   | 1645
read_buffer_io_min_dur   | 3
read_buffer_io_max_dur   | 981639
read_wal_buf_counter     | 9779
read_wal_buf_total_dur   | 193612470
read_wal_buf_avg_dur     | 19798
read_wal_buf_min_dur     | 3
read_wal_buf_max_dur     | 1914777
```

gs_recovery_conflict_waitevent_info()

Description: Queries wait event information about the function that processes redo conflicts. The query must be executed by connecting to the standby DN.

Return type: SETOF record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conflict_lock_counter	int8	Number of times that lock redo conflicts are triggered.
conflict_lock_total_dur	int8	Total duration for processing lock redo conflicts.
conflict_lock_avg_dur	int8	Average duration for processing lock redo conflicts.
conflict_lock_min_dur	int8	Minimum duration for processing lock redo conflicts.
conflict_lock_max_dur	int8	Maximum duration for processing lock redo conflicts.
conflict_snapshot_counter	int8	Number of times that snapshot redo conflicts are triggered.
conflict_snapshot_total_dur	int8	Total duration for processing snapshot redo conflicts.
conflict_snapshot_avg_dur	int8	Average duration for processing snapshot redo conflicts.
conflict_snapshot_min_dur	int8	Minimum duration for processing snapshot redo conflicts.
conflict_snapshot_max_dur	int8	Maximum duration for processing snapshot redo conflicts.
conflict_tablespace_counter	int8	Number of times that tablespace redo conflicts are triggered.
conflict_tablespace_total_dur	int8	Total duration for processing tablespace redo conflicts.
conflict_tablespace_avg_dur	int8	Average duration for processing tablespace redo conflicts.
conflict_tablespace_min_dur	int8	Minimum duration for processing tablespace redo conflicts.
conflict_tablespace_max_dur	int8	Maximum duration for processing tablespace redo conflicts.
conflict_database_counter	int8	Number of times that database redo conflicts are triggered.
conflict_database_total_dur	int8	Total duration for processing database redo conflicts.
conflict_database_avg_dur	int8	Average duration for processing database redo conflicts.
conflict_database_min_dur	int8	Minimum duration for processing database redo conflicts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conflict_database_max_dur	int8	Maximum duration for processing database redo conflicts.
conflict_truncate_counter	int8	Number of times that TRUNCATE redo conflicts are triggered.
conflict_truncate_total_dur	int8	Total duration for processing TRUNCATE redo conflicts.
conflict_truncate_avg_dur	int8	Average duration for processing TRUNCATE redo conflicts.
conflict_truncate_min_dur	int8	Minimum duration for processing TRUNCATE redo conflicts.
conflict_truncate_max_dur	int8	Maximum duration for processing TRUNCATE redo conflicts.
conflict_standby_query_timeout_counter	int8	Number of times that standby_query_timeout redo conflicts are triggered.
conflict_standby_query_timeout_total_dur	int8	Total duration for processing standby_query_timeout redo conflicts.
conflict_standby_query_timeout_avg_dur	int8	Average duration for processing standby_query_timeout redo conflicts.
conflict_standby_query_timeout_min_dur	int8	Minimum duration for processing standby_query_timeout redo conflicts.
conflict_standby_query_timeout_max_dur	int8	Maximum duration for processing standby_query_timeout redo conflicts.
conflict_force_recycle_counter	int8	Number of times that force_recycle redo conflicts are triggered.
conflict_force_recycle_total_dur	int8	Total duration for processing force_recycle redo conflicts.
conflict_force_recycle_avg_dur	int8	Average duration for processing force_recycle redo conflicts.
conflict_force_recycle_min_dur	int8	Minimum duration for processing force_recycle redo conflicts.
conflict_force_recycle_max_dur	int8	Maximum duration for processing force_recycle redo conflicts.

Example:

```
gaussdb=# SELECT * FROM gs_recovery_conflict_waitevent_info();
-[ RECORD 1 ]----------------------------+------
conflict_lock_counter                    | 0
conflict_lock_total_dur                  | 0
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
conflict_lock_avg_dur                  | 0
conflict_lock_min_dur                  | 0
conflict_lock_max_dur                  | 0

conflict_force_recycle_max_dur         | 0
```

gs_display_delay_ddl_info()

Description: Views information about files that are delayed for deletion on the standby node. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: SETOF record

Table 7-174

Name	Type	Description
type	INT4	Indicates that the deleted object is a table or database.
lsn	TEXT	Marks the location of a particular log file.
tablespace	INT4	Indicates the physical space for storing tables and indexes in a database.
database	INT4	Indicates the physical storage location of a database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relation	INT4	Indicates the object in a database, which can be the physical location of a table, view, or index.
bucketid	INT4	Specifies the bucket to which the relationship object belongs.
opt	INT4	Indicates the attribute of a compressed table.
forknum	INT4	Specifies a suffix name for a subject name. You can find a unique physical file based on the subject name and suffix name.

Example:

```
gaussdb=# SELECT * FROM gs_display_delay_ddl_info();
 type | lsn | tablespace | database | relation | bucketid | opt | forknum
------+-----+------------+----------+----------+----------+-----+---------
(0 rows)
```

7.6.28.2 Functions for Collecting Statistics in Partitioned Tables

gs_stat_get_partition_stats(oid)

Description: Obtains the statistics of a specific partition.

Return type: record

gs_stat_get_xact_partition_stats(oid)

Description: Obtains transaction statistics of a specific partition.

Return type: record

gs_stat_get_all_partitions_stats()

Description: Obtains the statistics of all partitions.

Return type: SETOF record

gs_stat_get_xact_all_partitions_stats()

Description: Obtains transaction statistics of all partitions.

Return type: SETOF record

gs_statio_get_all_partitions_stats()

Description: Obtains the I/O statistics of all partitions.

Return type: SETOF record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples of the preceding five functions

NOTE

Statistics are reported asynchronously during execution. Based on UDP, delay and packet loss may occur during backend thread processing. The following example is for reference only.

Querying out-of-transaction statistics:

```
gaussdb=# CREATE TABLE part_tab1

gs_stat_get_partition_analyze_count(oid)

Description: Specifies the number of times that a user starts analysis on a partition.

Return type: bigint

gs_stat_get_partition_autoanalyze_count(oid)

Description: Specifies the number of times that the autovacuum daemon thread starts analysis in a partition.

Return type: bigint

gs_stat_get_partition_autovacuum_count(oid)

Description: Specifies the number of times that the autovacuum daemon thread starts vacuum in a partition.

Return type: bigint

gs_stat_get_partition_last_analyze_time(oid)

Description: Specifies the last time when a partition starts to be analyzed manually or by the autovacuum thread.

Return type: timestamptz

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_stat_get_partition_last_autoanalyze_time(oid)

Description: Specifies the time when the last analysis initiated by the autovacuum daemon thread in a partition.

Return type: timestamptz

gs_stat_get_partition_last_autovacuum_time(oid)

Description: Specifies the time of the last vacuum initiated by the autovacuum daemon thread in a partition.

Return type: timestamptz

gs_stat_get_partition_last_data_changed_time(oid)

Description: Specifies the last time of a modification in a partition, such as insert, update, delete, and truncate. Currently, this parameter is not supported.

Return type: timestamptz

gs_stat_get_partition_last_vacuum_time(oid)

Description: Specifies the most recent time when the user manually cleared a table or when the autovacuum thread was started to clear a partition.

Return type: timestamptz

gs_stat_get_partition_numscans(oid)

Description: Specifies the number of sequential scans in a partition.

Return type: bigint

gs_stat_get_partition_tuples_returned(oid)

Description: Specifies the number of rows read by sequential scan in a partition.

Return type: bigint

gs_stat_get_partition_tuples_fetched(oid)

Description: Specifies the number of rows fetched by bitmap scans in a partition.

Return type: bigint

gs_stat_get_partition_vacuum_count(oid)

Description: Specifies the number of times that a user starts vacuum in a partition.

Return type: bigint

gs_stat_get_xact_partition_tuples_fetched(oid)

Description: Specifies the number of tuple rows scanned in a transaction.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_stat_get_xact_partition_numscans(oid)

Description: Specifies the number of sequential scans performed on a partition in the current transaction.

Return type: bigint

gs_stat_get_xact_partition_tuples_returned(oid)

Description: Specifies the number of rows read through sequential scans in a partition in the current transaction.

Return type: bigint

gs_stat_get_partition_blocks_fetched(oid)

Description: Specifies the number of disk block fetch requests for a partition.

Return type: bigint

gs_stat_get_partition_blocks_hit(oid)

Description: Specifies the number of disk block requests found in cache for a partition.

Return type: bigint

pg_stat_get_partition_tuples_inserted(oid)

Description: Specifies the number of rows inserted into a specified table partition.

Return type: bigint

pg_stat_get_partition_tuples_updated(oid)

Description: Specifies the number of rows updated in a specified table partition.

Return type: bigint

pg_stat_get_partition_tuples_deleted(oid)

Description: Specifies the number of rows deleted from a specified table partition.

Return type: bigint

pg_stat_get_partition_tuples_changed(oid)

Description: Specifies the total number of inserted, updated, and deleted rows after a table partition was last analyzed or autoanalyzed.

Return type: bigint

pg_stat_get_partition_live_tuples(oid)

Description: Specifies the number of live rows in a partitioned table.

Return type: bigint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_stat_get_partition_dead_tuples(oid)

Description: Specifies the number of dead rows in a partitioned table. It indicates the number of inactive row pointers in Ustore tables.

Return type: bigint

pg_stat_get_xact_partition_tuples_inserted(oid)

Description: Specifies the number of inserted tuples in the active sub-transactions related to a table partition.

Return type: bigint

pg_stat_get_xact_partition_tuples_deleted(oid)

Description: Specifies the number of deleted tuples in the active sub-transactions related to a table partition.

Return type: bigint

pg_stat_get_xact_partition_tuples_hot_updated(oid)

Description: Specifies the number of hot updated tuples in the active sub-transactions related to a table partition.

Return type: bigint

pg_stat_get_xact_partition_tuples_updated(oid)

Description: Specifies the number of updated tuples in the active sub-transactions related to a table partition.

Return type: bigint

pg_stat_get_partition_tuples_hot_updated(oid)

Description: Returns statistics on the number of hot updated tuples in a partition with a specified partition ID.

Parameter: **oid**

Return type: bigint

gs_session_alt_status()

Description: Queries the recoverable status of unplanned ALT sessions executed by the current user. Session status changes caused by unsupported driver API calling are not included. Only basic categories are provided for unrecoverable causes. If GUC parameters, SQL statements, or system functions are not supported, query the list supported by the ALT to check whether the requests called by the application are supported. For details, see section "Unplanned Application Lossless and Transparent" in *Feature Guide*. ALT support policy list description for SQL syntax and system functions.

Return type: SETOF record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sessionid	integer	Session ID.
sessionreplaystatus	text	ALT session recovery status. • **enable**: recoverable. • **disable**: unrecoverable.
xactreplaystatus	text	ALT transaction replay status. • **enable**: recoverable. • **disable**: unrecoverable.
reason	text	Description of the reason why the fault cannot be rectified.

Example:

```
gaussdb=# SELECT * FROM GS_SESSION_ALT_STATUS();
    sessionid     | sessionreplaystatus | xactreplaystatus |
reason
-----------------+---------------------+------------------
+-------------------------------------------------------------------------------------------
 140564166014720 | disable             | disable          | Session data types(valid after transaction is
finished):unsupported set from current, +
                 |                     |                  | Transaction non-replayable types:advisory lock,
(1 row)
```

7.6.29 Trigger Functions

pg_get_triggerdef(oid)

Description: Obtains the definition information of a trigger.

Parameter: OID of the trigger to be queried

Return type: text

Example:

```
-- Create the tri_insert table.
gaussdb=# CREATE TABLE tri_insert (a int, b int);
CREATE TABLE
-- Create the trigger_func function.
gaussdb=# CREATE FUNCTION trigger_func() RETURNS trigger LANGUAGE plpgsql AS '
gaussdb'# BEGIN
gaussdb'# RAISE NOTICE ''trigger_func(%) called: action = %, when = %, level = %'', TG_ARGV[0], TG_OP,
TG_WHEN, TG_LEVEL;
gaussdb'# RETURN NULL;
gaussdb'# END;';
CREATE FUNCTION
-- Create the before_ins_stmt_trig trigger.
gaussdb=# CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert
gaussdb-# FOR EACH STATEMENT EXECUTE PROCEDURE trigger_func('before_ins_stmt');
CREATE TRIGGER
-- Create the after_ins_when_trig trigger.
gaussdb=# CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert
gaussdb-# FOR EACH ROW WHEN (new.a IS NOT NULL) EXECUTE PROCEDURE
trigger_func('after_ins_when');
CREATE TRIGGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- View the trigger definition information of the tri_insert table.
gaussdb=# SELECT pg_get_triggerdef(oid) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;

pg_get_triggerdef
-------------------------------------------------------------------------------------------------------------------------------------------------------------
 CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT EXECUTE
PROCEDURE trigger_func('before_ins_stmt')
 CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN ((new.a IS NOT
NULL)) EXECUTE PROCEDURE trigger_func('after_ins_when')
(2 rows)
```

pg_get_triggerdef(oid, boolean)

Description: Obtains the definition information of a trigger.

Parameter: OID of the trigger to be queried and whether it is displayed in pretty mode

> NOTE
>
> Boolean parameters take effect only when the WHEN condition is specified during trigger creation.

Return type: text

Example:

```
-- View the trigger definition information of the tri_insert table in non-pretty mode.
gaussdb=# SELECT pg_get_triggerdef(oid, false) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;

pg_get_triggerdef
-------------------------------------------------------------------------------------------------------------------------------------------------------------
 CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT EXECUTE
PROCEDURE trigger_func('before_ins_stmt')
 CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN ((new.a IS NOT
NULL)) EXECUTE PROCEDURE trigger_func('after_ins_when')
(2 rows)

-- View the trigger definition information of the tri_insert table in pretty mode.
gaussdb=# SELECT pg_get_triggerdef(oid, true) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;
                                                pg_get_triggerdef
-------------------------------------------------------------------------------------------------------------------------------------------------------------
 CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT EXECUTE
PROCEDURE trigger_func('before_ins_stmt')
 CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN (new.a IS NOT
NULL) EXECUTE PROCEDURE trigger_func('after_ins_when')
(2 rows)
-- Clear the tri_insert table.
gaussdb=# DROP TABLE tri_insert CASCADE;
DROP TABLE
-- Clear the trigger_func function.
gaussdb=# DROP FUNCTION trigger_func;
DROP FUNCTION
```

7.6.30 Hash Functions

ora_hash(expression,[seed])

Description: Calculates the hash value of a given expression. **expression**: The value can be a character string, time, or number. The hash value is calculated based on the expression. **seed**: an int8 value that can return different results for the same

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

input value. This parameter is optional and is used to calculate the hash value with a random number.

Return type: hash value of the int8 type.

Example:

```
gaussdb=# SELECT ora_hash(123);
 ora_hash
------------
 4089882933
(1 row)
gaussdb=# SELECT ora_hash('123');
 ora_hash
------------
 2034089965
(1 row)
gaussdb=# SELECT ora_hash('sample');
 ora_hash
------------
 1573005290
(1 row)
gaussdb=# SELECT ora_hash(to_date('2012-1-2','yyyy-mm-dd'));
 ora_hash
------------
 1171473495
(1 row)
gaussdb=# SELECT ora_hash(123,234);
 ora_hash
------------
 -9089505052966355682
(1 row)
gaussdb=# SELECT ora_hash('123',234);
 ora_hash
------------
 5742589019960764616
(1 row)
gaussdb=# SELECT ora_hash('sample',234);
 ora_hash
------------
 -1747984408055821656
(1 row)
gaussdb=# SELECT ora_hash(to_date('2012-1-2','yyyy-mm-dd'),234);
 ora_hash
------------
 -3306025179710572679
(1 row)
```

NOTE

This function is valid only when **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**.

hash_array(anyarray)

Description: Hashes an array, obtains the result of an array element using the hash function, and returns the combination result.

Parameter: data of the anyarray type.

Return type: integer

Example:

```
gaussdb=# SELECT hash_array(ARRAY[[1,2,3],[1,2,3]]);
 hash_array
------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 -382888479
(1 row)
```

hash_numeric(numeric)

Description: Calculates the hash value of numeric data.

Parameter: data of the numeric type.

Return type: integer

Example:

```
gaussdb=# SELECT hash_numeric(30);
 hash_numeric
--------------
   -282860963
(1 row)
```

hash_range(anyrange)

Description: Calculates the hash value of a range.

Parameter: data of the anyrange type.

Return type: integer

Example:

```
gaussdb=# SELECT hash_range(numrange(1.1,2.2));
 hash_range
------------
  683508754
(1 row)
```

hashbpchar(character)

Description: Calculates the hash value of bpchar.

Parameter: data of the character type.

Return type: integer

Example:

```
gaussdb=# SELECT hashbpchar('hello');
 hashbpchar
-------------
 -1870292951
(1 row)
```

NOTE

If the GUC parameter **behavior_compat_options** is set to **a_hash_bpchar**, the hash value is calculated with spaces at the end of the character string retained.

hashchar(char)

Description: Converts char and Boolean data into hash values.

Parameter: data of the char or bool type.

Return type: integer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT hashbpchar('hello');
 hashbpchar
-------------
 -1870292951
(1 row)

gaussdb=# SELECT hashchar('true');
  hashchar
------------
 1686226652
(1 row)
```

NOTE

If the GUC parameter **behavior_compat_options** is set to **a_hash_bpchar**, the hash value is calculated with spaces at the end of the character string retained.

hashenum(anyenum)

Description: Converts enumerated values to hash values.

Parameter: data of the anyenum type.

Return type: integer

Example:

```
gaussdb=# CREATE TYPE b1 AS ENUM('good', 'bad', 'ugly');
CREATE TYPE
gaussdb=# call hashenum('good'::b1);
  hashenum
------------
 1821213359
(1 row)
```

hashfloat4(real)

Description: Converts float4 values to hash values.

Parameter: data of the real type.

Return type: integer

Example:

```
gaussdb=# SELECT hashfloat4(12.1234);
 hashfloat4
------------
 1398514061
(1 row)
```

hashfloat8(double precision)

Description: Converts float8 values to hash values.

Parameter: data of the double precision type.

Return type: integer

Example:

```
gaussdb=# SELECT hashfloat8(123456.1234);
 hashfloat8
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------
 1673665593
(1 row)
```

hashinet(inet)

Description: Converts inet or cidr values to hash values.

Parameter: data of the inet type.

Return type: integer

Example:

```
gaussdb=# SELECT hashinet('127.0.0.1'::inet);
  hashinet
-------------
 -1435793109
(1 row)
```

hashint1(tinyint)

Description: Converts INT1 values to hash values.

Parameter: data of the tinyint type.

Return type: uint32

Example:

```
gaussdb=# SELECT hashint1(20);
  hashint1
-------------
 -2014641093
(1 row)
```

hashint2(smallint)

Description: Converts INT2 values to hash values.

Parameter: data of the smallint type.

Return type: uint32

Example:

```
gaussdb=# SELECT hashint2(20000);
  hashint2
------------
 -863179081
(1 row)
```

7.6.31 Prompt Message Function

report_application_error()

Description: This function can be used to throw errors during PL execution.

Return type: void

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-175 report_application_error parameter description

Parameter	Type	Description	Required
log	text	Content of an error message.	Yes
code	int4	Error code corresponding to an error message. The value ranges from –20999 to –20000.	No

Example:

```
gaussdb=# CREATE OR REPLACE FUNCTION GET_RESULT_UNKNOWN(
gaussdb(#     IN context_id int, /*context_id*/
gaussdb(#     IN col_type text /*col_type*/
gaussdb(# )RETURNS INTEGER
gaussdb-# AS $$
gaussdb$# BEGIN
gaussdb$#     if col_type is NULL then
gaussdb$#         PG_CATALOG.REPORT_APPLICATION_ERROR('invalid input for the third parameter col_type
should not be null');
gaussdb$#     end if;
gaussdb$#     PG_CATALOG.REPORT_APPLICATION_ERROR('UnSupport data type for column_value(context:
'||context_id||', '||PG_CATALOG.QUOTE_LITERAL(col_type)||')');
gaussdb$#     return -1;
gaussdb$# END;
gaussdb$# $$ LANGUAGE plpgsql;
CREATE FUNCTION
gaussdb=# CALL GET_RESULT_UNKNOWN(NULL, NULL);
ERROR:  invalid input for the third parameter col_type should not be null
CONTEXT:  SQL statement "CALL pg_catalog.report_application_error('invalid input for the third parameter
col_type should not be null')"
PL/pgSQL function get_result_unknown(integer,text) line 4 at PERFORM
```

7.6.32 Global Temporary Table Functions

pg_get_gtt_relstats(relOid)

Description: Displays basic information about a global temporary table specified by the current session.

Parameter: OID of the global temporary table

Return type: record

Example:

```
gaussdb=# SELECT * FROM pg_get_gtt_relstats(74069);
 relfilenode | relpages | reltuples | relallvisible | relfrozenxid | relminmxid
-------------+----------+-----------+---------------+--------------+------------
       74069 |       58 |     13000 |             0 |        11151 |          0
(1 row)
```

pg_get_gtt_statistics(relOid, attnum, ''::text)

Description: Displays statistics about a single column in a global temporary table specified by the current session.

Parameter: OID and the **attnum** attribute of the global temporary table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: record

Example:

```
gaussdb=# SELECT * FROM  pg_get_gtt_statistics(74069,1,''::text);
 starelid | starelkind | staattnum | stainherit | stanullfrac | stawidth | stadistinct | stakind1 | stakind2 |
stakind3 | stakind4 | stakind5 | staop1 | staop2 | staop3 | staop4 | staop5 | stanumbers1 | stanumbers2 |
stanumbers3 | stanu
mbers4 | stanumbers5
|

stavalues1

                                                                | stavalues2 | stavalues3 | stavalues4 | stavalues5 |

```

pg_gtt_attached_pid(relOid)

Description: Displays PIDs and session IDs of all threads that are using the specified global temporary table. If the thread pool is enabled and the session that is using the global temporary table is in the detach state, the PID is **0** and **sessionid** indicates the session ID.

Parameter: OID of the global temporary table

Return type: record

Example:

```
gaussdb=# SELECT * FROM  pg_gtt_attached_pid(74069);
 relid |       pid       |   sessionid
-------+-----------------+-----------------
 74069 | 139648170456832 | 139648170456832
 74069 | 139648123270912 | 139648123270912
(2 rows)
```

dbe_perf.get_global_full_sql_by_timestamp(start_timestamp timestamp, end_timestamp timestamp)

Description: Obtains full SQL information at the instance level.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-176 dbe_perf.get_global_full_sql_by_timestamp parameter description

Parameter	Type	Description
start_timestamp	timestamp	Start point of the SQL start time range.
end_timestamp	timestamp	End point of the SQL start time range.

dbe_perf.get_global_slow_sql_by_timestamp(start_timestamp timestamp, end_timestamp timestamp)

Description: Obtains slow SQL information at the instance level.

Return type: record

Table 7-177 dbe_perf.get_global_slow_sql_by_timestamp parameter description

Parameter	Type	Description
start_timestamp	timestamp	Start point of the SQL start time range.
end_timestamp	timestamp	End point of the SQL start time range.

statement_detail_decode(detail text, format text, pretty bool)

Parses the details column in a full or slow SQL statement.

Table 7-178 statement_detail_decode parameter description

Parameter	Type	Description
detail	text	Set of events generated by the SQL statement (unreadable).
format	text	Parsing output format. The value is **plaintext** or **json**.
pretty	bool	Specifies whether to display the text in pretty format when **format** is set to **plaintext**. The options are as follows: • The value **true** indicates that events are separated by **\n**. • The value **false** indicates that events are separated by commas (,).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_list_gtt_relfrozenxids()

Description: Displays the frozen XID of each session.

If the value of **pid** is **0**, the earliest frozen XID of all sessions is displayed.

Parameter: none

Return type: record

Example:

```
gaussdb=# SELECT * FROM pg_list_gtt_relfrozenxids();
       pid       | relfrozenxid
-----------------+--------------
 139648123270912 |        11151
 139648170456832 |        11155
               0 |        11151
(3 rows)
```

7.6.33 Fault Injection System Function

gs_fault_inject(int64, text, text, text, text, text)

Description: This function cannot be called. WARNING information "unsupported fault injection" is reported when this function is called, which does not affect or change the database.

Parameter: fault injection of the int64 type (**0**: CLOG extended page; **1**: CLOG page reading; **2**: forcible deadlock)

- If the first input parameter of text is set to **2** and the second input parameter of text is set to **1**, the second input parameter deadlock occurs. Other input parameters are not deadlocked. When the first input parameter is **0** or **1**, the second input parameter indicates the number of the start page from which the CLOG starts to be extended or read.
- The third input parameter of text indicates the number of extended or read pages when the first input parameter is **0** or **1**.
- The fourth to sixth input parameters of text are reserved.

Return type: int64

7.6.34 AI Feature Functions

gs_index_advise(text)

Description: Recommends an index for a single query statement.

Parameter: SQL statement string

Return type: record

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Single-Query Index Recommendation" in *Feature Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hypopg_create_index(text, [text])

Description: Creates a virtual index.

Parameter: (optional) character string of the statement for creating an index, level of the created virtual index

Return type: record

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

hypopg_display_index([text])

Description: Displays information about all created virtual indexes.

Parameter: (optional) level of the virtual index to be displayed

Return type: record

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

hypopg_drop_index(oid)

Description: Deletes a specified virtual index.

Parameter: OID of the index

Return type: Boolean

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

hypopg_reset_index([text])

Description: Clears all virtual indexes.

Parameter: (optional) level of the virtual index to be cleared

Return type: none

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

hypopg_estimate_size(oid)

Description: Estimates the space required for creating a specified index.

Parameter: OID of the index

Return type: int8

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details, see section "DBMind: Autonomous Database O&M > AI Sub-functions of DBMind > Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

check_engine_status(ip text, port text)

Description: Tests whether a predictor engine provides services on a specified IP address and port number.

Parameter: IP address and port number of the predictor engine.

Return type: text

NOTE

This function is unavailable in the current version.

encode_plan_node(optname text, orientation text, strategy text, options text, dop int8, quals text, projection text)

Description: Encodes the plan operator information in the input parameters.

Parameter: plan operator information

Return type: text

NOTE

This function is an internal function. You are advised not to use it directly.

model_train_opt(template text, model text)

Description: Trains a given query performance prediction model.

Parameters: template name and model name of the performance prediction model

Return type: startup_time_accuracy FLOAT8, total_time_accuracy FLOAT8, rows_accuracy FLOAT8, peak_memory_accuracy FLOAT8

NOTE

This function is unavailable in the current version.

track_model_train_opt(ip text, port text)

Description: Returns the training log address of the predictor engine with the specified IP address and port number.

Parameter: IP address and port number of the predictor engine

Return type: text

NOTE

This function is unavailable in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

encode_feature_perf_hist(datname text)

Description: Encodes historical plan operators collected in the target database.

Parameter: database name

Return type: queryid bigint, plan_node_id int, parent_node_id int, left_child_id int, right_child_id int, encode text, startup_time bigint, total_time bigint, rows bigint, and peak_memory int

gather_encoding_info(datname text)

Description: Calls encode_feature_perf_hist to save the encoded data persistently.

Parameter: database name

Return type: int

db4ai_predict_by_bool (text, VARIADIC "any")

Description: Obtains a model whose return value is of the Boolean type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: Boolean

db4ai_predict_by_float4(text, VARIADIC "any")

Description: Obtains a model whose return value is of the float4 type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

db4ai_predict_by_float8(text, VARIADIC "any")

Description: Obtains a model whose return value is of the float8 type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

db4ai_predict_by_int32(text, VARIADIC "any")

Description: Obtains a model whose return value is of the int32 type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

db4ai_predict_by_int64(text, VARIADIC "any")

Description: Obtains a model whose return value is of the int64 type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

db4ai_predict_by_numeric(text, VARIADIC "any")

Description: Obtains a model whose return value is of the numeric type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: numeric

db4ai_predict_by_text(text, VARIADIC "any")

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

db4ai_predict_by_float8_array(text, VARIADIC "any")

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the PREDICT BY syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

gs_explain_model(text)

Description: Obtains the model whose return value is of the character type for text-based model parsing.

Parameter: model name

Return type: text

Example:

```
-- Create a data table.
gaussdb=# CREATE TABLE houses (
id INTEGER,
tax INTEGER,
bedroom INTEGER,
bath DOUBLE PRECISION,
price INTEGER,
size INTEGER,
lot INTEGER,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
mark text
);

-- Insert training data.
gaussdb=# INSERT INTO houses(id, tax, bedroom, bath, price, size, lot, mark) VALUES
(1,590,2,1,50000,770,22100,'a+'),
(2,1050,3,2,85000,1410,12000,'a+'),

gs_ai_stats_explain(text, text[])

Description: Prints the intelligent statistics of multiple columns in the corresponding table and columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: table name and column name collection.

Return type: text

gs_acm_analyze_workload_manual()

Description: Manually trains the cardinality estimation model based on the operator feedback data in the current database.

Parameter: none

Return type: text

gs_stat_get_acm_feedback_operator_info()

Description: Displays all operator feedback data collected in the global memory.

Parameter: none

Return type: record

gs_stat_get_sql_feedback_info()

Description: Displays the number of times that SQL statements are used and the execution time when SQL statements are used and not used within the effective range of the feedback cardinality function in the global memory.

Parameter: none

Return type: record

gs_costmodel_calibration_manual()

Description: Manually triggers operator time collection and corrects cost model parameters.

Parameter: none

Return type: text

gs_show_aplan(cstring)

Description: Views the multi-plan cache of queries cached in the current session.

Parameter: prepare name is used to search for the corresponding cache plan.

Return type: text

ai_watchdog_detection_warnings()

Description: Obtains the risk alarm information of the AI watchdog. The SYSADMIN or MONADMIN access permission is required.

Parameter: none

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ai_watchdog_monitor_status(int)

Description: Obtains the monitoring information of the AI watchdog. The SYSADMIN or MONADMIN access permission is required.

Parameter: Returns the upper limit of the length of the monitored sequence.

Return type: record

ai_watchdog_parameters()

Description: Obtains the internal parameters or status information of the AI watchdog. The SYSADMIN or MONADMIN access permission is required.

Parameter: none

Return type: record

7.6.35 Sensitive Data Discovery Function

gs_sensitive_data_discovery(scan_target text, scan_classifier text)

Description: Scans target data and returns statistical scanning results.

Parameters:

scan_target: specifies the object to be scanned. The value must be the name of a schema, table, or column, and the upper-level names of the object to be scanned must be specified. For example, if a column is scanned, the object to be scanned is *schema_name*.*table_name*.*column_name*.

scan_classifier: specifies the classifier to be used. Five classifiers can be specified: email, creditcard, phonenumber, chinesename, and encryptedcontent. Multiple classifiers are separated by commas (,). The value **all** indicates all classifiers are selected.

Return type: record

For details, see section "Sensitive Data Discovery" in *Feature Guide*.

gs_sensitive_data_discovery_detail(scan_target text, scan_classifier text)

Description: Scans the target data and returns the detailed scanning result.

scan_target: specifies the object to be scanned. The value must be the name of a schema, table, or column, and the upper-level names of the object to be scanned must be specified. For example, if a column is scanned, the object to be scanned is *schema_name*.*table_name*.*column_name*.

scan_classifier: specifies the classifier to be used. Five classifiers can be specified: email, creditcard, phonenumber, chinesename, and encryptedcontent. Multiple classifiers are separated by commas (,). The value **all** indicates all classifiers are selected.

Return type: record

For details, see section "Sensitive Data Discovery" in *Feature Guide*.

7.6.36 Dynamic Data Masking Functions

creditcardmasking(col text, letter char default 'x')

Description: Replaces the digits before the last four bits following the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

basicemailmasking(col text, letter char default 'x')

Description: Replaces the characters before the first at sign (@) in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

fullemailmasking(col text, letter char default 'x')

Description: Replaces the characters (except **@**) before the last period (.) in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

alldigitsmasking(col text, letter char default '0')

Description: Replaces the digits in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

shufflemasking(col text)

Description: Sorts the characters in the col string out of order.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

randommasking(col text)

Description: Randomizes the characters in the col string.

Parameter: Character string to be replaced or character string used for replacement

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: text

regexpmasking(col text, reg text, replace_text text, pos INTEGER default 0, reg_len INTEGER default -1)

Description: Replaces the col string with a regular expression.

Parameters: Character string to be replaced, regular expression, replacement start position, and replacement length.

Return type: text

7.6.37 Hierarchical Recursion Query Functions

The following functions can be used in a hierarchical recursion query statement to return information about the connection path.

sys_connect_by_path(col, separator)

Description: Returns the connection path from the root node to the current row. This function applies only to hierarchical recursion queries.

The **col** parameter indicates the name of the column displayed in the path. Only columns of the CHAR, VARCHAR, NVARCHAR2, TEXT, INT1, INT2, INT4, INT8, FLOAT4, FLOAT8, and NUMERIC type are supported. The **separator** parameter indicates the separator between path nodes. Currently, the col input of the function does not support expression input. If the column content is the same as the separator, the function can run properly and no error is reported.

Return type: text

Example:

```
-- Create a table and insert data.
gaussdb=# CREATE TABLE connect_by_table(id int,pid int,name text);
CREATE TABLE
gaussdb=# INSERT INTO connect_by_table VALUES(1,0,'a'),(2,1,'b'),(3,2,'c'),(4,1,'d');
INSERT 0 4
-- Query.
gaussdb=# SELECT *, sys_connect_by_path(name, '-') FROM connect_by_table START WITH id = 1 CONNECT
BY prior id = pid ORDER BY pid, id;
 id | pid | name | sys_connect_by_path
----+-----+------+---------------------
  1 |   0 | a    | -a
  2 |   1 | b    | -a-b
  4 |   1 | d    | -a-d
  3 |   2 | c    | -a-b-c
(4 rows)
-- Restore the environment.
gaussdb=# DROP TABLE IF EXISTS connect_by_table;
DROP TABLE
```

connect_by_root(col)

Description: Returns the value of a column in the top-most parent row of the current row. This function applies only to hierarchical recursion queries.

The **col** parameter indicates the name of an output column. Only columns of the following types are supported: INT8, INT1, INT2, OID, INT4, BOOL, CHAR, NAME, FLOAT4, FLOAT8, ABSTIME, RELTIME, DATE, CASH, TIME, TIMESTAMP,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

TIMESTAMPTZ, SMALLDATETIME, UUID, INTERVAL, TIMETZ, INT2VECTOR, CLOB, NVARCHAR2, VARCHAR, TEXT, VECTOR, BPCHAR, RAW, BYTEA, NUMERIC, XID, CID, and TID. The whitelist restriction cannot be bypassed by forcibly converting the type to the preceding types, for example, connect_by_root(col::text) (where **col** is not of the type in the whitelist) is not supported.

Return type: data type of the specified column **col**.

Example:

```
-- Create a table and insert data.
gaussdb=# CREATE TABLE connect_by_table(id int,pid int,name text);
CREATE TABLE
gaussdb=# INSERT INTO connect_by_table VALUES(1,0,'a'),(2,1,'b'),(3,2,'c'),(4,1,'d');
INSERT 0 4
-- Query.
gaussdb=# SELECT *, connect_by_root(name) FROM connect_by_table START WITH id = 1 CONNECT BY
prior id = pid ORDER BY pid, id;
 id | pid | name | connect_by_root
----+-----+------+-----------------
  1 |   0 | a    | a
  2 |   1 | b    | a
  4 |   1 | d    | a
  3 |   2 | c    | a
(4 rows)
-- Restore the environment.
gaussdb=# drop table if exists connect_by_table;
DROP TABLE
```

7.6.38 Other System Functions

Other system functions are classified into PG-compatible functions and internal functions. These functions are not recommended. Contact Huawei technical support if you need to use them.

7.6.38.1 PG-compatible Functions and Operators

The following table lists the built-in functions and operators of GaussDB that are compatible with PG.

_pg_char_max_length	_pg_char_octet_length	_pg_datetime_precision	_pg_expandarray	_pg_index_position	_pg_interval_type	_pg_numeric_precision

NOTE

In upgrade mode, system functions, for example, concat, with variable-length parameters cannot be called.

7.6.38.2 Internal Functions

The following table lists the functions used by GaussDB to implement internal system functions. You are advised not to use these functions. Contact Huawei technical support if you need to use them.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pv_compute_pool_workload()

Description: Provides the current load information of the cloud acceleration database instance. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

Return type: record

locktag_decode(locktag text)

Description: Parses lock details from **locktag**.

Return type: text

smgreq(a smgr, b smgr)

Description: Compares two smgrs to check whether they are the same.

Parameters: smgr, smgr

Return type: Boolean

smgrne(a smgr, b smgr)

Description: Checks whether the two smgrs are different.

Parameters: smgr, smgr

Return type: Boolean

xidin4

Description: Inputs a 4-byte xid.

Parameter: cstring

Return type: xid32

set_hashbucket_info

Description: Sets hash bucket information.

Parameter: text

Return type: Boolean

int1send

Description: Packs unsigned 1-byte integers into the internal data buffer stream.

Parameter: tinyint

Return type: bytea

listagg

Description: Specifies aggregate functions of the list type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: smallint, text

Return type: text

log_fdw_validator

Description: Specifies validation functions.

Parameters: text[], oid

Return type: void

nvarchar2typmodin

Description: Obtains the typmod information of the varchar type.

Parameter: cstring[]

Return type: integer

nvarchar2typmodout

Description: Obtains the typmod information of the varchar type, constructs a character string, and returns the character string.

Parameter: integer

Return type: cstring

read_disable_conn_file

Description: Reads forbidden connection files.

Parameter: nan

Return type: disconn_mode text, disconn_host text, disconn_port text, local_host text, local_port text, redo_finished text

regex_like_m

Description: Specifies the regular expression match, which is used to determine whether a character string complies with a specified regular expression.

Parameters: text, text

Return type: Boolean

update_pgjob

Description: Updates a job.

Parameters: bigint, "char", bigint, timestamp without time zone, timestamp without time zone, timestamp without time zone, timestamp without time zone, smallint, text

Return type: void

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enum_cmp

Description: Specifies the enumeration comparison function, which is used to determine whether two enumeration classes are equal and determine their relative sizes.

Parameters: anyenum, anyenum

Return type: integer

enum_eq

Description: Specifies the enumeration comparison function, which is used to implement the equal sign (=).

Parameters: anyenum, anyenum

Return type: Boolean

enum_first

Description: Returns the first element in the enumeration class.

Parameter: anyenum

Return type: anyenum

enum_ge

Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>) and equal sign (=).

Parameters: anyenum, anyenum

Return type: Boolean

enum_gt

Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).

Parameters: anyenum, anyenum

Return type: Boolean

enum_in

Description: Specifies the enumeration comparison function, which is used to determine whether an element is in an enumeration class.

Parameters: cstring, OID

Return type: anyenum

enum_larger

Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: anyenum, anyenum

Return type: anyenum

enum_last

Description: Returns the last element in the enumeration class.

Parameter: anyenum

Return type: anyenum

enum_le

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<) and equal sign (=).

Parameters: anyenum, anyenum

Return type: Boolean

enum_lt

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).

Parameters: anyenum, anyenum

Return type: Boolean

enum_smaller

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).

Parameters: anyenum, anyenum

Return type: Boolean

node_oid_name

Description: Not supported.

Parameter: oid

Return type: cstring

pg_buffercache_pages

Description: Reads status data from a shared buffer. In the multi-tenancy scenario, PDB data is returned to its own PDB, and global data is returned to a non-PDB.

Parameter: nan

Return type: SETOF record. For details about the returned columns, see **Table 7-179**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-179 Return columns

Name	Type	Description
bufferid	integer	Internal ID of the buffer.
relfilenode	oid	OID of the page ownership in the buffer.
bucketid	integer	ID of the hash bucket where the buffer is located.
storage_type	bigint	Storage type of data in the buffer.
reltablespace	oid	OID of the tablespace where the data in the buffer is located.
reldatabase	oid	OID of the database where the data in the buffer is located.
relforknumber	integer	Fork type of the relation file where the data in the buffer is located.
relblocknumber	integer	File block number of the data in the buffer in the relation file to which the data belongs.
isdirty	Boolean	Specifies whether the buffer is dirty.
isvalid	Boolean	Specifies whether the buffer is valid.
usage_count	smallint	Number of used buffers.
pinning_backends	integer	Number of backends that are using the buffer.

pg_check_xidlimit

Description: Checks whether nextxid is greater than or equal to xidwarnlimit.

Parameter: nan

Return type: Boolean

gs_static_threadpool_ctrl_status()

Description: Queries statistics about the static pool threads in the thread pool. The centralized mode does not support the query and returns an error message.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: nan

Return value: text node_name, int group_id, text worker_info For details about the returned columns, see **Table 7-180**.

Table 7-180 GS_STATIC_THREADPOOL_CTRL_STATUS columns

Name	Type	Description
node_name	OUT text	Instance name.
group_id	OUT int	Group ID of the thread pool.
worker_info	OUT text	Dynamic statistics about the running thread pool of the current group. The information includes: **default** and **default_s**: number of threads, including default value of the dynamic thread pool and that of the static thread pool. **expect** and **expect_s**: number of threads, including the expected value of the dynamic thread pool and that of the static thread pool. **actual**: actual number of running threads, including dynamic pool threads and static pool threads. **static threads limit**: indicates the number of static pool threads configured for the current group. **has static threads**: specifies whether a static pool is created for the current group. The default value is **0**, indicating no creation. **idle static threads**: number of idle static pool threads. **wait session num**: number of waiting sessions.

gs_validate_ext_listen_ip

Description: Clears services connected to invalid IP addresses on DNs.

Parameter: For details, see **Table 7-181**.

Return value: bigint pid, text node_name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-181 GS_VALIDATE_EXT_LISTEN_IP columns

Name	Type	Description
clear	IN cstring	Specifies whether to clear services connected to invalid IP addresses on DNs. When this function is queried in the current environment, only **normal** can be entered, indicating that services connected to invalid IP addresses on DNs are cleared. No value is returned.
validate_node_name	IN cstring	Specifies the name of the DN where the IP address connections to be cleared are located.
validate_ip	IN cstring	Specifies the IP address to be cleared.
pid	OUT bigint	ID of the worker thread where the IP address connections to be cleared are located.
node_name	OUT text	Name of the instance where the IP connections to be cleared are located.

gs_comm_listen_address_ext_info

Description: Displays the DFX information about the extended IP address configured for **listen_address_ext** connected to the current node.

Parameter: nan

Return type: text node_name, text app, bigint tid, integer lwtid, bigint query_id, integer socket, text remote_ip, text remote_port, text local_ip or text local_port For details about the returned columns, see **Table 7-182**.

Note: Currently, this function is not supported.

Table 7-182 GS_COMM_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	OUT text	Name of the current instance.
app	OUT text	Client connected to the DN.
tid	OUT bigint	Thread ID of the current thread.
lwtid	OUT integer	Lightweight thread ID of the current thread.
query_id	OUT bigint	Query ID of the current thread.
socket	OUT integer	Socket FD of the current physical connection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_ip	OUT text	Peer IP address of the current connection.
remote_port	OUT text	Peer port of the current connection.
local_ip	OUT text	Local IP address of the current connection.
local_port	OUT text	Local port of the current connection.

gs_libcomm_fd_info()

Description: Queries the socket persistent connection information of the libcomm communications library. This function is not supported for centralized.

Parameter: nan

Return value: See **Table 7-183**.

Table 7-183 Return values of gs_libcomm_fd_info

Name	Type	Description
node_name	OUT text	Instance name of the DN.
ip	OUT text	IP address of the DN.
ctrl_port	OUT bigint	Control channel port.
data_port	OUT bigint	Data channel port.
remote_name	OUT text	Instance name of the DN at the peer site.
remote_ip	OUT text	Peer IP address.
remote_port	OUT bigint	Peer port number.
local_ip	OUT text	Local IP address.
local_port	OUT bigint	Local port number.
fd	OUT bigint	Socket connection.
type	OUT text	Type of the TCP connection channel. The options are as follows: • **DATA_SEND_FD**: socket of the sender of the data channel • **DATA_RECV_FD**: socket of the receiver of the data channel. • **CTL_SEND_FD**: socket of the sender of the control channel. • **CTL_RECV_FD**: socket of the receiver of the control channel.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

This function can be used only on the DN. If no information is returned, the libcomm persistent connection is not established for the current DN instance.

gs_libcomm_memory_info()

Description: Queries the basic configuration information used by the internal memory of the current libcomm communications library. This function is not supported for centralized.

Parameter: nan

Return value: See **Table 7-184**.

Table 7-184 Return values of gs_libcomm_memory_info

Name	Type	Description
node_name	OUT text	Instance name of the DN.
current_used_memory	OUT bigint	Memory used by the libcomm communications library, in bytes.
current_data_item_num	OUT bigint	Number of data blocks in the libcomm lock-free queue.
init_mailbox_memory	OUT bigint	Memory used by libcomm to initialize the mailbox, in bytes.
max_datanode	OUT bigint	Maximum number of DNs supported by the libcomm communications library.
max_stream	OUT bigint	Maximum number of data streams supported by a single TCP connection of the libcomm.
max_quota_size	OUT bigint	Total buffer size of the libcomm logical connection, in bytes.
max_usable_memory	OUT bigint	Maximum memory that can be used by the libcomm communications library cache, in bytes.
max_memory_pool	OUT bigint	Total size of the memory resource pool that can be used by the libcomm communications library on each DN. The unit is byte.

gs_get_global_listen_address_ext_info

Description: Queries the global extended IP address configuration information.

Parameter: For details, see **Table 7-185**.

Return type: text node_name, text host, text port, text ext_listen_ip

Note: Currently, this function is not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-185 GS_GET_GLOBAL_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
dn_mode	IN cstring	Specifies the range of DNs to be displayed. If this parameter is set to **null**, all DNs are queried by default.
node_name	OUT text	DN name.
host	OUT text	Listening IP address of the DN.
port	OUT text	Listening port of the DN.
ext_listen_ip	OUT text	Extended listening IP address of the DN.

gs_get_listen_address_ext_info()

Description: Queries the extended IP address configuration of the current instance.

Parameter: nan

Return type: text node_name, text host, bigint port, text ext_listen_ip For details about the returned columns, see **Table 7-186**.

Note: Currently, this function is not supported.

Table 7-186 GS_GET_LISTEN_ADDRESS_EXT_INFO

Name	Type	Description
node_name	OUT text	DN name.
host	OUT text	Listening IP address of the DN.
port	OUT bigint	Listening port of the DN.
ext_listen_ip	OUT text	Extended listening IP address of the DN.

pg_comm_delay

Description: Displays the delay status of the communications library of a single DN.

Parameter: nan

Return type: text, text, integer, integer, integer, integer

pg_comm_recv_stream

Description: Displays the receiving stream status of all communication libraries on a single DN.

Parameter: nan

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint, bigint

pg_comm_send_stream

Description: Displays the sending stream status of all communication libraries on a single DN.

Parameter: nan

Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint, bigint

pg_comm_status

Description: Displays the communication status of a single DN.

Parameter: nan

Return type: text, integer, integer, bigint, bigint, bigint, bigint, bigint, integer, integer, integer, integer, integer

pg_log_comm_status

Description: Prints some logs on the DN.

Parameter: nan

Return type: Boolean

pg_parse_clog

Description: Parses Clog to obtain the XID status of an ordinary table.

Parameter: nan

Return type: xid xid, status text

pg_parse_clog(bucketid)

Description: The hash bucket table is not supported in the current version in centralized mode. An error is reported when the function is called.

pg_pool_ping

Description: Sets PoolerPing.

Parameter: Boolean

Return type: SETOF Boolean

pg_resume_bkp_flag

Description: Obtains the delay Xlog flag for backup and restoration.

Parameter: slot_name name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: start_backup_flag Boolean, to_delay Boolean, ddl_delay_recycle_ptr text, rewind_time text

pgfadvise_DONTNEED

Description: Sets the DONTNEED flag for the current relationship. This means that if you need to free some memory, the OS will first unload the pages of the file. The main idea is to unload files that are no longer in use (rather than pages that might be used).

Example:

```
cedric=# SELECT * FROM pgfadvise_dontneed('pgbench_accounts');
      relpath       | os_page_size | rel_os_pages | os_pages_free
--------------------+--------------+--------------+---------------
 base/11874/16447   |         4096 |       262144 |        342071
 base/11874/16447.1 |         4096 |        65726 |        408103
```

pgfadvise_WILLNEED

Description: Sets the WILLNEED flag for the current relationship. This means that the OS will try to load as many pages as possible for that relationship. The main idea is to preload files during server startup. During file preloading, information such as the cache hit rate, error rate, and relationships and indexes that are most likely to be used may be used.

Example:

```
cedric=# SELECT * FROM pgfadvise_willneed('pgbench_accounts');
relpath       | os_page_size | rel_os_pages | os_pages_free
--------------------+--------------+--------------+---------------
base/11874/16447   |         4096 |       262144 |         80650
base/11874/16447.1 |         4096 |        65726 |         80650
```

pgfadvise_NORMAL

Description: Sets the NORMAL flag for the current relationship.

pgfadvise_SEQUENTIAL

Description: Sets the SEQUENTIAL flag for the current relationship.

pgfadvise_RANDOM

Description: Sets the RANDOM flag for the current relationship.

pgfadvise_loader

Description: Allows direct interaction with the page cache. It may be used to load and/or unload a page from memory according to varbit representing a mapping of the page to be loaded/unloaded.

Example: The relationship name is **pgbench_accounts**, the segment number is 0, and any varbit mapping is used.

```
-- Load and unload.
cedric=# SELECT * FROM pgfadvise_loader('pgbench_accounts', 0, true, true, B'111000');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
relpath      | os_page_size | os_pages_free | pages_loaded | pages_unloaded
------------------+--------------+---------------+--------------+----------------
    base/11874/16447 |         4096 |        408376 |            3 |              3

-- Load.
cedric=# SELECT * FROM pgfadvise_loader('pgbench_accounts', 0, true, false, B'111000');
relpath      | os_page_size | os_pages_free | pages_loaded | pages_unloaded
------------------+--------------+---------------+--------------+----------------
 base/11874/16447 |         4096 |        408370 |            3 |              0

-- Unload.
cedric=# SELECT * FROM pgfadvise_loader('pgbench_accounts', 0, false, true, B'111000');
relpath      | os_page_size | os_pages_free | pages_loaded | pages_unloaded
------------------+--------------+---------------+--------------+----------------
base/11874/16447 |         4096 |        408370 |            0 |              3
```

pgfincore

Description: Provides information about the file system cache (page cache).

Example:

```
cedric=# SELECT * FROM pgfincore('pgbench_accounts');
 relpath       | segment | os_page_size | rel_os_pages | pages_mem | group_mem | os_pages_free | databit |
pages_dirty | group_dirty
-------------------+---------+--------------+--------------+-----------+-----------+---------------+---------
+-------------+-------------
base/11874/16447   |       0 |         4096 |       262144 |         3 |         1 |        408444 |         |           0
|           0
base/11874/16447.1 |       1 |         4096 |        65726 |         0 |         0 |        408444 |         |           0
|           0
```

For a specified relationship, the function returns the following columns:

- **relpath**: path of the relationship.
- **segment**: number of the segment to be analyzed.
- **os_page_size**: size of a page.
- **rel_os_pages**: total number of pages of the relationship.
- **pages_mem**: total number of pages of the relationship in the page cache (not from the PG shared buffer, but from the OS cache).
- **group_mem**: number of groups of adjacent pages_mem.
- **os_page_free**: number of idle pages in the OS page cache.
- **databit**: varbit mapping of the file. To output this column, use **pgfincore('pgbench_accounts', true)** to activate it.
- **pages_dirty**: If the HAVE_FINCORE constant is defined, the platform provides related information, which is similar to **pages_mem** except for dirty pages.
- **group_dirty**: If the HAVE_FINCORE constant is defined, the platform provides related information, which is similar to **group_mem** except for dirty pages.

pgsysconf

Description: Outputs the size of the OS block and the number of free pages in the OS page buffer.

Example:

```
cedric=# SELECT * FROM pgsysconf();
 os_page_size | os_pages_free | os_total_pages
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------------+---------------+----------------
        4096 |         80431 |        4094174
```

pgsysconf_pretty

Description: The function is similar to the preceding function. The difference is that the function converts the unit for easy reading.

Example:

```
cedric=# SELECT * FROM pgsysconf_pretty();
 os_page_size | os_pages_free | os_total_pages
--------------+---------------+----------------
 4096 bytes   | 314 MB        | 16 GB
```

pgfincore_drawer

Description: A very simple renderer. This function requires a varbit parameter. Generally, the value of this parameter comes from the **databit** return column of the **pgfincore** function. The value of the **databit** column consists of 0 and 1. If the value is **0**, it indicates that the page is not in the page cache of the OS. If the value is **1**, it indicates that the page is in the page cache of the OS.

Example:

```
cedric=# SELECT * FROM pgfincore_drawer(B'000111');
 drawer
--------------
   ...

cedric=# SELECT * FROM pgfincore_drawer(B'111000');
 drawer
--------------
   ...
```

psortoptions

Description: Returns the psort attribute.

Parameters: text[], Boolean

Return type: bytea

xideq4

Description: Compares two values of the xid type to check whether they are the same.

Parameters: xid32, xid32

Return type: Boolean

xideqint8

Description: Compares values of the xid type and int8 type to check whether they are the same.

Parameters: xid, bigint

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xidlt

Description: Returns whether xid1 < xid2 is true.

Parameters: xid, xid

Return type: Boolean

xidlt4

Description: Returns whether xid1 < xid2 is true.

Parameters: xid32, xid32

Return type: Boolean

gs_shutdown_cross_region_walsenders

Description: Interrupts cross-cluster streaming replication.

Parameter: nan

Return type: void

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate_mode** must be enabled for the O&M administrator role.

is_dblink_in_transaction

Description: Checks whether a database link corresponding to an OID is used in the current transaction.

Parameter: oid

Return type: Boolean

dblink_has_updatasent

Description: Checks whether DML statements are sent using a database link corresponding to an OID in the current transaction and are not committed.

Parameter: oid

Return type: Boolean

get_last_xmin_by_oid

Description: Obtains the maximum **xmin** value of all columns in a table based on the table OID.

Parameter: oid

Return type: xid

get_relid_by_relname

Description: Obtains the OID of a table based on the table name and relnamespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: cstring, OID

Return type: oid

copy_summary_create

Description: The summary table required by the COPY FROM error tolerance mechanism has been changed to the system catalog created during initialization. Therefore, the current function always returns **true** for compatibility.

Parameter: none

Return type: Boolean

btint12cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int1, int2

Return type: integer

btint14cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int1, int4

Return type: integer

btint18cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int1, int8

Return type: integer

btint116cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int1, int16

Return type: integer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

btint1numericcmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int1, numeric

Return type: integer

btint21cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int2, int1

Return type: integer

btint216cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int2, int16

Return type: integer

btint2numericcmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int2, numeric

Return type: integer

btint41cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int4, int1

Return type: integer

btint416cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int4, int16

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: integer

btint4numericcmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int4, numeric

Return type: integer

btint81cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int8, int1

Return type: integer

btint816cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int8, int16

Return type: integer

btint8numericcmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int8, numeric

Return type: integer

btint161cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int16, int1

Return type: integer

btint162cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int16, int2

Return type: integer

btint164cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int16, int4

Return type: integer

btint168cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int16, int8

Return type: integer

btnumericint1cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: numeric, int1

Return type: integer

btnumericint2cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: numeric, int2

Return type: integer

btnumericint4cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: numeric, int4

Return type: integer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

btnumericint8cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: numeric, int8

Return type: integer

btint16cmp()

Description: Compares the values of two parameters. If the value is greater than another one, a positive number is returned. If the value is equal to another one, **0** is returned. If the value is less than another one, a negative number is returned.

Parameters: int16, int16

Return type: integer

hashint16()

Description: Calculates the hash value of an input parameter.

Parameter: int16

Return type: integer

hashint1_numeric()

Description: Calculates the hash value of an input parameter.

Parameter: int1

Return type: integer

hashint2_numeric()

Description: Calculates the hash value of an input parameter.

Parameter: int2

Return type: integer

hashint4_numeric()

Description: Calculates the hash value of an input parameter.

Parameter: int4

Return type: integer

hashint8_numeric()

Description: Calculates the hash value of an input parameter.

Parameter: int8

Return type: integer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int12eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

Return type: Boolean

int14eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int4

Return type: Boolean

int18eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

int1numericeq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

int21eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

Return type: Boolean

int216eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int2, int16

Return type: Boolean

int2numericeq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

int41eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericeq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, numeric

Return type: Boolean

int81eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int1

Return type: Boolean

int816eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int8numericeq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int1

Return type: Boolean

int162eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int4

Return type: Boolean

int168eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

Return type: Boolean

numericint1eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: numeric, int2

Return type: Boolean

numericint4eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

numericint8eq()

Description: Compares whether two parameter values are equal. If they are equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

int12ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

Return type: Boolean

int14ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int4

Return type: Boolean

int18ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int1numericne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

int21ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

Return type: Boolean

int216ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int16

Return type: Boolean

int2numericne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

int41ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int4, numeric

Return type: Boolean

int81ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int1

Return type: Boolean

int816ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

int8numericne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int1

Return type: Boolean

int162ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int4

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int168ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

Return type: Boolean

numericint1ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int2

Return type: Boolean

numericint4ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

numericint8ne()

Description: Compares whether two parameter values are equal. If they are not equal, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

int12lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

Return type: Boolean

int14lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int1, int4

Return type: Boolean

int18lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

int1numericlt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

int21lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

Return type: Boolean

int216lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int16

Return type: Boolean

int2numericlt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int41lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericlt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, numeric

Return type: Boolean

int81lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int1

Return type: Boolean

int816lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

int8numericlt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int16, int1

Return type: Boolean

int162lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int4

Return type: Boolean

int168lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

Return type: Boolean

numericint1lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int2

Return type: Boolean

numericint4lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

numericint8lt()

Description: Compares whether a parameter is less than another one. If the parameter is less than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

int12gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

Return type: Boolean

int14gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int4

Return type: Boolean

int18gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

int1numericgt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int21gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

Return type: Boolean

int216gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int16

Return type: Boolean

int2numericgt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

int41gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericgt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, numeric

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

int81gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int1

Return type: Boolean

int816gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

int8numericgt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int1

Return type: Boolean

int162gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int16, int4

Return type: Boolean

int168gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

Return type: Boolean

numericint1gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int2

Return type: Boolean

numericint4gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

numericint8gt()

Description: Compares whether a parameter is greater than another one. If the parameter is greater than another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int12le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

Return type: Boolean

int14le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int4

Return type: Boolean

int18le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

int1numericle()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

int21le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

int216le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int16

Return type: Boolean

int2numericle()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

int41le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericle()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, numeric

Return type: Boolean

int81le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int8, int1

Return type: Boolean

int816le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

int8numericle()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int1

Return type: Boolean

int162le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int4

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int168le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

Return type: Boolean

numericint1le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int2

Return type: Boolean

numericint4le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

numericint8le()

Description: Compares whether a parameter is less than or equal to another one. If the parameter is less than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

int12ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

int14ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int4

Return type: Boolean

int18ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int8

Return type: Boolean

int116ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, int16

Return type: Boolean

int1numericge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int1, numeric

Return type: Boolean

int21ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, int1

Return type: Boolean

int216ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: int2, int16

Return type: Boolean

int2numericge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int2, numeric

Return type: Boolean

int41ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int1

Return type: Boolean

int416ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, int16

Return type: Boolean

int4numericge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int4, numeric

Return type: Boolean

int81ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int1

Return type: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

int816ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, int16

Return type: Boolean

int8numericge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int8, numeric

Return type: Boolean

int161ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int1

Return type: Boolean

int162ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int2

Return type: Boolean

int164ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int4

Return type: Boolean

int168ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: int16, int8

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: Boolean

numericint1ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int1

Return type: Boolean

numericint2ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int2

Return type: Boolean

numericint4ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int4

Return type: Boolean

numericint8ge()

Description: Compares whether a parameter is greater than or equal to another one. If the parameter is greater than or equal to another one, **true** is returned. Otherwise, **false** is returned.

Parameters: numeric, int8

Return type: Boolean

gs_relation_is_updatable()

Description: Returns whether a relationship can be inserted, updated, or deleted. If the value can be updated, **4** is returned. If the value can be inserted, **8** is returned. If the value can be deleted, **16** is returned. If the value meets the requirements, the value obtained by adding the corresponding values is returned.

Parameters: OID, Boolean

Return type: int32

gs_column_is_updatable()

Description: Returns whether a column can be updated. If the column can be updated, **t** is returned. Otherwise, **f** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: OID, int16, Boolean

Return type: Boolean

transform_dep_source()

Description: Converts the definitions of functions, stored procedures, and packages in the DBE_PLDEVELOPER.gs_source table to the gs_dep_source table.

Parameter: none

Return type: void

online_ddl_cleanup()

Description: Clears and restores a temporary tool when a fault occurs during the online DDL or online VACUUM FULL execution.

Parameters: text, text

Return type: text

Parameter	Type	Description	Value Range
relschema	text	Schema of a table.	-
relname	text	Name of a table.	-

Example:

```
-- Create a table.
gaussdb=#  CREATE TABLE t1(c1 int, c2 int);
-- Execute the online DDL.
gaussdb=# ALTER TABLE ONLINE t1 alter c2 type BIGINT;

-- Clear a fault after it occurs.
gaussdb=#  SELECT online_ddl_cleanup('public','t1');
 online_ddl_cleanup
--------------------
 cleanup success
(1 row)
```

7.6.39 Internal Functions

The following functions of GaussDB use internal data types, which cannot be directly called by users:

Selectivity calculation functions

areajoinsel	areasel	arraycontjoinsel	arraycontsel	contjoinsel	contsel	eqjoinsel
eqsel	iclikejoinsel	iclikesel	icnlikejoinsel	icnlikesel	icregexeqjoinsel	icregexeqsel

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

icregexnejoinsel	icregexnesel	likejoinsel	likesel	neqjoinsel	neqsel	nlikejoinsel

Auxiliary functions for the primary DN to remotely read the data page from the standby DN.

gs_read_block_from_remote is used to read pages of a non-segment-page table file. By default, only the initial user can view the data. Other users can use the data only after being granted permissions.

gs_read_segment_block_from_remote is used to read pages of a segment-page table file. By default, only the initial user can view the data. Other users can use the data only after being granted permissions.

Auxiliary functions for the primary DN to remotely read data files from the standby DN.

gs_read_file_from_remote is used to read a specified file. gs_repair_file uses this function to read the remote file segment by segment after using the gs_read_file_size_from_remote function to obtain the file size. By default, only the initial user can view the data. Other users can use the data only after being granted permissions.

gs_read_file_size_from_remote is used to read the size of a specified file. Before using the gs_repair_file function to repair a file, you need to obtain the size of the file from the remote end to verify the missing file information and repair the missing files one by one. By default, only the initial user can view the data. Other users can use the data only after being granted permissions.

Auxiliary functions for incrementally rebuilding other standby or cascaded standby DNs using the standby DN.

gs_standby_incremental_filemap_create is used to create a temporary filemap file for incremental rebuilding on the standby DN. The filemap file is used to store the path and size of the data to be transferred during the incremental rebuilding. This API can be called only when the initial user is used and **application** is **gs_rewind**.

gs_standby_incremental_filemap_insert is used to insert file information into a specified temporary filemap file. The file information includes the file path, transfer start point, length of data to be transferred at a time, and rebuild flag bit. This API can be called only when the initial user is used and **application** is **gs_rewind**.

gs_standby_incremental_filemap_execute is used to obtain file information stored in a specified temporary filemap file and delete the specified filemap file for data

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

transmission during incremental standby DN rebuilding. This API can be called only when the initial user is used and **application** is **gs_rewind**.

gs_txn_snapshot system catalog maintenance function

gs_insert_delete_txn_snapshot is used to maintain the gs_txn_snapshot system catalog of each node in distributed GTM-Lite mode. Only system administrators can call gs_insert_delete_txn_snapshot. In the current version, if this function is called, **f** is returned.

XMLType function

isschemavalid

7.6.40 Global SysCache Functions

gs_gsc_table_detail(database_id default NULL, rel_id default NULL)

Description: Queries the table metadata in the global system cache in a database. The user who calls this function must have the **SYSADMIN** permission. In the multi-tenancy scenario, data of a PDB can be viewed in its own PDB, and data of a non-PDB can be viewed in its own non-PDB.

Parameter: Specifies the database and table whose global system cache is to be queried. The default value of **database_id** is **NULL** or **–1**, indicating all databases. The value **0** indicates a shared table. Other values indicate the specified database and shared table. **rel_id** indicates the OID of the specified table. The default value **NULL** or **–1** indicates all tables. Other values indicate the specified table. If **database_id** does not exist, an error is reported. If **rel_id** does not exist, a null result is returned.

Return type: tuple

Example:

```
SELECT * FROM gs_gsc_table_detail(-1) limit 1;
database_oid | database_name | reloid |          relname          | relnamespace | reltype | reloftype | relowner |
relam | relfilenode | reltablespace | relhasindex | relisshared | relkind | relnatts | relhasoids | relhaspkey |
parttype | tdhasuids | attnames  | extinfo
--------------+---------------+--------+---------------------------+--------------+---------+-----------+----------+-------
+-------------+---------------+-------------+-------------+---------+----------+------------+------------+----------
+-----------+-----------+---------
0 |               |   2676 | pg_authid_rolname_index |          11 |       0 |         0 |       10 |   403 |           0 |
1664 | f          | t           | i       |         1 | f           | f           | n        | f         | 'rolname' |
(1 row)
```

gs_gsc_catalog_detail(database_id default NULL, rel_id default NULL)

Description: Queries the system catalog row information in the global system cache in a database. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the database and table whose global system cache is to be queried. The default value of **database_id** is **NULL** or **–1**, indicating all databases. The value **0** indicates a shared table. Other values indicate the specified database and shared table. **rel_id** indicates the ID of the specified table, including all system

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

catalogs that have system caches. The default value **NULL** or **–1** indicates all tables. Other values indicate the specified table. If the database does not exist, an error is reported. If the table does not exist, a null result is returned. In the multi-tenancy scenario, data of a PDB can be viewed in its own PDB, and data of a non-PDB can be viewed in its own non-PDB.

Return type: tuple

Example:

```
-- Obtain the OID of a specific database through pg_database, for example, running SELECT oid, * FROM pg_database;.
-- In the returned tuple, find the value of the OID column based on the datname column, and then run the following query command. In the example, the obtained OID is 16574.
gaussdb=# SELECT * FROM gs_gsc_catalog_detail(16574, 1260);
 database_id | database_name | rel_id | rel_name  | cache_id |  self  |  ctid  | infomask | infomask2 | hash_value | refcount
-------------+---------------+--------+-----------+----------+--------+--------+----------+-----------+------------+----------
           0 |               |   1260 | pg_authid |       10 | (0, 9) | (0, 9) |    10507 |        26 |  531311568 |       10
           0 |               |   1260 | pg_authid |       11 | (0, 4) | (0, 4) |     2313 |        26 |  365368336 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 9) | (0, 9) |    10507 |        26 | 3911517328 |       10
           0 |               |   1260 | pg_authid |       11 | (0, 7) | (0, 7) |     2313 |        26 | 1317799983 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 5) | (0, 5) |     2313 |        26 | 3664347448 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 1) | (0, 1) |     2313 |        26 |  276477273 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 3) | (0, 3) |     2313 |        26 | 2465837659 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 8) | (0, 8) |     2313 |        26 | 3205288035 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 6) | (0, 6) |     2313 |        26 |  131811687 |        1
           0 |               |   1260 | pg_authid |       11 | (0, 2) | (0, 2) |     2313 |        26 | 1226484587 |        1
(10 rows)
```

gs_gsc_clean(database_id default NULL)

Description: Clears the global system cache. Note that data in use will not be cleared. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the database whose global system cache needs to be cleared. The default value **NULL** or value **–1** indicates that the global system cache of all databases is forcibly cleared. The value **0** indicates that the global system cache of only the shared table is cleared. Other values indicate that the global system cache of a specified database and a specified shared table is cleared. If **database_id** does not exist, an error is reported. Only the data of the local PDB can be cleared in the PDB, and only the data of the non-PDB can be cleared in the non-PDB.

Return type: Boolean

Example:

```
gaussdb=# SELECT * FROM gs_gsc_clean();
gs_gsc_clean
--------------
t
(1 row)
```

gs_gsc_dbstat_info(database_id default NULL)

Description: Obtains GSC memory statistics on the local node, including cache query, hit, loading, expiration, and occupied space information of tuples, relations, and partitions, database-level eviction information, thread reference information, and memory usage information. This function can be used to locate performance problems. For example, if the value of the hits or searches array is far less than 1,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the value of **global_syscache_threshold** may be too small. As a result, the query hit ratio decreases. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the global system cache statistics of the database to be queried. Value **NULL** or **–1** indicates that all databases are queried. Value **0** indicates that only the shared table is queried. Other values indicate that a specified database and a specified shared table are queried. If an invalid value is entered, an error is reported, indicating that **database_id** does not exist.

In the multi-tenancy scenario, data of a PDB can be viewed in its own PDB, and data of a non-PDB can be viewed in its own non-PDB.

Return type: tuple

Example:

```
gaussdb=# SELECT * FROM gs_gsc_dbstat_info();
database_id | database_name | tup_searches | tup_hits | tup_miss | tup_count | tup_dead | tup_memory |
rel_searches | rel_hits | rel_mis
s | rel_count | rel_dead | rel_memory | part_searches | part_hits | part_miss | part_count | part_dead |
part_memory | total_memory | swa
pout_count | refcount
-------------+---------------+--------------+----------+----------+-----------+----------+------------+--------------
+----------+--------
--+-----------+----------+------------+---------------+-----------+-----------+------------+-----------+-------------
+--------------+----
-----------+----------
          0 |               |          300 |      235 |       31 |        22 |        2 |       9752 |          598 |      108 |       1
8 |        18 |        0 |     77720 |            0 |         0 |         0 |         0 |         0 |          0 |       752912 |
         0 |         0
      16574 | testdb      |         3368 |     2289 |      329 |       273 |        0 |      92593 |         1113 |      524
|       4
8 |        48 |        0 |    340456 |            0 |         0 |         0 |         0 |         0 |          0 |      4124792 |
         0 |        10
(2 rows)
```

7.6.41 Data Damage Detection and Repair Functions

The restrictions for repairing files or pages of the primary and standby nodes are as follows.

File Type	File/ Page	Primary/ Standby	Detection and Repair
Ordinary row-store tables (including Astore and Ustore) and segment-page tables (excluding indexes and compressed tables)	File and page	Primary	Manual detection and repair.
Undo files (excluding undo meta)	Page	Primary	Manual detection and repair (excluding analyse verify).
init fork file for unlogged tables	File	Primary	Manual detection and repair.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Ordinary row-store tables (Astore and Ustore), ILM compressed tables, segment-page tables, hash bucket tables, indexes (B-tree and UB-tree), and undo files (excluding undo meta. Undo files support only CRC errors verification.)	Page	Stand by	Automatic detection and repair during replay.

CAUTION

The main standby node and cascaded standby node of the standby cluster can be repaired.

A critical section is used in the database to ensure the consistency of access to key resources. Errors cannot be thrown in the critical section. If a damaged page is accessed in the critical area, PANIC is triggered. Repair detection and automatic repair are not supported. Typical operations that access the critical area during execution include database write operations such as INSERT, DELETE, UPDATE, and DROP.

gs_verify_data_file(verify_segment bool)

Description: Checks whether files in the current database of the current instance are lost. The verification only checks whether intermediate segments are lost in the main file of the data table. The default value is **false**, indicating that the segment-page table data file is not verified. If this parameter is set to **true**, only segment-page table files are verified. By default, only the initial user, users with the SYSADMIN attribute, and users with the OPRADMIN attribute in the O&M mode can view the information. Other users can view the information only after being granted permissions.

The returned result is as follows:

- Non-segment-page table: **rel_oid** and **rel_name** indicate the table OID and table name of the corresponding file, and **miss_file_path** indicates the relative path of the lost file.
- Segment-page table: All tables are stored in the same file. Therefore, **rel_oid** and **rel_name** cannot display information about a specific table. For a segment-page table, if the first file is damaged, the subsequent files such as .1 and .2 are not checked. For example, if 3, 3.1, and 3.2 are damaged, only 3 damage can be detected. When the number of segment-page files is less than 5, the files that are not generated are also detected during function detection. For example, if there are only files 1 and 2, files 3, 4, and 5 are detected during segment-page file detection. In the following examples, the first is an example of checking a non-segment-page table, and the second is an example of checking a segment-page table.

Parameter description:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- verify_segment

  Specifies the range of files to be checked. **false** indicates that non-segment-page tables are checked. **true** indicates that segment-page tables are checked.

  The value can be **true** or **false** (default value).

Return type: record

Example (The abnormal line is displayed only when an exception is detected. Otherwise, no line is displayed.):

Verify a non-segment-page table.

```
gaussdb=# SELECT * FROM gs_verify_data_file();
node_name         | rel_oid |  rel_name    |  miss_file_path
------------------+---------+--------------+------------------
dn_6001_6002_6003 |   16554 |     test     | base/16552/24745
```

Verify a segment-page table.

```
gaussdb=# SELECT * FROM gs_verify_data_file(true);
     node_name      | rel_oid | rel_name | miss_file_path
--------------------+---------+----------+----------------
 dn_6001_6002_6003 |       0 | none     | base/16573/2
```

gs_repair_file(tableoid Oid, path text, timeout int)

Description: Repairs the file based on the input parameters. Only the primary DN with normal primary/standby connection is supported. Only the main file of the data table can be repaired. The parameters are set based on the OID and path returned by the gs_verify_data_file function. The value of table OID for a segment-page table ranges from 0 to 4294967295. (The internal verification determines whether a file is a segment-page table file based on the file path. The table OID is not used for a segment-page table file.) If the repair is successful, **true** is returned. If the repair fails, the failure cause is displayed. By default, only the initial user, users with the SYSADMIN permission, and users with the OPRADMIN permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted permissions.

CAUTION

1. If a file on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal.
2. If a file exists but its size is 0, the file will not be repaired. To repair the file, you need to delete the file whose size is 0 and then repair it.
3. You can delete a file only after the file descriptor is automatically closed. You can manually restart the process or perform a primary/standby switchover.

Parameter description:

- tableoid

  OID of the table corresponding to the file to be repaired. Set this parameter based on the **rel_oid** column in the list returned by the **gs_verify_data_file** function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- path

  Path of the file to be repaired. Set this parameter based on the **miss_file_path** column in the list returned by the **gs_verify_data_file** function.

  Value range: a string.

- timeout

  Specifies the duration for waiting for the standby DN to replay. The repair file needs to wait for the standby DN to be put back to the corresponding location on the current primary DN. Set this parameter based on the replay duration of the standby DN.

  Value range: 60s to 3600s.

Return type: Boolean

Example (Set **tableoid** and **path** based on the output of gs_verify_data_file):

Page-based storage:

```
gaussdb=# SELECT * FROM gs_repair_file(16554,'base/16552/24745',360);
gs_repair_file
----------------
t
```

Segment-page storage:

```
gaussdb=# SELECT * FROM gs_repair_file(16554,'base/16573/2',360);
gs_repair_file
----------------
t
```

local_bad_block_info()

Description: Displays the page damage of the instance. You can read the page from the disk and record the page CRC failure. By default, only the initial user, users with the SYSADMIN attribute, users with the MONADMIN attribute, users with the OPRADMIN attribute in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted permissions. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

In the preceding information, **file_path** indicates the relative path of the damaged file. Segment-page mode is supported. **block_num** indicates the number of the page where the file is damaged. The page number starts from 0. **check_time** indicates the time when the page damage is detected. **repair_time** indicates the time when the page is repaired.

Return type: record

Example (Related entries are displayed only when there are damaged records. Otherwise, no log is displayed.):

```
gaussdb=# SELECT * FROM local_bad_block_info();
node_name    | spc_node | db_node | rel_node| bucket_node | fork_num | block_num |    file_path     |
check_time            |   repair_time
-----------------+-------+--------+--------+--------------+----------+-----------+-----------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
+-------------------------+-------------------------------
dn_6001_6002_6003|  1663 |  16552 |  24745 |       -1    |    0    | 0       | base/16552/24745 | 2022-01-13
20:19:08.385004+08 | 2022-01-13 20:19:08.407314+08
```

local_clear_bad_block_info()

Description: Deletes data of repaired pages from **local_bad_block_info**, that is, information whose **repair_time** is not empty. By default, only the initial user, users with the SYSADMIN attribute, users with the OPRADMIN attribute in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted permissions. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Return type: Boolean

Example:

```
gaussdb=# SELECT * FROM local_clear_bad_block_info();
result
--------
t
```

gs_inconsistency_info(reset bool)

Description: Displays or resets data inconsistency information in the database. If the input parameter **reset** is set to **true**, data inconsistency information is reset. If the input parameter **reset** is set to **false**, data inconsistency information is displayed. By default, only the initial user, users with the SYSADMIN attribute, users with the MONADMIN attribute, users with the OPRADMIN attribute in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted permissions. **inconsistency_type** indicates the inconsistency type, **node_name** indicates the node name, **spc_node** indicates the tablespace ID, **db_node** indicates the database node ID, **rel_node** indicates the table ID, **bucket_node** indicates the hash bucket ID, **backend** indicates the temporary table ID, **index_oid** indicates the index OID, **tuple_blkno** indicates the page number of the heap table where the tuple is located, **tuple_offset** indicates the offset of the heap table page where the tuple is located, **count** indicates the number of times the inconsistency information occurs, and **last_update_time** indicates the last time when the inconsistent information is updated.

Return type: record

When the input parameter **reset** is set to **false** and inconsistency information is detected, related items are displayed. In other cases, no line is displayed. Example:

```
gaussdb=# SELECT * FROM gs_inconsistency_info(false);
 inconsistency_type  | node_name | spc_node | db_node | rel_node | bucket_node | backend | index_oid |
tuple_blkno | tuple_offset | count |       last_update_time
--------------------+-----------+----------+---------+----------+-------------+---------+-----------+-------------
+--------------+-------+-------------------------------
 INCONSISTENCY_INDEX | sgnode    |     1663 |   12902 |    16722 |          -1 |      -1 |     16728 |           0
|            1 |     1 | 2024-11-20 16:18:56.85289-05
```

gs_verify_and_tryrepair_page (path text, blocknum oid, verify_mem bool, is_segment bool)

Description: Verifies the page specified by the instance. By default, only the initial user, users with the SYSADMIN attribute, and users with the OPRADMIN attribute

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in O&M mode on the primary DN can view the table. Other users can view the table only after being granted permissions.

In the command output, **disk_page_res** indicates the verification result of the page on the disk, **mem_page_res** indicates the verification result of the page in the memory, and **is_repair** specifies whether the repair function is triggered during the verification. **t** indicates that the page is repaired, and **f** indicates that the page is not repaired. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

NOTE

- If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables cannot be repaired.
- The repair triggered by this function can only repair pages in the memory. The repair takes effect only after the memory pages are flushed to disks and the physical pages are repaired.

Parameter description:

- path

  Path of the damaged file. Set this parameter based on the **file_path** column in the **local_bad_block_info** file. To verify the undo pages of the Ustore table, enter the path of the undo pages to be verified.

  Value range: a string.

- blocknum

  Page number of the damaged file. Set this parameter based on the **block_num** column in the **local_bad_block_info** file. If you want to verify the undo pages of the Ustore table, enter the block number of the undo pages to be verified.

  Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- verify_mem

  Specifies whether to verify a specified page in the memory. If this parameter is set to **false**, only pages on the disk are verified. If this parameter is set to **true**, pages in the memory and on the disk are verified. If a page on the disk is damaged, the system verifies the basic information of the page in the memory and flushes the page to the disk to restore the page. If a page is not found in the memory during memory page verification, the page on the disk is read through the memory API. During this process, if the disk page is faulty, the remote read automatic repair function is triggered.

  Value range: The value is of the Boolean type and can be **true** or **false**.

- is_segment

  Determines whether the table is a segment-page table. Set this parameter based on the value of **bucket_node** in the **local_bad_block_info** file. If the value of **bucket_node** is **–1**, the table is not a segment-page table. In this case, set **is_segment** to **false**. If the value of **bucket_node** is not –1, set **is_segment** to **true**. Segment-page storage is supported.

  Value range: The value is of the Boolean type and can be **true** or **false**.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples (Transfer parameters based on the output of local_bad_block_info. Otherwise, an error is reported.):

Page-based storage:

```
gaussdb=# SELECT * FROM gs_verify_and_tryrepair_page('base/16552/24745',0,false,false);
node_name         |       path       |  blocknum  |         disk_page_res         | mem_page_res | is_repair
------------------+------------------+------------+-------------------------------+--------------+----------
dn_6001_6002_6003 | base/16552/24745 |     0      | page verification succeeded.|              | f
```

Segment-page storage:

```
gaussdb=# SELECT * FROM gs_verify_and_tryrepair_page('base/14365/1',4494,false,true);
node_name         |     path     | blocknum |         disk_page_res         | mem_page_res | is_repair
------------------+--------------+----------+-------------------------------+--------------+-----------
dn_6001_6002_6003 | base/14365/1 |     4494 | page verification succeeded. |              | f
```

gs_repair_page(path text, blocknum oid, is_segment bool, timeout int)

Description: Restores the specified page of the instance. This function can be used only by the primary DN that is properly connected to the primary and standby DNs. If the page is successfully restored, **true** is returned. If an error occurs during the restoration, an error message is displayed. By default, only the initial user, users with the SYSADMIN attribute, and users with the OPRADMIN attribute in O&M mode on the primary DN can view the table. Other users can view the table only after being granted permissions.

Note: If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables or compressed tables cannot be repaired.

Parameter description:

- path

  Path of the damaged page. Set this parameter based on the **file_path** column in **local_bad_block_info** or the **path** column in the **gs_verify_and_tryrepair_page** function.

  Value range: a string.

- blocknum

  Number of the damaged page. Set this parameter based on the **block_num** column in **local_bad_block_info** or the **blocknum** column in the **gs_verify_and_tryrepair_page** function.

  Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- is_segment

  Determines whether the table is a segment-page table. The value of this parameter is determined by the value of **bucket_node** in **local_bad_block_info**. If the value of **bucket_node** is **–1**, the table is not a segment-page table and **is_segment** is set to **false**. If the value of **bucket_node** is not –1, **is_segment** is set to true. Segment-page storage is supported.

  Value range: The value is of the Boolean type and can be **true** or **false**.

- timeout

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Duration of waiting for standby DN replay. The page to be repaired needs to wait for the standby DN to be played back to the location of the current primary DN. Set this parameter based on the replay duration of the standby DN.

Value range: 60s to 3600s.

Return type: Boolean

Examples (Transfer parameters based on the output of local_bad_block_info. Otherwise, an error is reported.):

Page-based storage:

```
gaussdb=# SELECT * FROM gs_repair_page('base/16552/24745',0,false,60);
result
--------
t
```

Segment-page storage:

```
gaussdb=# SELECT * FROM gs_repair_page('base/16552/1',4494,true,60);
result
--------
t
```

gs_seg_verify_datafile(IN tablespace_name name, IN database_name name, IN file_id integer, IN bucketnode integer, IN start_block_id bigint default 0, IN end_block_id bigint default UINT32MAX)

1. Description

   Description: Verifies segment-page files 1 to 5, checks whether the main fork has page damage, and records the verification result in the local_bad_block_info() function.

   Permission: Only users with the SYSADMIN attribute and users with the OPRADMIN attribute in O&M mode can execute this function.

2. Parameter description:

Name	Type	Description
tablespace_name	name	Tablespace name.
database_name	name	Database name.
file_id	integer	File name. Value range: an int4 value in the range [1,5].
bucketnode	integer	Bucket node of the table. • **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. Currently, only hash bucket tables and segment-page ordinary tables are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_block_id	bigint	Start value of the verification page range. The default value is **0**.
end_block_id	bigint	End value of the verification page range. The default value is **4294967295**.

3. Return value: None

Example:

```
gaussdb=# SELECT * FROM gs_seg_verify_datafile('seg_tblspc', 'postgres', 2, 1024);
WARNING:  page verification failed, calculated checksum 60994 but expected 11565, the block num is 4157
 gs_seg_verify_datafile
------------------------

(1 row)
```

gs_edit_page_bypath(path text, blocknum int64, offset int, data text, data_size int, read_backup bool, storage_type text)

Description: Transfers the path, block number, offset, target data to be changed, and length of the target table file, changes the target data to the corresponding fields on the page, and returns the path of the modified file to be flushed to the disk. The **read_backup** column determines the file reading mode, and the **storage_type** column indicates the file storage mode (for example, segment-page storage). To prevent incorrect modification, this function does not directly change the original page but changes the copied page and flushes the changed page to the specified path. Only the SYSADMIN or OPRADMIN in O&M mode can execute this function.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-187 gs_edit_page_bypath parameters

Category	Parameter	Type	Description
Input parameter	path	text	Physical file path of the file to be modified, which is related to the **read_backup** field. The value can be the relative path of the file in the database directory or the absolute path of files such as the backup file. If the target file does not exist or fails to be read, an error message is displayed. ● If **read_backup** is **false**, the path format is *tablespace name*/*database oid*/*table relfilenode* (*physical file name*). For example, **base/16603/16394**. ● If **read_backup** is **true**, **path** is a valid path. In this case, because other information about the input file cannot be obtained, you need to ensure that the input data is correct. In page-based mode, only U-page and UB-tree data pages can be edited and modified. In segment-page mode, Astore data pages can be edited and modified. Tables with tablespaces are not supported. Other information about the input file cannot be obtained. Therefore, you need to ensure that the input data type is correct.
Input parameter	blocknum	bigint	Block number of the page to be repaired. Value range: 0 to *MaxBlockNumber*. Reads the page corresponding to the specified physical or logical block number based on the **read_backup** field. If the specified block number is out of range, an error message is returned.
Input parameter	offset	int	In-page offset of the field to be modified. Value range: 0 ≤ **offset** < *BLCKSZ*. If the specified value is less than **0** or greater than or equal to that of **BLCKSZ**, the system view is used to return the corresponding error information.
Input parameter	data	text	Type of the target value to be modified. Type: ● **'0x'**: hexadecimal. ● **'0b'**: binary. ● **'0s'**: character string. Others: If the value of the **data** parameter is not one of the preceding types, the value can only be a decimal numeric string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	data_size	int	Length of the written data, in bytes. Value range: 1 to 8. If the specified write length is less than 1 byte or greater than 8 bytes, or the sum of offset and data_size is greater than the value of **BLCKSZ**, the system view is used to return the corresponding error information.
Input parameter	read_backup	bool	Specifies whether to read pages from the backup directory. If this parameter is set to **false**, the target page is read based on the logical block number. Otherwise, the page is read based on the physical block number.
Input parameter	storage_type	text	Specifies the file storage mode. This parameter is optional. ● **'page'**: page mode. ● **'segment'**: segment-page mode.
Output parameter	output_msg	text	If the modification is successful, the absolute path of the modified file is returned. The modified file is stored in the **gs_log/dump** directory. If the modification fails, a failure message is returned.

In the example, transfer parameters based on the parameter description and use the actual physical path.

Example 1: Overwrite the data whose value is **0X1FFF** at the offset of 16 bytes on page 0 in the **base/15808/25075** table.

```
gaussdb=# SELECT gs_edit_page_bypath('base/15808/25075',0,16,'0x1FFF', 2, false, 'page');
                      gs_edit_page_bypath
-----------------------------------------------------------------------
/gs_log_dir/dump/1663_15808_25075_0.editpage

(1 rows)
```

Example 2: If the input parameter does not comply with the specifications, an error message is returned.

```
gaussdb=# SELECT gs_edit_page_bypath('base/15808/25075', 0,16,'@1231!', 8, false, 'page');
          gs_edit_page_bypath
-------------------------------------------
 Error: the parameter 'data' decode failed.
(1 row)
```

Example 3: When the data to be written is the same as the original value, an alarm is returned.

```
gaussdb=# SELECT gs_edit_page_bypath('/gs_log_dir/dump/1663_15808_25075_0.editpage', 0,16,'0x1FFF', 2,
true, 'page');
                  gs_edit_page_bypath
-------------------------------------------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 Warning: source buffer is consistent with target buffer.
(1 row)
```

gs_repair_page_bypath(src_path text, src_blkno int64, dest_path text, dest_blkno int64, storage_type text)

Description: Transfers the path and page number of the source file, and writes the page to the specified page number of the target file. You can repair pages of the standby node through the primary node or repair the pages of the primary node through the standby node. In addition, you can initialize bad blocks in this view.

1. Target pages are overwritten and synchronized to the standby node. In page storage mode, U-heap and UB-tree pages can be modified. The Undo Record page, Undo Slot page, compressed table, and Astore page will be supported later. In segment-page storage mode, Astore pages and hash bucket tables can be modified. System catalog files and data sections cannot be modified.
2. With this function, you can overwrite target pages during the write operation. Before overwriting, the target page is backed up and flushed to a specified directory. The backup page can be rewritten back to the target page. If an ordinary table is modified on the primary node, a new WAL is generated and synchronized to the standby node. If an ordinary table is modified on the standby node, no WAL is recorded.
3. The repair view applies to the primary node or the standby node when the read on standby function is enabled. Only the SYSADMIN or OPRADMIN in O&M mode can use this function. All modifications will be recorded in database logs. In addition, you are advised to enable the audit logging function of system functions before using this function to record audit information.
4. When the repair view is called on the standby node, the standby node can be repaired only by reading pages from the primary node.
5. The LSNs of the source and target pages must be the same. Otherwise, the repair fails.
6. The target page is verified. If the target page is correct, it cannot be overwritten. Currently, the U-heap and UB-tree pages can be verified.

Return type: text

⚠ CAUTION

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	src_path	text	Path of the source file. The following types of paths are supported: • Data files and index files: **gs_log/dump/1663_15808_25075_0.editpage**. • **src_path** is set to **'standby'** on the primary node. That is, pages are read from the standby node to repair the primary node. • **src_path** is set to **'primary'** on the standby node. That is, pages are read from the primary node to repair the standby node. On the standby node, **src_path** can only be set to **'primary'** and the read on standby function must be enabled before the repair. • **src_path** is set to **init_block** on the primary node to allow skipping bad blocks in extreme scenarios.
Input parameter	src_blkno	bigint	Physical block number of the source page. Value range: 0 to *MaxBlockNumber*.
Input parameter	dest_path	text	Relative path of the target file. For example, **base/15808/25075**.
Input parameter	dest_blkno	bigint	Logical block number of the target page. Value range: 0 to *MaxBlockNumber*.
Input parameter	storage_type	text	Specifies the target file storage mode. This parameter is optional. • **'page'**: page mode. • **'segment'**: segment-page mode.
Output parameter	output_msg	text	If the overwrite operation is successful, the backup path of the target page is returned. If the overwrite operation fails, an error message is returned. The format of the flushed file name is *relfilepath_blocknum_timestamp.repairpage*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Transfer parameters based on the preceding table and ensure that the physical file exists. If the input parameter is abnormal or the restoration fails, an error is reported.

Example 1: Enter a file in a specified path to overwrite the target file.

```
gaussdb=# SELECT * FROM gs_repair_page_bypath('gs_log/dump/1663_15991_16767_0.editpage', 0, 'base/
15991/16767', 0, 'page');
                                        output_msg
-------------------------------------------------------------------------------------------------
 /gs_log_dir/dump/1663_15991_16767_0_738039702421788.repairpage
(1 row)
```

Example 2: Read pages from the standby node to repair the primary node.

```
gaussdb=# SELECT * FROM gs_repair_page_bypath('standby', 0, 'base/15990/16768', 0, 'page');
                                        output_msg
-------------------------------------------------------------------------------------------------
/gs_log_dir/dump/1663_15990_16768_0_738040397197907.repairpage
(1 row)
```

Example 3: Read pages from the primary node to repair the standby node.

```
gaussdb=# SELECT * FROM gs_repair_page_bypath('primary', 0, 'base/15990/16768', 0, 'page');
                                        output_msg
-------------------------------------------------------------------------------------------------
 /gs_log_dir/dump/1663_15990_16768_0_738040506157799.repairpage
(1 row)
```

Example 4: Initialize the target page and skip bad blocks.

```
gaussdb=# SELECT * FROM gs_repair_page_bypath('init_block', 0, 'base/15990/16768', 0, 'page');
                                        output_msg
-------------------------------------------------------------------------------------------------
/gs_log/dump/1663_15990_16768_0_738040768010281.repairpage
(1 row)
```

gs_repair_undo_byzone(zone_id int)

Description: Transfers the ID of the undo zone to be repaired, repairs the metadata of the target undo zone, and returns the repair result details. If the undo zone is not repaired, no information is output.

Return type: record

Note: Currently, the function can be called only on the primary node. After the repair is successful, the repair will be synchronized to the standby node by recording Xlogs. The caller must be a SYSADMIN or an OPRADMIN in O&M mode. You are advised to enable the audit logging function before using the function to record audit information.

CAUTION

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-188 gs_repair_undo_byzone parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID. • **–1**: repairs the metadata of all undo zones. • **0** to **1048575**: repairs the metadata of the undo zone corresponding to the zone ID.
Output parameter	zone_id	int	Undo zone ID.
Output parameter	repair_detail	text	Repair result of the undo zone metadata corresponding to the zone ID. If the repair is successful, "rebuild undo meta succeed." is displayed. If the repair fails, "rebuild undo meta failed." as well as the failure cause is displayed.

Example 1: If the undo zone meta information corresponding to the entered **zone_id** is not damaged, no output is expected.

```
gaussdb=# SELECT * FROM gs_repair_undo_byzone(4);
 zone_id | repair_detail
---------+---------------
(0 rows)
```

Example 2: If the undo zone metadata corresponding to the entered **zone_id** is successfully restored, the system displays a message indicating that the restoration is successful.

```
gaussdb=# SELECT * FROM gs_repair_undo_byzone(78);
 zone_id | repair_detail
---------+---------------
      78 | rebuild undo meta succeed.
(1 row)
```

Example 3: If the undo zone metadata corresponding to the entered zone ID fails to be repaired, the detailed information about the repair failure is displayed.

```
gaussdb=# SELECT * FROM gs_repair_undo_byzone(0);
 zone_id | repair_detail
---------+---------------
       0 | rebuild undo meta failed. try lock undo zone_id failed.
(1 row)
```

NOTE

If the undo zone to be repaired is damaged and the zone ID is occupied by another active thread, the active thread that occupies the zone ID automatically ends when the repair function is called to forcibly repair the damaged undo zone metadata.

gs_verify_urq(index_oid oid, partindex_oid oid, blocknum bigint, queue_type text)

Description: Verifies the correctness of the index recycling queue (potential queue/available queue/single page).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: For details, see **Table 7-189**.

Return type: record

Table 7-189 gs_verify_urq parameters

Category	Parameter	Type	Description
Input parameter	index_oid	oid	UB-tree index OID. • Ordinary index: index OID. • Global index: GPI OID. • Local index: OID of the primary index.
Input parameter	partindex_oid	oid	UB-tree partitioned index OID. • Ordinary index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary).
Input parameter	blocknum	bigint	Specifies the page number: • If the queue type is single page, the correctness of all tuples of **blocknum** on a single page is verified. The value range is [0,*Queue file size*/8192). • If the queue is empty or free, **blocknum** is an invalid value.
Input parameter	queue_type	text	Specifies the queue type: • **empty queue**: potential queue • **free queue**: available queue • **single page**: single-page queue
Output parameter	error_code	text	Error code
Output parameter	detail	text	Detailed error information and other key information.

When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

Example 1:

```
gaussdb=# SELECT * FROM gs_verify_urq(16387, 0, 1, 'free queue');
 error_code | detail
------------+--------
(0 rows)
```

Example 2:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM gs_verify_urq(16387, 0, 1, 'empty queue');
      error_code       |
detail
----------------------
+-----------------------------------------------------------------------------------------------------------
 VERIFY_URQ_PAGE_ERROR | invalid urq meta: oid 16387, blkno 1, head_blkno = 1, tail_blkno = 3,
nblocks_upper = 4294967295, nblocks_lower = 1; urq_blocks = 6, index_blocks = 12
(1 row)
```

NOTE

Currently, this API supports only Ustore index tables. If the verification of the index recycling queue is normal, the view does not display the error code and error details. Otherwise, the view displays the error code and error details. The error codes include "VERIFY_URQ_PAGE_ERROR", "VERIFY_URQ_LINK_ERROR", "VERIFY_URQ_HEAD_MISSED_ERROR", and "VERIFY_URQ_TAIL_MISSED_ERROR". Contact Huawei technical support if any of the preceding error codes is displayed.

gs_urq_dump_stat(index_oid oid, partindex_oid oid)

Description: Queries information about a specified index recycling queue.

In the return result, **recentGlobalDataXmin** and **globalFrozenXid** are two oldestxmins used by the recycling queue to determine whether the index page can be recycled, **next_xid** is the XID of the next latest transaction, **urq_blocks** indicates the total number of pages in the recycling queue and information about valid pages in the free queue (available queue) and empty queue (potential queue). For PCR indexes, the output recentGlobalDataXmin is replaced by globalRecycleXid that affects the recycling of the PCR index pages.

Parameters: For details, see **Table 7-190**.

Table 7-190 gs_urq_dump_stat parameters

Category	Parameter	Type	Description
Input parameter	index_oid	oid	UB-tree index OID. • Ordinary index: index OID. • Global index: GPI OID. • Local index: OID of the primary index.
Input parameter	partindex_oid	oid	UB-tree partitioned index OID. • Ordinary index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary).
Output parameter	result	text	Detailed statistics about the index recycling queue.

When using the example, transfer parameters based on the parameter description and use the actual OID. Otherwise, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example (RCR):

```
gaussdb=# SELECT * FROM gs_urq_dump_stat(16387, 0);
                                                
```

Category	Parameter	Type	Description
Input parameter	partindex_oid	oid	UB-tree partitioned index OID. • Ordinary index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary).
Output parameter	result	text	If the repair is successful, "reinitial the recycle queue of index relation successfully" is displayed. Otherwise, the repair fails.

When using the example, transfer parameters based on the parameter description and use the actual OID. Otherwise, an error is reported.

Example:

```
gaussdb=# SELECT * FROM gs_repair_urq(16387, 0);
                              result
-------------------------------------------------------------
 reinitial the recycle queue of index relation successfully.
(1 row)
```

NOTE

Currently, this API supports only Ustore index tables.

gs_check_table(table_oid oid, partition_oid oid, index_oid oid, partindex_oid oid, start_blk bigint, end_blk bigint, duration text, need_repair bool, mode text)

Description: Verifies reverse data consistency between heap tables and indexes.

Constraints: The Astore and Ustore are supported. MOT storage engines are not supported. The verification of standby nodes is supported, but the verification of the logger node is not supported. The verification of common row-store tables, ILM compressed tables, and hash bucket tables is supported by heap tables. The verification of temporary tables, global temporary tables, and unlogged tables is not supported by heap tables. Indexes support B-tree and UB-tree index verification and are compatible with segment-page storage.

Parameters: For details, see **Table gs_check_table parameters**.

Return type: record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-192 gs_check_table parameters

Category	Parameter	Type	Description
Input parameter	table_oid	oid	Heap table OID. • Ordinary table: heap table OID. • Partitioned table: main table OID.
Input parameter	partition_oid	oid	Partition OID. • Ordinary table: **0**. • Partitioned table: partition OID. • All partitions scanned in the partitioned table: **0**.
Input parameter	index_oid	oid	Index OID. • Ordinary index: index OID. • Global index: GPI OID. • Local index: OID of the primary index. • All scanned indexes: **0**.
Input parameter	partindex_oid	oid	Partitioned index OID. • Ordinary index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary). • Local index of all scanned partitions: **0**.
Input parameter	start_blk	bigint	Number of the verification start page. If it and **end_blk** are set to **–1**, the verification starts from the beginning by default. When all partitions in a partitioned table are scanned, only the verification from the beginning is supported. The values of **start_blk** and **end_blk** must be **–1**.
Input parameter	end_blk	bigint	Number of the verification end page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	duration	text	Verification duration. The value can be in millisecond, second, minute, hour, or day, for example, **500ms**, **60s**, **10min**, **2h**, or **1d**. The maximum value is **24h**. There may be a millisecond-level, seconds-level, or minute-level error. If this parameter is set to **0**, the verification is complete by default. The verification duration is the minimum value of the actual execution time and the configured time. If the execution time exceeds the configured time, the verification stops and the current verification position is recorded. The next scanning can be resumed from the recorded position.
Input parameter	need_repair	bool	Specifies whether to automatically repair inconsistency. That is, add or delete index tuples based on heap tables. Currently, this parameter can only be set to **false**. This parameter is a pre-embedded parameter. This version does not support automatic repair.
Input parameter	mode	text	Pre-embedded parameter of the validation mode. The value can be **increment** or **full**. Resumable verification, increment verification, and full verification are supported.
Output parameter	error_code	int	Error code.
Output parameter	output_filepath	text	Relative path for flushing parsed data to disks. The path is the **gs_log/dump** dictionary. The flushed file name is **dbverify**_*error code_heap table OID*_**timestamp.log**. Example: /$GAUSSLOG/gs_log/dump/dbverify_0_16384_123456.log

When using the example, transfer parameters based on the parameter description and use the actual and matching OID and **blocknum**. Otherwise, an error is reported.

Example 1:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# select * from gs_check_table((select oid from pg_class where relname='t2'),0,0,0,-1,-1, '1h', false,
'full');
 verify_code |                              output_filepath
-------------+-------------------------------------------------------------------------------------
           0 | /$GAUSSLOG/gs_log/dump/dbverify_0_17279_766073191583799.log
(1 row)
```

Example 2:

```
gaussdb=# select * from gs_check_table((select oid from pg_class where relname='t1'),0,(select oid from
pg_class where relname='index_t1'),0,2,10, '2s', false, 'full');
 verify_code |                              output_filepath
-------------+-------------------------------------------------------------------------------------
           0 | /$GAUSSLOG/gs_log/dump/dbverify_0_17168_766073338594117.log
(1 row)
```

NOTE

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

Currently, this API supports consistency check between Astore and Ustore tables and between B-tree and UB-tree indexes. If no consistency problem is found after the verification, the error code is **0**. Contact Huawei technical support if an error code other than **0** is displayed.

Resumable verification and increment verification:

The information related to resumable verification and incremental verification is not persisted. After the database process is restarted, the previous verification is lost. When the verification is performed again, the full verification is performed from the beginning.

If the verification mode is **increment** and the last verification on the table and index is not complete, resumable verification is triggered and the verification starts from the position where the last verification is interrupted.

If the verification mode is **increment** and the last verification on the table and index is complete, increment verification is triggered to verify the incremental modification page.

If the verification mode is **full**, full verification is performed from the beginning.

I/O flow control:

By default, **io_priority** is set to a low priority for I/O flow control.

Use permission:

Only the initial user, users with the SYSADMIN, OPRADMIN, or MONADMIN permission can execute verification system functions. Only data tables or indexes in the current database can be verified.

Recommended application scenario:

You are advised to perform the verification during off-peak hours to ensure that most data is static data during the verification and ensure the integrity and accuracy of the verification.

gs_check_index(index_oid oid, partindex_oid oid, duration text, need_repair bool, mode text)

Description: Verifies forward data consistency between heap tables and indexes.

Constraints: The Astore and Ustore are supported. MOT storage engines are not supported. The verification of standby nodes is supported, but the verification of the logger node is not supported. The verification of common row-store tables, ILM compressed tables, and hash bucket tables is supported by heap tables. The verification of temporary tables, global temporary tables, and unlogged tables is not supported by heap tables. Indexes support B-tree and UB-tree index verification and are compatible with segment-page storage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters: For details, see **Table gs_check_index parameters**.

Return type: record

Table 7-193 gs_check_index parameters

Category	Parameter	Type	Description
Input parameter	index_oid	oid	Index OID. • Ordinary index: index OID. • Global index: GPI OID. • Local index: OID of the primary index.
Input parameter	partindex_oid	oid	Partitioned index OID. • Ordinary index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary). • Local index of all scanned partitions: **0**.
Input parameter	duration	text	Verification duration. The value can be in millisecond, second, minute, hour, or day, for example, **500ms**, **60s**, **10min**, **2h**, or **1d**. The maximum value is **24h**. There may be a millisecond-level, seconds-level, or minute-level error. If this parameter is set to **0**, the verification is complete by default. The verification duration is the minimum value of the actual execution time and the configured time. If the execution time exceeds the configured time, the verification stops and the current verification position is recorded. The next scanning can be resumed from the recorded position.
Input parameter	need_repair	bool	Specifies whether to automatically repair inconsistency. That is, add or delete index tuples based on heap tables. Currently, this parameter can only be set to **false**. This parameter is a pre-embedded parameter. This version does not support automatic repair.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Type	Description
Input parameter	mode	text	Pre-embedded parameter of the validation mode. The value can be **increment** or **full**. Resumable verification, increment verification, and full verification are supported.
Output parameter	error_code	int	Error code.
Output parameter	output_filepath	text	Relative path for flushing parsed data to disks. The path is the **gs_log/dump** dictionary. The flushed file name is **dbverify**_*error code_heap table OID*_**timestamp.log**. Example: /$GAUSSLOG/gs_log/dump/dbverify_0_16384_123456.log

When using the example, transfer parameters based on the parameter description and use the actual and matching OID. Otherwise, an error is reported.

Example 1:

```
gaussdb=# select * from gs_check_index((select oid from pg_class where relname='index_t1'),0, '1h', false, 'full');
 verify_code |                                output_filepath
-------------+-----------------------------------------------------------------------------------------
           0 | /$GAUSSLOG/gs_log/dump/dbverify_0_17302_766074761373434.log
(1 row)
```

Example 2:

```
gaussdb=# select * from gs_check_index((select oid from pg_class where relname='index_range_2'),(select oid from pg_partition where parentid=(select oid from pg_class where relname='index_range_2')and relname='p1_a_idx'), '10s', false, 'full');
 verify_code |                                output_filepath
-------------+-----------------------------------------------------------------------------------------
           0 | /$GAUSSLOG/gs_log/dump/dbverify_0_17306_766074834795344.log
(1 row)
```

NOTE

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

Currently, this API supports consistency check between Astore and Ustore tables and between B-tree and UB-tree indexes. If no consistency problem is found after the verification, the error code is **0**. Contact Huawei technical support if an error code other than **0** is displayed.

Resumable verification and increment verification:

The information related to resumable verification and incremental verification is not persisted. After the database process is restarted, the previous verification is lost. When the verification is performed again, the full verification is performed from the beginning.

If the verification mode is **increment** and the last verification on the table and index is not complete, resumable verification is triggered and the verification starts from the position where the last verification is interrupted.

If the verification mode is **increment** and the last verification on the table and index is complete, increment verification is triggered to verify the incremental modification page.

If the verification mode is **full**, full verification is performed from the beginning.

I/O flow control:

By default, **io_priority** is set to a low priority for I/O flow control.

Use permission:

Only the initial user, users with the SYSADMIN, OPRADMIN, or MONADMIN permission can execute verification system functions. Only data tables or indexes in the current database can be verified.

Recommended application scenario:

You are advised to perform the verification during off-peak hours to ensure that most data is static data during the verification and ensure the integrity and accuracy of the verification.

gs_get_standby_bad_block_info()

Description: Displays the pages that have been detected on the standby node but have not been repaired. By default, only the initial user, users with the SYSADMIN permission, users with the OPRADMIN permission in the O&M mode, and users with the MONADMIN permission on the standby DN can view the information. Other users can view the information only after being granted permissions. There are four return values in the **invalid_type** column: **NOT_PRESENT** (the page does not exist), **NOT_INITIALIZED** (the page initialization fails), **LSN_CHECK_ERROR** (the LSN check fails), and **CRC_CHECK_ERROR** (the CRC check fails).

Return type: record

Example (If no page is detected but not repaired, no line is displayed.)

```
gaussdb=# SELECT * FROM gs_get_standby_bad_block_info();
 spc_node | db_node | rel_node | bucket_node | fork_num | block_num |  invalid_type   | master_page_lsn
----------+---------+----------+-------------+----------+-----------+-----------------+-----------------
   1663   |   16552 |   24745  |      -1     |    0     |     0     | CRC_CHECK_ERROR | 0/B2009E8
(1 rows)
```

7.6.42 Functions of the XML Type

The following functions are inherited from open source PostgreSQL 9.2.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In all the following XML functions, when the GUC parameter **xmloption** is set to **content**, the value of **encoding** in the XML declaration can be **ZHS16GBK**. When the GUC parameter **xmloption** is set to **document**, the value of **encoding** in the XML declaration cannot be **ZHS16GBK**. If **encoding** is set to **ZHS16GBK**, an error is reported.

xmlparse ({ DOCUMENT | CONTENT } value [wellformed])

Description: Generates XML values from character data.

Parameter: data of the TEXT type

Return type: XML

Example:

```
gaussdb=# SELECT XMLPARSE (DOCUMENT '<?xml version="1.0"?><book><title>Manual</
title><chapter>...</chapter></book>');
                  xmlparse
-----------------------------------------------------------
 <book><title>Manual</title><chapter>...</chapter></book>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo><bar>foo</bar>');
         xmlparse
---------------------------------
 abc<foo>bar</foo><bar>foo</bar>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo' wellformed);
    xmlparse
-----------------
 abc<foo>bar</foo
(1 row)
```

xmlserialize({ DOCUMENT | CONTENT } value AS type)

Description: Generates a string from an XML file.

Parameter: The type can be character, character varying, text, or any variant of them.

Return type: XML

Example:

```
gaussdb=# SELECT XMLSERIALIZE(CONTENT 'good' AS CHAR(10));
 xmlserialize
--------------
 good
(1 row)
gaussdb=# SELECT xmlserialize(DOCUMENT '<head>bad</head>' as text);
  xmlserialize
-----------------
 <head>bad</head>
(1 row)
```

NOTE

If a string value is converted to XML without using the xmlparse or xmlserialize function, the **XML OPTION** session parameter determines the value, **DOCUMENT** or **CONTENT**. The **XML OPTION** session parameter can be set by the standard command.

```
SET XML OPTION { DOCUMENT | CONTENT };
```

Or use similar syntax to set this parameter.

```
SET xmloption TO { DOCUMENT | CONTENT };
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xmlcomment(text)

Description: Creates an XML value that contains an XML comment with the specified text as the content. The text does not contain the "--" character and does not end with a "-" character. Besides, the text should meet the format requirements of XML comments. If the parameter is empty, the result is also empty.

Parameter: data of the TEXT type

Return type: XML

Example:

```
gaussdb=# SELECT xmlcomment('hello');
  xmlcomment
--------------
 <!--hello-->
```

xmlconcat(xml[, ...])

Description: Concatenates a list of single XML values into a single value that contains an XML content fragment. Null values are ignored, and the result is null only when all parameters are null. In A-compatible mode, you can set **a_format_version** to **10c** and **a_format_dev_version** to **s2** to check whether the input segment is well-formed XML text.

Parameter: data of the XML type

Return type: XML

Note: Example 2 is a syntax example compatible with the A database.

Example 1:

```
gaussdb=# set xmloption=content;
SET
gaussdb=# select XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?><bar>foo</
bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>')) ;
                          xmlconcat
----------------------------------------------------------------------
<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)
gaussdb=# select XMLCONCAT('abc>');
 xmlconcat
-----------
 abc>
(1 row)
```

Example 2:

```
gaussdb=# SET a_format_version='10c';
SET
gaussdb=# SET a_format_dev_version=s2;
SET
gaussdb=# SET xmloption=content;
SET
gaussdb=# SELECT XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?><bar>foo</
bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>')) ;
                          xmlconcat
----------------------------------------------------------------------
<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)
gaussdb=# SELECT XMLCONCAT('abc>');
ERROR:  invalid XML document
DETAIL:  line 1: Start tag expected, '<' not found
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
abc>
^
CONTEXT:  referenced column: xmlconcat
```

NOTE

In A-compatible database, if **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, and the **encoding** attribute in the XML declaration is set to **ZHS16GBK**, the XMLCONCAT function reports an error.

xmlelement([ENTITYESCAPING | NOENTITYESCAPING] { [NAME] element_name | EVALNAME element_name } [, xmlattributes([ENTITYESCAPING | NOENTITYESCAPING] value [[AS] attname | AS EVALNAME attname] [, ...])] [, content [[AS] alias] [, ...]])

Description: Generates an XML element with the given name, attribute, and content.

Return type: XML

Example:

```
gaussdb=# SELECT xmlelement(name foo);
 xmlelement
------------
 <foo/>

In A-compatible mode:
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version=s2;
SET
1. If the keyword ENTITYESCAPING is not set in XMLElement by default or is set, the reserved characters in the content of XMLElement are escaped.
gaussdb=# SELECT xmlelement("entityescaping<>", 'a$><&"b');
                      xmlelement
-----------------------------------------------------------------
 <entityescaping<>>a$&gt;&lt;&amp;&quot;b</entityescaping<>>
(1 row)

gaussdb=# SELECT xmlelement(entityescaping "entityescaping<>", 'a$><&"b');
                      xmlelement
-----------------------------------------------------------------
 <entityescaping<>>a$&gt;&lt;&amp;&quot;b</entityescaping<>>
(1 row)

2. When the keyword NOENTITYESCAPING is set in XMLElement, the reserved characters in the content of XMLElement will not be escaped.
gaussdb=# SELECT xmlelement(noentityescaping "entityescaping<>", 'a$><&"b');
                xmlelement
-------------------------------------------
 <entityescaping<>>a$><&"b</entityescaping<>>
(1 row)

3. When [AS] alias is used to declare an alias for the content in XMLElement, the content value type must be XML.
gaussdb=# SELECT xmlelement("entityescaping<>", '<abc/>' b);
ERROR:  argument of XMLELEMENT must be type xml, not type unknown
LINE 1: SELECT xmlelement("entityescaping<>", '<abc/>' b);
                                              ^
CONTEXT:  referenced column: xmlelement

gaussdb=# SELECT xmlelement("entityescaping<>", '<abc/>' as b);
ERROR:  argument of XMLELEMENT must be type xml, not type unknown
LINE 1: SELECT xmlelement("entityescaping<>", '<abc/>' as b);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                                    ^
CONTEXT:  referenced column: xmlelement

gaussdb=# SELECT xmlelement("entityescaping<>", xml('<abc/>') b);
               xmlelement
-----------------------------------------
 <entityescaping<>><abc/></entityescaping<>>
(1 row)

gaussdb=# SELECT xmlelement("entityescaping<>", xml('<abc/>') as b);
               xmlelement
-----------------------------------------
 <entityescaping<>><abc/></entityescaping<>>
(1 row)

4. If the keyword ENTITYESCAPING is not set in XMLAttributes by default or is set, the reserved characters in XMLAttributes are escaped.
gaussdb=# SELECT xmlelement("entityescaping<>", xmlattributes('entityescaping<>' "entityescaping<>"));
                       xmlelement
-------------------------------------------------------------
 <entityescaping<> entityescaping<>="entityescaping&lt;&gt;"/>
(1 row)

gaussdb=# SELECT xmlelement(name "entityescaping<>", xmlattributes(entityescaping 'entityescaping<>' "entityescaping<>"));
                       xmlelement
-------------------------------------------------------------
 <entityescaping<> entityescaping<>="entityescaping&lt;&gt;"/>
(1 row)

5. When the NOENTITYESCAPING keyword is set in XMLAttributes, the reserved characters in XMLAttributes will not be escaped.
gaussdb=# SELECT xmlelement("entityescaping<>", xmlattributes(noentityescaping 'entityescaping<>' "entityescaping<>"));
                      xmlelement
-----------------------------------------------------------
 <entityescaping<> entityescaping<>="entityescaping<>"/>
(1 row)
```

NOTE

- For **xmlelement** and **xmlattributes**, when the value of **name** is **NULL**, the database behavior is different from that of the A database. When the **name** field of **xmlelement** is set to **NULL**, the name information is empty and the attribute information is not displayed. When the **name** field of **xmlattributes** is set to **NULL**, the attribute information is not displayed.
- After the following two parameters are set, the content escape rule of **xmlelement** is A-compatible. If the two parameters are not set, the content escape rule of **xmlelement** is PG-compatible.

  ```
  set a_format_version='10c';
  set a_format_dev_version=s2;
  ```

xmlforest(content [AS name] [, ...])

Description: Generates an XML sequence of elements using the given name and content.

Return type: XML

Example:

```
gaussdb=# SELECT xmlforest('abc' AS foo, 123 AS bar);
        xmlforest
------------------------------
 <foo>abc</foo><bar>123</bar>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xmlpi(name target [, content])

Description: Creates an XML processing instruction. If the content is not empty, the content cannot contain character collations.

Return type: XML

Example:

```
gaussdb=# SELECT xmlpi(name php, 'echo "hello world";');
           xmlpi
-----------------------------
 <?php echo "hello world";?>
```

xmlroot(xml, version text | no value [, standalone yes|no|no value])

Description: Modifies the attributes of the root node of an XML value. If a version is specified, it replaces the value in the version declaration of the root node. If a standalone property is specified, it replaces the value of standalone declaration in the root node.

Example:

```
gaussdb=# SELECT xmlroot('<?xml version="1.1"?><content>abc</content>',version '1.0', standalone yes);
                        xmlroot
---------------------------------------------------------------
 <?xml version="1.0" standalone="yes"?><content>abc</content>
(1 row)
```

xmlagg(xml [order_by_clause])

Description: Aggregates the input values called by the aggregate function and supports cross-row concatenation. For details about order_by_clause, see **SELECT**. In A-compatible mode, you can set **a_format_version** to **10c** and **a_format_dev_version** to **s2**. The **xmloption** parameter of the database is set to **content** by default. When **xmloption** is set to **document**, linefeed characters are used to concatenate multiple XML lines. If the encoding attribute value in the XML declaration is not the default UTF-8, the aggregation result contains the XML declaration.

Parameter: XML

Return type: XML

Note: Example 2 is a syntax example compatible with the A database.

Example 1:

```
gaussdb=# CREATE TABLE xmltest (
           id int,
           data xml
          );
gaussdb=# INSERT INTO xmltest VALUES (1, '<value>one</value>');
INSERT 0 1
gaussdb=# INSERT INTO xmltest VALUES (2, '<value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmlagg(data) FROM xmltest;
               xmlagg
--------------------------------------
 <value>one</value><value>two</value>
(1 row)
```

Example 2:

```
gaussdb=# set xmloption=document;
SET
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT xmlagg(data) FROM xmltest;
      xmlagg
-------------------
 <value>one</value>+
 <value>two</value>
(1 row)
gaussdb=# DELETE FROM XMLTEST;
DELETE 2
gaussdb=# INSERT INTO xmltest VALUES (1, '<?xml version="1.0" encoding="GBK"?><value>one</value>');
INSERT 0 1
gaussdb=# INSERT INTO xmltest VALUES (2, '<?xml version="1.0" encoding="GBK"?><value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmlagg(data) FROM xmltest;
                      xmlagg
-----------------------------------------------------------
 <?xml version="1.0" encoding="GBK"?><value>one</value>+
 <value>two</value>
(1 row)
gaussdb=# SELECT xmlagg(data order by id desc) FROM xmltest;
                      xmlagg
-----------------------------------------------------------
 <?xml version="1.0" encoding="GBK"?><value>two</value>+
 <value>one</value>
(1 row)

gaussdb=# DROP TABLE xmltest;
```

xmlexists(text passing [BY REF] xml [BY REF])

Description: Evaluates an XPath 1.0 expression (the first parameter) with the passed XML value as its context item. If the evaluation result generates an empty set of nodes, the function returns **false**. If any other value is generated, the function returns **true**. If the value of any parameter is null, the function returns **Null**. The non-null value passed as a context item must be an XML document, not a content fragment or any non-XML value.

Parameter: XML

Return type: Boolean.

Example:

```
gaussdb=# SELECT xmlexists('//town[text() = ''Toronto'']' PASSING BY REF '<towns><town>Toronto</
town><town>Ottawa</town></towns>');
 xmlexists
------------
 t
(1 row)
```

xml_is_well_formed(text)

Description: Checks whether the text is in the correct XML format and returns a Boolean value.

Parameter: text

Return type: Boolean.

Example:

```
gaussdb=# SELECT xml_is_well_formed('<>');
 xml_is_well_formed
--------------------
 f
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xml_is_well_formed_document(text)

Description: Checks whether the text is a well-formed XML document and returns a Boolean value.

Parameter: text

Return type: Boolean.

Example:

```
gaussdb=# SELECT xml_is_well_formed_document('<pg:foo xmlns:pg="http://postgresql.org/stuff">bar</
pg:foo>');
 xml_is_well_formed_document
-----------------------------
 t
(1 row)
```

xml_is_well_formed_content(text)

Description: Checks whether the text is well-formed XML content and returns a Boolean value.

Parameter: text

Return type: Boolean.

Example:

```
gaussdb=# select xml_is_well_formed_content('k');
 xml_is_well_formed_content
----------------------------
 t
(1 row)
```

xpath(xpath, xml [, nsarray])

Description: Calculates an XPath 1.0 expression, for example, xpath (a text value), on XML data. It returns an array of XML values corresponding to the node set generated by the XPath expression. If the XPath expression returns a scalar value rather than a node set, a single-element array is returned.

The second parameter must be a well formed XML document. Note that it must have a single root node element.

The optional third parameter of the function is an array of namespace mappings. This array should be a two-dimensional text array with the length of the second axis being equal to 2 (that is, it should be an array of arrays, each of which consists of exactly 2 elements). The first element of each array entry is the namespace name (alias), and the second element is the namespace URI. It is not required that aliases provided in this array be the same as those being used in the XML document itself (in other words, both in the XML document and in the XPath function context, aliases are local).

Return type: XML

Example:

```
gaussdb=# SELECT xpath('/my:a/text()', '<my:a xmlns:my="http://example.com">test</
my:a>',ARRAY[ARRAY['my', 'http://example.com']]);
 xpath
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 {test}
(1 row)
```

xpath_exists(xpath, xml [, nsarray])

Description: This function is a special form of the xpath function. It returns a Boolean indicating whether the query is satisfied or not (specifically, whether it produces any value other than an empty node set), instead of returning the individual XML values that satisfy the XPath 1.0 expression. This function is equivalent to the standard XMLEXISTS predicate, but it also provides support for a namespace mapping parameter.

Return type: Boolean.

Example:

```
gaussdb=# SELECT xpath_exists('/my:a/text()', '<my:a xmlns:my="http://example.com">test</
my:a>',ARRAY[ARRAY['my', 'http://example.com']]);
 xpath_exists
--------------
 t
(1 row)
```

NOTE

The following XML function examples show the data you need to prepare:

```
gaussdb=# CREATE SCHEMA testxmlschema;
CREATE SCHEMA
gaussdb=# CREATE TABLE testxmlschema.test1 (a int, b text);
CREATE TABLE
gaussdb=# INSERT INTO testxmlschema.test1 VALUES (1, 'one'), (2, 'two'), (-1, null);
INSERT 0 3
gaussdb=# CREATE DATABASE test;
CREATE DATABASE

-- After the example is executed, run the following commands to delete the preceding data:
gaussdb=# DROP DATABASE test;
DROP DATABASE
gaussdb=# DROP TABLE testxmlschema.test1;
DROP TABLE
gaussdb=# DROP SCHEMA testxmlschema;
DROP SCHEMA
```

query_to_xml(query text, nulls boolean, tableforest boolean, targetns text)

Description: This function maps the contents of a query to an XML schema document.

Return type: XML

Example:

```
gaussdb=# SELECT query_to_xml('SELECT * FROM testxmlschema.test1', false, false, '');
                        query_to_xml
-------------------------------------------------------------
 <table xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">+

query_to_xmlschema(query text, nulls boolean, tableforest boolean, targetns text)

Description: This function maps the contents of a query to an XML document and an XML schema document, and joins the two documents together.

Return type: XML

Example:

```
gaussdb=# SELECT query_to_xmlschema('SELECT * FROM testxmlschema.test1', false, false, '');
                              query_to_xmlschema
-------------------------------------------------------------------------------------------------
 <xsd:schema                                                                              +
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">                                          +

table_to_xmlschema(tbl regclass, nulls boolean, tableforest boolean, targetns text)

Description: This function maps the contents of a relational table to an XML schema document.

Return type: XML

Example:

```
gaussdb=# SELECT table_to_xmlschema('testxmlschema.test1', false, false, '');
                                        table_to_xmlschema
-----------------------------------------------------------------------------------------------------------------------
 <xsd:schema                                                                                                  +
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">                                                                +
                                                                                                               +

  <a>-1</a>                                                           +
</row>                                                               +
                                                                   +
</test1>                                                             +

(1 row)
```

NOTE

- For XPath-related functions, only XPath() and XPath_exists() are supported. These functions use the XPath language to query XML files and depend on the Libxml2 library, which is provided only in XPath1.0. Therefore, only XPath 1.0 is supported.
- The XQuery, XML extension, and XSLT functions are not supported.

getclobval(xml)

Description: Converts an XML type to a CLOB type. This function is valid only when parameters **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s4**.

Parameter: The input parameter is of the XML type.

Return type: CLOB

Example:

```
gaussdb=# SET a_format_version='10c';
SET
gaussdb=# SET a_format_dev_version='s4';
SET
gaussdb=# DECLARE
 xmldata xml;
 result clob;
BEGIN
 xmldata := '<a>123</a>';
 result := getclobval(xmldata);
 RAISE NOTICE 'result is : %',result;
END;
/
NOTICE:  result is : <a>123</a>
gaussdb=# SELECT getclobval(xmlparse(document '<a>123</a>'));
 getclobval
------------
 <a>123</a>
(1 row)
```

getstringval(xml)

Description: Converts an XML type to a string. This function is valid only when parameters **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s4**.

Parameter: The input parameter is of the XML type.

Return type: VARCHAR2

Example:

```
gaussdb=# SET a_format_version='10c';
SET
gaussdb=# SET a_format_dev_version='s4';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
SET
gaussdb=# DECLARE
 xmldata xml;
 result varchar2;
BEGIN
 xmldata := '<a>123<b>456</b></a>';
 result := getstringval(xmldata);
 RAISE NOTICE 'result is : %',result;
END;
/
NOTICE:  result is : <a>123<b>456</b></a>
gaussdb=# SELECT getstringval(xmlparse(document '<a>123<b>456</b></a>'));
    getstringval
----------------------
 <a>123<b>456</b></a>
(1 row)
```

xmlsequence(xml)

Description: Converts an XML parameter into an array of the XMLTYPE type. Each array element is an XMLTYPE object. The input parameter of this function cannot be null and must be a valid XML document. If the input parameter does not meet the requirements, the function returns a null value or throws an exception. This function can be used to process multiple child nodes in an XML document or split an XML document into multiple fragments.

Parameter: XML type.

Return type: Array of the XMLType type.

Example 1: If you want to convert this document into an array containing three elements, each of which is a book node, use the following statement:

```
gaussdb=# SELECT xmlsequence(xml('<books><book><title>The Catcher in the Rye</title><author>J.D.
Salinger</author><year>1951</year></book><book><title>1984</title><author>George Orwell</
author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>'));
                        xmlsequence
------------------------------------------------------------
 {"<books>                                          +
    <book>                                         +
      <title>The Catcher in the Rye</title>           +
      <author>J.D. Salinger</author>                 +
      <year>1951</year>                                +
    </book>                                        +
    <book>                                         +
      <title>1984</title>                             +
      <author>George Orwell</author>                    +
      <year>1949</year>                                +
    </book>                                        +
    <book>                                         +
      <title>The Hitchhiker's Guide to the Galaxy</title>+
      <author>Douglas Adams</author>                    +
      <year>1979</year>                                +
    </book>                                        +
  </books>"}
(1 row)
```

NOTE

If the XML file inputting the xmlsequence function contains double quotation marks, the result of the xmlsequence function contains escape characters of double quotation marks when you query the result of the xmlsequence function independently. The use of the xmlsequence function is not affected.

7.6.43 Functions of the XMLType Type

createxml(varchar2 [,varchar2 ,numeric ,numeric])

Description: Statically creates the XMLType type. The input parameters are of the varchar2 type.

Parameters: The first parameter is the character string to be converted to XMLType (required column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# SELECT createxml('<a>123</a>');
 createxml
---------------
 <a>123</a>
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Different from that in database A, in PL/SQL, createxml allows input parameters to be empty strings and returns **NULL**.
- For character encoding, only UTF-8, GBK, ZHS16GBK, and LATIN1 to LATIN10 are supported, and the **version** column can only be set to **1.x**.
- The createxml function can be called using the xmltype.createxml() syntax.

  Example:

```
gaussdb=# SELECT xmltype.createxml('<a>123</a>');
 createxml
------------
 <a>123</a>
(1 row)
```

- In this chapter, the function whose input parameter is xmltype() can be called in xmltype().func() mode. The XMLType type returned by a function is passed to the next function as the input parameter. This syntax supports multi-layer nesting. (If the input parameter is defined as XMLType by a user, this syntax is not supported.)

  Example:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').extract('/a/b').getstringval();
 xmltypefunc
-------------
 <b>456</b>
(1 row)
```

  The actual effect of the preceding example is the same as that of the following function nesting:

```
gaussdb=# select getstringval(extractxml(xmltype('<a>123<b>456</b></a>'),'/a/b'));
 getstringval
--------------
 <b>456</b>
(1 row)
```

- In a stored procedure, variables of the XMLType type can call functions in a.func() mode. This syntax supports one-layer nesting.

  Example:

```
gaussdb=# declare
        a xmltype;
        b varchar2;
begin
        a:=xmltype('<a>123<b>456</b></a>');
        b:=a.getstringval();
        RAISE NOTICE 'xmltype_str is : %',b;
end;
/
NOTICE:  xmltype_str is : <a>123<b>456</b></a>
```

createxml(clob [,varchar2 ,numeric ,numeric])

Description: Statically creates the XMLType type. The input parameters are of the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (required column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# declare
 xmltype_clob clob;
 xmltype_obj xmltype;
 xmltype_str varchar2(1000);
begin
 xmltype_clob := '<a>123</a>';
 xmltype_obj := createxml(xmltype_clob);
 xmltype_str := xmltype_obj.getstringval();
 RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE:  xmltype_str is : <a>123</a>
```

NOTE

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

createxml(blob, numeric [,varchar2 ,numeric ,numeric])

Description: Statically creates the XMLType type. The input parameters are of the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (required column). The second parameter is the character set ID of the input XML data (required column). The third parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
 xmltype_blob blob;
 xmltype_obj xmltype;
 xmltype_str varchar2(1000);
begin
 xmltype_blob := xmltype('<a>123</a>').getblobval(7);
 xmltype_obj := createxml(xmltype_blob,7);
 xmltype_str := xmltype_obj.getstringval();
 RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE:  xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123</a>
```

NOTE

- The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
- The character set ID ranges from 1 to 43.

getblobval(xmltype, numeric)

Description: Converts the XMLType type to the BLOB type. The xmltype().func() method can be called.

Parameters: The first parameter is of the XMLType type, and the second parameter is the ID of the target character set to be converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: BLOB

Example:

```
gaussdb=# SELECT getblobval(xmltype('<asd/>'),7);
                                   getblobval
--------------------------------------------------------------------------------

3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173642F3
E
(1 row)
```

xmltype ().func ():

```
gaussdb=# select xmltype('<asd/>').getblobVal(7);
                                   xmltypefunc
--------------------------------------------------------------------------------

3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173642F3
E
(1 row)
```

NOTE

The maximum length of the input parameter of the XMLType type is 256 MB minus 1 byte.

getclobval(xmltype)

Description: Converts the XMLType type to the CLOB type. The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: CLOB

Example:

```
gaussdb=# SELECT getclobval(xmltype('<a>123</a>'));
 getclobval
--------------
 <a>123</a>
(1 row)
```

xmltype ().func ():

```
gaussdb=# SELECT xmltype('<a>123</a>').getclobval();
 xmltypefunc
--------------
 <a>123</a>
(1 row)
```

getnumberval(xmltype)

Description: Converts the XMLType type to the numeric type. The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT getnumberval(xmltype('<a>123</a>').extract('/a/text()'));
 getnumberval
--------------
          123
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xmltype ().func ():

```
gaussdb=# SELECT xmltype('<a>123</a>').extract('/a/text()').getnumberval();
 xmltypefunc
--------------
          123
(1 row)
```

isfragment(xmltype)

Description: Returns a result indicating whether the XMLType type is fragment (1) or document (0). The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT isfragment(xmltype('<a>123</a>'));
 isfragment
--------------
           0
(1 row)
```

xmltype ().func ():

```
gaussdb=# SELECT xmltype('<a>123</a>').isfragment();
 xmltypefunc
--------------
           0
(1 row)
```

xmltype(varchar2 [,varchar2,numeric ,numeric])

Description: Creates the XMLType type from the varchar2 type.

Parameters: The first parameter is the character string to be converted to XMLType (required column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# SELECT xmltype('<a>123</a>');
 xmltype
--------------
 <a>123</a>
(1 row)
```

NOTE

- Different from that in database A, in PL/SQL, XMLType allows input parameters to be empty strings and returns **NULL**.
- For character encoding, only UTF-8, GBK, ZHS16GBK, and LATIN1 to LATIN10 are supported, and the **version** column can only be set to **1.x**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xmltype(clob [,varchar2 ,numeric ,numeric])

Description: Creates the XMLType type from the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (required column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
 xmltype_clob clob;
 xmltype_obj xmltype;
 xmltype_str varchar2(1000);
begin
 xmltype_clob := '<a>123</a>';
 xmltype_obj := xmltype(xmltype_clob);
 xmltype_str := xmltype_obj.getstringval();
 RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE:  xmltype_str is : <a>123</a>
```

NOTE

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

xmltype(blob, numeric [,varchar2 ,numeric ,numeric])

Description: Creates the XMLType type from the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (required column). The second parameter is the character set ID of the input XML data. The third parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
 xmltype_blob blob;
 xmltype_obj xmltype;
 xmltype_str varchar2(1000);
begin
 xmltype_blob := getblobval(createxml('<a>123</a>'),7);
 xmltype_obj := xmltype(xmltype_blob,7);
 xmltype_str := xmltype_obj.getstringval();
 RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
NOTICE:  xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123</a>
```

NOTE

- The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
- The character set ID ranges from 1 to 42.

getstringval(xmltype)

Description: Converts xmltype into a string.

Parameter: XMLType to be converted.

Return type: varchar2

The getstringval function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getstringval('<a>123<b>456</b></a>');
    getstringval
---------------------
 <a>123<b>456</b></a>
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123<b>456</b></a>').getstringval();
    xmltypefunc
---------------------
 <a>123<b>456</b></a>
(1 row)
```

getrootelement(xmltype)

Description: Gets the root element of the XMLType type.

Parameter: XMLType whose root element is to be obtained.

Return type: varchar2

The getrootelement function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getrootelement('<a>123<b>456</b></a>');
 getrootelement
----------------
 a
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123<b>456</b></a>').getrootelement();
 xmltypefunc
-------------
 a
(1 row)
```

getnamespace(xmltype)

Description: Gets the namespace of the XMLType top-level element.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: XMLType whose namespace is to be obtained.

Return type: varchar2

The getnamespace function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getnamespace('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>');
 getnamespace
--------------
 asd
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>').getnamespace();
 xmltypefunc
-------------
 asd
(1 row)
```

existsnode(xmltype, varchar2[, varchar2])

Description: Determines whether the XML node exists in XMLType based on the XPath expression. If the XML node exists, **1** is returned. Otherwise, **0** is returned.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: numeric

The existsnode function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT existsnode('<a>123<b>456</b></a>','/a/b');
 existsnode
------------
          1
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123<b>456</b></a>').existsnode('/a/b');
 xmltypefunc
-------------
           1
(1 row)
```

Example 3:

```
gaussdb=# SELECT existsnode('<a:b xmlns:a="asd">123<c>456</c></a:b>','/a:b/c','xmlns:a="asd"');
 existsnode
------------
          1
(1 row)
```

Example 4: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').existsnode('/a:b/c','xmlns:a="asd"');
 xmltypefunc
-------------
           1
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

extractxml(xmltype, varchar2[, varchar2])

Description: Checks whether an XML node exists in the given XMLType based on the XPath expression. If so, the XMLType containing the node is returned. If not, **NULL** is returned. The return value can be inserted into a table of the XMLType type.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: XMLType

The extractxml function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT extractxml('<a>123<b>456</b></a>','/a/b');
 extractxml
------------
 <b>456</b>
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123<b>456</b></a>').extract('/a/b');
 xmltypefunc
-------------
 <b>456</b>
(1 row)

gaussdb=# SELECT xmltype('<a>123<b>456</b></a>').extractxml('/a/b');
 xmltypefunc
-------------
 <b>456</b>
(1 row)
```

Example 3:

```
gaussdb=# SELECT extractxml('<a:b xmlns:a="asd">123<c>456</c></a:b>','/a:b','xmlns:a="asd"');
              extractxml
----------------------------------------
 <a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

Example 4: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extract('/a:b','xmlns:a="asd"');
             xmltypefunc
----------------------------------------
 <a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)

gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extractxml('/a:b','xmlns:a="asd"');
             xmltypefunc
----------------------------------------
 <a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

extractvalue(xmltype | xml, varchar2[, varchar2])

Description: Extracts the value of an XPath expression from an XML file based on the XPath expression (only XPath 1.0 is supported).

Parameters:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-194 extractvalue parameters

Parameter	Description	Remarks
xmltype | xml	XML text to be queried.	The result of the XPath expression must be a single node and must be a text node, attribute, or element. • If the XPath expression contains an element expression, the element must have a text node as a child node. The function returns the text. • If the result is an attribute, the function returns the value of the attribute.
varchar2	Expression of the XPath to be queried (path of the XPath node).	
[, varchar2]	(Optional) Namespace of the XPath node path. (If the input parameter contains a namespace with an alias, you need to define an alias for both the XPath expression and namespace. If the default namespace is used, you do not need to define an alias, as shown in example 3.)	

Return type: varchar2

The extractvalue function can be called in two ways: input without namespace and input with namespace.

Example 1: The input does not contain a namespace.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s5';
SET
gaussdb=# SELECT EXTRACTVALUE(xmltype('<book><title>Harry Potter</title><author>J.K. Rowling</
author></book>'), '/book/title') AS book_title;
  book_title
--------------
 Harry Potter
(1 row)
```

Example 2: The input contains a namespace.

```
gaussdb=# SELECT EXTRACTVALUE(xmltype('<ns:book xmlns:ns="http://www.example.com"><ns:title>Harry
Potter</ns:title><ns:author>J.K. Rowling</ns:author></ns:book>'), '/ns:book/ns:title', 'xmlns:ns="http://
www.example.com"') AS book_title;
  book_title
--------------
 Harry Potter
(1 row)
```

Example 3: The input contains multiple namespaces.

```
gaussdb=# SELECT EXTRACTVALUE(xmltype('<ns:book xmlns:ns="http://www.example.com"
xmlns:ff="http://www.ff.com"><ff:title>Harry Potter</ff:title><ns:author>J.K. Rowling</ns:author></
ns:book>'), '/ns:book/ff:title', 'xmlns:ns="http://www.example.com" xmlns:ff="http://www.ff.com"') AS
book_title;
  book_title
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------------

```

NOTE

- If the input contains multiple namespaces, they can be separated by one or more spaces (or newline characters). However, the namespace expression is in the **xmlns:***Name*="*Namespace*" format and the default namespace rule is in the **xmlns='***URL*' format.
- This function is compatible with the xmltype expression function, but the node value returned by the xmltype text must be unique.
- The XPath expression supports only XPath 1.0.
- Currently, the namespace URL in the XML text cannot be a space, and the namespace URL in the namespace expression cannot be a space.
- In the default namespace scenario, the default namespace declared first in the namespace expression is the default namespace of the current XML text.
- This function can be used only in O-compatible mode after setting **a_format_version** to **'10c'** and **a_format_dev_version** to **'s5'**.

xmlsequence(xmltype)

Description: Converts an XMLTYPE parameter into an array of the XMLTYPE type. Each array element is an XMLTYPE object. The input parameter of this function cannot be null and must be a valid XML document. If the input parameter does not meet the requirements, the function returns a null value or throws an exception. This function can be used to process multiple child nodes in an XML document or split an XML document into multiple fragments.

Parameter: The input parameter is of the XMLType type.

Return type: array of the XMLType type.

Example 1: If you want to convert this document into an array containing three elements, each of which is a book node, use the following statement:

```
gaussdb=# SELECT xmlsequence(xmltype('<books><book><title>The Catcher in the Rye</title><author>J.D.
Salinger</author><year>1951</year></book><book><title>1984</title><author>George Orwell</
author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>'));
                    xmlsequence
------------------------------------------------------------
 {"<books>                                      +
    <book>                                     +
      <title>The Catcher in the Rye</title>          +
      <author>J.D. Salinger</author>                 +
      <year>1951</year>                          +
    </book>                                    +
    <book>                                     +
      <title>1984</title>                        +
      <author>George Orwell</author>                 +
      <year>1949</year>                          +
    </book>                                    +
    <book>                                     +
      <title>The Hitchhiker's Guide to the Galaxy</title>+
      <author>Douglas Adams</author>                 +
      <year>1979</year>                          +
```

```
    </book>                                 +
  </books>"}
(1 row)
```

Example 2: If you want to extract the title and author of each book from this array, use the following statement:

```
gaussdb=# SELECT unnest(xmlsequence(xmltype('<books><book><title>The Catcher in the Rye</
title><author>J.D. Salinger</author><year>1951</year></book><book><title>1984</title><author>George
Orwell</author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>').extract('//title/text()'))) AS
title
    , unnest(xmlsequence(xmltype('<books><book><title>The Catcher in the Rye</title><author>J.D.
Salinger</author><year>1951</year></book><book><title>1984</title><author>George Orwell</
author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>').extract('//author/text()')))
AS author;
                          title                          |                author
---------------------------------------------------------+---------------------------------------
 The Catcher in the Rye1984The Hitchhiker's Guide to the Galaxy | J.D. SalingerGeorge OrwellDouglas
Adams
(1 row)
```

Example 3: If you want to convert the array into a JSON string, use the following statement:

```
gaussdb=# SELECT array_to_json(array_agg(row_to_json(t)))
FROM (
    SELECT unnest(xmlsequence(xmltype('<books><book><title>The Catcher in the Rye</title><author>J.D.
Salinger</author><year>1951</year></book><book><title>1984</title><author>George Orwell</
author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>').extract('//title/text()'))) AS
title
        , unnest(xmlsequence(xmltype('<books><book><title>The Catcher in the Rye</title><author>J.D.
Salinnger</author><year>1951</year></book><book><title>1984</title><author>George Orwell</
author><year>1949</year></book><book><title>The Hitchhiker''s Guide to the Galaxy</
title><author>Douglas Adams</author><year>1979</year></book></books>').extract('//author/text()')))
AS author
) t;

                                array_to_json
-----------------------------------------------------------------------------------------------------------
 [{"title":"The Catcher in the Rye1984The Hitchhiker's Guide to the Galaxy","author":"J.D. SalinngerGeorge
OrwellDouglas Adams"}]
(1 row)
```

NOTE

If the XML file inputting the xmlsequence function contains double quotation marks, the result of the xmlsequence function contains escape characters of double quotation marks when you query the result of the xmlsequence function independently. The use of the xmlsequence function is not affected.

7.6.44 Global PL/SQL Cache Functions

invalidate_plsql_object(), invalidate_plsql_object(schema, objname, objtype);

Description: Invalidates objects in the global PL/SQL cache. This function is available only when **enable_global_plsqlcache** is set to **on**. The user who calls this function must have the SYSADMIN permission.

Parameters: This function is an overloaded function. If there is no input parameter, all global cache objects in all databases are invalidated.

If the parameters **schema**, **objname**, and **objtype** are specified, the specified global cache object in the current database becomes invalid. **schema** indicates the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

name of the schema to which the object belongs. **objname** indicates the object name. **objtype** indicates the object type. If the object type is a package, the value is **package**. If the object type is a function or stored procedure, the value is **function**.

Example:

This function does not return the invalidation result. You can query the invalidation result in the gs_glc_memory_detail view. If the object is not invalidated, you can find it in valid state in the view. If the object is invalidated, there is no such state.

invalidate_plsql_object belongs to the **pg_catalog** schema. It can be called even if no schema is specified.

```
-- Create the package pkg1 and function f2, and query the view cache information. The status is valid.
gaussdb=# CREATE SCHEMA testInvalidate;

```

gs_plsql_memory_object_detail(db_oid, obj_oid, obj_type)

Description: Obtains the valid memory usage of packages and functions created during stored procedures. When **enable_global_plsqlcache** is set to **off**, this function displays the memory usage of stored procedures in the current session. Cross-session query is not supported. The user who calls this function must have the **SYSADMIN** permission.

Parameters: This function requires the **db_oid**, **obj_oid**, and **obj_type** input parameters. If the input parameters do not match, an empty line is returned. For details about the parameters, see **Table 7-195**. If the **db_oid** and **obj_oid** input parameters are set to **0**, the valid memory usage of all packages and functions in the cache is queried by default.

Return type: tuple

Table 7-195 gs_plsql_memory_object_detail parameters

Parameter	Type	Description	Value Range
db_oid	uint32	The valid memory usage of the stored procedure in the database whose OID is **db_oid**. The default value **0** indicates all database instances in the current cache.	0 to 2^32 – 1.
obj_oid	uint32	OID of the queried object. The default value **0** indicates all packages and functions in the current cache.	0 to 2^32 – 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
obj_type	text	Type of the queried object. The target object is a package or function.	• **all**: queries all object types by default. • **pkg**: queries the valid memory usage of packages that meet the conditions. • **func**: queries the valid memory usage of functions that meet the conditions. • **func_in_pkg**: queries the valid memory usage of functions in the package that meets the conditions.

The gs_plsql_memory_object_detail function displays the valid memory usage that meets the query conditions in the database, as described in **Table 7-196**.

Table 7-196 gs_plsql_memory_object_detail return values

Name	Type	Description
object_oid	uint32	OID of the queried memory object.
context_name	text	Name of a memory object.
item	text	Name of the queried memory object item.
searchpath	text	Schema and other environment variables of the compilation product accessed by the memory object.
guc	uint64	Environment parameter when an object is created, that is, the value of **behavior_compat_flags**.
file	text	File where the memory object is created.
line	uint32	Number of lines in the file where the memory object is created.
size	uint32	Size of a memory object.
db_oid	uint32	OID of the database where the queried memory object is located.

Example:

```
-- When enable_global_plsqlcache is set to on, create a package and a function and call gs_plsql_memory_object_detail to obtain the memory usage.
```

7.6.45 Pivot Table Functions

tablefunc()

Description: Extended API for processing table data, including pivot table functions. Only system administrators can install extensions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

By default, the extension is installed in the public schema. You are advised to install the extension in the user schema by running **create extension tablefunc [schema {user_schema}]**. The extended function is for internal use only. You are advised not to use it.

crosstab(source_sql text [, N int])

Description: Uses the result of **source_sql** as the source data to generate a pivot table.

Return type: SETOF record

Example:

```
gaussdb=# CREATE extension tablefunc;
CREATE EXTENSION
gaussdb=# CREATE TABLE cross_test(group_id text, id int, var text);
CREATE TABLE
gaussdb=# SELECT * FROM cross_test;
 group_id | id | var
----------+----+-----
(0 rows)

gaussdb=# SELECT * FROM crosstab('SELECT group_id, var FROM cross_test order by 1, 2;') AS c(group_
text, cat1 text, cat2 text, cat3 text);
 group_ | cat1 | cat2 | cat3
--------+------+------+------
(0 rows)
```

NOTE

N is a deprecated parameter and does not affect the function result.

crosstabN(source_sql text)

Description: Uses the result of **source_sql** as the source data to generate a pivot table with "*N*+1" columns. crosstabN is a group of functions, including crosstab2, crosstab3, and crosstab4.

Return type: setof tablefunc_crosstab_N. tablefunc_crosstab_N includes tablefunc_crosstab_2, tablefunc_crosstab_3, and tablefunc_crosstab_4.

Example:

```
-- If N in crossbatN(source_sql text) is set to 2, a pivot table with three columns is generated.
gaussdb=# CREATE extension tablefunc;
CREATE EXTENSION
gaussdb=# CREATE TABLE cross_test(group_id text, id int, var text);
CREATE TABLE
gaussdb=# SELECT * FROM crosstab2('SELECT group_id, var from cross_test ORDER BY 1, 2;');
 row_name | category_1 | category_2
----------+------------+------------
(0 rows)
```

crosstab(source_sql text, category_sql text)

Description: Uses the result of **source_sql** as the source data to generate a pivot table based on the result category of **category_sql**.

Return type: SETOF record

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CREATE extension tablefunc;
CREATE EXTENSION
gaussdb=# CREATE TABLE cross_test(group_id text, id int, var text);
CREATE TABLE
gaussdb=# SELECT * FROM crosstab('SLECT group_id, var FROM cross_test order by 1, 2;', 'SELECT
generate_series(1, 4)') AS c(group_ text, cat1 text, cat2 text, cat3 text, cat4 text);
 group_ | cat1 | cat2 | cat3 | cat4
--------+------+------+------+------
(0 rows)
```

7.6.46 UUID Functions

sys_guid()

Description: Generates and returns a 16-byte universally unique identifier (UUID). The generated UUID contains the IP address of the current node, generation timestamp, and random number.

Parameter: none

Return type: raw

Example:

```
gaussdb=# SET a_format_version='10c';
SET
gaussdb=# SET a_format_dev_version='s5';
SET
gaussdb=# SELECT sys_guid();
             sys_guid
----------------------------------
 9010675E560CB33C1BDAFA163E378F87
 (1 row)
```

uuid()

Description: Returns a UUID defined in RFC 4122, ISO/IEF 9834-8:2005, and related standards. The identifier is a string of lowercase hexadecimal digits, which are divided into several groups: a group of 8 digits, three groups of 4 digits, and a group of 12 digits. A total of 32 digits represent 128 bits.

Parameter: none

Return type: varchar

Example:

```
gaussdb=# SELECT uuid();
                 uuid
--------------------------------------
 dd8cbe92-1a25-013c-a514-e435c87e9182
(1 row)
```

uuid_short()

Description: Returns a short UUID under certain conditions. This identifier is a 64-bit unsigned integer.

The returned value is unique when the following conditions are met:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The number of service nodes in the current cluster cannot exceed 256.
- You cannot set the system time of the server host between node restarts.
- The average number of uuid_short() calls per second between node restarts is less than 16 million.

Parameter: none

Return type: uint64

Example:

```
gaussdb=# SELECT uuid_short();
    uuid_short
--------------------
 100440026956955649
(1 row)
```

NOTE

For upgrade from a version to GaussDB Kernel 505.0.0, the uuid_short() function cannot be used if the upgrade is not committed.

7.6.47 SQL Statement Concurrency Control Functions

gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)

Description: Creates an SQL statement concurrency control rule. Users must have the SYSADMIN permission.

Parameters: For details, see **Table 7-197**.

Return type: int8

Table 7-197 gs_add_workload_rule parameters

Parameter	Type	Description	Value Range
rule_type	text	Type of the concurrency control rule, which is case-insensitive.	**"sqlid"**: Concurrency control is based on the unique SQL ID. **"select"**, **"insert"**, **"update"**, **"delete"**, and **"merge"**: Concurrency control is based on the query type and keyword. **"resource"**: Instance-level concurrency control is based on the system resource usage.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.	Any character string or **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
databases	name[]	Array of database names for which the concurrency control rule takes effect. The value is case-sensitive.	List of names of created databases. The value can be **NULL**, indicating that the configuration takes effect in all databases. Currently, the database list takes effect only when **rule_type** is set to a query type because a unique SQL ID is bound to a database and belongs to only one database. The concurrency control rules based on resource usage take effect for instances, that is, all databases.
start_time	timestamptz	Start time of a concurrency control rule.	The value can be **NULL**, indicating that it takes effect from now on.
end_time	timestamptz	End time of a concurrency control rule.	The value can be **NULL**, indicating that the rule is always effective.
max_workload	int8	Maximum number of concurrent requests set in a concurrency control rule.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
option_val	text[]	Supplementary information about the concurrency control rule.	It matches **rule_type**. The matching relationship is as follows: • **"sqlid"**: specifies the unique ID of the SQL statement whose concurrency is to be controlled and slow SQL control rule. The format is '{id=1234, time_limit=100, max_execute_time=500, max_iops=1}', in which **id** indicates the unique SQL ID and is required. You can obtain it from the dbe_perf.statement or pg_stat_activity view. Others are optional. For details about their meanings, see section "Hint for Setting Slow SQL Control Rules." • **"select"**, **"insert"**, **"update"**, **"delete"**, and **"merge"**: keyword sequence for concurrency control, which is case-insensitive and can be **NULL**. • **"resource"**: resource threshold for triggering instance-level concurrency control. The value is in the format of '{cpu-80, memory-70}', indicating the OS resource threshold for triggering instance-level concurrency control. The value can be **NULL**, indicating that concurrency control is performed regardless of the resource usage.

Example:

```
gaussdb=#  SELECT gs_add_workload_rule('sqlid', 'rule for one query', '', now(), '', 20, '{id=32413214}');
 gs_add_workload_rule
----------------------
                    1
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=#  CREATE database db1;
gaussdb=#  CREATE database db2;
gaussdb=#  SELECT gs_add_workload_rule('select', 'rule for select', '{db1, db2}', '', '', 100, '{tb1, tb2}');
 gs_add_workload_rule
----------------------

gs_update_workload_rule(rule_id, rule_name, databases, start_time, end_time, max_workload, option_val)

Description: To update an SQL statement concurrency control rule, users need to reset all parameters instead of only some parameters. Users must have the SYSADMIN permission.

Parameters: For details, see **Table 7-198**.

Return type: Boolean

Table 7-198 gs_update_workload_rule parameters

Parameter	Type	Description	Value Range
rule_id	int8	ID of the concurrency control rule to be updated.	-
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.	Any character string or **NULL**.
databases	name[]	Array of database names for which the concurrency control rule takes effect. The value is case-sensitive.	List of names of created databases. The value can be **NULL**, indicating that the configuration takes effect in all databases. Currently, the database list takes effect only when **rule_type** is set to a query type because a unique SQL ID is bound to a database and belongs to only one database. The concurrency control rules based on resource usage take effect for instances, that is, all databases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
start_time	timestamptz	Start time of a concurrency control rule.	The value can be **NULL**, indicating that it takes effect from now on.
end_time	timestamptz	End time of a concurrency control rule.	The value can be **NULL**, indicating that the rule is always effective.
max_workload	int8	Maximum number of concurrent requests set in a concurrency control rule.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description	Value Range
option_val	text[]	Supplementary information about the concurrency control rule.	It matches **rule_type**. The matching relationship is as follows: • **"sqlid"**: specifies the unique ID of the SQL statement whose concurrency is to be controlled and slow SQL control rule. The format is '{id=1234, time_limit=100, max_execute_time=500, max_iops=1}', in which **id** indicates the unique SQL ID and is required. You can obtain it from the dbe_perf.statement or pg_stat_activity view. Others are optional. For details about their meanings, see section "Hint for Setting Slow SQL Control Rules." • **"select"**, **"insert"**, **"update"**, **"delete"**, and **"merge"**: keyword sequence for concurrency control, which is case-insensitive and can be **NULL**. • **"resource"**: resource threshold for triggering instance-level concurrency control. The value is in the format of '{cpu-80, memory-70}', indicating the OS resource threshold for triggering instance-level concurrency control. The value can be **NULL**, indicating that concurrency control is performed regardless of the resource usage.

Example:

```
gaussdb=#  CREATE database db1;
gaussdb=#  SELECT gs_update_workload_rule(2, 'rule for select 2', '{db1}', now(), '', 50, '{tb1}');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 gs_update_workload_rule
-------------------------
 t
(1 row)
```

gs_delete_workload_rule(rule_id int8)

Description: Deletes an SQL statement concurrency control rule. Users must have the SYSADMIN permission.

Parameter: **rule_id** indicates the ID of the concurrency control rule to be updated. The type is int8.

Return type: Boolean

Example:

```
gaussdb=#  SELECT gs_delete_workload_rule(3);
 gs_delete_workload_rule
-------------------------
 t
(1 row)
```

gs_get_workload_rule_stat(rule_id)

Description: Queries the number of times that SQL statements are blocked by SQL statement concurrency control rules. Users must have the SYSADMIN permission. In the multi-tenancy scenario, this function runs properly if it is called in a non-PDB, and an error is reported if it is called in a PDB.

Parameter: **rule_id** indicates the ID of the concurrency control rule to be queried. The type is int8. You can set **rule_id** to **–1**, indicating that all SQL statement concurrency control rules are queried.

Table 3 Return value types

Name	Type	Description
rule_id	int8	ID of the SQL statement concurrency control rule.
validate_count	int8	Number of SQL statements intercepted by the SQL statement concurrency control rule.

Example:

```
gaussdb=#  SELECT * FROM gs_get_workload_rule_stat(1);
 rule_id | validate_count
---------+----------------
       1 |              0
(1 row)
gaussdb=#  SELECT * FROM gs_get_workload_rule_stat(-1);
 rule_id | validate_count
---------+----------------
       1 |              0
       2 |              0
(2 rows)
```

7.6.48 Multi-Tenant Database Functions

gs_reload_pdb_conf(name pdbname)

Description: Makes the configuration file of a specified PDB take effect immediately. Only the local PDB can be specified in a PDB. The input parameter can be empty. If the input parameter is left empty, the configuration file of the PDB can be called only in the PDB and takes effect.

Return type: Boolean

Note: Each of these functions returns **true** if they are successful and **false** otherwise. Only users with the SYSADMIN permission or higher can execute this function.

gs_resplan_cgroup_info()

Description: Returns the architecture and quota details of a multi-tenant Cgroup. Its function is the same as that of **gs_cgroup -p**. All data can be viewed in a CDB. Only the data within the PDB range can be viewed in a PDB. It returns a CGroup (such as DefaultClass, DefaultBackend, and Vacuum) of a CGroup framework and the **Class**_*xxx* Cgroup of a PDB on the primary node. An error is reported when the function is executed on the standby node.

Return type: SETOF record

Name	Type	Description
cgroup_name	text	Cgroup name.
shares	bigint	CPU quota allocated to the Cgroup.
quota	bigint	Maximum number of CPU resources that can be used by the Cgroup.
cpuset	text	Allocated CPU cores.
cpu_usage	real	Total CPU usage time of the Cgroup.
relpath	text	Relative path of the Cgroup.
task_num	bigint	Number of threads in the Cgroup.
group_id	bigint	Thread group ID.
is_disable	boolean	Specifies whether the Cgroup is unavailable.

Example:

```
gaussdb=# select * FROM GS_RESPLAN_CGROUP_INFO();
      cgroup_name        | shares | quota | cpuset | cpu_usage |             relpath              | task_num | group_id |
is_disable
-------------------------+--------+-------+--------+-----------+----------------------------------+----------+----------
+------------
 Default_Class           |   2048 |    -1 | 0-15   |         0 | CDB:omm/Default_Class            |       17 |        0 | f
 Backend                 |  12288 |    -1 | 0-15   |   4.90895 | CDB:omm/Backend                  |        0 |        0 | f
 Backend/DefaultBackend |  81920 |    -1 | 0-15   |   4.91018 | CDB:omm/Backend/DefaultBackend |       44
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
|       0 | f
 Backend/Vacuum        | 20480 |    -1 | 0-15  |        0 | CDB:omm/Backend/Vacuum        |       0 |       0 | f
(4 rows)
```

gs_resplan_stat_info(view_type integer)

Description: Returns the real-time statistics result of the resource plan in the current CDB, including the CPU, memory, and I/O indicators. You can obtain real-time data, statistics of the last minute, and historical statistics of each minute (up to one hour).

All data can be viewed in a CDB. Only the data within the PDB range can be viewed in a PDB. An error is reported when the function is executed on the standby node.

When resources change, the shared cache counted by **used_shared_memory** starts from 0. As services are running, the value of **used_shared_memory** increases, and the statistics become normal. During this period, the performance is not affected.

The following lists the input parameters.

Name	Type	Input/Output	Value Range	Description
view_type	integer	Input	[0,1,2]	**0**: Real-time statistics are returned. **1**: The latest statistics are returned. **2**: Historical statistics of the last hour are returned.

Return type: SETOF record

Name	Type	Description
plan_name	text	Name of the resource plan that is taking effect at **end_time**.
pdb_name	name	For a CDB, the value is **cdb**. For a PDB, the value is the PDB name.
begin_time	timestamp with time zone	Collection start time. During real-time statistics collection, no value is returned.
end_time	timestamp with time zone	Collection end time. During real-time statistics collection, **now** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval_msec	integer	Interval for collecting statistics, in milliseconds (ms).
cpu_consumed_time	bigint	CPU usage time in the current period, in milliseconds (ms). The usage time of multiple cores is accumulated.
avg_cpu_utilization	double precision	CPU usage. The formula is as follows: **cpu_consumed_time**/**interval_msec**/Number of CPU cores of CDB.
iops	double precision	IOPS in this period. During real-time statistics collection, the IOPS of the last second is returned. During periodic statistics collection, the IOPS of the period is returned.
used_dynamic_memory	integer	Dynamic memory used at **end_time**, in KB.
used_shared_memory	integer	Shared cache used at **end_time**, in KB.
used_connections	integer	Number of connections used at the current time.
logical_decoder_used_memory	integer	Dynamic memory used by a logical decoding task at **end_time**, in KB.

Example:

```
gaussdb=# SELECT * FROM gs_resplan_stat_info(0);
       plan_name       | pdb_name | begin_time |           end_time           | interval_msec | cpu_consumed_time
| avg_cpu_utilization | iops | used_dynamic_memory | used_shared_memory | used_connections |

gs_get_pdb_tablespace_location(pdb_id oid in, tablespace_oid oid in)

Description: Returns the tablespace path according to the given PDB ID and tablespace OID.

The following lists the input parameters.

Name	Type	Input/ Output	Value Range	Description
pdb_id	oid	Input	[1, 4095]	PDB ID.
tablespace_oid	oid	Input	[0, 4294967295]	Tablespace OID.

Return type: text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Currently, you are advised not to use this function. It is used only for kernel function implementation. If the input parameter **pdb_id** is not in the range, **NULL** is returned. If the input parameter **pdb_id** is PDB ID of another PDB, an empty string is returned. If the running user is not **superuser** or **sysdba**, an empty string is returned. If the queried PDB does not have the corresponding tablespace, an error is reported.

get_mtd_user()

Description: Displays all user information by DB and user. In the multi-tenancy scenario, global information is returned if this function is called in a non-PDB, and information about a PDB is returned if this function is called in the PDB.

Return type: SETOF record

Name	Type	Description
dbid	oid	Database ID.
usename	name	Username.
usesysid	oid	User ID.
usecreatedb	boolean	Specifies whether a user has the permissions to create databases. ● **t** (true): yes. ● **f** (false): no.
usesuper	boolean	Specifies whether the user is the initial system administrator with the highest permissions. ● **t** (true): yes. ● **f** (false): no.
usecatupd	boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. This permission is unavailable for other users. ● **t** (true): yes. ● **f** (false): no.
userepl	boolean	Specifies whether the user has the permissions to duplicate data streams. ● **t** (true): yes. ● **f** (false): no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Start time for account validity (**NULL** if no start time).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
valuntil	timestamp with time zone	End time for account validity (**NULL** if no end time).
respool	name	Resource pool where the user is located.
parent	oid	Parent user OID.
spacelimit	text	Storage space of a permanent table, in KB.
useconfig	text	Default value of GUC items. For details, see section "PG_DB_ROLE_SETTING.setconfig."
nodegroup	name	Name of a logical database associated with a user. If the user does not manage the logical database, this column is left blank.
tempspacelimit	text	Storage space of a temporary table, in KB.
spillspacelimit	text	Operator disk spill space, in KB.
usemonitoradmin	boolean	Specifies whether this user is a MONADMIN. ● **t** (true): yes. ● **f** (false): no.
useoperatoradmin	boolean	Specifies whether the user is an OPRADMIN. ● **t** (true): yes. ● **f** (false): no.
usepolicyadmin	boolean	Specifies whether the user is a POLADMIN. ● **t** (true): yes. ● **f** (false): no.

get_instr_sql_count_info()

Description: Provides the count of SELECT, UPDATE, INSERT, DELETE, and MERGE INTO statements executed by the user on the current node by DB and user. In the multi-tenancy scenario, the global information is returned if this function is called in a non-PDB, and only the information about a local PDB is returned if this function is called in a PDB.

Return type: record

get_instr_db_rt_percentile()

Description: Displays the distribution information about the response time of 80% and 95% SQL statements by DB. Only the distribution information about the response time of 80% and 95% SQL statements of the current PDB is returned if this function is executed in the PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return type: record

Example:

```
-- Query in a CDB.
gaussdb=# select * from get_instr_db_rt_percentile();
    DBID    | P80  | P95
------------+------+------
      14539 | 7375 | 7547
 1255163054 | 3909 | 6558
(2 rows)

-- Query in a PDB.
gaussdb=# \c pdb1
pdb1=# select * from get_instr_db_rt_percentile();
    DBID    | P80  | P95
------------+------+------
 1255163054 | 6220 | 7358
(1 row)
```

get_instr_user_login_info()

Description: Displays the number of user logins and logouts on the current node by DB and user. To query this function, you must have the SYSADMIN or MONADMIN permission. If this function is executed in the PDB, only the login and logout information of the current PDB is returned.

Return type: record

Example:

```
-- Query in a CDB.
gaussdb=#  select * from get_instr_user_login_info();
 node_name |    dbid    | user_id | login_counter | logout_counter
-----------+------------+---------+---------------+----------------
 datanode  |      14539 |      10 |         82183 |          82182
 datanode  | 1255163054 |      10 |         39932 |          39932
(2 rows)

-- Query in a PDB.
gaussdb=# \c pdb1
pdb1=#  select * from get_instr_user_login_info();
 node_name |    dbid    | user_id | login_counter | logout_counter
-----------+------------+---------+---------------+----------------
 datanode  | 1255163054 |      10 |         39933 |          39932
(1 row)
```

gs_resplan_shared_memory_info()

Description: Displays detailed information about the shared cache of all available resource pools. This system function takes effect only when the GUC parameter **enable_mtd** is set to **on** and can be viewed only by system administrators in the CDB of the host.

Return type: SETOF record

Name	Type	Description
respool_oid	oid	OID of the resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
allocated_shared_memory	bigint	Size of the shared memory that has been allocated, in KB.
respool_group_shared_memory	bigint	Size of the memory occupied by each resource pool in the shared memory, in KB.
avaliable_shared_memory	bigint	Size of the available shared memory of each resource pool, in KB.
real_used_shared_memory	bigint	Size of the shared memory used by each resource pool, in KB.
shared_memory_hits_per	bigint	Hit ratio of the buffer found in the shared memory.

Example:

```
gaussdb=# select * from gs_resplan_shared_memory_info();
 respool_oid | allocated_shared_memory | respool_group_shared_memory | avaliable_shared_memory |
real_used_shared_memory | shared_memory_hits_per
-------------+-------------------------+-----------------------------+-------------------------+-------------------------
+-------------------------
          10 |                    8640 |                        8640 |                 1048568 |                      -1 |
100
(1 row)

-- After pdb1 is created, join query gs_pdb and gs_resplan_shared_memory_info to obtain information
about the PDB resource pool.
gaussdb=# select b.name,a.* from gs_resplan_shared_memory_info() as a LEFT JOIN gs_pdb as b on
a.respool_oid=b.grp_respool_oid where name = 'pdb1';
 name | respool_oid | allocated_shared_memory | respool_group_shared_memory |
avaliable_shared_memory | real_used_shared_memory | shared_memory_hits_per
------+-------------+-------------------------+-----------------------------+-------------------------
+-------------------------+-------------------------
 pdb1 |      155648 |                 1048576 |                     1048576 |                  459400 |                  589176
|                     100
(1 row)
```

7.6.49 Deprecated Functions

7.7 Expressions

7.7.1 Simple Expressions

Logical Expressions

Logical Operators lists the operators and calculation rules of logical expressions.

Comparative Expressions

Comparison Operators lists the common comparative operators.

In addition to comparative operators, you can also use the following sentence structure:

- BETWEEN operators:

  a BETWEEN x AND y is equivalent to **a >= x AND a <= y**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a NOT BETWEEN x AND y is equivalent to **a < x OR a > y**.

- To check whether a value is null, use:

  expression IS NULL

  expression IS NOT NULL

  or an equivalent (non-standard) sentence structure:

  expression ISNULL

  expression NOTNULL

  NOTICE

  - Do not write **expression=NULL** or **expression<>(!=)NULL**, because **NULL** represents an unknown value and these expressions cannot determine whether two unknown values are equal.
  - Only the comparative expressions IS NULL and IS NOT NULL support data of XML type.

- is distinct from/is not distinct from
  - is distinct from

    If the data types and values of A and B are different, the value is **true**.

    If the data types and values of A and B are the same, the value is **false**.

    Empty values are considered the same.
  - is not distinct from

    If the data types and values of A and B are different, the value is **false**.

    If the data types and values of A and B are the same, the value is **true**.

    Empty values are considered the same.
- <=> NULL-safe equal operator

  The comparison of NULL values is added on the basis of the comparison of '='. If neither the left nor right value of the operator is NULL, the result is the same as that of '='.

  If the data types and values of A and B are different, the value is **false**.

  If the data types and values of A and B are the same, the value is **true**.

  Empty values are considered the same.

  NOTE

  - The usage of the <=> operator is the same as that of IS NOT DISTINCT FROM.
  - This operator is valid only when the database is B-compatible (that is, **sql_compatibility** is set to **'B'**). Other types do not support this operator.

Examples

```
gaussdb=# SELECT 2 BETWEEN 1 AND 3 AS RESULT;
 result
----------
 t
(1 row)

gaussdb=# SELECT 2 >= 1 AND 2 <= 3 AS RESULT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 result
----------
 t
(1 row)

gaussdb=# SELECT 2 NOT BETWEEN 1 AND 3 AS RESULT;
 result
----------
 f
(1 row)

gaussdb=# SELECT 2 < 1 OR 2 > 3 AS RESULT;
 result
----------
 f
(1 row)

gaussdb=# SELECT 2+2 IS NULL AS RESULT;
 result
----------
 f
(1 row)

gaussdb=# SELECT 2+2 IS NOT NULL AS RESULT;
 result
----------
 t
(1 row)

gaussdb=# SELECT 2+2 ISNULL AS RESULT;
 result
----------
 f
(1 row)

gaussdb=# SELECT 2+2 NOTNULL AS RESULT;
 result
----------
 t
(1 row)

gaussdb=# SELECT 2+2 IS DISTINCT FROM NULL AS RESULT;
 result
----------
 t
(1 row)

gaussdb=# SELECT 2+2 IS NOT DISTINCT FROM NULL AS RESULT;
 result
----------
 f
(1 row)

gaussdb=# SELECT 1 <=> 1 AS RESULT;
 result
--------
 t
(1 row)

gaussdb=# SELECT NULL <=> 1 AS RESULT;
 result
--------
 f
(1 row)

gaussdb=# SELECT NULL <=> NULL AS RESULT;
 result
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 t
(1 row)
```

7.7.2 Condition Expressions

Data that meets the requirements specified by conditional expressions are filtered during SQL statement execution.

Conditional expressions include the following types:

- CASE

  CASE expressions are similar to the **CASE** statements in other coding languages.

  Figure 7-1 shows the syntax of a CASE expression.

  Figure 7-1 case::=

  
  A CASE clause can be used in a valid expression. The condition is an expression that returns a value of Boolean type.

  - If the result is true, the result of the CASE expression is the required result.
  - If the result is false, the following WHEN or ELSE clauses are processed in the same way.
  - If every WHEN condition is not true, the result of the expression is the result of the ELSE clause. If the ELSE clause is omitted and has no match condition, the result is NULL.
  - Operations on XML data are supported.
  - When the GUC parameter **enable_case_intervaltonumeric** is set to **true**, INTERVAL can be converted to NUMERIC without reporting an error.

  Example:

```
gaussdb=# CREATE TABLE case_when_t1(CW_COL1 INT);

gaussdb=# INSERT INTO case_when_t1 VALUES (1), (2), (3);

gaussdb=# SELECT * FROM case_when_t1;
cw_col1
---------
 1
 2
 3
(3 rows)

gaussdb=# SELECT CW_COL1, CASE WHEN CW_COL1=1 THEN 'one' WHEN CW_COL1=2 THEN 'two'
ELSE 'other' END FROM case_when_t1 ORDER BY 1;
 cw_col1 | case
---------+-------
       1 | one
       2 | two
       3 | other
(3 rows)

gaussdb=# DROP TABLE case_when_t1;

-- The default value of the GUC parameter is false. In this case, an error is reported.
gaussdb=# SHOW enable_case_intervaltonumeric;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 enable_case_intervaltonumeric
-------------------------------
 off
(1 row)

gaussdb=# SELECT CASE
gaussdb-#     WHEN 1=1 THEN
gaussdb-#         to_date('20240118','yyyymmdd')-to_date('20240116','yyyymmdd')
gaussdb-#     ELSE
gaussdb-#         1
gaussdb-# END;
ERROR:  CASE types integer and interval cannot be matched
LINE 3:         to_date('20240118','yyyymmdd')-to_date('20240116','y...
                ^
CONTEXT:  referenced column: case

-- Enable the GUC parameter. The result can be correctly returned.
gaussdb=# SET enable_case_intervaltonumeric=true;
SET
gaussdb=# SELECT CASE
gaussdb-#     WHEN 1=1 THEN
gaussdb-#         to_date('20240118','yyyymmdd')-to_date('20240116','yyyymmdd')
gaussdb-#     ELSE
gaussdb-#         1
gaussdb-# END;
 case
------
    2
(1 row)
```

- DECODE

  Figure 7-2 shows the syntax of DECODE.

  Figure 7-2 decode::=

  
  Compare each following compare(n) with base_expr. **value(n)** is returned if a compare(n) matches the base_expr expression. If no match occurs, default is returned.

  Operations on XML data are supported.

  For details, see **Conditional Expression Functions**.

```
gaussdb=# SELECT DECODE('A','A',1,'B',2,0);
 case
------
    1
(1 row)
```

- COALESCE

  Figure 7-3 shows the syntax of COALESCE.

  Figure 7-3 coalesce::=

  
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

COALESCE returns its first not-NULL value. If all the parameters are **NULL**, **NULL** is returned. It is often used to replace **NULL** with the default value. Like a CASE expression, COALESCE only evaluates the parameters that are needed to determine the result. That is, parameters to the right of the first non-null parameter are not evaluated.

Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE c_tabl(description varchar(10), short_description varchar(10), last_value
varchar(10)) ;

gaussdb=# INSERT INTO c_tabl VALUES('abc', 'efg', '123');
gaussdb=# INSERT INTO c_tabl VALUES(NULL, 'efg', '123');

gaussdb=# INSERT INTO c_tabl VALUES(NULL, NULL, '123');

gaussdb=# SELECT description, short_description, last_value, COALESCE(description, short_description,
last_value) FROM c_tabl ORDER BY 1, 2, 3, 4;
 description | short_description | last_value | coalesce
-------------+-------------------+------------+----------
 abc         | efg               | 123        | abc
             | efg               | 123        | efg
             |                   | 123        | 123
(3 rows)

gaussdb=# DROP TABLE c_tabl;
```

If **description** is not **NULL**, the value of **description** is returned. Otherwise, **short_description** is calculated. If **short_description** is not **NULL**, the value of **short_description** is returned. Otherwise, **last_value** is calculated. If **last_value** is not **NULL**, the value of **last_value** is returned. Otherwise, **none** is returned.

```
gaussdb=# SELECT COALESCE(NULL,'Hello World');
   coalesce
---------------
 Hello World
(1 row)
```

- NULLIF

  Figure 7-4 shows the syntax of NULLIF.

  Figure 7-4 nullif::=

  
  Only if **value1** is equal to **value2** can **NULLIF** return the **NULL** value. Otherwise, **value1** is returned. Operations on XML data are supported.

  Example:

```
gaussdb=# CREATE TABLE null_if_t1 (
    NI_VALUE1 VARCHAR(10),
    NI_VALUE2 VARCHAR(10)
);

gaussdb=# INSERT INTO null_if_t1 VALUES('abc', 'abc');
gaussdb=# INSERT INTO null_if_t1 VALUES('abc', 'efg');

gaussdb=# SELECT NI_VALUE1, NI_VALUE2, NULLIF(NI_VALUE1, NI_VALUE2) FROM null_if_t1 ORDER
BY 1, 2, 3;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 ni_value1 | ni_value2 | nullif
-----------+-----------+--------
 abc       | abc       |
 abc       | efg       | abc
(2 rows)
gaussdb=# DROP TABLE null_if_t1;
```

If the value of **value1** is equal to that of **value2**, **NULL** is returned. Otherwise, the value of **value1** is returned.

```
gaussdb=# SELECT NULLIF('Hello','Hello World');
 nullif
--------
 Hello
(1 row)
```

- GREATEST (maximum value) and LEAST (minimum value)

  Figure 7-5 shows the syntax of GREATEST.

  Figure 7-5 greatest::=

  
  You can select the maximum value from any numerical expression list. Operations on XML data are supported.

  ```
  gaussdb=# SELECT greatest(9000,155555,2.01);
   greatest
  ----------
    155555
  (1 row)
  ```

  Figure 7-6 shows the syntax of LEAST.

  Figure 7-6 least::=

  
  You can select the minimum value from any numerical expression list.

  Each of the preceding numeric expressions can be converted into a common data type, which will be the data type of the result.

  The NULL values in the list will be ignored. The result is **NULL** only if the results of all expressions are **NULL**.

  Operations on XML data are supported.

  ```
  gaussdb=# SELECT least(9000,2);
   least
  -------
      2
  (1 row)
  ```

  For details, see **Conditional Expression Functions**.

- NVL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 7-7 shows the syntax of NVL.

Figure 7-7 nvl::=

If the value of **value1** is **NULL**, **value2** is returned. Otherwise, **value1** is returned. Operations on XML data are supported.

Example:

```
gaussdb=# SELECT nvl(null,1);
nvl
-----
 1
(1 row)
gaussdb=# SELECT nvl('Hello World',1);
      nvl
---------------
 Hello World
(1 row)
```

7.7.3 Subquery Expressions

Subquery expressions include the following types:

- EXISTS/NOT EXISTS

  Figure 7-8 shows the syntax of EXISTS/NOT EXISTS.

  Figure 7-8 EXISTS/NOT EXISTS::=

  
  The parameter of an **EXISTS** expression is an arbitrary **SELECT** statement, that is, subquery. The subquery is evaluated to determine whether it returns any rows. If it returns at least one row, the result of EXISTS is true. If the subquery returns no rows, the result of EXISTS is false.

  The subquery will generally only be executed long enough to determine whether at least one row is returned, not all the way to completion.

  Operations on XML data are not supported.

  Example:

  ```
  gaussdb=# CREATE TABLE exists_t1(a int, b int);
  gaussdb=# INSERT INTO exists_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

  gaussdb=# CREATE TABLE exists_t2(a int, c int);
  gaussdb=# INSERT INTO exists_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

  gaussdb=# SELECT * FROM exists_t1 t1 WHERE EXISTS (SELECT * FROM exists_t2 t2 WHERE t2.a =
  t1.a);
   a | b
  ---+---
   3 | 4
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 4 | 5
(2 rows)

gaussdb=# DROP TABLE exists_t1, exists_t2;
```

- IN/NOT IN

  Figure 7-9 shows the syntax of IN/NOT IN.

  Figure 7-9 IN/NOT IN::=

  
  The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result. The result of IN is true if any equal subquery row is found. The result is false if no equal row is found (including the case where the subquery returns no rows).

  This is in accordance with SQL normal rules for Boolean combinations of null values. If the columns corresponding to two rows equal and are not empty, the two rows are equal to each other. If any columns corresponding to the two rows do not equal and are not empty, the two rows are not equal to each other. Otherwise, the result is **NULL**. If the results in each row are either unequal or NULL, with at least one NULL, the result of IN is null.

  Operations on XML data are not supported.

  Example:

  ```
  gaussdb=# CREATE TABLE in_t1(a int, b int);
  gaussdb=# INSERT INTO in_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

  gaussdb=# CREATE TABLE in_t2(a int, c int);
  gaussdb=# INSERT INTO in_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

  gaussdb=# SELECT * FROM in_t1 t1 WHERE t1.a IN (SELECT t2.a FROM in_t2 t2);
   a | b
  ---+---
   3 | 4
   4 | 5
  (2 rows)

  gaussdb=# DROP TABLE in_t1, in_t2;
  ```

- ANY/SOME

  Figure 7-10 shows the syntax of ANY/SOME.

  Figure 7-10 any/some::=

  
  The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of the subquery result using the given operator, which must yield a Boolean result. The result of ANY is true if any true result is obtained. The result is false if no true result is found (including the case where the subquery returns no rows). **SOME** is a synonym of **ANY**. IN can be equivalently replaced with ANY.

Operations on XML data are not supported.

Example:

```
gaussdb=# CREATE TABLE any_t1(a int, b int);
gaussdb=# INSERT INTO any_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE any_t2(a int, c int);
gaussdb=# INSERT INTO any_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM any_t1 t1 WHERE t1.a < ANY(SELECT t2.a FROM any_t2 t2 where t2.a = 3
or t2.a = 4);
 a | b
---+---
 1 | 2
 2 | 3
 3 | 4
(3 rows)

gaussdb=# DROP TABLE any_t1, any_t2;
```

- ALL

  Figure 7-11 shows the syntax of ALL.

  Figure 7-11 all::=

  
  The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result using the given operator, which must yield a Boolean result. The result of ALL is true if all values are true (including the case where the subquery returns no rows). The result is false if any false result is found.

  Operations on XML data are not supported.

  Example:

```
gaussdb=# CREATE TABLE all_t1(a int, b int);
gaussdb=# INSERT INTO all_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE all_t2(a int, c int);
gaussdb=# INSERT INTO all_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM all_t1 t1 WHERE t1.a < ALL(SELECT t2.a FROM all_t2 t2 where t2.a = 3 or
t2.a = 4);
 a | b
---+---
 1 | 2
 2 | 3
(2 rows)

gaussdb=# DROP TABLE all_t1, all_t2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.7.4 Array Expressions

IN

expression **IN** *(value [, ...])*

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list meets the expression result on the left, the result of IN is true. If no result meets the requirements, the result of IN is false.

Example:

```
gaussdb=# SELECT 8000+500 IN (10000, 9000) AS RESULT;
 result
----------
 f
(1 row)
```

NOTE

- If the expression result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of IN is null rather than false. This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

NOT IN

expression **NOT IN** *(value [, ...])*

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list does not meet the expression result on the left, the result of NOT IN is true. If any content meets the expression result, the result of NOT IN is false.

Example:

```
gaussdb=# SELECT 8000+500 NOT IN (10000, 9000) AS RESULT;
 result
----------
 t
(1 row)
```

NOTE

- If the query statement result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of NOT IN is null rather than false. This method is consistent with the Boolean rules used when SQL statements return empty values.
- In all situations, X NOT IN Y equals to NOT(X IN Y).
- Operations on XML data are not supported.

ANY/SOME (array)

expression operator **ANY** *(array expression)*

expression operator **SOME** *(array expression)*

The right side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

results in each row of the array expression. The comparison result must be a Boolean value.

Example:

```
gaussdb=# SELECT 8000+500 < SOME (array[10000,9000]) AS RESULT;
 result
----------
 t
(1 row)
gaussdb=# SELECT 8000+500 < ANY (array[10000,9000]) AS RESULT;
 result
----------
 t
(1 row)
```

NOTE

- If at least one comparison result is true, the result of ANY is true.
- If no comparison result is true, the result of ANY is false.
- If no comparison result is true and the array expression generates at least one null value, the value of **ANY** is **NULL** rather than **false**. This method is consistent with the Boolean rules used when SQL statements return empty values.
- SOME is a synonym of ANY.
- Operations on XML data are not supported.

ALL (array)

expression operator **ALL** *(array expression)*

The right-hand side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the results in each row of the array expression. The comparison result must be a Boolean value.

- The result of ALL is true if all comparisons yield true (including the case where the array has zero elements).
- If one or more comparison results are false, the result of ALL is false.
- If the array expression yields a null array, the result of **ALL** will be null. If the expression on the left yields **NULL**, the result of ALL is generally **NULL** (though a non-strict comparison operator could possibly yield a different result). If the array on the right contains any null elements and no false comparison result is found, the result of **ALL** is **NULL**, not true (again, assuming a strict comparison operator). This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

```
gaussdb=# SELECT 8000+500 < ALL (array[10000,9000]) AS RESULT;
 result
----------
 t
(1 row)
```

7.7.5 Row Expressions

The syntax is as follows:

```
row_constructor operator row_constructor
```

Both sides of the row expression are row constructors. The values of both rows must have the same number of fields and they are compared with each other. The row comparison allows operators including =, <>, <, <=, and >= or a similar operator.

For operators <, <=, >, and > =, the columns in rows are compared from left to right until a pair of columns that are not equal or are empty are detected. If the pair of columns contains at least one null value, the comparison result is null. Otherwise, the comparison result of this pair of columns is the final result. If no unequal or empty column is found, the values in the two rows are equal. The final result is determined based on the operator meaning.

Operations on XML data are not supported.

Example:

```
gaussdb=# SELECT ROW(1,2,NULL) < ROW(1,3,0) AS RESULT;
 result
----------
 t
(1 row)

gaussdb=# SELECT (4,5,6) > (3,2,1) AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT (4,1,1) > (3,2,1) AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT ('test','data') > ('data','data') AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT (4,1,1) > (3,2,null) AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT (null,1,1) > (3,2,1) AS result;
 result
--------

(1 row)

gaussdb=# SELECT (null,5,6) > (null,5,6) AS result;
 result
--------

(1 row)

gaussdb=# SELECT (4,5,6) > (4,5,6) AS result;
 result
--------
 f
(1 row)

gaussdb=# SELECT (2,2,5) >= (2,2,3) AS result;
 result
--------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 t
(1 row)

gaussdb=# SELECT (2,2,1) <= (2,2,3) AS result;
 result
--------
 t
(1 row)
```

The use of operators = and <> is slightly different from other operators. If all columns in the two rows are not empty and meet the operator condition, the two rows meet the operator condition. If any column in the two rows is not empty and does not meet the operator condition, the two rows do not meet the operator condition. If any column in the two rows is empty, the comparison result is null.

Example:

```
gaussdb=# SELECT (1,2,3) = (1,2,3) AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT (1,2,3) <> (2,2,3) AS result;
 result
--------
 t
(1 row)

gaussdb=# SELECT (2,2,3) <> (2,2,null) AS result;
 result
--------

(1 row)

gaussdb=# SELECT (null,5,6) <> (null,5,6) AS result;
 result
--------

(1 row)
```

7.7.6 Time Interval Expressions

Syntax: INTERVAL EXPR UNIT

Description: **EXPR** indicates a value, and the **UNIT** specifier indicates a unit of the value, such as HOUR, DAY, and WEEK. The keyword INTERVAL and specifier are case-insensitive.

Table 7-199 describes the value range of **UNIT** in a time interval expression. Any punctuation-separated EXPR format is allowed. The recommended separators are displayed in **Table 7-199**.

NOTE

The INTERVAL expression supports the preceding functions only when **sql_compatibility** is set to **'B'**, **b_format_version** is set to **5.7**, and **b_format_dev_version** is set to **s1**.

Table 7-199 Value range of UNIT in a time interval expression

UNIT Value Range	Expected EXPR Format
MICROSECOND	MICROSECONDS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

UNIT Value Range	Expected EXPR Format
SECOND	SECONDS
MINUTE	MINUTES
HOUR	HOURS
DAY	DAYS
WEEK	WEEKS
MONTH	MONTHS
QUARTER	QUARTERS
YEAR	YEARS
SECOND_MICROSECOND	'SECOND_MICROSECOND'
MINUTE_MICROSECOND	'MINUTES:SECONDS.MICROSECONDS'
MINUTE_SECOND	'MINUTES:SECONDS'
HOUR_MICROSECOND	'HOURS:MINUTES:SECONDS.MICROSECONDS'
HOUR_SECOND	'HOURS:MINUTES:SECONDS'
HOUR_MINUTE	'HOURS:MINUTES'
DAY_MICROSECOND	'DAYS HOURS:MINUTES:SECONDS.MICROSECONDS'
DAY_SECOND	'DAYS HOURS:MINUTES:SECONDS'
DAY_MINUTE	'DAYS HOURS:MINUTES'
DAY_HOUR	'DAYS HOURS'
YEAR_MONTH	'YEAR_MONTH'

Example:

```
gaussdb=# SELECT DATE_ADD('2018-05-01', INTERVAL 1 DAY);
  date_add
------------
 2018-05-02
(1 row)

gaussdb=# SELECT DATE_SUB('2018-05-01', INTERVAL 1 YEAR);
  date_sub
------------
 2017-05-01
(1 row)

gaussdb=# SELECT DATE'2023-01-10' - INTERVAL 1 DAY;
     ?column?
---------------------
 2023-01-09 00:00:00
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# SELECT DATE'2023-01-10' + INTERVAL 1 MONTH;
     ?column?
---------------------
 2023-02-10 00:00:00
(1 row)
```

7.8 Pseudocolumn

ROWNUM is a pseudocolumn that returns a number indicating the row number of the obtained query result. The value of **ROWNUM** in the first row is **1**, the value of **ROWNUM** in the second row is **2**, and so on. **ROWNUM** can be used to limit the number of rows returned by a query, as shown in the following example:

```
gaussdb=# CREATE TABLE Students (name varchar(20), id int) with (STORAGE_TYPE = USTORE);
gaussdb=# INSERT INTO Students VALUES ('Jack', 35);
gaussdb=# INSERT INTO Students VALUES ('Leon', 15);
gaussdb=# INSERT INTO Students VALUES ('James', 24);
gaussdb=# INSERT INTO Students VALUES ('Taker', 81);
gaussdb=# INSERT INTO Students VALUES ('Mary', 25);
gaussdb=# INSERT INTO Students VALUES ('Rose', 64);
gaussdb=# INSERT INTO Students VALUES ('Perl', 18);
gaussdb=# INSERT INTO Students VALUES ('Under', 57);
gaussdb=# INSERT INTO Students VALUES ('Angel', 101);
gaussdb=# INSERT INTO Students VALUES ('Frank', 20);
gaussdb=# INSERT INTO Students VALUES ('Charlie', 40);

-- Output the first 10 rows of data records in the Students table.
gaussdb=# SELECT * FROM Students WHERE rownum <= 10;
 name  | id
-------+-----
 Jack  |  35
 Leon  |  15
 James |  24
 Taker |  81
 Mary  |  25
 Rose  |  64
 Perl  |  18
 Under |  57
 Angel | 101
 Frank |  20
(10 rows)
```

If the statement has a clause, the output rows are reordered according to the clause.

```
gaussdb=# SELECT * FROM Students WHERE rownum < 5 order by 1;
 name  | id
-------+----
 Jack  | 35
 James | 24
 Leon  | 15
 Taker | 81
(4 rows)
```

If a subquery has a clause but the condition is placed in the outermost query, you can use the **ROWNUM** condition after sorting.

```
gaussdb=# SELECT rownum, * FROM (SELECT * FROM Students order by 1) WHERE rownum <= 2;
 rownum |  name   | id
--------+---------+-----
      1 | Angel   | 101
      2 | Charlie |  40
(2 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

As long as **ROWNUM** is greater than a specific positive integer, the condition is always false. As shown in the following example, the statement does not return any result in the table:

```
gaussdb=# SELECT * FROM Students WHERE rownum > 1;
 name | id
------+----
(0 rows)
```

Use **ROWNUM** to assign a value to each row within a certain range of the table.

```
gaussdb=# SELECT * FROM Students;
  name   | id
---------+-----
 Jack    |  35
 Leon    |  15
 James   |  24
 Taker   |  81
 Mary    |  25
 Rose    |  64
 Perl    |  18
 Under   |  57
 Angel   | 101
 Frank   |  20
 Charlie |  40
(11 rows)

gaussdb=# UPDATE Students set id = id + 5 WHERE rownum < 4;
UPDATE 3
gaussdb=# SELECT * FROM Students;
  name   | id
---------+-----
 Jack    |  40
 Leon    |  20
 James   |  29
 Taker   |  81
 Mary    |  25
 Rose    |  64
 Perl    |  18
 Under   |  57
 Angel   | 101
 Frank   |  20
 Charlie |  40
(11 rows)

gaussdb=# DROP TABLE Students;
DROP TABLE
```

The restrictions on using **ROWNUM** are as follows:

- Do not use ROWNUM as an alias to avoid ambiguity in SQL statements.
- Do not use ROWNUM when creating an index.
- Do not use ROWNUM as the default value when creating a table.
- Do not use ROWNUM as an alias in the WHERE clause.
- Do not use ROWNUM when inserting data.
- Do not use ROWNUM in a tableless query.
- Do not use ROWNUM in the LIMIT clause.
- **ROWNUM** cannot be used as a parameter of the EXECUTE statement.
- Do not use ROWNUM to update a clause in the UPSERT statement.
- If the HAVING clause contains ROWNUM (not in an aggregate function), the GROUP BY clause must also contain ROWNUM (not in an aggregate function), unless the GROUP BY clause contains an expression, for example, **SELECT a + a FROM t group by a + a having rownum < 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the ROWNUM condition exists in the HAVING clause, the HAVING clause cannot be pushed down to any scan node.

```
gaussdb=# CREATE TABLE test (a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO test SELECT generate_series, generate_series FROM generate_series(1, 10);
INSERT 0 10

-- The rownum condition cannot be pushed down to seqscan.
gaussdb=# EXPLAIN SELECT a,rownum FROM test group by a,rownum having rownum < 5;
                          QUERY PLAN
------------------------------------------------------------------------
 HashAggregate  (cost=42.23..69.10 rows=2149 width=4)
   Group By Key: a, ROWNUM
   Filter: ((ROWNUM) < 5)
   ->  Rownum  (cost=0.00..31.49 rows=2149 width=4)
         ->  Seq Scan on test  (cost=0.00..31.49 rows=2149 width=4)
(5 rows)
```

- If a subquery contains the ROWNUM condition, the predicate cannot be pushed down to any scan node.

```
-- b<5 cannot be pushed down to seqscan.
gaussdb=# EXPLAIN SELECT * FROM (SELECT * FROM test WHERE rownum < 5) WHERE b < 5;
                            QUERY PLAN
-------------------------------------------------------------------------------
 Subquery Scan on __unnamed_subquery__  (cost=0.00..0.01 rows=1 width=8)
   Filter: (__unnamed_subquery__.b < 5)
   ->  Rownum  (cost=0.00..0.00 rows=1 width=8)
         StopKey: (ROWNUM < 5)
         ->  Seq Scan on test  (cost=0.00..31.49 rows=2149 width=8)
(5 rows)

gaussdb=# DROP TABLE test;
DROP TABLE
```

CAUTION

It is not recommended that the ROWNUM condition be used in the JOIN ON clause. In GaussDB, when the ROWNUM condition is used in the JOIN ON clause, the behavior in the LEFT JOIN, RIGHT JOIN, FULL JOIN, and MERGE INTO scenarios is different from that in other databases, causing risks in service migration.

If the parent query contains the **rownum** restriction and the projection column of the subquery contains **rownum**, the restriction is pushed down to the subquery. The constraints are as follows:

- The parent query can be pushed down only when the **rownum** restriction condition is <, <=, or = and the subquery directly uses **rownum** as the pseudocolumn.
- If the parent query has multiple filter criteria for **rownum** in the subquery and the pushdown requirements are met, only the first filter criterion is pushed down.
- If a subquery contains volatile functions and stored procedures, the pushdown is not supported.

7.9 Type Conversion

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.9.1 Overview

Context

SQL is a typed language. That is, every data item has an associated data type which determines its behavior and allowed usage. GaussDB has an extensible type system that is more general and flexible than other SQL implementations. Hence, most type conversion behaviors in GaussDB are governed by general rules. This allows the use of mixed-type expressions.

The GaussDB scanner/parser divides lexical elements into five fundamental categories: integers, floating-point numbers, strings, identifiers, and keywords. Constants of most non-numeric types are first classified as strings. The SQL language definition allows specifying type names with constant strings. Example:

```
gaussdb=# SELECT text 'Origin' AS "label", point '(0,0)' AS "value";
 label  | value
--------+-------
 Origin | (0,0)
(1 row)
```

In this example, there are two literal constants of the text and point types, respectively. If a type is not specified for a string literal, then the placeholder type unknown is assigned initially.

There are four fundamental SQL constructs requiring distinct type conversion rules in GaussDB parser:

- Function calls

  Much of the SQL type system is built around a rich set of functions. Functions can have one or more arguments. Since SQL permits function overloading, the function name alone does not uniquely identify the function to be called. The parser must select the right function based on the data types of the supplied arguments.

- Operators

  SQL allows expressions with prefix and postfix unary (one-argument) operators, as well as binary (two-argument) operators. Like functions, operators can be overloaded, so the same problem of selecting the right operator exists.

- Value storage

  The INSERT and UPDATE statements place the results of expressions into a table. The expressions in the statement must be matched up with, and perhaps converted to, the types of the target columns.

- UNION, CASE, and Related Constructs

  Since all query results from a unionized SELECT statement must appear in a single set of columns, the types of the results of each SELECT clause must be matched up and converted to a uniform set. Similarly, the result expressions of a CASE construct must be converted to a common type so that the CASE expression as a whole has a known output type. The same holds for ARRAY constructs, and for the GREATEST and LEAST functions.

The system catalog pg_cast stores information about which conversions, or casts, exist between which data types, and how to perform those conversions. For details, see **PG_CAST**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The return type and conversion behavior of an expression are determined during semantic analysis. Data types are divided into several basic type categories, including Boolean, numeric, string, bitstring, datetime, timespan, geometric, and network. Within each category there can be one or more preferred types, which are preferred when there is a choice of possible types. With careful selection of preferred types and available implicit casts, it is possible to ensure that ambiguous expressions (those with multiple candidate parsing solutions) can be resolved in a useful way.

All type conversion rules are designed based on the following principles:

- Implicit conversions should never have surprising or unpredictable outcomes.
- There should be no extra overhead in the parser or executor if a query does not need implicit type conversion. That is, if a query is well-formed and the types already match, then the query should execute without spending extra time in the parser and without introducing unnecessary implicit conversion calls in the query.
- Additionally, if a query usually requires an implicit conversion for a function, and if then the user defines a new function with the correct argument types, the parser should use this new function.
- XML data does not support implicit type conversion, including implicit conversion between strings and XML types.

7.9.2 Operators

Operator Type Resolution

1. Select the operators to be considered from the pg_operator system catalog. Considered operators are those with the matching name and argument count. If the search path finds multiple available operators, only the most suitable one is considered.
2. Look for the best match.
   a. Discard candidate operators for which the input types do not match and cannot be converted (using an implicit conversion) to match. Unknown text can be converted to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
   b. Run through all candidates and keep those with the most exact matches on input types. In this case, the domain types are considered the same as their basic types. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
   c. Run through all candidates and keep those that accept preferred types (of the input data type's type category) at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
   d. If any input arguments are of unknown types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

because the correct choice cannot be deduced without more clues. Discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category, discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.

e. If there are both unknown and known-type arguments, and all the known-type arguments have the same type, assume that the unknown arguments are also of that type, and check which candidates can accept that type at the unknown-argument positions. If exactly one candidate passes this test, use it. Otherwise, an error occurs.

CAUTION

After an operator is found, if the type of the input parameter is different from that of the operator, implicit type conversion may occur. After the conversion, unpredictable behavior may occur. If the behavior is incorrect after implicit conversion, you can use explicit type conversion to avoid this problem. For example, after the fixed-length bpchar type is converted to the variable-length text type, spaces at the end of the character string are deleted. If the character string is compared with other character strings, errors may occur.

Examples

Example 1: Use factorial operator type resolution. There is only one factorial operator (postfix !) defined in the system catalog, and it takes an argument of bigint type. The scanner assigns bigint as an initial type to the argument in this query expression:

```
gaussdb=# SELECT 40 ! AS "40 factorial";

                  40 factorial
-------------------------------------------------
 815915283247897734345611269596115894272000000000
(1 row)
```

The parser performs a type conversion on the operand and the query is equivalent to:

```
gaussdb=# SELECT CAST(40 AS bigint) ! AS "40 factorial";
```

Example 2: String concatenation operator type resolution. A string-like syntax is used for working with string types and for working with complex extension types. Strings with unspecified type are matched with likely operator candidates. An example with one unspecified argument:

```
gaussdb=# SELECT text 'abc' || 'def' AS "text and unknown";
 text and unknown
------------------
 abcdef
(1 row)
```

In this example, the parser looks for an operator whose parameters are of the text type. Such an operator is found.

Here is a concatenation of two values of unspecified types:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT 'abc' || 'def' AS "unspecified";
 unspecified
-------------
 abcdef
(1 row)
```

NOTE

In this case there is no initial hint for which type to use, since no types are specified in the query. So, the parser looks for all candidate operators and finds that there are candidates accepting both string-category and bit-string-category inputs. Since string category is preferred when available, that category is selected, and then the preferred type for strings, text, is used as the specific type to resolve the unknown-type literals as.

Example 3: Absolute-value and negation operator type resolution. The GaussDB operator catalog has several entries for the prefix operator @. All the entries implement absolute-value operations for various numeric data types. One of these entries is for the float8 type, which is the preferred type in the numeric category. Therefore, GaussDB will use that entry when faced with an unknown input:

```
gaussdb=# SELECT @ '-4.5' AS "abs";
 abs
-----
 4.5
(1 row)
```

Here the system has implicitly resolved the unknown-type literal as the float8 type before applying the chosen operator.

Example 4: Use the array inclusion operator type resolution as an example. Here is another example of resolving an operator with one known and one unknown input:

```
gaussdb=# SELECT array[1,2] <@ '{1,2,3}' as "is subset";
 is subset
-----------
 t
(1 row)
```

NOTE

The GaussDB operator catalog has several entries for the infix operator <@, but the only two that could possibly accept an integer array on the left side are array inclusion (anyarray <@ anyarray) and range inclusion (anyelement <@ anyrange). Since none of these polymorphic pseudo-types (see **Pseudo-Types**) is considered preferred, the parser cannot resolve the ambiguity on that basis. However, the last resolution rule tells it to assume that the unknown-type literal is of the same type as the other input, that is, integer array. Now only one of the two operators can match, so array inclusion is selected. (Had range inclusion been selected, we would have gotten an error, because the string does not have the right format to be a range literal.)

7.9.3 Functions

Function Type Resolution

1. Select the functions to be considered from the pg_proc system catalog. If a non-schema-qualified function name was used, the functions in the current search path are considered. If a qualified function name was given, only functions in the specified schema are considered.

   If the search path finds multiple functions of different argument types, a proper function in the path is considered.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Check for a function accepting exactly the input argument types. If the function exists, use it. Cases involving unknown types will never find a match at this step.
3. If no exact match is found, see if the function call appears to be a special type conversion request.
4. Look for the best match.
   a. Discard candidate functions for which the input types do not match and cannot be converted (using an implicit conversion) to match. Unknown text can be converted to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
   b. Run through all candidates and keep those with the most exact matches on input types. Domains are considered the same as their base type for this purpose. Keep all candidates if none has exact matches. If only one candidate remains, use it; else continue to the next step.
   c. Run through all candidates and keep those that accept preferred types at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
   d. If any input arguments are of unknown types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail because the correct choice cannot be deduced without more clues. Now discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category, discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
   e. If there are both unknown and known arguments, and all the known arguments have the same type, assume that the unknown arguments are also of that type, and check which candidates can accept that type at the unknown-argument positions. If exactly one candidate passes this test, use it. Otherwise, an error occurs.

Examples

Example 1: Use the rounding function argument type resolution as the first example. There is only one round function that takes two arguments; it takes a first argument of numeric type and a second argument of integer type. So the following query automatically converts the first argument of type integer to numeric:

```
gaussdb=# SELECT round(4, 4);
 round
--------
 4.0000
(1 row)
```

That query is actually transformed by the parser to:

```
gaussdb=# SELECT round(CAST (4 AS numeric), 4);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Since numeric constants with decimal points are initially assigned the numeric type, the following query will require no type conversion and therefore might be slightly more efficient:

```
gaussdb=# SELECT round(4.0, 4);
```

Example 2: Use the substring function type resolution as the second example. There are several substr functions, one of which takes text and integer types. If the function is called with a string constant of unspecified type, the system chooses the candidate function that accepts an argument of the preferred category string (namely of type text).

```
gaussdb=# SELECT substr('1234', 3);
 substr
--------
    34
(1 row)
```

If the string is declared to be of varchar type, as might be the case if it comes from a table, then the parser will try to convert it to become text:

```
gaussdb=# SELECT substr(varchar '1234', 3);
 substr
--------
    34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (varchar '1234' AS text), 3);
```

NOTE

The parser learns from the pg_cast catalog that text and varchar are binary-compatible, meaning that one can be passed to a function that accepts the other without doing any physical conversion. Therefore, no type conversion is really inserted in this case.

And, if the function is called with an argument of integer type, the parser will try to convert that to text:

```
gaussdb=# SELECT substr(1234, 3);
substr
--------
 34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (1234 AS text), 3);
 substr
--------
    34
(1 row)
```

7.9.4 Value Storage

Value Storage Type Resolution

1. Search for an exact match with the target column.
2. Try to convert the expression to the target type. This will succeed if there is a registered cast between the two types. If the expression is an unknown-type literal, the content of the literal string will be fed to the input conversion routine for the target type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Check whether there is a sizing cast for the target type. A sizing cast is a cast from that type to itself. If one is found in the pg_cast catalog, apply it to the expression before storing into the destination column. The implementation function for such a cast always takes an extra parameter of integer type. The parameter receives the destination column's **atttypmod** value (typically its declared length, although the interpretation of **atttypmod** varies for different data types), and may take a third Boolean parameter that says whether the cast is explicit or implicit. The cast function is responsible for applying any length-dependent semantics such as size checking or truncation.

Examples

Use the character storage type conversion as an example. For a target column declared as character(20), the following statement shows that the stored value is sized correctly:

```
gaussdb=# CREATE TABLE tpcds.value_storage_t1 (
   VS_COL1 CHARACTER(20)
);
gaussdb=# INSERT INTO tpcds.value_storage_t1 VALUES('abcdef');
gaussdb=# SELECT VS_COL1, octet_length(VS_COL1) FROM tpcds.value_storage_t1;
      vs_col1        | octet_length
----------------------+--------------
 abcdef               |           20
(1 row)
)

gaussdb=# DROP TABLE tpcds.value_storage_t1;
```

NOTE

What has happened here is that the two unknown literals are resolved to text by default, allowing the || operator to be resolved as text concatenation. Then the text result of the operator is converted to bpchar ("blank-padded char", the internal name of the character data type) to match the target column type. Since the conversion from text to bpchar is binary-coercible, this conversion does not insert any real function call. Finally, the sizing function bpchar(bpchar, integer, Boolean) is found in the system catalog and used for the operator's result and the stored column length. This type-specific function performs the required length check and addition of padding spaces.

7.9.5 UNION, CASE, and Related Constructs

SQL UNION constructs must match up possibly dissimilar types to become a single result set. The resolution algorithm is applied separately to each output column of a union query. The INTERSECT and EXCEPT constructs resolve dissimilar types in the same way as UNION. The CASE, ARRAY, VALUES, GREATEST and LEAST constructs use the identical algorithm to match up their component expressions and select a result data type.

Type Resolution for UNION, CASE, and Related Constructs

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type (the preferred type of the string category). Otherwise, unknown inputs are ignored.
- If the inputs are not all of the same type category, a failure will be resulted. (The unknown type is not included in this case.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the inputs are all of the same type category, choose the top preferred type in that category. (Exception: The UNION operation regards the type of the first branch as the selected type.)

  NOTE

  typcategory in the pg_type system catalog indicates the data type category. **typispreferred** specifies whether a type is preferred in **typcategory**.
- Convert all inputs to the selected type. (Retain the original lengths of strings). Fail if there is not an implicit conversion from a given input to the selected type.
- If the input contains the json, txid_snapshot, sys_refcursor, or geometry type, UNION cannot be performed.

Type Resolution for CASE and COALESCE in TD-compatible Type

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type.
- If inputs are of the string type (including unknown which is resolved as text) and digit type, resolve them as the string type. If the inputs are not of the two types, an error will be reported.
- If the inputs are all of the same type category, choose the top preferred type in that category.
- Convert all inputs to the selected type. Fail if there is not an implicit conversion from a given input to the selected type.

Type Resolution for CASE in A-compatible Mode

decode(expr, search1, result1, search2, result2, ..., defresult): When the **sql_beta_feature** is set to **a_style_coerce**, the final return value type of the expression is set to the data type of result1 or a higher-precision data type in the same type as result1. (For example, numeric and int are both numeric data types, but numeric has higher precision and priority than int.) For CASE WHEN, the behavior is the same as the default behavior in A-compatible mode.

- If all inputs are of the same type and are not unknown, resolve them as the unknown type. Otherwise, proceed to the next step.
- Set the data type of result1 to the final return value type preferType, which belongs to preferCategory.
- Consider the data types of result2, result3, and defresult in sequence. If the type category is also preferCategory, which is the same as that of result1, check whether the precision (priority) is higher than that of preferType. If it is, update preferType to a data type with higher precision. If the type category is not preferCategory, check whether the category can be implicitly converted to preferType. If it cannot, an error is reported.
- Uses the data type recorded by preferType as the return value type of the expression. The expression result is implicitly converted to this data type.

Note 1:

There is a special case where the character type of a super-large number is converted to the numeric type, for example, **select decode(1, 2, 2,**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

'53465465676465454657567678676'), in which the large number exceeds the range of the bigint and double types. If result1 is of the numeric type and does not meet the condition that all inputs are of the same type, the type of the return value is set to numeric to be compatible with this special case.

Note 2:

Priority of the numeric types: numeric > float8 > float4 > int8 > int4 > int2 > int1

Priority of the character types: text > varchar (nvarchar2) > bpchar > char

Priority of date types: timestamptz > timestamp > smalldatetime > date > abstime > timetz > time

Priority of date span types: interval > tinterval > reltime

Note 3:

The following figure shows the supported implicit type conversion when **set sql_beta_feature** is set to **'a_style_coerce'** in ORA-compatible mode. **** indicates that conversion is not required, **yes** indicates that conversion is supported, and the blank value indicates that conversion is not supported.

	bool	int1	int2	int4	int8	float4	float8	numeric	money	char	bpchar	varchar2	nvarchar2	text/clob	raw	blob	date	time	timetz	timestamp	timestamptz	smalldatetime	interval	reltime	abstime
bool	\																								
int1		\	yes	yes	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int2		yes	\	yes	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int4		yes	yes	\	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int8		yes	yes	yes	\	yes	yes	yes		yes	yes	yes	yes	yes											
float4		yes	yes	yes	yes	\	yes	yes		yes	yes	yes	yes	yes											
float8		yes	yes	yes	yes	yes	\	yes		yes	yes	yes	yes	yes											
numeric		yes	yes	yes	yes	yes	yes	\		yes	yes	yes	yes	yes											
money									\																
char		yes	yes	yes	yes	yes	yes	yes		\	yes	yes	yes	yes											
bpchar		yes	yes	yes	yes	yes	yes	yes		yes	\	yes	yes	yes											
varchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	\	yes	yes	yes										
nvarchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	\	yes											
text/clob		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	yes	\											
raw												yes		yes	\	yes									
blob															yes	\									
date												yes	yes	yes			\			yes	yes	yes			yes
time														yes				\	yes						
timetz														yes				yes	\						
timestamp												yes	yes	yes			yes			\	yes	yes			yes
timestamptz														yes			yes			yes	\	yes			yes
smalldatetime												yes		yes			yes			yes	yes	\			yes
interval												yes	yes	yes									\	yes	
reltime														yes									yes	\	
abstime														yes			yes			yes	yes	yes			\

Examples

Example 1: Use type resolution with underspecified types in a union as the first example. Here, the unknown-type literal **'b'** will be resolved to type **text**.

```
gaussdb=# SELECT text 'a' AS "text" UNION SELECT 'b';
 text
------
 a
 b
(2 rows)
```

Example 2: Use type resolution in a simple union as the second example. The literal **1.2** is of numeric type, and the integer value **1** can be cast implicitly to numeric type, so that type is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT 1.2 AS "numeric" UNION SELECT 1;
 numeric
---------
       1
     1.2
(2 rows)
```

Example 3: Use type resolution in a transposed union as the third example. Since the real type cannot be implicitly cast to integer, but integer can be implicitly cast to real, the union result type is resolved as real.

```
gaussdb=# SELECT 1 AS "real" UNION SELECT CAST('2.2' AS REAL);
 real
------
    1
  2.2
(2 rows)
```

Example 4: In TD mode, if input parameters for **COALESCE** are of int and varchar types, resolve them as the varchar type. In the A-compatible mode, an error is reported.

```
-- In the A-compatible mode, create the a_1 database compatible with A.
gaussdb=# CREATE DATABASE a_1 dbcompatibility = 'A';

-- Switch to the a_1 database.
gaussdb=# \c a_1

-- Create the t1 table.
a_1=# CREATE TABLE t1(a int, b varchar(10));

-- Show the execution plan of a statement for querying the types int and varchar of input parameters for
COALESCE.
a_1=# EXPLAIN SELECT coalesce(a, b) FROM t1;
ERROR:  COALESCE types integer and character varying cannot be matched
LINE 1: EXPLAIN SELECT coalesce(a, b) FROM t1;
                               ^
CONTEXT:  referenced column: coalesce

-- Delete the table.
a_1=# DROP TABLE t1;

-- Switch to the testdb database.
a_1=# \c testdb

-- In TD mode, create the td_1 database compatible with Teradata.
gaussdb=# CREATE DATABASE td_1 dbcompatibility = 'C';

-- Switch to the td_1 database.
gaussdb=# \c td_1

-- Create the t2 table.
td_1=# CREATE TABLE t2(a int, b varchar(10));

-- Show the execution plan of a statement for querying the types int and varchar of input parameters for
COALESCE.
td_1=# EXPLAIN VERBOSE select coalesce(a, b) from t2;
                                  QUERY PLAN
-------------------------------------------------------------------------------------------
 Data Node Scan  (cost=0.00..0.00 rows=0 width=0)
   Output: (COALESCE((t2.a)::character varying, t2.b))
   Node/s: All dbnodes
   Remote query: SELECT COALESCE(a::character varying, b) AS "coalesce" FROM public.t2
(4 rows)

-- Delete the table.
td_1=# DROP TABLE t2;

-- Switch to the testdb database.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
td_1=# \c testdb

-- Delete the A- and TD-compatible databases.
gaussdb=# DROP DATABASE a_1;
gaussdb=# DROP DATABASE td_1;
```

Example 5: In ORA-compatible mode, set the final return value type of the expression to the data type of result1 or a higher-precision data type whose category is the same as that of the data type of result1.

```
-- In ORA-compatible mode, create the ora_1 database compatible with ORA.
gaussdb=# CREATE DATABASE ora_1 dbcompatibility = 'A';

-- Switch to the ora_1 database.
gaussdb=# \c ora_1

-- Enable the decode compatibility parameters.
set sql_beta_feature='a_style_coerce';

-- Create the t1 table.
ora_1=# CREATE TABLE t1(c_int int, c_float8 float8, c_char char(10), c_text text, c_date date);

-- Insert data.
ora_1=# INSERT INTO t1 VALUES(1, 2, '3', '4', date '12-10-2010');

-- The data type of result1 is char and that of defresult is text. The precision of text is higher, and the type of the return value is changed to text from char.
ora_1=# SELECT decode(1, 2, c_char, c_text) AS result, pg_typeof(result) FROM t1;
 result | pg_typeof
--------+-----------
 4      | text
(1 row)

-- The data type of result1 is int, which is a numeric type. The type of the return value is set to numeric.
ora_1=# SELECT decode(1, 2, c_int, c_float8) AS result, pg_typeof(result) FROM t1;
 result | pg_typeof
--------+-----------
      2 | numeric
(1 row)

-- The implicit conversion from the data type of defresult to that of result1 does not exist. If it is performed, an error is reported.
ora_1=# SELECT decode(1, 2, c_int, c_date) FROM t1;
ERROR:  CASE types integer and timestamp without time zone cannot be matched
LINE 1: SELECT decode(1, 2, c_int, c_date) FROM t1;
                                   ^
CONTEXT:  referenced column: c_date

-- Disable the decode compatibility parameters.
set sql_beta_feature='none';

-- Delete the table.
ora_1=# DROP TABLE t1;
DROP TABLE

-- Switch to the testdb database.
ora_1=# \c testdb

-- Delete the ORA-compatible database.
gaussdb=# DROP DATABASE ora_1;
DROP DATABASE
```

7.10 System Operation

GaussDB text runs SQL statements to perform different system operations, such as setting variables, displaying the execution plan, and collecting garbage data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting Variables

For details about how to set various parameters for a session or transaction, see **SET**.

Displaying the Execution Plan

For details about how to display the execution plan that GaussDB makes for SQL statements, see **EXPLAIN**.

Specifying a Checkpoint in Transaction Logs

By default, WALs periodically specify checkpoints in a transaction log. **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system. For details, see **CHECKPOINT**.

Collecting Unnecessary Data

For details about how to collect garbage data and analyze a database as required, For details, see **VACUUM**.

Collecting Statistics

For details about how to collect statistics on tables in databases, see **ANALYZE | ANALYSE**.

Setting the Constraint Check Mode for the Current Transaction

For details about how to set the constraint check mode for the current transaction, For details, see **SET CONSTRAINTS**.

Shutting Down The Current Database Node

For details about shutting down the current database node, see **SHUTDOWN**.

7.11 Controlling Transactions

A transaction is a user-defined sequence of database operations, which form an integral unit of work.

Starting a Transaction

GaussDB starts a transaction using **START TRANSACTION** and **BEGIN**. For details, see **START TRANSACTION** and **BEGIN**.

Setting a Transaction

GaussDB sets a transaction using **SET TRANSACTION** or **SET LOCAL TRANSACTION**. For details, see **SET TRANSACTION**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Committing a Transaction

GaussDB commits all operations of a transaction using **COMMIT** or **END**. For details, see **COMMIT | END**.

Rolling Back a Transaction

If a fault occurs during a transaction and the transaction cannot proceed, the system performs rollback to cancel all the completed database operations related to the transaction. See **ROLLBACK**.

NOTE

If an execution request (not in a transaction block) received in the database contains multiple statements, the request is packed into a transaction. If one of the statements fails, the entire request will be rolled back.

7.12 SQL Syntax

7.12.1 SQL Syntax

Table 7-200 SQL syntax

Format	Description
[ ]	The part enclosed in brackets ([]) is optional.
...	Preceding elements can appear repeatedly.
[x | y | ...]	One item is selected from two or more options or no item is selected.
{ x | y | ... }	One item is selected from two or more options.
[x | y | ...] [...]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with spaces.
[x | y | ...] [,...]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with commas (,).
{ x | y | ... } [...]	At least one parameter can be selected. If multiple parameters are selected, separate them with spaces.
{ x | y | ... } [,...]	At least one parameter can be selected. If multiple parameters are selected, separate them with commas (,).

7.12.2 DCL Syntax Overview

Data control language (DCL) is used to set or change the permissions of database users or roles.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Granting Rights

GaussDB provides a statement for granting rights to data objects and roles. For details, see **GRANT**.

Revoking Rights

GaussDB provides a statement for revoking rights. For details, see **REVOKE**.

Setting Default Rights

GaussDB allows users to set rights for objects that will be created. For details, see .**ALTER DEFAULT PRIVILEGES**

Changing Owners

GaussDB provides statements for changing owners of database objects. For details, see **REASSIGN OWNED**.

7.12.3 DDL Syntax Overview

Data definition language (DDL) is used to define or change an object in a database, such as a table, an index, or a view.

NOTE

GaussDB does not support DDL operations when the the primary node of the database is incomplete. For example, if the primary node of the database is faulty, creating a database or a table will fail.

Defining a Role

A role is used to manage permissions. For database security, management and operation permissions can be granted to different roles. For details about related SQL statements, see **Table 7-201**.

Table 7-201 SQL statements for defining a role

Function	SQL Statement
Creating a role	**CREATE ROLE**
Altering role attributes	**ALTER ROLE**
Dropping a role	**DROP ROLE**
Dropping the database objects owned by a database role	**DROP OWNED**

Defining a User

A user is used to log in to a database. Different permissions can be granted to users for managing data accesses and operations of the users. For details about related SQL statements, see **Table 7-202**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-202 SQL statements for defining a user

Function	SQL Statement
Creating a User	**CREATE USER**
Altering user attributes	**ALTER USER**
Dropping a user	**DROP USER**

Defining a CMK

CMKs are used to encrypt column encryption keys (CEKs) for the encrypted database feature. CMK definition includes creating and deleting a CMK. **Table 7-203** lists the involved SQL statements.

Table 7-203 SQL statements for defining a CMK

Function	SQL Statement
Creating a CMK	**CREATE CLIENT MASTER KEY**
Dropping a CMK	**DROP CLIENT MASTER KEY**

Defining a Column Encryption Key (CEK)

CEKs are used to encrypt data for the encrypted database feature. You can create a CEK, change the client master key specified by a CEK, and delete a CEK. **Table 7-204** lists the involved SQL statements.

Table 7-204 SQL statements for defining a CEK

Function	SQL Statement
Creating a CEK	**CREATE COLUMN ENCRYPTION KEY**
Changing the client master key specified by a CEK	**ALTER COLUMN ENCRYPTION KEY**
Dropping a CEK	**DROP COLUMN ENCRYPTION KEY**

Defining a Database

A database is the warehouse for organizing, storing, and managing data. Defining a database includes: creating a database, altering the database attributes, and dropping the database. **Table 7-205** lists the involved SQL statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-205 SQL statements for defining a database

Function	SQL Statement
Creating a database	CREATE DATABASE
Altering database attributes	ALTER DATABASE
Dropping a Database	DROP DATABASE

Defining a Schema

A schema is the set of a group of database objects and is used to control the access to the database objects. Table 7-206 lists the involved SQL statements.

Table 7-206 SQL statements for defining a schema

Function	SQL Statement
Creating a schema	CREATE SCHEMA
Altering schema attributes	ALTER SCHEMA
Dropping a schema	DROP SCHEMA

Defining a Tablespace

A tablespace is used to manage data objects and corresponds to a catalog on a disk. Table 7-207 lists the involved SQL statements.

Table 7-207 SQL statements for defining a tablespace

Function	SQL Statement
Creating a tablespace	CREATE TABLESPACE
Altering tablespace attributes	ALTER TABLESPACE
Dropping a tablespace	DROP TABLESPACE

Defining a Table

A table is a special data structure in a database and is used to store data objects and relationship between data objects. Table 7-208 lists the involved SQL statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-208 SQL statements for defining a table

Function	SQL Statement
Creating a table	**CREATE TABLE**
Altering table attributes	**ALTER TABLE**
Changing one or more tables to be flashed back	**RENAME TABLE**
Dropping a table	**DROP TABLE**
Creating a table from the results of a query	**CREATE TABLE AS**

Defining a Partitioned Table

A partitioned table is a logical table used to improve query performance and does not store data (data is stored in ordinary tables). **Table 7-209** lists the involved SQL statements.

Table 7-209 SQL statements for defining a partitioned table

Function	SQL Statement
Creating a partitioned table	**CREATE TABLE PARTITION**
Modifying a partitioned table (including adding/deleting partitions and modifying partition attributes)	**ALTER TABLE PARTITION**
Dropping a partitioned table	**DROP TABLE**
Creating a level-2 partitioned table	**CREATE TABLE SUBPARTITION**
Changing partitions in a level-2 partitioned table	**ALTER TABLE SUBPARTITION**
Creating a partitioned table based on the query result	**CREATE TABLE PARTITION | SUBPARTITION AS**

Defining an Index

An index indicates the sequence of values in one or more columns in a database table. It is a data structure that improves the speed of data access to specific information in a database table. **Table 7-210** lists the involved SQL statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 7-210 SQL statements for defining an index

Function	SQL Statement
Creating an index	**CREATE INDEX**
Altering index attributes	**ALTER INDEX**
Dropping an index	**DROP INDEX**
Rebuilding an index	**REINDEX**
Creating a global secondary index in a specified table	**CREATE GLOBAL INDEX**

Defining a Stored Procedure

A stored procedure is a set of SQL statements for achieving specific functions and is stored in the database after compiling. Users can specify a name and provide parameters (if necessary) to execute the stored procedure. **Table 7-211** lists the involved SQL statements.

Table 7-211 SQL statements for defining a stored procedure

Function	SQL Statement
Creating a stored procedure	**CREATE PROCEDURE**
Dropping a stored procedure	**DROP PROCEDURE**
Recompiling a stored procedure	**ALTER PROCEDURE**

Defining a Function

In GaussDB, a function is similar to a stored procedure, which is a set of SQL statements. The function and stored procedure are used the same. **Table 7-212** lists the involved SQL statements.

Table 7-212 SQL statements for defining a function

Function	SQL Statement
Creating a function	**CREATE FUNCTION**
Altering a function attribute	**ALTER FUNCTION**
Dropping a function	**DROP FUNCTION**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Package

A package consists of the package specification and package body. It is used to manage stored procedures and functions by class, which is similar to classes in languages such as Java and C++. **Table 7-213** lists the involved SQL statements.

Table 7-213 SQL statements for defining a package

Function	SQL Statement
Creating a package	**CREATE PACKAGE**
Dropping a package	**DROP PACKAGE**
Altering a package attribute	**ALTER PACKAGE**

Defining a Cursor

To process SQL statements, the stored procedure thread assigns a memory segment to store context association. Cursors are handles or pointers pointing to context areas. With a cursor, the stored procedure can control alterations in context areas, as shown in **Table 7-214**.

Table 7-214 SQL statements for defining a cursor

Function	SQL Statement
Creating a cursor	**CURSOR**
	DECLARE
Moving a cursor	**MOVE**
Closing a cursor	**CLOSE**

Defining a Resource Pool

A resource pool is a system catalog used by the workload management module to specify attributes related to resource management, such as Cgroups. **Table 7-215** lists the involved SQL statements.

Table 7-215 SQL statements for defining a resource pool

Function	SQL Statement
Creating a resource pool	**CREATE RESOURCE POOL**
Altering a resource pool attribute	**ALTER RESOURCE POOL**
Dropping a resource pool	**DROP RESOURCE POOL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining an Aggregate Function

Table 7-216 SQL statements for defining an aggregate function

Function	SQL Statement
Creating an aggregate function	**CREATE AGGREGATE**
Changing an aggregate function	**ALTER AGGREGATE**
Dropping an aggregate function	**DROP AGGREGATE**

Defining Data Type Conversion

Table 7-217 SQL statements for defining a data type

Function	SQL Statement
Creating user-defined data type conversion	**CREATE CAST**
Dropping user-defined data type conversion	**DROP CAST**

Defining a Plug-in Extension

This feature is for internal use only. You are advised not to use it.

Table 7-218 SQL statements for defining a plug-in extension

Function	SQL Statement
Creating an extension	**CREATE EXTENSION**
Changing an extension	**ALTER EXTENSION**
Dropping an extension	**DROP EXTENSION**

Defining an Operator

Table 7-219 SQL statements for defining an operator

Function	SQL Statement
Creating an operator	**CREATE OPERATOR**
Changing an operator	**ALTER OPERATOR**
Dropping an operator	**DROP OPERATOR**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Defining a new operator class	CREATE OPERATOR CLASS

Defining a Data Type

Table 7-220 SQL statements for defining a data type

Function	SQL Statement
Creating a data type	CREATE TYPE
Changing a data type	ALTER TYPE
Dropping a data type	DROP TYPE

Defining a Scheduled Task

Table 7-221 SQL statements for defining a scheduled task

Function	SQL Statement
Creating a scheduled task	CREATE EVENT
Changing a scheduled task	ALTER EVENT
Dropping a scheduled task	DROP EVENT

Defining a Database Link

DATABASE LINK can be used to remotely operate a database object. **Table 7-222** lists the involved SQL statements.

Table 7-222 DATABASE LINK-related SQL statements

Function	SQL Statement
Creating a database link	CREATE DATABASE LINK
Changing a database link	ALTER DATABASE LINK
Dropping a database link	DROP DATABASE LINK

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining an Audit Policy

Table 7-223 SQL statements for defining an audit policy

Function	SQL Statement
Creating a unified audit policy	CREATE AUDIT POLICY
Changing a unified audit policy	ALTER AUDIT POLICY
Dropping an audit policy	DROP AUDIT POLICY

Defining a Directory

Table 7-224 SQL statements for defining a directory

Function	SQL Statement
Creating a directory	CREATE DIRECTORY
Changing attributes of a directory	ALTER DIRECTORY
Dropping a specified directory	DROP DIRECTORY

Creating a Foreign Data Wrapper

Table 7-225 SQL statements related to the foreign data wrapper

Function	SQL Statement
Creating a foreign data wrapper	CREATE FOREIGN DATA WRAPPER
Changing a foreign data wrapper	ALTER FOREIGN DATA WRAPPER
Dropping a foreign data wrapper	DROP FOREIGN DATA WRAPPER

Defining a Foreign Table

Table 7-226 SQL statements for defining a foreign table

Function	SQL Statement
Creating a foreign table	CREATE FOREIGN TABLE
Changing a foreign table	ALTER FOREIGN TABLE
Dropping a foreign table	DROP FOREIGN TABLE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SQL Statements Related to the gs_global_config System Catalog

Table 7-227 SQL statements related to the gs_global_config system catalog

Function	SQL Statement
Adding and Changing parameter values in the gs_global_config system catalog	**ALTER GLOBAL CONFIGURATION**
Dropping parameter values from the gs_global_config system catalog	**DROP GLOBAL CONFIGURATION**
Inserting one or more weak passwords into the gs_global_config system catalog	**CREATE WEAK PASSWORD DICTIONARY**
Clearing all weak passwords in the gs_global_config system catalog	**DROP WEAK PASSWORD DICTIONARY**

Defining a User Group

Table 7-228 SQL statements for defining a user group

Function	SQL Statement
Creating a user group	**CREATE GROUP**
Changing attributes of a user group	**ALTER GROUP**
Dropping a user group	**DROP GROUP**

Defining a Procedural Language

Table 7-229 SQL statements for defining a procedural language

Function	SQL Statement
Defining a new procedural language	**CREATE LANGUAGE**
Changing the definition of a procedural language	**ALTER LANGUAGE**
Dropping a procedural language	**DROP LANGUAGE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Masking Policy

Table 7-230 SQL statements for defining a masking policy

Function	SQL Statement
Creating a masking policy	CREATE MASKING POLICY
Changing a masking policy	ALTER MASKING POLICY
Dropping a masking policy	DROP MASKING POLICY

Defining a Materialized View

Table 7-231 SQL statements for defining a materialized view

Function	SQL Statement
Creating a complete-refresh materialized view	CREATE MATERIALIZED VIEW
Creating a fast-refresh materialized view	CREATE INCREMENTAL MATERIALIZED VIEW
Changing multiple auxiliary attributes of an existing materialized view	ALTER MATERIALIZED VIEW
Forcibly deleting an existing materialized view from the database	DROP MATERIALIZED VIEW
Refreshing a materialized view in complete refresh mode	REFRESH MATERIALIZED VIEW
Refreshing a materialized view in fast refresh mode	REFRESH INCREMENTAL MATERIALIZED VIEW

Defining a Resource Label

Table 7-232 SQL statements for defining a resource label

Function	SQL Statement
Creating a resource label	CREATE RESOURCE LABEL
Changing a resource label	ALTER RESOURCE LABEL
Dropping a resource label	DROP RESOURCE LABEL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Row-level Security Policy

Table 7-233 SQL statements for defining a row-level security policy

Function	SQL Statement
Creating a row-level security policy for a table	CREATE ROW LEVEL SECURITY POLICY
Changing an existing row-level security policy	ALTER ROW LEVEL SECURITY POLICY
Dropping a row-level security policy from a table	DROP ROW LEVEL SECURITY POLICY

Defining a Sequence

Table 7-234 SQL statements for defining a sequence

Function	SQL Statement
Adding a sequence to the current database	CREATE SEQUENCE
Changing parameters of an existing sequence	ALTER SEQUENCE
Dropping a sequence from the current database	DROP SEQUENCE

Defining a Foreign Server

Table 7-235 SQL statements for defining a foreign server

Function	SQL Statement
Defining a new foreign server	CREATE SERVER
Adding, changing, and deleting parameters of an existing server	ALTER SERVER
Dropping a data server	DROP SERVER

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Synonym Object

Table 7-236 SQL statements for defining a synonym object

Function	SQL Statement
Creating a synonym object	CREATE SYNONYM
Changing the owner of a synonym object	ALTER SYNONYM
Dropping a specified synonym object	DROP SYNONYM

Defining a Trigger

Table 7-237 SQL statements for defining a trigger

Function	SQL Statement
Creating a trigger	CREATE TRIGGER
Renaming a trigger	ALTER TRIGGER
Dropping a trigger	DROP TRIGGER

Defining a Mapping

Table 7-238 SQL statements for defining a mapping

Function	SQL Statement
Defining a new mapping from a user to a foreign server	CREATE USER MAPPING
Altering the definition of a user mapping	ALTER USER MAPPING
Dropping a user mapping for a foreign server	DROP USER MAPPING

Defining a View

Table 7-239 SQL statements for defining a view

Function	SQL Statement
Creating a view	CREATE VIEW

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Changing the auxiliary attributes of a view	ALTER VIEW
Forcibly deleting a view from the database	DROP VIEW

Collecting Statistics

For details about how to collect statistics related to the contents of ordinary tables in the database, see ANALYZE | ANALYSE.

Creating an Encoding Conversion Task

For details about how to define a new conversion between two character set encodings, see CREATE CONVERSION.

Defining a Model

Table 7-240 SQL statements for defining a model

Function	SQL Statement
Training a machine learning model and saving the model	CREATE MODEL
Dropping a model that has been trained and saved	DROP MODEL

Defining a Rewriting Rule

Table 7-241 SQL statements for defining a rewriting rule

Function	SQL Statement
Defining a new rewriting rule	CREATE RULE
Dropping a rewriting rule	DROP RULE

Defining a Security Label

Table 7-242 SQL statements for defining a security label

Function	SQL Statement
Creating a security label	CREATE SECURITY LABEL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Applying, updating, or canceling a security label	SECURITY LABEL ON
Dropping a security label	DROP SECURITY LABEL

Importing a Database/Table/PDB

Table 7-243 SQL statements for data import

Function	SQL Statement
Preparation phase for importing a database	IMPDP DATABASE CREATE
Execution phase of importing a database	IMPDP RECOVER
Preparation phase for importing a table	IMPDP TABLE PREPARE
Execution phase of importing a table	IMPDP TABLE
Execution phase of importing a PDB	IMPDP PLUGGABLE DATABASE CREATE
Rectification phase of importing a PDB	IMPDP PLUGGABLE DATABASE RECOVER

Clearing a Recycle Bin

GaussDB provides statements for clearing a recycle bin. For details, see **PURGE**.

Clustering a Table

GaussDB supports statements for clustering a table based on an index. For details, see **CLUSTER**.

Defining an Object Comment

GaussDB supports statements for defining or changing an object comment. For details, see **COMMENT**.

Creating a Table Based on Query Results

GaussDB supports statements for creating a table based on query results and inserting queried data into the new table. For details, see **SELECT INTO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Restoring a Table to an Earlier State

GaussDB allows you to restore a table to an earlier state in the event of a manual operation or application error. For details, see **TIMECAPSULE TABLE**.

Clearing Table Data

GaussDB supports statements for quickly deleting all rows from a table. For details, see **TRUNCATE**.

Recycling Storage Space

GaussDB supports statements for recycling storage space occupied by deleted rows in a table or B-Tree index. For details, see **VACUUM**.

7.12.4 DML Syntax Overview

Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.

Inserting Data

Inserting data refers to adding one or multiple records to a database table. For details, see **INSERT**.

To add one or more records to multiple tables at the same time, see **INSERT ALL**.

Updating Data

Updating data refers to changing one or multiple records in a database table. For details, see **UPDATE**.

Changing or Inserting Data

GaussDB provides statements for matching data in a target table with that in a source table based on join conditions. If data matches, UPDATE is executed on the target table; if data does not match, INSERT is executed. For details, see **MERGE INTO**.

Querying Data

The database query statement SELECT is used to search required information in a database. For details, see **SELECT**.

Deleting Data

GaussDB provides statements for deleting data that meets specified conditions from a table. For details, see **DELETE**.

Copying Data

GaussDB provides a statement for copying data between tables and files. For details, see **COPY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Locks

GaussDB provides multiple lock modes to control concurrent accesses to table data. For details, see **LOCK**.

GaussDB provides bucket-level locks. For details, see **LOCK BUCKETS**.

Calling a Function

GaussDB provides three statements for calling functions. These statements are the same in the syntax structure. For details, see **CALL**.

Prepared Statements

Table 7-244 SQL statements related to prepared statements

Function	SQL Statement
Executing a prepared statement	**EXECUTE**
Deallocating a prepared statement	**DEALLOCATE**

Session Management

A session is a connection established between the user and the database. For details, see **Table 7-245**.

Table 7-245 SQL statements related to sessions

Function	SQL Statement
Altering a session	**ALTER SESSION**
Killing a session	**ALTER SYSTEM KILL SESSION**

Executing an Anonymous Code Block

GaussDB provides statements for executing an anonymous code block. For details, see **DO**.

Exporting a File

Table 7-246 SQL statements for exporting files

Function	SQL Statement
Exporting all physical files in a database	**EXPDP DATABASE**
Exporting all files related to a table	**EXPDP TABLE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Exporting all physical files in a PDB	**EXPDP PLUGGABLE DATABASE**

Retrieving Data Using a Cursor

GaussDB provides statements for retrieving data using a created cursor. For details, see **FETCH**.

Inserting or Replacing Data

GaussDB provides statements for inserting or replacing data in a table. For details, see **REPLACE**.

Calculating a Value based on an Expression

GaussDB provides statements for calculating a value of a row or a group of rows based on a given value expression. For details, see **VALUES**.

Importing Data

GaussDB provides a statement for importing data from a file to a specified table in the database. For details, see **LOAD DATA**.

7.12.5 Other Syntax List

In addition to DCL, DDL, and DML syntax, GaussDB also provides syntax for other functions.

Shutting Down The Current Node

GaussDB allows users to run the **shutdown** command to shut down the current database node. For details, see **SHUTDOWN**.

SQL Statements Related to Bucket Scale-out

GaussDB supports statements used by the scale-out tool to notify the kernel of the buckets that have been migrated. For details, see **MARK BUCKETS**.

Clearing Database Connections

GaussDB supports statements for clearing database connections. For details, see **CLEAN CONNECTION**.

Showing an Execution Plan of an SQL Statement

GaussDB provides statements for showing an execution plan of an SQL statement. For details, see **EXPLAIN**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Storage Execution Plan

GaussDB provides statements for storing query execution plan information in the **PLAN_TABLE** table. For details, see **EXPLAIN PLAN**.

Prediction:

GaussDB provides statements for using a trained model to perform inference tasks. For details, see **PREDICT BY**.

Creating a Prepared Statement

GaussDB provides statements for creating a prepared statement. For details, see **PREPARE**.

SQL Statements Related to Transactions

Table 7-247 SQL statements related to transactions

Function	SQL Statement
Rolling back the current transaction and canceling the changes in the transaction	**ABORT**
	ROLLBACK
Starting a transaction	**BEGIN**
	SET TRANSACTION
	START TRANSACTION
Setting transaction log checkpoints	**CHECKPOINT**
Committing the current transaction	**COMMIT | END**
Committing a prepared two-phase transaction	**COMMIT PREPARED**
Preparing the current transaction for two-phase commit	**PREPARE TRANSACTION**
Deleting a savepoint previously defined for the current transaction	**RELEASE SAVEPOINT**
Canceling a transaction ready for two-phase commit	**ROLLBACK PREPARED**
Rolling back to a savepoint	**ROLLBACK TO SAVEPOINT**
Creating a savepoint in the current transaction	**SAVEPOINT**
Setting constraint check timing for the current transaction	**SET CONSTRAINTS**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Modifying, Displaying, and Restoring a GUC Parameter

Table 7-248 SQL statements for modifying, displaying, and restoring a GUC parameter

Function	SQL Statement
Modifying a GUC parameter	**SET**
Showing the current value of a GUC parameter	**SHOW**
Restoring a GUC parameter to the default value	**RESET**

Setting a User Identifier

Table 7-249 SQL statements for setting a user identifier

Function	SQL Statement
Setting the current user identifier of the current session	**SET ROLE**
Setting the session user identifier and the current user identifier of the current session to a specified user	**SET SESSION AUTHORIZATION**

Displaying Basic Information About All Scheduled Tasks

GaussDB provides statements for displaying basic information about all scheduled tasks in a specified schema. For details, see **SHOW EVENTS**.

Controlling Data in a Unified Manner

GaussDB provides statements for controlling data in a unified manner for multiple users. For details, see **SNAPSHOT**.

7.12.6 Online DDL and Related Operations

During traditional DDL operations, tables cannot provide read and write services. As a result, services may be interrupted for a long time. Online DDL operations have little impact on running services, improving service continuity and database availability.

By using the ONLINE keyword, you can perform the following online DDL operations: Change column types and precisions, reduce lengths, increase the CHAR type lengths, move tablespaces at the table level, add NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints, and perform VACUUM FULL. An exclusive lock is temporarily added to online DDL operations only in the early and later

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

phases of the execution and does not block concurrent read and write services for a long time. For details, see **ALTER TABLE** and **VACUUM**.

Table 7-250 lists the supported online DDL operations.

Table 7-250 Online DDL operations supported by the current version

Category	Operation	Required Time	Remarks
Column operations	The supported operations are as follows: • Add columns, that is, set default values of columns to an expression. • Drop columns. • Rename columns. • Set and drop default values of columns. • Change column lengths. • Change column precisions. • Change column types. • Change definitions of ENUM/SET columns.	• When data needs to be reorganized, the time required depends on the data volume. • When only metadata is changed, the time required is irrelevant to the data volume.	To change column types or precisions, reduce lengths, or increase CHAR type lengths, you need to use the ONLINE keyword.
Table operations	The supported operations are as follows: • Move tablespaces online at the table level. • Rename tables. • Specify character sets. • Delete tables.	• When data needs to be moved, the time required depends on the data volume. • When only metadata is changed, the time required is irrelevant to the data volume.	To move tablespaces online at the table level, you need to use the ONLINE keyword.
Tablespace operations	The supported operations are as follows: • Rename tablespaces. • Change owners of tablespaces. • Delete tablespaces.	When only metadata is changed, the time required is irrelevant to the data volume.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Operation	Required Time	Remarks
Constraint operations	The supported operations are as follows: • Add NOT NULL, CHECK, UNIQUE, and PRIMARY KEY constraints. • Set a column constraint to **NULL**.	• When data needs to be queried, the time required depends on the data volume. • When only metadata is changed, the time required is irrelevant to the data volume.	To add NOT NULL, CHECK, UNIQUE, and PRIMARY KEY constraints, you need to use the ONLINE keyword.
Partition operations	Add, delete, and truncate partitions, enable or disable row movement, and invalidate partitioned indexes.	When only metadata is changed, the time required is irrelevant to the data volume.	-
Recycling storage space	VACUUM FULL	When data needs to be reorganized, the time required depends on the data volume.	To recycle storage space, you need to use the ONLINE keyword.
Index operations	Build and rebuild the CONCURRENTLY index.	When data needs to be queried, the time required depends on the data volume.	For details about index operations, see **CREATE INDEX** and **REINDEX**.

7.12.7 A

7.12.7.1 ABORT

Description

Rolls back the current transaction and cancels the changes in the transaction.

This command is equivalent to **ROLLBACK**, and is present only for historical reasons. Now ROLLBACK is recommended.

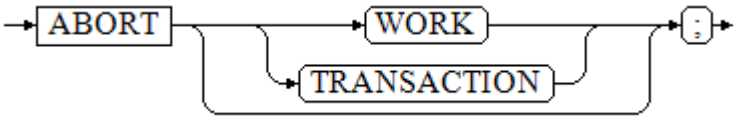
Precautions

ABORT has no impact outside a transaction, but will return a NOTICE message.

Syntax

```
ABORT [ WORK | TRANSACTION ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **WORK | TRANSACTION**

  Optional keyword has no effect except improving readability.

Examples

```
-- Create the customer_demographics_t1 table.
gaussdb=# CREATE TABLE customer_demographics_t1
(
    CD_DEMO_SK              INTEGER              NOT NULL,
    CD_GENDER               CHAR(1)                     ,
    CD_MARITAL_STATUS       CHAR(1)                     ,
    CD_EDUCATION_STATUS     CHAR(20)                    ,
    CD_PURCHASE_ESTIMATE    INTEGER                     ,
    CD_CREDIT_RATING        CHAR(10)                    ,
    CD_DEP_COUNT            INTEGER                     ,
    CD_DEP_EMPLOYED_COUNT   INTEGER                     ,
    CD_DEP_COLLEGE_COUNT    INTEGER
)
;

-- Insert data.
gaussdb=# INSERT INTO customer_demographics_t1 VALUES(1920801,'M', 'U', 'DOCTOR DEGREE', 200,
'GOOD', 1, 0,0);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Update the column value. Change the value of cd_education_status to Unknown.
gaussdb=# UPDATE customer_demographics_t1 SET cd_education_status= 'Unknown';

-- Abort the transaction. All updates are rolled back.
gaussdb=# ABORT;

-- Query data and find that the value of cd_education_status is not changed to Unknown.
gaussdb=# SELECT * FROM customer_demographics_t1 WHERE cd_demo_sk = 1920801;
cd_demo_sk | cd_gender | cd_marital_status | cd_education_status  | cd_purchase_estimate | cd_credit_rating
| cd_dep_count | cd_dep_employed_count | cd_dep_college_count
------------+-----------+-------------------+----------------------+----------------------+-----------------
+--------------+-----------------------+----------------------
   1920801 | M         | U                 | DOCTOR DEGREE        |                200 | GOOD             |           1
|                  0 |                     0
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE customer_demographics_t1;
```

Helpful Links

SET TRANSACTION, **COMMIT | END**, and **ROLLBACK**

7.12.7.2 ALTER AGGREGATE

Description

Modifies the definition of an aggregate function, including the name, owner, and schema.

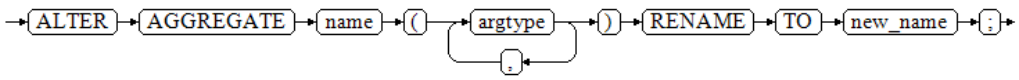
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

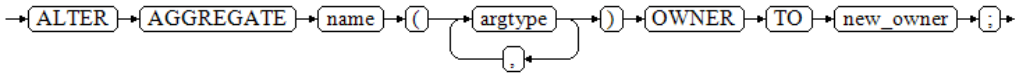
To use ALTER AGGREGATE, you must be the owner of the aggregate function. To change the schema of an aggregate function, you must have the CREATE permission on the new schema. To change the owner, you must be a direct or indirect member of the new role, and the role must have the CREATE permission on the aggregate function's schema. (These constraints restrict the owner from performing illegal operations by deleting and rebuilding aggregate functions.) However, a user with the SYSADMIN permission can change the ownership of an aggregate function in any way.

Syntax

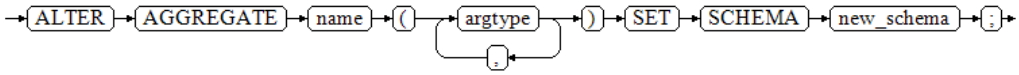
```
ALTER AGGREGATE name ( argtype [ , ... ] ) RENAME TO new_name;
```



```
ALTER AGGREGATE name ( argtype [ , ... ] ) OWNER TO new_owner;
```



```
ALTER AGGREGATE name ( argtype [ , ... ] ) SET SCHEMA new_schema;
```



Parameters

- **name**

  Name (optionally schema-qualified) of an existing aggregate function.
- **argtype**

  Input data type of the aggregate function. To reference a zero-parameter aggregate function, you can write an asterisk (*) instead of a list of input data types.
- **new_name**

  New name of the aggregate function.
- **new_owner**

  New owner of the aggregate function.
- **new_schema**

  New schema of the aggregate function.

Examples

- Change the name of the aggregate function.

```
-- Create a user-defined function.
gaussdb=# CREATE OR REPLACE FUNCTION int_add(int,int)
    RETURNS int AS $BODY$
DECLARE
BEGIN
    RETURN $1 + $2;
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
$BODY$ language plpgsql;

-- Create an aggregate function.
gaussdb=# CREATE AGGREGATE myavg (int)
(
    sfunc = int_add,
    stype = int,
    initcond = '0'
);

-- Rename the aggregate function myavg that accepts int-type parameters to my_average.
gaussdb=# ALTER AGGREGATE myavg(int) RENAME TO my_average;
```

- Change the owner of the aggregate function.

```
-- Create a user joe.
gaussdb=# CREATE USER joe PASSWORD '********';

-- Change the owner of the aggregate function myavg that accepts integer-type parameters to joe.
gaussdb=# ALTER AGGREGATE my_average(integer) OWNER TO joe;
```

- Change the schema of the aggregate function.

```
-- Create a schema myschema.
gaussdb=# CREATE SCHEMA myschema;

-- Move the aggregate function myavg that accepts int-type parameters to myschema.
gaussdb=# ALTER AGGREGATE my_average(int) SET SCHEMA myschema;

-- Delete the schema, user, and related function.
gaussdb=# DROP SCHEMA myschema CASCADE;
gaussdb=# DROP USER joe;
gaussdb=# DROP FUNCTION int_add(int,int);
```

Helpful Links

CREATE AGGREGATE and DROP AGGREGATE

Compatibility

The SQL standard does not contain the ALTER AGGREGATE statement.

7.12.7.3 ALTER AUDIT POLICY

Description

Modifies the unified audit policy.

Precautions

- Only the user with the POLADMIN or SYSADMIN permission, or initial user has the permission to maintain audit policies.
- The unified audit policy takes effect only after **enable_security_policy** is set to **on**.

Syntax

Add or delete an operation type in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ADD | REMOVE } { [ privilege_audit_clause ]
[ access_audit_clause ] };
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Change the filter criteria in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name MODIFY ( filter_group_clause );
```

Delete the filter criteria from the audit policy.

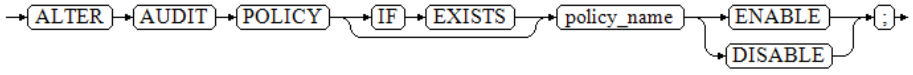
```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name DROP FILTER;
```

Change the description of the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name COMMENTS policy_comments;
```

Enable or disable the audit policy.

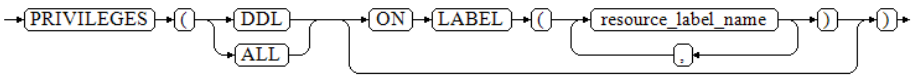
```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ENABLE | DISABLE };
```



- privilege_audit_clause

  DDL operation type and target resource label in the audit policy.

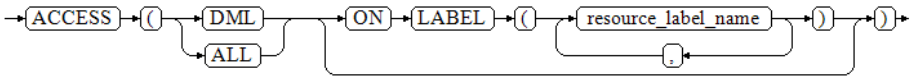
  ```
  PRIVILEGES ({ DDL | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ])
  ```

- access_audit_clause

  DML operation type and target resource label in the audit policy.

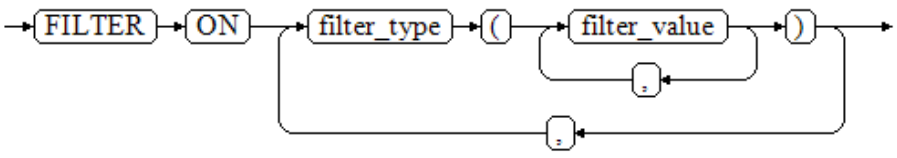
  ```
  ACCESS ({ DML | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ])
  ```

- filter_group_clause

  Filter criteria in the audit policy.

  ```
  FILTER ON { filter_type ( filter_value [, ... ] ) } [, ... ]
  ```

- DDL

  Perform audit when the following operations are performed on the database.

  ```
  { ( ALTER | ANALYZE | COMMENT | CREATE | DROP | GRANT | REVOKE | SET | SHOW ) }
  ```

- DML

  Perform audit when the following operations are performed on the database.

  ```
  { ( COPY | DEALLOCATE | DELETE | EXECUTE | REINDEX | INSERT | PREPARE | SELECT | TRUNCATE |
  UPDATE ) }
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **resource_label_name**

  Specifies the resource label name.

- **DDL**

  Specifies the operations that are audited in the database: CREATE, ALTER, DROP, ANALYZE, COMMENT, GRANT, REVOKE, SET, and SHOW.

- **DML**

  Specifies the operations that are audited in the database: SELECT, COPY, DEALLOCATE, DELETE, EXECUTE, INSERT, PREPARE, REINDEX, TRUNCATE, and UPDATE.

- **ALL**

  Specifies all operations supported by the specified DDL or DML statements in the database. When the form is { DDL | ALL }, **ALL** indicates all DDL operations. When the form is { DML | ALL }, **ALL** indicates all DML operations.

- **filter_type**

  Specifies the types of information to be filtered by the policy: **IP**, **ROLES**, and **APP**.

- **filter_value**

  Specifies the detailed information to be filtered.

- **policy_comments**

  Records description information of the audit policy.

- **ENABLE|DISABLE**

  Enables or disables the unified audit policy.

Examples

- Add or delete an operation type in the audit policy.

```
-- Create audit policy adt1 for executing CREATE on the database.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- Add DROP to the adt1 audit policy.
gaussdb=# ALTER AUDIT POLICY adt1 ADD PRIVILEGES (DROP);

-- Delete DROP from the adt1 audit policy.
gaussdb=# ALTER AUDIT POLICY adt1 REMOVE PRIVILEGES (DROP);
```

- Change the comments of the audit policy.

```
-- Change the comment of the adt1 audit policy to adt1_comments.
gaussdb=#  ALTER AUDIT POLICY adt1 COMMENTS 'adt1_comments';
```

- Change the filter information of the audit policy.

```
-- Create a user bob_audit.
gaussdb=#  CREATE USER bob_audit PASSWORD '********';

-- Change the filtering user of the adt1 audit policy to bob_audit.
gaussdb=#  ALTER AUDIT POLICY adt1 MODIFY (FILTER ON (ROLES(bob_audit)));

-- Delete user bob_audit.
gaussdb=# DROP USER bob_audit;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Delete the filter criteria from the audit policy.

```
-- Delete the filter criteria in the adt1 audit policy.
gaussdb=#  ALTER AUDIT POLICY adt1 DROP FILTER;
```

- Disable the audit policy.

```
-- Disable the adt1 audit policy.
gaussdb=#  ALTER AUDIT POLICY adt1  DISABLE;

-- Delete the adt1 audit policy.
gaussdb=# DROP AUDIT POLICY adt1;
```

Helpful Links

CREATE AUDIT POLICY and **DROP AUDIT POLICY**

7.12.7.4 ALTER COLUMN ENCRYPTION KEY

Description

Encrypts the CMKs of CEKs in round robin (RR) mode and encrypts the plaintext of CEKs.

Precautions

- This syntax is specific to the fully-encrypted database. When connecting to the database server, enable the fully-encrypted database before using this syntax.
- This syntax takes effect on CMKs only. Encrypting the plaintext of CEKs does not change the ciphertext of the encrypted columns.

Syntax

```
ALTER COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES ( CLIENT_MASTER_KEY =
client_master_key_name );
```

Parameters

- **column_encryption_key_name**

  Specifies the key name. In the same namespace, the value of this parameter must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **client_master_key_name**

  Specifies the CMK used to encrypt the CEK. The value is the CMK name, which is created using the CREATE CLIENT MASTER KEY syntax. The encrypted CMKs are different from those specified before RR encryption.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The constraints of using SM cryptographic algorithms are as follows:

SM2, SM3, and SM4 are Chinese cryptographic algorithms. To avoid legal risks, these algorithms must be used together. The SM cryptographic algorithms used for the RR encryption must be the same as those used before RR encryption.

Helpful Links

CREATE COLUMN ENCRYPTION KEY and **DROP COLUMN ENCRYPTION KEY**

7.12.7.5 ALTER DATABASE

Description

Modifies a database, including its name, owner, object isolation, and connection limitation.

Precautions

- Only the database owner or a user with the ALTER permission can run the ALTER DATABASE command. By default, system administrators have the permission. The following are permission constraints depending on the attributes to be modified:
  - To change the database name, you must have the CREATEDB permission.
  - To change a database owner, you must be a database owner or system administrator and a member of the new owner role, with the CREATEDB permission.
  - To change the default tablespace of the database, the user must have the CREATE permission on the tablespace. This statement physically migrates tables and indexes in a default tablespace to a new tablespace. Note that tables and indexes outside the default tablespace are not affected.
- You are not allowed to rename a database in use. To rename it, connect to another database.
- You are not allowed to rename other schemas as **templatem** or rename the **templatem** schema as others.

Syntax

- Change the maximum number of connections to the database.

```
ALTER DATABASE database_name
    [ WITH ] CONNECTION LIMIT connlimit;
```

- Rename the database.

```
ALTER DATABASE database_name
    RENAME TO new_name;
```

NOTE

Do not rename **templatea**.

- Change the database owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER DATABASE database_name
    OWNER TO new_owner;
```

- Change the default tablespace of the database.

```
ALTER DATABASE database_name
    SET TABLESPACE new_tablespace;
```

NOTE

If some tables or objects in the database have been created in new_tablespace, the default tablespace of the database cannot be changed to **new_tablespace**. An error will be reported during the execution.

- Change the session parameter value of the database.

```
ALTER DATABASE database_name
    SET configuration_parameter { { TO | = } { value | DEFAULT } | FROM CURRENT };
```

- Reset the database configuration parameter.

```
ALTER DATABASE database_name RESET
    { configuration_parameter | ALL };
```

- Change the object isolation attribute of the database.

```
ALTER DATABASE database_name [ WITH ] { ENABLE | DISABLE } PRIVATE OBJECT;
```

NOTE

- To change the object isolation attribute of a database, the database must be connected. Otherwise, the change will fail.
- For a new database, the object isolation attribute is disabled by default. After the database object isolation attribute is enabled, the database automatically adds row-level security policies to the system catalogs PG_CLASS, PG_ATTRIBUTE, PG_PROC, PG_NAMESPACE, PGXC_SLICE, and PG_PARTITION. Common users can only view the objects (tables, functions, views, and columns) that they have the permission to access. This attribute does not take effect for administrators. After this attribute is enabled, administrators can still view all database objects.

- Change the database time zone.

```
ALTER DATABASE database_name SET DBTIMEZONE = time_zone;
```

- Migrate a specified bucket from one DN to another. It is not supported in the current version.

```
ALTER DATABASE database_name
    MOVE BUCKETS(bucketlist) FROM datanode_name TO datanode_name;
```

- Use the SLICEBUCKET syntax during bucket scale-out. It is not supported in the current version.

```
ALTER DATABASE database_name
    SLICE BUCKETS(bucketlist);
```

- Enable or disable the ILM feature of the database.

```
ALTER DATABASE set ilm = { on | off } ;
```

Parameters

- **database_name**

  Specifies the name of the database whose attributes are to be modified.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **connlimit**

  Specifies the maximum number of concurrent connections that can be made to this database (excluding administrators' connections).

  Value range: an integer ranging from –1 to 2^{31} – 1. You are advised to set this parameter to an integer ranging from 1 to 50. The default value **–1** indicates that there is no restriction on the number of concurrent connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_name**

  Specifies the new name of a database.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **new_owner**

  Specifies the new owner of a database.

  Value range: a string. It must be a valid username.

- **new_tablespace**

  Specifies the new default tablespace of a database. The tablespace exists in the database. The default tablespace is **pg_default**.

  Value range: a string. It must be a valid tablespace name.

- **configuration_parameter**
  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string.

    - **DEFAULT**
    - **OFF**
    - **RESET**
    - User-specified value: The value must meet the restriction of the modified parameter.

  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

- **time_zone**

  Sets the time zone of the database specified by **database_name**. You must have the permission on the corresponding database.

  Value range: a string.

  - Time zones supported by the system and their abbreviations.
  - -15:59~+15:00

- **RESET configuration_parameter**

  Resets the specified database session parameter.

- **RESET ALL**

  Resets all database session parameters.

NOTE

- If you change the default tablespace of a database, the tables and indexes in the old tablespace are moved into the new tablespace. This operation does not affect the tables or indexes in other non-default tablespaces.
- The modified database session parameter values will take effect in the next session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Rename the database.

```
-- Create the database testdb.
gaussdb=# CREATE DATABASE testdb;

-- Rename testdb to test_db1.
gaussdb=# ALTER DATABASE testdb RENAME TO test_db1;
```

- Change the maximum number of database connections.

```
-- Change the maximum number of connections to test_db1 to 100.
gaussdb=# ALTER DATABASE test_db1 WITH CONNECTION LIMIT 100;

-- View information about test_db1.
gaussdb=# SELECT datname,datconnlimit FROM pg_database WHERE datname = 'test_db1';
 datname  | datconnlimit
----------+--------------
 test_db1 |          100
(1 row)
```

- Change the database owner.

```
-- Create user scott.
gaussdb=# CREATE USER scott PASSWORD '********';

-- Change the owner of test_db1 to scott.
gaussdb=# ALTER DATABASE test_db1 OWNER TO scott;

-- View information about test_db1.
gaussdb=# SELECT t1.datname, t2.usename
          FROM pg_database t1, pg_user t2
          WHERE t1.datname='test_db1' AND t1.datdba=t2.usesysid;
 datname  | usename
----------+---------
 test_db1 | scott
(1 row)
```

- Change the default tablespace of the database.

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Change the default tablespace of test_db1.
gaussdb=# ALTER DATABASE test_db1 SET TABLESPACE tbs_data1;

-- View information about test_db1.
gaussdb=# SELECT t1.datname AS database, t2.spcname AS tablespace
          FROM pg_database t1, pg_tablespace t2
          WHERE t1.dattablespace = t2.oid AND
               t1.datname = 'test_db1';
 database | tablespace
----------+------------
 test_db1 | tbs_data1
(1 row)
```

- Change the database time zone. Prerequisites: The current database is an A-compatible database, **a_format_version** is set to **'10c'**, and **a_format_dev_version** is set to **'s2'**.

```
-- Check the time zone of the test_db1 database.
gaussdb=# SELECT datname,datcompatibility,dattimezone FROM pg_database WHERE datname =
'test_db1';
 datname  | datcompatibility | dattimezone
----------+------------------+-------------
 test_db1 | A                | PRC

-- After setting the parameters, change the database time zone to +08:00.
gaussdb=# SET a_format_version='10c';
gaussdb=# SET a_format_dev_version='s2';
gaussdb=# ALTER DATABASE test_db1 SET DBTIMEZONE = '+08:00';

-- Check the database time zone.
gaussdb=# SELECT datname,datcompatibility,dattimezone FROM pg_database WHERE datname =
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
'test_db1';
 datname | datcompatibility | dattimezone
---------+------------------+-------------
 test_db1| A                | +08:00
(1 row)
```

- Change the object isolation attribute of the database.

```
-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '********';

-- Create the test_tbl1 table in test_db1.
gaussdb=# \c test_db1
test_db1=# CREATE TABLE test_tbl1(c1 int,c2 int);

-- Switch to user jack and view pg_tables.
test_db1=# SET ROLE jack PASSWORD '********';
test_db1=> SELECT tablename FROM pg_tables WHERE tablename = 'test_tbl1';
 tablename
-----------
 test_tbl1
(1 row)

-- Change the object isolation attribute.
test_db1=> SET ROLE scott PASSWORD '********';
test_db1=> ALTER DATABASE test_db1 ENABLE PRIVATE OBJECT;

-- Switch to user jack and view pg_tables.
test_db1=> SET ROLE jack PASSWORD '********';

-- Due to the isolation attribute, 0 data records can be queried.
test_db1=> SELECT tablename FROM pg_tables WHERE tablename = 'test_tbl1';
 tablename
-----------
(0 rows)

-- Switch to the default user and perform the deletion.
test_db1=> RESET ROLE;
test_db1=# DROP TABLE public.test_tbl1;

-- Switch to the default database. Change the database name based on actual situation.
test_db1=# \c postgres
gaussdb=# DROP DATABASE test_db1;
gaussdb=# DROP TABLESPACE tbs_data1;
gaussdb=# DROP USER jack;
gaussdb=# DROP USER scott;
```

Helpful Links

CREATE DATABASE and **DROP DATABASE**

7.12.7.6 ALTER DATABASE LINK

Description

Modifies database link objects. For details about database links, see **DATABASE LINK**.

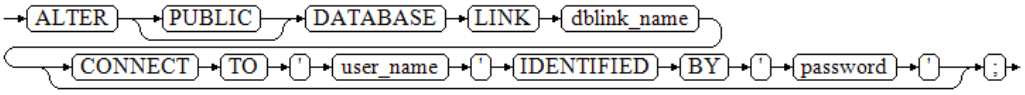
Precautions

Currently, only the username and password can be modified for database links.

Syntax

```
ALTER [PUBLIC] DATABASE LINK dblink_name
    [CONNECT TO 'user_name' IDENTIFIED BY 'password'];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **dblink_name**

  Name of a connection.
- **user_name**

  Username for connecting to a remote database.
- **password**

  Password for connecting to a remote database.
- **PUBLIC**

  Connection type. If **PUBLIC** is not specified, the database link is private by default.

Examples

```
-- Create a user with the system administrator permission.
gaussdb=#  CREATE USER user1 WITH SYSADMIN PASSWORD '********';
gaussdb=#  SET ROLE user1 PASSWORD '********';

-- Create a public database link.
gaussdb=# CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '********'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Create a common user.
gaussdb=# CREATE USER user2 PASSWORD '********';

-- Change database link object information.
gaussdb=# ALTER PUBLIC DATABASE LINK public_dblink CONNECT TO 'user2' IDENTIFIED BY '********';

-- Delete a public database link.
gaussdb=# DROP PUBLIC DATABASE LINK public_dblink;

-- Delete the created user.
gaussdb=# RESET ROLE;
gaussdb=# DROP USER user1;
gaussdb=# DROP USER user2;
```

CREATE DATABASE LINK and **DROP DATABASE LINK**

7.12.7.7 ALTER DEFAULT PRIVILEGES

Description

ALTER DEFAULT PRIVILEGES is used to modify the default permissions of a user on a specific object in the database. It does not affect the permissions assigned to existing objects.

Precautions

Currently, you can change only the permissions for tables (including views), sequences, functions, types, CMKs of encrypted databases, and CEKs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
ALTER DEFAULT PRIVILEGES
    [ FOR { ROLE | USER } target_role [, ...] ]
    [ IN SCHEMA schema_name [, ...] ]
    abbreviated_grant_or_revoke;
```

- abbreviated_grant_or_revoke grants or revokes permissions on some objects.

  ```
  grant_on_tables_clause
    | grant_on_sequences_clause
    | grant_on_functions_clause
    | grant_on_types_clause
    | grant_on_client_master_keys_clause
    | grant_on_column_encryption_keys_clause
    | revoke_on_tables_clause
    | revoke_on_sequences_clause
    | revoke_on_functions_clause
    | revoke_on_types_clause
    | revoke_on_client_master_keys_clause
    | revoke_on_column_encryption_keys_clause
  ```

- grant_on_tables_clause grants permissions on tables.

  ```
  GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP |
  COMMENT | INDEX | VACUUM }
      [, ...] | ALL [ PRIVILEGES ] }
      ON TABLES
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- grant_on_sequences_clause grants permissions on sequences.

  ```
  GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
      [, ...] | ALL [ PRIVILEGES ] }
      ON SEQUENCES
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- grant_on_functions_clause grants permissions on functions.

  ```
  GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
      ON FUNCTIONS
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- grant_on_types_clause grants permissions on types.

  ```
  GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
      ON TYPES
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- grant_on_client_master_keys_clause grants permissions on CMKs.

  ```
  GRANT { { USAGE  | DROP } [, ...] | ALL [ PRIVILEGES ] }
      ON CLIENT_MASTER_KEYS
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- grant_on_column_encryption_keys_clause grants permissions on CEKs.

  ```
  GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
      ON COLUMN_ENCRYPTION_KEYS
      TO { [ GROUP ] role_name | PUBLIC } [, ...]
      [ WITH GRANT OPTION ]
  ```

- revoke_on_tables_clause revokes permissions on tables.

  ```
  REVOKE [ GRANT OPTION FOR ]
      { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
  INDEX | VACUUM }
      [, ...] | ALL [ PRIVILEGES ] }
      ON TABLES
      FROM { [ GROUP ] role_name | PUBLIC } [, ...]
      [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
  ```

- revoke_on_sequences_clause revokes permissions on sequences.

  ```
  REVOKE [ GRANT OPTION FOR ]
      { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    [, ...] | ALL [ PRIVILEGES ] }
    ON SEQUENCES
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- revoke_on_functions_clause revokes permissions on functions.

```
REVOKE [ GRANT OPTION FOR ]
    { {EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON FUNCTIONS
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- revoke_on_types_clause revokes permissions on types.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TYPES
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- revoke_on_client_master_keys_clause revokes permissions on CMKs.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
    ON CLIENT_MASTER_KEYS
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- revoke_on_column_encryption_keys_clause revokes permissions on CEKs.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
    ON COLUMN_ENCRYPTION_KEYS
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

Parameters

- **target_role**

  Specifies the name of an existing role. If **FOR ROLE/USER** is omitted, the current role is assumed.

  Value range: an existing role name

- **schema_name**

  Specifies the name of an existing schema.

  target_role must have the CREATE permission for **schema_name**.

  Value range: an existing schema name

- **role_name**

  Specifies the name of an existing role to grant or revoke permissions for.

  Value range: an existing role name

NOTICE

To drop a role for which the default permissions have been granted, reverse the changes in its default permissions or use DROP OWNED BY to get rid of the default permission entry for the role.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Grant the SELECT permission on all the tables (and views) in tpcds to every user.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT SELECT ON TABLES TO PUBLIC;

-- Create a common user jack.
gaussdb=# CREATE USER jack PASSWORD '********';

-- Grant the INSERT permission on all the tables in tpcds to the user jack.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT INSERT ON TABLES TO jack;

-- Grant the INSERT permission on all the tables created by jack in tpcds to the user jack.
gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO jack;
gaussdb=# ALTER DEFAULT PRIVILEGES FOR ROLE jack IN SCHEMA tpcds GRANT INSERT ON TABLES TO
jack;

-- Revoke the preceding permissions.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE SELECT ON TABLES FROM PUBLIC;
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE INSERT ON TABLES FROM jack;

-- Delete user jack.
gaussdb=# DROP USER jack CASCADE;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds;
```

Helpful Links

GRANT and **REVOKE**

7.12.7.8 ALTER DIRECTORY

Description

Modifies directory attributes.

Precautions

- Currently, only the directory owner can be changed.
- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to change the directory owner. When **enable_access_server_directory** is set to **on**, users with the **SYSADMIN** permission and the directory object owner can change the directory object owner, and the user who changes the owner is required to be a member of the new owner.
- The DIRECTORY object cannot be used in a PDB.

Syntax

```
ALTER DIRECTORY directory_name
    OWNER TO new_owner;
```

Parameters

- **directory_name**

  Specifies the name of a directory to be modified. The value must be an existing directory name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_owner**

  Specifies the new owner of the directory.

Examples

```
-- Create a directory.
gaussdb=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';

-- Create a user.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Change the owner of the directory.
gaussdb=# ALTER DIRECTORY dir OWNER TO jim;

-- Delete a directory.
gaussdb=# DROP DIRECTORY dir;

-- Delete the user.
gaussdb=# DROP USER jim;
```

Helpful Links

CREATE DIRECTORY and **DROP DIRECTORY**

7.12.7.9 ALTER EVENT

Description

Modifies the parameters in the created scheduled event.

Precautions

- Operations related to scheduled events are supported only when **sql_compatibility** is set to **'B'**.
- Only the owner has the permission to change the corresponding scheduled event. By default, system administrators have the permission to change all scheduled events.
- You can execute **SHOW EVENTS** or view the **log_user** column in the PG_JOB table to obtain the event owner information.
- Each time a scheduled event is modified, the owner of the modified event is changed to the current user. If a definer is specified during modification, the owner is changed to the specified definer.
- The restrictions for the definer are the same as those described in **CREATE EVENT**.

NOTICE

If a system administrator modifies a scheduled event created by another user, the owner of the modified event is changed to the system administrator. The statements to be executed are executed by the system administrator.

Syntax

```
ALTER
    [DEFINER = user]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
EVENT event_name
    [ON SCHEDULE schedule]
    [ON COMPLETION [NOT] PRESERVE]
    [RENAME TO new_event_name]
    [ENABLE | DISABLE | DISABLE ON SLAVE]
    [COMMENT 'string']
    [DO event_body];
```

- schedule

  ```
  {
      AT timestamp [+ INTERVAL interval] ...
    | EVERY interval
      [STARTS timestamp [+ INTERVAL interval] ...]
      [ENDS timestamp [+ INTERVAL interval] ...]
  }
  ```

- Interval

  ```
  quantity
          {YEAR | MONTH | DAY | HOUR | MINUTE | SECOND |
           YEAR TO MONTH | DAY TO HOUR | DAY TO MINUTE |
           DAY TO SECOND | HOUR TO MINUTE | HOUR TO SECOND |
           MINUTE TO SECOND}
  ```

Parameters

- **DEFINER**

  Specifies the permission for the scheduled event statement to be executed during execution. By default, the permission of the user who creates the scheduled event is used. When definer is specified, the permission of the specified user is used.

  Only users with the sysadmin permission can specify the definer.

- **ON SCHEDULE**

  Specifies the time when a scheduled event is executed. The SCHEDULE clause is the same as that in **CREATE EVENT**.

- **RENAME TO**

  Specifies the updated scheduled event name.

- **ON COMPLETION [NOT] PRESERVE**

  Once a transaction is complete, the scheduled event is deleted from the system catalog immediately by default. You can overwrite the default behavior by setting **ON COMPLETION PRESERVE**.

- **ENABLE | DISABLE | DISABLE ON SLAVE**

  The scheduled event is in the **ENABLE** state by default after it is created. That is, the statement to be executed is executed immediately at the specified time. You can use the keyword **DISABLE** to change the enabled state. The performance of **DISABLE ON SLAVE** is the same as that of **DISABLE**.

- **COMMENT**

  You can add comments to a scheduled event. The comments can be viewed in GS_JOB_ATTRIBUTE.

- **DO**

  Specifies the statement to be executed for a scheduled event.

- **interval**

  Specifies the time interval. You can replace TO with an underscore (_) in the value of **interval**, for example, **YEAR_MONTH** and **DAY_HOUR**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> In the B-compatible mode, this parameter can be used only when the GUC parameter **b_format_version** is **'5.7'** and **b_format_dev_version** is **'s1'**.

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test_event WITH DBCOMPATIBILITY = 'b';
gaussdb=# \c test_event

-- Create a table.
test_event=# CREATE TABLE t_ev(num int);

-- Create a scheduled task in the DISABLE state, indicating that the scheduled task is disabled.
test_event=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE AT sysdate + interval 5 second
DISABLE DO insert into t_ev values(0);

-- To query a scheduled task, set ENABLE to f.
test_event=# SHOW EVENTS;
 job_name | schema_name | log_user | priv_user | job_status |      start_date      | interval |       end_date       |
enable | failure_msg
----------+-------------+----------+-----------+------------+----------------------+----------+----------------------
+--------+-------------
 event_e1 | public      | omm      | omm       | s          | 2023-11-28 09:10:58 | null     | 3999-12-31 16:00:00 |
f      |
(1 row)

-- Change the status of the scheduled task to ENABLE and query the table five seconds later.
test_event=# ALTER EVENT event_e1 ENABLE;
test_event=# SELECT * FROM t_ev;
 num
-----
   0
(1 row)

-- Create a scheduled event that is executed every minute.
test_event=# CREATE EVENT IF NOT EXISTS event_e2 ON SCHEDULE EVERY 1 minute DO insert into t_ev
values(1);

-- Query the table every one minute. A new record is displayed.
test_event=# SELECT * FROM t_ev;
 num
-----
   0
   1
   1
(3 rows)

-- Change the statements to be executed in the scheduled task and query the table.
test_event=# ALTER EVENT event_e2 DO insert into t_ev values(3);

test_event=# SELECT * FROM t_ev;
 num
-----
   0
   1
   1
   3
(4 rows)

-- Change the name of a scheduled event.
test_event=# ALTER EVENT event_e2 RENAME TO event_ee;

-- Delete the scheduled event.
test_event=# DROP EVENT event_ee;

-- Drop the table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
test_event=# DROP TABLE t_ev;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual database name.
test_event=# \c postgres
gaussdb=# DROP DATABASE test_event;
```

Helpful Links

CREATE EVENT, **DROP EVENT**, and **SHOW EVENTS**

7.12.7.10 ALTER EXTENSION

NOTICE

The extended function is for internal use only. You are advised not to use it.

Description

Modifies the definition of an installed extension.

Precautions

- UPDATE

  Updates the extension to a target version. The extension must be applicable to an update script (or a series of scripts) so that the current installation version can be modified to a required version.

- SET SCHEMA

  Moves the extended object to another schema. This extension must be relocatable to make the command successful.

- ADD member_object

  Adds an existing object to an extension, which is mainly applicable to the extension update script. This object is then treated as a member of the extension and can only be canceled by canceling the extension.

- DROP member_object

  Removes a member object from the extension, which is mainly applicable to the extension update script. The object is not canceled but removed from the extension.

  You must have an extension before using ALTER EXTENSION. You must have the permission on adding or deleting an object before using the ADD or DROP statement.

NOTICE

To use this function, set **support_extended_features** to **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Modify the version of an extension.

```
ALTER EXTENSION name UPDATE [ TO new_version ];
```

- Modify the schema of the extension.

```
ALTER EXTENSION name SET SCHEMA new_schema;
```

- Add or delete member objects of the extension.

```
ALTER EXTENSION name { ADD | DROP } member_object;
```

The member object **member_object** is written as follows:

```
{AGGREGATE agg_name (agg_type [, ...] ) |
  CAST (source_type AS target_type) |
  COLLATION object_name |
  CONVERSION object_name |
  DOMAIN object_name |
  EVENT TRIGGER object_name |
  FOREIGN DATA WRAPPER object_name |
  FOREIGN TABLE object_name |
  FUNCTION function_name ( [ [ argname ] [ argmode ] argtype [, ...] ] ) |
  MATERIALIZED VIEW object_name |
  OPERATOR operator_name (left_type, right_type) |
  OPERATOR CLASS object_name USING index_method |
  OPERATOR FAMILY object_name USING index_method |
  [ PROCEDURAL ] LANGUAGE object_name |
  SCHEMA object_name |
  SEQUENCE object_name |
  SERVER object_name |
  TABLE object_name |
  TEXT SEARCH CONFIGURATION object_name |
  TEXT SEARCH DICTIONARY object_name |
  TEXT SEARCH PARSER object_name |
  TEXT SEARCH TEMPLATE object_name |
  TYPE object_name |
  VIEW object_name}
```

Parameters

- **name**

  Name of an installed extension.

- **new_version**

  Latest version of the extension, which can be overridden by identifiers and string literals. If a target version of the extension is not specified, ALTER EXTENSION UPDATE updates to the default version shown in the extension's control file.

- **new_schema**

  New schema of the extension.

- **object_name**

  agg_name

  function_name

  operator_name

  Names of objects that are added or removed from the extension, including names of tables, aggregations, domains, external linked lists, functions, operators, operator classes, operator families, sequences, text search objects, types, and views that can be schema-qualified.

- **agg_type**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Input data type of the aggregate function. To reference a zero-parameter aggregate function, use * to replace the input data type list.

- **source_type**

  Name of the source data type to be forcibly converted.

- **target_type**

  Name of the target data type to be forcibly converted.

- **argmode**

  Model of the function parameter. The value can be **IN**, **OUT**, **INOUT**, or **VARIADIC**. The default value is **IN**. ALTER EXTENSION does not relate to the OUT parameter, because you only need to enter parameters to confirm the consistency of functions. Therefore, the IN, INOUT, and VARIADIC parameters are enough.

- **argname**

  Name of a function parameter. ALTER EXTENSION does not relate to the parameter name. Only the parameter data type is required to confirm the consistency of the function.

- **argtype**

  Data type (optionally schema-qualified) of a function parameter.

- **left_type**

  right_type

  Data type (optionally schema-qualified) of an operator parameter. **NONE** is written for a missing parameter of a prefix or suffix operator.

Helpful Links

CREATE EXTENSION and **DROP EXTENSION**

7.12.7.11 ALTER FOREIGN DATA WRAPPER

Description

Modifies the definition of a foreign data wrapper.

Precautions

- Only initial users and system administrators can modify the foreign data wrapper.
- The ALTER statement can be successfully executed only when **support_extended_features** is set to **on**.

Syntax

- Set the attributes of the foreign data wrapper.

```
ALTER FOREIGN DATA WRAPPER name
[ HANDLER handler_function | NO HANDLER ]
[ VALIDATOR validator_function | NO VALIDATOR ]
[ OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ]) ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **name**

  Specifies a name of an existing foreign data wrapper.

- **HANDLER handler_function**

  Specifies a new handler function for a foreign data wrapper.

- **NO HANDLER**

  Specifies that the foreign data wrapper no longer has the handler function.

  NOTICE

  Foreign tables that use foreign data wrapper but do not have handlers cannot be accessed.

- **VALIDATOR validator_function**

  Specifies a new validator function for a foreign data wrapper.

  NOTICE

  Depending on the new validator, an existing option for the foreign data wrapper or dependent server, user mapping, or foreign table may be invalid. Before using foreign data wrapper, ensure that these options are correct. However, any options specified in the **ALTER FOREIGN DATA WRAPPER** command will be checked using the new validator function.

- **NO VALIDATOR**

  Specifies that the foreign data wrapper no longer has the validator function.

- **OPTIONS ([ADD | SET | DROP] option ['value'] [, ...])**

  Modifies the options of a foreign data wrapper. ADD, SET, and DROP specify the actions to be performed. If no operation is specified, the default operation is ADD. The option name must be unique. When foreign data is used to wrap validator functions, names and values are also validated.

Example

```
-- Creates a foreign data wrapper dbi.
gaussdb=# CREATE FOREIGN DATA WRAPPER dbi OPTIONS (bar 'true');

-- Modify a foreign data wrapper dbi, add the foo option, and delete bar.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi OPTIONS (ADD foo '1', DROP 'bar');

-- Change the validator of the foreign data wrapper dbi to file_fdw_validator.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi VALIDATOR file_fdw_validator;

-- Change the function for processing the foreign data wrapper dbi to file_fdw_handler.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi HANDLER file_fdw_handler;
```

CREATE FOREIGN DATA WRAPPER and DROP FOREIGN DATA WRAPPER

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.7.12 ALTER FOREIGN TABLE

Description

Modifies a foreign table.

Precautions

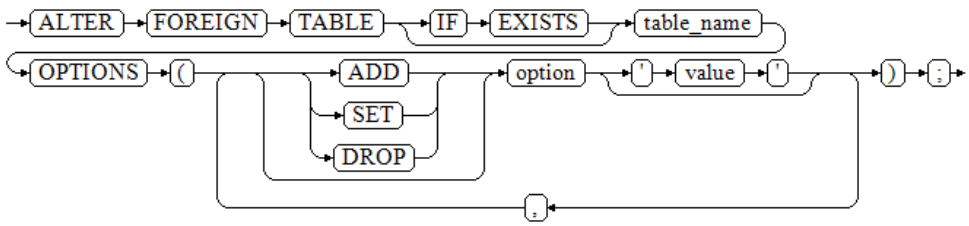
When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

In the multi-tenancy scenario, only the initial user can run the **ALTER FOREIGN TABLE** command in a PDB.

Syntax

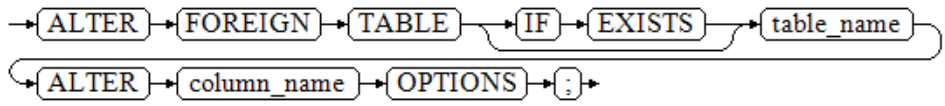
- Change the attributes of a foreign table.

```
ALTER FOREIGN TABLE [ IF EXISTS ]  table_name
    OPTIONS ( {[ ADD | SET | DROP ] option ['value']}[, ... ]);
```



- Change the column options of the foreign table.

```
ALTER FOREIGN TABLE [ IF EXISTS ] table_name
    ALTER column_name OPTIONS;
```



Parameters

- **table_name**

  Specifies the name of an existing foreign table to be modified.

  Value range: an existing foreign table name.

- **option**

  Specifies the option of a foreign table or foreign table column to be modified. **ADD**, **SET**, and **DROP** are operations to be performed. If no operation is set explicitly, the default value **ADD** is used. The option name must be unique (although table options and table column options can share the same name). The name and value of the option are also validated by a class library of a foreign data wrapper.

  – Options supported by **file_fdw** are as follows:

    ▪ filename

      File to be read. This parameter is required and must be an absolute path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- format

  File format of the remote server, which is the same as the **FORMAT** option in the **COPY** statement. The value can be **text**, **csv**, **binary**, or **fixed**.

- header

  Specifies whether a specified file has a header, which is the same as the **HEADER** option of the **COPY** statement.

  - delimiter

    File delimiter, which is the same as the **DELIMITER** option of the **COPY** statement.

  - quote

    Quote character of a file, which is the same as the **QUOTE** option of the **COPY** statement.

  - escape

    Escape character of a file, which is the same as the **ESCAPE** option of the **COPY** statement.

  - null

    Null string of a file, which is the same as the **NULL** option of the **COPY** statement.

  - encoding

    Encoding of a file, which is the same as the **ENCODING** option of the **COPY** statement.

  - force_not_null

    This is a Boolean option. If it is true, the value of the declared field cannot be an empty string. This option is the same as the **FORCE_NOT_NULL** option of the **COPY** statement.

  NOTE

  For details about how to use file_fdw, see section "Foreign Data Wrapper > file_fdw" in *Feature Guide*.

- **value**

  Specifies the new value of **option**.

- **column_name**

  Specifies the name of an existing column.

  Value range: a string. It must comply with the naming convention in **Identifier Naming Conventions**.

Examples

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a foreign table.
gaussdb=# CREATE FOREIGN TABLE foreign_tbl (col1 text) SERVER my_server OPTIONS (logtype 'gs_log');

-- Change the attributes of the foreign table.
gaussdb=# ALTER FOREIGN TABLE foreign_tbl OPTIONS (ADD latest_files '2');
gaussdb=# ALTER FOREIGN TABLE foreign_tbl OPTIONS ( SET latest_files '5');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# ALTER FOREIGN TABLE foreign_tbl OPTIONS ( DROP latest_files);

-- Delete the foreign table.
gaussdb=# DROP FOREIGN TABLE foreign_tbl;

-- Delete the server.
gaussdb=# DROP SERVER my_server;
```

8.15.72 CREATE FOREIGN TABLE and **DROP FOREIGN TABLE**

7.12.7.13 ALTER FUNCTION

Description

Modifies the attributes of a user-defined function or recompiles a function.

Precautions

- Only the function owner or a user granted the ALTER permission can run the **ALTER FUNCTION** command. By default, system administrators have the permission. The following are permission constraints depending on the attributes to be modified:
  - If a function involves operations on temporary tables, ALTER FUNCTION cannot be used.
  - To change the owner or schema of a function, you must be a function owner or system administrator and a member of the new owner role.
  - Only the system administrator and initial user can change the schema of a function to public.
- Only the initial user or the user who creates the stored procedure can change the stored procedure to a stored procedure that has the definer permission.
- When separation of duties is enabled, no role is allowed to change the owner of a function with the definer permission.
- When separation of duties is disabled, only the initial user and system administrator can change the owner of a function with the definer permission. However, the function owner cannot be changed to an O&M administrator.
- Only the initial user can change the owner of a function to the initial user.

Syntax

- Change the additional parameters of the user-defined function.

```
ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    action [ ... ] [ RESTRICT ];
```

The syntax of the action clause is as follows:

```
{CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT}
| {IMMUTABLE | STABLE | VOLATILE}
| {SHIPPABLE | NOT SHIPPABLE}
| {NOT FENCED | FENCED}
| [ NOT ] LEAKPROOF
| { [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER }
| AUTHID { DEFINER | CURRENT_USER }
| COST execution_cost
| ROWS result_rows
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| SET configuration_parameter { { TO | = } { value | DEFAULT }| FROM CURRENT}
| RESET {configuration_parameter | ALL}
```

- Rename the user-defined function.

```
ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    RENAME TO new_name;
```

- Change the owner of the user-defined function.

```
ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    OWNER TO new_owner;
```

- Change the schema of the user-defined function.

```
ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    SET SCHEMA new_schema;
```

- Recompile the function.

```
ALTER FUNCTION function_name COMPILE;
```

Parameters

- **function_name**

  Specifies the name of the function to be modified.

  Value range: an existing function name

- **argmode**

  Specifies whether a parameter is an input or output parameter.

  Value range:

  - **IN**: declares input parameters.
  - **OUT**: declares output parameters.
  - **INOUT**: declares input and output parameters.
  - **VARIADIC**: declares parameters of the array type.

- **argname**

  Parameter name.

  Value range: a string. It must comply with the **naming convention**.

- **argtype**

  Specifies the data type of a function parameter.

  Value range: a valid type. For details, see **Data Types**.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the function can be called in normal mode if the parameter values are **NULL**. Omitting this parameter is the same as specifying it.

- **RETURNS NULL ON NULL INPUT**

  STRICT

  Specifies that the function always returns **NULL** whenever any of its parameters is **NULL**. If this parameter is specified, the function is not executed when there is **NULL** parameter; instead a **NULL** result is assumed automatically.

  RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **IMMUTABLE**

  Specifies that the function always returns the same result if the parameter values are the same.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **STABLE**

  Specifies that the function cannot change the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

  Specifies that the function value can change in a single table scan and no optimization is performed.

- **LEAKPROOF**

  Specifies that the function has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.

- **EXTERNAL**

  (Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

  AUTHID CURRENT_USER

  Specifies that the function will be executed with the permissions of the user who calls it. Omitting this parameter is the same as specifying it.

  SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the function will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **COST execution_cost**

  Estimates the execution cost of a function.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: a positive integer

- **ROWS result_rows**

  Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

  Value range: a positive number. The default value is **1000**.

- **configuration_parameter**
  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string

    - **DEFAULT**
    - **OFF**
    - **RESET**
    - User-specified value: The value must meet the restriction of the modified parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

- **new_name**

  Specifies the new name of a function. To change the schema of a function, you must have the CREATE permission on the new schema.

  Value range: a string. It must comply with the **naming convention**.

- **new_owner**

  Specifies the new owner of a function. To change the owner of a function, the new owner must have the CREATE permission on the schema to which the function belongs. Note that only the initial user can set the function owner to another initial user.

  Value range: an existing user role

- **new_schema**

  Specifies the new schema of a function.

  Value range: an existing schema

Examples

- The following is an example of changing a function:

```
-- Create a function.
gaussdb=# CREATE OR REPLACE FUNCTION test_func(a int) RETURN int
IS
    proc_var int;
BEGIN
    proc_var := a;
    return 1;
END;
/

-- Change the name of the function test_func(a int) to test_func_tk(a int).
gaussdb=# ALTER FUNCTION test_func(a int) RENAME TO test_func_tk;

-- Create a user jim.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Change the owner of the function to jim.
gaussdb=# ALTER FUNCTION test_func_tk(a int) OWNER TO jim;

-- Create a schema named test.
gaussdb=# CREATE SCHEMA test;

-- Change the function schema to test.
gaussdb=# ALTER FUNCTION test_func_tk(a int) SET SCHEMA test;
```

- The following is an example of recompiling a function:

```
-- Recompile the function with a function name.
gaussdb=# ALTER FUNCTION test.test_func_tk COMPILE;

-- Recompile the stored procedure with a function of a signed type.
gaussdb=# ALTER FUNCTION test.test_func_tk(a int) COMPILE;

-- Delete the function.
gaussdb=# DROP FUNCTION test.test_func_tk(a int);

-- Delete user jim.
gaussdb=# DROP USER jim;

-- Delete a schema.
gaussdb=# DROP SCHEMA test;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE FUNCTION and **DROP FUNCTION**

7.12.7.14 ALTER GLOBAL CONFIGURATION

Description

Adds or modifies **key-value** of the gs_global_config system catalog. You can modify an existing parameter or add a new one.

Precautions

- Only the initial database user can run this command.
- The parameter name cannot be **weak_password** or **undostoragetype**.

Syntax

```
ALTER GLOBAL CONFIGURATION with(name=value, name=value...);
```

Parameters

- **name**

  Parameter name, which is of the text type. The value cannot be **weak_password** or **undostoragetype**.

- **value**

  Parameter value, which is of the text type.

Examples

```
-- Insert.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = true);

-- Query.
gaussdb=# SELECT * FROM gs_global_config;
      name       | value
-----------------+-------
 buckets_len     | 16384
 undostoragetype | page
 redis_is_ok     | true
(3 rows)

-- Modify.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = false);

-- Query.
gaussdb=# SELECT * FROM gs_global_config;
      name       | value
-----------------+-------
 buckets_len     | 16384
 undostoragetype | page
 redis_is_ok     | false
(3 rows)

-- Drop.
gaussdb=# DROP GLOBAL CONFIGURATION redis_is_ok;

-- Query.
gaussdb=# SELECT * FROM gs_global_config;
      name       | value
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------------+-------
 buckets_len     | 16384
 undostoragetype | page
(2 rows)
```

DROP GLOBAL CONFIGURATION

7.12.7.15 ALTER GROUP

Description

Modifies the attributes of a user group.

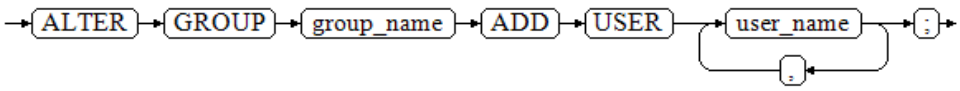
Precautions

- ALTER GROUP is not a standard SQL statement and is not recommended.
- Two clauses (ADD USER and DROP USER) are used to add users to or delete users from a user group. Any user can be a user or a user group. These two clauses are equivalent to granting or revoking the permissions of a user or role to other users or roles. Therefore, you are advised to replace them with GRANT or REVOKE.
- The RENAME TO clause changes the user group name, which is equivalent to renaming roles using ALTER ROLE.

Syntax

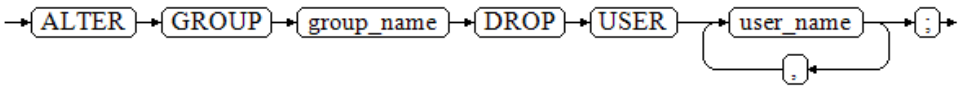
- Add users to a group.

```
ALTER GROUP group_name
    ADD USER user_name [, ... ];
```



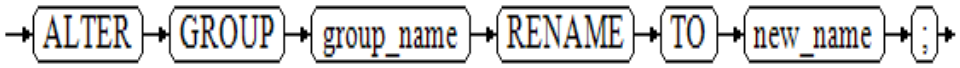
- Remove users from a group.

```
ALTER GROUP group_name
    DROP USER user_name [, ... ];
```



- Change the name of the group.

```
ALTER GROUP group_name
    RENAME TO new_name;
```



Parameters

- **user_name**

  Role name.

  Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **group_name**

  Name of an existing user group.

  Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

- **new_name**

  Name of a new role.

  Value range: a string. It must comply with the identifier naming convention and can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").

Examples

- Rename a user group.

```
-- Create a user test.
gaussdb=# CREATE ROLE test PASSWORD '********';

-- Change the username, which is equivalent to ALTER ROLE RENAME.
gaussdb=# ALTER GROUP test RENAME TO tu_a1;
```

- Add users to or delete users from a user group.

```
-- Create users tu_a2 and tu_a3.
gaussdb=# CREATE ROLE tu_a2 PASSWORD '********';
gaussdb=# CREATE ROLE tu_a3 PASSWORD '********';

-- Add user tu_a2 to user group tu_a1.
gaussdb=# ALTER GROUP tu_a1 ADD USER tu_a2;

-- The preceding SQL statement is equivalent to the GRANT statement.
gaussdb=# GRANT tu_a1 TO tu_a3;

-- Query.
gaussdb=# SELECT groname, grolist FROM pg_group WHERE groname = 'tu_a1';
 groname |    grolist
---------+---------------
 tu_a1   | {25590,25593}
(1 row)
gaussdb=# SELECT rolname, oid FROM gs_roles WHERE oid IN (25590,25593);
 rolname |  oid
---------+-------
 tu_a2   | 25590
 tu_a3   | 25593
(2 rows)

-- Delete.
gaussdb=# DROP ROLE tu_a1,tu_a2,tu_a3;
```

CREATE GROUP, DROP GROUP, and ALTER ROLE

7.12.7.16 ALTER INDEX

Description

Modifies the definition of an existing index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- Only the index owner, a user who has the INDEX permission on the table where the index resides, or a user who has the ALTER ANY INDEX permission can run the **ALTER INDEX** command. When separation of duties is disabled, system administrators have this permission by default.
- Do not keep a large number of invisible indexes on the same base table. Otherwise, the performance of DML operations such as INSERT, UPDATE, and DELETE may be affected.

Syntax

- Rename a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    RENAME TO new_name;
```
- Change the tablespace to which a table index belongs.
```
ALTER INDEX [ IF EXISTS ] index_name
    SET TABLESPACE tablespace_name;
```
- Change the storage parameter of a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    SET ( {storage_parameter = value} [, ... ] );
```
- Reset the storage parameter of a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    RESET ( storage_parameter [, ... ] ) ;
```
- Set a table index or an index partition to be unavailable.
```
ALTER INDEX [ IF EXISTS ] index_name
    [ MODIFY PARTITION index_partition_name ] UNUSABLE;
```
- Rebuild a table index or index partition.
```
ALTER INDEX index_name
    REBUILD [ PARTITION index_partition_name ];
```
- Rename an index partition.
```
ALTER INDEX [ IF EXISTS ] index_name
    RENAME PARTITION index_partition_name TO new_index_partition_name;
```
- Change the tablespace to which an index partition belongs.
```
ALTER INDEX [ IF EXISTS ] index_name
    MOVE PARTITION index_partition_name TABLESPACE new_tablespace;
```
- Set the distributed global secondary index to be ready.
```
ALTER INDEX [ IF EXISTS ] index_name GSIVALID;
```

  NOTE

  The centralized system does not support distributed global secondary indexes. Therefore, this syntax is not supported.

- Set the distributed global secondary index to be available.
```
ALTER INDEX [ IF EXISTS ] index_name GSIUSABLE;
```

  NOTE

  The centralized system does not support distributed global secondary indexes. Therefore, this syntax is not supported.

- Set the index to be visible.
```
ALTER INDEX [ IF EXISTS ] index_name VISIBLE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- When **disable_keyword_options** is set to **"visible"**, the VISIBLE keyword cannot be used.
- This syntax is not supported in the upgrade uncommitted phase.

- Set the index to be invisible.

```
ALTER INDEX [ IF EXISTS ] index_name INVISIBLE;
```

NOTE

- When **disable_keyword_options** is set to **"invisible"**, the INVISIBLE keyword cannot be used.
- This syntax is not supported in the upgrade uncommitted phase.
- In the standby node read scenario, after the index is set to invisible, the execution plan of the query statement may change, and the query performance of the standby node may be affected.

Parameters

- **index_name**

  Specifies the index name to be modified.

- **IF EXISTS**

  Sends a notice instead of an error if the specified index does not exist.

- **RENAME TO new_name**

  Changes only the name of the index. The stored data is not affected.

  – **new_name**

    Specifies the new name of the index.

    Value range: a string that complies with the **Identifier Naming Conventions**.

- **SET TABLESPACE tablespace_name**

  Changes the index tablespace to the specified tablespace and moves index-related data files to the new tablespace.

  – **tablespace_name**

    Specifies the tablespace name.

    Value range: an existing tablespace name.

- **SET ({storage_parameter = value} [, ...])**

  Changes one or more index-method-specific storage parameters of an index. Note that the index content will not be modified immediately by this statement. You may need to use REINDEX to rebuild the index based on different parameters to achieve the expected effect.

  – **storage_parameter**

    Specifies the name of an index-method-specific parameter.
    ACTIVE_PAGES indicates the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **value**

    Specifies the new value for an index-method-specific storage parameter. This might be a number or a word depending on the parameter.

- **RESET ({ storage_parameter } [, ...])**

  Resets one or more index-method-specific storage parameters of an index to the default value. Similar to the SET statement, REINDEX may be used to completely update the index.

- **[MODIFY PARTITION index_partition_name] UNUSABLE**

  Sets the indexes on a table or index partition to be unavailable.

  NOTE

  If a UNIQUE index is specified, the subsequent insertion and update operations on the table are controlled by the GUC parameter **enable_unique_checking_of_unusable_index**.

- **REBUILD [PARTITION index_partition_name]**

  Rebuilds indexes on a table or an index partition. If the index contains the **lpi_parallel_method** option and the value is **PARTITION** when the index is rebuilt, and the **parallel_workers** value of the index's table is greater than 0, the index cannot be rebuilt in parallel. If the index does not contain the **lpi_parallel_method** option or the value of the option is set to **AUTO**, page-level parallel index is rebuilt by default. For details, see **LPI_PARALLEL_METHOD**.

- **RENAME PARTITION index_partition_name TO new_index_partition_name**

  Renames an index partition.

- **MOVE PARTITION index_partition_name TABLESPACE new_tablespace**

  Modifies the tablespace to which an index partition belongs.

- **new_index_partition_name**

  Specifies the new name of the index partition.

- **index_partition_name**

  Specifies the name of an index partition.

- **new_tablespace**

  Specifies a new tablespace.

- **GSIVALID**

  Internally called by the CREATE GLOBAL INDEX CONCURRENTLY function to change the status of distributed global secondary indexes. The centralized system does not support distributed global secondary indexes. Therefore, this syntax is not supported.

- **GSIUSABLE**

  Internally called by the VACUUM FULL function to change the status of distributed global secondary indexes. The centralized system does not support distributed global secondary indexes. Therefore, this syntax is not supported.

- **VISIBLE**

  Sets the index to be visible.

- **INVISIBLE**

  Sets the index to be invisible.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Rename an index.

```
-- Create the test1 table and create an index for it.
gaussdb=# CREATE TABLE test1(col1 INT, col2 INT);
gaussdb=# CREATE INDEX aa ON test1(col1);

-- Rename index aa to idx_test1_col1.
gaussdb=# ALTER INDEX aa RENAME TO idx_test1_col1;

-- Query the index information in the test1 table.
gaussdb=# SELECT tablename,indexname,tablespace FROM pg_indexes WHERE tablename = 'test1';
 tablename |   indexname    | tablespace
-----------+----------------+------------
 test1     | idx_test1_col1 |
(1 row)
```

- Change the tablespace to which the index belongs.

```
-- Create the tbs_index1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_index1 RELATIVE LOCATION 'tablespace1/tbs_index1';

-- Change the tablespace to which the idx_test1_col1 index belongs to tbs_index1.
gaussdb=# ALTER INDEX IF EXISTS idx_test1_col1 SET TABLESPACE tbs_index1;

-- Query the index information in the test1 table.
gaussdb=# SELECT tablename,indexname,tablespace FROM pg_indexes WHERE tablename = 'test1';
 tablename |   indexname    | tablespace
-----------+----------------+------------
 test1     | idx_test1_col1 | tbs_index1
(1 row)
```

- Change and reset index storage parameters.

```
-- View details about the idx_test1_col1 index.
gaussdb=# \di idx_test1_col1
                    List of relations
 Schema |      Name      | Type  | Owner | Table | Storage
--------+----------------+-------+-------+-------+---------
 public | idx_test1_col1 | index | omm   | test1 | {storage_type=USTORE}
(1 row)

-- Change the fill factor of the idx_test1_col1 index.
gaussdb=# ALTER INDEX IF EXISTS idx_test1_col1 SET (FILLFACTOR = 70);

-- View details about the idx_test1_col1 index.
gaussdb=# \di idx_test1_col1
                       List of relations
 Schema |      Name      | Type  | Owner | Table |     Storage
--------+----------------+-------+-------+-------+-----------------
 public | idx_test1_col1 | index | omm   | test1 | {storage_type=USTORE,fillfactor=70}
(1 row)
-- Reset the storage parameter of the idx_test1_col1 index.
gaussdb=# ALTER INDEX IF EXISTS idx_test1_col1 RESET (FILLFACTOR);

-- View details about the idx_test1_col1 index.
gaussdb=# \di idx_test1_col1
                    List of relations
 Schema |      Name      | Type  | Owner | Table | Storage
--------+----------------+-------+-------+-------+---------
 public | idx_test1_col1 | index | omm   | test1 | {storage_type=USTORE}
(1 row)
```

- Change the availability and visibility of indexes.

```
-- Set the idx_test1_col1 index to be unavailable.
gaussdb=# ALTER INDEX IF EXISTS idx_test1_col1 UNUSABLE;

-- Check the availability of the idx_test1_col1 index.
gaussdb=# SELECT indisusable FROM pg_index WHERE indexrelid = 'idx_test1_col1'::regclass;
 indisusable
-------------
 f
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

-- Rebuild the idx_test1_col1 index.
gaussdb=# ALTER INDEX idx_test1_col1 REBUILD;

-- Check the availability of the idx_test1_col1 index.
gaussdb=# SELECT indisusable FROM pg_index WHERE indexrelid = 'idx_test1_col1'::regclass;
 indisusable
-------------
 t
(1 row)

-- Set the idx_test1_col1 index to be invisible.
gaussdb=# ALTER INDEX idx_test1_col1 INVISIBLE;
-- Query visible rows of the idx_test1_col1 index. The return value of the indexdef column contains INVISIBLE.
gaussdb=# SELECT * FROM pg_indexes WHERE tablename = 'test1';
 schemaname | tablename |   indexname    | tablespace |
indexdef
------------+-----------+----------------+------------
+-------------------------------------------------------------------------------------------------------------------------
 public     | test1     | idx_test1_col1 | tbs_index1 | CREATE INDEX idx_test1_col1 ON test1 USING
ubtree (col1) WITH (storage_type=USTORE) TABLESPACE tbs_index1 INVISIBLE
(1 row)

-- Set the idx_test1_col1 index to be visible.
gaussdb=# ALTER INDEX idx_test1_col1 VISIBLE;
-- Query visible rows of the idx_test1_col1 index. The return value of the indexdef column does not contain INVISIBLE.
gaussdb=# SELECT * FROM pg_indexes WHERE tablename = 'test1';
 schemaname | tablename |   indexname    | tablespace |
indexdef
------------+-----------+----------------+------------
+---------------------------------------------------------------------------------------------------------
 public     | test1     | idx_test1_col1 | tbs_index1 | CREATE INDEX idx_test1_col1 ON test1 USING

(1 row)

-- Drop.
gaussdb=# DROP INDEX idx_test1_col1;
gaussdb=# DROP TABLE test1;
gaussdb=# DROP TABLESPACE tbs_index1;
```

- Rename an index partition.

```
-- Create the partitioned table test2.
gaussdb=# CREATE TABLE test2(col1 int, col2 int) PARTITION BY RANGE (col1)(
    PARTITION p1 VALUES LESS THAN (100),
    PARTITION p2 VALUES LESS THAN (200)
);

-- Create a partitioned index.
gaussdb=# CREATE INDEX idx_test2_col1 ON test2(col1) LOCAL(
    PARTITION p1,
    PARTITION p2
);
-- Rename the index partition.
gaussdb=# ALTER INDEX idx_test2_col1 RENAME PARTITION p1 TO p1_test2_idx;
gaussdb=# ALTER INDEX idx_test2_col1 RENAME PARTITION p2 TO p2_test2_idx;

-- Query the partition name of the idx_test2_col1 index.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_test2_col1'::regclass;
   relname
--------------
 p1_test2_idx
 p2_test2_idx
(2 rows)
```

- Change the tablespace to which an index partition belongs.

```
-- Create tablespaces tbs_index2 and tbs_index3.
gaussdb=# CREATE TABLESPACE tbs_index2 RELATIVE LOCATION 'tablespace1/tbs_index2';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLESPACE tbs_index3 RELATIVE LOCATION 'tablespace1/tbs_index3';

-- Change the tablespace to which the idx_test2_col1 index partition belongs.
gaussdb=# ALTER INDEX idx_test2_col1 MOVE PARTITION p1_test2_idx TABLESPACE tbs_index2;
gaussdb=# ALTER INDEX idx_test2_col1 MOVE PARTITION p2_test2_idx TABLESPACE tbs_index3;

-- Query the tablespace to which the idx_test2_col1 index partition belongs.
gaussdb=# SELECT t1.relname index_name,
       t2.spcname tablespace_name
FROM pg_partition t1, pg_tablespace t2
WHERE t1.parentid = 'idx_test2_col1'::regclass AND
      t1.reltablespace = t2.oid;
  index_name  | tablespace_name
--------------+-----------------
 p1_test2_idx | tbs_index2
 p2_test2_idx | tbs_index3
(2 rows)

-- Drop.
gaussdb=# DROP INDEX idx_test2_col1;
gaussdb=# DROP TABLE test2;
gaussdb=# DROP TABLESPACE tbs_index2;
gaussdb=# DROP TABLESPACE tbs_index3;
```

CREATE INDEX, **DROP INDEX**, and **REINDEX**

7.12.7.17 ALTER LANGUAGE

Description

Modifies the definition of a procedural language.

Precautions

In earlier versions, user cannot alter procedural languages, so this syntax is not supported.

7.12.7.18 ALTER MASKING POLICY

Description

Modifies a masking policy.

Precautions

- Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.
- The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**.

Syntax

- Change the policy description.

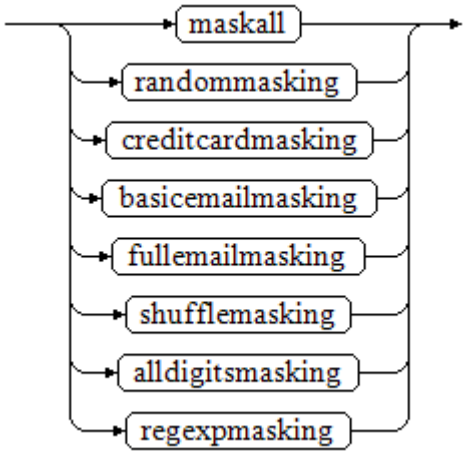
```
ALTER MASKING POLICY policy_name COMMENTS policy_comments;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Change the masking method.
  ALTER MASKING POLICY policy_name { ADD | REMOVE | MODIFY } masking_actions[, ...];

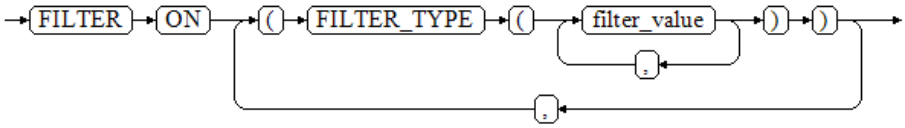
  
  - The syntax of **masking_actions**
    masking_function ON LABEL(label_name[, ...])

    
  - The syntax of **masking_function**
    { maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking | shufflemasking | alldigitsmasking | regepmasking }

- Change the scenarios where the masking policies take effect.
  ALTER MASKING POLICY policy_name MODIFY (filter_group_clause);

  
  - The syntax of **filter_group_clause**
    FILTER ON { (FILTER_TYPE (filter_value [, ...])) [, ...] }

- Remove the filters of the masking policies.
  ALTER MASKING POLICY policy_name DROP FILTER;

  
- Enable or disable the masking policies.
  ALTER MASKING POLICY policy_name {ENABLE | DISABLE};

  
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **policy_name**

  Specifies the masking policy name, which must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **policy_comments**

  Adds or modifies description of masking policies.

- **masking_function**

  Specifies eight preset masking methods or user-defined functions. Schema is supported.

  maskall is not a preset function. It is hard-coded and cannot be displayed by running **\df**.

  The masking methods during presetting are as follows:

  ```
  { maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |
  shufflemasking | alldigitsmasking | regexpmasking }
  ```

- **label_name**

  Specifies the resource label name.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policies: **IP**, **ROLES**, and **APP**.

- **filter_value**

  Indicates the detailed information to be filtered, such as the IP address, app name, and username.

- **ENABLE|DISABLE**

  Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

- Change the policy description.

```
-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text,
col6 text, col7 text,col8 text);

-- Insert data into the tb_for_masking table.
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',

CREATE MASKING POLICY and DROP MASKING POLICY

7.12.7.19 ALTER MATERIALIZED VIEW

Description

Modifies multiple auxiliary attributes of an existing materialized view.

Statements and actions that can be used for ALTER MATERIALIZED VIEW are a subset of ALTER TABLE and have the same meaning when used for materialized views. For details, see ALTER TABLE.

Precautions

- Only the owner of a materialized view or a system administrator has the ALTER MATERIALIZED VIEW permission.
- The materialized view structure cannot be modified.

Syntax

- Change the owner of a materialized view.

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    OWNER TO new_owner;
```

- Rename a column of a materialized view.

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    RENAME [ COLUMN ] column_name TO new_column_name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Rename a materialized view.

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    RENAME TO new_name;
```

Parameters

- **mv_name**

  Specifies the name of an existing materialized view, which can be schema-qualified.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies the name of a new or existing column.

  Value range: a string. It must comply with the **naming convention**.

- **new_column_name**

  Specifies the new name of an existing column.

- **new_owner**

  Specifies the username of the new owner of a materialized view.

- **new_name**

  Specifies the new name of a materialized view.

Examples

- Change the owner of a materialized view.

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW foo AS SELECT * FROM my_table;

-- Create a user.
gaussdb=# CREATE USER test PASSWORD '********';

-- Change the owner of the complete-refresh materialized view.
gaussdb=# ALTER MATERIALIZED VIEW foo OWNER TO test;

-- View the information about the materialized view.
gaussdb=# \dm foo
                        List of relations
 Schema | Name |       Type        | Owner |             Storage
--------+------+-------------------+-------+-----------------------------------
 public | foo  | materialized view | test  | {orientation=row,compression=no}
(1 row)
```

- Rename a column of a materialized view.

```
-- Query the columns of the materialized view.
gaussdb=# \d foo;
Materialized view "public.foo"
 Column |  Type   | Modifiers
--------+---------+-----------
 c1     | integer |
 c2     | integer |
Rules:
    "_RETURN" AS
    ON SELECT TO foo DO INSTEAD  SELECT my_table.c1, my_table.c2
   FROM my_table
Replica Identity: NOTHING
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Change column c1 of materialized view foo to col1 and column c2 to col2.
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME c1 to col1;
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME c2 to col2;

-- Use the SELECT statement to view the columns of the materialized view.
gaussdb=# SELECT * FROM foo WHERE 1=2;
 col1 | col2
------+------
(0 rows)
```

- Rename a materialized view.

```
-- Rename the materialized view foo to my_mview.
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME TO my_mview;

-- Query information.
gaussdb=# \dm my_mview
                        List of relations
 Schema |   Name   |       Type        | Owner |            Storage
--------+----------+-------------------+-------+-----------------------------------
 public | my_mview | materialized view | test  | {orientation=row,compression=no}
(1 row)

-- Delete.
gaussdb=# DROP MATERIALIZED VIEW my_mview;
gaussdb=# DROP TABLE my_table ;
gaussdb=# DROP USER test;
```

CREATE MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **DROP MATERIALIZED VIEW**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

7.12.7.20 ALTER OPERATOR

Description

Modifies the definition of an operator.

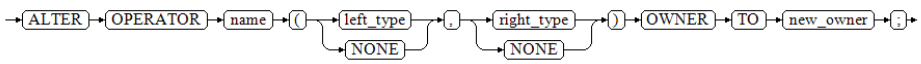
Precautions

To use ALTER OPERATOR, you must be the owner of the operator. To change the owner, you must also be a direct or indirect member of the new owning role, and that member must have CREATE permission on the operator's schema. (These restrict that the owner cannot be changed by doing anything other than deleting or rebuilding the operator. However, a user with the SYSADMIN permission can change the ownership of any operator in any way.)

Syntax

- Change the owner of the operator.

```
ALTER OPERATOR name ( { left_type | NONE } , { right_type | NONE } ) OWNER TO new_owner;
```



- Change the schema of the operator.

```
ALTER OPERATOR name ( { left_type | NONE } , { right_type | NONE } ) SET SCHEMA new_schema;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **name**

  Name of an existing operator.

- **left_type**

  Data type of the left operand for the operator; if there is no left operand, write **NONE**.

- **right_type**

  Data type of the right operand for the operator; if there is no right operand, write **NONE**.

- **new_owner**

  New owner of the operator.

- **new_schema**

  New schema name of the operator.

Examples

```
-- Create a function.
gaussdb=# CREATE FUNCTION func_add(num1 integer, num2 integer) RETURN INTEGER AS
BEGIN
  RETURN num1+num2;
END;
/

-- Create an operator.
gaussdb=# CREATE OPERATOR @@@ (PROCEDURE = func_add,LEFTARG = int,RIGHTARG = int);

-- Create a user.
gaussdb=# CREATE USER user1 PASSWORD '********';

-- Change the operator.
gaussdb=# ALTER OPERATOR @@@ (int,int) OWNER to user1;

-- Create a schema.
gaussdb=# CREATE SCHEMA oper_sch;

-- Change the operator.
gaussdb=# ALTER OPERATOR @@@ (int,int) SET SCHEMA oper_sch;

-- Delete.
gaussdb=# DROP OPERATOR oper_sch.@@@(int,int);
gaussdb=# DROP SCHEMA oper_sch;
gaussdb=# DROP USER user1;
gaussdb=# DROP FUNCTION func_add;
```

Helpful Links

CREATE OPERATOR, **CREATE OPERATOR CLASS**, and **DROP OPERATOR**

Compatibility

The SQL standard does not contain the ALTER OPERATOR statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.7.21 ALTER PACKAGE

Description

Modifies the attributes of a package or recompiles a package.

Precautions

- Currently, only users with the ALTER PACKAGE OWNER permission can run this command. By default, system administrators have the permission. The restrictions are as follows:
  - The current user must be the owner of the package or the system administrator and a member of the new owner role.
- When separation of duties is enabled, to change the owner of a package, users must have the user group permission, even a system administrator. The owner of a package of the DEFINER type cannot be changed.
- Only the initial user can change the owner of a package to the initial user.
- When separation of duties is disabled, only a system administrator or a higher-level user can change the package owner, but the owner cannot be changed to an O&M administrator.
- The system administrator is not allowed to change the owner of a package of the DEFINER type to the initial user or O&M administrator.

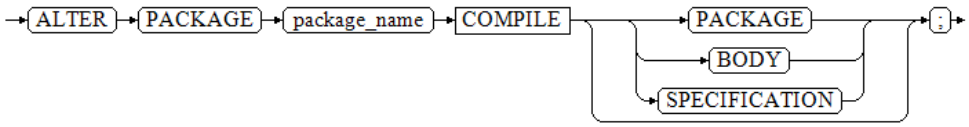
Syntax

- Change the owner of a package.

```
ALTER PACKAGE package_name OWNER TO new_owner;
```

- Recompile the package.

```
ALTER PACKAGE package_name COMPILE [PACKAGE | BODY | SPECIFICATION];
```



Parameters

- **package_name**

  Specifies the name of the package to be modified.

  Value range: an existing package name. Only one package can be modified at a time.

- **new_owner**

  Specifies the new owner of a package. To change the owner of a package, the new owner must have the CREATE permission on the schema to which the package belongs.

  Value range: an existing user role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Change the owner of a package.

```
-- Create a package.
gaussdb=# CREATE OR REPLACE PACKAGE test_pkg AS
    pkg_var int := 1;
    PROCEDURE test_pkg_proc(var int);
END test_pkg;
/
gaussdb=# CREATE OR REPLACE PACKAGE BODY test_pkg AS
    PROCEDURE test_pkg_proc(var int) AS
    BEGIN
        pkg_var := 1;
    END;
END test_pkg;
/

-- Create a user.
gaussdb=# CREATE ROLE test PASSWORD '********';

-- Change the owner of a package.
gaussdb=# ALTER PACKAGE test_pkg OWNER TO test;

-- Query the owner of test_pkg.
gaussdb=# SELECT t1.pkgname,t2.rolname FROM gs_package t1, gs_roles t2 WHERE t1.pkgname =
'test_pkg' AND t1.pkgowner = t2.oid;
 pkgname  | rolname
----------+---------
 test_pkg | test
(1 row)
```

- Recompile the package.

```
-- Recompile the package.
gaussdb=# ALTER PACKAGE test_pkg COMPILE;

-- Delete.
gaussdb=# DROP PACKAGE test_pkg;
gaussdb=# DROP ROLE test;
-- Disable the dependent function.
gaussdb=# RESET behavior_compat_options;
```

Helpful Links

CREATE PACKAGE and **DROP PACKAGE**

7.12.7.22 ALTER PLUGGABLE DATABASE

Description

Modifies the status of a PDB, including enabling, disabling, and forcibly disabling the PDB.

Precautions

- This command can be used only when the GUC parameter **enable_mtd** is set to **on**.
- This operation can be performed only in the non-PDB. This command cannot be executed in M-compatible databases.
- The operation user must be the PDB owner (see the pg_database.datdba system catalog) or have the SYSADMIN permission.
- Only the initial database user can use this statement to change the template PDB (**template_pdb**).

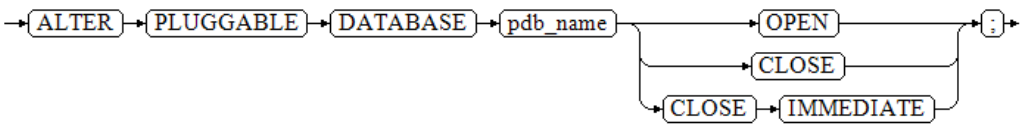
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Only the initial database user can connect to the template PDB.
- Do not perform any data operation in the template PDB. Otherwise, unexpected behavior may occur. For example, if tablespaces are created in a template PDB, subsequent PDBs created based on the template will not synchronize the soft links of the tablespaces in the template, and the soft links will be lost.

Syntax

```
ALTER PLUGGABLE DATABASE pdb_name { OPEN | CLOSE | CLOSE IMMEDIATE };
```



Parameters

- **pdb_name**

  Specifies the PDB name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **OPEN**

  Opens a specified PDB. The OPEN operation of the PDB starts the database instance. That is, the PDB provides services only when it is started. Administrators can enable or disable some PDBs as required. A PDB can be connected only when it is enabled.

  NOTE

  A PDB can be successfully opened only when the current resource plan contains resource plan instructions associated with the PDB.

- **CLOSE**

  Closes a specified PDB. If a PDB is no longer used or needs to be deleted, you can perform the CLOSE operation to close PDB services. After the PDB is closed, the PDB cannot be connected. A database performs basic routine maintenance on closed PDBs to ensure the overall consistency within the system. The system overhead of these closed PDBs can be ignored. If a PDB has service connections when you run this statement, wait for a maximum of 5 seconds. If the PDB still has service connections, the PDB fails to be closed.

- **CLOSE IMMEDIATE**

  Forcibly disables a specified PDB. If the administrator cannot disconnect the service connection of a PDB, the administrator can use this option to clear the existing service connection of the PDB and disable the PDB.

Examples

- Prerequisites

  For details about how to create a PDB, see **Examples** in *Developer Guide*.

- Start and stop a PDB.

```
-- Connect to the postgres database as a system administrator and open the created PDB.
gaussdb=# alter pluggable database my_pdb open;
ALTER PLUGGABLE DATABASE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Connect to the postgres database as a system administrator and attempt to close the PDB that has been opened.
gaussdb=# alter pluggable database my_pdb close;
ALTER PLUGGABLE DATABASE

-- Connect to the postgres database as a system administrator and open the created PDB.
gaussdb=# alter pluggable database my_pdb open;
ALTER PLUGGABLE DATABASE

-- Connect to the postgres database as a system administrator and immediately close the PDB that has been opened.
gaussdb=# alter pluggable database my_pdb close immediate;
ALTER PLUGGABLE DATABASE
```

CREATE PLUGGABLE DATABASE, **DROP PLUGGABLE DATABASE INCLUDING DATAFILES**, and **GS_PDB**

7.12.7.23 ALTER PROCEDURE

Description

Modifies the attributes of a user-defined stored procedure or recompiles a stored procedure.

Precautions

- Only the owner of a stored procedure or a user granted the ALTER permission can run the **ALTER PROCEDURE** command. The system administrator has this permission by default. The following are permission constraints depending on the attributes to be modified:
  - If a stored procedure involves operations on temporary tables, ALTER PROCEDURE cannot be used.
  - To change the owner or schema of a stored procedure, you must be the owner of the stored procedure or system administrator and a member of the new owner role.
  - Only the system administrator and initial user can change the schema of a stored procedure to a public schema.
- Only the initial user or the user who creates the stored procedure can change the stored procedure to a stored procedure that has the definer permission.
- When separation of duties is enabled, no role is allowed to change the owner of a stored procedure with the definer permission.
- When separation of duties is disabled, only the initial user and system administrator can change the owner of a stored procedure with the definer permission. However, the stored procedure owner cannot be changed to an O&M administrator.
- Only the initial user can change the owner of a stored procedure to the initial user.

Syntax

- Change the additional parameters of a user-defined stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER PROCEDURE procedure_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    action [ ... ] [ RESTRICT ];
```

The syntax of the ACTION clause is as follows:

```
{CALLED ON NULL INPUT  | STRICT}
 | {IMMUTABLE | STABLE | VOLATILE}
 | {SHIPPABLE | NOT SHIPPABLE}
 | {NOT FENCED | FENCED}
 | [ NOT ] LEAKPROOF
 | { [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER }
 | AUTHID { DEFINER | CURRENT_USER }
 | COST execution_cost
 | ROWS result_rows
 | SET configuration_parameter { { TO | = } { value | DEFAULT }| FROM CURRENT}
 | RESET {configuration_parameter | ALL}
```

- Change the name of a user-defined stored procedure.

```
ALTER PROCEDURE procedure_name( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    RENAME TO new_name;
```

- Change the owner of a user-defined stored procedure.

```
ALTER PROCEDURE procedure_name( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    OWNER TO new_owner;
```

- Change the schema of a user-defined stored procedure.

```
ALTER PROCEDURE procedure_name( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
    SET SCHEMA new_schema;
```

- Recompile a stored procedure.

```
ALTER PROCEDURE procedure_name[( [ { [ argname ] [ argmode ] argtype} [, ...] ] )] COMPILE;
```

Parameters

- **procedure_name**

  Specifies the name of the stored procedure to be modified.

  Value range: an existing stored procedure name

- **argmode**

  Specifies whether a parameter is an input or output parameter.

  Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**

- **argname**

  Specifies the parameter name.

  Value range: a string. It must comply with the naming convention in **Identifier Naming Conventions**.

- **argtype**

  Specifies the type of the stored procedure parameter.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the stored procedure can be called in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.

- **IMMUTABLE**

  Specifies that the stored procedure always returns the same result if the parameter values are the same.

- **STABLE**

  Specifies that the stored procedure cannot change the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **VOLATILE**

  Specifies that the stored procedure value can change in a single table scan and no optimization is performed.

- **LEAKPROOF**

  Specifies that the stored procedure has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.

- **EXTERNAL**

  (Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

  AUTHID CURRENT_USER

  Specifies that the stored procedure will be executed with the permissions of the user who calls it. Omitting this parameter is the same as specifying it.

  SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the stored procedure will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **COST execution_cost**

  Estimates the execution cost of the stored procedure.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: a positive integer

- **ROWS result_rows**

  Estimates the number of rows returned by the stored procedure. This is only allowed when the stored procedure is declared to return a set.

  Value range: a positive number. The default value is **1000**.

- **configuration_parameter**
  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string.

    - **DEFAULT**
    - **OFF**
    - **RESET**
    - User-specified value: The value must meet the restriction of the modified parameter.

  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_name**

  Specifies the new name of the stored procedure. To change the schema of a stored procedure, you must have the CREATE permission on the new schema.

  Value range: a string. It must comply with the naming convention in **Identifier Naming Conventions**.

- **new_owner**

  Specifies the new owner of the stored procedure. To change the owner of a stored procedure, the new owner must have the CREATE permission on the schema to which the stored procedure belongs.

  Value range: an existing user role

- **new_schema**

  Specifies the new schema of the stored procedure.

  Value range: an existing schema

Examples

```
-- Create a stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE test_proc(a int)
IS
    proc_var int;
BEGIN
    proc_var := a;
END;
/

-- Recompile a stored procedure with the stored procedure name.
gaussdb=# ALTER PROCEDURE test_proc COMPILE;

-- Recompile a stored procedure with a signed int type stored procedure.
gaussdb=# ALTER PROCEDURE test_proc(int) COMPILE;

-- Change the execution rule of a stored procedure to IMMUTABLE. That is, the returned results are the same when the parameters remain unchanged.
gaussdb=# ALTER PROCEDURE test_proc(a int) IMMUTABLE;

-- Create a user.
gaussdb=# CREATE USER joe PASSWORD '********';

-- Change the owner of a stored procedure.
gaussdb=# ALTER PROCEDURE test_proc(a int)  OWNER TO joe;

-- Create a schema.
gaussdb=# CREATE SCHEMA test;

-- Change the schema of a stored procedure.
gaussdb=# ALTER PROCEDURE  test_proc(a int)  SET SCHEMA test;

-- Delete a stored procedure. The schema to which the function belongs must be specified.
gaussdb=# DROP PROCEDURE test.test_proc;

-- Delete the new user and schema.
gaussdb=# DROP USER joe;
gaussdb=# DROP SCHEMA test;
```

7.12.7.24 ALTER RESOURCE LABEL

Description

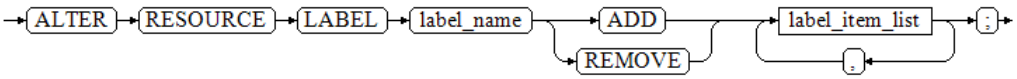
ALTER RESOURCE LABEL modifies a resource label.

Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

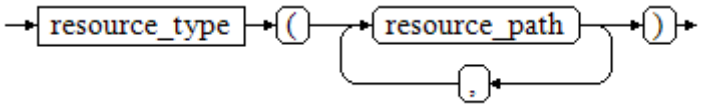
Syntax

```
ALTER RESOURCE LABEL label_name {ADD|REMOVE}
  label_item_list[, ...];
```



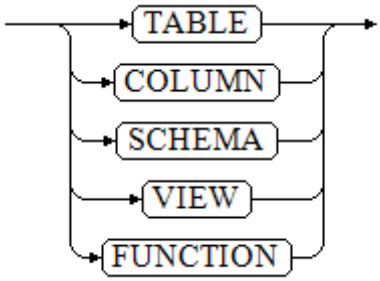
- label_item_list

  ```
  resource_type(resource_path[, ...])
  ```

- resource_type

  ```
  TABLE | COLUMN | SCHEMA | VIEW | FUNCTION
  ```

Parameters

- **label_name**

  Specifies the resource label name.

  Value range: a string. It must comply with the **naming convention**.

- **resource_type**

  Specifies the type of database resources to be labeled.

- **resource_path**

  Specifies the path of database resources.

Examples

```
-- Create basic table table_for_label.
gaussdb=# CREATE TABLE table_for_label(col1 int, col2 text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create resource label table_label.
gaussdb=# CREATE RESOURCE LABEL table_label ADD COLUMN(table_for_label.col1);

-- Attach resource label table_label to col2.
gaussdb=# ALTER RESOURCE LABEL table_label ADD COLUMN(table_for_label.col2);

--  Remove an item from table_label.
gaussdb=# ALTER RESOURCE LABEL table_label REMOVE COLUMN(table_for_label.col1);

-- Delete the resource label table_label.
gaussdb=# DROP RESOURCE LABEL table_label;

-- Delete the base table table_for_label.
gaussdb=# DROP TABLE table_for_label;
```

Helpful Links

CREATE RESOURCE LABEL and **DROP RESOURCE LABEL**

7.12.7.25 ALTER RESOURCE POOL

Description

Changes the Cgroup of a resource pool.

Precautions

Only users with the SYSADMIN permission, or the initial user can perform this operation.

This syntax is not supported in the multi-tenancy scenario. Use the RESOURCE_MANAGER advanced package.

This syntax is not supported during upgrade.

Syntax

```
ALTER RESOURCE POOL pool_name
    WITH ({MEM_PERCENT= pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT="memory_size" | io_limits=io_limits | io_priority="io_priority" |
max_worker=max_worker | max_connections=max_connections |
max_dynamic_memory="max_dynamic_memory"| max_shared_memory="max_shared_memory" |
max_concurrency=concurrency}[, ... ]);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **pool_name**

  Specifies the name of a resource pool.

  The resource pool must already exist.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **group_name**

  Specifies the name of a Cgroup.

  NOTE

  - You can use either double quotation marks ("") or single quotation marks (') in the syntax when setting the name of a Cgroup.
  - The value of **group_name** is case-sensitive.
  - If an administrator specifies a Workload Cgroup under Class, for example, **control_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control_group** is set to **class1:workload1:1**.
  - If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.

  Value range: an existing Cgroup.

- **stmt**

  Specifies the maximum number of statements that can be concurrently executed in a resource pool. The value **–1** indicates that the number of concurrent statements is not limited.

  Value range: numeric data ranging from –1 to 2147483647.

- **dop**

  Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

  Value range: numeric data ranging from 1 to 2147483647.

- **memory_size**

  Specifies the maximum memory size of a resource pool.

  Value range: a string of 1 KB to 2047 GB case-sensitive characters.

- **mem_percent**

  Specifies the proportion of available resource pool memory to the total memory or group user memory.

  In multi-tenant scenarios, **mem_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

  In common scenarios, **mem_percent** of common users is an integer ranging from 0 to 100. The default value is **0**.

  NOTE

  When both of **mem_percent** and **memory_limit** are specified, only **mem_percent** takes effect.

- **io_limits**

  Specifies the upper limit of IOPS in a resource pool. The value **0** indicates no limit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The unit is 10,000.

Value range: numeric data ranging from 0 to 2147483647.

- **io_priority**

  Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

  There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, set this parameter to **None**, which is the default value.

  Value range: enumerated type. The options are **None**, **Low**, **Medium**, and **High**.

  NOTE

  The settings of **io_limits** and **io_priority** are valid only for complex jobs, such as batch import (using INSERT INTO SELECT, COPY FROM, or CREATE TABLE AS), complex queries involving over 500 MB data on each DN, and VACUUM FULL.

- **max_worker**

  Concurrency in a table during data redistribution. This is used only for scaling.

- **max_connections**

  Maximum number of connections that can be used by a resource pool.

  NOTE

  The total maximum number of connections in all resource pools cannot exceed the maximum number of connections specified by **max_connections** of the entire GaussDB process.

- **max_dynamic_memory**

  Specifies the maximum dynamic memory that can be used by a resource pool.

- **max_shared_memory**

  Specifies the maximum shared memory that can be used by a resource pool.

- **max_concurrency**

  Specifies the maximum concurrent requests that can be used by a resource pool.

Examples

The following example assumes that the user has created the **class1** Cgroup and three Workload Cgroups under **class1**: **Low**, **wg1**, and **wg2**. (Contact an administrator to create a Cgroup.)

```
-- Create a resource pool.
gaussdb=# CREATE RESOURCE POOL pool1;

-- Specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");

-- Specify the Low Timeshare Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:Low");

-- Specify the wg1 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg1");

-- Specify the wg2 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg2:3");
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the resource pool pool1.
gaussdb=# DROP RESOURCE POOL pool1;
```

Helpful Links

CREATE RESOURCE POOL and **DROP RESOURCE POOL**

7.12.7.26 ALTER ROLE

Description

Modifies role attributes.

Precautions

The ALTER ROLE IN DATABASE statement cannot be executed in a PDB.

Syntax

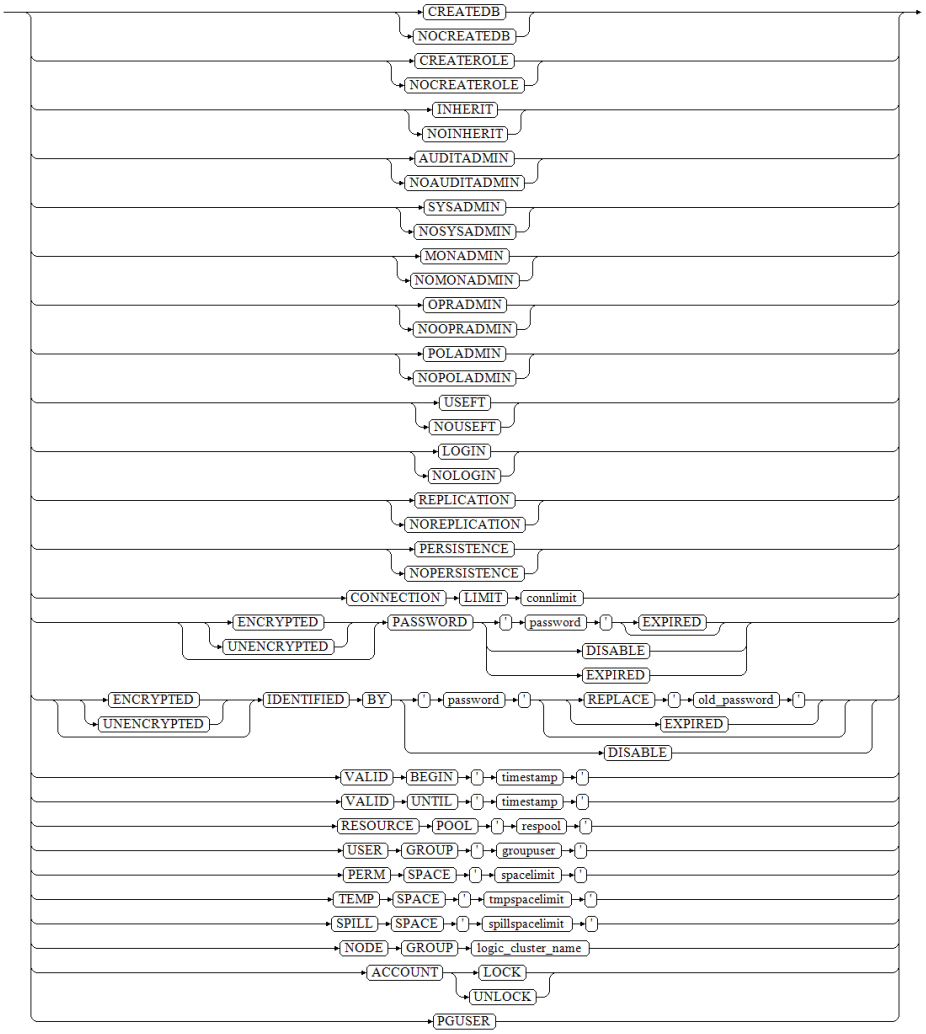
- Change the permissions of a role.

```
ALTER ROLE role_name [ [ WITH ] option [ ... ] ];
```

  - The **option** clause for granting permissions is as follows:

```
{CREATEDB | NOCREATEDB}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}
    | {AUDITADMIN | NOAUDITADMIN}
    | {SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | {USEFT | NOUSEFT}
    | {LOGIN | NOLOGIN}
    | {REPLICATION | NOREPLICATION}
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' [EXPIRED] | DISABLE | EXPIRED }
    | [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' |
EXPIRED ] | DISABLE }
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | TEMP SPACE 'tmpspacelimit'
    | SPILL SPACE 'spillspacelimit'
    | NODE GROUP logic_cluster_name
    | ACCOUNT { LOCK | UNLOCK }
    | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

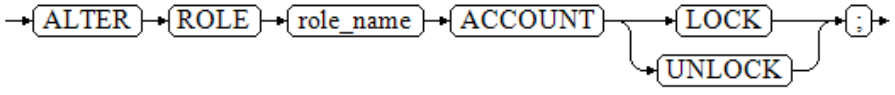


- Rename a role.

```
ALTER ROLE role_name
    RENAME TO new_name;
```

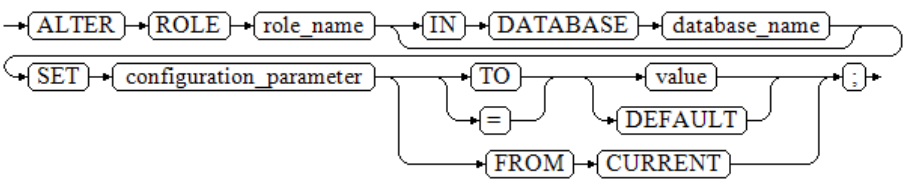
- Lock or unlock.

```
ALTER ROLE role_name
    ACCOUNT { LOCK | UNLOCK };
```



- Set parameters for a role.

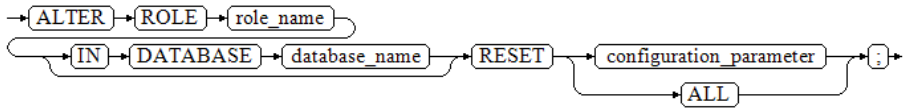
```
ALTER ROLE role_name [ IN DATABASE database_name ]
    SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT};
```



- Reset parameters for a role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER ROLE role_name
    [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```



Parameters

- **role_name**

  Specifies a role name.

  Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

- **IN DATABASE database_name**

  Modifies the parameters of a role in a specified database.

- **SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT}**

  Sets parameters for a role. Session parameters modified by ALTER ROLE apply to a specified role and take effect in the next session triggered by the role.

  Value range:

  For details about the values of **configuration_parameter** and **value**, see **SET**.

  DEFAULT: clears the value of **configuration_parameter**. **configuration_parameter** will inherit the default value of the new session generated for the role.

  FROM CURRENT: uses the value of **configuration_parameter** of the current session.

- **RESET {configuration_parameter|ALL}**

  Clears the value of **configuration_parameter**. The statement has the same effect as that of **SET configuration_parameter TO DEFAULT**.

  Value range: **ALL** indicates that the values of all parameters are cleared.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.

- **PGUSER**

  In the current version, the **PGUSER** attribute of a role cannot be modified.

- **{PASSWORD|IDENTIFIED BY} 'password'**

  Resets or changes the user password. Except the initial user, other administrators and common users need to enter the correct old password when changing their own passwords. Only the initial user, the system administrator (sysadmin) when separation of duties is disabled, or users who have the permission (CREATEROLE) to create users can reset the password of a common user without entering the old password. The initial user can reset passwords of system administrators. A system administrator cannot reset passwords of other system administrators. The user password should be enclosed by single quotation marks.

- **EXPIRED**

  Invalidates the password. Only the initial user, the system administrator (sysadmin), or user who has the permission to create a user (CREATEROLE)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

can invalidate the user password. A system administrator can invalidate the password of itself or other system administrators only when separation of duties is disabled. The password of the initial user cannot be invalidated.

The user whose password is invalid can log in to the database but cannot perform the query operation. The query operation can be performed only after the password is changed or the administrator resets the password.

For details about other parameters, see **Parameters** in "CREATE ROLE."

Examples

```
-- Create role test_role.
gaussdb=# CREATE ROLE test_role PASSWORD '********';

-- Set role test_role to log in to the database.
gaussdb=# ALTER ROLE test_role WITH LOGIN;

-- Create a database.
gaussdb=# CREATE DATABASE testdb1;

-- Set the role configuration parameter configuration_parameter to DEFAULT.
gaussdb=# ALTER ROLE test_role IN DATABASE testdb1 SET configuration_parameter  =  DEFAULT;

-- Reset the role configuration parameter.
gaussdb=# ALTER ROLE test_role IN DATABASE testdb1 RESET configuration_parameter;

-- Lock role test_role.
gaussdb=# ALTER ROLE test_role ACCOUNT LOCK;

-- Unlock a locked role.
gaussdb=# ALTER ROLE test_role ACCOUNT UNLOCK;

-- Change the password of role test_role.
gaussdb=# ALTER ROLE test_role PASSWORD '********';

-- Rename role test_role to test_role2.
gaussdb=# ALTER ROLE test_role RENAME TO test_role2;

-- Change role test_role2 to the system administrator.
gaussdb=# ALTER ROLE test_role2 SYSADMIN;

-- Delete.
gaussdb=# DROP ROLE test_role2;
gaussdb=# DROP DATABASE testdb1;
```

CREATE ROLE, **DROP ROLE**, and **SET ROLE**

7.12.7.27 ALTER ROW LEVEL SECURITY POLICY

Description

Modifies an existing row-level security policy, including the policy name and the users and expressions affected by the policy.

Precautions

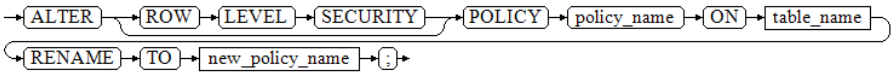
Only the table owner or a system administrator can perform this operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

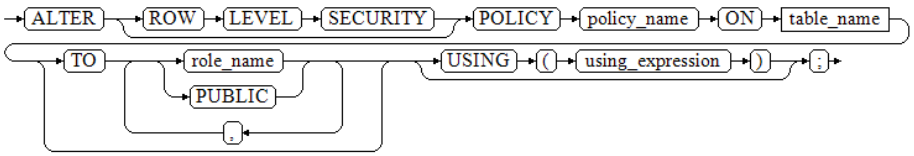
- Change the name of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name RENAME TO new_policy_name;
```



- Change the specified user and policy expression of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
    [ TO { role_name | PUBLIC } [, ...] ]
    [ USING ( using_expression ) ];
```



Parameters

- **policy_name**

  Specifies the name of a row-level security policy.

- **table_name**

  Specifies the name of a table to which a row-level security policy is applied.

- **new_policy_name**

  Specifies the new name of a row-level security policy.

- **role_name**

  Specifies names of users affected by a row-level security policy. **PUBLIC** indicates that the row-level security policy will affect all users.

- **using_expression**

  Specifies a row-level security policy, which is similar to a Boolean expression in the WHERE clause.

Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);
gaussdb=# \d+ all_data
                        Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |
 data   | character varying(100) |           | extended |              |
Row Level Security Policies:
    POLICY "all_data_rls" FOR ALL
      TO public
      USING (((role)::name = "current_user"()))
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE, segment=off

-- Create users alice and bob.
gaussdb=# CREATE ROLE alice WITH PASSWORD '********';
gaussdb=# CREATE ROLE bob WITH PASSWORD '********';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Change the name of the all_data_rls policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_rls ON all_data RENAME TO all_data_new_rls;

-- Change the users affected by the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data TO alice, bob;
gaussdb=# \d+ all_data
                        Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |
 data   | character varying(100) |           | extended |              |
Row Level Security Policies:
    POLICY "all_data_new_rls" FOR ALL
      TO alice,bob
      USING (((role)::name = "current_user"()))
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE, segment=off

-- Modify the row-level security expression to view only the data of the user whose id column is greater than 100.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data USING (id > 100 AND role = current_user);
gaussdb=# \d+ all_data
                        Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |
 data   | character varying(100) |           | extended |              |
Row Level Security Policies:
    POLICY "all_data_new_rls" FOR ALL
      TO alice,bob
      USING (((id > 100) AND ((role)::name = "current_user"())))
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE, segment=off

-- Delete the policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data;

-- Delete users alice and bob.
gaussdb=# DROP ROLE alice, bob;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

CREATE ROW LEVEL SECURITY POLICY and **DROP ROW LEVEL SECURITY POLICY**

7.12.7.28 ALTER SCHEMA

Description

Modifies schema attributes.

Precautions

- Only the owner of a schema or users with the ALTER permission on the schema can run the **ALTER SCHEMA** command. When separation of duties is disabled, system administrators have this permission by default. To change

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

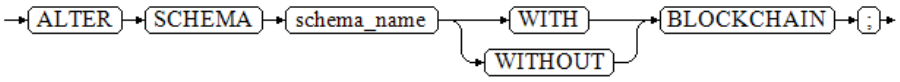
the owner of a schema, you must be the owner of the schema or system administrator and a member of the new owner role.

- For system schemas other than public, such as pg_catalog and sys, only the initial user is allowed to change the owner of a schema. Changing the names of the built-in system schemas may make some functions unavailable or even affect the normal running of the database. By default, the names of the built-in system schemas cannot be changed. To ensure forward compatibility, you can change the names of the built-in system schemas only when the system is being started or upgraded or when **allow_system_table_mods** is set to **on**.
- Except the initial user, other users cannot change the owner of a schema to an O&M administrator.

Syntax

- Alter the tamper-proof attribute of a schema.

```
ALTER SCHEMA schema_name { WITH | WITHOUT } BLOCKCHAIN;
```



- Rename a schema.

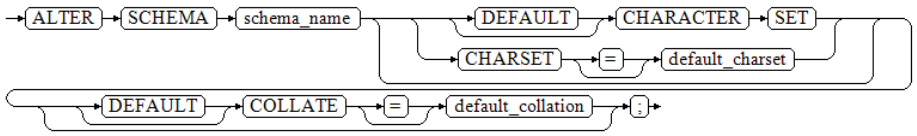
```
ALTER SCHEMA schema_name
  RENAME TO new_name;
```

- Change the owner of a schema.

```
ALTER SCHEMA schema_name
  OWNER TO new_owner;
```

- Modify the default character set and collation of the schema.

```
ALTER SCHEMA schema_name
  [ [DEFAULT] CHARACTER SET | CHARSET [ = ] default_charset ] [ [DEFAULT] COLLATE [ = ]
default_collation ];
```



Parameters

- **schema_name**

  Specifies the name of an existing schema.

  Value range: an existing schema name.

- **RENAME TO new_name**

  Renames a schema. If a non-administrator user wants to change the schema name, the user must have the CREATE permission on the database.

  new_name: new name of the schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with **pg_**.
- The schema name cannot start with **gs_role_**.

Value range: a string. It must comply with the **naming convention**.

- **OWNER TO new_owner**

  Changes the owner of a schema. To do this as a non-administrator, you must be a direct or indirect member of the new owner role, and that role must have the CREATE permission on the database.

  new_owner: new owner of the schema.

  Value range: an existing username or role name.

- **{ WITH | WITHOUT } BLOCKCHAIN**

  Alters the tamper-proof attribute of a schema by using WITH. Common row-store tables with the tamper-proof attribute are tamper-proof history tables, excluding foreign tables, temporary tables, and system catalogs. The tamper-proof attribute can be altered only when no table is contained in the schema. The tamper-proof attribute of the temporary table schema, the TOAST table schema, dbe_perf schema, and blockchain schema cannot be modified. This syntax can be used to convert between normal and tamper-proof modes only if the schema does not contain any tables.

  NOTE

  To change a common schema to a tamper-proof schema, set the GUC parameter **enable_ledger** to **on**. The default value is **off**, and the level is SIGHUP.

- **default_charset**

  Modifies the default character set of a schema. If you specify a schema separately, the default collation of the schema is set to the default collation of the specified character set.

  This syntax is supported only when **sql_compatibility** is set to **'B'**. For details about the supported character sets, see **Table 7-255**.

- **default_collate**

  Changes the default collation of a schema. If you specify a collation separately, the default character set of the schema is set to the character set corresponding to the specified collation.

  This syntax is supported only when **sql_compatibility** is set to **'B'**. For details about the supported collation, see **Table 7-255**.

Examples

- Rename a schema.

```
-- Rename the schema test_schema1 to test_sch1.
gaussdb=# ALTER SCHEMA test_schema1 RENAME TO test_sch1;

-- Query schema information.
gaussdb=# \dn+ test*
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                        List of schemas
  Name    | Owner | Access privileges | Description | WithBlockChain
----------+-------+-------------------+-------------+----------------
 test_sch1 | omm   |                   |             | t
(1 row)
```

- Change the owner of a schema.

```
-- Create user test_user.
gaussdb=# CREATE ROLE test_user PASSWORD '********';

-- Change the owner of schema test_sch1 to test_user.
gaussdb=# ALTER SCHEMA test_sch1 OWNER TO test_user;

-- Query schema information.
gaussdb=# \dn+  test_sch1;
                          List of schemas
  Name    |   Owner   | Access privileges | Description | WithBlockChain
----------+-----------+-------------------+-------------+----------------
 test_sch1 | test_user |                   |             | t
(1 row)

-- Drop.
gaussdb=# DROP SCHEMA test_sch1;
gaussdb=# DROP ROLE test_user;
```

- Modify the default character set and collation.

  This syntax is supported only when **sql_compatibility** is set to **'B'**.

  Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test1 WITH DBCOMPATIBILITY = 'B' ENCODING = 'UTF8' LC_COLLATE
= 'zh_CN.utf8' LC_CTYPE = 'zh_CN.utf8';

gaussdb=# \c test1

-- Create a schema test_sch2.
test1=# CREATE SCHEMA test_sch2;

-- Change the default character set to utf8mb4 and the default collation of characters to
utf8mb4_bin.
test1=# ALTER SCHEMA test_sch2 CHARACTER SET utf8mb4 COLLATE utf8mb4_bin;

-- Drop.
test1=# DROP SCHEMA test_sch2;

-- Switch to the default database. Change the database name based on actual situation.
test1=# \c postgres
gaussdb=# DROP DATABASE test1;
```

Helpful Links

CREATE SCHEMA and **DROP SCHEMA**

7.12.7.29 ALTER SEQUENCE

Description

Modifies the parameters of an existing sequence.

Precautions

- Only the owner of a sequence, a user granted the ALTER permission on a sequence, or a user granted the ALTER ANY SEQUENCE permission on a sequence can run the **ALTER SEQUENCE** command. When separation of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

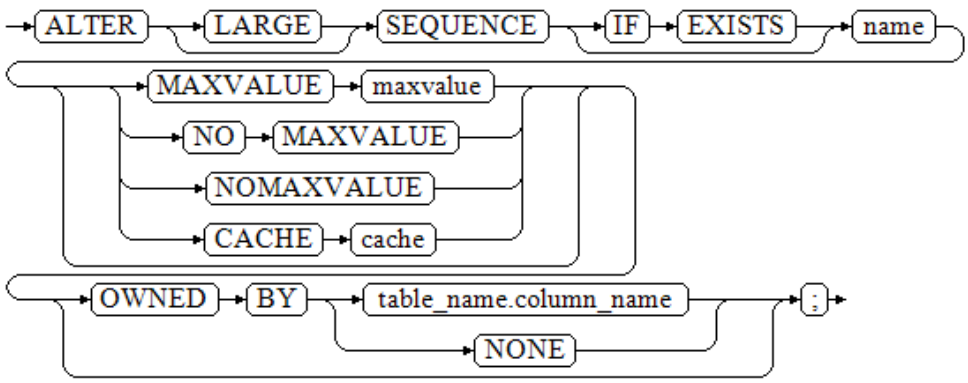
duties is disabled, a system administrator has this permission by default. To change a sequence owner, you must be the sequence owner or system administrator and a member of the new owner role.

- In the current version, you can change only the owner, owning column, maximum value, and cache value. To change other parameters, delete the sequence and create it again. Then, use the Setval function to restore parameter values.
- ALTER SEQUENCE MAXVALUE cannot be used in transactions, functions, and stored procedures.
- After the maximum value of a sequence is changed, the cache of the sequence in all sessions is cleared.
- If the LARGE identifier is used when a sequence is created, the LARGE identifier must be used when the sequence is altered.
- The ALTER SEQUENCE statement blocks the calling of nextval, setval, currval, and lastval.

Syntax

- Change the maximum sequence value, owning column, and cache value.

```
ALTER [ LARGE ] SEQUENCE [ IF EXISTS ] name
    [MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE | CACHE cache]
    [ OWNED BY { table_name.column_name | NONE } ] ;
```



- Change the owner of a sequence.

```
ALTER [ LARGE ] SEQUENCE [ IF EXISTS ] name OWNER TO new_owner;
```

Parameters

- **name**

  Specifies the name of the sequence to be modified.

- **IF EXISTS**

  This option is used when the sequence does not exist. ERROR is not displayed. Instead, a NOTICE message is returned.

- **MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE**

  Specifies the maximum value of the sequence. The new maximum value must be greater than **last_value**. If not specified, the old maximum value is retained.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: (last_value, 2^{63} – 1]. If LARGE is used, the range is (last_value, 2^{127} – 1].

- **CACHE**

  Specifies the number of sequences stored in the memory for quick access purposes. If this parameter is not specified, the old cache value is retained.

  Value range: [1, 2^{63} – 1]. If LARGE is used, the range is [1, 2^{127} – 1].

- **OWNED BY**

  Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to.

  If the sequence has been associated with another table before you use this option, the new association will overwrite the old one.

  The associated table and sequence must be owned by the same user and in the same schema.

  If OWNED BY NONE is used, all existing associations will be deleted.

- **new_owner**

  Specifies the username of the new owner of the sequence. To change the owner, you must also be a direct or indirect member of the new role, and this role must have the CREATE permission on the sequence's schema.

Examples

```
-- Create an ascending sequence named serial, which starts from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Create a table and specify default values for the sequence.
gaussdb=# CREATE TABLE t1(c1 bigint default nextval('serial'));

-- Change the owning column of serial to T1.C1.
gaussdb=# ALTER SEQUENCE serial OWNED BY t1.c1;

-- Delete a sequence and a table.
gaussdb=# DROP SEQUENCE serial CASCADE;
gaussdb=# DROP TABLE t1;

-- Create the seq_test sequence.
gaussdb=# CREATE SEQUENCE seq_test;

-- Query sequence information.
gaussdb=# \ds
              List of relations
 Schema |   Name   |   Type   | Owner | Storage
--------+----------+----------+-------+---------
 public | seq_test | sequence | omm   |
(1 row)

-- Create the user u_test and change the sequence owner.
gaussdb=# CREATE USER u_test PASSWORD '********';
gaussdb=# ALTER SEQUENCE seq_test OWNER TO u_test;
gaussdb=# \ds
               List of relations
 Schema |   Name   |   Type   | Owner  | Storage
--------+----------+----------+--------+---------
 public | seq_test | sequence | u_test |
(1 row)

-- Delete the user and sequence.
gaussdb=# DROP SEQUENCE seq_test;
gaussdb=# DROP USER u_test;
```

CREATE SEQUENCE and **DROP SEQUENCE**

7.12.7.30 ALTER SERVER

Description

Adds, modifies, or deletes the parameters of an existing server. You can query existing servers from the pg_foreign_server system catalog.

Precautions

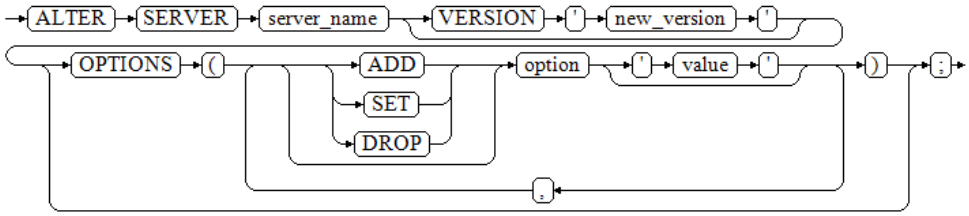
- Only the server owner or a user granted the ALTER permission can run the **ALTER SERVER** command. By default, system administrators have the permission. To change a server owner, you must be the server owner or system administrator and a member of the new owner role.
- When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

- Change the parameters for a foreign server.

```
ALTER SERVER server_name [ VERSION 'new_version' ]
    [ OPTIONS ( {[ ADD | SET | DROP ] option ['value']} [, ... ] ) ];
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, ADD operations will be performed by default. **option** and **value** are the parameters of the corresponding operation.



- Change the owner of a foreign server.

```
ALTER SERVER server_name
  OWNER TO new_owner;
```

- Change the name of a foreign server.

```
ALTER SERVER server_name
  RENAME TO new_name;
```

Parameters

- **server_name**

  Specifies the name of the server to be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_version**

  Specifies the target version of the server.

- **OPTIONS**

  Changes options of the server. ADD, SET, and DROP are operations to be performed. If the operation is not set explicitly, ADD is used. The option name must be unique, and the name and value are also validated with the foreign data wrapper library of the server.

  In addition to the connection parameters supported by libpq, the following parameters are provided:

  – **fdw_startup_cost**

    Estimates the startup time required for a foreign table scan. This value usually contains the time taken to establish a connection, analyze the request at the remote end, and generate a plan. The default value is **100**. The value is a real number greater than 0.

  – **fdw_tuple_cost**

    Specifies the additional consumption when each tuple is scanned on a remote server. The value specifies the extra consumption of data transmission between servers. The default value is **0.01**. The value is a real number greater than 0.

- **new_owner**

  Specifies the owner of the server.

- **new_name**

  Specifies the new name of the server.

Examples

```
-- Create my_server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Change the name of an external server.
gaussdb=# ALTER SERVER my_server RENAME TO my_server_1;

-- Create a user.
gaussdb=# CREATE USER jack PASSWORD '********';

-- Change the owner of the external server.
gaussdb=# ALTER SERVER my_server_1 OWNER TO jack;

-- Add the dbname and dbuser information to the external server.
gaussdb=# ALTER SERVER my_server_1 OPTIONS(ADD dbname 'test',dbuser' test_user');

-- Query the external server information.
gaussdb=# SELECT * FROM pg_foreign_server WHERE srvname='my_server_1';
   srvname   | srvowner | srvfdw | srvtype | srvversion | srvacl |            srvoptions
-------------+----------+--------+---------+------------+--------+----------------------------------
 my_server_1 |    25158 |  16065 |         |            |        | {dbname=test,"dbuser= test_user"}
(1 row)

-- Change the dbname in the external server to 'db_test'.
gaussdb=# ALTER SERVER my_server_1 OPTIONS (SET dbname 'db_test');

-- Query the external server information.
gaussdb=# SELECT srvname,srvoptions FROM pg_foreign_server WHERE srvname='my_server_1';
   srvname   |              srvoptions
-------------+--------------------------------------
 my_server_1 | {dbname=db_test,"dbuser= test_user"}
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the dbname information from the external server.
gaussdb=# ALTER SERVER my_server_1 OPTIONS (DROP dbname);

-- Query the external server information.
gaussdb=# SELECT srvname,srvoptions FROM pg_foreign_server WHERE srvname='my_server_1';
   srvname   |      srvoptions
-------------+----------------------
 my_server_1 | {"dbuser= test_user"}
(1 row)

-- Delete my_server_1.
gaussdb=# DROP SERVER my_server_1;

-- Delete the user.
gaussdb=# DROP USER jack;
```

CREATE SERVER and **DROP SERVER**

7.12.7.31 ALTER SESSION

Description

Defines or modifies the conditions or parameters that affect the current session. Modified session parameters are kept until the current session is disconnected.

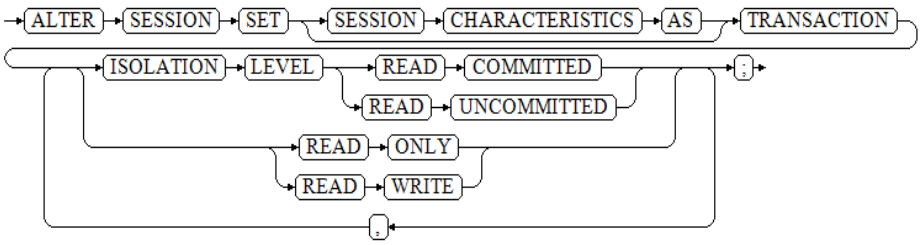
Precautions

- If the START TRANSACTION statement is not executed before the SET TRANSACTION statement, the transaction is ended instantly and the statement does not take effect.
- You can use the transaction_mode(s) method declared in the START TRANSACTION statement to avoid using the SET TRANSACTION statement. For details, see **START TRANSACTION**.

Syntax

- Set transaction parameters of a session.

```
ALTER SESSION SET [ SESSION CHARACTERISTICS AS ] TRANSACTION
    { ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED } } | { READ ONLY  | READ
WRITE } } [, ...] ;
```

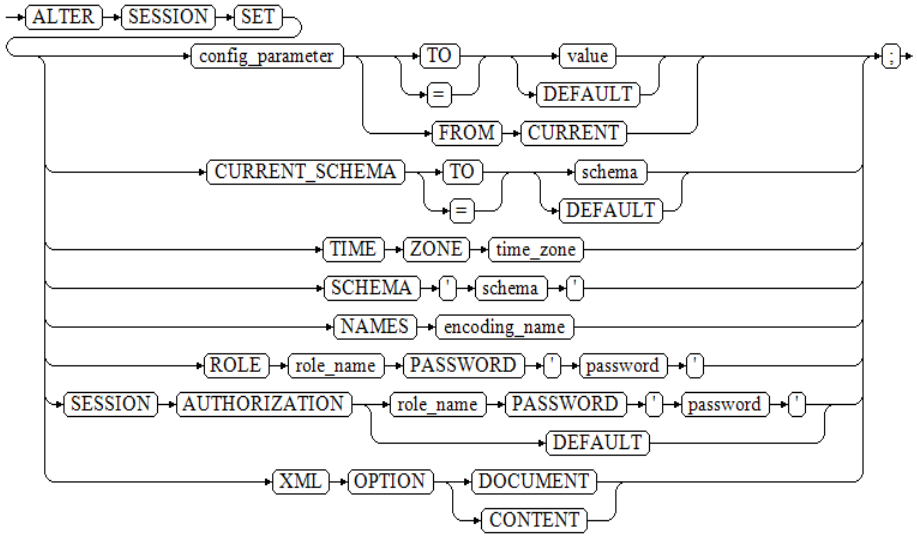


- Set other GUC parameters of a session.

```
ALTER SESSION SET
    {{config_parameter { { TO  | =  }  { value | DEFAULT } | FROM CURRENT }}
      | CURRENT_SCHEMA { TO | = } { schema | DEFAULT  }
      | TIME ZONE time_zone
      | SCHEMA 'schema'
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| NAMES encoding_name
    | ROLE role_name PASSWORD 'password'
    | SESSION AUTHORIZATION { role_name PASSWORD 'password' | DEFAULT }
    | XML OPTION { DOCUMENT | CONTENT }
  } ;
```



Parameters

- **config_parameter**

  Specifies the name of a configurable GUC parameter. You can use SHOW ALL to view available GUC parameters.

  - **value**

    Specifies the new value of **config_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these. **DEFAULT** is used to set default values for parameters.

    - **DEFAULT**
    - **OFF**
    - **RESET**
    - User-specified value: The value must meet the restriction of the modified parameter.

  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

- **TIME ZONE timezone**

  Specifies the local time zone for the current session.

  Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT_SCHEMA**

  schema

  Specifies the current schema.

  Value range: an existing schema name. If the schema name does not exist, the value of **CURRENT_SCHEMA** will be empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SCHEMA schema**

  Specifies the current schema. Here the schema is a string.

- **NAMES encoding_name**

  Specifies the client character encoding. This statement is equivalent to **set client_encoding to encoding_name**.

  Value range: a valid character encoding name. The GUC parameter corresponding to this option is **client_encoding**. The default encoding is **UTF8**.

- **role_name**

  Value range: a string. It must comply with the **naming convention**.

- **password**

  Specifies the password of a role. It must comply with the password convention.

- **SESSION AUTHORIZATION**

  Sets the session user identifier of the current session.

- **XML OPTION { DOCUMENT | CONTENT }**

  Specifies the XML parsing mode.

  Value range: **CONTENT** (default) and **DOCUMENT**

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  Value range:

  – **READ COMMITTED**: Only committed data can be read. This is the default value.

  – **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.

Examples

- Set transaction parameters of a session.

  The keyword ALTER SESSION can be omitted in the example.

```
-- Start a transaction and set the transaction level.
gaussdb=# START TRANSACTION;
gaussdb=# ALTER SESSION SET TRANSACTION READ ONLY;
gaussdb=# END;
```

- Set other GUC parameters of a session.

  The keyword ALTER SESSION can be omitted in the example.

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Set the search path of a schema.
gaussdb=# SET SEARCH_PATH TO ds, public;

-- Set the time/date type to the traditional postgres format (date before month).
gaussdb=# SET DATESTYLE TO postgres, dmy;

-- Set the character code of the current session to UTF8.
gaussdb=# ALTER SESSION SET NAMES 'UTF8';

-- Set the time zone to Berkeley of California.
gaussdb=# SET TIME ZONE 'PST8PDT';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Set the time zone to Italy.
gaussdb=# SET TIME ZONE 'Europe/Rome';

-- Set the current schema.
gaussdb=# ALTER SESSION SET CURRENT_SCHEMA TO tpcds;

-- Set XML OPTION to DOCUMENT.
gaussdb=# ALTER SESSION SET XML OPTION DOCUMENT;

-- Create the role joe, and set the session role to joe.
gaussdb=# CREATE ROLE joe WITH PASSWORD '********';
gaussdb=# ALTER SESSION SET SESSION AUTHORIZATION joe PASSWORD '********';

-- Switch to the default user.
gaussdb=> ALTER SESSION SET SESSION AUTHORIZATION default;

-- Delete the ds schema.
gaussdb=# DROP SCHEMA ds;

-- Delete joe.
gaussdb=# DROP ROLE joe;
```

SET

7.12.7.32 ALTER SYNONYM

Description

Changes the owner of a SYNONYM object.

Precautions

- Currently, only the owner of the SYNONYM object can be changed.
- Only a system administrator has the permission to modify the owner of the SYNONYM object. When separation of duties is enabled, system administrators do not have the permission to change the owner of the SYNONYM object by default.
- The new owner must have the CREATE permission on the schema where the SYNONYM object resides.
- PUBLIC synonyms cannot be modified.

Syntax

```
ALTER SYNONYM synonym_name
    OWNER TO new_owner;
```

Parameters

- **synonym_name**

  Specifies the name of the synonym to be modified, which can contain the schema name.

  Value range: a string. It must comply with the **naming convention**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_owner**

  Specifies the new owner of the SYNONYM object.

  Value range: a string. It must be a valid username.

Examples

```
-- Create a system administrator.
gaussdb=# CREATE USER sysadmin WITH SYSADMIN PASSWORD '********';

-- Switch the system administrator.
gaussdb=# \c - sysadmin

-- Create synonym t1.
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Create user u1.
gaussdb=# CREATE USER u1 PASSWORD '********';

-- Assign permissions to the new system administrator.
gaussdb=# GRANT ALL ON SCHEMA sysadmin TO u1;

-- Change the owner of synonym t1 to u1.
gaussdb=# ALTER SYNONYM t1 OWNER TO u1;

-- Delete synonym t1.
gaussdb=# DROP SYNONYM t1;

-- Revoke permissions from user u1.
gaussdb=# REVOKE ALL ON SCHEMA sysadmin FROM u1;

-- Delete user u1.
gaussdb=# DROP USER u1;

-- Switch to the initial user init_user. Replace init_user with the actual initial username.
gaussdb=# \c - init_user

-- Delete user sysadmin.
gaussdb=# DROP USER sysadmin;
```

Helpful Links

CREATE SYNONYM and **DROP SYNONYM**

7.12.7.33 ALTER SYSTEM KILL SESSION

Description

ALTER SYSTEM KILL SESSION ends a session.

Syntax

```
ALTER SYSTEM KILL SESSION 'pid, sessionid' [ IMMEDIATE ];
```

Parameters

- **pid, sessionid**

  Specifies the PID and SESSIONID of a session (To obtain the values, see the example.) You can use the pg_stat_activity system catalog to query the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

current active threads (see the examples). However, when you run the **ALTER SYSTEM KILL SESSION** command, the threads may have ended.

Value range: PIDs and SESSIONIDs of all sessions that can be queried from the system catalog pg_stat_activity. In non-thread pool mode, the PID and SESSIONID are usually the same.

- **IMMEDIATE**

  Specifies that a session will be ended instantly after the statement is executed.

Examples

```
-- Start two sessions, and create a table and start a transaction to insert data in the first session.
gaussdb=# CREATE TABLE tbl_test(id int);
gaussdb=# BEGIN;
gaussdb=# INSERT INTO tbl_test VALUES (1);

-- Query the session information in the second session. If the value of state is idle in transaction, the transaction is waiting to be committed.
gaussdb=# SELECT datname,
       usename,
       pid,
       sessionid,
       state
FROM pg_stat_activity
WHERE query LIKE 'INSERT INTO tbl_test%';
 datname  | usename |       pid       | sessionid |        state
----------+---------+-----------------+-----------+---------------------
 postgres | omm     | 139802072635136 |       143 | idle in transaction
(1 row)

-- End a session. If the IMMEDIATE parameter is not specified, the session and transactions in the session are forcibly ended.
gaussdb=# ALTER SYSTEM KILL SESSION '139802072635136,143';
 pg_terminate_session
----------------------
 t
(1 row)

-- Perform the reconnection and query the tbl_test table. The transaction is forcibly ended and the data is rolled back.
gaussdb=# SELECT * FROM tbl_test;
 id
----
(0 rows)

-- Drop the table.
gaussdb=# DROP TABLE tbl_test;
```

7.12.7.34 ALTER SYSTEM SET

Description

When the multi-tenancy feature is enabled, you can run this command in a non-PDB (such as the **postgres** database) to switch resource plans.

Precautions

- This command can be used only by the initial user and users with the SYSADMIN permission.
- This command cannot be executed in a PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- This command cannot be executed in M-compatible databases.

Syntax

```
ALTER SYSTEM SET resource_manager_plan TO plan_name;
```

Parameters

- **plan_name**

  Specifies the name of a resource plan.

Examples

```
-- Connect to the postgres database and set the current resource plan to default_resource_plan. The new resource plan takes effect immediately.
gaussdb=# ALTER SYSTEM SET RESOURCE_MANAGER_PLAN TO 'default_resource_plan';
ALTER SYSTEM SET
```

7.12.7.35 ALTER TABLE

Description

Modifies tables, including changing table definitions, renaming tables, renaming specified columns in tables, renaming table constraints, setting table schemas, enabling or disabling row-level security policies, and adding or updating multiple columns.

Precautions

- The owner of a table, users with the ALTER permission on the table, or users with the ALTER ANY TABLE permission can run the **ALTER TABLE** command. System administrators have the permission to run the command by default. To change the owner or schema of a table, you must be the table owner or system administrator and a member of the new owner role.
- The tablespace of a partitioned table cannot be modified, but the tablespace of the partition can be modified.
- The storage parameter **ORIENTATION** cannot be modified.
- Currently, SET SCHEMA can only set schemas to user schemas. It cannot set a schema to a system internal schema.
- The partition key columns of a partitioned table cannot be changed or the character set cannot be converted.
- A column whose **DEFAULT** value contains the nextval() expression cannot be added.
- Row-level security cannot be enabled for foreign tables and temporary tables.
- When you delete a PRIMARY KEY constraint by constraint name, the NOT NULL constraint is not deleted. If necessary, manually delete the NOT NULL constraint.
- When JDBC is used, the **DEFAULT** value can be set through PreparedStatement.
- If you add a column using ADD COLUMN, all existing rows in the table are initialized to the column's default value (**NULL** if no **DEFAULT** value is specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If no **DEFAULT** value is specified for the new column, **NULL** is used, and no full table update is triggered.

If the new column has the **DEFAULT** value, the column must meet all the following requirements. Otherwise, the entire table is updated, leading to additional overheads and affecting online services.

1. The data type is BOOL, BYTEA, TINYINT, SMALLINT, BIGINT, INTEGER, NUMERIC, FLOAT, DOUBLE PRECISION, CHAR, VARCHAR, TEXT, TIMESTAMPTZ, TIMESTAMP, DATE, TIME, TIMETZ, INTERVAL, SERIAL, BIGSERIAL, SMALLSERIAL, FLOATVECTOR, or BOOLVECTOR.

2. The length of the **DEFAULT** value of the added column cannot exceed 128 bytes.

3. The **DEFAULT** value of the added column does not contain the volatile function.

4. The **DEFAULT** value is required and cannot be **NULL**.

If you are not sure whether condition 3 is met, check whether the **provolatile** attribute of the function in the PG_RPOC system catalog is **v**.

5. If the PG-compatible mode is enabled, the data type of the new column can be SERIAL, BIGSERIAL, or SMALLSERIAL. Only ordinary tables are supported, and partitioned tables, temporary tables, unlogged permanent tables are not supported. Astore and Ustore are supported.

- If **FIRST | AFTER column_name** is used to change the character set of a column, add or change a column, the update overhead of entire table is generated and affects online services.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.

- The number of table constraints cannot exceed 32,767.
- When performing online DDL operations, reserve sufficient disk space. That is, the remaining space must be the total space of the tables to be operated and the accessories such as indexes on the tables.
- Online DDL operations cannot be performed in a transaction or a stored procedure.
- If online DDL execution is canceled, the residual data clearance process starts first. If the execution is canceled again, the clearance process ends and residual data remains.
- Resource contention exists between online DDL operations and user services. Therefore, online DDL operations are not suitable for heavy-traffic scenarios. In scenarios where resources are limited, fine-grained resource control is recommended. Parallel acceleration is not recommended.
- Online DDL operations are not supported in M-compatible mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- In the following cases, online DDL does not take effect. By default, DDL is executed in offline mode. If the ONLINE keyword exists, a notice is displayed, indicating that the keyword ONLINE is ignored.
  - If the clause contains any keyword such as CHARSET, COLLATE, FIRST, or AFTER or **column_constraint**, the MODIFY [COLUMN] column_name data_type [CHARACTER SET | CHARSET charset] [{[COLLATE collation] | [column_constraint]} [...]] [FIRST | AFTER column_name] or MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT NULL [ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...]) syntax is used to change the column type, precision, or length online.
  - The following syntax is used to change the column type, precision, and length online: CHANGE [COLUMN] column_name new_column_name data_type [CHARACTER SET | CHARSET charset] [{[COLLATE collation] | [column_constraint]} [...]] [FIRST | AFTER column_name].
  - A column type is changed or converted to the SET data type online.
  - The ALTER TABLE statement contains operations that are not supported by the current online DDL feature. (The supported online DDL operations include changing column types and precisions, reducing lengths, moving table-level tablespaces, and adding NOT NULL, CHECK, PRIMARY KEY, or UNIQUE constraints.)
- Online DDL operations do not take effect when they are performed on the database-level, index-level, partitioned, secondary partitioned, segment-page, hash bucket, temporary, unlogged, or HTAP tables. (These operations include changing the column type, precision, and length online, moving table-level tablespaces online, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints online.) By default, the DDL operations are executed offline, and a notice is displayed, indicating that the current DDL statement cannot be executed online.
- Long transactions may block online DDL operations (including changing the column type, precision, and length online, moving table-level tablespaces online, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints online). Therefore, you are advised not to perform online DDL operations when long transactions exist.
- At the later stage of execution, online DDL operations will block DQL operations and report errors for concurrent DML operations. (The preceding online DDL operations include changing the column type, precision, and length online, moving table-level tablespaces online, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints online.) Ensure that retry upon error reporting is supported. For a service model with continuous retries, the thread pool may be full and cannot provide external services. Therefore, before using this feature, evaluate the tolerance of waiting for locks in the service model and check whether slow SQL statements exist to determine whether this feature can be used.
- During online DDL execution, do not execute DDL statements concurrently with other DDL statements. Otherwise, deadlocks or errors may occur. In this case, reconnect to the client and try again.
- If DDL is upgraded from a version that does not support online DDL operations to a version that supports online DDL operations, online DDL operations are not supported during the observation period. By default, DDL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

operations are executed offline, and a notice is displayed, indicating that online DDL operations are not supported during the upgrade. (The preceding online DDL operations include changing the column type, precision, and length online, moving table-level tablespaces online, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints online.)

- A schema named **online***$$ddl$$[Hash value of (Table schema + Table name)]* is generated during online DDL operations. (The online DDL operations include changing the column type, precision, and length online, moving table-level tablespaces online, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints online.)
  - By default, the owner of the schema is the initial user. You are advised not to operate the schema during online DDL operations; otherwise, the online DDL operations may be terminated and an unknown error may occur. By default, this schema is not exported when gs_dump is used for data export.
  - Do not create a schema with the prefix online$$. Otherwise, an error message is displayed. If a schema with the same name already exists, online DDL operations do not take effect. By default, offline DDL operations are executed, and a message is displayed indicating that the current DDL statement cannot be online due to a schema name conflict.
- If online DDL operations fail, the storage space of the table may bloat significantly. (The preceding online DDL operations include changing the column type, precision, and length online, and moving table-level tablespaces online.) Then table may bloat significantly if NOT NULL, CHECK, PRIMARY KEY, or UNIQUE constraints are added online no matter whether the operation fails or not. The bloat degree is proportional to the DDL statement execution period and the number of concurrent write operations. Do not perform online DDL operations when long transactions exist.
- If online DDL operations include adding NOT NULL/CHECK/PRIMARY KEY/UNIQUE constraints, the error reported when data that violates the constraints may be different from that for offline DDL operations.
- In an online DDL operation for adding a PRIMARY KEY or UNIQUE constraint, if the constraint contains an expression, the DDL operation is performed offline by default. If the ONLINE keyword exists, a notice is displayed, indicating that the DDL operation cannot be performed online.
- Online DDL operations (including changing column types, precisions, and lengths, moving tablespaces at the table level, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints) inherit the usage restrictions from **CREATE TABLE**.

Syntax

- Change the definition of a table.

```
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
    { table_name [*] | ONLY table_name | ONLY ( table_name ) }
    action [, ... ];
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
table_name
    ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint
[ ... ] ] } [, ... ] );
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
table_name
    MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL
[ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [, ... ] );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
table_name
    RENAME [ TO | AS | = ] new_table_name;
RENAME { TABLE | TABLES } { table_name TO new_table_name } [, ... ];
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
    { table_name [*] | ONLY table_name | ONLY ( table_name ) }
    RENAME [ COLUMN ] column_name TO new_column_name;
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
    { table_name [*] | ONLY table_name | ONLY ( table_name ) }
    RENAME CONSTRAINT constraint_name TO new_constraint_name;
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
table_name
    SET SCHEMA new_schema;
ALTER TABLE [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ] [ IF EXISTS ]
table_name
    GSIWAITALL;
```

The table operation **action** can be one of the following clauses:

```
column_clause
    | ADD table_constraint [ NOT VALID ]
    | ADD table_constraint_using_index
    | VALIDATE CONSTRAINT constraint_name
    | DROP CONSTRAINT [ IF EXISTS ]  constraint_name [ RESTRICT | CASCADE ]
    | DROP PRIMARY KEY
    | DROP FOREIGN KEY fk_symbol
    | CLUSTER ON index_name
    | SET WITHOUT CLUSTER
    | SET ( {storage_parameter = value} [, ... ] )
    | RESET ( storage_parameter [, ... ] )
    | OWNER TO new_owner
    | SET TABLESPACE new_tablespace
    | TO { GROUP groupname | NODE ( nodename [, ... ] ) }
    | ADD NODE ( nodename [, ... ] )
    | DELETE NODE ( nodename [, ... ] )
    | UPDATE SLICE LIKE table_name
    | DISABLE TRIGGER { trigger_name | ALL | USER }
    | ENABLE TRIGGER { trigger_name | ALL | USER }
    | ENABLE REPLICA TRIGGER trigger_name
    | ENABLE ALWAYS TRIGGER trigger_name
    | ENABLE ROW LEVEL SECURITY
    | DISABLE ROW LEVEL SECURITY
    | FORCE ROW LEVEL SECURITY
    | NO FORCE ROW LEVEL SECURITY
    | REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }

NOTE

- **ADD table_constraint [NOT VALID]**

  Adds a table constraint.

- **ADD table_constraint_using_index**

  Adds a PRIMARY KEY constraint or UNIQUE constraint to a table based on the existing unique index.

- **VALIDATE CONSTRAINT constraint_name**

  Validates a check-class constraint created with the **NOT VALID** option, and scans the entire table to ensure that all rows meet the constraint. Nothing happens if the constraint is already marked valid.

- **DROP CONSTRAINT [IF EXISTS] constraint_name [RESTRICT | CASCADE]**

  Drops a table constraint.

- **DROP PRIMARY KEY**

  Drops a primary key constraint from a table.

  This syntax is valid only when **sql_compatibility** is set to **'B'**.

- **DROP FOREIGN KEY fk_symbol**

  Drops foreign key constraints from a table. **fk_symbol** indicates the name of the foreign key constraint to be deleted. This syntax is valid only when **sql_compatibility** is set to **'B'**.

- **CLUSTER ON index_name**

  Selects the default index for future CLUSTER operations. Actually, the table is not re-clustered.

- **SET WITHOUT CLUSTER**

  Deletes the most recently used CLUSTER index from the table. This affects future CLUSTER operations that do not specify an index.

- **SET ({storage_parameter = value} [, ...])**

  Changes one or more storage parameters for the table. If the value of **table_name** is an index name, **ACTIVE_PAGES** specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimizer optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTO VACUUM). You are advised not to manually set this parameter.

- **RESET (storage_parameter [, ...])**

  Resets one or more storage parameters to their defaults. As with SET, a table rewrite might be needed to update the table entirely.

- **OWNER TO new_owner**

  Changes the owner of a table, sequence, or view to the specified user.

- **SET TABLESPACE new_tablespace**

  Changes the table's tablespace to the specified tablespace and moves the data files associated with the table to the new tablespace. Indexes on the table, if any, are not moved; but they can be moved separately with additional **SET TABLESPACE** option in ALTER INDEX.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  The syntax is only available in extended mode (when GUC parameter **support_extended_features** is **on**). Exercise caution when enabling the mode. It is mainly used for tools like internal dilatation tools. Common users should not use the mode.

- **ADD NODE (nodename [, ...])**

  It is only available for internal scale-out tools. Common users should not use the syntax.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **DELETE NODE (nodename [, ...])**

  It is only available for internal scale-in tools. Common users should not use the syntax.

- **DISABLE TRIGGER { trigger_name | ALL | USER }**

  Disables a single trigger specified by **trigger_name**, disables all triggers, or disables only user triggers (excluding internally generated constraint triggers, for example, deferrable UNIQUE constraint triggers and exclusion constraint triggers).

  Exercise caution when using this function because data integrity cannot be ensured as expected if the triggers are not executed.

- **| ENABLE TRIGGER { trigger_name | ALL | USER }**

  Enables a single trigger specified by **trigger_name**, enables all triggers, or enables only user triggers.

- **| ENABLE REPLICA TRIGGER trigger_name**

  Determines that the trigger firing mechanism is affected by the configuration variable *session_replication_role*. When the replication role is **origin** (default value) or **local**, a simple trigger is fired.

  When **ENABLE REPLICA** is configured for a trigger, it is triggered only when the session is in replica mode.

- **| ENABLE ALWAYS TRIGGER trigger_name**

  Determines that all triggers are fired regardless of the current replica mode.

- **| { DISABLE | ENABLE } ROW LEVEL SECURITY**

  Enables or disables row-level security for a table.

  If row-level security is enabled for a data table but no row-level security policy is defined, the row-level access to the data table is not affected. If row-level security for a table is disabled, the row-level access to the table is not affected even if a row-level security policy has been defined. For details, see **CREATE ROW LEVEL SECURITY POLICY**.

- **| { NO FORCE | FORCE } ROW LEVEL SECURITY**

  Forcibly enables or disables row-level security for a table.

  By default, the table owner is not affected by the row-level security feature. However, if row-level security is forcibly enabled, the table owner (excluding system administrators) will be affected. System administrators are not affected by any row-level security policies.

- **REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING | UNIQUE}**

  Specifies the record level of old tuples in UPDATE and DELETE statements on a table in logical replication scenarios.

  - **DEFAULT** records the old value of the primary key column. If there is no primary key, **DEFAULT** does not record the old value.
  - **USING INDEX** records the old values of columns covered by the named indexes. These values must be unique, non-local, and non-deferrable, and contain the values of columns marked **NOT NULL**.
  - **FULL** records the old values of all columns in the row.
  - **NOTHING** does not record information in old rows.
  - **UNIQUE** records the old values of columns of the primary key or unique key.

  In logical replication scenarios, when the UPDATE and DELETE statements of a table are parsed, the parsed old tuples consist of the information recorded in this method. For tables with primary keys, this option can be set to **DEFAULT** or **FULL**. For a table without a primary key, set this parameter to **FULL**. Otherwise, the old tuple will be parsed as empty during decoding. You are advised not to set this parameter to **NOTHING** in common scenarios because old tuples are always parsed as empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For Ustore tables, the **NOTHING** option is invalid, and the actual effect is the same as that of **FULL**. If **DEFAULT** does not have a primary key, all columns in the row are recorded.

- **AUTO_INCREMENT [=] value**

  Sets the next auto-increment value of the auto-increment column. The configured value takes effect only when it is greater than the current auto-increment counter.

  The value must be a non-negative integer and cannot be greater than $2^{127} - 1$.

  This clause takes effect only when **sql_compatibility** is set to **B**.

- **[[DEFAULT] CHARACTER SET | CHARSET [=] default_charset] [[DEFAULT] COLLATE [=] default_collation]**

  Modifies the default character set and default collation of a table to the specified values. The modification does not affect the existing columns in the table.

- **CONVERT TO CHARACTER SET | CHARSET charset [COLLATE collation]**

  Modifies the default character set and default collation of a table to the specified values, sets the character set and collation of all columns with character type to the specified value and converts the data in the column to new character set encoding.

- **ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]**

  Adds an ILM policy to a table. A complete ILM policy consists of two parts: ILM action and ILM condition. The ILM action is used to define a specific data compression or movement behavior. The ILM condition is used to define a condition for triggering the ILM action. The ILM condition is a row-level condition, that is, when the ILM condition applies to each row in the heap table and the current row is not modified within a period of time, the ILM condition is met, and the ILM action is triggered. EXPR supports only basic operation functions (such as to_date and substr) of table columns and types.

- **[MODIFY { PARTITION partition_name | SUBPARTITION subpartition_name }] ILM { ENABLE | DISABLE | DELETE } POLICY policy_name**

  Modifies a single ILM policy of a table (partition or subpartition). **policy_name** is the value of **POLICY_NAME** queried from the system view GS_ADM_ILMOBJECTS or GS_MY_ILMOBJECTS.

- **[MODIFY { PARTITION partition_name | SUBPARTITION subpartition_name }] ILM { ENABLE_ALL | DISABLE_ALL | DELETE_ALL}**

  Modifies all ILM policies of a table (partition or subpartition).

– The column_clause can be one of the following clauses:

```
ADD [ COLUMN ] [ IF NOT EXISTS ] column_name data_type [ CHARACTER SET | CHARSET charset ] [ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ] [ FIRST | AFTER column_name ]
| MODIFY column_name data_type
| MODIFY column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ]
| MODIFY column_name [ CONSTRAINT constraint_name ] NULL
| MODIFY [ COLUMN ] column_name data_type [ CHARACTER SET | CHARSET charset ] [{[ COLLATE collation ] | [ column_constraint ]} [ ... ] ] [ FIRST | AFTER column_name ]
| CHANGE [ COLUMN ] column_name new_column_name data_type [ CHARACTER SET | CHARSET charset ] [{[ COLLATE collation ] | [ column_constraint ]} [ ... ] ] [ FIRST | AFTER column_name ]
| DROP [ COLUMN ] [ IF EXISTS ] column_name [ RESTRICT | CASCADE ]
| ALTER [ COLUMN ] column_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ USING expression ]
| ALTER [ COLUMN ] column_name { SET DEFAULT expression | DROP DEFAULT }
| ALTER [ COLUMN ] column_name { SET | DROP } NOT NULL
| ALTER [ COLUMN ] column_name SET STATISTICS [ PERCENT ] integer
| ADD STATISTICS (( column_1_name, column_2_name [, ...] ))
| DELETE STATISTICS (( column_1_name, column_2_name [, ...] ))
| DISABLE STATISTICS (( column_1_name, column_2_name [, ...] ))
| ENABLE STATISTICS (( column_1_name, column_2_name [, ...] ))
| ALTER [ COLUMN ] column_name SET ( {attribute_option = value} [, ... ] )
| ALTER [ COLUMN ] column_name RESET ( attribute_option [, ... ] )
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| ALTER [ COLUMN ] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }
| MODIFY column_name DROP IDENTITY
| MODIFY column_name GENERATED [ ALWAYS | BY DEFAULT [ ON NULL ] ] AS IDENTITY
[ ( identity_options ) ]
| ALTER [ COLUMN ] column_name ADD GENERATED [ ALWAYS | BY DEFAULT [ON NULL] ] AS
IDENTITY [ [ SEQUENCE NAME sequence_name] | ( identity_options ) ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **ADD [COLUMN] [IF NOT EXISTS] column_name data_type [CHARACTER SET | CHARSET charset] [compress_mode] [COLLATE collation] [column_constraint [...]] [FIRST | AFTER column_name]**

  Adds a column to a table. If you add a column using ADD COLUMN, all existing rows in the table are initialized to the column's default value (**NULL** if no **DEFAULT** value is specified). **FIRST | AFTER column_name** indicates that a column is added to a certain position. When IF NOT EXISTS is specified and columns with the same name exist, a notice is returned, indicating that the column already exists. When IF NOT EXISTS is not specified and columns with the same name exist, an error is returned.

- **ADD ({ column_name data_type [compress_mode] } [, ...])**

  Adds columns in the table.

- **MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT NULL [ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...])**

  Modifies the data type of an existing column in the table. Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

- **MODIFY [COLUMN] column_name data_type [CHARACTER SET | CHARSET charset] [{[COLLATE collation] | [column_constraint]} [...]] [FIRST | AFTER column_name]**

  Replaces the definition of existing field in a table with a new definition. The indexes and independent object constraints, such as primary keys, unique key and CHECK constraints in the previous field are not deleted. The [FIRST | AFTER column_name] syntax indicates that the position of a column in a table is changed when the column definition is modified.

  This syntax can be used only when **sql_compatibility** is set to **'B'**. Foreign tables are not supported. Encrypted columns cannot be modified. The data type and collation rule of partition key columns cannot be modified. The data type and collation rule of columns referenced by rules and materialized views cannot be modified.

  If a column whose data type or collation rule is modified is referenced by a generated column, the data in the generated column is regenerated.

  If the IDENTITY attribute is specified for a column that does not contain this attribute, the IDENTITY attribute is successfully added. If the IDENTITY attribute is specified for a column that already contains this attribute, an error is reported.

  If some objects (such as indexes, independent object constraints, views, triggers, and row-level security policies) depend on a modified column, these objects are rebuilt during column modification. If the definition of the modified column violates the constraints of this type of object, the modification fails. For example, the data type of the column that is used as the view result column cannot be modified. Pay attention on the failure impact before modification.

  If a modified column is called by some objects (such as user-defined functions and stored procedures), the modified column does not process these objects. After the columns are modified, these objects may be unavailable. Please evaluate the impact before modification.

  Changing the character set or collation of a column converts the data in the column to the new character set for encoding.

  The syntax of this clause is the same as that of **MODIFY column_name data_type** in the previous clause, but the semantic function is different. When the GUC parameter **b_format_behavior_compat_options** contains the **enable_modify_column** option, the function of this clause is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

This command refreshes statistics or historical statistics. More statistics are recorded, indicates that the cost of this command is higher. Therefore, exercise caution when running this command in multi-partition and multi-historical statistics scenarios.

- **CHANGE [COLUMN] column_name new_column_name data_type [CHARACTER SET | CHARSET charset] [{[COLLATE collation] | [column_constraint]} [...]] [FIRST | AFTER column_name]**

  Replaces the definition and name of existing column in a table with a new definition and name. The new column name must be different from the previous. The indexes and independent object constraints, such as primary keys, unique key and CHECK constraints in the previous column are not deleted. The **[FIRST | AFTER column_name]** syntax indicates that the position of a column in a table is changed when the name and definition of the column are modified.

  This syntax can be used only when **sql_compatibility** is set to **'B'**. Foreign tables are not supported. Encrypted columns cannot be modified. The data type and collation rule of partition key columns cannot be modified. The data type and collation rule of columns referenced by rules and materialized views cannot be modified.

  If a column whose data type or collation rule is modified is referenced by a generated column, the data in the generated column is regenerated.

  If some objects (such as indexes, independent object constraints, views, triggers, and row-level security policies) depend on a modified column, these objects are rebuilt during column modification. If the definition of the modified column violates the constraints of this type of object, the modification fails. For example, the data type of the column that is used as the view result column cannot be modified. Pay attention on the failure impact before modification.

  If a modified column is called by some objects (such as user-defined functions and stored procedures), the modified column does not process these objects. After the column names are modified, these objects may be unavailable. Please evaluate the impact before modification.

  Changing the character set or collation of a column converts the data in the column to the new character set for encoding.

- **DROP [COLUMN] [IF EXISTS] column_name [RESTRICT | CASCADE]**

  Drops a column from a table. Indexes and constraints related to the column are automatically dropped. If an object not belonging to the table depends on the column, **CASCADE** must be specified, such as a view.

  The DROP COLUMN statement does not physically remove the column, but simply makes it invisible to SQL operations. Subsequent INSERT and UPDATE operations on the table will store a **NULL** value for the column. Therefore, column deletion takes a short period of time but does not immediately release the tablespace on the disks, because the space occupied by the deleted column is not recycled. The space will be recycled when **VACUUM** is executed.

- **ALTER [COLUMN] column_name [SET DATA] TYPE data_type [COLLATE collation] [USING expression]**

  Modifies the type of a column in a table. Indexes and simple table constraints on the column will automatically use the new data type by reparsing the originally supplied expression.

  If the original data type of a column and the modified data type are binary compatible, you do not need to rewrite the entire table when running this statement. In other scenarios, the entire table is rewritten. You can check whether the source type and target type are binary compatible in the PG_CAST system catalog. If **castmethod** is **b**, they are binary compatible. For

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

example, if the data type of the source table is text and is converted to int, table rewriting is triggered. If it is converted to clob, table rewriting is not triggered. If table rewriting is triggered, the deleted space on the table is recycled immediately.

Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

- **ALTER [COLUMN] column_name { SET DEFAULT expression | DROP DEFAULT }**

  Sets or removes the default value for a column. The default values only apply to subsequent INSERT operations; they do not cause rows already in the table to change. Defaults can also be created for views, in which case they are inserted into INSERT statements on the view before the view's ON INSERT rule is applied.

- **ALTER [COLUMN] column_name { SET | DROP } NOT NULL**

  Alters whether a column is marked to allow **NULL** values or to reject **NULL** values. You can only use SET NOT NULL when the column contains no null values.

- **ALTER [COLUMN] column_name SET STATISTICS [PERCENT] integer**

  Specifies the per-column statistics-collection target for subsequent ANALYZE operations. The target can be set in the range from 0 to 10000. Set it to **–1** to revert to using the default system statistics target.

- **{ ADD | DELETE } STATISTICS ((column_1_name, column_2_name [, ...]))**

  Adds or deletes the declaration of collecting multi-column statistics to collect multi-column statistics as needed when ANALYZE is performed for a table or a database. If the GUC parameter **enable_functional_dependency** is disabled, the statistics about a maximum of 32 columns can be collected at a time. If the GUC parameter **enable_functional_dependency** is enabled, the statistics about a maximum of 4 columns can be collected at a time. You are not allowed to add or delete such declaration for system catalogs or foreign tables.

- **{DISABLE | ENABLE} STATISTICS ((column_1_name, column_2_name [, ...]))**

  Sets the status of multi-column statistics. If multi-column statistics are disabled, related statistics are not collected, and the optimizer does not use the multi-column statistics during plan generation.

- **ALTER [COLUMN] column_name SET ({attribute_option = value} [, ...])**

  ALTER [COLUMN] column_name RESET (attribute_option [, ...])

  Sets or resets per-attribute options.

  Currently, the only defined attribute options are **n_distinct** and **n_distinct_inherited**. **n_distinct** affects statistics of a table, while **n_distinct_inherited** affects the statistics of the table and its subtables. Currently, only **SET/RESET n_distinct** is supported, and **SET/RESET n_distinct_inherited** is forbidden.

- **ALTER [COLUMN] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }**

  Sets the storage mode for a column. It specifies whether this column is held inline or in an attached table, and whether the data should be compressed. SET STORAGE itself does not change anything in the table. It sets the strategy to be pursued during future table updates.

- **MODIFY column_name DROP IDENTITY**

  Cancels an **IDENTITY** column. This operation deletes only the identity attribute and related implicit sequence of the column.

- **MODIFY column_name GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [(identity_options)]**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Modifies the attributes and sequence parameters of the **IDENTITY** column. If the attributes of the **IDENTITY** column are not specified, the original attributes of the **IDENTITY** column are retained. The optional identity_options clause can be used to override sequence options.

- **ALTER [COLUMN] column_name ADD GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [[SEQUENCE NAME sequence_name] | (identity_options)]**

  Sets an existing column to an **IDENTITY** column. The column must be of the smallint, integer, bigint, decimal, numeric, float, double precision, or real numeric type (decimal, numeric, float, double precision, or real numeric type in A-compatible mode), and the default attribute is not set for the column. **sequence_name** specifies the name of the implicit sequence. By default, NOT NULL constraint is added to the **IDENTITY** column. If the column has **NULL** values, the modification fails.

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
  { NOT NULL |
    NULL |
    CHECK ( expression ) |
    DEFAULT default_expr |
    ON UPDATE update_expr |
    GENERATED ALWAYS AS ( generation_expr ) [STORED] |
    GENERATED [ ALWAYS | BY DEFAULT [ ON NULL ] ] AS IDENTITY
[ ( identity_options ) ] |
    AUTO_INCREMENT |
    COMMENT 'string' |
    COLVIEW |
    NOCOLVIEW |
    UNIQUE [KEY] index_parameters |
    PRIMARY KEY index_parameters |
    ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
ENCRYPTION_TYPE = encryption_type_value ) |
    REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH
SIMPLE ]
      [ ON DELETE action ] [ ON UPDATE action ] }
  [ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

  - **htap_action** is as follows:

```
COLVIEW
  | COLVIEW NOCOLVIEW
  | NOCOLVIEW
  | NOCOLVIEW COLVIEW
```

  - **identity_options** is as follows:

```
[ INCREMENT [ BY ] increment ] [ MINVALUE minvalue | NO MINVALUE |
NOMINVALUE] [ MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE ] [ START
{ [ WITH ] start | WITH LIMIT VALUE } ]
[ CACHE cache | NOCACHE ] [ [ NO ] CYCLE | NOCYCLE] [ SCALE [ EXTEND |
NOEXTEND] | NOSCALE ]
```

  - **update_expr** is as follows:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

- **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

– **table_constraint_using_index** used to add the PRIMARY KEY constraint or UNIQUE constraint based on the unique index is as follows:

```
[ CONSTRAINT constraint_name ]
  { UNIQUE | PRIMARY KEY } USING INDEX index_name
  [ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

– **table_constraint** is as follows:

```
[ CONSTRAINT [ constraint_name ] ]
  { CHECK ( expression ) |
    UNIQUE [ idx_name ] [ USING method ] ( { { column_name [ ( length ) ] | ( expression ) }
[ ASC | DESC ] } [, ... ] ) index_parameters |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] }[, ... ] ) index_parameters
|
 |
    FOREIGN KEY [ idx_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn
[, ... ] ) ]
      [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
action ] }
   [ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ] [ NOT
ENFORCED ]
   { [ COMMENT 'string' ] [ ... ] }
```

NOTE

The NOT ENFORCED syntax specifies that the created constraint is an informational constraint. That is, the database only records the constraint information and does not impose mandatory constraints on data. This syntax is mainly used to provide information required for optimization for the optimizer. Currently, only UNIQUE KEY, PRIMARY KEY, and FOREIGN KEY are supported.

index_parameters is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ USING INDEX TABLESPACE tablespace_name ]
```

- Rename a table. The renaming does not affect stored data.

```
ALTER TABLE [ IF EXISTS ] table_name
   RENAME [ TO | AS | = ] new_table_name;
```

NOTE

If you specify this parameter in a version 5.7 B-compatible database (**sql_compatibility** set to **'B'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s2'**), the following situations may occur:

- If the character string corresponding to the new table name starts with "#mysql50#" and is followed by other characters, "#mysql50#" will be ignored.
- If the old and new table names are the same, no error is reported.

- Rename the specified column in the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
   RENAME [ COLUMN ] column_name TO new_column_name;
```

- Rename the constraint of the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
   RENAME CONSTRAINT constraint_name TO new_constraint_name;
```

- Set the schema of the table.

```
ALTER TABLE [ IF EXISTS ] table_name
   SET SCHEMA new_schema;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The schema setting moves the table into another schema. Associated indexes and constraints owned by table columns are migrated as well. Currently, the schema for sequences cannot be changed. If the table has sequences, delete the sequences, and create them again or delete the ownership between the table and sequences. In this way, the table schema can be changed.
- To change a schema of a table, you must also have the CREATE permission on the new schema. To add the table as a new child of a parent table, you must own the parent table as well. To change the owner, you must also be a direct or indirect member of the new owning role, and that role must have the **CREATE** permission on the table's schema. These restrictions enforce that the user can only rebuild and delete the table. However, a system administrator can alter the ownership of any table anyway.
- All the actions except for RENAME and SET SCHEMA can be combined into a list of multiple alterations to apply in parallel. For example, it is possible to add several columns or alter the type of several columns in a single command. This is useful with large tables, since only one pass over the tables need be made.
- Adding a CHECK or NOT NULL constraint will scan the table to validate that existing rows meet the constraint.
- Adding a column with a non-NULL default or changing the type of an existing column will rewrite the entire table. Rewriting a large table may take much time and temporarily needs doubled disk space.

- Add columns.

```
ALTER TABLE [ IF EXISTS ] table_name
    ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint
[ ... ] ]} [, ...] );
```

- Update columns.

```
ALTER TABLE [ IF EXISTS ] table_name
    MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL
[ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [, ...] );
```

- Commit all DML transactions in the table when the SQL statement is executed.

```
ALTER TABLE [ IF EXISTS ] table_name GSIWAITALL;
```

NOTE

This syntax is internally called by the CREATE GLOBAL INDEX CONCURRENTLY function to synchronize lock wait during online creation of global secondary indexes. The centralized system does not support distributed global secondary indexes. Therefore, this syntax is not supported.

Parameters

- **ONLINE | OFFLINE**

  Controls whether to enable online DDL operations.

  The keywords ONLINE and OFFLINE are used.

  – ONLINE: DDL operations are executed online. In this case, if the ALTER TABLE statement contains a scenario that is not supported by the current DDL feature, the DDL operations are executed offline and a notice is displayed, indicating that the ONLINE keyword is ignored.

  – OFFLINE: DDL operations are executed offline.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Whether the data meets the data type conversion, length modification, or constraint requirements is checked during online DDL operations (including changing the column type, precision, and length, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints). If the data does not meet the requirements, an error is reported during DDL operations. Online DDL operations support concurrent DML operations. Concurrent DML operations may delete data that does not meet conversion requirements or violates constraints, but an error may be still reported for the DDL operations.

  For example, when online DDL scans a table to change the column type, if the data of tuple A in the table does not meet data conversion requirements, an error is reported immediately when the online DDL transaction scans tuple A. At the same time, if tuple A is deleted by a parallel transaction DELETE after tuple A has been scanned by an online DDL operation, tuple A is not considered as deleted.
- Online DDL error troubleshooting: The system automatically creates a temporary schema as the DDL implementation tool and sets the table to the **append_mode** state during online DDL operations (including changing the column type, precision, and length, and adding NOT NULL, CHECK, PRIMARY KEY, and UNIQUE constraints). If the online DDL execution is complete, the temporary mode is automatically cleared and restored. Automatic cleanup may fail due to reasons such as lock timeout. In this case, manual cleanup is required. If a severe fault occurs, such as FATAL, PANIC, database fault, or node disconnection, the created temporary schema and table appending status may remain. In this case, you need to manually clear and restore the temporary schema and table. The scenarios are as follows:
  - Canceling online DDL operations: If you cancel online DDL operations during the execution, the system automatically clears the data.
  - Operation error: If an error needs to be reported during the execution of a DDL command, for example, type conversion fails or length modification damages data, the system reports an error and automatically clears the data.
  - Major fault: After the cluster becomes normal, manually clear the data through **online_ddl_cleanup()**.
  - Adding PRIMARY KEY and UNIQUE constraints online: If an exception (for example, manual cancellation, duplicate unique index key values, insufficient resources, thread startup failure, or lock timeout) occurs during online index creation, the index fails to be created online. In this case, residual indexes and temporary tables may occupy system resources. For details about how to handle the exception, see **CONCURRENTLY**.
- You are advised not to call **online_ddl_cleanup()** during online DDL execution. Otherwise, the online DDL operations may be terminated or an unknown error may occur.
- When the column char type extension is modified online, the underlying data is not modified and rewritten. After online DDL operations, the underlying storage of existing data still retains the old length, and the underlying storage of new and modified data caused by DML operations complies with the extended length.

- **online_parameter**

  Specifies the online DDL option when the ONLINE keyword is specified. If the ONLINE keyword is not specified or online DDL conditions are not met, this parameter does not take effect.

  Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **parallel_threads**: specifies the number of threads when parallelism is enabled. Value range: an integer ranging from 1 to 32. The default value is **1**.
    - When **parallel_threads** is set to a value greater than **1**, multiple threads are enabled and the number of threads is specified.
    - If **parallel_threads** is not set or is set to **1**, multi-thread acceleration is disabled.

      When a user enables resource and workload management, for example, I/O resource management (for example, **io_limits** > **0** or **io_priority** = **high**/**medium**/**low**), **parallel_threads** ignores resource and workload management under the user or session. In addition, a notice is displayed, indicating that the current resource and workload management is invalid and multi-thread acceleration is enabled. The multi-thread execution process of online DDL operations actually follows the resource and workload management of the initial user.
    - When **parallel_workers** and **parallel_threads** are used together for acceleration, **parallel_workers** controls the maximum number of parallel threads in an index, and **parallel_threads** controls the maximum number of parallel threads between indexes.
  - **max_catchup_times**: specifies the maximum number of online DDL catchups to prevent long online DDL execution time. Value range: an integer ranging from 1 to 50. The default value is **50**.
    - Online DDL execution records the DML incremental data generated during data reconstruction to a temporary table and performs multiple cyclic catchups to reconstruct the incremental data. If the amount of concurrent DML data is too large, online DDL catchup fails. To prevent this problem, you can set this parameter to limit the number of catchups.

- **IF EXISTS**

  Sends a notice instead of an error if no tables have identical names. The notice prompts that the table you are querying does not exist.

- **table_name [*] | ONLY table_name | ONLY (table_name)**

  table_name is the name of the table that you need to change.

  If **ONLY** is specified, only the table is modified. If **ONLY** is not specified, the table and all subtables are modified. You can explicitly add the asterisk (*) option following the table name to specify that all subtables are scanned, which is the default operation.

- **constraint_name**
  - Specifies the name of an existing constraint to drop in the DROP CONSTRAINT operation.
  - Specifies the name of a new constraint in the ADD CONSTRAINT operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

For a new constraint, **constraint_name** is optional in B-compatible mode (that is, **sql_compatibility** set to **'B'**). For other modes, **constraint_name** is required.

- **index_name**

  Specifies the index name.

  NOTICE

  In the ADD CONSTRAINT operation:

  - The **index_name** is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - For foreign key constraints, if **constraint_name** and **index_name** are specified at the same time, **constraint_name** is used as the index name.
  - For a unique key constraint, if both **constraint_name** and **index_name** are specified, **index_name** is used as the index name.

- **USING method**

  Specifies the name of the index method to be used.

  For details about the value range, see USING method in **Parameters**.

  NOTICE

  In the ADD CONSTRAINT operation:

  - The USING method is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
  - In B-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.
  - If the storage mode of a table is Ustore and the constraint in the SQL statement is specified as USING BTREE, the underlying layer automatically creates the constraint as USING UBTREE.

- **ASC | DESC**

  ASC specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

  NOTICE

  ADD CONSTRAINT supports **ASC | DESC** only in B-compatible databases (that is, **sql_compatibility** set to **'B'**) and M-compatible databases (that is, **sql_compatibility** set to **'M'**). For details about the behavior of the M-compatible databases, see "SQL Reference > SQL Syntax > SQL Statements > A > ALTER TABLE" in *M Compatibility Developer Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **expression**

  Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

  NOTICE

  Expression indexes in the UNIQUE constraint are supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).

- **storage_parameter**

  Specifies the name of a storage parameter.

  The following option is added for creating an index:

  – **parallel_workers** (int type)

    Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

    Value range: [0,32]. The value **0** indicates that parallel index creation is disabled.

    Default value: If this parameter is not set, the parallel index creation function is disabled.

  – **hasuids** (Boolean type)

    Default value: **off**

    If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

  – **statistic_granularity**

    Records the default **partition_mode** when the table analyzes statistics. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

    Value range: See the value range of **partition_mode**.

    Default value: **AUTO**

  The following options are added to online DDL operations:

  – **online_ddl_status** (enumerated type)

    This parameter is used to update the online DDL execution status of a target table.

    It is called in online DDL operations. You are advised not to use it.

    - **on**: enables the online DDL status.
    - **off**: disables the online DDL status.
    - **init**: initializes online DDL temporary objects.
    - **catchup**: performs catchup when column types, precisions, or lengths are changed online.
    - **scan_catchup**: performs catchup when NOT NULL or CHECK constraints are added online.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

    - **vacuum_catchup**: performs catchup when VACUUM FULL is performed online.
    - **vacuum_verbose_catchup**: performs catchup when VACUUM FULL VERBOSE is performed online.
    - **last_catchup**: reports errors for the write service in the last online DDL catchup.
    - **switch**: exchanges temporary tables in the last online DDL catchup.
    - **copy_switch**: exchanges temporary tables in the last online tablespace movement catchup.
    - **record_toast_oid**: records the OID of a TOAST table attached to a target table of online DDL operations.
    - **abort**: specifies that online DDL operations enter the abort state.
    - **flush_buffer**: forcibly flushes buffers to disks when tablespaces are moved online.
    - **tmp_rel**: indicates a temporary table created during an online DDL process.
  - **online_ddl_lock_tag** (int type)

    Unique ID of a target table of online DDL operations, which is used to generate temporary objects. The ID is the hash value of (Table schema + Table name).

    It is called in online DDL operations. You are advised not to use it.
- **new_owner**

  Specifies the name of the new table owner.
- **new_tablespace**

  Specifies the new name of the tablespace to which the table belongs.
- **column_name**, **column_1_name**, **column_2_name**

  Specifies the name of a new or existing column.
- **data_type**

  Specifies the type of a new column or a new type of an existing column.
- **compress_mode**

  Specifies whether to compress a table column. The clause specifies the compression algorithm preferentially used by the column. This parameter is available only to column-store compression.
- **charset**

  Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

  This syntax is supported only in B-compatible databases (that is, **sql_compatibility** is set to **'B'**).
- **collation**

  Specifies the collation rule name of a column. The optional COLLATE clause specifies a collation for the new column; if omitted, the collation is the default

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

for the new column. You can run the **select * from pg_collation;** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

In a B-compatible database (that is, **sql_compatibility** set to **'B'**), the utf8mb4_bin, utf8mb4_general_ci, utf8mb4_unicode_ci, binary, gbk_chinese_ci, gbk_bin, gb18030_chinese_ci, and gb18030_bin collations are also supported. For details, see **Table 7-255**.

NOTE

- Only the character type supports the specified character set. If the binary character set or collation is specified, the character type is converted to the corresponding binary type. If the type mapping does not exist, an error is reported. Currently, only the mapping from the TEXT type to the BLOB type is available.
- Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.
- If the character set or collation of a column is not explicitly specified and the default character set or collation of the table is specified, the character set or collation of the column is inherited from the table. If the default character set or collation of a table does not exist, the character set and collation of table columns inherit the character set and collation of the current database when **b_format_behavior_compat_options** contains **'default_collation'**.
- If the character set corresponding to the modified character set or collation is different from the character set of current column, the data in the column is converted to the specified character set for encoding.

- **USING expression**

  Specifies how to compute the new column value from the old; if omitted, the default conversion is an assignment cast from old data type to new. A USING clause must be provided if there is no implicit or assignment cast from the old to new type.

  NOTE

  USING in ALTER TYPE can specify any expression involving the old values of the row; that is, it can refer to any columns other than the one being cast. This allows general casting to be done with the ALTER TYPE syntax. Because of this flexibility, the USING expression is not applied to the column's default value (if any); the result might not be a constant expression as required for a default. This means that when there is no implicit or assignment cast from old to new type, ALTER TYPE might fail to convert the default even though a USING clause is supplied. In such cases, drop the default with DROP DEFAULT, perform ALTER TYPE, and then use SET DEFAULT to add a suitable new default. Similar considerations apply to indexes and constraints involving the column.

- **NOT NULL | NULL**

  Sets whether the column allows null values.

- **ENABLE**

  Specifies that the constraint is enabled. By default, the constraint is enabled.

- **integer**

  Specifies the constant value of a signed integer. When using **PERCENT**, the range of **integer** is from 0 to 100.

- **attribute_option**

  Specifies an attribute option.

- **PLAIN | EXTERNAL | EXTENDED | MAIN**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies a column-store mode.

- **PLAIN** must be used for fixed-length values (such as integers). It must be inline and uncompressed.
- **MAIN** is for inline, compressible data.
- **EXTERNAL** is for external, uncompressed data. Use of **EXTERNAL** will make substring operations on **text** and **bytea** values run faster, at the penalty of increased storage space.
- **EXTENDED** is for external, compressed data. **EXTENDED** is the default for most data types that support non-**PLAIN** storage.

- **CHECK (expression)**

  New rows or rows to be updated must satisfy for an expression to be true. If any row produces a false result, an error is raised and the database is not modified.

  A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

  Currently, **CHECK (expression)** does not include subqueries and cannot use variables apart from the current column.

- **DEFAULT default_expr**

  Assigns a default data value to a column.

  The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **ON UPDATE update_expr**

  The ON UPDATE clause is an attribute constraint of a column.

  When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This attribute can be specified in a B-compatible database (that is, **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**) or a PG-compatible database (this syntax is not supported during upgrade observation).
- In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also specify or not specify the precision of a keyword with parentheses. The three types of keywords are synonyms of each other and have the same attribute effect. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. In a PG-compatible database, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE NOW(5) are not supported.
- This attribute can be specified only on columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime. A PG-compatible database does not support the datetime type.
- The CREATE TABLE AS syntax does not inherit the column attributes.
- The CREATE TABLE LIKE syntax can use **INCLUDING UPDATE** or **EXCLUDING UPDATE** to inherit or exclude a constraint. In a PG-compatible database, only **EXCLUDING UPDATE** can be used to exclude a constraint. The **INCLUDING ILM** option is added to copy the ILM policy information of a source table. This option is used together with the **INCLUDING PARTITION** option to copy the policy information of partition objects in the source table.
- The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, **ALTER TABLE t1 ADD col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3);**. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
- The same column cannot be specified for this attribute and the generated column constraint at the same time.
- This attribute cannot be specified for the partition key in a partitioned table.

- **COLUMN_ENCRYPTION_KEY = column_encryption_key**

  Specifies the name of the CEK in the ENCRYPTED WITH constraint.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **ENCRYPTION_TYPE = encryption_type_value**

  For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption_type_value** is **DETERMINISTIC** or **RANDOMIZED**.

- **GENERATED ALWAYS AS (generation_expr) [STORED]**

  This clause creates a column as a generated column. The value of the generated column is calculated by **generation_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored like an ordinary column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause at the same time. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause at the same time.
- The method of modifying and deleting generated columns is the same as that of ordinary columns. If you delete an ordinary column that a generated column depends on, the generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for ordinary columns.
- Columns cannot be generated. In foreign tables, only **postgres_fdw** supports generated columns.

- **GENERATED [ALWAYS | BY DEFAULT [ON NULL]] AS IDENTITY [(identity_options)]**

  Creates a column as an **IDENTITY** column. An implicit sequence is automatically created based on identity_options and attached to a specified column. When data is inserted, the value obtained from the sequence is automatically assigned to the column.

  – **GENERATED [ALWAYS] AS IDENTITY**: Only identity values provided by the sequence generator can be inserted into this column. User-specified values cannot be inserted into this column.

  – **GENERATED BY DEFAULT AS IDENTITY**: User-specified values are preferentially inserted into this column. If no value is specified, the identity values provided by the sequence generator are inserted.

  – **GENERATED BY DEFAULT ON NULL AS IDENTITY**: User-specified values are preferentially inserted into this column. If a null value is specified or no value is specified, the identity values provided by the sequence generator are inserted.

  The optional identity_options clause can be used to override sequence options.

  – **increment**: specifies the implicit sequence step. If the value is a positive number, an ascending sequence is generated. If the value is a negative number, a descending sequence is generated. The default value is **1**.

  – **MINVALUE minvalue | NO MINVALUE | NOMINVALUE**: specifies the minimum value of an execution sequence. If **minvalue** is not specified or **NO MINVALUE** is specified, the default value of an ascending sequence is **1**, and the default value of a descending sequence is **$-10^{27} + 1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE**: specifies the maximum value of an execution sequence. If **maxvalue** is not specified or **NO MAXVALUE** is specified, the default value of an ascending sequence is $10^{28} - 1$, and the default value of a descending sequence is **–1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.
- **[START { [WITH] start | WITH LIMIT VALUE }]**: **start** specifies the start value of the specified implicit sequence. Default value: **minvalue** for ascending sequences and **maxvalue** for descending sequences. If **START WITH LIMIT VALUE** is declared, the maximum (for ascending sequences) or minimum (for descending sequences) value in the table is specified as the start value of an implicit sequence.
- **cache**: specifies the number of sequences stored in the memory for quick access purposes. The default value is **1**, indicating that only one value can be generated at a time, that is, no cache is generated.
- **NOCACHE**: No value of the sequence is stored in advance.
- **CYCLE**: recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**. If **NO CYCLE** is declared, any call to nextval returns an error after the sequence reaches its maximum or minimum value. **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.
- **SCALE**: enables sequence scalability. If specified, a numeric offset is appended to the beginning of the sequence to prevent duplicate items in the generated value. If **NOSCALE** is declared, sequence scalability is disabled. The default value is **NOSCALE**.
- **EXTEND**: extends the numeric offset length (default value: **6**), aligns the sequence generation value to **x** (default value: **6**) + **y** (maximum number of digits). **SCALE** must be specified when **EXTEND** is specified. If **NOEXTEND** is declared, the numeric offset length is not extended. The default value is **NOEXTEND**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The **IDENTITY** column can only be of the smallint, integer, bigint, decimal, numeric, float, double precision, or real type.
- In A-compatible mode, when an **IDENTITY** column of the integer type is created, the **IDENTITY** column is of the numeric type by default.
- The method of changing an IDENTITY column is the same as that of changing an ordinary column, but the type can be changed only to smallint, integer, bigint, decimal, numeric, float, double precision, or real.
- By default, the **IDENTITY** column has the NOT NULL constraint.
- A table can contain only one **IDENTITY** column.
- The method of deleting an IDENTITY column is the same as that of deleting an ordinary column. When a column is deleted, the implicit sequence of the IDENTITY column is automatically deleted.
- The **IDENTITY** column cannot be specified together with the SET DEFAULT action.
- The type of the implicit sequence that is automatically created is LARGE SEQUENCE.
- You cannot use DROP LARGE SEQUENCE or ALTER LARGE SEQUENCE to modify the implicit sequence of an identity.
- The [SCALE [EXTEND | NOEXTED] | NOSCALE] clause is available only when an **IDENTITY** column is created in a centralized system in A-compatible mode.
- In a fully-encrypted database, the encrypted **IDENTITY** column cannot be specified during table creation.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

  For details, see **AUTO_INCREMENT**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - The COMMENT 'string' in column_constraint indicates that comments are added to a column.
  - The COMMENT 'string' in table_constraint indicates that comments are added to the indexes corresponding to the primary key and unique key.

  For details, see **COMMENT[=]'string'**.

- **UNIQUE [KEY] index_parameters**

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'B'**, which has the same semantics as UNIQUE.

  Specifies that a group of one or more columns of a table can contain only unique values.

- **UNIQUE [index_name][USING method]({{ column_name [(length)] | (expression) } [ASC | DESC] }[, ...]) index_parameters**

  Specifies that a group of one or more columns of a table can contain only unique values.

  column_name (length) is the prefix key. For details, see **column_name(length)**.

  index_name indicates the index name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The index_name is supported only in B-compatible databases (that is, **sql_compatibility** set to **'B'**).
- For a unique key constraint, if both constraint_name and index_name are specified, index_name is used as the index name.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY [USING method] ({ column_name [ASC | DESC] } [, ...]) index_parameters [NOT ENFORCED]

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

- **REFERENCES reftable [(refcolumn)] [MATCH matchtype] [ON DELETE action] [ON UPDATE action] (column constraint)**

  FOREIGN KEY (column_name [, ...]) REFERENCES reftable [(refcolumn [, ...])] [MATCH matchtype] [ON DELETE action] [ON UPDATE action] (table constraint) [NOT ENFORCED]

  The foreign key constraint requires that the group consisting of one or more columns in the new table should contain and match only the referenced column values in the referenced table. If **refcolumn** is omitted, the primary key of **reftable** is used. The referenced column should be the only column or primary key in the referenced table. A foreign key constraint cannot be defined between a temporary table and a permanent table.

  There are three types of matching between a reference column and a referenced column:

  - **MATCH FULL**: A column with multiple foreign keys cannot be **NULL** unless all foreign key columns are **NULL**.
  - **MATCH SIMPLE** (default): Any unexpected foreign key column can be **NULL**.
  - **MATCH PARTIAL**: This option is not supported currently.

  In addition, when certain operations are performed on the data in the referenced table, the operations are performed on the corresponding columns in the new table. **ON DELETE**: specifies the operations to be executed after a referenced row in the referenced table is deleted. **ON UPDATE**: specifies the operation to be performed when the referenced column data in the referenced table is updated. Possible responses to the **ON DELETE** and **ON UPDATE** clauses are as follows:

  - **NO ACTION** (default): When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. If the constraint is deferrable and there are still any referenced rows, this error will occur when the constraint is checked.
  - **RESTRICT**: When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. It is the same as **NO ACTION** except that the constraint is not deferrable.
  - **CASCADE**: deletes any row that references the deleted row from the new table, or update the column value of the referenced row in the new table to the new value of the referenced column.
  - **SET NULL**: sets the referenced columns to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **SET DEFAULT**: sets the referenced columns to their default values.

- **DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE**

  Sets whether the constraint can be deferrable.

  - **DEFERRABLE**: deferrable to the end of the transaction and checked using **SET CONSTRAINTS**.
  - **NOT DEFERRABLE**: checks immediately after the execution of each command.
  - **INITIALLY IMMEDIATE**: checks immediately after the execution of each statement.
  - **INITIALLY DEFERRED**: checks when the transaction ends.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies an optional storage parameter for a table or an index.

- **tablespace_name**

  Specifies the name of the tablespace where the index locates.

- **COMPRESS|NOCOMPRESS**
  - **NOCOMPRESS**: If the **NOCOMPRESS** keyword is specified, the existing compression feature of the table will not be changed.
  - **COMPRESS**: If the **COMPRESS** keyword is specified, the table compression feature will be triggered by batch tuple insertion. This parameter is available only to column-store compression.

- **new_table_name**

  Specifies the new table name.

- **new_column_name**

  Specifies the new name of a specific column in a table.

- **new_constraint_name**

  Specifies the new name of a table constraint.

- **new_schema**

  Specifies the new schema name.

- **CASCADE**

  Automatically drops objects that depend on the dropped column or constraint (for example, views referencing the column).

- **RESTRICT**

  Refuses to drop the column if the column is referenced by other columns or constraints. **RESTRICT** is the default option. If **CASCADE** is not specified, the value is **RESTRICT**. An example of the statement is as follows:

  ```
  ALTER TABLE table_name [DROP [column] col_name [CASCADE | RESTRICT]];
  ```

  table_name indicates the table name, and **col_name** indicates the column name.

- **FIRST**

  Adds or changes the column to the first place.

- **AFTER column_name**

  Adds or changes the column after the column specified by **column_name**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This syntax is supported only in B-compatible databases (that is, **sql_compatibility** is set to **'B'**).
- **FIRST | AFTER column_name** cannot be used in the encrypted column.
- The position of a column in a table that depends on rules cannot be changed (including the addition and change of the column position).
- **FIRST | AFTER column_name** cannot be used in the foreign table.
- Columns of the SET type cannot be changed to the specified position.

- **schema_name**

  Specifies the schema name of a table.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified and columns with the same name exist, a notice is returned, indicating that the column already exists. When IF NOT EXISTS is not specified and columns with the same name exist, an error is returned.

- **[DEFAULT] CHARACTER SET | CHARSET [=] default_charset**

  Changes the default character set of the table. If this parameter is specified separately, the default collation of the table is set to the default collation of the specified character set.

  This syntax is supported only when **sql_compatibility** is set to **'B'**.

- **[DEFAULT] COLLATE [=] default_collation**

  Changes the default collation of the table. If this parameter is specified separately, the default character set of the table is set to the character set corresponding to the specified collation.

  This syntax is supported only when **sql_compatibility** is set to **'B'**. For details about the collation, see **Table 7-255**.

  NOTE

  If the character set or collation of a table is not explicitly specified and the default character set or collation of the schema is specified, the character set or collation of the table is inherited from the schema. If the default character set or collation of a schema does not exist, the character set and collation of the table inherit those of the current database when **b_format_behavior_compat_options** contains **'default_collation'**.

- **COLVIEW | NOCOLVIEW**

  Specifies whether the declaration table is an IMCV table or a non-IMCV table. For details, see section "Hybrid Transactional/Analytical Processing" in *Feature Guide*.

Examples of Changing a Table

- Rename a table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# ALTER TABLE IF EXISTS aa RENAME TO test_alt1;
```

- Change the schema of a table.

```
-- Create the test_schema schema.
gaussdb=# CREATE SCHEMA test_schema;

-- Change the schema of the test_alt1 table to test_schema.
gaussdb=# ALTER TABLE test_alt1 SET SCHEMA test_schema;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Query table information.
gaussdb=# SELECT schemaname,tablename FROM pg_tables WHERE tablename = 'test_alt1';
 schemaname  | tablename
-------------+-----------
 test_schema | test_alt1
(1 row)
```

- Change the owner of a table.

```
-- Create user test_user.
gaussdb=# CREATE USER test_user PASSWORD '********';

-- Change the owner of the test_alt1 table to test_user.
gaussdb=# ALTER TABLE IF EXISTS test_schema.test_alt1 OWNER TO test_user;

-- Query.
gaussdb=# SELECT tablename, schemaname, tableowner FROM pg_tables WHERE tablename =
'test_alt1';
 tablename | schemaname  | tableowner
-----------+-------------+------------
 test_alt1 | test_schema | test_user
(1 row)
```

- Change the tablespace of a table.

```
-- Create the tbs_data1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Change the tablespace of the test_alt1 table to tbs_data1.
gaussdb=# ALTER TABLE test_schema.test_alt1 SET TABLESPACE tbs_data1;

-- Query.
gaussdb=# SELECT tablename, tablespace FROM pg_tables WHERE tablename = 'test_alt1';
 tablename | tablespace
-----------+------------
 test_alt1 | tbs_data1
(1 row)

-- Create a table.
gaussdb=# CREATE TABLE test(c1 int, c2 int);
-- Change the space of the test table to tbs_data1 online.
gaussdb=# ALTER TABLE ONLINE test SET TABLESPACE tbs_data1;

-- Query.
gaussdb=# SELECT tablename, tablespace FROM pg_tables WHERE tablename = 'test';
 tablename | tablespace
-----------+------------
 test| tbs_data1
(1 row)

-- Drop.
gaussdb=# DROP TABLE test ;
gaussdb=# DROP TABLE test_schema.test_alt1;
gaussdb=# DROP TABLESPACE tbs_data1;
gaussdb=# DROP SCHEMA test_schema;
gaussdb=# DROP USER test_user;
```

Examples of Changing a Column

- Change column names.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt2(c1 INT,c2 INT);

-- Change column names.
gaussdb=# ALTER TABLE test_alt2 RENAME c1 TO id;
gaussdb=# ALTER TABLE test_alt2 RENAME COLUMN c2 to areaid;

-- Query.
gaussdb=# \d test_alt2
   Table "public.test_alt2"
 Column |  Type   | Modifiers
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--------+---------+-----------
 id     | integer |
 areaid | integer |
```

- Add columns.

```
-- Add a column to the test_alt2 table.
gaussdb=# ALTER TABLE IF EXISTS test_alt2 ADD COLUMN name VARCHAR(20);

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
  Column  |         Type          | Modifiers
----------+-----------------------+-----------
 id       | integer               |
 areaid   | integer               |
 name     | character varying(20) |
```

- Add the **AUTO_INCREMENT** column.

```
-- Create a table and add an auto-increment column.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY = 'B';
gaussdb=# \c test
test=# CREATE TABLE test_autoinc(col1 int);

-- Insert a data record.
test=# INSERT INTO test_autoinc(col1) VALUES(1);

-- Add a local auto-increment column, which starts from 1.
test=# ALTER TABLE test_autoinc ADD COLUMN col int primary key AUTO_INCREMENT;
test=# SELECT col,col1 FROM test_autoinc ORDER BY 2,1;
 col | col1
-----+------
   1 |    1
(1 row)

-- Set the next auto-increment value to 10.
test=# ALTER TABLE test_autoinc AUTO_INCREMENT = 10;

-- Enter NULL to trigger auto-increment. The auto-increment value is 10.
test=# INSERT INTO test_autoinc(col, col1) VALUES(NULL,2);

-- Enter 0 to trigger auto-increment. The auto-increment value is 11.
test=# INSERT INTO test_autoinc(col, col1) VALUES(0,3);

test=# SELECT col,col1 FROM test_autoinc ORDER BY 2,1;
 col | col1
-----+------
   1 |    1
  10 |    2
  11 |    3
(3 rows)

-- Drop.
test=# DROP TABLE test_autoinc;

-- Switch to the default database. Change the database name based on actual situation.
test=# \c postgres;
gaussdb=# DROP DATABASE test;
```

- Change the data type of a column.

```
-- Change the type of the name column in the test_alt2 table.
gaussdb=# ALTER TABLE test_alt2 MODIFY name VARCHAR(50);

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 areaid | integer               |
 name   | character varying(50) |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Change the type of the name column in the test_alt2 table online.
gaussdb=# ALTER TABLE ONLINE test_alt2 MODIFY name VARCHAR(60);

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 areaid | integer               |
 name   | character varying(60) |
-- Change the type of the name column in the test_alt2 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name TYPE VARCHAR(25);

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 areaid | integer               |
 name   | character varying(25) |

-- Change the type of the name column in the test_alt2 table online.
gaussdb=# ALTER TABLE ONLINE test_alt2 ALTER COLUMN name TYPE VARCHAR(35);

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 areaid | integer               |
 name   | character varying(35) |
```

- Drop a column.

```
-- Drop the areaid column from test_alt2.
gaussdb=# ALTER TABLE test_alt2 DROP COLUMN areaid;

-- Query.
gaussdb=# \d test_alt2
          Table "public.test_alt2"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 name   | character varying(25) |
```

- Change the column-store mode.

```
-- View table details.
gaussdb=# \d+ test_alt2
                            Table "public.test_alt2"
 Column |         Type          | Modifiers | Storage  | Stats target | Description
--------+-----------------------+-----------+----------+--------------+-------------
 id     | integer               |           | plain    |              |
 name   | character varying(25) |           | extended |              |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE, segment=off

-- Change the storage mode of the name column in the test_alt2 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name SET STORAGE PLAIN;

-- Query.
gaussdb=# \d+ test_alt2
                           Table "public.test_alt2"
 Column |         Type          | Modifiers | Storage | Stats target | Description

Options: orientation=row, compression=no, storage_type=USTORE, segment=off
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop.
gaussdb=# DROP TABLE test_alt2;
```

- Move a column to a specified position.

```
-- Create a B-compatible database.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY 'B';

-- Connect to the test database and create the tbl_test table.
gaussdb=# \c test
test=# CREATE TABLE tbl_test(id int, name varchar(20));

-- Change the type of the name column in the tbl_test table and move it to the beginning.
test=# ALTER TABLE tbl_test MODIFY COLUMN name varchar(25) FIRST;

-- Query.
test=# \d tbl_test;
          Table "public.tbl_test"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 name   | character varying(25) |
 id     | integer               |

-- Change the type of the name column in the tbl_test table and move it after the id column.
test=# ALTER TABLE tbl_test MODIFY COLUMN name varchar(10) AFTER id;

-- Query.
test=# \d tbl_test;
          Table "public.tbl_test"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 id     | integer               |
 name   | character varying(10) |

-- Drop the tbl_test table.
test=# DROP TABLE tbl_test;

-- Switch to the default database and delete the test database. (Switch to the corresponding
database as required.)
test=# \c postgres
gaussdb=# DROP DATABASE test;
```

Examples of Changing a Constraint

- Add a NOT NULL constraint to a column.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt3(pid INT, areaid CHAR(5), name VARCHAR(20));

Add a NOT NULL constraint to pid.
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NOT NULL;

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 pid    | integer               | not null
 areaid | character(5)          |
 name   | character varying(20) |

-- Cancel the NOT NULL constraint on a column.
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NULL;

-- Add a NOT NULL constraint to the PID online.
gaussdb=# ALTER TABLE ONLINE test_alt3 MODIFY pid NOT NULL;

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 pid    | integer               | not null
 areaid | character(5)          |
 name   | character varying(20) |
```

- Cancel the NOT NULL constraint on a column.

```
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NULL;
-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 pid    | integer               |
 areaid | character(5)          |
 name   | character varying(20) |
```

- Change the default value of a column.

```
-- Change the default value of id in the test_alt3 table.
gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid SET DEFAULT '00000';

-- Query.
gaussdb=# \d test_alt3
                Table "public.test_alt3"
 Column |         Type          |        Modifiers
--------+-----------------------+-------------------------
 pid    | integer               |
 areaid | character(5)          | default '00000'::bpchar
 name   | character varying(20) |
-- Drop the default value of id.
gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid DROP DEFAULT;

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 pid    | integer               |
 areaid | character(5)          |
 name   | character varying(20) |
```

- Add a table-level constraint.
  - Directly add a constraint.

```
-- Add a primary key constraint to the table.
gaussdb=# ALTER TABLE test_alt3 ADD CONSTRAINT pk_test3_pid PRIMARY KEY (pid);

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 pid    | integer               | not null
 areaid | character(5)          |
 name   | character varying(20) |
Indexes:
    "pk_test3_pid" PRIMARY KEY, ubtree (pid) WITH (storage_type=USTORE) TABLESPACE
pg_default

-- Drop the table.
gaussdb=# DROP TABLE IF EXISTS test_alt3;

-- Create a table.
gaussdb=# CREATE TABLE test_alt3(pid INT, areaid CHAR(5), name VARCHAR(20));

-- Add a primary key constraint to the table online.
gaussdb=# ALTER TABLE ONLINE test_alt3 ADD CONSTRAINT pk_test3_pid PRIMARY KEY (pid);

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 Column |          Type          | Modifiers
--------+------------------------+-----------
 pid    | integer                | not null
 areaid | character(5)           |
 name   | character varying(20) |
Indexes:
    "pk_test3_pid" PRIMARY KEY, ubtree (pid) WITH (storage_type=USTORE) TABLESPACE
pg_default
```

  - Create an index and then add constraints.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt4(c1 INT, c2 INT);

-- Create an index.
gaussdb=# CREATE UNIQUE INDEX pk_test4_c1 ON test_alt4(c1);

-- Associate the created index when adding a constraint.
gaussdb=# ALTER TABLE test_alt4 ADD CONSTRAINT pk_test4_c1 PRIMARY KEY USING INDEX
pk_test4_c1;

-- Query.
gaussdb=# \d test_alt4
   Table "public.test_alt4"
 Column |  Type   | Modifiers
--------+---------+-----------
 c1     | integer | not null
 c2     | integer |
Indexes:
    "pk_test4_c1" PRIMARY KEY, ubtree (c1) WITH (storage_type=USTORE) TABLESPACE
pg_default

-- Drop.
gaussdb=# DROP TABLE test_alt4;
```

- Delete a table-level constraint.

```
-- Drop a constraint.
gaussdb=# ALTER TABLE test_alt3 DROP CONSTRAINT IF EXISTS pk_test3_pid;

-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
 Column |          Type          | Modifiers
--------+------------------------+-----------
 pid    | integer                | not null
 areaid | character(5)           |
 name   | character varying(20) |

-- Drop.
gaussdb=# DROP TABLE test_alt3;
```

- Rename a constraint.

```
-- Create the tbl_test1 table and specify the primary key constraint.
gaussdb=# CREATE TABLE tbl_test1(
    id int,
    name varchar(50),
    CONSTRAINT aaa PRIMARY KEY (id)
);

-- Rename the constraint.
gaussdb=# ALTER TABLE tbl_test1 RENAME CONSTRAINT aaa TO pk_test1_id;

-- View the information.
gaussdb=# \d tbl_test1;
          Table "public.tbl_test1"
 Column |          Type          | Modifiers
--------+------------------------+-----------
 id     | integer                | not null
 name   | character varying(50) |
Indexes:
    "pk_test1_id" PRIMARY KEY, ubtree (id) WITH (storage_type=USTORE) TABLESPACE pg_default
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the table.
gaussdb=# DROP TABLE tbl_test1;
```

CREATE TABLE and **DROP TABLE**

7.12.7.36 ALTER TABLE PARTITION

Description

Changes table partitions, including adding, deleting, splitting, merging, clearing, exchanging, and renaming partitions, moving partition tablespaces, enabling and disabling the automatic partitioning function, and changing partition attributes.

Precautions

- Only the partitioned table owner or a user with the ALTER permission can run the **ALTER TABLE PARTITION** command. When separation of duties is disabled, system administrators have this permission by default.
- The tablespace of the added partition cannot be PG_GLOBAL.
- The name of the added partition must be different from names of existing partitions in the partitioned table.
- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition.
- Hash partitions cannot be added.
- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If a partitioned table has only one partition, the partition cannot be deleted.
- Use PARTITION FOR() to choose partitions. The number of specified values in the brackets should be the same as the number of columns specified when you define a partition, and they must be consistent. ALTER TABLE processes the partition to which **partition_value** belongs.
- The **Value** partitioned table does not support the ALTER PARTITION operation.
- Partitions cannot be added to an interval partitioned table.
- Hash partitioned tables do not support splitting, combination, addition, or deletion of partitions.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global indexes. The UPDATE GLOBAL INDEX clause can be used to update the indexes synchronously.
- If the UPDATE GLOBAL INDEX clause is not used when you delete, split, merge, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If **enable_gpi_auto_update** is set to **on**, the global index is automatically updated even if the UPDATE GLOBAL INDEX clause is not declared.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.
- To enable automatic range partitioning, ensure that no MAXVALUE partition key exists in the partitioned table.
- Only a single partition key is supported when automatic range partitioning is enabled.
- To enable automatic list partitioning, ensure that no partition whose partition key is DEFAULT exists in a partitioned table.

Syntax

Changing partitions in a partitioned table includes the main syntax of changing a table partition, and the syntaxes of changing a table partition name, resetting the partition ID, and enabling or disabling the automatic partitioning function.

- Change the syntax of the table partition.

```
ALTER TABLE [ IF EXISTS ] { table_name  [*] | ONLY table_name | ONLY ( table_name  )}
  action [, ... ];
```

  action indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes DROP PARTITION and ADD PARTITION first, and then the rest clauses in sequence.

```
  move_clause |
  exchange_clause |
  row_clause |
  merge_clause |
  modify_clause |
  split_clause |
  add_clause |
  drop_clause |
  truncate_clause |
  ilm_clause |
  set_partitioning_clause
```

  - The move_clause syntax is used to move the partition to a new tablespace.

```
MOVE PARTITION { partion_name | FOR ( partition_value [, ...] ) } TABLESPACE tablespacename
```

  - The exchange_clause syntax is used to move the data from an ordinary table to a specified partition.

```
EXCHANGE PARTITION { ( partition_name ) | partition_name | FOR ( partition_value [, ... ] ) }
   WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY
( ordinary_table_name )}
   [ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
```

    The ordinary table and partition whose data is to be exchanged must meet the following requirements:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The number of columns in the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
- The compression information of the ordinary table and partition should be consistent.
- The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
- The number and information of constraints of the ordinary table and partition should be consistent.
- An ordinary table cannot be a temporary table. A partitioned table can only be a range partitioned table, list partitioned table, hash partitioned table, or interval partitioned table.
- When the built-in security policy is enabled, ordinary and partitioned tables cannot have dynamic data masking or row-level security constraints.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. In this case, the statistics on the ordinary table and partition become unreliable, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

  To exchange data, you can create an intermediate table. You need to insert the partition data to the intermediate table, truncate the partition, insert the ordinary table data to the partitioned table, drop the ordinary table, and rename the intermediate table to complete data exchange.
- In a scenario where both an ordinary table and a partitioned table are Ustore tables, if the UB-tree index type (RCR or PCR, RCR by default) of the ordinary table is different from the local UB-tree index type (RCR or PCR, RCR by default) of the partitioned table, data cannot be exchanged.
- If the DROP COLUMN operation is performed on an ordinary or partitioned table, the dropped column still exists physically. Therefore, you need to ensure that the dropped column of the ordinary table is strictly aligned with that of the partition. Otherwise, the exchange will fail.
- The EXCHANGE PARTITION { (partition_name) | partition_name | FOR (partition_value [, ...]) } operation is available in a B-compatible database (that is, **sql_compatibility** set to **'B'**). In other modes, only the EXCHANGE PARTITION { (partition_name) | FOR (partition_value [, ...]) } operation is available.
  - When **sql_compatibility** is set to **'B'**, if **partition_name** is the name of a level-1 partition, the level-1 partition and ordinary table are exchanged. If **partition_name** is the name of a level-2 partition, the level-2 partition and ordinary table are exchanged.
  - Level-1 partitions and ordinary tables cannot be exchanged in level-2 partitioned tables.

– The row_clause syntax is used to set row movement of a partitioned table.

```
{ ENABLE | DISABLE } ROW MOVEMENT
```

– The merge_clause syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.

```
MERGE PARTITIONS { partition_name } [, ...] INTO PARTITION partition_name
    [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- For range partitioning and interval partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.
- If the GUC parameter **enable_ilm** is not enabled and the merge_clause syntax is used to merge multiple partitions with the ILM policy into one partition, the new partition does not inherit the ILM policy.

⚠ CAUTION

Ustore tables do not support ALTER TABLE MERGE PARTITIONS in transaction blocks and stored procedures.

– The modify_clause syntax is used to set whether a partitioned index is usable.

```
MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES | COLVIEW [ PRIORITY { HIGH | LOW | NONE } ] | NOCOLVIEW [ PRIORITY { HIGH | LOW | NONE } ]}
```

– The split_clause syntax is used to split one partition into multiple ones.

```
SPLIT PARTITION { partition_name | FOR ( partition_value [, ...] ) } { split_point_clause | no_split_point_clause } [ UPDATE GLOBAL INDEX ]
```

NOTICE

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.
- If the GUC parameter **enable_ilm** is not enabled and the split_clause syntax is used to split a partition with the ILM policy into multiple partitions, the new partitions do not inherit the ILM policy.

▪ The split_point_clause syntax for specifying the split point for range partitioned tables and interval partitioned tables is as follows:

```
AT ( partition_value ) INTO ( PARTITION partition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] , PARTITION partition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] )
```

NOTICE

The split point must be in the range of partition keys of the partition to be split. Specifying a split point can only split one partition into two partitions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The no_split_point_clause syntax for not specifying the split point for range partitioned tables and interval partitioned tables is as follows:

```
INTO { ( partition_less_than_item [, ...] ) | ( partition_start_end_item [, ...] ) }
```

NOTICE

- The first new partition key specified by **partition_less_than_item** should be greater than that of the previously split partition (if any), and the last partition key specified by **partition_less_than_item** should equal that of the partition being split.
- The first new partition key specified by **partition_start_end_item** should equal that of the former partition (if any), and the last partition key specified by **partition_start_end_item** should equal that of the partition being split.
- **partition_less_than_item** supports a partition key with up to 16 columns, while **partition_start_end_item** supports a one-column partition key. For details about the supported data types, see **PARTITIONBYRANGE[COLUMNS](partition_key)**.
- **partition_less_than_item** and **partition_start_end_item** cannot be used in the same statement. There is no restriction on different SPLIT statements.

- The partition_less_than_item syntax is as follows (the range of the last partition is not defined, that is, the VALUES LESS THAN (partition_value) part is not defined; by default, the last partition inherits the upper boundary value of the range defined for the source partition):

```
PARTITION partition_name VALUES LESS THAN {( { partition_value | MAXVALUE }  [, ...] ) | MAXVALUE }
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ]
```

NOTICE

During range partitioning, the MAXVALUE keyword can be used without parentheses. It can be used only in B-compatible mode. It cannot be used in subpartitions of level-2 partitions or in scenarios where multi-column partition keys are used.

- The partition_start_end_item syntax is as follows. For details about the constraints, see **START END**.

```
PARTITION partition_name {
      {START(partition_value) END (partition_value) EVERY (interval_value)} |
      {START(partition_value) END ({partition_value | MAXVALUE})} |
      {START(partition_value)} |
      {END({partition_value | MAXVALUE})}
} [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [TABLESPACE tablespace_name]
```

- The split_point_clause syntax for specifying the split point for a list partitioned table is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
VALUES ( partition_value_list ) INTO ( PARTITION partition_name [ ILM ADD POLICY
ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]] [ TABLESPACE tablespacename ] , PARTITION
partition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n
{ day | month | year } OF NO MODIFICATION [ ON ( EXPR )]] [ TABLESPACE
tablespacename ] )
```

NOTICE

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- The no_split_point_clause syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( PARTITION partition_name VALUES (partition_value_list) [ ILM ADD POLICY ROW
STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]] [ TABLESPACE tablespacename ][, ...] )
```

NOTICE

COMPRESS ADVANCED ROW:

- The range of the last partition is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

– The add_clause syntax is used to add one or more partitions to a specified partitioned table.

```
ADD {{partition_less_than_item | partition_start_end_item| partition_list_item } |
    PARTITION({partition_less_than_item | partition_start_end_item | partition_list_item})}
```

NOTICE

- The PARTITION({partition_less_than_item | partition_start_end_item | partition_list_item}) syntax can be used only in B-compatible mode.
- The ALTER TABLE table_name ADD PARTITION (partition_definition1, partition_definition2,…); syntax cannot be used to add multiple partitions. Only the original syntax for adding multiple partitions is supported: ALTER TABLE table_name ADD PARTITION (partition_definition1), ADD PARTITION (partition_definition2), …

– The partition_list_item syntax is as follows:

```
PARTITION partition_name VALUES [IN] (list_values_clause)
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year }
OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- **partition_list_item** supports a maximum of 16 partition keys. For details about the supported data types, see **PARTITION BY LIST [COLUMNS] (partition_key)**.
- Interval and hash partitioned tables do not support partition addition.
- IN needs to be used in B-compatible mode and cannot be used in subpartitions of level-2 partitions.

– The drop_clause syntax is used to remove a partition from a specified partitioned table.

```
DROP PARTITION  { partition_name | FOR (  partition_value [, ...] )  } [ UPDATE GLOBAL INDEX ]
```

NOTICE

- Hash partitioned table does not support partition deletion.
- If a partitioned table has only one partition, the partition cannot be deleted.

– The truncate_clause syntax is used to remove a specified partition from a partitioned table.

```
TRUNCATE PARTITION  { partition_name | FOR (  partition_value [, ...] )  } [ UPDATE GLOBAL INDEX ]
```

– The ilm_clause syntax adds an ILM policy to a partition. It supports the syntax for the OLTP table compression feature of data lifecycle management.

```
MODIFY PARTITION partition_name ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR ) ]
```

– The set_partitioning_clause syntax enables or disables automatic list/range partitioning.

```
SET PARTITIONING { AUTOMATIC | MANUAL } |
SET INTERVAL ( [ interval_expr ] )
```

- Alter the name of a partition.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )}
    RENAME PARTITION { partion_name | FOR ( partition_value [, ...] ) } TO partition_new_name;
```

- Reset a partition ID.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )} RESET PARTITION;
```

Parameters

- **table_name**

  Specifies the name of a partitioned table.

  Value range: an existing partitioned table name.

- **partition_name**

  Specifies the name of a partition.

  Value range: an existing partition name.

- **tablespacename**

  Specifies which tablespace the partition moves to.

  Value range: an existing tablespace name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **partition_value**

  Specifies the key value of a partition.

  The value specified by PARTITION FOR (partition_value [, ...]) can uniquely identify a partition.

  Value range: partition keys for the partition to be operated.

- **UNUSABLE LOCAL INDEXES**

  Sets all the indexes unusable in the partition.

- **REBUILD UNUSABLE LOCAL INDEXES**

  Rebuilds all the indexes in the partition.

- **{ ENABLE | DISABLE } ROW MOVEMET**

  Specifies whether to enable row movement.

  If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.

  By default, this function is enabled.

- **ordinary_table_name**

  Specifies the name of the ordinary table whose data is to be migrated.

  Value range: an existing ordinary table name.

- **{ WITH | WITHOUT } VALIDATION**

  Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.

  Value range:

  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.

  The default value is **WITH**.

  The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.

- **VERBOSE**

  When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

NOTICE

Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **partition_new_name**

  Specifies the new name of a partition.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **UPDATE GLOBAL INDEX**

  Updates all global indexes in the partitioned table to ensure that correct data can be queried using global indexes. If this parameter is not used, all global indexes in the partitioned table become invalid.

- **SET PARTITIONING { AUTOMATIC | MANUAL }**

  Enables or disables the function of automatic list partitioning. If the keyword **AUTOMATIC** is used, the automatic partitioning function is enabled. If the keyword **MANUAL** is used, the automatic partitioning function is disabled.

- **SET INTERVAL ([interval_expr])**

  Implements the conversion between the interval partition and the range partition. The interval partition is equivalent to the range partition after the automatic partitioning function is enabled. If **interval_expr** is set to the default value, an interval partition is converted to a range partition. Otherwise, a range partition is converted to an interval partition. In the preceding information, **interval_expr** indicates the interval for automatically creating partitions. The value must comply with the value type of **partition_key**. Currently, only the numeric type and date/time type are supported, for example, **1**, **'1 day'**, and **'1 month'**.

- **COLVIEW | NOCOLVIEW**

  Specifies whether the partition is an IMCV partition or a non-IMCV partition. For details, see section "Hybrid Transactional/Analytical Processing" in *Feature Guide*.

Examples

- Change the name of a table partition.

```
-- Create a pre-partitioned table.
gaussdb=# CREATE TABLE test_p1 (col1 INT, col2 INT) PARTITION BY RANGE (col1)
(
    PARTITION p1 VALUES LESS THAN (10),
    PARTITION p2 VALUES LESS THAN (20),
    PARTITION p3 VALUES LESS THAN (MAXVALUE)
);

-- Change the partition name.
gaussdb=# ALTER TABLE test_p1 RENAME PARTITION p3 TO pmax;

-- Query partition information.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_p1'::regclass
AND parttype <> 'r';
 relname | boundaries |  oid
---------+------------+-------
 p1      | {10}       | 17066
 p2      | {20}       | 17067
 pmax    | {NULL}     | 17068
(3 rows)
```

- Move partition tablespaces.

```
-- Create a partition.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Move partition tablespaces.
gaussdb=# ALTER TABLE test_p1 MOVE PARTITION P1 TABLESPACE tbs_data1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Check the partition tablespace.
gaussdb=# SELECT relname, spcname FROM pg_partition t1, pg_tablespace t2 WHERE
T1.reltablespace=t2.oid and t1.parentid='test_p1'::regclass;
 relname |  spcname
---------+-----------
 p1      | tbs_data1
(1 row)
```

- Exchange partitions.

```
-- Create an ordinary table and insert data into the table.
gaussdb=# CREATE TABLE test_ep1(col1 INT,col2 INT);
gaussdb=# INSERT INTO test_ep1 VALUES (GENERATE_SERIES(1,30), 1000);

-- Migrate ordinary table data to a specified partition.
gaussdb=# ALTER TABLE test_p1 EXCHANGE PARTITION (p1) WITH TABLE test_ep1 VERBOSE;

-- Query.
gaussdb=# SELECT COUNT(*) FROM test_p1 PARTITION (p1);
 count
-------
     9
(1 row)

-- Drop the test_ep1 table.
gaussdb=# DROP TABLE test_ep1;
```

- Merge partitions.

```
-- Merge the p2 and pmax partitions in the test_p1 table into pmax.
gaussdb=# ALTER TABLE test_p1 MERGE PARTITIONS p2,pmax INTO PARTITION pmax;

-- View a partition.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_p1'::regclass
AND parttype <> 'r' order by 1;
 relname | boundaries |  oid
---------+------------+-------
 p1      | {10}       | 17066
 pmax    | {NULL}     | 17070
(2 rows)

-- Drop the table and tablespace.
gaussdb=# DROP TABLE test_p1;
gaussdb=# DROP TABLESPACE tbs_data1;
```

- Split partitions.

```
-- Create a table.
gaussdb=# CREATE TABLE test_r1 (col1 INT,col2 INT) PARTITION BY RANGE (col1)(
    PARTITION p1   VALUES LESS THAN (10),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);

-- Split partitions.
gaussdb=# ALTER TABLE test_r1 SPLIT PARTITION pmax AT (20) INTO (PARTITION p2, PARTITION
pmax);
gaussdb=# ALTER TABLE test_r1 SPLIT PARTITION pmax INTO (
    PARTITION p3   VALUES LESS THAN (30),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);

-- Query.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_r1'::regclass
AND parttype <> 'r' order by 1;
 relname | boundaries |  oid
---------+------------+-------
 p1      | {10}       | 17088
 p2      | {20}       | 17090
 p3      | {30}       | 17092
 pmax    | {NULL}     | 17093
(4 rows)

-- Drop the test_r1 table.
gaussdb=# DROP TABLE test_r1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a table.
gaussdb=# CREATE TABLE test_r2(col1 INT, col2 INT) PARTITION BY RANGE (col1)(
    PARTITION p1   START(1) END(10),
    PARTITION p2   START(10) END(20),
    PARTITION pmax START(20) END(MAXVALUE)
);

-- Split partitions.
gaussdb=# ALTER TABLE test_r2 SPLIT PARTITION pmax INTO (
    PARTITION p3 START(20) END(30),
    PARTITION pmax START(30) END (MAXVALUE)
);

-- Query.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_r2'::regclass
AND parttype <> 'r' order by 1;
 relname | boundaries |  oid
---------+------------+-------
 p1_0    | {1}        | 17112
 p1_1    | {10}       | 17113
 p2      | {20}       | 17114
 p3      | {30}       | 17116
 pmax    | {NULL}     | 17117
(5 rows)

-- Drop the test_r2 table.
gaussdb=# DROP TABLE test_r2;
-- Create a table.
gaussdb=# CREATE TABLE test_l1(col1 INT, col2 INT) PARTITION BY LIST(col1)(
    PARTITION p1   VALUES (10,20),
    PARTITION p2 VALUES (30,40)
);

-- Split partitions.
gaussdb=# ALTER TABLE test_l1 SPLIT PARTITION p1 VALUES (10) INTO (PARTITION p1_1, PARTITION
p1_2);
gaussdb=# ALTER TABLE test_l1 SPLIT PARTITION p2 INTO (PARTITION p3_1 VALUES(30), PARTITION
p3_2);

-- Query.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_l1'::regclass
AND parttype <> 'r' order by 1;
 relname | boundaries |  oid
---------+------------+-------
 p1_1    | {10}       | 17132
 p1_2    | {20}       | 17133
 p3_1    | {30}       | 17134
 p3_2    | {40}       | 17135
(4 rows)

-- Drop the test_l1 table.
gaussdb=# DROP TABLE test_l1;
```

- Add a partition.

```
-- Create a table.
gaussdb=# CREATE TABLE test_p2 (col1 INT, col2 INT) PARTITION BY RANGE (col1)(
    PARTITION p1 VALUES LESS THAN (10),
    PARTITION p2 VALUES LESS THAN (20)
);

-- Add a partition.
gaussdb=# ALTER TABLE test_p2 ADD PARTITION p3 VALUES LESS THAN (30);

-- Drop the test_p2 table.
gaussdb=# DROP TABLE test_p2;
-- Create a table.
gaussdb=# CREATE TABLE test_p3 (col1 INT, col2 INT) PARTITION BY LIST(col1)(
    PARTITION p1 VALUES (1),
    PARTITION p2 VALUES (2)
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Add a partition.
gaussdb=# ALTER TABLE test_p3 ADD PARTITION p3 VALUES (3);

-- Drop the test_p3 table.
gaussdb=# DROP TABLE test_p3;
```

- Delete a partition.

```
-- Create a table.
gaussdb=# CREATE TABLE test_p4 (col1 INT, col2 INT) PARTITION BY LIST(col1)(PARTITION p1
VALUES (1),PARTITION p2 VALUES (2));

-- Drop the p2 partition from the test_p3 table.
gaussdb=# ALTER TABLE test_p4 DROP PARTITION p2;

-- Query.
gaussdb=# SELECT relname, boundaries, oid FROM pg_partition WHERE parentid='test_p4'::regclass;
 relname | boundaries |  oid
---------+------------+-------
 test_p4 |            | 17187
 p1      | {1}        | 17188
(2 rows)

-- Drop the test_p4 table.
gaussdb=# DROP TABLE test_p4;

-- Specify the partition value to delete a partition.
-- Create a table.
gaussdb=# CREATE TABLE test_p4 (col1 INT, col2 INT) PARTITION BY RANGE(col1)(PARTITION p1
VALUES LESS THAN(1),PARTITION p2 VALUES LESS THAN (2));

-- Drop the partition whose partition key is 1 from the test_p3 table.
gaussdb=# ALTER TABLE test_p4 DROP PARTITION FOR (1);

-- Query.
gaussdb=# SELECT relname, boundaries FROM pg_partition WHERE parentid='test_p4'::regclass order
by 1 desc;
 relname | boundaries
---------+------------
 test_p4 |
 p1      | {1}
(2 rows)

-- Drop the test_p4 table.
gaussdb=# DROP TABLE test_p4;
```

- Truncate a partition.

```
-- Create a table.
gaussdb=# CREATE TABLE test_p5 (col1 INT, col2 INT) PARTITION BY RANGE (col1)(
    PARTITION p1 VALUES LESS THAN (5),
    PARTITION p2 VALUES LESS THAN (10)
);

-- Insert data.
gaussdb=# INSERT INTO test_p5 VALUES (GENERATE_SERIES(1,9), 100);

-- View data in the p2 partition.
gaussdb=# SELECT * FROM test_p5 PARTITION (p2);
 col1 | col2
------+------
    5 |  100
    6 |  100
    7 |  100
    8 |  100
    9 |  100
(5 rows)

-- Clear the data in the p2 partition.
gaussdb=# ALTER TABLE test_p5 TRUNCATE PARTITION p2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- View data in the p2 partition.
gaussdb=# SELECT * FROM test_p5 PARTITION (p2);
 col1 | col2
------+------
(0 rows)

-- Drop the test_p5 table.
gaussdb=# DROP TABLE test_p5;
```

- Enable and disable the automatic list partitioning function.

```
-- Create a list partition.
gaussdb=# CREATE TABLE list_int (c1 int, c2 int)
PARTITION BY LIST (c1)
(
    PARTITION p1 VALUES (1, 2, 3),
    PARTITION p2 VALUES (4, 5, 6)
);

-- Enable the automatic list partitioning function.
gaussdb=# ALTER TABLE list_int SET PARTITIONING AUTOMATIC;

-- Disable the function of automatic list partitioning.
gaussdb=# ALTER TABLE list_int SET PARTITIONING MANUAL;

-- Drops a list partition.
gaussdb=# DROP TABLE list_int;
```

- Enable and disable the automatic range partitioning function.

```
-- Create a range partition.
gaussdb=# CREATE TABLE range_int (c1 int, c2 int)
PARTITION BY RANGE (c1)
(
    PARTITION p1 VALUES LESS THAN (5),
    PARTITION p2 VALUES LESS THAN (10),
    PARTITION p3 VALUES LESS THAN (15)
);

-- Enable the automatic range partitioning function.
gaussdb=# ALTER TABLE range_int SET INTERVAL (5);

-- Disable the automatic range partitioning function.
gaussdb=# ALTER TABLE range_int SET INTERVAL ();

-- Drop a range partition.
gaussdb=# DROP TABLE range_int;
```

Helpful Links

CREATE TABLE PARTITION and **DROP TABLE**

7.12.7.37 ALTER TABLE SUBPARTITION

Description

Modifies partitions of a level-2 partitioned table, including adding, deleting, clearing, splitting, merging, exchanging, and renaming partitions, moving partition tablespaces, enabling and disabling the automatic partitioning function, and changing partition attributes.

Precautions

- The tablespace of the added partition cannot be PG_GLOBAL.
- The name of the added partition must be different from the names of the existing level-1 and level-2 partitions in the partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table. To add a partition to a table with the **MAXVALUE** partition, you are advised to use the SPLIT syntax.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition. To add a partition to a table with the **DEFAULT** partition, you are advised to use the SPLIT syntax.
- Hash partitions cannot be added. However, if the level-2 partition mode of an level-2 partitioned table is hash but the level-1 partition mode is not hash, you can add a level-1 partition and create the corresponding level-2 partition.
- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If the partitioned table contains only one level-1 or level-2 partition, the partition cannot be deleted.
- Hash partitions cannot be deleted.
- PARTITION FOR() and SUBPARTITION FOR() can be used to select partitions. The number of specified values in the brackets must be the same as the number of columns defined in partition creation.
- Only level-2 partitions (leaf nodes) can be split. Only range and list partitioning policies can be used and hash partitioning policies are not supported.
- Only level-2 partitions (leaf nodes) can be merged, and the source partitions must belong to the same level-1 partition.
- Only the owner of a partitioned table or users with the ALTER permission on the partitioned table can run the **ALTER TABLE PARTITION** command. System administrators have the permission to run the command by default.
- Deleting, splitting, clearing, and exchanging partitions will invalidate the global index. The UPDATE GLOBAL INDEX clause can be used to update the index synchronously.
- If the UPDATE GLOBAL INDEX clause is not used when you delete, split, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.
- If **enable_gpi_auto_update** is set to **on**, the global index is automatically updated even if the UPDATE GLOBAL INDEX clause is not declared.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in B-compatible mode, uppercase conversion will be unavailable.
- To enable automatic level-1 or level-2 list partitioning, ensure that no DEFAULT partition key exists in the corresponding partitions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

Changing partitions in a level-2 partitioned table includes changing the main syntax of a table partition, changing the syntax of a table partition name, resetting the partition ID, and enabling or disabling the syntax of the automatic partitioning function.

- Change the syntax of the table partition.

```
ALTER TABLE [ IF EXISTS ] { table_name  [*] | ONLY table_name | ONLY ( table_name  )}
  action [, ... ];
```

action indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes DROP PARTITION and ADD PARTITION first, and then the rest clauses in sequence.

```
  move_clause  |
  exchange_clause  |
  row_clause  |
  merge_clause  |
  modify_clause  |
  add_clause   |
  drop_clause   |
  split_clause  |
  truncate_clause  |
  ilm_clause   |
  set_partitioning_clause
```

  - The move_clause syntax is used to move the partition to a new tablespace.

```
MOVE SUBPARTITION { subpartion_name | FOR ( subpartition_value [, ...] ) } TABLESPACE
tablespacename
```

  - The exchange_clause syntax is used to move the data from an ordinary table to a specified partition.

```
EXCHANGE SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
   WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY
( ordinary_table_name )}
   [ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
```

    The ordinary table and partition whose data is to be exchanged must meet the following requirements:

    - The number of columns in the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
    - The compression information of the ordinary table and partition should be consistent.
    - The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
    - The number and information of constraints of the ordinary table and partition should be consistent.
    - The ordinary table cannot be a temporary table, and the partitioned table should be a level-2 partitioned table.
    - Ordinary tables and partitioned tables do not support dynamic data masking and row-level security constraints.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. In this case, the statistics on the ordinary table and partition become unreliable, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

  To exchange data, you can create an intermediate table, insert partition data into the intermediate table, truncate partitions, insert ordinary table data into the partitioned table, drop the ordinary table, and rename the intermediate table.
- If the DROP COLUMN operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition. Otherwise, the exchange will fail.

– The row_clause syntax is used to set row movement of a partitioned table.

```
{ ENABLE | DISABLE } ROW MOVEMENT
```

– The merge_clause syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.

```
MERGE SUBPARTITIONS { subpartition_name } [, ...] INTO SUBPARTITION subpartition_name
    [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )]] [ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]
```

NOTICE

- For range partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.
- If the GUC parameter **enable_ilm** is not enabled and the merge_clause syntax is used to merge multiple partitions with the ILM policy into one partition, the new partition does not inherit the ILM policy.

CAUTION

Ustore tables do not support ALTER TABLE MERGE SUBPARTITIONS in transaction blocks and stored procedures.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The modify_clause syntax is used to set whether a partitioned index is usable. The syntax can be used in level-1 partitions.

```
MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

  It can also be used in level-2 partitions.

```
MODIFY SUBPARTITION subpartition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

- The add_clause syntax is used to add one or more partitions to a specified partitioned table. The syntax can be used in level-1 partitions.

```
ADD {partition_less_than_item | partition_list_item } [ ( subpartition_definition_list ) ]
```

  It can also be used in level-2 partitions.

```
MODIFY PARTITION partition_name ADD subpartition_definition
```

  partition_less_than_item defines a range partition. The syntax is as follows:

```
PARTITION partition_name VALUES LESS THAN ( partition_value | MAXVALUE )[ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ]
```

  partition_list_item defines a list partition. The syntax is as follows:

```
PARTITION partition_name VALUES ( partition_value [, ...] | DEFAULT ) [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ]
```

  subpartition_definition_list contains the **subpartition_definition** object of one or more level-2 partitions. The syntax is as follows:

```
SUBPARTITION subpartition_name [ VALUES LESS THAN ( partition_value | MAXVALUE ) | VALUES ( partition_value [, ...] | DEFAULT )] [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespace ]
```

  NOTICE

  If the level-1 partition is a hash partition, you cannot use ADD to add a level-1 partition. If the level-2 partition is a hash partition, you cannot use MODIFY to add a level-2 partition.

- The drop_clause syntax is used to remove a partition from a specified partitioned table. The syntax can be used in level-1 partitions.

```
DROP PARTITION  { partition_name | FOR (  partition_value )  } [ UPDATE GLOBAL INDEX ]
```

  It can also be used in level-2 partitions.

```
DROP SUBPARTITION  { subpartition_name | FOR (  partition_value, subpartition_value )  } [ UPDATE GLOBAL INDEX ]
```

  NOTICE

  - If the level-1 partition is a hash partition, the level-1 partition cannot be deleted. If the level-2 partition is a hash partition, the level-2 partition cannot be deleted.
  - At least one sub-partition must be retained.

- The split_clause syntax is used to split one partition into multiple ones.

```
SPLIT SUBPARTITION { subpartition_name| FOR ( subpartition_value [, ...] ) } { split_point_clause | no_split_point_clause } [ UPDATE GLOBAL INDEX ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.
- If the GUC parameter **enable_ilm** is not enabled and the split_clause syntax is used to split a partition with the ILM policy into multiple partitions, the new partitions do not inherit the ILM policy.

- The split_point_clause syntax for specifying the split point for range partitioning is as follows:

```
AT ( subpartition_value ) INTO ( SUBPARTITION subpartition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] , SUBPARTITION subpartition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] )
```

  NOTICE

  The split point must be in the range of partition keys of the partition to be split. Specifying a split point can only split one partition into two partitions.

- The no_split_point_clause syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( SUBPARTITION subpartition_name VALUES LESS THAN (subpartition_value) [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ][, ...] )
```

  NOTICE

  - The range defined for the first new partition must be greater than that of the previous partition (if any) of the partition being split.
  - The range of the last partition is not defined, that is, the VALUES LESS THAN (subpartition_value) part is not defined; by default, the last partition inherits the upper boundary value of the range defined for the source partition.
  - The new partition must meet the constraint of continuously increasing range.

- The split_point_clause syntax for specifying the split point for list-range partitioning is as follows:

```
VALUES ( subpartition_value_list ) INTO ( SUBPARTITION subpartition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] , SUBPARTITION subpartition_name [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ] )
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- The no_split_point_clause syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( SUBPARTITION subpartition_name VALUES (subpartition_value_list) [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR )] ] [ TABLESPACE tablespacename ][, ...] )
```

NOTICE

- The range of the last partition is not defined, that is, the VALUES (subpartition_value_list) part is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

– The truncate_clause syntax is used to remove a specified partition from a partitioned table. The syntax can be used in level-1 partitions.

```
TRUNCATE PARTITION  { partition_name | FOR (  partition_value [, ...] )  } [ UPDATE GLOBAL INDEX ]
```

It can also be used in level-2 partitions.

```
TRUNCATE SUBPARTITION  { subpartition_name | FOR (  subpartition_value [, ...] )  } [ UPDATE GLOBAL INDEX ]
```

– The ilm_clause syntax adds an ILM policy to a partition. It supports the syntax for the OLTP table compression feature of data lifecycle management. The syntax can be used in level-1 partitions.

```
MODIFY PARTITION partition_name ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR ) ]
```

It can also be used in level-2 partitions.

```
MODIFY SUBPARTITION subpartition_name ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ ON ( EXPR ) ]
```

– The set_partitioning_clause syntax enables or disables automatic list partitioning.

```
SET { PARTITIONING | SUBPARTITIONING } { AUTOMATIC | MANUAL }
```

- Change the name of a partition. This syntax can be used to change level-1 partitions of a partitioned table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )}
    RENAME PARTITION { partion_name | FOR ( partition_value [, ...] ) } TO partition_new_name;
```

It can also be used to change level-2 partitions of a partitioned table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )}
    RENAME SUBPARTITION { subpartion_name | FOR ( subpartition_value [, ...] ) } TO subpartition_new_name;
```

- Reset a partition ID.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )} RESET PARTITION;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **table_name**

  Specifies the name of a partitioned table.

  Value range: an existing partitioned table name.

- **subpartition_name**

  Specifies the name of a level-2 partition.

  Value range: an existing level-2 partition name.

- **tablespacename**

  Specifies which tablespace the partition moves to.

  Value range: an existing tablespace name.

- **partition_value**

  Specifies the key value of the level-1 partition.

  The value specified by PARTITION FOR (partition_value [, ...]) can uniquely identify a level-1 partition.

  Value range: partition keys for the level-1 partition to be operated.

- **subpartition_value**

  Specifies the level-1 and level-2 partition key values.

  The value specified by SUBPARTITION FOR (subpartition_value [, ...]) can uniquely identify a level-2 partition.

  Value range: partition key values of the level-1 and level-2 partitions for the level-2 partition to be operated.

- **UNUSABLE LOCAL INDEXES**

  Sets all the indexes unusable in the partition.

- **REBUILD UNUSABLE LOCAL INDEXES**

  Rebuilds all the indexes in the partition.

- **{ ENABLE | DISABLE } ROW MOVEMET**

  Specifies whether to enable row movement.

  If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.

  By default, this function is enabled.

- **ordinary_table_name**

  Specifies the name of the ordinary table whose data is to be migrated.

  Value range: an existing ordinary table name.

- **{ WITH | WITHOUT } VALIDATION**

  Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.

  Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.

  The default value is **WITH**.

  The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.

- **VERBOSE**

  When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

  NOTICE

  Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

- **partition_new_name**

  Specifies the new name of a partition.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **subpartition_new_name**

  Specifies the new name of a level-2 partition.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **UPDATE GLOBAL INDEX**

  If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

- **SET { PARTITIONING | SUBPARTITIONING } { AUTOMATIC | MANUAL }**

  Enables or disables the function of automatic level-1/level-2 list partitioning. If the keyword **PARTITIONING** is used, the level-1 partition is specified. If the keyword **SUBPARTITIONING** is used, the level-2 partition is specified. If the keyword **AUTOMATIC** is used, the automatic partitioning function is enabled. If the keyword **MANUAL** is used, the automatic partitioning function is disabled.

Examples

- Rename a partition.

```
-- Create a level-2 partitioned table tbl_rge_lst_test.
gaussdb=# CREATE TABLE tbl_lst_reg_test(
    area_id char(5),
    sdate char(8),
    eid char(5),
    sales_amt int
) PARTITION BY LIST(area_id) SUBPARTITION BY RANGE(sdate)(
    PARTITION p_1001 VALUES ('1001')(
        SUBPARTITION p_1001_201901 VALUES LESS THAN ('20190201'),
        SUBPARTITION p_1001_201902 VALUES LESS THAN ('20190301'),
        SUBPARTITION p_1001_201903 VALUES LESS THAN ('20190401')
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    ),
    PARTITION p_1002 VALUES ('1002')(
        SUBPARTITION p_1002_201901 VALUES LESS THAN ('20190201'),
        SUBPARTITION p_1002_201902 VALUES LESS THAN ('20190301'),
        SUBPARTITION p_100w VALUES LESS THAN ('20190401')
    )
);

-- Change the name of the subpartition p_100w to p_1002_201903.
gaussdb=# ALTER TABLE tbl_lst_reg_test RENAME SUBPARTITION p_100w TO p_1002_201903;

-- Query.
gaussdb=# SELECT table_name,partition_name,subpartition_name FROM db_tab_subpartitions
WHERE table_name = 'tbl_lst_reg_test' AND partition_name = 'p_1002';
    table_name    | partition_name | subpartition_name
------------------+----------------+-------------------
 tbl_lst_reg_test | p_1002         | p_1002_201901
 tbl_lst_reg_test | p_1002         | p_1002_201902
 tbl_lst_reg_test | p_1002         | p_1002_201903
(3 rows)
```

- Move partition tablespaces.

```
-- Create the tbs_data1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace/tbs_data1';

-- Move the level-2 partition p_1002_201901 to the tablespace tbs_data1.
gaussdb=# ALTER TABLE tbl_lst_reg_test MOVE SUBPARTITION p_1002_201901 TABLESPACE
tbs_data1;

-- Move the level-2 partition p_1002_201902 to the tablespace tbs_data1.
gaussdb=# ALTER TABLE tbl_lst_reg_test MOVE SUBPARTITION FOR ('1002','20190325') TABLESPACE
tbs_data1;

-- Query the tablespace of the modified level-2 partition.
gaussdb=# SELECT subpartition_name,tablespace_name FROM db_tab_subpartitions WHERE
subpartition_name IN ('p_1002_201901','p_1002_201903');
 subpartition_name | tablespace_name
-------------------+-----------------
 p_1002_201901     | tbs_data1
 p_1002_201903     | tbs_data1
(2 rows)
```

- Exchange partitions.

```
-- Create an ordinary table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(
    area_id char(5),
    sdate char(8),
    eid char(5),
    sales_amt int
);

gaussdb=# INSERT INTO tbl_test VALUES ('1002','20190326','00001',9000);
gaussdb=# INSERT INTO tbl_test VALUES ('1002','20190326','00002',7500);
gaussdb=# INSERT INTO tbl_test VALUES ('1002','20190326','00003',6000);

-- Insert data into the partitioned table.
gaussdb=# INSERT INTO tbl_lst_reg_test VALUES ('1002','20190301','00001',126);

-- Exchange partitions.
gaussdb=# ALTER TABLE tbl_lst_reg_test EXCHANGE SUBPARTITION (p_1002_201903) WITH TABLE
tbl_test;

-- Query data. Data in the table and partition is exchanged.
gaussdb=# SELECT * FROM tbl_lst_reg_test;
 area_id |  sdate   |  eid  | sales_amt
---------+----------+-------+-----------
 1002    | 20190326 | 00001 |      9000
 1002    | 20190326 | 00002 |      7500
 1002    | 20190326 | 00003 |      6000
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM tbl_test;
 area_id |  sdate   |  eid  | sales_amt
---------+----------+-------+-----------
 1002    | 20190301 | 00001 |       126
(1 row)

-- Check that the partitioned table tablespace is exchanged.
gaussdb=# SELECT subpartition_name,tablespace_name FROM db_tab_subpartitions WHERE
subpartition_name = 'p_1002_201903';
 subpartition_name |  tablespace_name
-------------------+--------------------
 p_1002_201903     | DEFAULT TABLESPACE
(1 row)
```

- Merge partitions.

```
-- Merge partitions.
gaussdb=# ALTER TABLE tbl_lst_reg_test MERGE SUBPARTITIONS
p_1002_201901,p_1002_201902,p_1002_201903 INTO SUBPARTITION p_1002_20191;

-- Query level-2 partition information.
gaussdb=# SELECT table_name,partition_name,subpartition_name FROM db_tab_subpartitions
WHERE table_name = 'tbl_lst_reg_test';
    table_name    | partition_name | subpartition_name
------------------+----------------+-------------------
 tbl_lst_reg_test | p_1001         | p_1001_201901
 tbl_lst_reg_test | p_1001         | p_1001_201902
 tbl_lst_reg_test | p_1001         | p_1001_201903
 tbl_lst_reg_test | p_1002         | p_1002_20191
(4 rows)
```

- Add a partition.

```
-- Add a level-1 partition.
gaussdb=# ALTER TABLE tbl_lst_reg_test ADD PARTITION p_1003 VALUES('1003') (SUBPARTITION
p_1003_201901 VALUES LESS THAN ('20190201'));

-- Add a level-2 partition to a specific level-1 partition.
gaussdb=# ALTER TABLE tbl_lst_reg_test MODIFY PARTITION p_1003 ADD SUBPARTITION
p_1003_201902 VALUES LESS THAN ('20190301');

-- Query partition information.
gaussdb=# SELECT table_name,partition_name,subpartition_name FROM db_tab_subpartitions
WHERE table_name = 'tbl_lst_reg_test';
    table_name    | partition_name | subpartition_name
------------------+----------------+-------------------
 tbl_lst_reg_test | p_1001         | p_1001_201901
 tbl_lst_reg_test | p_1001         | p_1001_201902
 tbl_lst_reg_test | p_1001         | p_1001_201903
 tbl_lst_reg_test | p_1002         | p_1002_20191
 tbl_lst_reg_test | p_1003         | p_1003_201901
 tbl_lst_reg_test | p_1003         | p_1003_201902
(6 rows)
```

- Delete a partition.

```
-- Drop the level-2 partition p_1003_201902.
gaussdb=# ALTER TABLE tbl_lst_reg_test DROP SUBPARTITION p_1003_201902;

-- Query.
gaussdb=# SELECT table_name,partition_name,subpartition_name FROM db_tab_subpartitions
WHERE table_name = 'tbl_lst_reg_test' AND partition_name = 'p_1003';
    table_name    | partition_name | subpartition_name
------------------+----------------+-------------------
 tbl_lst_reg_test | p_1003         | p_1003_201901
(1 row)

-- Drop the level-1 partition p_1003.
gaussdb=# ALTER TABLE tbl_lst_reg_test DROP PARTITION p_1003;

CREATE TABLE SUBPARTITION

7.12.7.38 ALTER TABLESPACE

Description

Modifies the attributes of a tablespace.

Precautions

- Only the tablespace owner or a user granted the ALTER permission can run the **ALTER TABLESPACE** command. By default, system administrators have the permission. To modify a tablespace owner, you must be the tablespace owner or system administrator and a member of the **new_owner** role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The ALTER TABLESPACE operation on a row-store table cannot be performed in a transaction block.
- To change the owner, you must also be a direct or indirect member of the new owning role.

  NOTE

  If **new_owner** is the same as **old_owner**, the current user will not be verified. A message indicating successful ALTER execution is displayed.

Syntax

- The syntax of renaming a tablespace is as follows:

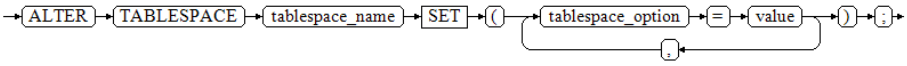
```
ALTER TABLESPACE tablespace_name
    RENAME TO new_tablespace_name;
```

- The syntax of setting the owner of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name
    OWNER TO new_owner;
```

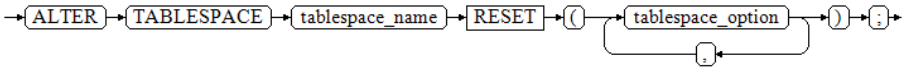
- The syntax of setting the attributes of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name
    SET ( { tablespace_option = value } [, ... ] );
```



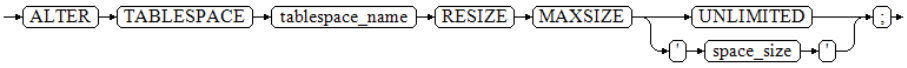
- The syntax of resetting the attributes of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name
    RESET ( { tablespace_option } [, ... ] );
```



- The syntax of setting the quota of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name
    RESIZE MAXSIZE { UNLIMITED | 'space_size'};
```



Parameters

- **tablespace_name**

  Specifies the tablespace to be modified.

  Value range: an existing tablespace name.

- **new_tablespace_name**

  Specifies the new name of the tablespace. The new name cannot start with **PG_**.

  Value range: a string. It must comply with the **naming convention**.

- **new_owner**

  Specifies the new owner of the tablespace.

  Value range: an existing username

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **tablespace_option**

  Sets or resets the parameters of a tablespace.

  Value range:

  - seq_page_cost: sets the optimizer to calculate the cost of obtaining disk pages in sequence. The default value is **1.0**.
  - **random_page_cost**: sets the optimizer to calculate the cost of obtaining disk pages in a non-sequential manner. The default value is **4.0**.

    NOTE

    - The value of **random_page_cost** is relative to that of **seq_page_cost**. It is meaningless when the value is equal to or less than the value of **seq_page_cost**.
    - The prerequisite for the default value **4.0** is that the optimizer uses indexes to scan table data and the hit ratio of table data in the cache is about 90%.
    - If the size of the table data space is smaller than that of the physical memory, decrease the value to a proper level. On the contrary, if the hit ratio of table data in the cache is lower than 90%, increase the value.
    - If random-access memory like SSD is adopted, the value can be decreased to a certain degree to reflect the cost of true random scan.

  Value range: Positive number of the floating-point type.

- **RESIZE MAXSIZE**

  Resets the maximum size of tablespace.

  Value range:

  - **UNLIMITED**: No limit is set for the tablespace.
  - Determined by **space_size**. For details about the format, see **CREATE TABLESPACE**.

    NOTE

    - If the adjusted quota is smaller than the current tablespace usage, the adjustment is successful. You need to decrease the tablespace usage to a value less than the new quota before writing data to the tablespace.

Examples

- Rename a tablespace.

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Rename a tablespace.
gaussdb=# ALTER TABLESPACE tbs_data1 RENAME TO tbs_data2;

-- Query.
gaussdb=# \db tbs_data2
            List of tablespaces
   Name    | Owner |       Location
-----------+-------+-----------------------
 tbs_data2 | omm   | tablespace1/tbs_data1
```

- Set the tablespace owner.

```
-- Create a user.
gaussdb=# CREATE USER test PASSWORD '********';

-- Change the owner of the tablespace.
gaussdb=# ALTER TABLESPACE tbs_data2 OWNER TO test;

-- Query.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# \db tbs_data2
            List of tablespaces
   Name    | Owner |       Location
-----------+-------+----------------------
 tbs_data2 | test  | tablespace1/tbs_data1
(1 row)
```

- Set tablespace attributes.

```
-- Change the value of seq_page_cost.
gaussdb=# ALTER TABLESPACE tbs_data2 SET (seq_page_cost = 10);

-- Query.
gaussdb=# SELECT * FROM pg_tablespace WHERE spcname = 'tbs_data2';
  spcname  | spcowner | spcacl |     spcoptions      | spcmaxsize | relative
-----------+----------+--------+---------------------+------------+----------
 tbs_data2 |    16778 |        | {seq_page_cost=10} |            | t
(1 row)
```

- Reset tablespace attributes.

```
-- Reset the value of seq_page_cost to the default value.
gaussdb=# ALTER TABLESPACE tbs_data2 RESET (seq_page_cost);

-- Query.
gaussdb=# SELECT * FROM pg_tablespace WHERE spcname = 'tbs_data2';
  spcname  | spcowner | spcacl | spcoptions | spcmaxsize | relative
-----------+----------+--------+------------+------------+----------
 tbs_data2 |    16778 |        |            |            | t
(1 row)
```

- Set the tablespace limit.

```
-- Set the maximum size of a tablespace.
gaussdb=# ALTER TABLESPACE tbs_data2 RESIZE MAXSIZE '10G';

-- Query.
gaussdb=# SELECT * FROM pg_tablespace WHERE spcname = 'tbs_data2';
  spcname  | spcowner | spcacl | spcoptions | spcmaxsize | relative
-----------+----------+--------+------------+------------+----------
 tbs_data2 |    16778 |        |            | 10485760 K | t
(1 row)

-- Delete the tablespace.
gaussdb=# DROP TABLESPACE tbs_data2;

-- Delete the user.
gaussdb=# DROP USER test;
```

CREATE TABLESPACE and **DROP TABLESPACE**

7.12.7.39 ALTER TRIGGER

Description

ALTER TRIGGER is used to change the name and owner of a trigger.

NOTE

Currently, only the name and owner of a trigger can be modified.

Precautions

- The owner of the table where a trigger resides or a user with the ALTER ANY TRIGGER permission can perform the ALTER TRIGGER operation. A system administrator has this permission by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- To modify the owner of a trigger, you must be the owner of the trigger or a system administrator, and you must be a direct or indirect member of the role to which the new owner belongs. The new owner must have the CREATE permission on the schema where the trigger is. When the separation of duties is disabled, SYSADMIN has this permission by default. When the separation of duties is enabled, SYSADMIN does not this permission by default.
- Only the initial user can change the owner of a trigger to the initial user.

Syntax

- Rename a trigger.

```
ALTER TRIGGER trigger_name ON table_name RENAME TO new_name;
```

- Change the owner of a trigger.

```
ALTER TRIGGER trigger_name ON table_name OWNER TO new_owner;
```

Parameters

- **trigger_name**

  Specifies the name of the trigger to be modified.

  Value range: an existing trigger.

- **table_name**

  Specifies the name of the table where the trigger to be modified is located.

  Value range: an existing table having a trigger.

- **new_name**

  Specifies the new name after modification.

  Value range: a string, which complies with the **Identifier Naming Conventions**. A value contains a maximum of 63 characters and cannot be the same as other triggers on the same table.

- **new_owner**

  Name of the new owner of a trigger.

  Value range: an existing username in the database.

Examples

```
-- Create a source table and a target table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a DELETE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE plpgsql;

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger BEFORE DELETE ON test_trigger_src_tbl FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Rename a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;

-- Change the owner of the trigger to jack. (Ensure that jack is a user created in the database.)
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl OWNER TO jack;

-- Drop the trigger.
gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;

-- Delete the function.
gaussdb=# DROP FUNCTION tri_delete_func;

-- Delete the source table and target table.
gaussdb=# DROP TABLE test_trigger_src_tbl;
gaussdb=# DROP TABLE test_trigger_des_tbl;
```

CREATE TRIGGER, **DROP TRIGGER**, and **ALTER TABLE**

7.12.7.40 ALTER TYPE

Description

Modifies the definition of a type.

Precautions

Only the owner of a type, a user granted the ALTER permission on a type, or a user granted the ALTER ANY TYPE permission on a sequence can run the **ALTER TYPE** command. When separation of duties is disabled, system administrators have this permission by default. To change the owner or schema of a type, you must be a type owner or system administrator and a member of the new owner role.

Syntax

- Change a type.

  ```
  ALTER TYPE name action [, ... ];
  ```

  
  The clauses corresponding to **action** are as follows:

  – Add a new attribute to a composite type.

    ```
    ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
    ```

    
  – Delete an attribute from a composite type.

    ```
    DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]
    ```

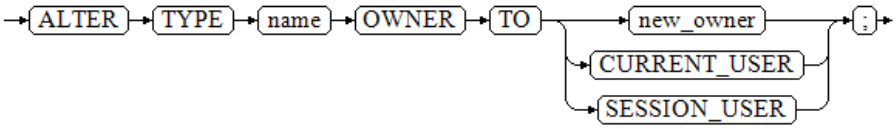
    
  – Change the type of an attribute in a composite type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE collation ]
[ CASCADE | RESTRICT ]
```

- Change the owner of a type.

  ```
  ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER };
  ```



- Change the name of a type.

  ```
  ALTER TYPE name RENAME TO new_name;
  ```

- Change the name of an attribute in a composite type.

  ```
  ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE |
  RESTRICT ];
  ```

- Move a type to a new schema.

  ```
  ALTER TYPE name SET SCHEMA new_schema;
  ```

- Add a new value to an enumerated type.

  ```
  ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER }
  neighbor_enum_value ];
  ```

- Change an enumerated value in the value list.

  ```
  ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value;
  ```

Parameters

- **name**

  Specifies the name of an existing type that needs to be modified (optionally schema-qualified).

- **new_name**

  Specifies the new name of the type.

- **new_owner**

  Specifies the new owner of the type.

- **new_schema**

  Specifies the new schema of the type.

- **attribute_name**

  Specifies the name of the attribute to be added, modified, or deleted.

- **new_attribute_name**

  Specifies the new name of the attribute to be renamed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **data_type**

  Specifies the data type of the attribute to be added, or the new type of the attribute to be modified.

- **new_enum_value**

  Specifies a new enumerated value. It is a non-null string with a maximum length of 63 bytes.

- **neighbor_enum_value**

  Specifies an existing enumerated value before or after which a new enumerated value will be added.

- **existing_enum_value**

  Specifies an enumerated value to be changed. It is a non-null string with a maximum length of 63 bytes.

- **CASCADE**

  Determines that the type to be modified, its associated records, and subtables that inherit the type will all be updated.

- **RESTRICT**

  (Default) Refuses to update the associated records of the modified type.

NOTICE

- **ADD ATTRIBUTE**, **DROP ATTRIBUTE**, and **ALTER ATTRIBUTE** can be combined for changing multiple attributes. For example, it is possible to add several attributes or change the types of several attributes at the same time in one command.
- To change a schema of a type, you must have the CREATE permission on the new schema. To change the owner, you must be a direct or indirect member of the new owning role, and the member must have the **CREATE** permission on the schema of this type. (The user can only rebuild and delete the type. However, system administrators can change ownership of any type in any way when separation of duties is disabled.) To add an attribute or change the type of an attribute, you must also have the USAGE permission of this type.

- **CURRENT_USER**

  Specifies the current user.

- **SESSION_USER**

  Specifies the current system user.

- **COLLATE collation**

  Assigns a collation to the column, which must be a sortable data type. If the collation is not specified, the default collation for the column's data type is used.

Examples

- Change a composite type:

```
-- Create a composite type.
gaussdb=# CREATE TYPE typ_stu AS (name varchar(10),age int);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a table and insert data into the table. The data type of the info column is typ_stu.
gaussdb=# CREATE TABLE tbl_test (id int PRIMARY KEY,info typ_stu);
gaussdb=# INSERT INTO tbl_test VALUES (1,('Jim',16));

-- View data in the tbl_test table.
gaussdb=# SELECT * FROM tbl_test;
 id |   info
----+----------
  1 | (Jim,16)
(1 row)

-- Add an attribute to a composite type.
gaussdb=# ALTER TYPE typ_stu ADD ATTRIBUTE year int CASCADE;

-- Check data in the tbl_test table again. The info column contains an extra attribute.
gaussdb=# SELECT * FROM tbl_test;
 id |   info
----+-----------
  1 | (Jim,16,)
(1 row)

-- Delete an attribute from a composite type.
gaussdb=# ALTER TYPE typ_stu DROP ATTRIBUTE year;
```

- Change the type owner.

```
-- Create a user test.
gaussdb=# CREATE ROLE test PASSWORD '********';

-- Change the owner of typ_stu to test.
gaussdb=# ALTER TYPE typ_stu OWNER TO test;

-- Query the owner of typ_stu.
gaussdb=# SELECT t1.typname, t2.rolname AS owner
FROM pg_type t1, gs_roles t2
WHERE t1.typname = 'typ_stu' AND
      t1.typowner = t2.oid;
 typname | owner
---------+--------
 typ_stu | test
(1 row)
```

- Change a type or the name of an attribute in a composite type.

```
-- Rename  attribute age of typ_stu to age1.
gaussdb=# ALTER TYPE typ_stu RENAME ATTRIBUTE age to age1;

-- Query the data whose age is 16 in the tbl_test table.
gaussdb=# SELECT id,(info).name,(info).age1 FROM tbl_test WHERE (info).age1 = 16;
 id | name | age1
----+------+------
  1 | Jim  |   16
(1 row)
```

- Move a type to a new schema.

```
-- Create a schema sctest.
gaussdb=# CREATE SCHEMA sctest;

-- Move typ_stu to the sc_test schema.
gaussdb=# ALTER TYPE typ_stu SET SCHEMA sctest;

-- Query the schema of typ_stu.
gaussdb=# \dT sctest.*
          List of data types
 Schema |      Name      | Description
--------+----------------+-------------
 sctest | sctest.typ_stu |
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE tbl_test;
gaussdb=# DROP TYPE sctest.typ_stu;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# DROP ROLE test;
gaussdb=# DROP SCHEMA sctest;
```

- Add a new value to an enumerated type.

```
-- Create an enumerated type typ_bugstatus.
gaussdb=# CREATE TYPE typ_bugstatus AS ENUM ('create', 'modify', 'closed');

-- Create a table tbl_test1.
gaussdb=# CREATE TABLE tbl_test1 (id serial, bugstat typ_bugstatus);

-- Insert data and ensure that the value of the bugstat column must be of the enumerated type. Otherwise, an error is reported.
gaussdb=# INSERT INTO tbl_test1 (bugstat) VALUES ('closed');
gaussdb=# INSERT INTO tbl_test1 (bugstat) VALUES ('deleted');
ERROR:  invalid input value for enum typ_bugstatus: "deleted"
LINE 1: INSERT INTO tbl_test1 (bugstat) VALUES ('deleted');
                                                ^
CONTEXT:  referenced column: bugstat

-- View data in the tbl_test1 table.
gaussdb=# SELECT * FROM tbl_test1;
 id | bugstat
----+---------
  1 | closed
(1 row)

-- Add a tag value to an enumerated type.
gaussdb=# ALTER TYPE typ_bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';
-- Query.
gaussdb=# \dT+ typ_bugstatus
                                  List of data types
 Schema |     Name      | Internal name | Size | Elements | Access privileges | Description

7.12.7.41 ALTER USER

Description

Modifies the attributes of a database user.

Precautions

- Session parameters changed by **ALTER USER** apply to a specified user and take effect in the next session.
- The ALTER USER IN DATABASE statement cannot be executed in a PDB.

Syntax

- Change user permissions or other information.

```
ALTER USER user_name [ [ WITH ] option [ ... ] ];
ALTER USER user_name
    RENAME TO new_name;
ALTER USER user_name [ IN DATABASE database_name ]
    SET configuration_parameter {{ TO | = } { value | DEFAULT }|FROM CURRENT};
ALTER USER user_name
    [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```

  The option clause is as follows:

```
{ CREATEDB | NOCREATEDB }
    | { CREATEROLE | NOCREATEROLE }
    | { INHERIT | NOINHERIT }
    | { AUDITADMIN | NOAUDITADMIN }
    | { SYSADMIN | NOSYSADMIN }
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | { USEFT | NOUSEFT }
    | { LOGIN | NOLOGIN }
    | { REPLICATION | NOREPLICATION }
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' [EXPIRED] | DISABLE | EXPIRED }
    | [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' |
EXPIRED ] | DISABLE }
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | TEMP SPACE 'tmpspacelimit'
    | SPILL SPACE 'spillspacelimit'
    | NODE GROUP logic_cluster_name
    | ACCOUNT { LOCK | UNLOCK }
    | PGUSER
```

- Change the username.

```
ALTER USER user_name
    RENAME TO new_name;
```

- Change the value of a specified parameter associated with the user.

```
ALTER USER user_name [ IN DATABASE database_name ]
    SET configuration_parameter {{ TO | = } { value | DEFAULT }|FROM CURRENT};
```

- Reset the value of a specified parameter associated with the user.

```
ALTER USER user_name
    [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **user_name**

  Specifies the current username.

  Value range: an existing username. If a username contains uppercase letters, enclose the name with double quotation marks ("").

- **new_password**

  Specifies a new password.

  The new password must:

  - Differ from the old password.
  - Contain at least eight characters. This is the default length.
  - Differ from the username or the username spelled backward.
  - Contain at least three of the following four types of characters: uppercase characters (A to Z), lowercase characters (a to z), digits (0 to 9), and special characters, including: ~!@#$%^&*()-_=+\|[{}];:,<.>/? If the password contains characters other than the preceding characters, an error will be reported during statement execution.
  - Be enclosed by single quotation marks.

  Value range: a string.

- **old_password**

  Specifies the old password.

- **ACCOUNT { LOCK | UNLOCK }**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**

  In the current version, the **PGUSER** attribute of a user cannot be modified.

For details about other parameters, see "Parameters" in **CREATE ROLE** and **ALTER ROLE**.

Examples

```
-- Create user jim whose login password is ********.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Create a database.
gaussdb=# CREATE DATABASE testdb1;

-- Set the role configuration parameter configuration_parameter to DEFAULT.
gaussdb=# ALTER USER jim IN DATABASE testdb1 SET configuration_parameter  =  DEFAULT;

-- Reset the role configuration parameter.
gaussdb=# ALTER USER jim IN DATABASE testdb1 RESET configuration_parameter;

-- Change the login password of user jim.
gaussdb=# ALTER USER jim IDENTIFIED BY '**********' REPLACE '********';

-- Set enable_seqscan to on. (The setting will take effect in the next session.)
gaussdb=# ALTER USER jim SET enable_seqscan TO on;

-- Reset the enable_seqscan parameter for jim.
gaussdb=# ALTER USER jim RESET enable_seqscan;

-- Lock jim.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# ALTER USER jim ACCOUNT LOCK;

-- Unlock jim.
gaussdb=# ALTER USER jim ACCOUNT UNLOCK;

-- Change the username.
gaussdb=# ALTER USER jim RENAME TO lisa;

-- Delete the user.
gaussdb=# DROP USER lisa CASCADE;

-- Delete the database.
gaussdb=# DROP DATABASE testdb1;
```

Helpful Links

CREATE ROLE, **CREATE USER**, and **DROP USER**

7.12.7.42 ALTER USER MAPPING

Description

ALTER USER MAPPING changes the definition of the mapping from a user to a foreign server. The owner of the foreign server can change the user mapping of the server for any user. In addition, if the USAGE permission on the server has been granted to a user, the user can change the user mapping of its own username.

Precautions

- If the **password** option is displayed in **OPTIONS**, ensure that the **usermapping.key.cipher** and **usermapping.key.rand** files exist in the *$GAUSSHOME*/**bin** directory of each node in GaussDB. If the two files do not exist, use the gs_guc tool to generate them and use the gs_ssh tool to release them to the *$GAUSSHOME*/**bin** directory on each node. For details, see the description in **OPTIONS**.
- When multi-layer quotation marks are used for sensitive columns (such as **password**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
ALTER USER MAPPING FOR { user_name | USER | CURRENT_USER | PUBLIC }
    SERVER server_name
    OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ] );
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, ADD operations will be performed by default. **option** and **value** are the parameters and values of the corresponding operation.

Parameters

- **user_name**

  Specifies username of the mapping.

  CURRENT_USER and **USER** match the name of the current user. **PUBLIC** is used to match all current and future usernames in the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **server_name**

  Specifies name of the server to which the user is mapped.

- **OPTIONS**

  Changes an option for the user mapping. The new option overwrites any previously specified option. **ADD**, **SET**, and **DROP** are operations to be performed. If the operation is not set explicitly, **ADD** is used. The option name must be unique and will be validated with the foreign data wrapper of the server.

  NOTE

  - User passwords are encrypted and stored in the system catalog PG_USER_MAPPING. During the encryption, **usermapping.key.cipher** and **usermapping.key.rand** are used as the encryption password file and encryption factor. Before using the tool for the first time, create the two files, save the files to the *$GAUSSHOME*/**bin** directory on each node, and ensure that you have the read permission on the files. **gs_ssh** helps you quickly place files in the specified directory of each node.
    ```
    gs_ssh -c "gs_guc generate -o usermapping -S default -D $GAUSSHOME/bin"
    ```
  - If the **-S** parameter is set to default, a password is randomly generated. You can also specify a password for the **-S** parameter to ensure the security and uniqueness of the generated password file. You do not need to save or memorize the password. For details about other parameters, see the description of the gs_guc tool in *Tool Reference*.

Examples

```
-- Create a role.
gaussdb=# CREATE ROLE bob PASSWORD '********';

-- Create a foreign server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a user mapping.
gaussdb=# CREATE USER MAPPING FOR bob SERVER my_server OPTIONS (user 'bob', password '********');

-- Modify the user mapping.
gaussdb=# ALTER USER MAPPING FOR bob SERVER my_server OPTIONS (SET password '********');

-- Delete the user mapping.
gaussdb=# DROP USER MAPPING FOR bob SERVER my_server;

-- Delete the foreign server.
gaussdb=# DROP SERVER my_server;

-- Delete the role.
gaussdb=# DROP ROLE bob;
```

CREATE USER MAPPING and DROP USER MAPPING

7.12.7.43 ALTER VIEW

Description

Changes the auxiliary attributes of a view. If you want to change the query definition of a view, use CREATE OR REPLACE VIEW.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

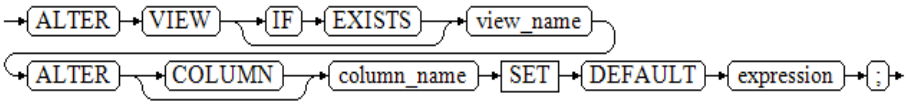
Only the view owner or a user granted the ALTER permission on a view can run the **ALTER VIEW** command. When separation of duties is disabled, a system administrator has this permission by default. The following are permission constraints depending on the attributes to be modified:

- To change the schema of a view, you must be the owner of the view or system administrator and have the CREATE permission on the new schema. When separation of duties is enabled, a system administrator cannot change the view mode.
- To change the owner of a view, you must be the owner of the view or system administrator and a member of the new owner role, with the CREATE permission on the schema of the view. When separation of duties is enabled, a system administrator cannot change the owner of a view.
- Do not change the type of a column in a view.

Syntax

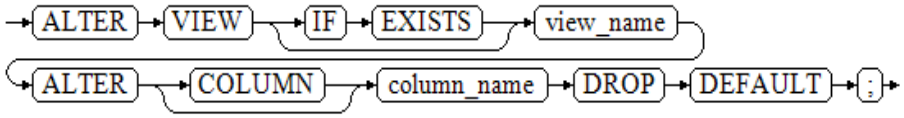
- Set the default value of a view column.

```
ALTER VIEW [ IF EXISTS ] view_name
    ALTER [ COLUMN ] column_name SET DEFAULT expression;
```



- Remove the default value of a view column.

```
ALTER VIEW [ IF EXISTS ] view_name
    ALTER [ COLUMN ] column_name DROP DEFAULT;
```



- Change the owner of a view.

```
ALTER VIEW [ IF EXISTS ] view_name
    OWNER TO new_owner;
```

- Rename a view.

```
ALTER VIEW [ IF EXISTS ] view_name
    RENAME TO new_name;
```

- Set the schema of a view.

```
ALTER VIEW [ IF EXISTS ] view_name
    SET SCHEMA new_schema;
```

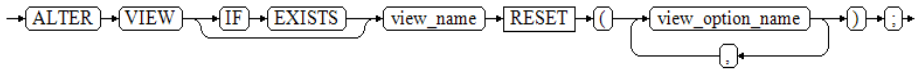
- Set the options of a view.

```
ALTER VIEW [ IF EXISTS ] view_name
    SET ( { view_option_name [ = view_option_value ] } [, ... ] );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Reset the options of a view.

```
ALTER VIEW [ IF EXISTS ] view_name
    RESET ( view_option_name [, ... ] );
```



Parameters

- **IF EXISTS**

  If this option is used, no error is generated when the view does not exist, and only a message is displayed.

- **view_name**

  Specifies the view name, which can be schema-qualified.

  Value range: a string. It must be an existing view name.

- **column_name**

  Specifies the column name.

  Value range: a string. It must be an existing view column name.

- **SET/DROP DEFAULT**

  Sets or deletes the default value of a column. This parameter does not take effect.

- **new_owner**

  Specifies the new owner of a view.

- **new_name**

  Specifies the new view name.

- **new_schema**

  Specifies the new schema of the view.

- **view_option_name [= view_option_value]**

  Specifies an optional parameter for a view.

  - **security_barrier**: specifies whether the view provides row-level security. The value is of the Boolean type. The default value is **true**.
  - **check_option**: controls the behavior of updating a view. This parameter can be set to **CASCADED** or **LOCAL**. This parameter cannot be left blank.

- **expression**

  Specifies constants, functions, or SQL expressions.

Examples

- Rename a view.

```
-- Create the test_tbl table.
gaussdb=# CREATE TABLE test_tb1(col1 INT,col2 INT);

-- Create a view.
gaussdb=# CREATE VIEW abc AS SELECT * FROM test_tb1;

-- Set the default value of the view column to 100.
gaussdb=# ALTER VIEW IF EXISTS  abc ALTER  COLUMN  col1 SET DEFAULT 100;

-- Cancel the default value of the view column.
gaussdb=# ALTER VIEW IF EXISTS  abc ALTER  COLUMN  col1 DROP DEFAULT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Rename the view.
gaussdb=# ALTER VIEW IF EXISTS abc RENAME TO test_v1;

-- Query the view.
gaussdb=# \dv
            List of relations
 Schema |  Name   | Type | Owner | Storage
--------+---------+------+-------+---------
 public | test_v1 | view | omm   |
(1 row)
```

- Change the owner of the view.

```
-- Create a user.
gaussdb=# CREATE ROLE role_test PASSWORD '********';

-- Change the owner of the view.
gaussdb=# ALTER VIEW IF EXISTS test_v1 OWNER TO role_test;

-- Query the view information.
gaussdb=# \dv
              List of relations
 Schema |  Name   | Type |   Owner   | Storage
--------+---------+------+-----------+---------
 public | test_v1 | view | role_test |
(1 row)
```

- Set the schema of the view.

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tcpds;

-- Change the schema of the view.
gaussdb=# ALTER VIEW test_v1 SET SCHEMA tcpds;

-- Query the view information.
gaussdb=# \dv tcpds.test_v1;
              List of relations
 Schema |  Name   | Type |   Owner   | Storage
--------+---------+------+-----------+---------
 tcpds  | test_v1 | view | role_test |
(1 row)
```

- Set and reset view options.

```
-- Change view options.
gaussdb=# ALTER VIEW tcpds.test_v1 SET (security_barrier = TRUE);
ALTER VIEW

-- Query.
gaussdb=# \dv tcpds.test_v1;
                  List of relations
 Schema |  Name   | Type | Owner |         Storage
--------+---------+------+-------+-------------------------
 tcpds  | test_v1 | view | chenxi | {security_barrier=true}
(1 row)

-- Change the check_option option.
gaussdb=# ALTER VIEW tcpds.test_v1 SET (check_option = 'LOCAL');
ALTER VIEW

-- Query.
gaussdb=# \dv tcpds.test_v1;
                           List of relations
 Schema |  Name   | Type | Owner |                 Storage
--------+---------+------+-------+-----------------------------------------------
 tcpds  | test_v1 | view | chenxi | {security_barrier=true,check_option=LOCAL}
(1 row)

-- Reset view options.
gaussdb=# ALTER VIEW tcpds.test_v1 RESET (security_barrier);
ALTER VIEW
gaussdb=# ALTER VIEW tcpds.test_v1 RESET (check_option);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER VIEW

-- Query.
gaussdb=# \dv tcpds.test_v1;

CREATE VIEW and **DROP VIEW**

7.12.7.44 ANALYZE | ANALYSE

Description

- Collects statistics about ordinary tables in a database and stores the results in the PG_STATISTIC and PG_STATISTIC_EXT system catalogs. After you run the **ANALYZE** command, you can query the collected statistics in the system catalogs or in the system views PG_STATS and PG_EXT_STATS. The execution plan generator uses these statistics to generate the most effective execution plan.
- If no parameters are specified, ANALYZE analyzes each table and partitioned table in the database. You can also specify **table_name**, **column_name**, and **partition_name** to limit the analysis to a specified table, column, or partitioned table.
- ANALYZE|ANALYSE VERIFY is used to check whether data files of ordinary tables in a database are damaged.
- Statistics collected each time are stored in historical statistics tables (**GS_STATISTIC_HISTORY**, **GS_STATISTIC_EXT_HISTORY**, and **GS_TABLESTATS_HISTORY**). The number of historical tables and the retention period of statistics are specified by the GUC parameters **stats_history_record_limit** and **stats_history_retention_time**.

Precautions

- Non-temporary tables cannot be analyzed in an anonymous block, transaction block, function, or stored procedure. Temporary tables can be analyzed during stored procedures, but statistics cannot be rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If remote read is not involved, the remote read parameter does not take effect. If a key system catalog page is damaged, an error is reported and the detection stops.
- If no parameter to be analyzed is specified, tables on which the current user has the corresponding permission are analyzed by default. If a table parameter is specified, only the specified table is analyzed.
- To perform ANALYZE operation to a table, you must be a table owner or a user with the VACUUM permission on the table. By default, system administrators have this permission. However, database owners are allowed to analyze all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide analyze operation can only be executed by a system administrator). ANALYZE skips tables on which users do not have permissions.
- ANALYZE does not collect columns for which comparison or equivalent operations cannot be performed, for example, columns of the cursor type.
- If the table to be analyzed is empty, ANALYZE does not record the statistics of the table. The existing statistics are retained.

Syntax

- Collect statistics information about a table.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]
  [ table_name [ ( column_name [, ...] ) ] ] [ WITH PARTITION_MODE ];
```

- Collect partition statistics information about a partitioned table.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]
  table_name [ ( column_name [, ...] ) ] { SUBPARTITION | PARTITION } ( partition_name ) ;
```

  NOTE

  If the keyword PARTITION is used, **partition_name** must be the name of a level-1 partition. If the keyword SUBPARTITION is used, **partition_name** must be the name of a level-2 partition.

- Collect statistics about multiple columns manually.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]
  table_name (( column_1_name, column_2_name [, ...] )) [ WITH partition_mode ];
```

  NOTE

  - If the GUC parameter **enable_functional_dependency** is disabled, the statistics about a maximum of 32 columns can be collected at a time. If the GUC parameter **enable_functional_dependency** is enabled, the statistics about a maximum of 4 columns can be collected at a time.
  - You are not allowed to collect statistics about multiple columns in system catalogs and global temporary tables.

- Collect statistics about multiple columns automatically.

  After the **auto_statistic_ext_columns** parameter is enabled and the ANALYZE statement is executed, multi-column statistics are automatically created based on the index prefix of the table. The number of columns in the multi-column statistics cannot exceed the value of **auto_statistic_ext_columns**.

  For example, if index (a, b, c, d) exists in table **t** and **auto_statistic_ext_columns** is set to **4**, multi-column statistics about (a, b), (a, b, c), and (a, b, c, d) are created after table **t** is analyzed.

```
{ ANALYZE | ANALYSE } [ VERBOSE ] table_name [ WITH partition_mode ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Check the data files in the current database.
  ```
  { ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE };
  ```

  NOTE

  - In fast mode, DML operations need to be performed on the tables to be verified concurrently. As a result, an error is reported during the verification. In the current fast mode, data is directly read from the disk. When other threads change files concurrently, the obtained data is incorrect. Therefore, you are advised to perform the verification offline.
  - You can perform operations on the entire database. Because a large number of tables are involved, you are advised to save the results in redirection mode.
    ```
    gsql -d database -p port -f sqlfile> sqllog.txt  2>&1
    ```
  - NOTICE is displayed only for externally visible tables. The detection of internal tables is included in the foreign tables on which the internal tables depend and is not displayed externally.
  - This statement can be executed with error tolerance.
  - If a key system catalog is damaged during a full database operation, an error is reported and the operation stops.
- Check data files of tables and indexes.
  ```
  { ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } { table_name | index_name } [CASCADE];
  ```

  NOTE

  - Operations on ordinary tables and index tables are supported, but CASCADE operations on indexes of index tables are not supported. The CASCADE mode is used to process all index tables of the main table. When the index tables are checked separately, the CASCADE mode is not required.
  - When the main table is checked, the internal tables of the main table, such as the TOAST tables, are also checked.
  - When the system displays a message indicating that the index table is damaged, you are advised to run the **reindex** command to rebuild the index.
- Check the data files of the table partition.
  ```
  { ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } table_name PARTITION (partition_name)
  [CASCADE];
  ```

  NOTE

  - You can check a single partition of a table, but cannot perform the CASCADE operation on the indexes of an index table.
  - Temporary tables and unlogged tables are not supported.

Parameters

- **VERBOSE**

  Enables the display of progress messages.

  NOTE

  If **VERBOSE** is specified, ANALYZE displays the progress information, indicating the table that is being processed. Statistics about tables are also displayed.
- **table_name**

  Specifies the name (possibly schema-qualified) of a specific table to analyze. If omitted, all regular tables (but not foreign tables) in the current database are analyzed.

  Currently, you can use ANALYZE to collect statistics only from row-store tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an existing table name.

- **column_name**, **column_1_name**, **column_2_name**

  Specifies the name of a specific column to analyze. All columns are analyzed by default.

  Value range: an existing column name.

- **partition_name**

  Assumes that the table is a partitioned table. You can specify **partition_name** following the keyword PARTITION to analyze the statistics of this table.

  Value range: a partition name of a table.

- **index_name**

  Specifies the name of the specific index table to be analyzed (possibly schema-qualified).

  Value range: an existing table name.

- **FAST|COMPLETE**

  For a row-store table, the FAST mode verifies the CRC and page header of the row-store table. If the verification fails, an alarm is generated. In COMPLETE mode, the pointer and tuple of the row-store table are parsed and verified.

- **CASCADE**

  In **CASCADE** mode, all indexes of the current table are verified.

- **PARTITION_MODE**

  Cascadingly collects statistics about partitioned tables. The following table describes the options and their meanings. This is not applicable to non-partitioned tables.

  Table 7-251 PARTITION_MODE options

PARTITION_MODE Option	Description
ALL	Statistics about the entire table, level-1 partitions, and level-2 partitions are collected.
GLOBAL	Statistics about the entire table are collected.
PARTITION	Statistics about the level-1 partition are collected.
GLOBAL AND PARTITION	Statistics about the entire table and level-1 partition are collected.
SUBPARTITION	Statistics about the level-2 partition are collected.
ALL COMPLETE	Statistics about the entire table, level-1 partitions, and level-2 partitions are collected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PARTITION_MODE Option	Description
AUTO	Default value. The parameter configured in **statistic_granularity** or **default_statistic_granularity** prevails. The priority of the table-level parameter **statistic_granularity** is higher than that of the global parameter **default_statistic_granularity**.

A difference between **ALL** and **ALL COMPLETE** is as follows: **ALL_COMPLETE** uses a higher sampling rate and takes a longer time to calculate statistics.

CAUTION

- When a version earlier than 505.0.0 is upgraded to 505.0.0 or later, **PARTITION_MODE** does not take effect during the upgrade observation period. The behavior of **PARTITION_MODE** is the same as that of the source version.
- When the entire database is analyzed, the partition mode cannot be specified. That is, syntax such as ANALYZE WITH GLOBAL is not supported.
- When the entire database is analyzed, **default_statistic_granularity** can be set to **GLOBAL** or **ALL**. In this case, the ANALYZE behavior is the same as that defined in **default_statistic_granularity**. When **default_statistic_granularity** is set to other values, the ANALYZE behavior is degraded to the GLOBAL behavior.

Examples

- Collect statistics information about a table.

```
-- Create the customer_info table.
gaussdb=# CREATE TABLE customer_info(
wr_returned_date_sk INTEGER ,
wr_returned_time_sk INTEGER ,
wr_item_sk INTEGER NOT NULL
,wr_refunded_customer_sk INTEGER );

-- Run ANALYZE to update statistics.
gaussdb=# ANALYZE customer_info;

-- Run ANALYZE VERBOSE to update statistics and display information about the customer_info table.
gaussdb=# ANALYZE VERBOSE customer_info;
INFO:  analyzing "public.customer_info"(datanode pid=38661)
INFO:  ANALYZE INFO : estimate total rows of "customer_info": scanned 0 pages of total 0 pages with 1 retry times, containing 0 live rows and 0 dead rows,  estimated 0 total rows(datanode pid=38661)
INFO:  ANALYZE INFO : "customer_info": scanned 0 of 0 pages, containing 0 live rows and 0 dead rows; 0 rows in sample, 0 estimated total rows(datanode pid=38661)

-- Run ANALYZE VERBOSE to export the wr_returned_time_sk column information in the customer_info table.
gaussdb=# ANALYZE VERBOSE customer_info(wr_returned_time_sk);
INFO:  analyzing "public.customer_info"(datanode pid=38661)
INFO:  ANALYZE INFO : estimate total rows of "customer_info": scanned 0 pages of total 0 pages with
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
1 retry times, containing 0 live rows and 0 dead rows,  estimated 0 total rows(datanode pid=38661)
INFO:  ANALYZE INFO : "customer_info": scanned 0 of 0 pages, containing 0 live rows and 0 dead
rows; 0 rows in sample, 0 estimated total rows(datanode pid=38661)
```

- Collect statistics about a partitioned table.

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE customer_par(
wr_returned_date_sk INTEGER ,
wr_returned_time_sk INTEGER ,
wr_item_sk INTEGER NOT NULL,
wr_returned_customer_sk INTEGER)
PARTITION BY RANGE(wr_returned_date_sk)(PARTITION P1 VALUES LESS THAN(2452275),PARTITION
P2 VALUES LESS THAN(2452640),PARTITION P3 VALUES LESS THAN(2453000),PARTITION P4 VALUES
LESS THAN(MAXVALUE))ENABLE ROW MOVEMENT;

-- Run ANALYZE to update statistics.
gaussdb=# ANALYZE customer_par;

-- Run ANALYZE VERBOSE to export the information in the customer_par table.
gaussdb=# ANALYZE VERBOSE customer_par;
INFO:  analyzing "public.customer_par"(datanode pid=38661)
-- Run ANALYZE VERBOSE to output information about the P1 level-1 partitioned table.
gaussdb=# ANALYZE VERBOSE customer_par PARTITION(P1);
INFO:  analyzing "public.customer_par"(datanode pid=38661)
```

- Collect statistics about multiple columns manually.

```
-- Manually collect statistics in the wr_returned_date_sk and wr_returned_time_sk columns.
gaussdb=# ANALYZE VERBOSE customer_info (wr_returned_date_sk,wr_returned_time_sk);
INFO:  analyzing "public.customer_info"(datanode pid=38661)
INFO:  ANALYZE INFO : estimate total rows of "customer_info": scanned 0 pages of total 0 pages with
1 retry times, containing 0 live rows and 0 dead rows,  estimated 0 total rows(datanode pid=38661)
INFO:  ANALYZE INFO : "customer_info": scanned 0 of 0 pages, containing 0 live rows and 0 dead
rows; 0 rows in sample, 0 estimated total rows(datanode pid=38661)
```

- Collect statistics about multiple columns automatically.

```
-- Create an index for the customer_info table.
gaussdb=# CREATE INDEX customer_index ON customer_info USING
btree(wr_returned_date_sk,wr_returned_time_sk,wr_item_sk,wr_refunded_customer_sk);

-- Set auto_statistic_ext_columns to 4.
gaussdb=# set auto_statistic_ext_columns=4;

-- Collect statistics about multiple columns automatically.
gaussdb=# ANALYZE VERBOSE customer_info;
INFO:  analyzing "public.customer_info"(datanode pid=38661)
INFO:  ANALYZE INFO : estimate total rows of "customer_info": scanned 0 pages of total 0 pages with
1 retry times, containing 0 live rows and 0 dead rows,  estimated 0 total rows(datanode pid=38661)
INFO:  ANALYZE INFO : "customer_info": scanned 0 of 0 pages, containing 0 live rows and 0 dead
rows; 0 rows in sample, 0 estimated total rows(datanode pid=38661)
```

- Check the data files in the current database.

```
gaussdb=# ANALYZE VERIFY FAST;
```

- Check data files of tables and indexes.

```
-- Check the customer_info table.
gaussdb=# ANALYZE VERIFY FAST customer_info;

-- Check the customer_index index.
gaussdb=# ANALYZE VERIFY FAST customer_index;
```

- Check the data files of the table partition.

```
-- Check the P1 partition in the customer_par partitioned table.
gaussdb=# ANALYZE VERIFY FAST customer_par PARTITION (P1);
```

- Drop data.

```
-- Drop the index customer_index.
gaussdb=# DROP INDEX customer_index;

-- Drop the customer_info table.
gaussdb=# DROP TABLE customer_info;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the customer_par partitioned table.
gaussdb=# DROP TABLE customer_par;
```

7.12.8 B

7.12.8.1 BEGIN

Description

BEGIN may be used to initiate an anonymous block or a single transaction.

An anonymous block is a structure that can dynamically create and execute stored procedure code instead of permanently storing code as a database object in the database.

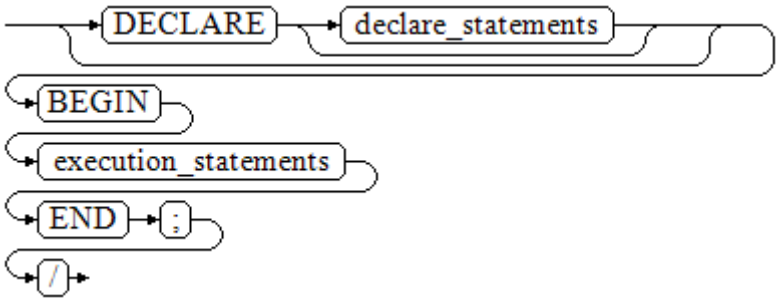
Precautions

None

Syntax

- Enable an anonymous block.

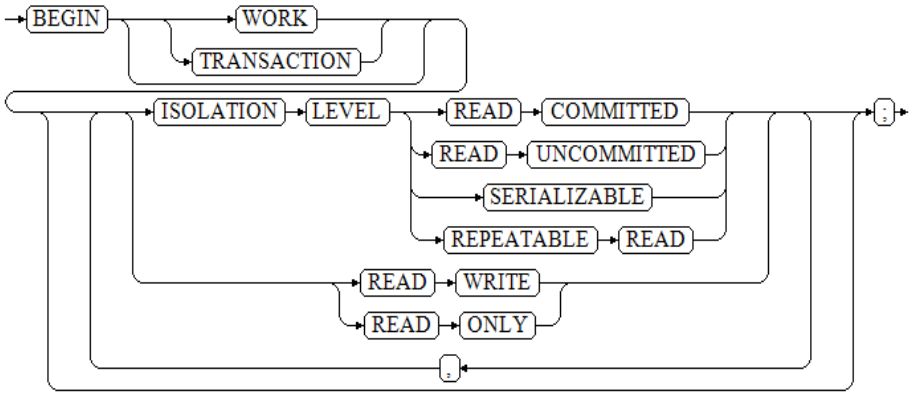
```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```



- Start a transaction.

```
BEGIN [ WORK | TRANSACTION ]
 [
  {
    ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE
READ }
    | { READ WRITE | READ ONLY }
   } [, ...]
 ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **declare_statements**

  Declares a variable, including its name and type, for example, **sales_cnt int**.

- **execution_statements**

  Specifies the statement to be executed in an anonymous block.

  Value range: DML operations (such as SELECT, INSERT, DELETE, and UPDATE) or registered functions in the system catalog.

- **WORK | TRANSACTION**

  Specifies the optional keyword in the BEGIN syntax, which is meaningless.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  NOTE

  The isolation level of a transaction cannot be reset after the first clause (INSERT, DELETE, UPDATE, FETCH, or COPY) for modifying data is executed in the transaction.

  Value range:

  - **READ COMMITTED**: Only committed data can be read. This is the default value.
  - **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported. Setting this isolation level is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

Examples

- Start a transaction.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(col1 int, col2 int);
gaussdb=# INSERT INTO tbl_test1 VALUES (1,1), (2,2), (3,3);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Start a transaction in default mode.
gaussdb=# BEGIN;
INSERT INTO tbl_test1 VALUES (4,4);
END;

-- Start a transaction with the separation level being REPEATABLE READ.
gaussdb=# BEGIN ISOLATION LEVEL REPEATABLE READ;
SELECT * FROM tbl_test1;
END;

-- Drop the table.
gaussdb=# DROP TABLE tbl_test1;
```

- Use anonymous blocks.

```
-- Generate a string using anonymous blocks.
gaussdb=# BEGIN
dbe_output.print_line('Hello');
END;
/
```

Helpful Links

START TRANSACTION

7.12.9 C

7.12.9.1 CALL

Description

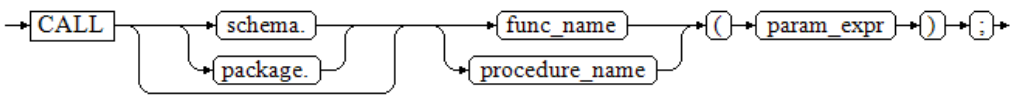
Calls defined functions and stored procedures.

Precautions

The owner of a function or stored procedure, users with the EXECUTE permission on the function or stored procedure, or users with the EXECUTE ANY FUNCTION permission can call the function or stored procedure. When separation of duties is disabled, a system administrator has the permission to use the CALL commands by default.

Syntax

```
CALL [schema.|package.] {func_name| procedure_name} ( param_expr );
```



Parameters

- **schema**

  Specifies the name of the schema where a function or stored procedure is located.

- **package**

  Specifies the name of the package where a function or stored procedure is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **func_name**

  Specifies the name of the function or stored procedure to be called.

  Value range: an existing role name

  NOTE

  You can use database links to perform operations on remote functions or stored procedures. For details, see **DATABASE LINK**.

- **param_expr**

  Specifies a list of parameters. Use := or => to separate a parameter name and its value. This method allows parameters to be placed in any order. If only parameter values are in the list, the value order must be the same as that defined in the function or stored procedure.

  Value range: an existing function parameter name or stored procedure parameter name

  NOTE

  The parameters include input parameters (whose name and type are separated by **IN**) and output parameters (whose name and type are separated by **OUT**). When you run the **CALL** command to call a function or stored procedure, the parameter list must contain an output parameter for non-overloaded functions. You can set the output parameter to a variable or any constant. For details, see **Examples**. For an overloaded package function, the parameter list can have no output parameter, but the function may not be found. If an output parameter is contained, it must be a constant.

Examples

```
-- Create the func_add_sql function, calculate the sum of two integers, and return the result.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Transfer by parameter value.
gaussdb=# CALL func_add_sql(1, 3);

-- Transfer by naming tag method.
gaussdb=# CALL func_add_sql(num1 => 1,num2 => 3);
gaussdb=# CALL func_add_sql(num2 := 2, num1 := 3);

-- Drop the function.
gaussdb=# DROP FUNCTION func_add_sql;

-- Create a function with output parameters.
gaussdb=# CREATE FUNCTION func_increment_sql(num1 IN integer, num2 IN integer, res OUT integer)
RETURN integer
AS
BEGIN
res := num1 + num2;
END;
/

-- Transfer a constant as an output parameter.
gaussdb=# CALL func_increment_sql(1,2,1);

-- Drop the function.
gaussdb=# DROP FUNCTION func_increment_sql;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE FUNCTION and **CREATE PROCEDURE**

7.12.9.2 CHECKPOINT

Function

A checkpoint is a point in the transaction log sequence at which all data files have been updated to reflect the information in the log. All data files will be flushed to a disk.

It sets transaction log checkpoints. By default, WALs periodically specify checkpoints in a transaction log. You may use gs_guc to specify GUC parameters **checkpoint_segments**, **checkpoint_timeout**, and **incremental_checkpoint_timeout** to adjust the atomized checkpoint intervals.

Precautions

- Only the system administrator and O&M administrator can invoke CHECKPOINT.
- CHECKPOINT forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system.
- The CHECKPOINT statement cannot be executed in a PDB.

Syntax

```
CHECKPOINT;
```

Parameter Description

None

Examples

```
-- Set a checkpoint.
gaussdb=# CHECKPOINT;
```

7.12.9.3 CLEAN CONNECTION

Description

Clears database connections. You may use this statement to delete a specific user's connections to a specified database.

Precautions

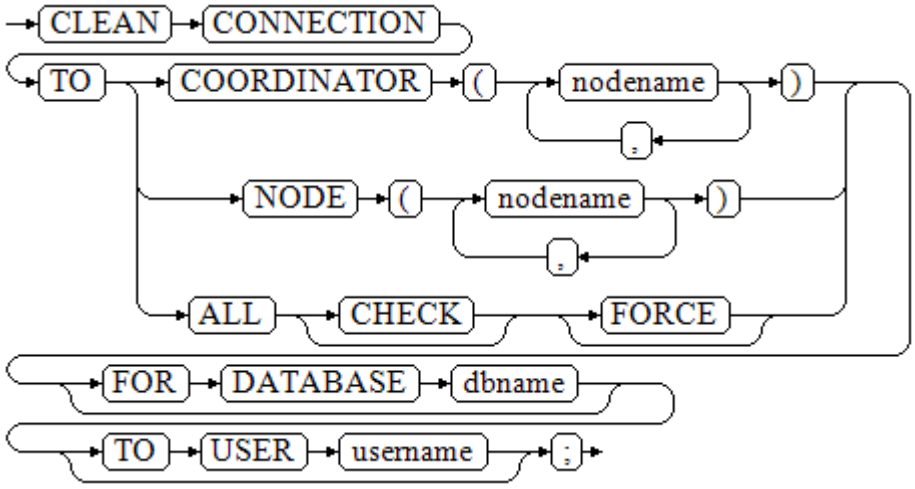
- GaussDB does not support specified nodes and supports only TO ALL.
- This function can be used to clear the normal connections that are being used only in force mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The CLEAN CONNECTION statement with the **DATABASE** option specified cannot be executed in a PDB.

Syntax

```
CLEAN CONNECTION
    TO { COORDINATOR ( nodename [, ... ] ) | NODE ( nodename [, ... ] )| ALL [ CHECK ] [ FORCE ] }
    [ FOR DATABASE dbname ]
    [ TO USER username ];
```



Parameters

- **CHECK**

  This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will check whether a database is accessed by other sessions before its connections are cleared. If any sessions are detected before **DROP DATABASE** is executed, an error will be reported and the database will not be deleted.

- **FORCE**

  This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will send **SIGTERM** signals to all the threads related to the specified **dbname** and **username** and forcibly shut them down.

- **COORDINATOR (nodename [, ...]) | NODE (nodename [, ...]) | ALL**

  Only **TO ALL** is supported. This parameter must be specified. All specified connections on the node will be deleted.

- **dbname**

  Deletes connections to a specified database. If this parameter is not specified, connections to all databases will be deleted.

  Value range: an existing database name

- **username**

  Deletes connections of a specific user. If this parameter is not specified, connections of all users will be deleted.

  Value range: an existing username

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create the test_clean_connection database.
gaussdb=# CREATE DATABASE test_clean_connection;

-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '********';

-- Log in to the database as the user jack in another session, and query the connection information in the view.
gaussdb=# SELECT datname,usename,application_name,waiting,state
          FROM pg_stat_activity
          WHERE datname = 'test_clean_connection';
       datname        | usename | application_name | waiting | state
----------------------+---------+------------------+---------+-------
 test_clean_connection | jack    | gsql             | f       | idle
(1 row)

-- If you directly delete the test_clean_connection database, the following error information is displayed:
gaussdb=# DROP DATABASE test_clean_connection;
ERROR:  Database "test_clean_connection" is being accessed by other users. You can stop all connections by command: "clean connection to all force for database XXXX;" or wait for the sessions to end by querying view: "pg_stat_activity".
DETAIL:  There is 1 other session using the database.

-- Delete the connections to all nodes for logging in to the test_clean_connection database.
-- If the FORCE parameter is not used, connections in other states cannot be deleted.
gaussdb=# CLEAN CONNECTION TO ALL FORCE FOR DATABASE test_clean_connection;

-- Query the connection for logging in to the test_clean_connection database.
gaussdb=# SELECT datname,usename,application_name,waiting,state
          FROM pg_stat_activity
          WHERE datname = 'test_clean_connection';
 datname | usename | application_name | waiting | state
---------+---------+------------------+---------+-------
(0 rows)

-- Delete the test_clean_connection database.
gaussdb=# DROP DATABASE test_clean_connection;

-- Delete user jack.
gaussdb=# DROP USER jack;
```

7.12.9.4 CLOSE

Description

CLOSE frees the resources associated with an open cursor.

Precautions

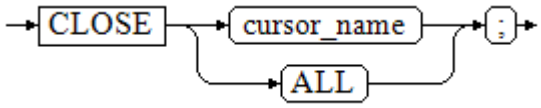
- After a cursor is closed, no subsequent operations are allowed on it.
- A cursor should be closed when it is no longer needed.
- Every non-holdable open cursor is implicitly closed when a transaction is terminated by COMMIT or ROLLBACK.
- A holdable cursor is implicitly closed if the transaction that created it aborts by ROLLBACK.
- If the cursor creation transaction is successfully committed, the holdable cursor remains open until an explicit CLOSE operation is executed, or the client disconnects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- GaussDB does not have an explicit OPEN cursor statement. A cursor is considered open when it is declared. You can view all available cursors by querying the pg_cursors system view.

Syntax

```
CLOSE { cursor_name | ALL };
```



Parameters

- **cursor_name**

  Specifies the name of a cursor to be closed.

- **ALL**

  Closes all open cursors.

Examples

For details, see **Examples**.

Helpful Links

FETCH and **MOVE**

7.12.9.5 CLUSTER

Description

- Clusters a table based on an index.
- CLUSTER instructs GaussDB to cluster the table specified by the table name based on the index specified by the index name. The index must have been defined by the table name.
- When a table is clustered, it is physically reordered based on the index information. Clustering is a one-time operation. When the table is subsequently updated, the changes are not clustered. That is, no attempt is made to store new or updated rows according to their index order.
- When a table is clustered, GaussDB records which index the table was clustered by. CLUSTER table_name reclusters the clustered index that was previously recorded in the table. You can also use ALTER TABLE table_name CLUSTER on index_name to set the index of a specified table for subsequent CLUSTER operations, or use ALTER TABLE table_name SET WITHOUT CLUSTER to clear the previously clustered index of a specified table.
- If CLUSTER does not contain parameters, all tables that have been clustered in the database owned by the current user will be reprocessed. If a system administrator uses this command, all clustered tables are reclustered.
- When a table is clustered, an ACCESS EXCLUSIVE lock is requested on the table. This avoids that other operations (including read and write operations) are performed on the table before the CLUSTER operation is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- Only row-store B-tree indexes support CLUSTER.
- In the case where you are accessing single rows randomly within a table, the actual order of the data in the table is unimportant. However, if there are many accesses to some data and an index groups the data, using the CLUSTER index improves performance.
- If you use an index to query a table for a range or multiple rows, CLUSTER will also help because once the index identifies the table page for the first row that matches, all other rows that match are probably already on the same table page. This saves disk accesses and speeds up the query.
- During clustering, the system creates a temporary backup of the table created in the index sequence and a temporary backup of each index in the table. Therefore, ensure that the disk has sufficient free space during clustering, which is at least the sum of the table size and all index sizes.
- CLUSTER records which indexes have been used for clustering. Therefore, you can manually specify indexes for the first time, cluster specified tables, and set a maintenance script that will be executed periodically. You only need to run the **CLUSTER** command without parameters. In this way, tables that you want to periodically cluster can be automatically updated.
- The optimizer records table clustering statistics. After clustering a table, you need to execute the ANALYZE operation to ensure that the optimizer has the latest clustering information. Otherwise, the optimizer may select a non-optimal query plan.
- CLUSTER cannot be executed in transactions.
- If the GUC parameter **xc_maintenance_mode** is not set to **on**, the CLUSTER operation skips all system catalogs.

Syntax

- Cluster a table.

```
CLUSTER [ VERBOSE ] table_name [ USING index_name ];
```

- Cluster a partition.

```
CLUSTER [ VERBOSE ] table_name PARTITION ( partition_name ) [ USING index_name ];
```

- Recluster a table.

```
CLUSTER [ VERBOSE ];
```

Parameters

- **VERBOSE**

  (Optional) Enables the display of progress messages.

- **table_name**

  Specifies the table name.

  Value range: an existing table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **[USING index_name]**

  Specifies the index name.

  Value range: an existing index name

  You must specify **index_name** when performing clustering on the table for the first time. If you do not specify **index_name** next time, the table will be clustered based on existing records.

- **partition_name**

  Specifies the partition name.

  Value range: an existing partition name

Examples

- Cluster the table.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_c1(id int, name varchar(20));
gaussdb=# CREATE INDEX idx_test_c1_id ON test_c1(id);
gaussdb=# INSERT INTO test_c1 VALUES (3,'Joe'),(1,'Jack'),(2,'Scott');

-- Query.
gaussdb=# SELECT * FROM test_c1;
 id | name
----+-------
  3 | Joe
  1 | Jack
  2 | Scott
(3 rows)

-- Perform clustering.
gaussdb=# CLUSTER test_c1 USING idx_test_c1_id;

-- Query.
gaussdb=# SELECT * FROM test_c1;
 id | name
----+-------
  1 | Jack
  2 | Scott
  3 | Joe
(3 rows)

-- Delete.
gaussdb=# DROP TABLE test_c1;
```

- Recluster a table.

```
-- Create a table.
gaussdb=# CREATE TABLE test(col1 int,CONSTRAINT pk_test PRIMARY KEY (col1));

-- An error is reported when the keyword USING is not contained in the first clustering.
gaussdb=# CLUSTER test;
ERROR:  there is no previously clustered index for table "test"

-- Perform clustering.
gaussdb=# CLUSTER test USING pk_test;

-- Insert data.
gaussdb=# INSERT INTO test VALUES (1),(99),(10),(8);

-- Recluster a table.
gaussdb=# CLUSTER VERBOSE test;
INFO:  clustering "public.test" using index scan on "pk_test"(dn_6001 pid=3672)

-- Perform clustering on partition p2.
gaussdb=# CLUSTER test_c2 PARTITION (p2) USING idx_test_c2_id1;

-- Query.
gaussdb=# SELECT * FROM test_c2;
 id | info
----+------
  6 | ABBB
  2 | ABAB
  9 | AAAA
 11 | AAAB
 16 | BABA
 19 | BBBA
(6 rows)

-- Delete.
gaussdb=# DROP TABLE test_c2;
```

7.12.9.6 COMMENT

Description

Defines or changes the comment of an object.

Precautions

- Each object stores only one comment. Therefore, you need to modify a comment and issue a new **COMMENT** command to the same object. To delete the comment, write **NULL** at the position of the text string. When an object is deleted, the comment is automatically deleted.
- Currently, there is no security protection for viewing comments. Any user connected to a database can view all the comments for objects in the database. For shared objects such as databases, roles, and tablespaces, comments are stored globally so any user connected to any database in the cluster can see all the comments for shared objects. Therefore, do not put security-critical information in comments.
- To comment objects, you must be an object owner or user granted the COMMENT permission. By default, system administrators have the permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Roles do not have owners, so the rule for **COMMENT ON ROLE** is that you must be an administrator to comment on an administrator role, or have the CREATE ROLE permission to comment on non-administrator roles. A system administrator can comment on all objects.
- The COMMENT ON DATABASE statement cannot be executed in a PDB.

Syntax

```
COMMENT ON
{
  AGGREGATE agg_name (agg_type [, ...] ) |
  CAST (source_type AS target_type) |
  COLLATION object_name |
  COLUMN { table_name.column_name | view_name.column_name } |
  CONSTRAINT constraint_name ON table_name |
  CONVERSION object_name |
  DATABASE object_name |
  DOMAIN object_name |
  EXTENSION object_name |
  FOREIGN DATA WRAPPER object_name |
  FOREIGN TABLE object_name |
  FUNCTION function_name ( [ {[ argname ] [ argmode ] argtype} [, ...] ] ) |
  INDEX object_name |
    OPERATOR operator_name (left_type, right_type) |
  OPERATOR CLASS object_name USING index_method |
  OPERATOR FAMILY object_name USING index_method |
  [ PROCEDURAL ] LANGUAGE object_name |
  ROLE object_name |
  RULE rule_name ON table_name |
  SCHEMA object_name |
  SERVER object_name |
  TABLE object_name |
  TABLESPACE object_name |
  TEXT SEARCH CONFIGURATION object_name |
  TEXT SEARCH DICTIONARY object_name |
  TEXT SEARCH PARSER object_name |
  TEXT SEARCH TEMPLATE object_name |
  TYPE object_name |
  VIEW object_name |
  TRIGGER trigger_name ON table_name
}
   IS 'text';
```

Parameters

- **agg_name**

  Specifies the new name of an aggregate function.

- **agg_type**

  Specifies the data type of the aggregate function parameters.

- **source_type**

  Specifies the source data type of the cast.

- **target_type**

  Specifies the target data type of the cast.

- **object_name**

  Specifies the name of an object.

- **table_name.column_name**

  view_name.column_name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies a column name. You can add the table name or view name as the prefix.

- **constraint_name**

  Specifies the name of a table constraint.

- **table_name**

  Specifies the name of a table.

- **function_name**

  Specifies a function name.

- **argname,argmode,argtype**

  Specifies the name, schema, and type of the function parameters.

- **large_object_oid**

  Specifies an OID of a large object.

- **operator_name**

  Specifies the name of the operator.

- **left_type,right_type**

  Specifies the data type of the operator parameters (optionally schema-qualified). If the prefix or suffix operator does not exist, the **NONE** option can be added.

- **trigger_name**

  Specifies the trigger name.

- **text**

  Specifies the comment content.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE emp(
    empno varchar(7),
    ename varchar(50),
    job varchar(50),
    mgr varchar(7),
    deptno int
);

-- Add comments to a table.
gaussdb=# COMMENT ON TABLE emp IS 'Department table';

-- Add comments to columns.
gaussdb=# COMMENT ON COLUMN emp.empno  IS  'Employee ID';
gaussdb=# COMMENT ON COLUMN emp.ename  IS  'Employee name';
gaussdb=# COMMENT ON COLUMN emp.job    IS  'Job';
gaussdb=# COMMENT ON COLUMN emp.mgr    IS  'Manager ID';
gaussdb=# COMMENT ON COLUMN emp.deptno IS  'Department ID';

-- View table comments.
gaussdb=# \d+
                                    List of relations
 Schema | Name | Type  | Owner |  Size   |                          Storage                           | Description
--------+------+-------+-------+---------+------------------------------------------------------------+-------------
public | emp | table | omm | 0 bytes | {orientation=row,compression=no,storage_type=USTORE,segment=off}
| Department table
(1 row)

-- View column comments.
gaussdb=# \d+ emp
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                              Table "public.emp"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 empno  | character varying(7)   |           | extended |              | Employee ID
 ename  | character varying(50)  |           | extended |              | Employee name
 job    | character varying(50)  |           | extended |              | Job
 mgr    | character varying(7)   |           | extended |              | Manager ID
 deptno | integer                |           | plain    |              | Department ID
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE, segment=off

-- Delete the emp table.
gaussdb=# DROP TABLE emp;
```

7.12.9.7 COMMIT | END

Description

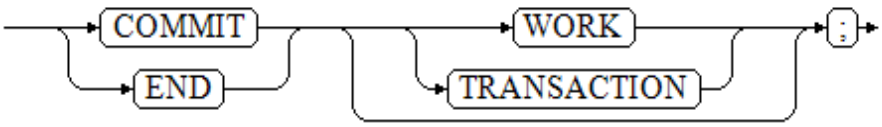
COMMIT or END commits all operations of a transaction.

Precautions

Only the creator of a transaction or the system administrator can run the **COMMIT** command. The creation and commit operations do not need to be in different sessions.

Syntax

```
{ COMMIT | END } [ WORK | TRANSACTION ];
```



Parameters

- **COMMIT | END**

  Commits the current transaction and makes all changes made by the transaction become visible to others.

- **WORK | TRANSACTION**

  Specifies an optional keyword, which has no effect except improving readability.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.customer_demographics_t2
(
    CD_DEMO_SK              INTEGER              NOT NULL,
    CD_GENDER               CHAR(1)                      ,
    CD_MARITAL_STATUS       CHAR(1)                      ,
    CD_EDUCATION_STATUS     CHAR(20)                     ,
    CD_PURCHASE_ESTIMATE    INTEGER                      ,
    CD_CREDIT_RATING        CHAR(10)                     ,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    CD_DEP_COUNT              INTEGER                   ,
    CD_DEP_EMPLOYED_COUNT     INTEGER                   ,
    CD_DEP_COLLEGE_COUNT      INTEGER
)
;

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(1,'M', 'U', 'DOCTOR DEGREE', 1200,
'GOOD', 1, 0, 0);
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(2,'F', 'U', 'MASTER DEGREE', 300, 'BAD',
1, 0, 0);

-- Commit the transaction to make all changes permanent.
gaussdb=# COMMIT;

-- Query data.
gaussdb=# SELECT * FROM tpcds.customer_demographics_t2;

-- Delete the tpcds.customer_demographics_t2 table.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds;
```

ROLLBACK

7.12.9.8 COMMIT PREPARED

Description

Commits a prepared two-phase transaction.

Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc_maintenance_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the creator of a transaction or a system administrator can run this command. The creation and commit operations do not need to be in different sessions.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
COMMIT PREPARED transaction_id [ WITH commit_sequence_number ];
```

Parameters

- **transaction_id**

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

- **commit_sequence_number**

  Specifies the sequence number of the transaction to be committed. It is a 64-bit, incremental, unsigned number.

Example

```
-- Start.
gaussdb=# BEGIN;

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';

-- Create a table.
gaussdb=# CREATE TABLE item1(id int);

-- Commit the transaction whose identifier is trans_test.
gaussdb=# COMMIT PREPARED 'trans_test';

-- Drop the table.
gaussdb=# DROP TABLE item1;
```

PREPARE TRANSACTION and **ROLLBACK PREPARED**

7.12.9.9 COPY

Description

Copies data between tables and files.

COPY FROM copies data from a file to a table, and COPY TO copies data from a table to a file.

Precautions

- When the **enable_copy_server_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** command. When the **enable_copy_server_files** parameter is enabled, users with the SYSADMIN permission or users who inherit the permissions of built-in role gs_role_copy_files are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** command. By default, you cannot run the **COPY FROM FILENAME** or **COPY TO FILENAME** command for database configuration files, key files, certificate files, and audit logs to prevent unauthorized users from viewing or modifying sensitive files. When **enable_copy_server_files** is enabled, the administrator can use the GUC parameter **safe_data_path** to set the path for common users to import and export to the subpath of the set path. If this GUC parameter is not set (by default), the path used by common users is not blocked. This parameter reports an error for the relative path in the path of the COPY statement. In multi-tenancy scenarios, only the initial user can execute the **COPY FROM FILENAME** or **COPY TO FILENAME** command in a PDB.
- COPY applies only to tables but not views.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COPY TO requires the SELECT permission on the table to be read, and COPY FROM requires the INSERT permission on the table to be inserted.
- If a list of columns is specified, COPY copies only the data of the specified columns between the file and the table. If a table has any columns that are not in the column list, COPY FROM inserts default values into those columns.
- If a data source file is specified, the server must be able to access the file. If **STDIN** is specified, data flows between the client and the server. When entering data, use the **TAB** key to separate the columns of the table and use a backslash and a period (\.) in a new row to indicate the end of the input.
- COPY FROM throws an error if any row in the data file contains more or fewer columns than expected.
- The end of the data can be represented by a line that contains only backslashes and periods (\.). If data is read from a file, the end flag is unnecessary. If data is copied between client applications, an end tag must be provided.
- In COPY FROM, **\N** is an empty string. To enter the actual value **\N**, use **\\N**.
- COPY FROM can preprocess data using column expressions, but column expressions do not support subqueries.
- When a data format error occurs during COPY FROM execution, the transaction is rolled back. However, the error information is insufficient, making it difficult to locate the error data from a large amount of raw data.
- COPY FROM and COPY TO apply to low concurrency and local import and export of a small amount of data.
- If the target table has triggers, COPY is supported.
- Ensure that the generated column is not in the list of the specified column in the COPY statement. When COPY... TO is used to export data, if no column list is specified, all columns except the generated columns in the table are exported. When COPY... FROM is used to import data, the generated columns are automatically updated and saved as ordinary columns.
- **COPY** is a server command and its operating environment is the same as that of the database server process. **\COPY** is a client meta-command and its execution environment is the same as that of gsql on the client. Note that when the database and gsql are used in the cloud environment, the **COPY** and **\COPY** commands both use the paths in the cloud environment. When the database is used in the cloud environment and gsql is used outside the cloud environment, the **COPY** command uses the path inside the cloud environment, and the **\COPY** command uses the path outside the cloud environment.
- During the export using COPY TO, if the GUC parameter **support_zero_character** is disabled and the column data in the table contains the '\0' characters, the column data will be truncated during the export. Only the data before '\0' will be exported. When the parameter is enabled, the '\0' characters are also exported. The performance loss is positively correlated with the number of '\0' characters.
- The schema of the gs_copy_summary and pgxc_copy_error_log tables is changed from public to pg_catalog. The two tables in the original public schema are deprecated. A table in the public schema may have the same name as a user table. Therefore, you need to identify the table. If the table is not a user table, migrate data to the corresponding table in the pg_catalog

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

schema and delete the table in the original public schema. If a table under the public schema is not deleted and the pg_catalog schema has a table with the same name, running the **\d(+)** gsql meta-command will preferentially find the table in pg_catalog. Such table is not displayed in the list because it is a system catalog. Therefore, gs_copy_summary and pgxc_copy_error_log cannot be found in the list, but they are in the public schema. You can directly reference public.gs_copy_summary and public.pgxc_copy_error_log.

- When exporting data of the float4 or float8 type, you are advised to set **extra_float_digits** to **3** to avoid loss of significant digits and ensure consistency between the data before and after import and export.
- In some scenarios, you can set the GUC parameter **batch_insert_index_types** to **"rcr_ubtree"** to improve the performance of inserting indexes in batches.
- For security purposes, do not use COPY FROM to import data to the pg_authid, pg_auth_history, gs_global_config, and gs_workload_rule system catalogs.
- When the parameter **enable_security_policy** is enabled, and if a masking policy has been set, the system will perform data masking.
- When COPY is used to import data, the size of a single-line data tuple cannot exceed 1 GB – 1 byte in non-transcoding scenarios, and cannot exceed 256 MB – 1 byte in transcoding scenarios.

Syntax

- Copy data from a file to a table.

```
COPY [BINARY] table_name [ ( column_name [, ...] ) ]
    [ WITH OIDS ]
    FROM { 'filename' | STDIN }
    [ LOAD ]
    [ LOAD_DISCARD 'discard_file_name' ]
    [ LOAD_BAD 'bad_file_name' ]
    [ USEEOF ]
    [ [ USING ] DELIMITERS 'delimiters' ]
    [ WITHOUT ESCAPING ]
    [ LOG ERRORS | LOG ERRORS DATA ]
    [ REJECT LIMIT 'limit' ]
    [ WITH ]
    [ copy_option [ ...] | ( option [, ...] ) ];
```

- Copy data from a table to a file.

```
COPY table_name [ ( column_name [, ...] ) ]
    [ WITH OIDS ]
    TO { 'filename' | STDOUT }
    [ [ USING ] DELIMITERS 'delimiters' ]
    [ WITHOUT ESCAPING ]
    [ WITH ]
    [ copy_option [ ...] | ( option [, ...] ) ];

COPY query {(SELECT) | (VALUES)}
    TO { 'filename' | STDOUT }
    [ WITHOUT ESCAPING ]
    [ WITH ]
    [ copy_option [ ...] | ( option [, ...] ) ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The restrictions on the COPY TO syntax are as follows:

  (query) is incompatible with [USING] DELIMITERS. If the data comes from a query result, COPY TO cannot specify [USING] DELIMITERS.
- **copy_option** is the native parameter, while **option** is the parameter imported by a compatible foreign table.
- The **FILLER**, **SEQUENCE**, and **CONSTANT** parameters are supported only in the copy_option clause. If set in the option clause, they will be ignored.

The optional parameters of the copy_option clause are as follows:

```
OIDS
| DELIMITER [ AS ] 'delimiter_string'
| NULL [ AS ] 'null_string'
| HEADER
| FILEHEADER 'header_file_string'
| FREEZE
| FORCE NOT NULL column_name [, ...]
| FORCE QUOTE { column_name [, ...] | * }
| BINARY
| CSV
| FIXED
| QUOTE [ AS ] 'quote_character'
| ESCAPE [ AS ] 'escape_character'
| EOL 'newline_character'
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA
| FILL_MISSING_FIELDS [ { 'one' | 'multi' } ]
| COMPATIBLE_ILLEGAL_CHARS
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| DATEA_FORMAT 'datea_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
| SKIP int_number
| WHEN { { ( start - end ) | column_name } { = | != } 'string' [ AND ...] }
| SEQUENCE ( { column_name ( integer [, incr] ) [, ...] } )
| FILLER ( { column_name [, ...] } )
| CONSTANT ( { column_name 'constant_string' [, ...] } )
| COPY_CUSTOM_ID 'custom_id_string'
| TABLE_COMPRESS_CLAUSE( ROW STORE COMPRESS ADVANCED [ MEDIUM | HIGH ] ROW [ON
(EXPR)])
| FORMATTER ( [ column_name( offset, length ) ] [, ...] )
| TRANSFORM ( [ column_name [ data_type ] [ AS transform_expr ] ] [, ...] )
| STARTS begin_line_number
| LIMIT limit_line_number
| ROWS commit_row_number
```

The optional parameters of the option clause are as follows:

```
FORMAT 'format_name'
| OIDS [ boolean ]
| DELIMITER 'delimiter_character'
| NULL 'null_string'
| HEADER [ boolean ]
| USEEOF [ boolean ]
| FILEHEADER 'header_file_string'
| FREEZE [ boolean ]
| QUOTE 'quote_character'
| ESCAPE 'escape_character'
| EOL 'newline_character'
| NOESCAPING [ boolean ]
| FORCE_QUOTE { ( column_name [, ...] ) | * }
| FORCE_NOT_NULL ( column_name [, ...] )
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA [ boolean ]
| FILL_MISSING_FIELDS [ boolean ]
| COMPATIBLE_ILLEGAL_CHARS [ boolean ]
| DATE_FORMAT 'date_format_string'
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| DATEA_FORMAT 'datea_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
| SKIP int_number
| COPY_CUSTOM_ID 'custom_id_string'
| BEGIN_LINE_NO begin_line_number
| LIMIT limit_line_number
| ROWS commit_row_number
```

Parameters

- **query**

  Specifies that the results will be copied.

  Value range: Only one SELECT or VALUES command is supported. A semicolon (;) is not required at the end of the command.

- **table_name**

  Specifies the name (possibly schema-qualified) of an existing table.

  Value range: an existing table name.

- **column_name**

  Specifies an optional list of columns to be copied.

  Value range: any columns. All columns will be copied if no column list is specified.

- **STDIN**

  Specifies that input comes from the standard input. In the input, table columns are separated by tabs and each row ends with a backslash and a period (\.).

- **STDOUT**

  Specifies that output goes to the standard output.

- **LOAD**

  Calls a gs_loader tool. You cannot directly use it.

- **LOAD_DISCARD 'discard_file_name'**

  Specifies the path of the **discard** file generated by gs_loader. It is called only by gs_loader. You are advised not to use it directly.

- **LOAD_BAD 'bad_file_name'**

  Specify the path of the **bad** file generated by gs_loader. It is called only by gs_loader. You are advised not to use it directly.

- **USEEOF**

  The system does not report an error for "\." in the imported data.

  Value range: **true**/**on** or **false**/**off**.

  Default value: **false**

- **[USING] DELIMITERS 'delimiters'**

  String that separates columns within each row (line) of the file. It cannot be larger than 10 bytes.

  Value range:

  – The delimiter in text format cannot include any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789, but has no restriction for the CSV format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The delimiter cannot be set to **'\r'**, **'\n'**, or a user-defined newline character.
  - A delimiter cannot contain the null string (refer to **NULL null_string**), nor can it be contained within the null string.
  - A delimiter cannot contain \0.
  - When **COMPATIBLE_ILLEGAL_CHARS** is specified (see **COMPATIBLE_ILLEGAL_CHAR...**), a delimiter cannot be set to a space or a question mark (?). Otherwise, the delimiter may conflict with the characters after error tolerance conversion.
  - In CSV mode, a delimiter cannot contain QUOTE characters. For details, see **QUOTE [AS] 'quote_chara...**.
  - The value of **delimiter** can be a multi-character delimiter whose length is less than or equal to 10 bytes.

  Value range: The default value is a tab character in text format and a comma in CSV format.

  NOTE

  - Both DELIMITER and DELIMITERS can specify delimiters. DELIMITERS can be followed by brackets, but DELIMITER cannot be directly followed by brackets. Otherwise, an error is reported.
  - Delimiters can be specified only in TEXT or CSV mode.
  - The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
  - You are advised to use multi-character delimiters or invisible delimiters. For example, you can use multi-characters (such as $^&) and invisible characters (such as 0x07, 0x08, and 0x1b).
  - If a column to be exported in TEXT format contains data that is the same as separators, a backslash (\) is added as an escape character before a conflicting data record, ensuring that the exported data can be properly identified.

- **WITHOUT ESCAPING**

  Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

  Value range: text only

  NOTE

  For options related to escape characters, pay attention to the following:

  - If you prepare a data file, you need to choose the desired import behavior (import with or without escaping).
  - If a data file is exported using the kernel COPY syntax, the escape options must be the same for both export and import.

- **LOG ERRORS**

  If this parameter is specified, the error tolerance mechanism for data type errors in the COPY FROM statement is enabled.

  Value range: a value set while data is imported using COPY FROM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions of this error tolerance parameter are as follows:

- This error tolerance mechanism captures only the data type errors (DATA_EXCEPTION) that occur during data parsing of COPY FROM on the primary node of the database.
- If existing error tolerance parameters (for example, **IGNORE_EXTRA_DATA**) of the COPY statement are enabled, the error of the corresponding type will be processed as specified by the parameters and no error will be reported. Therefore, the error table does not contain such error data.
- This default option is that error tolerance does not support constraint conflicts. To make constraint conflicts tolerated, set the session-level GUC parameter **a_format_load_with_constraints_violation** to **"s2"** and import the file again.
  - The conflicts of the NOT NULL constraints, conditional constraints, PRIMARY KEY constraints, UNIQUE constraints, and unique index constraints can be tolerated.
  - This function is valid only in centralized A-compatible mode.
  - A statement-level trigger cannot handle any constraint conflict above, so the attempt to import data into a table with such trigger will fail with an error reported.
  - Under this feature, data will be inserted into partitioned tables row by row instead of in batches, which deteriorates the import performance.
  - Under this feature, the UB-tree indexes will be built row by row instead of in batches, degrading the index building performance.
  - This feature is still valid even if a constraint conflict is triggered by an operation on a table with a row-level trigger. Constraint conflicts of row-level triggers are implemented in sub-transactions, which use more memory resources and increase execution time. Therefore, you are advised to use this feature when constraint conflicts are very likely to occur. In this scenario, the amount of data to be imported at a time by using COPY should be less than or equal to 1 GB.
- During a rolling upgrade from an earlier version to this version, do not use the COPY error tolerance import capability before all nodes are upgraded.

- **LOG ERRORS DATA**

  The differences between LOG ERRORS DATA and LOG ERRORS are as follows:

  a. LOG ERRORS DATA fills the **rawrecord** column in the error tolerance table.

  b. Only users with the super permission can use the parameter options of LOG ERRORS DATA.

  NOTE

  - If error content is too complex, it may fail to be written to the error tolerance table by using LOG ERRORS DATA, causing the task failure.
  - For errors that cannot be read in certain code, the error codes are ERRCODE_CHARACTER_NOT_IN_REPERTOIRE and ERRCODE_UNTRANSLATABLE_CHARACTER. The rawrecord column is not recorded.
  - Files in BINARY format are not supported.
  - During a rolling upgrade from an earlier version to this version, do not use the COPY error tolerance import capability before all nodes are upgraded.

- **REJECT LIMIT 'limit'**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Used with the **LOG ERRORS** option to set the upper limit of the tolerated errors in the COPY FROM statement. If the number of errors exceeds the limit, any further errors will be reported based on the original mechanism.

Value range: a positive integer (1 to *INTMAX*) or **'unlimited'**

Default value: If **LOG ERRORS** is not specified, an error will be reported. If **LOG ERRORS** is specified, the default value is **0**.

NOTE

In the error tolerance mechanism described in the description of LOG ERRORS, the count of **REJECT LIMIT** is calculated based on the number of data parsing errors on the primary database node where the **COPY FROM** statement is executed, not based on the number of all errors on the node.

- **copy_option**

  Specifies all types of native parameters of COPY.

  - OIDS

    Specifies whether to import and export OID hidden columns for tables (usually system catalogs) that contain OIDs.

    Value range: **true**/**on** or **false**/**off**.

    Default value: **false**

    NOTE

    - If the table to be exported does not have an OID, an error is reported.
    - The exported OID defaults to the first column. If the **HEADER** option is specified, the exported **HEADER** row does not include the OID column description.

  - DELIMITER [AS] 'delimiter_string'

    Specifies the column delimiter of data in a data file line. The value range is the same as that of **[USING] DELIMITERS 'deli...**.

  - NULL [AS] 'null_string'

    Specifies the string that represents a null value.

    Value range:

    - The **NULL** value cannot contain '\r', '\n', or user-defined newline characters.
    - The **NULL** value contains a maximum of 100 characters.
    - **NULL** cannot contain delimiters (see **[USING] DELIMITERS 'deli...**) or be contained by delimiters.
    - In CSV mode, **NULL** cannot contain QUOTE characters. For details, see **QUOTE [AS] 'quote_chara...**.
    - When **COMPATIBLE_ILLEGAL_CHARS** is specified (see **COMPATIBLE_ILLEGAL_CHAR...**), **NULL** cannot be set to a space or a question mark (?). Otherwise, the delimiter may conflict with the characters after error tolerance conversion.
    - The **NULL** value cannot contain the '\0' character.

    Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The default value for the CSV format is an empty string without quotation marks.
- The default value for the TEXT format is **\N**.

NOTE

- The **NULL** parameter can be specified only in TEXT or CSV mode.
- When using COPY FROM, any data item that matches this string will be stored as a null value, so make sure that you use the same string as you used with COPY TO.

– HEADER

Specifies whether the exported data file contains a header row and whether the first row in the data stream is the header row during import. A header row describes information about each column.

NOTE

- This parameter can be specified only in CSV or FIXED mode. The content in the header row of the FIXED file must meet the column length definition.
- When this option is specified, the first row of the data text is identified as a header row during import and will be ignored. The first row in the data file exported is the header row.
- If this option is not specified, the first row of the data text is identified as data and imported. The exported data file does not contain a header row.

– FILEHEADER 'header_file_string'

Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

NOTICE

- This option is valid only when the header function is enabled.
- **fileheader** specifies an absolute path.
- The file can contain only one row of header information, and ends with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters.)
- The length of the file including the newline character cannot exceed 1 MB.

– FREEZE

Sets the COPY loaded data row as **frozen**, like these data have executed VACUUM FREEZE.

This is a performance option of initial data loading. The data will be frozen only when the following three requirements are met:

- The table being loaded has been created or truncated in the same transaction before copying.
- There are no cursors open in the current transaction.
- There are no original snapshots in the current transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

When COPY is completed, all the other sessions will see the data immediately. However, this violates the general principle of MVCC visibility, and users should understand that this may cause potential risks.

- FORCE NOT NULL column_name [, ...]

  Assigns a value to a specified column in CSV COPY FROM mode. If the column is null, its value is regarded as a string of 0 characters.

  Value range: name of an existing column.

- FORCE QUOTE { column_name [, ...] | * }

  In CSV COPY TO mode, forces all non-**NULL** values to be surrounded by the QUOTE characters (see **QUOTE [AS] 'quote_chara...**) around each specified column. The asterisk (*) indicates all columns. **NULL** values are not enclosed in quote characters.

  Value range: name of an existing column.

- BINARY

  Specifies that data is stored and read in binary mode instead of text mode.

  NOTE

  - In binary mode, you cannot declare **DELIMITER**, **NULL**, or **CSV**.
  - When **BINARY** is specified, **CSV**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.
  - If the GUC parameter **copy_special_character_version** is set to **'no_error'**, invalid characters will not be checked during the import and will be displayed as garbled characters in query results. The database server code must be the same as the client code. Exercise caution when enabling this parameter.
  - In binary mode, **copy_special_character_version** is set to **'no_error'**, and it takes effect only for columns of the TEXT, CHAR, VARCHAR, NVARCHAR2, and CLOB types.
  - Exporting data to STDOUT or importing from STDIN is not supported.

  The following table lists the types of data that cannot be imported or exported in binary mode.

smgr	aclitem	gtsvector	any	trigger
language_handler	internal	opaque	anyelement	anynesttable
anyindexbytable	anynonarray	anyenum	fdw_handler	anyrange
hll_hashval	hash16	hash32	anyset	-

  The following table lists some options that do not support binary import and export.

DELIMITER	NULL	EOL	CSV	FIXED

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SMALLDATETIME_FORMAT	DATE_FORMAT	TIME_FORMAT	TIMESTAMP_FORMAT	DATEA_FORMAT

- CSV

  Enables the CSV mode. When **CSV** is specified, **BINARY**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.

- FIXED

  Fixes column length. When the column length is fixed, **DELIMITER**, **NULL**, and **CSV** cannot be specified. When **FIXED** is specified, **BINARY**, **CSV**, and **TEXT** cannot be specified by **option** or **copy_option**. Newline characters in data columns cannot be correctly processed when the column length is fixed. **FORMATTER** must be specified.

  NOTE

  The definition of fixed length is as follows:

  - The column length of each record is the same.
  - Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
  - No delimiters are used between columns.

- FORMATTER ([column_name (offset, length)] [, ...])

  Defines the place of each column in the data file only in fixed length mode. Defines the place of each column in the data file in the **column(***offset*,*length***)** format.

  Value range:

  - The value of **offset** must be larger than 0. The unit is byte.
  - The value of **length** must be larger than 0. The unit is byte.

  The total length of all columns must be less than 1 GB.

  All columns must not overlap with each other.

  Replace columns that are not in the file with null.

- QUOTE [AS] 'quote_character'

  Specifies the quote character for a CSV file.

  Value range:

  - A single-byte character without '\0', '\r', '\n', or end-of-line characters. You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.
  - The value cannot contain delimiters (**see [USING] DELIMITERS 'deli...**) or be contained by delimiters.
  - The value cannot contain **NULL** (see **NULL [AS] 'null_string'**) or be included in **NULL**.
  - When **COMPATIBLE_ILLEGAL_CHARS** is specified (see **COMPATIBLE_ILLEGAL_CHAR...**), **NULL** cannot be set to a space or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a question mark (?). Otherwise, the delimiter may conflict with the characters after error tolerance conversion.

Default value: double quotation marks ("").

- ESCAPE [AS] 'escape_character'

  Specifies the escape character in CSV format.

  Value range:

  - A single-byte character without '\0'. You are advised to set **ESCAPE** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.
  - The value cannot contain delimiters (see **[USING] DELIMITERS 'deli...**) or be contained by delimiters.
  - The value cannot contain **NULL** (see **NULL [AS] 'null_string'**) or be included in **NULL**.
  - When **COMPATIBLE_ILLEGAL_CHARS** is specified (see **COMPATIBLE_ILLEGAL_CHAR...**), **NULL** cannot be set to a space or a question mark (?). Otherwise, the delimiter may conflict with the characters after error tolerance conversion.
  - If the quote character is set (see **QUOTE [AS] 'quote_chara...**) but ESCAPE is not set, ESCAPE uses the same character as QUOTE.

  Default value: double quotation marks ("").

- EOL 'newline_character'

  Specifies the end-of-line character (newline character) style of the imported or exported data file.

  Value range: Common end-of-line characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special end-of-line characters include **$** and **#**.

  - Value range: multi-character end-of-line characters within 10 bytes.
  - The end-of-line character cannot be contained in the delimiter.
  - The end-of-line character cannot be contained in a **NULL** string.
  - In non-CSV mode, the end-of-line character cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.
  - An end-of-line character cannot contain '\0'.

  NOTE

  The EOL parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the EOL parameter can be set to **0x0A** or **0x0D0A** for data export in the CSV or FIXED format.

- ENCODING 'encoding_name'

  Specifies the name of a file encoding format.

  Value range: a valid encoding format. Common encoding formats are **utf8**, **gb18030**, and **gbk**.

  Default value: encoding format of the current client

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- IGNORE_EXTRA_DATA

  Specifies that when the number of data source files exceeds the number of foreign table columns, excess columns at the end of the row are ignored. This parameter is used only during data import.

  If this parameter is not used and the number of columns in the data source file is greater than that defined in the foreign table, the following error information is displayed:

  ```
  extra data after last expected column
  ```

- COMPATIBLE_ILLEGAL_CHARS

  Specifies whether to tolerate invalid characters during data import and export.

  Value range: **true**/**on** or **false**/**off**.

  - **true** or **on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database. Invalid characters are converted into valid ones, and then exported from the database. No error is reported and data export is not interrupted.
  - **false** or **off**: An error occurs when there are invalid characters, and the import stops. An error is reported and data export is interrupted when there are invalid characters and characters whose encodings do not exist.

  Default value: **false** or **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space. When **support_zero_char** is enabled, data is imported in the original format.
2. Other invalid characters are converted to the characters specified by the GUC parameter **convert_illegal_char_mode**. The default value is **'?'**.
3. When **compatible_illegal_chars** is set to **true** or **on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
4. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be imported. The error message "cannot specify bulkload compatibility options in BINARY mode" is displayed.
5. If the GUC parameter **copy_special_character_version** is set to **'no_error'**, invalid characters will not be checked during the import and will be displayed as garbled characters in query results. Exercise caution when enabling this parameter.
6. If **copy_special_character_version** is set to **'no_error'** and **compatible_illegal_chars** is set to **true**, the former has a higher priority. That is, invalid characters will not be checked during the import.
7. If **copy_special_character_version** is set to **'no_error'** or **compatible_illegal_chars** is set to **true**, a record is written to the database run logs each time a row of data containing invalid characters is identified. The log writing behavior occupies a small amount of disk bandwidth. To eliminate the impact, set the GUC parameter **enable_log_copy_illegal_chars** to **off**, that is, do not write records to the database run logs. You are advised not to modify this configuration unless otherwise required.

The rules for exporting invalid characters are as follows:

The export is classified into the scenario where transcoding is required (the database server code is different from the client code) and the scenario where transcoding is not required (the database server code is the same as the client code). The export performance varies according to the scenario. You can run **show server_encoding;** to query the database server code and **show client_encoding;** to query the database client code.

- In scenarios where transcoding is required:

1. '\0' is converted to a space. When **support_zero_char** is enabled, data is exported in the original format.
2. Other invalid characters are converted to the characters specified by the GUC parameter **convert_illegal_char_mode**. The default value is **'?'**.
3. When **compatible_illegal_chars** is set to **true** or **on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are exported to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the export.
4. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be exported.
5. If **compatible_illegal_chars** is set to **true**, a record is written to the database run logs each time a row of data containing invalid characters is identified. The log writing behavior occupies a small amount of disk bandwidth. To eliminate the impact, set the GUC parameter **enable_log_copy_illegal_chars** to **off**, that is, do not write records to the database run logs. You are advised not to modify this configuration unless otherwise required.

- In scenarios where transcoding is not required:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Data is exported as it is in the database, even if the data contains invalid characters and **compatible_illegal_chars** is set to **true**.
2. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be exported.

- FILL_MISSING_FIELDS [{ 'one' | 'multi' }]

  Specifies how to handle the problem that a data row loses the last or multiple columns during data import. If **one** or **multi** is not specified or **one** is specified, **null** is used to supplement the last missing column (an error is reported if multiple columns are missing). If **multi** is specified, **null** is used to supplement the last missing columns.

  Value range: **true**/**on** or **false**/**off**.

  Default value: **false** or **off**

- DATE_FORMAT 'date_format_string'

  Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid DATE value. For details, see **Date and Time Processing Functions and Operators**.

  NOTE

  You can use the **TIMESTAMP_FORMAT** parameter to set the DATE format to **TIMESTAMP** for data import. For details, see **TIMESTAMP_FORMAT** below.

- TIME_FORMAT 'time_format_string'

  Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid TIME value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- TIMESTAMP_FORMAT 'timestamp_format_string'

  Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- DATEA_FORMAT 'datea_format_string'

  Specifies the DATEA format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid DATEA value. For details, see **Date and Time Processing Functions and Operators**.

- SMALLDATETIME_FORMAT 'smalldatetime_format_string'

  Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

"cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

Value range: a valid SMALLDATETIME value. For details, see **Date and Time Processing Functions and Operators**.

- SKIP int_number

  Specifies that the first *int_number* rows of the data file are skipped during data import.

- WHEN { { (start - end) | column_name } { = | != } 'string' [AND ...] }

  When data is imported, each row of data is checked. Only the rows that meet the WHEN condition are imported to the table.

- SEQUENCE ({ column_name (integer [, incr]) [, ...] })

  During data import, columns modified by SEQUENCE do not read data from the data file. The values are incremented by the value of **incr** based on the specified integer. If **incr** is not specified, the values are incremented from 1 by default.

- FILLER ({ column_name [, ...] })

  When data is imported, the column modified by FILLER is discarded after being read from the data file.

  NOTE

  - To use FILLER, you need to specify the list of columns to be copied. Data is processed based on the position of the **filler** column in the column list.
  - When FILLER is used for import, columns modified by FILLER cannot have NOT NULL constraints.

- CONSTANT ({ column_name 'constant_string' [, ...] })

  When data is imported, the column modified by CONSTANT is not read from the data file, and **constant_string** is used to assign a value to the column.

- TABLE_COMPRESS_CLAUSE(ROW STORE COMPRESS ADVANCED [MEDIUM | HIGH] ROW [ON (EXPR)])

  Compresses the imported data. EXPR is an expression. Data that meets the expression is compressed, and data that does not meet the expression is not compressed. The parameter is valid only for data import using COPY FROM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This applies only to Astore tables.
- TOAST data cannot be compressed.
- This feature is not supported during the upgrade observation period.
- When this feature is used, the new data page is used for storing the imported data.
- When this feature is used together with the error tolerance mechanism (LOG ERRORS or LOG ERRORS DATA), compression may have no benefits if error data frequently occurs.
- Compression is not supported when a single row is imported. For example, a partitioned table is imported and the function of non-rollback upon constraint violation is enabled, or the table contains triggers.
- This feature cannot be used together with logical decoding. If logical decoding is enabled, an error will occur during compression of data imported using COPY.

– TRANSFORM ({ column_name [data_type] [AS transform_expr] } [, ...])

  Specifies the conversion expression of each column in the table. **data_type** specifies the data type of the column in the expression parameter. **transform_expr** is the target expression that returns the result value whose data type is the same as that of the target column in the table. For details about the expression, see **Expressions**.

– STARTS begin_line_number

  Specifies the starting row number of the input data in the error table. If the n^{th} row in the input data contains incorrect information, the value of **lineno** in the error table is n + **begin_line_number**. For example, when the error data is in rows 1, 2, and 5, if **STARTS** is set to **3**, the corresponding row numbers in the error table are 4, 5, and 8.

  Value range: The value of **begin_line_number** must be greater than or equal to 0.

– LIMIT limit_line_number

  Specifies the maximum number of rows that can be processed from the input data source.

  Value range: The value of **limit_line_number** is greater than 0.

– ROWS commit_row_number

  Commits the data after every **commit_row_number** rows are processed. This parameter is used by gs_loader and cannot be called directly.

– COPY_CUSTOM_ID 'custom_id_string'

  During data import, enter a user-defined character string, which is used as the identifier of the COPY import.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- In non-separation-of-duties scenarios, the pg_catalog.gs_copy_summary table contains the **custom_id** column by default. If **copy_custom_id** is not used, **NULL** is inserted into the column.
- In separation-of-duties scenarios, if the schema with the same name as the current connection user contains the gs_copy_summary table with the **custom_id** column, the input string is recorded to the column, importing one row of data per COPY operation.
- In non-separation-of-duties scenarios, the pg_catalog.pgxc_copy_error_log table contains the **custom_id** column by default. If **copy_custom_id** is not used, **NULL** is inserted into the column.
- In separation-of-duties scenarios, if the schema with the same name as the current connection user contains the pgxc_copy_error_log table with the **custom_id** column, LOG ERRORS or LOG ERRORS DATA is used, and the error tolerance data volume is less than the value specified by **reject limit**, the character string input by this parameter is recorded to the **custom_id** column in the pgxc_copy_error_log table. One import may correspond to zero or multiple data records.
- This operation takes effect only for import. The error table and log table are not recorded during export.
- The length of a user-defined character string cannot exceed 64 bytes.
- If the error table and log table do not contain the **custom_id** column but the **copy_custom_id** parameter is set, an error message is displayed, prompting you to add a column to the table using a function or ALTER statement.
- The **custom_id** column in the error table and log table may not be unique. The column content can be duplicate.

- **option**

  Specifies all types of parameters of a compatible foreign table.

  – FORMAT 'format_name'

    Specifies the format of the source data file in the foreign table.

    Value range: **CSV**, **TEXT**, **FIXED**, and **BINARY**

    - In CSV files, newline characters can be processed efficiently, but certain special characters may pose challenges. It is equivalent to the **CSV** parameter in **copy_option**.
    - In TEXT files, certain special characters can be processed efficiently, except newline characters.
    - In FIXED files, the column of each record is fixed to a certain length by padding the short ones with spaces and truncating the long ones. Newline characters in data columns cannot be correctly processed. It is equivalent to the **FIXED** parameter in **copy_option**.
    - In BINARY files, all data is stored/read as binary format rather than as text. It is faster than the text and CSV formats, but a binary-format file is less portable. It is equivalent to the **BINARY** parameter in **copy_option**.

    Default value: **TEXT**

  – OIDS [boolean]

    Specifies whether to import and export OID hidden columns for tables (usually system catalogs) that contain OIDs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **true**/**on** or **false**/**off**.

Default value: **false**

- DELIMITER 'delimiter_character'

  Specifies the column delimiter of data in a data file line. The value range is the same as that of **[USING] DELIMITERS 'deli...**.

- NULL 'null_string'

  Specifies the string that represents a null value. The value is the same as that of **NULL null_string**.

- HEADER [boolean]

  Specifies whether the exported data file contains a header row and whether the first row in the data stream is the header row during import. A header row describes information about each column.

  Value range: **true**/**on** or **false**/**off**.

  - If the parameter is set to **true** or **on**, the first row of the data text is identified as the header row during import and will be ignored. The first row in the data file exported is the header row.
  - If the parameter is set to **false** or **off**, the first row of the data text is identified as data and imported. The exported data file does not contain a header row.

  Default value: **false**

  NOTE

  This parameter can be specified only in CSV or FIXED mode. The content in the header row of the FIXED file must meet the column length definition.

- FILEHEADER 'header_file_string'

  Specifies a file that defines the content in the header for exported data. The file contains data description of each column. It is equivalent to the **FILEHEADER 'header_file...** parameter in **copy_option**.

- FREEZE [boolean]

  Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

  Value range: **true**/**on** or **false**/**off**. If the value is **true** or **on**, it is equivalent to the **FREEZE** parameter in **copy_option**.

  Default value: **false**

- NOESCAPING [boolean]

  Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

  Value range: **true**/**on** or **false**/**off**. If the value is **true** or **on**, it is equivalent to the **WITHOUT ESCAPING** parameter in **copy_option**.

  Default value: **false**

- SKIP int_number

  Specifies that the first *int_number* rows of the data file are skipped during data import. It is equivalent to the **SKIP int_number** parameter in **copy_option**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- USEEOF [boolean]

  The system does not report an error for "\." in the imported data.

  Value range: **true**/**on** or **false**/**off**. If the value is **true** or **on**, this parameter is equivalent to the **USEEOF** parameter.

  Default value: **false**

- QUOTE 'quote_character'

  Specifies a quote character for a CSV file. It is equivalent to the **QUOTE** parameter in **copy_option**.

- ESCAPE 'escape_character'

  Specifies an escape character for a CSV file. It is equivalent to the **ESCAPE** parameter in **copy_option**.

- EOL 'newline_character'

  Specifies the newline character style of the imported or exported data file. The value is the same as that of **EOL 'newline_character'**.

- FORCE_QUOTE { (column_name [, ...]) | * }

  In CSV COPY TO mode, forces all non-**NULL** values to be surrounded by the QUOTE characters (see **QUOTE [AS] 'quote_chara...**) around each specified column.

  Value range: name of an existing column.

  NOTE

  - The asterisk (*) indicates all columns.
  - The **NULL** output is not enclosed in quotation marks. If the original data has the content as the **NULL** option, the original data is quoted.

- FORCE_NOT_NULL (column_name [, ...])

  In CSV COPY FROM mode, if the specified column is **NULL** during data writing, the content specified by **NULL** (see **NULL [AS] 'null_string'**) is written instead. That is, this column does not allow **NULL** to be written directly.

  Value range: name of an existing column.

- ENCODING 'encoding_name'

  Specifies the encoding format of a data file. The default value is the current client-side encoding format.

- IGNORE_EXTRA_DATA [boolean]

  Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.

  Value range: **true**/**on** or **false**/**off**.

  - **true**/**on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
  - **false**/**off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:

    ```
    extra data after last expected column
    ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **false**

NOTICE

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

– COMPATIBLE_ILLEGAL_CHARS [boolean]

Specifies whether to tolerate invalid characters during data import and export.

Value range: **true**/**on** or **false**/**off**.

- **true** or **on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database. Invalid characters are converted into valid ones, and then exported from the database. No error is reported and data export is not interrupted.
- **false** or **off**: An error occurs when there are invalid characters, and the import stops. An error is reported and data export is interrupted when there are invalid characters and characters whose encodings do not exist.

Default value: **false** or **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space. When **support_zero_char** is enabled, data is imported in the original format.
2. Other invalid characters are converted to the characters specified by the GUC parameter **convert_illegal_char_mode**. The default value is **'?'**.
3. When **compatible_illegal_chars** is set to **true** or **on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
4. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be imported and an error message stating "cannot specify bulkload compatibility options in BINARY mode" will be displayed.
5. If the GUC parameter **copy_special_character_version** is set to **'no_error'**, invalid characters will not be checked during the import and will be displayed as garbled characters in query results. Exercise caution when enabling this parameter.
6. If **copy_special_character_version** is set to **'no_error'** and **compatible_illegal_chars** is set to **true**, the former has a higher priority. That is, invalid characters will not be checked during the import.
7. If **copy_special_character_version** is set to **'no_error'** or **compatible_illegal_chars** is set to **true**, a record is written to the database run logs each time a row of data containing invalid characters is identified. The log writing behavior occupies a small amount of disk bandwidth. To eliminate the impact, set the GUC parameter **enable_log_copy_illegal_chars** to **off**, that is, do not write records to the database run logs. You are advised not to modify this configuration unless otherwise required.

The rules for exporting invalid characters are as follows:

The export is classified into the scenario where transcoding is required (the database server code is different from the client code) and the scenario where transcoding is not required (the database server code is the same as the client code). The export performance varies according to the scenario. You can run **show server_encoding;** to query the database server code and **show client_encoding;** to query the database client code.

- In scenarios where transcoding is required:

1. '\0' is converted to a space. When **support_zero_char** is enabled, data is exported in the original format.
2. Other invalid characters are converted to the characters specified by the GUC parameter **convert_illegal_char_mode**. The default value is **'?'**.
3. When **compatible_illegal_chars** is set to **true** or **on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are exported to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the export.
4. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be exported.
5. If **compatible_illegal_chars** is set to **true**, a record is written to the database run logs each time a row of data containing invalid characters is identified. The log writing behavior occupies a small amount of disk bandwidth. To eliminate the impact, set the GUC parameter **enable_log_copy_illegal_chars** to **off**, that is, do not write records to the database run logs. You are advised not to modify this configuration unless otherwise required.

- In scenarios where transcoding is not required:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Data is exported as it is in the database, even if the data contains invalid characters and **compatible_illegal_chars** is set to **true**.
2. If **compatible_illegal_chars** is set to **true** or **on**, data in binary format cannot be exported.

- FILL_MISSING_FIELDS [boolean]

  Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

  Value range: **true**/**on** or **false**/**off**.

  Default value: **false** or **off**

- COPY_CUSTOM_ID 'custom_id_string'

  During data import, enter a user-defined character string, which is used as the identifier of the COPY import. It is equivalent to the **COPY_CUSTOM_ID 'custom_...** parameter in **copy_option**.

- BEGIN_LINE_NO begin_line_number

  Specifies the starting row number of the input data in the error table. It is equivalent to the **STARTS begin_line_numbe...** parameter in **copy_option**.

- LIMIT limit_line_number

  Specifies the maximum number of rows that can be processed from the input data source. It is equivalent to the **LIMIT limit_line_number** parameter in **copy_option**.

- ROWS commit_row_number

  Commits the data after every **commit_row_number** rows are processed. It is equivalent to the **ROWS commit_row_number** parameter in **copy_option**.

- DATE_FORMAT 'date_format_string'

  Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid DATE value. For details, see **Date and Time Processing Functions and Operators**.

  NOTE

  You can use the **TIMESTAMP_FORMAT** parameter to set the DATE format to **TIMESTAMP** for data import. For details, see **TIMESTAMP_FORMAT** below.

- TIME_FORMAT 'time_format_string'

  Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid TIME value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- TIMESTAMP_FORMAT 'timestamp_format_string'

  Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- SMALLDATETIME_FORMAT 'smalldatetime_format_string'

  Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using COPY FROM.

  Value range: a valid SMALLDATETIME value. For details, see **Date and Time Processing Functions and Operators**.

- DATEA_FORMAT 'datea_format_string'

  Specifies the DATEA format for data import (supported only in A-compatible mode). This parameter does not support the BINARY format. When data of such format is imported, the error message "cannot specify bulkload compatibility options in BINARY mode" will be displayed. The parameter is valid only for data import using COPY FROM.

  Value range: a valid DATEAFORMAT value. For details, see **Date and Time Processing Functions and Operators**.

NOTE

The following special backslash sequences are recognized by COPY FROM:

- **\b**: Backslash (ASCII 8)
- **\f**: Form feed (ASCII 12)
- **\n**: Newline character (ASCII 10)
- **\r**: Carriage return character (ASCII 13)
- **\t**: Tab (ASCII 9)
- **\v**: Vertical tab (ASCII 11)
- **\digits**: Backslash followed by one to three octal digits specifies that the ASCII value is the character with that numeric code.
- **\xdigits**: Backslash followed by an x and one or two hex digits specifies the character with that numeric code.

Permission Control Examples

```
gaussdb=> copy t1 from '/home/xy/t1.csv';
ERROR:  COPY to or from a file is prohibited for security concerns
HINT:  Anyone can COPY to stdout or from stdin. gsql's \copy command also works for anyone.
gaussdb=> grant gs_role_copy_files to xxx;
```

This error occurs because a non-initial user does not have the COPY permission. To use the COPY function, an administrator need to enable the GUC parameter **enable_copy_server_files**, whereas a common user also needs to join the **gs_role_copy_files** group.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.ship_mode table.
gaussdb=# CREATE TABLE tpcds.ship_mode
(
    SM_SHIP_MODE_SK          INTEGER               NOT NULL,
    SM_SHIP_MODE_ID          CHAR(16)              NOT NULL,
    SM_TYPE                  CHAR(30)                      ,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    SM_CODE                CHAR(10)                ,
    SM_CARRIER             CHAR(20)                ,
    SM_CONTRACT            CHAR(20)
)
;

-- Insert a single data record into the tpcds.ship_mode table.
gaussdb=# INSERT INTO tpcds.ship_mode VALUES (1,'a','b','c','d','e');

-- Copy data from the tpcds.ship_mode file to the /home/omm/ds_ship_mode.dat file.
gaussdb=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode.dat';

-- Output tpcds.ship_mode to STDOUT.
gaussdb=# COPY tpcds.ship_mode TO STDOUT;

-- Output the data of tpcds.ship_mode to STDOUT. The parameters are as follows: The delimiter is ',' (delimiter ',') and the encoding format is UTF8 (encoding 'utf8').
gaussdb=# COPY tpcds.ship_mode TO STDOUT WITH (delimiter ',', encoding 'utf8');

-- Output the data of tpcds.ship_mode to STDOUT. The parameters are as follows: The import format is CSV (format'CSV'), and the exported content of the SM_SHIP_MODE_SK column is enclosed in quotation marks (force_quote(SM_SHIP_MODE_SK)).
gaussdb=# COPY tpcds.ship_mode TO STDOUT WITH (format 'CSV', force_quote(SM_SHIP_MODE_SK));

-- Create the tpcds.ship_mode_t1 table.
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
    SM_SHIP_MODE_SK          INTEGER               NOT NULL,
    SM_SHIP_MODE_ID          CHAR(16)              NOT NULL,
    SM_TYPE                  CHAR(30)                ,
    SM_CODE                  CHAR(10)                ,
    SM_CARRIER               CHAR(20)                ,
    SM_CONTRACT              CHAR(20)
)
;

-- Copy data from STDIN to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM STDIN;

-- Enter a row of data as an example.
--gaussdb=# COPY tpcds.ship_mode_t1 FROM STDIN;
--Enter data to be copied followed by a newline.
--End with a backslash and a period on a line by itself.
-->> 1      a    a    a    a    a
-->> \.
-- Notes: Enter a tab between data.

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat';

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, convert the data using the TRANSFORM expression, and insert the 10 characters on the left of the SM_TYPE column into the table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' TRANSFORM (SM_TYPE AS LEFT(SM_TYPE, 10));

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the import format set to TEXT (format 'text'), the delimiter set to '\t' (delimiter E'\t'), excessive columns ignored (ignore_extra_data 'true'), and characters not escaped (noescaping 'true').
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' WITH(format 'text', delimiter E'\t', ignore_extra_data 'true', noescaping 'true');

-- Copy data from the /home/omm/ds_ship_mode_fixed.dat file to the tpcds.ship_mode_t1 table, with the import format set to FIXED, fixed-length format specified (FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20), SM_CONTRACT(82,20))), excessive columns ignored (ignore_extra_data), and headers included (header).
gaussdb=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode_fixed.dat' FIXED FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20), SM_CONTRACT(82,20)) header;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode_fixed.dat' FIXED
FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10),
SM_CARRIER(61,20), SM_CONTRACT(82,20)) header ignore_extra_data;

-- Drop tables and the schema.
gaussdb=# DROP TABLE tpcds.ship_mode;
gaussdb=# DROP TABLE tpcds.ship_mode_t1;
gaussdb=# DROP SCHEMA tpcds;
```

7.12.9.10 CREATE AGGREGATE

Description

Creates an aggregate function.

Syntax

```
CREATE AGGREGATE name ( input_data_type [ , ... ] ) (
    SFUNC = sfunc,
    -- SFUNC1 = sfunc,
    STYPE = state_data_type
    -- STYPE1 = state_data_type,
    [ , FINALFUNC = ffunc ]
    [ , INITCOND = initial_condition ]
    -- [ , INITCOND1 = initial_condition ]
    [ , SORTOP = sort_operator ]
    [ , CFUNC = collection_func ]
    [ , INITCOLLECT = initial_collection_condition ]
    [ , IFUNC = init_func ]
    [ , SHIPPABLE = is_shippable ]
);

or the old syntax

CREATE AGGREGATE name (
    BASETYPE = base_type,
    SFUNC = sfunc,
    -- SFUNC1 = sfunc,
    STYPE = state_data_type
    -- STYPE1 = state_data_type,
    [ , FINALFUNC = ffunc ]
    [ , INITCOND = initial_condition ]
    -- [ , INITCOND1 = initial_condition ]
    [ , SORTOP = sort_operator ]
    [ , CFUNC = collection_func ]
    [ , INITCOLLECT = initial_collection_condition ]
    [ , IFUNC = init_func ]
);
```

Parameters

- **name**

  Name (optionally schema-qualified) of the aggregate function to be created.

- **input_data_type**

  Data type of the input to be processed by the aggregate function. To create a zero-parameter aggregate function, you can use an asterisk (*) instead of a list of input data types. (count(*) is an instance of this aggregate function.)

- **base_type**

  In the CREATE AGGREGATE syntax, the input data type is specified by the **basetype** parameter instead of following **name**. Note that the previous syntax allows only one input parameter. To create a zero-parameter aggregate function, you can set **basetype** to **ANY** instead of ***.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **sfunc**

  Name of the state conversion function that will be called on each input line. For an aggregate function with N parameters, **sfunc** must have more than one parameter. The first parameter is of the **state_data_type** type, and the other parameters match the declared input data types. The function must return a value of the **state_data_type** type. This function accepts the current state value and the current input data, and returns the next state value. The default behavior of the conversion function of an A-compatible database is strict, that is, the **NULL** input value is skipped. For GaussDB, you need to define the **strict** attribute of the conversion function.

- **state_data_type**

  Data type of the aggregation status value.

- **ffunc**

  Final processing function called after all the input lines have been converted, which calculates the result of aggregation. This function must accept a parameter of **state_data_type**. The output data type of the aggregation is defined as the return type of this function. If **ffunc** is not specified, the state value of the aggregation result is used as the aggregation result, and the output type is **state_data_type**.

- **initial_condition**

  Initial setting (value) of a state value. It must be a text constant value acceptable to **state_data_type**. If the parameter is not specified, the initial state value is **NULL**.

- **sort_operator**

  Sort operator used for MIN or MAX aggregation. This is just an operator name (optionally schema-qualified). This operator assumes that the input data type is the same as that of aggregation.

- **collection_func**

  Currently, this parameter does not take effect in centralized mode.

- **initial_collection_condition**

  Collects the initial setting (value) of the function status value. It must be a text constant value acceptable to **state_data_type**. If the parameter is not specified, the initial state value is **NULL**.

- **init_func**

  Initial setting function of the **sfunc** status value. It cannot return **NULL**. It must return the state_data_type type and have no input parameter. If both **init_func** and **initial_condition** are set, the return value of **init_func** is preferentially used as the initial value.

- **is_shippable**

  Specifies whether the aggregate function can be pushed down. The value can only be **true** or **false**. Currently, this parameter does not affect the pushdown of built-in aggregate functions. It affects only the behavior of user-defined aggregate functions. The default value is **false**. Currently, this parameter does not take effect in centralized mode.

Examples

```
-- Create a user-defined function.
gaussdb=# CREATE OR REPLACE FUNCTION int_add(int,int)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 returns int as $BODY$
declare
begin
 return $1 + $2;
end;
$BODY$ language plpgsql;

-- Create an aggregate function.
gaussdb=# CREATE AGGREGATE sum_add(int)
(
    sfunc = int_add,

    stype = int,

    initcond = '0'

);

-- Create a test table and add data.
gaussdb=# CREATE TABLE test_sum(a int,b int,c int);
gaussdb=# INSERT INTO test_sum VALUES(1,2),(2,3),(3,4),(4,5);

-- Execute the aggregate function.
gaussdb=# SELECT sum_add(a) FROM test_sum;
  sum_add
-----------
  10

-- Delete the aggregate function.
gaussdb=# DROP AGGREGATE sum_add(int);

-- Delete the user-defined function.
gaussdb=# DROP FUNCTION int_add(int,int);

-- Delete the test table.
gaussdb=# DROP TABLE test_sum;
```

ALTER AGGREGATE and **DROP AGGREGATE**

7.12.9.11 CREATE AUDIT POLICY

Description

Creates a unified audit policy.

Precautions

- Only the user with the POLADMIN or SYSADMIN permission, or initial user has the permission to create and maintain audit policies.
- Before creating an audit policy, ensure that the security policy function has been enabled. That is, the masking policy takes effect only after the GUC parameter **enable_security_policy** is set to **on**.
- A system administrator or security policy administrator can access the GS_AUDITING_POLICY, GS_AUDITING_POLICY_ACCESS, GS_AUDITING_POLICY_PRIVILEGES, and GS_AUDITING_POLICY_FILTERS system catalogs to query the created audit policies.
- The audit policy name must be unique to avoid conflicts with existing policies. You can use IF NOT EXISTS to check whether the specified audit policy exists to avoid repeated creation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see **DATABASE LINK**.

Syntax

```
CREATE AUDIT POLICY [ IF NOT EXISTS ] policy_name { { privilege_audit_clause | access_audit_clause }
[, ... ] [ filter_group_clause ] [ ENABLE | DISABLE ] };
```

- privilege_audit_clause
  ```
  PRIVILEGES { DDL | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ]
  ```
- access_audit_clause
  ```
  ACCESS { DML | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ]
  ```
- filter_group_clause
  ```
  FILTER ON { FILTER_TYPE ( filter_value [, ... ] ) } [, ... ]
  ```
- DDL
  ```
  { ALTER | ANALYZE | COMMENT | CREATE | DROP | GRANT | REVOKE | SET | SHOW }
  ```
- DML
  ```
  { COPY | DEALLOCATE | DELETE | EXECUTE | REINDEX | INSERT | PREPARE | SELECT | TRUNCATE |
  UPDATE }
  ```
- FILTER_TYPE
  ```
  { APP | ROLES | IP }
  ```

Parameters

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the audit policy name. If an audit policy name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create an audit policy name that contains uppercase letters, enclose the audit policy name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **resource_label_name**

  Specifies the resource label name.

- **DDL**

  Specifies the operations that are audited in the database: CREATE, ALTER, DROP, ANALYZE, COMMENT, GRANT, REVOKE, SET, and SHOW.

  If this parameter is set to **ANALYZE**, both ANALYZE and VACUUM operations are audited.

- **DML**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the operations that are audited within the database: SELECT, COPY, DEALLOCATE, DELETE, EXECUTE, INSERT, PREPARE, REINDEX, TRUNCATE, and UPDATE.

- **ALL**

  Specifies all operations supported by the specified DDL or DML statements in the database. When the form is { DDL | ALL }, **ALL** indicates all DDL operations. When the form is { DML | ALL }, **ALL** indicates all DML operations.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policy, including **APP**, **ROLES**, and **IP**.

- **filter_value**

  Indicates the detailed information to be filtered.

- **ENABLE|DISABLE**

  Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

- Creates audit policy for executing **CREATE** on the database.

```
-- Create the adt1 policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- View the adt1 policy.
gaussdb=# SELECT * FROM GS_AUDITING_POLICY;
 polname | polcomments |         modifydate         | polenabled
---------+-------------+----------------------------+------------
 adt1    |             | 2023-11-06 16:41:40.947417 | t

-- Check the location where the audit policy is stored.
gaussdb=# SHOW audit_directory;

-- Delete the audit policy adt1.
gaussdb=# DROP AUDIT POLICY adt1;
```

- Create an audit policy to audit only the CREATE operation performed by the **dev_audit** user.

```
-- Create user dev_audit.
gaussdb=# CREATE USER dev_audit PASSWORD '********';

-- Create the tb_for_audit table.
gaussdb=# CREATE TABLE tb_for_audit(col1 text, col2 text, col3 text);

-- Create the adt_lb0 resource label based on the tb_for_audit table.
gaussdb=# CREATE RESOURCE LABEL adt_lb0 add TABLE(public.tb_for_audit);

-- Create the adt2 audit policy for the CREATE operation on the adt_lb0 resource.
gaussdb=# CREATE AUDIT POLICY adt2 PRIVILEGES CREATE ON LABEL(adt_lb0) FILTER ON
ROLES(dev_audit);

-- Delete the audit policy adt2.
gaussdb=# DROP AUDIT POLICY adt2;

-- Delete the tb_for_audit table.
gaussdb=# DROP TABLE tb_for_audit;

-- Delete the dev_audit user.
gaussdb=# DROP USER dev_audit;
```

- Create an audit policy to audit only the SELECT, INSERT, and DELETE operations performed on the **adt_lb0** resource by user **dev_audit** using client

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tool gsql on the servers whose IP addresses are **10.20.30.40** and **127.0.0.0/24**, respectively.

```
-- Create user dev_audit.
gaussdb=# CREATE USER dev_audit PASSWORD '********';

-- Create the audit policy adt3.
gaussdb=# CREATE AUDIT POLICY adt3 ACCESS SELECT ON LABEL(adt_lb0), INSERT ON
LABEL(adt_lb0), DELETE FILTER ON ROLES(dev_audit), APP(gsql), IP('10.20.30.40', '127.0.0.0/24');

-- Delete the audit policy adt3.
gaussdb=# DROP AUDIT POLICY adt3;

-- Delete the dev_audit user.
gaussdb=# DROP USER dev_audit;
```

Helpful Links

ALTER AUDIT POLICY and **DROP AUDIT POLICY**

7.12.9.12 CREATE CAST

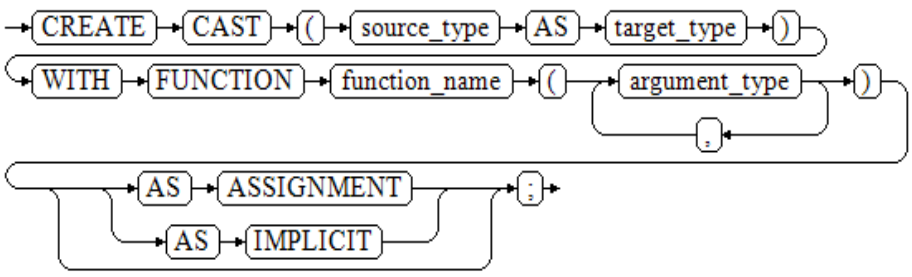
Description

CREATE CAST defines a user-defined conversion.

Syntax

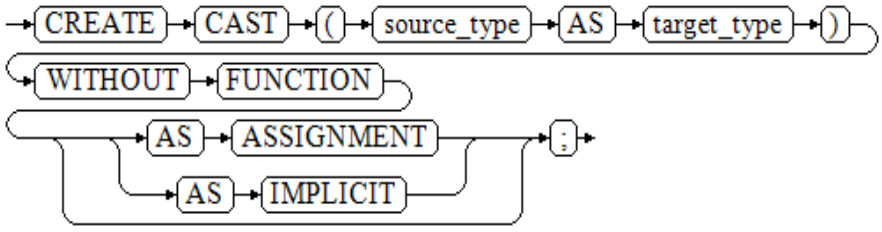
- Define the CAST as a conversion with function.

```
CREATE CAST (source_type AS target_type)
   WITH FUNCTION function_name (argument_type [, ...])
   [ AS ASSIGNMENT | AS IMPLICIT ];
```



- Define the CAST as a conversion without function.

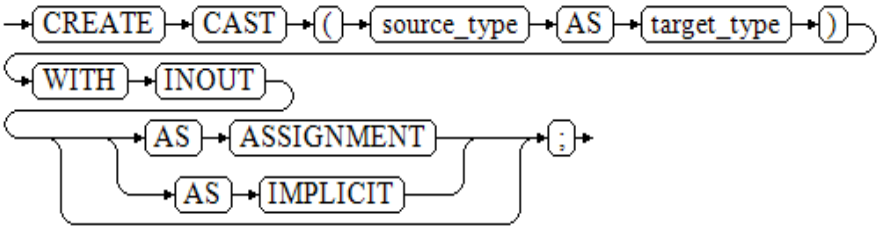
```
CREATE CAST (source_type AS target_type)
   WITHOUT FUNCTION
   [ AS ASSIGNMENT | AS IMPLICIT ];
```



- Defines the CAST as a conversion with I/O.

```
CREATE CAST (source_type AS target_type)
   WITH INOUT
   [ AS ASSIGNMENT | AS IMPLICIT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **source_type**

  Type of the source data to be converted.

- **target_type**

  Type of the target data to be converted.

- **function_name(argument_type [, ...])**

  Function used for conversion. The function name can be modified with a schema name. If it is not modified with a schema name, the function will be found in the schema search path. The result data type of the function must match the target type of the conversion. Its parameters are discussed below.

- **WITHOUT FUNCTION**

  Indicates that the source type is a binary castable to the target type, so no function is needed to perform this conversion.

- **WITH INOUT**

  Indicates that the conversion is an I/O conversion, which is performed by calling the output function of the source data type and transferring the result to the input function of the target data type.

- **AS ASSIGNMENT**

  Indicates that the conversion can be implicitly called in assignment mode.

- **AS IMPLICIT**

  Indicates that the conversion can be implicitly called in any environment.

  A conversion implementation function can have one to three parameters. The type of the first parameter must be the same as that of the source type to be converted, or can be forcibly converted from the binary of the source type to be converted. If the second parameter exists, it must be of the integer type. It receives these type modifiers associated with the target type, or **–1** if nothing is present. If the third parameter exists, it must be of the Boolean type. If the conversion is an explicit type conversion, **true** is received. Otherwise, **false** is received.

  The return type of a conversion function must be the same as the target type of the conversion, or the two types can be binary coercible.

  Typically, a transformation must have different source and target data types. However, if there is a conversion implementation function with more than one parameter, it is allowed to declare a conversion with the same source and target types. This is used to represent a length enforcement function of a specific type in the system catalog. The named function is used to force a value of this type to be the type modifier value given by the second parameter.

  If the source type and target type of a type conversion are different and more than one parameter is received, it indicates that only one step is required to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

convert one type to another and the length conversion is performed at the same time. If no such conversion is available, converting to a type that uses a type modifier involves two steps, one to convert between data types, and the other to apply a conversion specified by the modifier.

Currently, domain type conversion does not take effect. Transformations are typically targeted to the domain-related data types to which they belong.

NOTE

Cast is executed depending on the permission of the user who calls it. When calling a cast created by others, check the execution content of the cast function to prevent the cast creator from performing unauthorized operations with the permission of the executor.

Examples

To create an assignment mapping from the double precision type to the timestamp with time zone type, use the double_to_timestamp(double precision) function.

```
-- Create a function.
gaussdb=# CREATE OR REPLACE FUNCTION double_to_timestamp(double precision) RETURNS TIMESTAMP
WITH TIME ZONE AS $$
SELECT to_timestamp($1);
$$ LANGUAGE SQL STRICT;

-- Create a type conversion.
gaussdb=# CREATE CAST(double precision AS timestamp with time zone) WITH FUNCTION
double_to_timestamp(double precision) AS IMPLICIT;

-- Delete the type conversion.
gaussdb=# DROP CAST (double precision AS timestamp with time zone);
```

Compatibility

The CREATE CAST instruction complies with the SQL standard. Except that the SQL does not have extra parameters that can be forcibly converted to binary types or implement functions.

Helpful Links

DROP CAST

7.12.9.13 CREATE CLIENT MASTER KEY

Description

The encrypted equality query feature adopts a multi-level encryption model. The master key encrypts the column key, and the column key encrypts data. This syntax is used to create a master key object.

Precautions

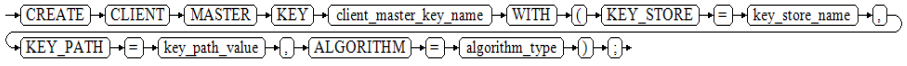
- This syntax is specific to a fully-encrypted database.
- When connecting to the database, you need to enable the connection parameters of the encrypted equality query feature on the database driver side before running this syntax.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The master key is provided by an external key manager. This syntax processes only information such as the key source and key ID. The following external key managers are supported:
  a. Huawei Cloud KMS
  b. Derived key from the user password or provided key user_token
- Before using this syntax, set environment variables for the external key manager on the database driver side. For details, see section "Setting Encrypted Equality Query" in *Feature Guide*.

Syntax

```
CREATE CLIENT MASTER KEY client_master_key_name WITH (KEY_STORE = key_store_name, KEY_PATH = key_path_value, ALGORITHM = algorithm_type);
```



Parameters

- **client_master_key_name**

  This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **KEY_STORE**

  External key manager. For details about the value, see **Table 7-252**.

  If **KEY_STORE** is set to **user_token**, you do not need to provide the **KEY_PATH** parameter.

- **KEY_PATH**

  Each key is managed by an external key manager and the key path format varies depending on the key manager. The value is a character string. For details, see **Table 7-252**. A character string is enclosed in single or double quotation marks. If the length of a character string exceeds 64 characters, only single quotation marks can be used.

- **ALGORITHM**

  Encryption algorithm used by the key. For details about the value, see **Table 7-252**.

Table 7-252 Parameter values for different key managers

KEY_STORE	KEY_PATH	ALGORITHM
user_token	Users do not need to provide **KEY_PATH**.	AES_256_CBC AES_256_GCM SM4

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- user_token scenario:

```
-- Decompress the installation package GaussDB-Kernel_Database version number_OS version number_64bit_Gsql.tar.gz to find the gsql_env.sh script.

-- Use the script to automatically configure the environment variables.
source gsql_env.sh

-- Connect to the database, use the privileged account, and create a user, for example, alice.
gsql -p Port number -d postgres -r
gaussdb=# CREATE USER alice PASSWORD '*******';
gaussdb=# \q

-- Connect to the database. The -C parameter must be used.
gsql -p Port number -d postgres -U alice -r -C

-- Set the user password or derived key. gsql can use password=stdin or key_token=stdin for interactive input.
-- Set the user password. The password must contain at least eight characters, including three types of the following: uppercase letters, lowercase letters, digits, and symbols.
gaussdb=> \key_info keyType=user_token,password=*********
-- Alternatively, connect to a key that meets the security strength requirements. The key is a hexadecimal code.
gaussdb=> \key_info keyType=user_token,key_token=********************************

-- Create a master key.
gaussdb=> CREATE CLIENT MASTER KEY alice_cmk WITH ( KEY_STORE = user_token , ALGORITHM = AES_256_GCM );

-- Delete the master key.
gaussdb=> DROP CLIENT MASTER KEY alice_cmk;
gaussdb=> \q

-- Connect to the database, use the privileged account, and delete user alice.
gsql -p Port number -d postgres -r
gaussdb=# DROP USER alice;
```

Helpful Links

DROP CLIENT MASTER KEY

7.12.9.14 CREATE COLUMN ENCRYPTION KEY

Description

Creates a CEK that can be used to encrypt a specified column in a table.

Precautions

- This syntax is specific to a fully-encrypted database.
- When using gsql to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.
- The CEK object created using this syntax can be used for column-level encryption. When defining a column in a table, you can specify a CEK object to encrypt the column.

Syntax

```
CREATE COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES(CLIENT_MASTER_KEY = client_master_key_name, ALGORITHM = algorithm_type [, ENCRYPTED_VALUE = encrypted_value]);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **column_encryption_key_name**

  Key object name. In the same namespace, the name must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **CLIENT_MASTER_KEY**

  CMK, which is used to encrypt a specified CEK. The value is the name of a CMK. The CMK object is created using the CREATE CLIENT MASTER KEY syntax.

- **ALGORITHM**

  Specifies an encryption algorithm to be used by the CEK. The value can be **AEAD_AES_256_CBC_HMAC_SHA256**, **AEAD_AES_128_CBC_HMAC_SHA256**, **AEAD_AES_256_CTR_HMAC_SHA256**, **AES_256_GCM**, or **SM4_SM3**.

  The data expansion rates of different encryption algorithms are sorted as follows: AEAD_AES_256_CTR_HMAC_SHA256 < AES_256_GCM < AEAD_AES_256_CBC_HMAC_SHA256 = AEAD_AES_128_CBC_HMAC_SHA256 = SM4_SM3. The AEAD_AES_256_CTR_HMAC_SHA256 and AES_256_GCM encryption algorithms are recommended.

  If **KEY_STORE** (master key) is set to **third_kms**, you do not need to provide the **ALGORITHM** parameter.

- **ENCRYPTED_VALUE (optional)**

  A key password specified by a user. The key password length ranges from 28 to 256 characters. The derived 28-character key meets the AES-128 security requirements. If the user needs to use AES-256, the key password length must be 39 characters. If the user does not specify the key password length, a 256-character key is automatically generated.

NOTICE

- SM algorithm constraints: SM2, SM3, and SM4 are Chinese national cryptography standards. To avoid legal risks, these algorithms must be used together. If you specify the SM4 algorithm to encrypt CEKs when creating a CMK, you must specify the SM3 and SM4 algorithms (SM4_SM3) to encrypt data when creating CEKs.
- Constraints on the **ENCRYPTED_VALUE** column: If the CMK generated by Huawei KMS is used to encrypt the CEK and the **ENCRYPTED_VALUE** column is used to transfer the key in the CREATE COLUMN ENCRYPTION KEY syntax, the length of the input key must be an integer multiple of 16 bytes.

Helpful Links

ALTER COLUMN ENCRYPTION KEY and **DROP COLUMN ENCRYPTION KEY**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.15 CREATE CONVERSION

Description

CREATE CONVERSION defines a new conversion between two character set encodings. This function is for internal use only. You are advised not to use it.

Precautions

- The **DEFAULT** parameter indicates that the conversion between the source encoding and the target encoding is executed by default between the client and the server. To support this usage, bidirectional conversion must be defined, that is, both conversion from A to B and conversion from B to A are supported.
- To perform conversion, you must have the EXECUTE permission on function and the CREATE permission on the target schema.
- SQL_ASCII cannot be used for either source encoding or target encoding because the server behavior is hardwired when SQL_ASCII "encoding" is involved.
- You can remove user-defined conversions using DROP CONVERSION.

Syntax

```
CREATE [ DEFAULT ] CONVERSION name
    FOR 'source_encoding' TO 'dest_encoding' FROM function_name;
```

Parameters

- **DEFAULT**

  Specifies that the conversion is the default conversion from the source encoding to the target encoding. There should be only one default conversion for each encoding pair in a schema.

- **name**

  Specifies the name of the conversion, which can be restricted by the schema. If not restricted by a schema, the conversion is defined in the current schema. The conversion name must be unique in a schema.

- **source_encoding**

  Source encoding name.

- **dest_encoding**

  Target encoding name.

- **function_name**

  Function used for conversion. A function name can be restricted by a schema. If not, the function is found in the path. The return value of the function is the number of bytes that are successfully converted.

  The function must be in the following format:

  ```
  conv_proc(
      integer,  -- Source encoding ID
      integer,  -- Target encoding ID
      cstring, -- Source character string (a null-terminated C character string)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    internal,-- Target (filled with a null-terminated C character string)
    integer  -- Length of the source string
) RETURNS void;
```

CAUTION

- Currently, only internal creation is supported.

7.12.9.16 CREATE DATABASE

Description

Creates a database. By default, an A-compatible database is created by copying **templatea** of the standard system database, and a non-A-compatible database is created by copying **template0** of the standard system database.

Precautions

- A user who has the CREATEDB or SYSADMIN permission can create a database.
- It cannot be executed inside a transaction block.
- During database creation, if an error message indicating that permission denied is displayed, the possible cause is that the permission on the data directory in the file system is insufficient; if an error message indicating no space left on device is displayed, the possible cause is that the disk space is used up.
- Do not use **template0**, **templatea**, or **templatem** to create a database when updating template databases. During the upgrade or update of the standard system database template, you cannot create a database by copying **template0**, **templatea**, or **templatem** of the standard system database.
- **templatem** cannot be used as the name of the new database during database creation.

Syntax

```
CREATE DATABASE database_name
   [ [ WITH ] { [ OWNER [=] user_name ] |
            [ TEMPLATE [=] template ] |
            [ ENCODING [=] 'encoding' ] |
            [ LC_COLLATE [=] 'lc_collate' ] |
            [ LC_CTYPE [=] 'lc_ctype' ] |
            [ DBCOMPATIBILITY [=] 'compatibility_type' ] |
            [ TABLESPACE [=] tablespace_name ] |
            [ CONNECTION LIMIT [=] connlimit ] |
            [ DBTIMEZONE [=] 'time_zone' ] }[...] ];
```

Parameters

- **database_name**

  Specifies the database name.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the database name.

If a database name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a database name that contains uppercase letters, enclose the database name with double quotation marks ("").

- **OWNER [=] user_name**

  (Optional) Specifies the owner of the new database.

  Value range: an existing username. If no username is specified, the owner of the new database is the current user.

- **TEMPLATE [=] template**

  (Optional) Creates a database based on the specified standard system database template.

  GaussDB creates a database by copying data from a template database. GaussDB has four default template databases **template0**, **template1**, **templatea**, and **templatem**, and a default user database **postgres**.

  Value range: **template0**, **templatem**, and **templatea**.

  NOTE

  After the templatem feature is enabled, a template database **templatem** is added. For details about the database behavior after the templatem feature is enabled, see section "Creating an M-compatible Database and User" in *M-Compatibility Developer Guide*.

- **ENCODING [=] 'encoding'**

  (Optional) Specifies the character encoding used by the database.

  If this parameter is not specified, the M-compatible database uses the UTF-8 encoding by default, and other compatible databases use the encoding of the template database by default.

  By default, the encoding of the template databases **template0**, **template1**, and **templatea** is related to the OS environment.

  The character encoding of **template1** cannot be changed. To modify the character encoding, use the **template0** or **templatea** database to create a database.

  Common values are **GBK**, **UTF8**, **Latin1**, and **GB18030**. The supported character sets are listed in **Table 7-253**.

Table 7-253 GaussDB character set

NOTICE

- Not all client APIs support the character sets listed in **Table 7-253**.
- The behavior of the SQL_ASCII setting is different from that of other settings. If the character set of the server is SQL_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as characters that cannot be parsed. If any non-ASCII data is used, do not set the character set to **SQL_ASCII**. If the character set is set to **SQL_ASCII**, the database cannot convert or verify non-ASCII characters.
- The character set encoding of the new database must be compatible with the local settings (**LC_COLLATE** and **LC_CTYPE**).
- When the specified character encoding set is **GBK** or **ZHS16GBK**, some uncommon Chinese characters cannot be directly used as object names. This is because when the second byte of the GBK ranges from 0x40 to 0x7E, the byte encoding overlaps with the ASCII characters, including uppercase characters (A–Z), lowercase characters (a–z), @, [, \,], ^, _, `, {, |, and }. @, [, \, ], ^, _, `, {, |, and } are operators in the database. If they are directly used as object names, a syntax error will be reported.
- If the client-side encoding is different from that of the server, the database must support encoding format conversion. You can view all encoding formats supported for conversion in the **PG_CONVERSION** system catalog. If the database does not support encoding format conversion, it is recommended that the client-side encoding be the same as the server-side encoding. You can change the client-side encoding by setting the GUC parameter **client_encoding**.
- If both the database character set encoding and client-side encoding are GB18030_2022, ensure that the client OS supports GB18030_2022. Otherwise, data inconsistency may occur due to incomplete compatibility between GB18030 character set versions. In addition, if historical data needs to be switched to the GB18030_2022 database, follow the database switchover process to migrate data.

- **LC_COLLATE [=] 'lc_collate'**

  (Optional) Specifies the character set used by the new database.

  Value range: character set supported by the OS. By default, the character set of the template database is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The use of this parameter affects the sorting order of strings, such as the sorting of the ORDER BY operation results or the sorting of indexes on text columns.
- This parameter does not take effect for M-compatible databases.
- The value ranges of the **lc_collate** and **lc_ctype** parameters are related to the character sets supported by the local environment. For example, in the Linux OS, you can run the **locale -a** command to obtain the list of character sets supported by the OS. When the **lc_collate** and **lc_ctype** parameters are used, select the required character set and character type from the obtained character set list.
- If you want to set the character encoding set to GB18030_2022, ensure that the value ranges of **lc_collate** and **lc_ctype** are the same as those of GB18030.
- If you want to set the character encoding set to ZHS16GBK, ensure that the value ranges of **lc_collate** and **lc_ctype** are the same as those of GBK character set.

- **LC_CTYPE [=] 'lc_ctype'**

  (Optional) Specifies the character type used by the new database.

  Value range: character type supported by the OS. By default, the character type of the template database is used.

  NOTE

  - The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits.
  - This parameter does not take effect for M-compatible databases.
  - The value ranges of the **lc_collate** and **lc_ctype** parameters are related to the character sets supported by the local environment. For example, in the Linux OS, you can run the **locale -a** command to obtain the list of character sets supported by the OS. When the **lc_collate** and **lc_ctype** parameters are used, select the required character set and character type from the obtained character set list.
  - If you want to set the character encoding set to GB18030_2022, ensure that the value ranges of **lc_collate** and **lc_ctype** are the same as those of GB18030.
  - If you want to set the character encoding set to ZHS16GBK, ensure that the value ranges of **lc_collate** and **lc_ctype** are the same as those of GBK character set.

- **DBCOMPATIBILITY [=] 'compatibility_type'**

  (Optional) Specifies the compatible database type. The default database is an O-compatible database.

  Value range: **A**, **B**, **C**, **PG**, and **M**, indicating O-, MY-, TD-, POSTGRES-, and M-compatible databases, respectively.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- For A compatibility, the database treats empty strings as **NULL** and replaces **DATE** with **TIMESTAMP(0) WITHOUT TIME ZONE**.
- When a character string is converted to an integer, if the input is invalid, the B-compatible database converts the input to 0. In other compatible databases, an error is reported.
- In PG-compatible databases, CHAR and VARCHAR are counted by character. In other compatible databases, CHAR and VARCHAR are counted by byte. For example, for the UTF-8 character set, CHAR(3) can store three Chinese characters in PG-compatible databases, but can store only one Chinese character in other compatible databases.
- For details about M-compatible database features, see *M Compatibility Developer Guide*. Between two MY-compatible modes (B-compatible and M-compatible), M-compatible database is recommended because it is more compatible with the MySQL database in terms of syntax, data types, metadata, and protocols. B-compatible mode is not recommended because it is not compatible with the MySQL database due to architecture restrictions and will no longer evolve.

- **TABLESPACE [=] tablespace_name**

  (Optional) Specifies the tablespace of a database.

  Value range: an existing tablespace name

- **CONNECTION LIMIT [=] connlimit**

  (Optional) Specifies the maximum number of concurrent connections that can be made to the database.

  Value range: an integer in the range [–1, 2^{31} – 1]. The default value is **–1**, indicating that there is no limit.

  NOTICE

  - System administrators are not restricted by this parameter.
  - **connlimit** is calculated separately for each primary database node. Number of connections of the database = Value of **connlimit** x Number of normal primary database nodes.

- **DBTIMEZONE [=] time_zone**

  Specifies the time zone of the new database.

  This parameter affects the time zone of the new database. The PRC is used by default.

  Value range:

  – Time zone names and abbreviations supported by the OS.

  – Timestamp ranges from –15:59 to +15:00.

  Prerequisites: The currently connected database is an A-compatible database, **a_format_version** is set to **'10c'**, and **a_format_dev_version** is set to **'s2'**.

The restrictions on character encoding are as follows:

- If the locale is set to **C** (or **POSIX**), all encoding types are allowed. For other locale settings, the character encoding must be the same as that of the locale.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the character encoding mode is SQL_ASCII and the modifier is an administrator, the character encoding mode can be different from the locale setting.
- The encoding and region settings must match the template database, except that **template0** or **templatea** is used as a template. This is because other databases may contain data that does not match the specified encoding, or may contain indexes whose sorting order is affected by **LC_COLLATE** and **LC_CTYPE**. Copying this data will invalidate the indexes in the new database. **template0**/**templatea** does not contain any data or indexes that may be affected.

Examples

```
-- Create user jim.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Create the GBK-encoded database testdb1.
gaussdb=# CREATE DATABASE testdb1 ENCODING 'GBK' template = template0;
-- View information about the testdb1 database.
gaussdb=#SELECT datname,pg_encoding_to_char(encoding) FROM pg_database WHERE datname =
'testdb1';
 datname | pg_encoding_to_char
---------+---------------------
 testdb1 | GBK
(1 row)
-- Create a database that 1000 concurrent connections can be made.
gaussdb=# CREATE DATABASE testdb4 CONNECTION LIMIT=1000;
-- View the information about testdb4.
gaussdb=# SELECT datname,datconnlimit  FROM pg_database where datname = 'testdb4';
 datname | datconnlimit
---------+--------------
 testdb4 |         1000
(1 row)
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_test RELATIVE LOCATION 'test_tablespace/tbs_test';
-- Create a database and specify tbs_test as the default tablespace.
gaussdb=# CREATE DATABASE testdb5 TABLESPACE = tbs_test ;
-- View the information about testdb5.
gaussdb=# SELECT db.datname,ts.spcname FROM pg_database db JOIN pg_tablespace ts ON
db.dattablespace = ts.oid WHERE db.datname = 'testdb5';
 datname | spcname
---------+----------
 testdb5 | tbs_test
(1 row)
-- Create the A-compatible database testdb2 and specify jim as the owner.
gaussdb=# CREATE DATABASE testdb2 OWNER jim DBCOMPATIBILITY = 'A';
-- View the information about testdb2.
gaussdb=# SELECT t1.datname,t2.usename,t1.datcompatibility
                  FROM pg_database t1,gs_user t2
                  WHERE t1.datname = 'testdb2' AND t1.datdba=t2.usesysid;
 datname | usename | datcompatibility
---------+---------+------------------
 testdb2 | jim     | A
(1 row)
gaussdb=# CREATE DATABASE testdb_tmp OWNER jim template=templatea;
-- View the information about testdb2.
gaussdb=# SELECT t1.datname,t2.usename,t1.datcompatibility
                  FROM pg_database t1,gs_user t2
                  WHERE t1.datname = 'testdb_tmp' AND t1.datdba=t2.usesysid;
  datname   | usename | datcompatibility
------------+---------+------------------
 testdb_tmp | jim     | A
(1 row)
-- Switch to the A-compatible database testdb2 and set session parameters.
gaussdb=# \c testdb2
testdb2=# SET a_format_version='10c';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
testdb2=# SET a_format_dev_version='s2';
-- Create the A-compatible database and specify the time zone.
testdb2=# CREATE DATABASE testdb3 DBCOMPATIBILITY 'A' DBTIMEZONE='+08:00';
-- View the information about testdb3.
testdb2=# SELECT datname,datcompatibility,dattimezone FROM pg_database WHERE datname = 'testdb3';
 datname | datcompatibility | dattimezone
---------+------------------+-------------
 testdb3 | A                | +08:00
(1 row)
-- Switch to the initial database. Change the database name based on actual situation.
testdb2=# \c postgres
-- Drop databases.
gaussdb=# DROP DATABASE testdb1;
gaussdb=# DROP DATABASE testdb2;
gaussdb=# DROP DATABASE testdb3;
gaussdb=# DROP DATABASE testdb4;
gaussdb=# DROP DATABASE testdb5;
gaussdb=# DROP DATABASE testdb_tmp;
-- Drop the user.
gaussdb=# DROP USER jim;
-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_test;
```

Helpful Links

ALTER DATABASE and **DROP DATABASE**

7.12.9.17 CREATE DATABASE LINK

Description

Creates a database link object. For details about database links, see **DATABASE LINK**.

Precautions

- The database link feature can be used only in A-compatible versions.
- Do not use database links to connect to the initial user.
- The initial user is not allowed to create, modify, or delete database links.
- If the upgrade is not committed, the database link cannot be created.
- If the CURRENT_USER is used or the CONNECT TO connection string is omitted, the initial username and empty password of the current database are used for connection, resulting in connection failure.
- Use localhost, 127.0.0.1, or the local IP address and port to connect to the GaussDB instance.

Syntax

```
CREATE [ PUBLIC ] DATABASE LINK dblink
  [ CONNECT TO { CURRENT_USER | 'user' IDENTIFIED BY 'password' } ] [ USING ( option 'value' [...]) ];
```

option is as follows:

```
{ HOST | PORT | DBNAME | FETCH_SIZE }
```

Parameters

- **PUBLIC**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user.

- **dblink**

  Specifies the name of the database link to be created.

- **user**

  Specifies the username of the user for connecting to the remote end using the created database link.

- **password**

  Specifies the user password for connecting to the remote end using the created database link.

- **CURRENT_USER**

  Uses the initial username and empty password of the current database for connection.

- **USING (option 'value' [, ...])**

  Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

  - **host**: specifies the IP address for connection. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, encrypted databases are not supported. If no IP address is specified, this parameter is left empty by default.
  - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
  - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
  - **fetch_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch_size** ranges from 0 to 2147483647. The default value is **100**.

NOTICE

- You can write only part of the preceding options in the brackets after USING.
- If the keyword USING is not written, the content in the brackets is not written as well.
- When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

Examples

```
-- Create a user with the SYSADMIN permission.
gaussdb=#  CREATE USER user1 WITH SYSADMIN PASSWORD '********';
gaussdb=#  SET ROLE user1 PASSWORD '********';

-- Create a private database link. host can be an IPv6 address.
gaussdb=#  CREATE DATABASE LINK private_dblink CONNECT TO 'user1' IDENTIFIED BY '********' USING
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(host '192.168.11.11',port '54399',dbname 'db01');

-- Drop the private database link.
gaussdb=#  DROP DATABASE LINK private_dblink;

-- Create a public database link. host can be an IPv6 address.
gaussdb=#  CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '********'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Drop the public database link.
gaussdb=#  DROP PUBLIC DATABASE LINK public_dblink;

-- Drop the created user.
gaussdb=#  RESET ROLE;
gaussdb=#  DROP USER user1;
```

Helpful Links

ALTER DATABASE LINK and **DROP DATABASE LINK**

7.12.9.18 CREATE DIRECTORY

Description

CREATE DIRECTORY creates a directory. The directory defines an alias for a path in the server file system and is used to store data files used by users. Users can read and write these files through the dbe_file advanced package.

The read and write permissions for the directory can be granted to specified users to provide permission control for dbe_file.

Precautions

- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to create the directory object. When **enable_access_server_directory** is set to **on**, users with the SYSADMIN permission and users inherited the built-in role permission gs_role_directory_create can create directory objects.
- By default, the user who creates a directory has the read and write permissions on the directory.
- The default owner of a directory is the user who creates the directory.
- A directory cannot be created for the following paths:
  - The path contains special characters.
  - The path is a relative path.
- The following validity check is performed during directory creation:
  - Check whether the path exists in the OS. If it does not exist, a message is displayed, indicating the potential risks.
  - Check whether the database initial user **omm** has the R/W/X permissions for the OS path. If the user does not have all the permissions, a message is displayed, indicating the potential risks.
- Ensure that the path is the same on all the database nodes. Otherwise, the path may fail to be found on some nodes when the directory is used.
- You can view existing directory objects in the pg_directory table.
- The DIRECTORY object cannot be used in a PDB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
CREATE [OR REPLACE] DIRECTORY directory_name
AS 'path_name';
```

Parameters

- **directory_name**

  Specifies the name of a directory.

  Value range: a string. It must comply with the **naming convention**.

- **path_name**

  Specifies the OS path for which a directory is to be created.

  Value range: a valid OS path

Examples

```
-- Create a directory object.
gaussdb=# CREATE OR REPLACE DIRECTORY  dir  AS '/tmp/';

-- View the created directory object.
gaussdb=# select * from pg_directory;
 dirname | owner | dirpath | diracl
---------+-------+---------+--------
 dir     |    10 | /tmp    |
(1 row)

-- Delete the directory object.
gaussdb=# DROP DIRECTORY dir;
```

Helpful Links

ALTER DIRECTORY and **DROP DIRECTORY**

7.12.9.19 CREATE EVENT

Description

Creates a scheduled event. The scheduled event is a special object defined in the database. It is associated with tables or other database objects. When specified event conditions are met, the scheduled event automatically triggers the execution of pre-defined operations or statements.

Precautions

- Operations related to scheduled events are supported only when **sql_compatibility** is set to **'B'**.
- A user without the sysadmin permission must obtain the permission from the user who has the sysadmin permission to create, modify or delete the scheduled event. The operation permissions of the scheduled event are the same as those of creating scheduled events for the advanced package DBE_SCHEDULER.
- Currently, the interval expression of a scheduled event is compatible with the syntax of floating-point number, for example, interval 0.5 minutes. However,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the floating-point number is rounded up during calculation. Therefore, you are advised not to use the floating-point number for the interval.

- Scheduled events with the same name are not supported in the same database.
- The statements to be executed in a scheduled event are any SQL statements except security-related operations. However, some statements with restrictions fail to be executed. For example, a database cannot be created by using composite statements.
- The security-related operations are as follows:
  - Use the encryption function.
  - Create and set users and groups.
  - Connect to a database.
  - Encrypt the function.
- The definer fails to be specified for a scheduled event in the following scenarios:
  - The user who operates the scheduled event does not have the sysadmin permission.
  - The current user is inconsistent with the specified definer.
    - An initial user is specified as the definer.
    - An O&M administrator or monitor administrator is specified as the definer.
    - The parameter **enableSeparationOfDuty** is set to **on** to enable the separation of duties.

Syntax

```
CREATE
    [DEFINER = user]
EVENT
    [IF NOT EXISTS]
    event_name
    ON SCHEDULE schedule
    [ON COMPLETION [NOT] PRESERVE]
    [ENABLE | DISABLE | DISABLE ON SLAVE]
    [COMMENT 'string']
    DO event_body;
```

- schedule

  ```
  {
      AT timestamp [+ INTERVAL interval] ...
    | EVERY interval
      [STARTS timestamp [+ INTERVAL interval] ...]
      [ENDS timestamp [+ INTERVAL interval] ...]
  }
  ```

- interval

  ```
  quantity
          {YEAR | MONTH | DAY | HOUR | MINUTE | SECOND |
           YEAR TO MONTH | DAY TO HOUR | DAY TO MINUTE |
           DAY TO SECOND | HOUR TO MINUTE | HOUR TO SECOND |
           MINUTE TO SECOND}
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **DEFINER**

  Specifies the permission for the scheduled event statement to be executed during execution. By default, the permission of the user who creates the scheduled event is used. When a definer is specified, the permission of the specified user is used.

  Only users with the sysadmin permission can specify the definer.

- **ON SCHEDULE**

  Specifies the time when a scheduled event is executed. A scheduled event can be set to be executed once or multiple times through SCHEDULE.

  - **AT timestamp [+ INTERVAL interval]** indicates that the scheduled event is executed only once at **timestamp [+ INTERVAL interval]**.
  - **EVERY interval** indicates that the scheduled event is executed at the interval specified by **interval**.

    - **STARTS timestamp [+ INTERVAL interval]** indicates that user can specify the start time for a scheduled event that can be executed repeatedly. That is, the scheduled event is executed since **timestamp [+ INTERVAL interval]**. If this parameter is left blank, the task is executed from the current time by default.

    - **ENDS timestamp [+ INTERVAL interval]** indicates that user can specify the end time for a scheduled event that can be executed repeatedly. That is, the scheduled event ends at **timestamp [+ INTERVAL interval]**. If this parameter is left empty, the default value **3999-12-31 16:00:00** is used.

- **INTERVAL**

  Specifies the interval. The value of **INTERVAL** consists of a number and a time unit specified by **quantity**, for example, **1 YEAR**.

- **ON COMPLETION [NOT] PRESERVE**

  Once a transaction is complete, the scheduled event is deleted from the system catalog immediately by default. You can overwrite the default behavior by setting **ON COMPLETION PRESERVE**.

- **ENABLE | DISABLE | DISABLE ON SLAVE**

  The scheduled event is in the **ENABLE** state by default after it is created. That is, the statement to be executed is executed immediately at the specified time. You can use the keyword **DISABLE** to change the enabled state. The performance of **DISABLE ON SLAVE** is the same as that of **DISABLE**.

- **COMMENT**

  You can add comments to the scheduled event. The comments can be viewed in the **GS_JOB_ATTRIBUTE** table.

- **DO**

  Specifies the statement to be executed for a scheduled event.

- interval

  Specifies the time interval. You can replace TO with an underscore (_) in the value of **interval**, for example, **YEAR_MONTH** and **DAY_HOUR**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In the B-compatible mode, this parameter can be used only when the GUC parameter **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s1'**.

Examples

```
-- Create and switch to the test database.
gaussdb=# CREATE DATABASE test_event WITH DBCOMPATIBILITY = 'b';
gaussdb=# \c test_event

-- Create a table.
test_event=# CREATE TABLE t_ev(num int);

-- Create a scheduled event that is executed once every five seconds. After the event is executed, the scheduled event is automatically deleted.
test_event=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE AT sysdate + interval 5 second DO INSERT INTO t_ev VALUES(0);

-- Query the table five seconds later.
test_event=# SELECT * FROM t_ev;
 num
-----
   0
(1 row)

-- Create a scheduled event that is executed every minute.
test_event=# CREATE EVENT IF NOT EXISTS event_e2 ON SCHEDULE EVERY 1 minute DO INSERT INTO t_ev VALUES(1);

-- Query the table every one minute. A new record is displayed.
test_event=# SELECT * FROM t_ev;
 num
-----
   0
   1
   1
(3 rows)

-- Delete the scheduled event.
test_event=# DROP EVENT event_e2;

-- Drop the table.
test_event=# DROP TABLE t_ev;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual database name.
test_event=#\c postgres
gaussdb=# DROP DATABASE test_event;
```

NOTICE

- If a scheduled event fails to be executed after being created, you can view the failure cause in the SHOW EVENTS or PG_JOB table.
- When operations related to user passwords (such as creating weak passwords) are performed in the statements to be executed for a scheduled event, system catalog records the password in plaintext. Therefore, you are advised not to perform operations related to user passwords in the statements to be executed for the scheduled event.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

ALTER EVENT, **DROP EVENT**, and **SHOW EVENTS**

7.12.9.20 CREATE EXTENSION

NOTICE

The extended function is for internal use only. You are advised not to use it. Currently, CREATE EXTENSION can be performed only on postgis, postgis_sfcgal, postgis_raster, postgis_topology, yukon_geomodel, yukon_geogridcoder, pkg_bpchar_opc, and tablefunc.

Description

Installs an extension.

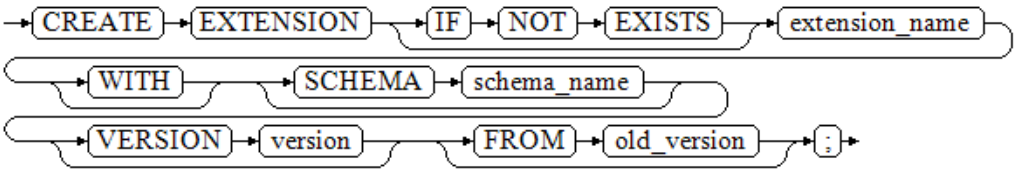
Precautions

- Before running the **CREATE EXTENSION** command to load an extension into the database, you must install the support file for the extension first.
- The **CREATE EXTENSION** command installs a new extension to a database. Ensure that no extension with the same name has been installed.
- Installing an extension means to execute an extended script file that creates an SQL entity, such as a function, data type, operator, and index-supported method.
- Installing an extension requires the same permissions as creating its component objects. For most extensions, this means that the superuser or database owner's permissions are required. For subsequent permission checks and entities created by the extension script, the role that runs the **CREATE EXTENSION** command becomes the owner of the extension.
- During the execution of **CREATE EXTENSION**, if the database contains database objects with the same name as that in the EXTENSION, such as packages, synonyms, operators, directories, functions, stored procedures, views, and tables, the execution will fail.
- Do not directly create extensions for the database to avoid unexpected errors and incompatibility problems after the upgrade. To create an extension, set **enable_extension** to **true**.
- During the execution of CREATE EXTENSION, if the GUC parameter **enable_object_special_character** is set to **off** and "@extschema@" is used in the extension script file, the value of the **schema** parameter in the extension support file cannot contain any special characters in ["$'\].

Syntax

```
CREATE EXTENSION [ IF NOT EXISTS ] extension_name
[ WITH ] [ SCHEMA schema_name ]
[ VERSION version ]
[ FROM old_version ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **IF NOT EXISTS**

  If an extension with the same name exists in the system, no error is reported. However, a message is displayed. Note that this parameter does not ensure that the existing extensions of the system are the same as those created by the script.

- **extension_name**

  Specifies the name of the extension to be installed. The database creates the extension by using the information in the **SHAREDIR/extension/extension_name.control** file.

- **schema_name**

  The extension instance is installed in this schema, and the extended content can be reinstalled. The specified schema must exist. If it is not specified, the extended control file does not specify a schema either. In this case, the default schema is used.

  ⚠ CAUTION

  Extensions do not belong to any schema (no restriction is posed on the name of extensions within the scope of a database), but an extension instance belongs to a schema.

- **version**

  Version of an extension to be installed, which can be written as an identifier or a string. The default version is specified in the extended control file.

- **old_version**

  If you want to upgrade the content that is not contained in the **old style** module, you need to specify **FROM old_version**. This option makes **CREATE EXTENSION** run an installation script to install new content into the extension instead of creating an entity. Note that **SCHEMA** specifies the schema that includes these existing entities.

Helpful Links

ALTER EXTENSION and **DROP EXTENSION**

7.12.9.21 CREATE FOREIGN DATA WRAPPER

Description

Creates a foreign data wrapper. The user who created the foreign data wrapper becomes its owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- The name of the foreign data wrapper must be unique in the database.
- Only initial users and system administrators can create foreign data wrappers.

Syntax

```
CREATE FOREIGN DATA WRAPPER name
[ HANDLER handler_function | NO HANDLER ]
[ VALIDATOR validator_function | NO VALIDATOR ]
[ OPTIONS ( option 'value' [, ... ] ) ];
```

Parameters

- **name**

  Specifies the name of the foreign data wrapper to be created.

- **HADNLER handler_function**

  handler_function is the name of a registered function used to retrieve execution functions for foreign tables. The handler function must have no arguments, and its return type must be fdw_handler.

  It is possible to create foreign data wrappers without processor functions, but foreign tables that use such wrappers can only be declared and cannot be accessed.

- **VALIDATOR validator_function**

  validator_function is the name of a registered function used to check the common options provided to the foreign data wrapper, as well as the options for the foreign server, user mapping, and foreign table that use the foreign data wrapper. If there is no validator function or **NO VALIDATOR** is declared, options are not checked at creation time (foreign data wrappers may ignore or reject invalid option descriptions at runtime, depending on the implementation). The validator function must accept two arguments: one is of text[] type, which will contain an array of options stored in the system directory, and the other is of OID type, which will be the OID of the system directory that contains the options. The return type is ignored. The function should report invalid options using the ereport(ERROR) function.

- **OPTIONS (option 'value' [, ...])**

  This clause declares options for the new foreign data wrapper. The allowed option names and values are specific to each foreign data wrapper and are validated by the validator function of the foreign data wrapper. The option name must be unique.

Examples

```
-- Create a useless foreign data wrapper dummy.
gaussdb=# CREATE FOREIGN DATA WRAPPER dummy;

-- Create a foreign data wrapper file with the handler function file_fdw_handler.
gaussdb=# CREATE FOREIGN DATA WRAPPER file HANDLER file_fdw_handler;

-- Create a foreign data wrapper mywrapper with some options.
gaussdb=# CREATE FOREIGN DATA WRAPPER mywrapper OPTIONS (debug 'true');
```

Helpful Links

ALTER FOREIGN DATA WRAPPER and **DROP FOREIGN DATA WRAPPER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.22 CREATE FOREIGN TABLE

Description

Creates a foreign table.

Precautions

- System columns (such as **tableoid** and **ctid**) cannot be used in foreign tables. Foreign tables in the Private or Shared schema require the initial user permission or the O&M administrator permission in O&M mode (operation_mode).
- When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.
- In the multi-tenancy scenario, only the initial user can run the **CREATE FOREIGN TABLE** command in the PDB.

Syntax

```
CREATE FOREIGN TABLE [ IF NOT EXISTS ] table_name ( [
    column_name type_name [ OPTIONS ( { option 'value' } [, ... ] ) ] [ COLLATE collation ]
[ column_constraint [ ... ] ]
    [, ... ]
] )
  SERVER server_name
[ OPTIONS ( { option 'value' } [, ... ] ) ];
```

column_constraint is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  DEFAULT default_expr }
```

Parameters

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.

- **table_name**

  Specifies the name of a foreign table.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies the name of a column in the foreign table.

  Value range: a string. It must comply with the **naming convention**.

- **type_name**

  Specifies the data type of the column.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation;** command to query the collation from the pg_collation system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SERVER server_name**

  Specifies the server name of the foreign table.

- **OPTIONS (option 'value' [, ...])**

  Options are related to the new foreign table or the columns in the foreign table. The allowed option names and values are specified by each foreign data wrapper, and are also verified by the verification function of the foreign data wrapper. The option name must be unique (although table options and table column options can share the same name).

  – Options supported by **file_fdw** are as follows:

    - filename

      File to be read. This parameter is required and must be an absolute path.

    - format

      File format of the remote server, which is the same as the **FORMAT** option in the **COPY** statement. The value can be **text**, **csv**, **binary**, or **fixed**.

    - header

      Specifies whether a specified file has a header, which is the same as the **HEADER** option of the **COPY** statement.

      ○ delimiter

        File delimiter, which is the same as the **DELIMITER** option of the **COPY** statement.

      ○ quote

        Quote character of a file, which is the same as the **QUOTE** option of the **COPY** statement.

      ○ escape

        Escape character of a file, which is the same as the **ESCAPE** option of the **COPY** statement.

      ○ null

        Null string of a file, which is the same as the **NULL** option of the **COPY** statement.

      ○ encoding

        Encoding of a file, which is the same as the **ENCODING** option of the **COPY** statement.

      ○ force_not_null

        This is a Boolean option. If it is true, the value of the declared column cannot match a null string (file-level null option). This option is the same as the **FORCE_NOT_NULL** option of the **COPY** statement.

  NOTE

  For details about how to use file_fdw, see section "Foreign Data Wrapper > file_fdw" in *Feature Guide*.

- **NOT NULL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Forbids NULL values in columns.

- **NULL**

  Allows NULL values in columns.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

Examples

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Create a foreign table.
gaussdb=# CREATE FOREIGN TABLE foreign_tbl (col1 text) SERVER my_server OPTIONS (logtype 'gs_log');

-- Delete the foreign table.
gaussdb=# DROP FOREIGN TABLE foreign_tbl;

-- Delete the server.
gaussdb=# DROP SERVER my_server;
```

Helpful Links

ALTER FOREIGN TABLE and **DROP FOREIGN TABLE**

7.12.9.23 CREATE FUNCTION

Description

Creates a function.

Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- **current_schema** and **search_path** specified by SET during function creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- If a function has output parameters, the GUC parameter **behavior_compat_options** must be set to **'proc_outparam_override'** for the output parameters to take effect. When the function is called using SELECT or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CALL, an argument must be provided in the position of the output parameter. Otherwise, the function fails to be called.

- Only the functions compatible with PG or those with the PACKAGE attribute can be overloaded. After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You cannot create overloaded functions with different formal parameter names (the function name and parameter list type are the same).
- You cannot create a function that has the same name and parameter list as a stored procedure.
- Formal parameters cannot be overloaded if only the custom ref cursor type is different from the sys_refcursor type.
- Function overloading is not supported if only the returned data types are different.
- Function overloading is not supported if only the default values are different.
- When an overloaded function is called, the variable type must be specified.
- A-compatible functions are created for A-compatible databases and PG-compatible functions are created for PG-compatible databases. Hybrid creation is not recommended.
- If a function supports overloading, you need to add the keyword PACKAGE.
- If an undeclared variable is used in a function, an error is reported when the function is called.
- You can use the SELECT statement to specify different parameters using identical functions. The syntax does not support calling identical functions without the PACKAGE attribute.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.
- By default, the permissions to execute new functions are granted to PUBLIC users. For details, see **GRANT**. By default, a user inherits the permissions of the PUBLIC role. Therefore, the user has the permission to execute a function and view the definition of the function. In addition, to execute the function, the user must have the USAGE permission on the schema to which the function locates. You can revoke the default execution permissions from the PUBLIC role when creating a function and grant the function execute permission to users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have permission to execute.
- When functions without parameters are called inside another function, you can omit brackets and call functions using their names directly.
- When other functions with output parameters are called in a function and an assignment expression, set the GUC parameter **behavior_compat_options** to **'proc_outparam_override'**, define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called functions will be ignored.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Oracle-compatible functions support viewing, exporting, and importing parameter comments.
- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and plsql_body.
- Users with the CREATE ANY FUNCTION permission can create or replace functions in the user schemas.
- The default permission on a function is SECURITY INVOKER. To change the permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- If the GUC parameter **behavior_compat_options** is not set to **'proc_outparam_override'**, the **OUT** and **IN OUT** output parameters of the function directly called by an anonymous block or stored procedure cannot be of the composite type, and the return value is used as the first value of the **OUT** output parameter. As a result, the calling fails. To correctly use the **OUT** and **IN OUT** output parameters, set the parameter **behavior_compat_options** to **'proc_outparam_override'**. For details, see **Examples**.
- For PL/SQL functions, after **behavior_compat_options** is set to **'proc_outparam_override'**, the behaviors of out and inout parameters change. In the functions, **return**, **out**, and **inout** can be returned at the same time. Before the parameter is set to **'proc_outparam_override'**, only **return** is returned. For details, see **Examples**.
- For PL/SQL functions, after **behavior_compat_options** is set to **'proc_outparam_override'**, the restrictions are as follows:
  a. If a function with the **out/inout** parameter already exists in the same schema or package, you cannot create another function with the same name with the **out/inout** parameter.
  b. The **out** parameter must be added no matter whether the SELECT or CALL statement is used to call a stored procedure.
  c. In some scenarios, functions cannot be used in expressions (compared with those before the parameter is enabled), for example, left assignment in a stored procedure and the call function. For details, see **Examples**.
  d. Functions without return cannot be called. The perform function can be used to call functions.
  e. When a function is called in a stored procedure, **out** or **inout** cannot be set to a constant. For details, see **Examples**.
  f. After the GUC parameter **'proc_outparam_override'** is set, if the return type of the function is setof, the **out** output parameter will not take effect.
- When creating a function, you cannot use the function itself as the default value of input parameter.
- The function with OUT parameter cannot be called by SQL statement.
- The function with OUT parameter cannot be called by SELECT INTO syntax.
- Functions with OUT parameters cannot be called in nested mode.

  Example:

  ```
  b := func(a,func(c,1));
  ```

  Should be changed to:

  ```
  tmp := func(c,1); b := func(a,tmp);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When a function is created, the type of the return value of the function is not checked.
- If a function with the definer specified is created in a schema of another user, the function will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- In the schema of the O&M administrator, only the initial user, system administrator, and schema owner can create objects. The schema that does not allow other users to create and modify objects is the schema of the O&M administrator.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The execute immediate sqlv using func syntax is used to execute a function. (b) The select func into syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The select where a=func() statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- In the RETURN statement of a function, when the constructor of the composite type is called, if the actual return type is different from the defined return type, the result can be implicitly converted to the defined return type. Cross-schema call is supported, for example: **RETURN schema.record;**. Cross-database call is not supported, for example, **RETURN package.schema.record;**. In the RETURN statement of a function, when the function is called, the function with the OUT parameter in an expression of an arithmetic operation is not supported, for example, **RETURN func(c out) + 1**.
- When the complex function is called, for example, func(x).a, a composite type is returned. Cross-schema call is supported, but the database.schema.package.func(x).b call is not supported.
- When a stored procedure with the **out** parameter is called, you can set the GUC parameter **behavior_compat_options** to **'proc_outparam_transfer_length'** to pass the parameter length. The specifications and constraints are as follows:

  a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).

  b. If the **out** parameter does not take effect (for example, **perform**), the length does not need to be passed.

  c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.

  d. Regardless of whether the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, the parameter length can be passed.

  e. If you need to pass the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior_compat_options** to **tableof_elem_constraints**.

- Functions contain syntax and functions that use GUC parameters to control features. If GUC parameters are modified in a session, the result may be inconsistent with the expected result. If the parameters are modified, the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

function may retain the behavior before the modification. Therefore, exercise caution when modifying GUC parameters.

- Only the initial user can perform the REPLACE operation on the functions of the initial user.

Syntax

- PG-compatible syntax for creating a user-defined function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
    ( [  { argname [ argmode  ] argtype [  { DEFAULT  | :=  | =  } expression  ]}  [, ...]  ] )
    [ RETURNS rettype [ DETERMINISTIC  ]  | RETURNS TABLE (  { column_name column_type  }
[, ...] )]
    LANGUAGE lang_name
    [
      {IMMUTABLE  | STABLE  | VOLATILE }
       | {SHIPPABLE | NOT SHIPPABLE}
       | WINDOW
       | [ NOT  ] LEAKPROOF
       | {CALLED ON NULL INPUT  | RETURNS NULL ON NULL INPUT | STRICT }
       | {[ EXTERNAL  ] SECURITY INVOKER | [ EXTERNAL  ] SECURITY DEFINER | AUTHID DEFINER  |
AUTHID CURRENT_USER}
       | {fenced | not fenced}
       | {PACKAGE}
       | COST execution_cost
       | ROWS result_rows
       | SET configuration_parameter { {TO | =} value | FROM CURRENT }
     ][...]
    {
       AS 'definition'
       | AS 'obj_file', 'link_symbol'
    };
```

- A-compatible syntax for creating a user-defined function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
    ( [  { argname [ argmode  ] argtype [  { DEFAULT | := | =  } expression  ] }  [, ...]  ] )
    RETURN rettype [ DETERMINISTIC  ]
    [
       {IMMUTABLE  | STABLE  | VOLATILE }
       | {SHIPPABLE | NOT SHIPPABLE}
       | {PACKAGE}
       | {FENCED | NOT FENCED}
       | [ NOT  ] LEAKPROOF
       | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
       | {[ EXTERNAL  ] SECURITY INVOKER  | [ EXTERNAL  ] SECURITY DEFINER | AUTHID DEFINER |
AUTHID CURRENT_USER}
       | COST execution_cost
       | ROWS result_rows
       | SET configuration_parameter { {TO | =} value  | FROM CURRENT }
       | LANGUAGE lang_name
    ][...]
    {
      IS  | AS
    } plsql_body
/
```

Parameters

- **function_name**

  Specifies the name of the function to be created (optionally schema-qualified).

  Value range: a string that complies with the **Identifier Naming Conventions**. The value can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> You are advised not to create a function with the same name as a system function. Otherwise, you need to specify the schema of the function when calling the function.

- **argname**

  Specifies the parameter name of the function.

  Value range: a string that complies with the **Identifier Naming Conventions**. The value can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function parameter name.

- **argmode**

  Specifies the parameter mode of the function.

  Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameters of OUT can be followed by **VARIADIC**. The parameters of OUT and INOUT cannot be used in the function definition of RETURNS TABLE.

  > NOTE
  >
  > **VARIADIC** specifies parameters of the array type.

- **argtype**

  Specifies the data type of a function parameter. **%TYPE** or **%ROWTYPE** can be used to indirectly reference a variable or table type. For details, see **Variable Definition Statements**.

- **expression**

  Specifies the default expression of a parameter.

  > NOTE
  >
  > - If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
  > - It is recommended that you define all default parameters after all non-default parameters.
  > - If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
  > - If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. These inputs can be set to default values. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
  > - When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.

- **rettype**

  Specifies the return data type. Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

  When there is OUT or INOUT parameter, the RETURNS clause can be omitted. If the clause is not omitted, the result type of the clause must be the same as that of the output parameter. If there are multiple output parameters, the result type of the clause is RECORD. Otherwise, the result type of the clause is the same as that of a single output parameter.

  The SETOF modifier indicates that the function will return a set of items, rather than a single item.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In **FUNCTION argtype** and **rettype** outside **PACKAGE**, **%TYPE** cannot reference the type of the *PACKAGE* variable.

- **column_name**

  Specifies the column name.

- **column_type**

  Specifies the column type.

  NOTE

  When the return type of the function is RETURNS TABLE, each column is regarded as an **out** parameter. When the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, you must call functions using SELECT and CALL based on the actual parameters provided by the corresponding column. Otherwise, an error is reported, indicating that the function does not exist.

- **definition**

  Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, an SQL query, or text in a procedural language.

- **DETERMINISTIC**

  Specifies an API compatible with the SQL syntax. You are advised not to use it.

- **LANGUAGE lang_name**

  Specifies the name of the language that is used to implement the function. It can be **SQL**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.

  Due to compatibility issues, no matter which language is specified when an A-style database is created, the language used is plpgsql.

  NOTE

  - When an internal function is defined, if AS specifies the function as an internal system function, the parameter type, number of parameters, and return value type of the new function must be the same as those of the internal system function, and the user who creates the internal function must have the permission to execute the internal system function.
  - Only users with the SYSADMIN permission can create internal functions.

- **WINDOW**

  Indicates that this function is a window function. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

  NOTICE

  For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

- **IMMUTABLE**

  Specifies that the function always returns the same result if the parameter values are the same.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **STABLE**

  Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

  Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE|NOT SHIPPABLE**

  Specifies whether the function can be pushed down for execution. This port is reserved and is not recommended.

  NOTICE

  If the result of a function depends on the scanning of data tables or a function has modified data or performed DDL operations on data tables, do not set the function attribute to **IMMUTABLE** or **SHIPPABLE**. Otherwise, database execution may be abnormal.

- **FENCED|NOT FENCED**

  Specifies whether the function is executed in fenced mode or not fenced mode. This port is reserved and is not recommended.

- **PACKAGE**

  Specifies whether the function can be overloaded. PG-style functions can be overloaded, and this parameter is designed for functions of other styles.

  - All PACKAGE and non-PACKAGE functions cannot be overloaded or replaced.
  - PACKAGE functions do not support parameters of the VARIADIC type.
  - The **PACKAGE** attribute of functions cannot be modified.

- **LEAKPROOF**

  Specifies that the function has no side effects. LEAKPROOF can be set only by system administrators.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the function can be called in normal mode if the parameter values are **NULL**. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

  STRICT

  Specifies that a function always returns **NULL** whenever any of its parameters is **NULL**. If this parameter is specified, the function is not executed when there is a **NULL** parameter. Instead, a **NULL** result is returned automatically.

  RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **EXTERNAL**

  The purpose is to be compatible with SQL statements and it is optional. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

  AUTHID CURRENT_USER

 Copyright © Huawei Cloud Computing Technologies Co., Ltd. 2023

Specifies that the function will be executed with the permissions of the user who calls it. This parameter can be omitted.

SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the function will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **COST execution_cost**

  Estimates the execution cost of a function.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: ≥ 0

- **ROWS result_rows**

  Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

  Value range: ≥ 0. The default value is **1000**.

- **configuration_parameter**
  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string

    - **DEFAULT**
    - **OFF**
    - RESET
    - Specified default value
  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

  When a stored procedure is created, the **PLSQL_BODY** can end with "END;" or "END function_name;".

  NOTE

  The constraints that must be followed when ending with **END function_name;** are the same as **Constraints for stored procedures ending with END procedure_name;**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd. 2024

NOTICE

When you are performing operations in the function body related to password or key, such as creating a user, changing a password, encrypting or decrypting, the system catalog and log record plaintext information about the password or key. To prevent sensitive information leakage, you are advised not to perform operations in the function body related to sensitive information, such as passwords or keys.

Examples

```
-- Define a function as SQL query.
gaussdb=# CREATE FUNCTION func_add_sql(integer, integer) RETURNS integer
    AS 'select $1 + $2;'
    LANGUAGE SQL
    IMMUTABLE
    RETURNS NULL ON NULL INPUT;

-- Add an integer by parameter name using PL/pgSQL.
gaussdb=# CREATE OR REPLACE FUNCTION func_increment_plsql(i integer) RETURNS integer AS $$
        BEGIN
            RETURN i + 1;
        END;
    $$ LANGUAGE plpgsql;

-- Return the RECORD type.
gaussdb=# CREATE OR REPLACE FUNCTION func_increment_sql(i int, out result_1 bigint, out result_2 bigint)
    RETURNS SETOF RECORD
    AS $$
    BEGIN
        result_1 = i + 1;
        result_2 = i * 10;
        RETURN next;
    END;
    $$LANGUAGE plpgsql;

-- Return a record containing multiple output parameters.
gaussdb=# CREATE FUNCTION func_dup_sql(in int, out f1 int, out f2 text)
    AS $$ SELECT $1, CAST($1 AS text) || ' is text' $$
    LANGUAGE SQL;

-- Call the func_dup_sql function.
gaussdb=# SELECT * FROM func_dup_sql(42);
 f1 |     f2
----+------------
 42 | 42 is text
(1 row)

-- Compute the sum of two integers and returning the result (if the input is null, the returned result is null):
gaussdb=# CREATE FUNCTION func_add_sql2(num1 integer, num2 integer) RETURN integer
    AS
    BEGIN
        RETURN num1 + num2;
    END;
    /

Helpful Links

ALTER FUNCTION and **DROP FUNCTION**

7.12.9.24 CREATE GLOBAL INDEX

Description

Creates a global secondary index (GSI) on a specified table.

The GSI allows users to define indexes that are inconsistent with the distribution of base tables. In this way, single-node plans for querying non-distributed columns of base tables and unique/primary key constraints on non-distributed columns of base tables are achieved.

NOTE

The centralized system does not support this function.

7.12.9.25 CREATE GROUP

Description

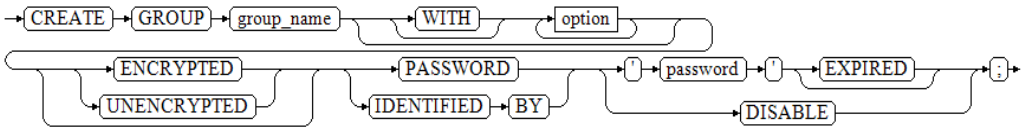
Creates a user group.

Precautions

CREATE GROUP is an alias for CREATE ROLE, and it is not a standard SQL syntax and not recommended. Users can use CREATE ROLE directly.

Syntax

```
CREATE GROUP group_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```



The syntax of the option clause (optional) is as follows:

```
{SYSADMIN | NOSYSADMIN}
   | {MONADMIN | NOMONADMIN}
   | {OPRADMIN | NOOPRADMIN}
   | {POLADMIN | NOPOLADMIN}
   | {AUDITADMIN | NOAUDITADMIN}
   | {CREATEDB | NOCREATEDB}
   | {USEFT | NOUSEFT}
   | {CREATEROLE | NOCREATEROLE}
   | {INHERIT | NOINHERIT}
   | {LOGIN | NOLOGIN}
   | {REPLICATION | NOREPLICATION}
   | {PERSISTENCE | NOPERSISTENCE}
   | CONNECTION LIMIT connlimit
   | VALID BEGIN 'timestamp'
   | VALID UNTIL 'timestamp'
   | RESOURCE POOL 'respool'
   | USER GROUP 'groupuser'
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_group_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid

Parameters

See **Parameters**.

Examples

```
-- Create a user group. The effect is the same as that of CREATE ROLE.
gaussdb=# CREATE GROUP test_group WITH PASSWORD "********";

-- Run CREATE ROLE to create a role. You cannot log in to the database by default.
-- Run ALTER ROLE role_name WITH LOGIN to enable users to log in to the database.
gaussdb=# CREATE ROLE test_role WITH PASSWORD "********";

-- Run CREATE USER to create a user. A schema with the same name is automatically created and the user has the login permission.
gaussdb=# CREATE USER test_user WITH PASSWORD "********";

-- View the user information.
gaussdb=# \du test*
            List of roles
 Role name  |  Attributes  | Member of
------------+--------------+-----------
 test_group | Cannot login | {}
 test_role  | Cannot login | {}
 test_user  |              | {}

-- Query the schema automatically created by running the CREATE USER command.
gaussdb=# \dn test*
    List of schemas
   Name    |   Owner
-----------+-----------
 test_user | test_user
(1 row)

-- Drop.
gaussdb=# DROP ROLE test_role;
gaussdb=# DROP GROUP test_group;
gaussdb=# DROP USER test_user;

7.12.9.26 CREATE INCREMENTAL MATERIALIZED VIEW

Description

CREATE INCREMENTAL MATERIALIZED VIEW creates a fast-refresh materialized view, and you can refresh the data of the materialized view by using REFRESH MATERIALIZED VIEW (complete-refresh) and REFRESH INCREMENTAL MATERIALIZED VIEW (fast-refresh).

CREATE INCREMENTAL MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Incremental materialized views cannot be created on database link tables, temporary tables, or global temporary tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fast-refresh materialized views support only simple filter queries and UNION ALL queries of base tables.
- Fast-refresh materialized views do not support clauses WITH, GROUP BY, ORDER BY, LIMIT, and WINDOW. Operators DISTINCT and AGG are not supported. Subqueries except UNION ALL are not supported.
- After a fast-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on fast-refresh materialized views.
- After a fast-refresh materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.
- Ustore does not support the creation and use of materialized views.

Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name
    [ (column_name [, ...] ) ]
    [ TABLESPACE tablespace_name ]
    AS query;
```

Parameters

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as that of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the **naming convention**.

- **TABLESPACE tablespace_name**

  (Optional) Tablespace to which the new materialized view belongs. If not specified, the default tablespace is used.

- **AS query**

  SELECT or **TABLE** command. This query will be run in a security-constrained operation.

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH (STORAGE_TYPE = ASTORE);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv (col1,col2) TABLESPACE tbs_data1 AS
SELECT * FROM my_table;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1);

-- Query fast-refresh materialized view data.
gaussdb=# SELECT * FROM my_imv;
 col1 | col2
------+------
(0 rows)

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Query fast-refresh materialized view data.
gaussdb=# SELECT * FROM my_imv;
 col1 | col2
------+------
    1 |    1
(1 row)

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete my_table.
gaussdb=# DROP TABLE my_table;

-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_data1;
```

ALTER MATERIALIZED VIEW, **CREATE MATERIALIZED VIEW**, **CREATE TABLE**, **DROP MATERIALIZED VIEW**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

7.12.9.27 CREATE INDEX

Description

Defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried.
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a WHERE clause.
- Columns that appear after ORDER BY, GROUP BY, and DISTINCT

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index). If the GLOBAL or LOCAL keyword is declared during index creation, the index of the corresponding type is created. Otherwise, if the partition name is specified during index creation, the LOCAL index is created. If a unique index contains non-partition keys, a GLOBAL index is created. If a unique index contains all partition keys, a LOCAL index is created. Otherwise, a GLOBAL index is created by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import. Therefore, you are advised to import the data before creating indexes). Therefore, create indexes only when they are necessary.
- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a user-defined function in an index or WHERE clause, mark it as an immutable function.
- Partitioned table indexes are classified into local indexes and global indexes. A local index binds to a specific partition, and a global index corresponds to the entire partitioned table.
- A user with the CREATE ANY INDEX permission can create indexes in both the public and user schemas.
- If a user-defined function is called in an expression index, the expression index function is executed based on the permission of the table owner.
- All users can create expression indexes on their own tables. Non-initial user cannot create expression indexes on the tables of the initial user. The initial user can create expression indexes on all tables. When separation of duties is disabled, a system administrator can create expression indexes on non-initial user tables. When separation of duties is enabled, a system administrator can create expression indexes on tables of common users, but cannot create expression indexes on tables of the initial user and the AUDITADMIN and CREATEROLE roles.
- Data of the XML type cannot be used as ordinary indexes, unique indexes, global indexes, local indexes, or partial indexes.
- Only B-tree and UB-tree indexes can be created online. Only ordinary indexes of non-partitioned tables, as well as global and local indexes of partitioned tables can be created. PCR UB-tree indexes, level-2 partitions, and GSIs are not supported. Only ordinary indexes, global indexes, and local indexes of Astore and Ustore can be created online in parallel.
- Currently, UGINs support only the Ustore and single-column indexes. For details about other scenarios, see **ugin**.
- Creating an index using CREATE INDEX may change the table access mode. As a result, the query execution plan changes.
- If the SQL statement for creating an index is too long (greater than or equal to 5250 characters), a warning is reported. You are advised to shorten the SQL statement for creating an index.

  NOTE

  If the SQL statement for creating an index is too long, it may cause failures during index backup and restoration. The statement for creating an index during backup and restoration is exported by gs_dump. When gs_dump exports the index definition, it adds quotation marks, parentheses, and column types to the function name, condition, and column name. Therefore, the original SQL statement becomes longer. As a result, the pg_index tuple corresponding to the statement cannot be stored on a page, and the index fails to be created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Create an index on a table.

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ IF NOT EXISTS ] [ [schema_name.] index_name ]
ON table_name [ USING method ]
    ({ { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS { FIRST | LAST } ] }[, ...] )
    [ INCLUDE ( column_name [, ...] ) ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ TABLESPACE tablespace_name ]
    { [ COMMENT 'string' ] [ ... ] }
    [ { VISIBLE | INVISIBLE } ]
    [ WHERE predicate ];
```

- Create an index on a partitioned table.

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
    ( { { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS LAST ] } [, ...] )
    [ LOCAL
        [ ( { PARTITION index_partition_name [ FOR { partition_name | ( partition_value [, ...] ) } ]
[ TABLESPACE index_partition_tablespace ]
                [ ( [SUBPARTITION index_subpartition_name] [ FOR { partition_name | ( partition_value
[, ...] ) } ]  [ TABLESPACE index_partition_tablespace ]
                    [, ...] ) ]
            [, ...] } ) ]
        | GLOBAL ]
    [ INCLUDE ( column_name [, ...] ) ]
    [ WITH ( { storage_parameter = value } [, ...] ) ]
    [ TABLESPACE tablespace_name ]
    { [ COMMENT 'string' ] [ ... ] }
    [ { VISIBLE | INVISIBLE } ];
```

Parameters

- **UNIQUE**

  Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

  Currently, only B-tree indexes and UB-tree indexes support unique indexes.

- **CONCURRENTLY**

  Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

  – This option can only specify a name of one index.

  – The CREATE INDEX statement can be run within a transaction, but CREATE INDEX CONCURRENTLY cannot.

  – For temporary tables, you can use CONCURRENTLY to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This keyword is specified when an index is created. The Astore needs to scan the entire table twice to build it. During the first scan, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated. Ustore needs to scan the entire table only once. During the scan, the data generated by concurrent DML operations is inserted into the temporary table **index_oid_cctmp**. After the scan is complete, the data in the temporary table is merged to the primary index and the temporary table is deleted, the index is created. You can use the GUC parameter **delete_cctmp_table** to specify whether to delete temporary tables after indexes are created online. The default value of this parameter is **on**, indicating that temporary tables are deleted by default. If this parameter is set to **off**, temporary tables are retained.
- For Astore, the table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the creation of the index takes a longer time than normal. In addition, the CPU and I/O consumption also affects other services. Although the Ustore only needs to scan the entire table once to create indexes, the preceding consumption also exists.
- Exceptions may occur during online index creation (for example, manual cancellation, duplicate UNIQUE index key values, insufficient resources, thread startup failure, and lock timeout). As a result, online index creation fails. In this case, indexes in the **not valid** state may be retained to avoid occupying system resources. The system automatically clears the failed indexes. Before clearing the failed indexes, wait until the transaction in the table ends. If a long transaction exists, the system may keep waiting. If you cancel the thread, the failed indexes remain. Particularly, if the user cancels the online index creation thread, the process of clearing the failed indexes is started first. If the user cancels the thread again, the process of clearing the failed indexes is ended, and the failed indexes remain. For critical errors, such as FATAL, PANIC, and database faults, you need to manually clear indexes and temporary tables. If both online index creation and automatic residual clearing fail, indexes that are not valid are retained. The residual indexes may be ready or not ready (depending on the phase in which the online index creation fails. For example, the index failed in the first phase is not ready, and the index failed in the third phase is ready). If the residual indexes are ready, the DML statements still maintain the residual indexes. During the maintenance, other errors may occur (for example, the size of the index column exceeds the maximum value or the unique index constraint is violated). To prevent residual indexes from occupying system resources and generating unexpected errors, you need to manually delete them as soon as possible.
- For Astore, after the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to end. In addition, the ShareUpdateExclusiveLock (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
  - If two sessions create an index by using CONCURRENTLY for the same table, a deadlock occurs.
  - If a session creates an index by using CONCURRENTLY for a table and the other session drops a table, a deadlock occurs.
  - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
  - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
- When the I/O and CPU resources are not limited, the service performance deterioration caused by online index creation can be controlled within 10%.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

However, in special scenarios, the service performance deterioration may exceed 10%. This is because online index creation is a long transaction that consumes a large number of I/O and CPU resources. It consumes more resources than offline index creation. The longer the online index creation transaction lasts, the greater the impact on service performance. The time for creating indexes online is positively correlated with the data volume of base tables and the data volume generated by concurrent DML statements. When the I/O and CPU resources are not limited, the time for creating indexes online is about two to six times that for creating indexes offline. However, when the number of concurrent transactions is large (> 10000 TPS) or resource contention occurs, the time may be even longer. If a long transaction exists during online index creation, the long transaction running time must be added. In Astore and Ustore modes, you can create indexes in parallel to shorten the index creation time. The performance of online parallel index creation increases to a certain value and becomes stable as the number of parallel worker threads increases. Compared with the performance of creating indexes in serial mode, the performance of creating indexes in parallel online is improved by about 30%. You are advised to create indexes online during off-peak hours to avoid great impact on services. In addition, do not execute long transactions during online index creation. Although online index creation provides the capability of uninterrupted services to some extent, it still needs to be implemented with caution.

- When a UNIQUE index is created online (by using CREATE UNIQUE INDEX CONCURRENTLY), the table is scanned to check whether the data in the table is unique. If the data in the table is not unique, an error is reported and the online index creation exits. During online index creation, whether data in the table is unique may change. Whether the creation fails depends on whether duplicate data is scanned. Consider the following situations: 1. Tuple A and tuple B are inserted during table scan, and their index columns are the same. If both tuple A and tuple B are scanned during online index scan, a uniqueness violation may be reported. However, if tuple B is deleted later, in this case, an error may be reported during online index creation, indicating that the uniqueness is violated. However, after the online index creation fails and exits, the data in the table is found to be unique. 2. During online index creation, if tuple A is inserted, deleted, and then inserted, and SnapshotNow is used to scan the table, tuple A may be scanned twice, which may violate the uniqueness constraint. During online index creation, Astore uses SnapshotMVCC to scan tables, and Ustore uses SnapshotNow to scan tables.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating an index. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name.

- **index_name**

  Specifies the name of the index to be created. The schema of the index is the same as that of the table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **table_name**

  Specifies the name of the table to be indexed (optionally schema-qualified).

  Value range: an existing table name.

- **USING method**

  Specifies the name of the index method to be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree is applicable to comparison query and range query.
- **ubtree**: Multi-version B-tree index used only for Ustore tables. The index page contains transaction information and can be recycled. By default, the INSERTPT function is enabled for UB-tree indexes.
- **ugin**: UGINs are generalized inverted indexes used only for Ustore tables.

Row-store tables (Astore) support the index type: **btree** (default). Row-store tables (Ustore) support the following index type: **ubtree** and **ugin**.

NOTICE

B-tree and UB-tree are closely related to the table storage type Astore or Ustore. When an index is created, if the specified index type does not correspond to the main table, the index type is automatically converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

UGIN:

- Supports only one **opclass**: **ugin_trgm_ops**.
  - **ugin_trgm_ops** is not the default **opclass**.
  - **ugin_trgm_ops** supports index keys of the text, varchar, nvarchar2, and clob data types and alias data types of the four types, but does not support the char(n) type.
    - Specifies that the maximum length of the index column data of **ugin_trgm_ops** is 238609291 bytes.
  - Specifies the index key of **ugin_trgm_ops**, whose collation cannot be B-compatible collation. Otherwise, an error is reported when an index is created. For details about B-compatible collations, see **COLLATE collation**.
  - Specifies the index key of **ugin_trgm_ops**. Index scan can be performed only when the LIKE condition is met.
    - When extracting index keys, **ugin_trgm_ops** considers every three characters as a token. If the token extracted by the index scan condition is fewer than three characters, the specific index key cannot be located during index scan, and all index keys are scanned, such as **col LIKE '%ab%'**.
- The number of index keys cannot exceed 1. Index keys do not support the NULLS FIRST/LAST or INCLUDE syntax.
- Only Bitmap Index Scan can be used to execute planned scans. Index Scan is not supported.
  - When standby nodes are queried in ultimate RTO mode, UGINs are not selected for scanning.
  - If the GUC parameter **gin_fuzzy_search_limit** is set to a non-zero value, an error is reported during UGIN scan.
- Supports the following WITH options: **storage_type**, **gin_pending_list_limit**, and **fastupdate**.
  - Currently, the incremental buffer (pending list area) cannot be disabled. Therefore, **fastupdate** can only be set to **ON**. If **fastupdate** is set to **OFF**, an error is reported.
- Cannot be used as the index of a segment-page table, local temporary table, global temporary table, unlogged table, or encrypted table, and as the global index of a partitioned table.
- Cannot be used as a primary key, unique key, virtual index, or be encrypted.
- Cannot be reconstructed, created, and deleted online (CONCURRENTLY).
- Does not support parallel functions, such as parallel creation and parallel scanning.
- Cannot be created or used in the database where **sql_compatibility** is set to **'M'**.

- **column_name**

  Specifies the name of the column on which an index is to be created.

  Multiple columns can be specified if the index method supports multi-column indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.

- **column_name (length)**

  Creates a prefix key index based on a column in the table. **column_name** indicates the column name of the prefix key, and **length** indicates the prefix length.

  The prefix key uses the prefix of the specified column data as the index key value, which reduces the storage space occupied by the index. Indexes can be used for partial filter and join conditions that contain prefix key columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The prefix key supports the following index methods: btree and ubtree.
- The data type of the prefix key column must be binary or character (excluding special characters).
- The prefix length must be a positive integer that does not exceed 2676 and cannot exceed the maximum length of the column. For the binary type, the prefix length is measured in bytes. For non-binary character types, the prefix length is measured in characters. The actual length of the key value is restricted by the internal page. If a column contains multi-byte characters or an index has multiple keys, the length of the index line may exceed the upper limit. As a result, an error is reported. Consider this situation when setting a long prefix length.
- In the CREATE INDEX syntax, the following keywords cannot be used as prefix keys for column names: COALESCE, EXTRACT, GREATEST, LEAST, LNNVL, NULLIF, NVL, NVL2, OVERLAY, POSITION, REGEXP_LIKE, SUBSTRING, TIMESTAMPDIFF, TREAT, TRIM, XMLCONCAT, XMLELEMENT, XMLEXISTS, XMLFOREST, XMLPARSE, XMLPI, XMLROOT and XMLSERIALIZE.
- The prefix key is a special expression key. Some constraints and restrictions that are not described are the same as those of the expression key. For details, see the description of the expression index.

- **expression**

  Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.

  Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on upper(col) would allow the clause WHERE upper(col) = 'JIM' to use an index.

  If an expression contains IS NULL, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **opclass**

  Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use int4_ops; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator classes for the data type and then selecting the proper class when making an index. In addition, if the value of **COLLATE** of an index of the string type (such as varchar, varchar2, and text) is not **C** or **POSIX**, but you want the index to support prefix matching, you need to specify the **varchar_pattern_ops** option.

- **ASC**

  Specifies an ascending (default) sort order.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **DESC**

  Specifies a descending sort order.

- **NULLS FIRST**

  Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.

- **NULLS LAST**

  Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **LOCAL**

  Specifies that the partitioned index to be created is a local index.

- **GLOBAL**

  Specifies the partitioned index to be created as a global index. If no keyword is specified, a global index is created by default.

- **INCLUDE (column_name [, ...]**)

  The optional **INCLUDE** clause specifies that some non-key columns are included in indexes. Non-key columns cannot be used as search criteria for accelerating index scans, and they are omitted when the UNIQUE constraints of the indexes are checked.

  An index-only scan can directly return content in the non-key columns without accessing the heap table corresponding to the indexes.

  Exercise caution when adding non-key columns as **INCLUDE** columns, especially for wide columns. If the size of an index tuple exceeds the maximum size allowed by the index type, data insertion fails. Note that in any case, adding non-key columns to an index increases the space occupied by the index, which may slow down the search speed.

  Currently, only UB-tree indexes access mode supports this feature. Non-key columns are stored in the index leaf tuple corresponding to the heap tuple and are not included in the tuple on the upper-layer index page.

- **PARTITION clause**

  The syntax for specifying level-1 partition information is as follows:

  ```
  PARTITION index_partition_name [ FOR { partition_name | ( partition_value [, ...] ) } ] [ TABLESPACE index_partition_tablespace ]
  ```

  The syntax for specifying level-2 partition information is as follows:

  ```
  SUBPARTITION index_subpartition_name [ FOR { partition_name | ( partition_value [, ...] ) } ]
  [ TABLESPACE index_partition_tablespace ]
  ```

  If **for partition_name** or **partition_value** is specified in the PARTITION clause, the created partitioned index has the sparsely partitioned index attribute. If **for partition_name** or **partition_value** is not specified, the number of PARTITION clauses must be the same as the number of partitions in the target table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- A sparsely partitioned index is a type of local index for partitioned table. It is created only on a single partition, whereas an ordinary local index needs to be created on every partition of the table.
- The sparsely partitioned index can be created only on a single partition.
- The sparsely partitioned index supports only B-tree and UB-tree indexes.
- The sparsely partitioned index does not support the UNIQUE attribute.
- The created sparsely partitioned index contains the **sparsely_partitioned=true** option. Note that the CREATE TABLE or ALTER TABLE statement cannot be used to explicitly specify a non-sparsely partitioned index as a sparsely partitioned index in this option. If the created index is a sparsely partitioned index, **sparsely_partitioned=false** will be ignored.
- If a version earlier than 505.0.0 is upgraded to 505.0.0 or later, sparsely partitioned indexes cannot be created during upgrade observation.
- If the specified partition does not exist during the sparsely partitioned index creation for partition_value and the partitioned table supports automatic partitioning, a new partition is created and the sparsely partitioned index is created in the new partition. The autonomous transaction solution is used to create a partition. After the primary transaction is rolled back due to an exception, the new partition may still exist.

  - **PARTITION index_partition_name**

    Specifies the name of an index partition.

    Value range: a string that complies with the **Identifier Naming Conventions**.

  - **SUBPARTITION index_subpartition_name**

    Specifies the name of a level-2 index partition.

    Value range: a string that complies with the **Identifier Naming Conventions**.

  - **FOR partition_name**

    Specifies the name of the target partition. If the specified partition does not exist, an error is reported.

  - **FOR (partition_value [, ...])**

    Specifies the value of the specified partition key. The level-1 partition key values are placed in the partition key value FOR list of the level-1 partition, and the level-2 partition key values are placed in the partition key value FOR list of the level-2 partition. If there are multiple columns of partition keys, specify multiple **partition_value** values.

  - **TABLESPACE index_partition_tablespace**

    Specifies the tablespace of an index partition.

    Value range: If this parameter is not specified, the value of **index_tablespace** is used.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies the storage parameter used for an index.

  Value range:

  Indexes except for psort support the **FILLFACTOR** parameter. Only UB-tree indexes support **INDEXSPLIT**. Only non-partitioned B-tree indexes support the **DEDUPLICATION** parameter. Only UB-tree indexes support the **INDEX_TXNTYPE** parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **STORAGE_TYPE**

  Storage engine type of the table where the index is located. If **storage_type** specified by the index conflicts with the index type, the storage engine type is automatically changed to the correct one. Only B-tree and UB-tree are supported. This parameter can be specified only once.

  Value range: **USTORE** (The table where the index is located uses the in-place update storage engine.) and **ASTORE** (The table where the index is located uses the append-only storage engine.)

  Default value: **USTORE** for Ustore tables and **ASTORE** for Astore tables.

- **FILLFACTOR**

  The fill factor of an index is a percentage from 10 to 100. In the scenario where a large number of concurrent insertions are performed and the key value range is dense, the contention of the same index page is high during the insertion. Therefore, a smaller fill factor is more appropriate.

  Value range: 10–100.

- FASTUPDATE

  Specifies whether to enable fast update for the UGIN. Currently, the incremental buffer (pending list area) cannot be disabled. Therefore, **fastupdate** can only be set to **ON**. If **fastupdate** is set to **OFF**, an error is reported.

  Value range: **ON**: The index is fast updated.

  Default value: **ON**

- **GIN_PENDING_LIST_LIMIT**

  Sets the maximum pending list capacity of the UGIN.

  Value range: 64–2147483647. The unit is KB.

  Default value: The default value of **gin_pending_list_limit** depends on the GUC parameter **gin_pending_list_limit** whose default value is **4**, in MB.

- **INDEXSPLIT**

  Specifies the splitting policy of UB-tree indexes. The **DEFAULT** policy is the same as the splitting policy of B-tree indexes. The **INSERTPT** policy can significantly reduce the index space usage in some scenarios.

  Value range: **INSERTPT** and **DEFAULT**

  Default value: **INSERTPT**

- **INDEX_TXNTYPE**

  Specifies the UB-tree index type (only UB-tree indexes support **INDEX_TXNTYPE**). When the value is **PCR**, flashback queries can be performed using UB-tree. PCR UB-tree indexes do not support online index creation, GSIs, ultimate RTO replay, and read on standby. If **INDEX_TXNTYPE** is not specified, the GUC parameter **index_txntype** specifies the type of the index to be created. **INDEX_TXNTYPE** cannot be modified by using ALTER INDEX INDEX_NAME SET (INDEX_TXNTYPE=PCR or RCR).

  Type: character string (case-insensitive)

  Value range: **RCR** and **PCR**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **RCR**

For example:

```
CREATE UNIQUE INDEX t2_b_pkey ON t(b) WITH(index_txntype='pcr');
```

- **ACTIVE_PAGES**

  Specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter.

- **DEDUPLICATION**

  Specifies whether to deduplicate and compress tuples with duplicate key values. This is an index parameter. When there are a large number of indexes with duplicate key values, enabling this parameter can effectively reduce the space occupied by indexes. This parameter does not take effect for primary key indexes and unique indexes. If non-unique indexes are used and the index key value duplication rate is low or the index key values are unique, enabling this parameter will slightly deteriorate the index insertion performance. Currently, local and global indexes of partitioned tables are not supported.

  Value range: Boolean value. The default value is the value of the **enable_default_index_deduplication** GUC parameter (the default value is **off**).

- **stat_state**

  Determines whether index statistics are locked. If locked, the index statistics cannot be updated.

  Value range: **locked** and **unlock**.

  Default value: **unlock**.

- **LPI_PARALLEL_METHOD**

  Index parameter, which is used to set the parallel creation mode of local indexes for partitioned tables.

  Type: string

  Value range: **PAGE**, **PARTITION**, and **AUTO PAGE** creates indexes for pages in parallel. Multiple worker threads are started to scan and sort data. Each worker thread processes a data page at a time. After scanning and sorting, the main thread combines the sorting results in serial mode and inserts tuples into the indexes. **PARTITION** creates indexes at the partition level in parallel and starts multiple worker threads. Each worker thread scans, sorts, and inserts indexes into a partition. **AUTO** estimates the cost of parallel index creation at the page level and partition level based on the partitioned table statistics, and selects the parallel index creation mode with a lower cost. (The statistics may be different from the actual data, resulting in inaccurate calculation results.)

  Default value: **PAGE**

  Setting suggestion: Set this parameter to **PARTITION** if the partitioned table data is evenly distributed in each partition. This parameter supports only the B-tree local index of Astore partitioned tables. It does not support the global index of partitioned tables, non-partitioned table indexes, segment-page table indexes, or online index creation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For example:

```
CREATE INDEX idx ON tbl(col) WITH (lpi_parallel_method = 'partition');
```

- **TABLESPACE tablespace_name**

  Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

  Value range: an existing tablespace name.

- **WHERE predicate**

  Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, the WHERE clause with a UNIQUE constraint can be used to enforce uniqueness over a subset of a table.

  Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in WHERE. You are advised not to use numeric types such as int for predicate, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

  For a partitioned table index, if the created index contains the GLOBAL keyword or the created index is a GLOBAL index, the WHERE clause cannot be used to create an index.

- **COMMENT 'string'**

  COMMENT 'string' is used to add comments to an index.

  NOTICE

  - This clause is valid only when **sql_compatibility** is set to **'B'**.
  - An index-level comment can contain a maximum of 1024 characters.

- **VISIBLE**

  Sets the index to be visible. This is the default option.

  NOTE

  - VISIBLE can be set only in an A-compatible database (that is, **sql_compatibility** set to **'A'**).
  - When **disable_keyword_options** is set to **"visible"**, this keyword cannot be used.
  - This keyword is not supported in the upgrade uncommitted phase.

- **INVISIBLE**

  Sets the index to be invisible.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- INVISIBLE can be set only in an A-compatible database (that is, **sql_compatibility** set to **'A'**).
- When **disable_keyword_options** is set to **"invisible"**, this keyword cannot be used.
- This keyword is not supported in the upgrade uncommitted phase.

Examples

- **Ordinary index**

```
-- Create the tbl_test1 table.
gaussdb=# CREATE TABLE tbl_test1(
    id int,           -- User ID
    name varchar(50), -- Username
    postcode char(6)  -- Postal code
);

-- Create the tbs_index1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_index1 RELATIVE LOCATION 'test_tablespace/tbs_index1';

-- Create the idx_test1 index for the tbl_test1 table and specify a tablespace.
gaussdb=# CREATE INDEX idx_test1 ON tbl_test1(name) TABLESPACE tbs_index1;

-- Query information about the idx_test1 index.
gaussdb=# SELECT indexname,tablename,tablespace FROM pg_indexes WHERE indexname =
'idx_test1';
 indexname | tablename | tablespace
-----------+-----------+------------
 idx_test1 | tbl_test1 | tbs_index1
(1 row)

-- Drop the index.
gaussdb=# DROP INDEX idx_test1;

-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_index1;
```

- **Unique index**

```
-- Create the unique index idx_test2 for the tbl_test1 table.
gaussdb=# CREATE UNIQUE INDEX idx_test2 ON tbl_test1(id);

-- Query index information.
gaussdb=# \d tbl_test1
          Table "public.tbl_test1"
  Column  |         Type          | Modifiers
----------+-----------------------+-----------
 id       | integer               |
 name     | character varying(50) |
 postcode | character(6)          |
Indexes:
    "idx_test2" UNIQUE, btree (id) TABLESPACE pg_default

-- Drop the index.
gaussdb=# DROP INDEX idx_test2;
```

- **Expression index**

```
-- Create an expression index for the tbl_test1 table.
gaussdb=# CREATE INDEX idx_test3 ON tbl_test1(substr(postcode,2));

-- Query index information.
gaussdb=# \d tbl_test1
          Table "public.tbl_test1"
  Column  |         Type          | Modifiers
----------+-----------------------+-----------
 id       | integer               |
 name     | character varying(50) |
 postcode | character(7)          |
Indexes:
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    "idx_test3" btree (substr(postcode::text, 2)) TABLESPACE pg_default

-- Drop the index.
gaussdb=# DROP INDEX idx_test3;
```

- **Partial index**

```
-- Create an index for data whose ID is not empty in the tbl_test1 table.
gaussdb=# CREATE INDEX idx_test4 ON tbl_test1(id) WHERE id IS NOT NULL;

-- Drop the index.
gaussdb=# DROP INDEX idx_test4;

-- Drop the table.
gaussdb=# DROP TABLE tbl_test1;
```

- **Partitioned index**

```
-- Create a table.
gaussdb=# CREATE TABLE student(id int, name varchar(20)) PARTITION BY RANGE (id) (
    PARTITION p1 VALUES LESS THAN (200),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);

-- Create a local partitioned index without specifying the index partition name.
gaussdb=# CREATE INDEX idx_student1 ON student(id) LOCAL;

-- Check the index partition information. It is found that the number of local index partitions is the
same as the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student1'::regclass;
   relname
-------------
 p1_id_idx
 pmax_id_idx
(2 rows)

-- Drop the local partitioned index.
gaussdb=# DROP INDEX idx_student1;

-- Create a global index.
gaussdb=# CREATE INDEX idx_student2 ON student(name) GLOBAL;

-- Check the index partition information. It is found that the number of global index partitions is
different from the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student2'::regclass;
 relname
---------
(0 rows)

-- Drop the global partitioned index.
gaussdb=# DROP INDEX idx_student2;

-- Create a local expression index without specifying the index partition name.
gaussdb=# CREATE INDEX idx_student3 ON student(lower(name)) LOCAL;

-- Check the index partition information. It is found that the number of local index partitions is the
same as the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student3'::regclass;
   relname
-------------
 p1_id_idx
 pmax_id_idx
(2 rows)

-- Drop the expression index of the LOCAL partition.
gaussdb=# DROP INDEX idx_student3;

-- Create a global expression index.
gaussdb=# CREATE INDEX idx_student4 ON student(lower(name)) GLOBAL;

-- Check the index partition information. It is found that the number of global expression index
partitions is different from the number of table partitions.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student4'::regclass;
 relname
---------
(0 rows)

-- Drop the expression index of the global partition.
gaussdb=# DROP INDEX idx_student4;

-- Drop the table.
gaussdb=# DROP TABLE student;
```

- **UGIN**

```
-- Create a table.
gaussdb=# CREATE TABLE test_trgm(t varchar(100)) WITH (STORAGE_TYPE=USTORE);

-- Insert data.
gaussdb=#
INSERT INTO test_trgm VALUES('qwertyu0001');
INSERT INTO test_trgm VALUES('qwertyu0099');
INSERT INTO test_trgm VALUES ('2024 Happy New Year 7 days');

-- Create a UGIN.
gaussdb=# create index trgm_idx on test_trgm using ugin (t ugin_trgm_ops);

-- Query using the Like statement.
gaussdb=# select * from test_trgm where t like '%24 Happy%';
```

Helpful Links

ALTER INDEX and **DROP INDEX**

Suggestions

- create index

  Constraints:

  - An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.
  - The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree or UB-tree cannot exceed one-third of the page size.
  - When a GLOBAL index is created on a partitioned table, the following constraints apply:
    - Expression indexes and partial indexes are not supported.
    - Only B-tree indexes are supported.
  - In the same attribute column, the local index and global index of a partition cannot coexist.
  - If the ALTER statement does not contain UPDATE GLOBAL INDEX, the original global index is invalid. In this case, other indexes are used for query. If the ALTER statement contains UPDATE GLOBAL INDEX, the original global index is still valid and the index function is correct.

7.12.9.28 CREATE LANGUAGE

Function

Defines a new procedural language.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

In the current version, you cannot create procedural language features, so this syntax cannot be used.

7.12.9.29 CREATE MASKING POLICY

Description

Creates a masking policy.

Precautions

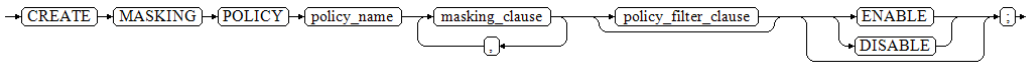
- Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.
- The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**.

CAUTION

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see **DATABASE LINK**.

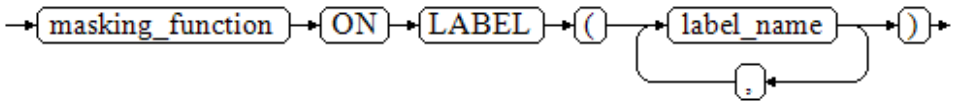
Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...] [ policy_filter_clause ] [ENABLE | DISABLE];
```



- masking_clause

  ```
  masking_function ON LABEL(label_name[, ...])
  ```

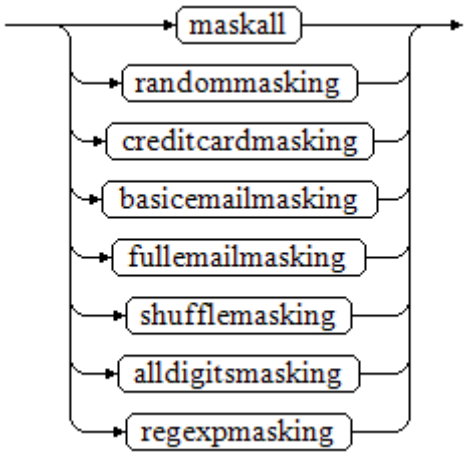
- masking_function

  maskall is not a preset function and cannot be displayed by running **\df**.

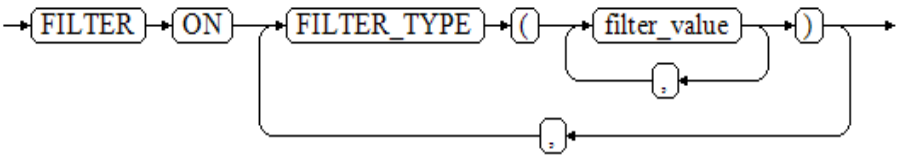
  The masking methods during presetting are as follows:

  ```
  { maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |
  shufflemasking | alldigitsmasking | regexpmasking }
  ```

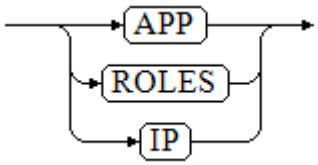
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



- policy_filter_clause:
  FILTER ON { FILTER_TYPE (filter_value [, ...]) } [, ...]



- FILTER_TYPE:
  { APP | ROLES | IP }



Parameters

- **policy_name**

  Specifies the masking policy name, which must be unique.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the masking policy name. If a masking policy name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a masking policy name that contains uppercase letters, enclose the masking policy name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **label_name**

  Specifies the resource label name.

- **masking_clause**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the masking function to be used to anonymize database resources labeled by **label_name**. **schema.function** can be used to specify the masking function.

- **policy_filter**

  Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.

- **filter_value**

  Indicates the detailed information to be filtered, such as the IP address, app name, and username.

- **ENABLE|DISABLE**

  Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

- Create a masking policy using maskall. (All values of the character string type are masked as **x**, and other types are displayed as the default values of this type.)

```
-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text,
col6 text, col7 text,col8 text);

-- Insert data into the tb_for_masking table.
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',
'abc@huawei.com', '1234-4567-7890-0123', 'abcdef 123456 ui 323 jsfd321 j3k2l3',
'4880-9898-4545-2525', 'this is a llt case');

-- View data.
gaussdb=# SELECT * FROM tb_for_masking;
 idx |    col1    |   col2    |      col3      |      col4      |       col5         |               col6
     |       col7         |       col8
-----+------------+-----------+----------------+----------------+--------------------
+------------------------------
------+---------------------+---------------------
   1 | 9876543210 | usr321usr | abc@huawei.com | abc@huawei.com | 1234-4567-7890-0123 | abcdef
123456 ui 323 jsfd321 j
3k2l3 | 4880-9898-4545-2525 | this is a llt case
(1 row)

-- Create a resource label for sensitive column col1.
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a data masking policy named maskpol1.
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);

-- Access the tb_for_masking table. The masking policy is triggered for the col1 column.
gaussdb=# SELECT col1 FROM tb_for_masking;
    col1
------------
 xxxxxxxxxx
(1 row)
```

- Create a data masking policy that uses random masking to mask values of the character string type to random numbers. The masked values are different each time.

```
-- Create a resource label for sensitive column col2.
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);
```

gaussdb=# SELECT col3 FROM tb_for_masking;
     col3
----------------
 xxx@huawei.com
(1 row)
```

- Create a data masking policy that uses fullemailmasking to retain only the at sign (@) and **.com** in the email address format of the character string type, and set other parameters to **x**.

```
-- Create a resource label for sensitive column col4.
gaussdb=# CREATE RESOURCE LABEL mask_lb4 ADD COLUMN(tb_for_masking.col4);

-- Create a data masking policy named maskpol4.
gaussdb=# CREATE MASKING POLICY maskpol4 fullemailmasking ON LABEL(mask_lb4);

-- Access the tb_for_masking table. The masking policy is triggered for the col4 column.
gaussdb=# SELECT col4 FROM tb_for_masking;
    col4
----------------
 xxx@xxxxxx.com
(1 row)
```

- Create a masking policy that uses creditcardmasking to retain the hyphen (-) and the last four digits for values of the string type, and set the rest to **x**.

```
-- Create a resource label for sensitive column col5.
gaussdb=# CREATE RESOURCE LABEL mask_lb5 ADD COLUMN(tb_for_masking.col5);

-- Create a data masking policy named maskpol5.
gaussdb=# CREATE MASKING POLICY maskpol5 creditcardmasking ON LABEL(mask_lb5);

-- Access the tb_for_masking table. The masking policy is triggered for the col5 column.
gaussdb=# SELECT col5 FROM tb_for_masking;
       col5
---------------------
 xxxx-xxxx-xxxx-0123
(1 row)
```

- Create a data masking policy that uses shuffle masking to shuffle the positions of characters in the value of the character string type.

```
-- Create a resource label for sensitive column col6.
gaussdb=# CREATE RESOURCE LABEL mask_lb6 ADD COLUMN(tb_for_masking.col6);

-- Create a data masking policy named maskpol6.
gaussdb=#  CREATE MASKING POLICY maskpol6 shufflemasking ON LABEL(mask_lb6);

-- Access the tb_for_masking table. The masking policy is triggered for the col6 column.
gaussdb=# SELECT col6 FROM tb_for_masking;
              col6
```

ALTER MASKING POLICY and **DROP MASKING POLICY**

7.12.9.30 CREATE MATERIALIZED VIEW

CREATE MATERIALIZED VIEW creates a complete-refresh materialized view, and you can use REFRESH MATERIALIZED VIEW (full refresh) to refresh the data in the materialized view.

CREATE MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Complete-refresh materialized views cannot be created in temporary tables or global temporary tables.
- Complete-refresh materialized views do not support node groups.
- After a complete-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on complete-refresh materialized views.
- After a complete-refresh materialized view is created, if the base table data changes, you need to run the **REFRESH** command to synchronize the materialized view with the base table.
- The Ustore does not support the creation and use of materialized views.
- The segment-page does not support the creation and use of materialized views.

Syntax

```
CREATE MATERIALIZED VIEW mv_name
   [ (column_name [, ...] ) ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ TABLESPACE tablespace_name ]
   AS query
   [ WITH DATA ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies a column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as that of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the **naming convention**.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. For details, see **CREATE TABLE**.

- **TABLESPACE tablespace_name**

  Tablespace to which the new materialized view belongs. If not specified, the default tablespace is used.

- **AS query**

  Specifies the **SELECT**, **TABLE**, or **VALUES** command. This query will be run in a security-constrained operation.

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Query the complete-refresh materialized view.
gaussdb=# SELECT * FROM my_mv;
 c1 | c2
----+----
(0 rows)
-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Query the complete-refresh materialized view.
gaussdb=# SELECT * FROM my_mv;
 c1 | c2
----+----
  1 |  1
  2 |  2
(2 rows)
-- Delete the complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_data1;
```

ALTER MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **CREATE TABLE**, **DROP MATERIALIZED VIEW**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

7.12.9.31 CREATE MODEL

Description

CREATE MODEL trains a machine learning model and saves the model.

Precautions

- The model name must be unique. Pay attention to the naming format.
- The AI training duration fluctuates greatly, and in some cases, the training duration is long. If the duration specified by the GUC parameter **statement_timeout** is too long, the training will be interrupted. You are advised to set **statement_timeout** to **0** so that the statement execution duration is not limited.

Syntax

```
CREATE  MODEL model_name USING architecture_name
FEATURES { {attribute_list} }
[TARGET attribute_name],
FROM ([schema.]table_name | subquery)
[WITH ([hyper_parameter_name = {hp_value | DEFAULT},]...)];
```

Parameters

- **model_name**

  Name of the training model, which must be unique.

  Value range: a string. It must comply with the **naming convention**.

- **architecture_name**

  Algorithm type of the training model.

  Value range: a string. Currently, the value can be **logistic_regression**, **linear_regression**, **svm_classification**, or **kmeans**.

- **attribute_list**

  Enumerated input column name of the training model.

  Value range: a string. It must comply with the naming convention of data attributes.

- **attribute_name**

  Target column name of the training model in a supervised learning task (simple expression processing can be performed).

  Value range: a string. It must comply with the naming convention of data attributes.

- **subquery**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data source.

Value range: a string. It must comply with the SQL syntax of databases.

- **hyper_parameter_name**

  Hyperparameter name of the machine learning model.

  Value range: a string. The value range varies depending on the algorithm. For details, see "Hyperparameters supported by operators" in section "DB4AI: Database-driven AI > Native DB4AI Engine" in *Feature Guide*.

- **hp_value**

  Hyperparameter value.

  Value range: a string. The value range varies depending on the algorithm. For details, see "Default values and value ranges of hyperparameters" in section "DB4AI: Database-driven AI > Native DB4AI Engine" in *Feature Guide*.

Examples

```
-- Create a data table.
gaussdb=# CREATE TABLE houses (
id INTEGER,
tax INTEGER,
bedroom INTEGER,
bath DOUBLE PRECISION,
price INTEGER,
size INTEGER,
lot INTEGER,
mark text
);

-- Insert training data.
gaussdb=# INSERT INTO houses(id, tax, bedroom, bath, price, size, lot, mark) VALUES
(1,590,2,1,50000,770,22100,'a+'),
(2,1050,3,2,85000,1410,12000,'a+'),
(3,20,2,1,22500,1060,3500,'a-'),
(4,870,2,2,90000,1300,17500,'a+'),
(5,1320,3,2,133000,1500,30000,'a+'),
(6,1350,2,1,90500,850,25700,'a-'),
(7,2790,3,2.5,260000,2130,25000,'a+'),
(8,680,2,1,142500,1170,22000,'a-'),
(9,1840,3,2,160000,1500,19000,'a+'),
(10,3680,4,2,240000,2790,20000,'a-'),
(11,1660,3,1,87000,1030,17500,'a+'),
(12,1620,3,2,118500,1250,20000,'a-'),
(13,3100,3,2,140000,1760,38000,'a+'),
(14,2090,2,3,148000,1550,14000,'a-'),
(15,650,3,1.5,65000,1450,12000,'a-');

-- Train the model.
gaussdb=# CREATE MODEL price_model USING logistic_regression
 FEATURES size, lot
 TARGET mark
 FROM HOUSES
 WITH learning_rate=0.88, max_iterations=default;

-- Delete the model.
gaussdb=# DROP MODEL price_model;

-- Delete the table.
gaussdb=# DROP TABLE houses;
```

7.12.9.32 CREATE OPERATOR

Description

Defines a new operator.

Precautions

CREATE OPERATOR defines a new name operator. The user who defines the operator becomes the owner of the operator. If a schema name is given, the operator is created in the specified schema. Otherwise, it will be created in the current schema.

The operator name is a character string consisting of the following characters:

+ - * / < > = ~ ! @ # % ^ & | ` ?

When selecting a name, note the following restrictions:

- -- and /* cannot appear anywhere in the operator name, because they are regarded as the beginning of a comment.
- A multi-character operator cannot end with + or - unless the name contains at least one of the following characters:

  ~ ! @ # % ^ & | ` ?
- => The operator name is no longer used.

Operator! = is mapped to <> when being entered. Therefore, the two names are always equivalent.

At least one LEFTARG and one RIGHTARG must be defined. For binocular operators, both need to be defined. For the right operator, only LEFTARG needs to be defined. For the left operator, only RIGHTARG needs to be defined.

Also, the function_name procedure must have been defined with CREATE FUNCTION, and must be defined to accept the correct number of specified type parameters (one or two).

Other clauses declare optional operator optimization clauses.

To create an operator, you must have the USAGE permission on the parameter type and return type, and the EXECUTE permission on the underlying function. If exchange or negative operators are specified, you must have them.

Syntax

```
CREATE OPERATOR name (
    PROCEDURE = function_name
    [, LEFTARG = left_type ] [, RIGHTARG = right_type ]
    [, COMMUTATOR = com_op ] [, NEGATOR = neg_op ]
    [, RESTRICT = res_proc ] [, JOIN = join_proc ]
    [, HASHES ] [, MERGES ]
);
```

Parameters

- **name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Operator to be defined. The available characters are listed above. The name can be schema-qualified, for example, CREATE OPERATOR myschema.+ (...). If there is no schema, the operator is created in the current schema. Two operators in the same schema can have the same name as long as they perform operations on different data types. This is an overloading process.

- **function_name**

  Function used to implement the operator.

- **left_type**

  Parameter data type on the left of the operator, if any. This parameter can be omitted if the left operator is used.

- **right_type**

  Parameter data type on the right of the operator, if any. This parameter can be omitted if the right-view operator is used.

- **com_op**

  Exchange operator corresponding to the operator.

- **neg_op**

  Negative operator corresponding to the operator.

- **res_proc**

  This operator constrains the selectivity evaluation function.

- **join_proc**

  This operator joins the selectivity evaluation function.

- **HASHES**

  Indicates that the operator supports hash joins.

- **MERGES**

  Indicates that this operator supports a merge join.

  Use the OPERATOR() syntax to provide a schema-qualified operator name in com_op or other optional parameters. For example:

  ```
  COMMUTATOR = OPERATOR(myschema.===) ,
  ```

Examples

The following command defines a new operator: equal area for the box data type.

```
CREATE OPERATOR === (
   LEFTARG = box,
   RIGHTARG = box,
   PROCEDURE = area_equal_procedure,
   COMMUTATOR = ===,
   NEGATOR = !==,
   RESTRICT = area_restriction_procedure,
   JOIN = area_join_procedure,
   HASHES, MERGES
);
SELECT box1 === box2;
```

Define operators in other schemas.

```
CREATE OPERATOR pg_temp.=== (
   LEFTARG = box,
   RIGHTARG = box,
   PROCEDURE = area_equal_procedure,
   COMMUTATOR = ===,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    NEGATOR = !==,
    RESTRICT = area_restriction_procedure,
    JOIN = area_join_procedure,
    HASHES, MERGES
);
SELECT box1 OPERATOR(pg_temp.===) box2;
```

ALTER OPERATOR, **CREATE OPERATOR CLASS**, and **DROP OPERATOR**

7.12.9.33 CREATE OPERATOR CLASS

Description

CREATE OPERATOR CLASS defines a new operator class. This function is for internal use only. You are advised not to use it.

Precautions

CREATE OPERATOR CLASS defines a new operator class. An operator class defines how to use a specified data type together with an index. The operator class declares that certain operators will provide particular roles or "strategies" for this data type and this index method. The operator class also declares the supported programs used by the index method when the operator class is selected for an index column. All the operators and functions used by an operator class must be defined before the operator class is created.

If a schema name is given, then the operator class is created in the specified schema. Otherwise, it is created in the current schema. Two operator classes in the same schema can have the same name only if they are for different index methods.

The user who defines an operator class becomes the owner. Currently, the creator must be an initial user.

CREATE OPERATOR CLASS does not check whether the class definition includes all the operators and functions required by the index method, nor whether the operators and functions form a self-contained set.

Related operator classes can be grouped into operator families. To add a new operator class to an existing family, specify the **FAMILY** option in CREATE OPERATOR CLASS. Without this option, the new class is placed into a family with the same name (a family is created if it does not exist).

Syntax

```
CREATE OPERATOR CLASS
name [ DEFAULT ] FOR TYPE data_type
USING index_method [
FAMILY family_name ] AS
{  OPERATOR strategy_number operator_name [ (
op_type, op_type ) ] [ FOR SEARCH | FOR ORDER BY sort_family_name ]
| FUNCTION
support_number [ ( op_type [ , op_type ] ) ] function_name ( argument_type [,
...] )
| STORAGE storage_type
} [, ... ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **name**

  Specifies the name of the operator class to be created (which can be schema-qualified).

- **default**

  Specifies that the operator class will become the default operator class for its data type. At most one operator class can be the default for a specific data type and index method.

- **data_type**

  Specifies the column data type processed by the operator class.

- **index_method**

  Specifies the name of the index method processed by the operator class.

- **family_name**

  Specifies the name of an existing operator family where an operator class is added. If not specified, the class is placed into a family with the same name (a family is created if it does not exist).

- **strategy_number**

  Specifies the strategy number of the index method associated with the operator class.

- **operator_name**

  Specifies the name (which can be schema-qualified) of the operator associated with the operator class.

- **op_type**

  Specifies the data type of the operator's operand in an OPERATOR clause. The value **NONE** represents a left unary operator or right unary operator. The data type of the operand can be omitted if it is the same as that of the operator class.

  In a FUNCTION clause, if the data type of the function's operand is different from the input data type of the function (such as B-tree comparison functions and hash functions) or the class's data type, the data type of the operand supported by this function must be included in this clause. These default values are correct. Therefore, **op_type** need not be specified in FUNCTION clauses, except in cases where the B-tree sort support function supports cross-type comparisons.

- **sort_family_name**

  Specifies the name of an existing B-tree operator family that describes the sort ordering associated with a sort operator.

  The default value is **FOR SEARCH**.

- **support_number**

  Specifies the number of an index method for a function associated with the operator class.

- **function_name**

  Specifies a function name of an index method for an operator class.

- **argument_type**

  Specifies a data type of a function parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **storage_type**

  Specifies the data type stored in the index. Normally, this is the same as the column data type, but some index methods allow it to be different. The STORAGE clause must be omitted unless the index method allows a different type to be used.

Examples

```
-- Define a function.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer AS BEGIN
RETURN num1 + num2;
END;
/

-- Create an operator class and associate it with the preceding function.
gaussdb=# CREATE OPERATOR CLASS oc1 DEFAULT FOR TYPE _int4 USING btree AS FUNCTION 1
func_add_sql (integer, integer);

-- Drop the operator.
gaussdb=# DROP OPERATOR CLASS oc1 USING btree;

-- Delete the function.
gaussdb=# DROP FUNCTION func_add_sql;
```

ALTER OPERATOR, **CREATE OPERATOR**, and **DROP OPERATOR**

7.12.9.34 CREATE PACKAGE

Description

Creates a package.

Precautions

- The functions or stored procedures declared in the package specification must be defined in the package body.
